

1 **Statement of Principles**  
2 **Regarding Property and**  
3 **Casualty Valuations**

4 (As ADOPTED SEPTEMBER 22, 1989)

5 The purpose of this Statement is to identify and describe principles applicable to property  
6 and casualty valuations. The Statement establishes fundamental concepts for research and  
7 education regarding valuation techniques. The principles in this Statement provide the  
8 foundation for actuarial procedures and standards of practice regarding valuations. These  
9 principles apply to valuations regarding any risk bearer of property and casualty contingencies.

10 This Statement consists of three parts: I. Definitions

11 II. Principles

12 III. Discussion

13 I. Definitions

14 **Valuation** is the process of determining and comparing, for the purpose of assessing a  
15 risk bearer's financial condition as of a given date, called the valuation date, the values of part  
16 or all of a risk bearer's obligations and the assets and considerations designated as supporting  
17 those obligations.

18 A valuation is carried out in accordance with specified rules or assumptions selected or  
19 prescribed in accordance with the purpose of the valuation.

20 A risk bearer is a person or other entity that is exposed to the risk of financial losses  
21 that may arise out of specified contingent events during a specified period of exposure.

22 **Cash flows** are receipts or disbursements of cash.

23 An **asset** is cash held or any other resource that can generate receipts or reduce  
24 disbursements.

25 An **obligation** is a commitment by or requirement of a risk bearer to make disbursements  
26 with respect to financial losses arising out of specified contingent events or with respect to any  
27 type of other expense or investment commitment.

28 A **consideration** is a receipt or a reduction in disbursements in exchange for accepting  
29 the risk of financial losses that may arise out of specified contingent events during a specified  
30 period of exposure.

31 II. Principles

32 1. Every obligation, consideration or asset, with the exception of cash held, is  
33 associated with one or more items of cash flow.

34 2. The value of every item of cash flow depends upon the following valuation  
35 variables, each of which may involve uncertainty:

36 a. the occurrence of the item of cash flow,

37 b. the amount of the item of cash flow,

38 c. the interval of time between the valuation date and the date of occurrence of  
39 the item of cash flow, and

40 d. a rate of interest related to the interval of time between the valuation date  
41 and the date of occurrence of the cash flow.

- 42 3. The degree of uncertainty affecting each valuation variable for any item of cash  
43 flow associated with a given asset, obligation or consideration depends upon:
- 44 a. the nature of the asset, obligation or consideration,
- 45 b. the various environments (e.g. regulatory, judicial, social, financial and  
46 economic environments) within which the valuation is being performed, and
- 47 c. the predictive value of the data used to estimate the valuation variables  
48 associated with each item of cash flow.
- 49 4. In general, the values of items of cash flow associated with a given asset,  
50 obligation or consideration, and the values of assets, obligations and considerations  
51 themselves are not only uncertain, they are also not independent of each other.  
52 Consequently, the degree of uncertainty relative to the combined value of items of  
53 cash flow or of assets, obligations and considerations reflects the uncertainties  
54 affecting the underlying valuation variables and arising out of the interaction of  
55 those variables in the process of combination.
- 56 5. The value of an asset, obligation or consideration is equal to the combined values  
57 of its constituent items of cash flow.
- 58 6. The result of a valuation is the combined value of the assets, obligations  
59 and considerations involved in the valuation with due recognition of the offsetting  
60 characteristics of receipts and disbursements.
- 61 7. These valuation principles apply to any valuation whether it involves a risk bearer's total  
62 assets, obligations and considerations as of a given valuation date or only identified  
63 segments of the risk bearer's assets, obligations and considerations including:
- 64 a. commitments made on or before the valuation date, or
- 65 b. the commitments in (a) and commitments projected to be made after the  
66 valuation date, or
- 67 c. only those commitments projected to be made after the valuation date.

68 III. Discussion

69 Although no valuation methodology is appropriate in all situations, a number of  
70 considerations commonly apply. Some of these considerations are discussed in this section.  
71 These discussions are intended to provide a foundation for the development of actuarial  
72 procedures and standards of practice.

73 **Data**

74 Data to be used in valuation include descriptions of the characteristics of the risk bearer's  
75 assets, obligations and considerations. The descriptions should be sufficiently detailed to permit  
76 reasonable projections of cash flows from these assets, obligations and considerations.

77 The actuary may use a risk bearer's own experience relative to its assets, obligations and  
78 considerations if this provides a basis for developing a reasonable indication of the future.  
79 Moreover, the actuary may use external data drawn from relevant experience of the insurance  
80 industry, other financial institutions or surrounding environments.

81 **Organization of Data**

82 Organization of data for valuation is affected by the characteristics of the assets,  
83 obligations and considerations involved and the characteristics of the valuation variables

84 connected with them.

85 Much of the data organizational work relative to obligations and considerations begins  
86 with data used in connection with the reserving and ratemaking processes. However, it may be  
87 necessary to adjust the results of those processes so as to take into account differences between  
88 cash flow dates and the various dates used in those processes. It may also be necessary to  
89 identify any relevant expenses that fall outside the data used in the reserving and ratemaking  
90 processes and reflect them in the valuation process. It is important, too, to identify potential  
91 adjustments to considerations like retrospective premiums or audit premiums that may be  
92 received or paid in the future.

93 If a valuation deals with detailed analyses of cash flows, data organization relative to assets  
94 involves principally the work of classifying the assets and developing projections of contractual or  
95 anticipated cash flows from them. It is also often necessary to divide assets into classes of  
96 investment by such things as time to maturity or quality and to project flows of anticipated receipts  
97 into particular classes of investment in accordance with an assumed investment strategy.

#### 98 **Homogeneity**

99 Valuation accuracy is often improved by dividing the data on assets, obligations and  
100 considerations into groups exhibiting similar characteristics. Homogeneous groupings recognize,  
101 when appropriate, the interrelationships between those assets, obligations and considerations.

#### 102 **Credibility**

103 Credibility is a measure of the predictive value attached to a body of data. Credibility is  
104 increased by defining groups of assets, obligations or considerations so as to increase their  
105 homogeneity or to increase the volume of data relative to the groups. Increasing homogeneity  
106 may fragment the groups to such an extent that their predictive value is reduced to an  
107 unacceptable level. Each situation requires balancing homogeneity and the volume of data.

#### 108 **Operating Conditions**

109 Operating conditions should be reflected in valuation. Operating conditions include mix  
110 of business, underwriting, claims handling, marketing, accounting, premium processing,  
111 portfolio of investments, investment strategy, and reinsurance programs.

#### 112 **Environmental Conditions**

113 Environmental conditions should be reflected in valuation. The regulatory, judicial,  
114 social, financial, and economic environments are some of the major ones to be considered.

#### 115 **Losses and Loss Adjustment Expenses**

116 The major obligations of a risk bearer are usually those relating to the future payment of  
117 losses and loss adjustment expenses. When these obligations are estimated for purposes of a  
118 valuation, their future development may be a factor for consideration. Development of losses  
119 and loss adjustment expenses is defined in the Casualty Actuarial Society's Statement of  
120 Principles Regarding Property and Casualty Loss and Loss Adjustment Expense Reserves.

#### 121 **Rules and Assumptions**

122 The objective of a valuation is to produce an assessment of a risk bearer's financial  
123 condition that will be useful for the purpose for which the valuation is performed. The purpose  
124 of the valuation affects the rules and assumptions used.

125 Cash flow analyses produce projections of receipts and disbursements. These analyses are  
126 conceptually the most fundamental of the forms of valuation. The other forms of valuation

127 can be derived from cash flow analysis by suitable selection of rules and assumptions relative to  
128 the valuation variables.

129 Balance sheets and income statements are often produced internally by a risk bearer using  
130 rules and assumptions established by its management to assess financial strength and earning  
131 performance.

132 Appraisals are intended to help determine the value of all or a part of a risk bearer's  
133 assets, obligations and considerations related to property and casualty contingencies, taking into  
134 account not only financial statement items but also off-balance-sheet items such as investment in  
135 staff, leases and so on. Appraisals are usually made in connection with mergers and acquisitions  
136 and the sale of parts of a risk bearer's business.

137 GAAP accounting rules or assumptions are intended to produce financial statements that  
138 the financial community believes are useful for assessing a risk bearer's earning capacity.

139 Statutory accounting rules or assumptions are intended to produce financial statements  
140 that regulators believe are useful for assessing whether an insurer's financial condition warrants  
141 its being allowed to write insurance.

142 The value of any of the valuation variables with respect to a given set of items of cash  
143 flow may be determined on the basis of any set of rules and assumptions that is appropriate to  
144 the purpose of the valuation. Rules and assumptions relative to different classes of assets,  
145 obligations or considerations need not necessarily be consistent with each other as long as the  
146 differences are consistent with the purpose of the valuation, or the effect of the inconsistencies  
147 is not great enough to invalidate the valuation.

148 Assumptions are based on a reasonable review of whatever appropriate facts are available  
149 supplemented by the actuary's experience and judgement as necessary. Rules are helpful to the  
150 assurance of appropriately consistent treatment of facts and assumptions in valuation. Both rules  
151 and assumptions can be helpful to achieving a result with a degree of refinement consistent with  
152 the purpose of the valuation. Anticipated changes in operating and environmental conditions  
153 should be reflected in the rules and assumptions applied to a valuation.

154 **Valuation Variables**

155 The valuation variables of occurrence, amount, interval of time and rate of interest  
156 describe the quantitative characteristics of all cash flows for purposes of financial analysis. All  
157 of the valuation variables are conceptually involved in the determination of the values of all  
158 assets, obligations and considerations. The roles of the valuation variables in the determination  
159 of values may be limited by the selection of rules or assumptions.

160 The value of any item of cash flow changes with the passage of time. This implies that  
161 valuations of the same sets of items of cash flow performed at different valuation dates will in  
162 general produce different results. It further implies that a valuation of one set of items of  
163 cash flow performed as of a given valuation date will produce a result that is not directly  
164 comparable with that of a second valuation of the same or a different set of items of cash flow  
165 performed as of a different date.

166 **Uncertainty**

167 The result of a valuation involves uncertainty because of the uncertainty connected with  
168 the valuation variables themselves and because the result of combining valuation variables is  
169 affected by whatever relationships may exist among them.

170 **Valuation Risks**

171 The risks associated with valuation can be summarized into the following three broad  
172 classes:

173 1. Asset Risk

174 The risk that the occurrence, amount or timing of items of cash flow connected  
175 with assets will differ from that anticipated as of the valuation date for reasons  
176 other than a change in the interest environment.

177 There are several factors that affect asset risk:

- 178 a. Type—This factor relates to whether the asset is, for example, a bond, a mortgage, a  
179 preferred or common stock, an agent's balance, a recoverable reinsurance item or  
180 interest accrued but not paid. It also relates to such things as whether a bond is callable and, if so, at what premiums; whether a bond  
181 has a sinking fund provision; or whether prepayments can be made on  
182 a mortgage and, if so, what penalty may apply.  
183
- 184 b. Quality—This factor relates to the financial strength of the entity from which the  
185 cash flow is to be received and the relative standing of the type of asset  
186 in the hierarchy of financial instruments.
- 187 c. Deferred Acquisition Expenses, Goodwill and Similar Assets—This factor relates to  
188 the valuation question of whether any asset of these or similar  
189 types involves cash flows that are not explicitly or implicitly recognized elsewhere in  
190 the valuation.
- 191 d. Investment Strategy—This factor relates to plans for investment of receipts in  
192 various types of security, taking into account such things as the insurer's  
193 needs for funds to meet obligations as they mature, market conditions at the time  
194 the investments are made, and the overall condition of the insurer's investment  
195 portfolio at the time the investments are made.
- 196 e. Trends—This factor relates to changes over time in the valuation variables  
197 other than interest, insofar as they affect assets, and in the degree of  
198 uncertainty affecting them.

199 2. Obligation and Consideration Risk

200 The risk that the occurrence, amount or timing of items of cash flow connected with  
201 obligations and considerations will differ from that anticipated as of the valuation date for  
202 reasons other than a change in the interest environment.

203 There are several factors that affect obligation and consideration risk:

- 204 a. Coverage—This factor relates to the riskiness of the coverage involved.
- 205 b. Type—This factor relates to whether the obligation is, for example, a loss or loss  
206 adjustment reserve, an unearned premium reserve, a contingent commission reserve,  
207 a retrospective premium adjustment reserve, a policyholder or shareholder dividend  
208 reserve, a premium deficiency reserve, an income tax liability, an investment  
209 commitment or an account payable for something such as expenses, taxes, licenses,  
210 fees and assessments.
- 211 c. Commitment Provisions—This factor relates to the extent to which the range of the  
212 valuation variables may be effectively limited by terms of the commitments out of  
213 which the obligations arise. Examples of such commitment provisions are basic

- 214 limits, increased limits, aggregate limits, claims made, salvage and subrogation,  
 215 coinsurance, deductibles, coordination of benefits and second injury fund  
 216 recoveries.
- 217 d. Reinsurance Programs—This factor relates to the extent to which the range of the  
 218 valuation variables may be effectively limited by the terms of reinsurance programs  
 219 applicable to the commitments out of which the obligations arise. Examples of such  
 220 programs are those involving surplus, excess of loss and catastrophe reinsurance.  
 221 Frequency and severity of losses, attachment points and upper limits of reinsurance  
 222 are features of the programs relating to their limiting effect. On the other hand,  
 223 reinsurance programs also involve uncertainty as to whether reinsurance will be  
 224 collectible.
- 225 e. Exposure—This factor relates to the uncertainty involved in measuring or  
 226 projecting levels of exposure, and for periods beginning after the valuation date, the  
 227 considerations for those periods and the obligations to arise out of them.  
 228 Obligations and considerations related to these periods of exposure may be offset  
 229 against each other in recognition of the fact that the obligations would not arise if  
 230 the considerations were not received. Determination of whether obligations and  
 231 considerations relative to such periods should be recognized in a valuation depends  
 232 upon the timing relative to the valuation date of the commitments to accept risks  
 233 for those periods.
- 234 f. Loss Development—This factor relates to the uncertainty arising out of  
 235 changes over time in patterns of emergence, development, reopening,  
 236 settlement and payment of claims.
- 237 g. Trends—This factor relates to changes over time in the valuation variables  
 238 other than interest, insofar as they affect obligations and considerations, and  
 239 in the degree of uncertainty affecting them.
- 240 h. Large Latent Losses—This factor relates to the treatment of identifiable  
 241 classes of very serious potential losses for which probable frequency and  
 242 severity can not be reasonably estimated for a considerable period of time.
- 243 i. Off-Balance-Sheet Items Such as Long-Term Leases and Commitments to Buy  
 244 Securities—This factor relates to the valuation question of whether any  
 245 obligation of these or similar types involve cash flows that are not explicitly  
 246 or implicitly recognized elsewhere in the valuation.
- 247 3. Interest Risk
- 248 The risk that different amounts of change in the anticipated values, and the degree of  
 249 uncertainty therein, of obligations and of the assets and considerations with which the  
 250 obligations are being compared will occur:
- 251 i. simply because of a change in the interest environment, or
- 252 ii. because a change in the interest environment brings about a change from expected  
 253 experience as to the occurrence, amount or timing of items of cash flow connected  
 254 with assets, obligations or considerations.
- 255 There are several factors that affect interest risk:
- 256 a. Mismatch of Asset and Obligation Cash Flows—This factor relates to the  
 257 development of an excess of a risk bearer's receipts over its required

- 258 disbursements or vice versa.
- 259 If an excess of receipts over required disbursements develops, the risk  
260 bearer may not be able to invest the excess cash at yields that will produce  
261 future cash flows large enough to meet its obligations as they mature. This is  
“reinvestment” risk.
- 263 If an excess of required disbursements over receipts develops, the risk  
264 bearer may have to borrow or liquidate assets with yields below then current  
265 market rates to make up the difference. Borrowing at a relatively high  
266 interest rate, or inability to invest the difference at then current market rates  
267 produces a reduction in the risk bearer’s future profits. This is “market” risk.
- 268 b. Changes in the Timing of Receipts and Disbursements—This factor relates to  
269 the preference of borrowers to prepay debt carrying high rates of interest  
270 when rates go down and to defer repayments of debt carrying low rates of  
271 interest when rates go up. For risk bearers of property and casualty  
272 contingencies, this risk affects mainly their assets.
- 273 c. General Economy—This factor relates to the way in which things such as  
274 liquidity, inflation, demand for cash to fund expansion, government debt,  
275 trade imbalances and distortions in the yield curve affect the general level of  
276 interest rates.
- 277 d. Trends—This factor relates to changes over time in the interest valuation  
278 variable and in the degree of uncertainty affecting it and how those changes  
279 affect the other asset and obligation valuation variables.

#### 280 **Interaction with Other Professionals**

281 The uncertainties that affect other actuarial fields, such as ratemaking and reserving, also affect  
282 valuation. In addition, valuation is affected by uncertainties met in other fields, such as marketing,  
283 underwriting, finance, regulation, risk management and so on. This implies that professionals  
284 working in other fields can be helpful in gathering information and developing rules and assumptions  
285 to be used in valuation.

#### 286 **Actuarial Judgment**

287 It is important to apply actuarial judgment based on education and experience in selecting and  
288 organizing data and making rules and assumptions to be used in the valuation process and in  
289 assessing the reasonableness of the results.
