- The relevant statute may have been amended to provide a new or revised benefit;
- An applicable policy of the public personal injury compensation plan may have been revised recently;
- The public personal injury compensation plan’s claim adjudication practices or administration practices may have changed recently;
- A recent appeal decision may be expected to have a material effect on future benefit payments; or
- Economic conditions or health care practices in the relevant jurisdiction may have changed, which may be expected to have a material effect on benefits.

Where the data are not sufficiently relevant to expected future experience for a specific benefit, the actuary would consider adjusting the data and historic claim settlement patterns to make them more representative of expected experience going forward.

5330 Methods

The actuary should value the benefits liabilities assuming that the public personal injury compensation plan continues indefinitely as a going concern entity. [Effective February 1, 2018]
.02 The value of the benefits liabilities is the value, by the actuarial present value method, of cash flows after the calculation date with respect to

- All claims incurred before that date, whether reported or not; and
- Workplace exposures that have occurred prior to that date. The workplace exposures should include those which may potentially lead to occupational disease claims, in accordance with the policy of the plan for recognizing such claims. [Effective December 15, 2019]

.03 The cash flows after the calculation date on account of all claims and exposures incurred before that date should include all expenses expected to be incurred after the calculation date which are related to those claims and exposures, including relevant administration expenses. [Effective December 15, 2019]

.04 The actuary’s work should take into account the benefits, relevant policies, and administration practices of the public personal injury compensation plan as of the calculation date, and should take into account any definitive or virtually definitive amendment to these items that is expected to have a material effect on benefits, unless the circumstances affecting the work require otherwise. [Effective December 15, 2019]

.05 The benefits liabilities should include an amount in respect of benefits for employees of a self-insured employer, unless the exclusion of such benefits is in accordance with the circumstances affecting the work. [Effective February 1, 2018]

Occupational disease

.06 For the purpose of this part, occupational disease refers to diseases or conditions arising from the cumulative effects of long-term exposure to repetitive activities or environmental hazards in the workplace. Latency refers to the period from exposure to a causative factor to the manifestation of the occupational disease.

.07 The actuary would include in the benefits liabilities an appropriate allowance for occupational disease claims expected to arise after the calculation date as a result of exposures incurred in the workplace prior to the calculation date. This allowance would be in respect of occupational diseases with a long latency period as recognized by the public personal injury compensation plan, by legislation, by regulation, or by appeal, regardless of the plan’s approach to funding such claims.
5340 Assumptions

.01 The actuary should set assumptions that reflect the expectation that the public personal injury compensation plan will continue indefinitely as a going concern entity, but may make adjustment for short-term considerations, where appropriate. [Effective February 1, 2018]

.02 The actuary should select either best estimate assumptions or best estimate assumptions modified to incorporate margins for adverse deviations to the extent, if any, required by law or by the circumstances affecting the work, and should provide the rationale for the decision made with respect to margins. [Effective December 15, 2019]

.03 Where a public personal injury compensation plan has an established practice of providing ad hoc increases to benefits, or a periodic update to rates or tables used in the administration of the plan, the actuary should recognize such established practice when valuing the benefits liabilities by assuming the continuation of such practice, unless a policy decision to discontinue such established practice has been taken by the plan. [Effective December 15, 2019]

5350 Economic assumptions

.01 The economic assumptions chosen for the valuation would depend on the purpose of the valuation. For valuations for funding purposes, the assumptions would be consistent with the plan’s funding policy. Considerations for funding valuations would include, but are not limited to,

- The plan’s risk tolerance;
- Stability of premiums or assessment rates; and
- Intergenerational equity among employers.

.02 The economic assumptions that are needed would depend on the nature of the benefits that are being valued, and may vary by year. Generally, the needed economic assumptions would include a discount rate and various inflation rate assumptions such as general inflation, wage inflation, and health care inflation.
The economic assumptions chosen for the valuation would be internally consistent. In particular, the chosen assumptions would generally be appropriate for a similar time horizon. For example, a long-term investment rate of return assumption would generally not be combined with an inflation assumption based on short-term expectations. Similarly, the valuation would generally not mix assumptions based on current market prices (e.g., market-implied inflation expectation) with those not based on current prices.

When determining a best estimate assumption for the expected rate of investment return, the actuary would take into account the expected investment return on the assets of the public personal injury compensation plan at the calculation date and the expected investment policy after that date.

In establishing the assumption for the expected rate of investment return, the actuary would assume that there would be no additional returns achieved, net of investment expenses, from an active investment management strategy compared to a passive investment management strategy except to the extent that the actuary has reason to believe, based on relevant supporting data, that such additional returns will be consistently and reliably earned over the long term.

The expected investment expenses would depend on the investment policy of the plan, the types of investments held and projected to be held in the future, and the nature of investment operations.

The actuary may adopt an assumption for the expected rate of investment income that varies depending on the part of the public personal injury compensation plan being valued and the assets backing the liabilities in that part.

The economic assumptions need not be a flat rate but may vary from period to period.

**5360 Non-economic assumptions**

When setting non-economic assumptions, the actuary would reflect all material contingencies.

The actuary would recognize the effect of varying experience and settlement patterns that result from definitive or virtually definitive revisions to the plan’s benefits or claims practices and would consider the relevance of historical claims experience.
When setting the assumptions for wage loss, disability, pension, and other benefits, the actuary would take into account all applicable material contingencies, including the possibility of recoveries, relapses, mortality improvements, changing benefit levels, and the intermittence of income replacement and rehabilitation benefits throughout the lifetime of claimants. Further, the actuary would consider the potential effect on future benefit payments of factors such as changing economic conditions, employment levels, the claimant’s occupation, and industry and seasonal variations.

### 5370 Margins for adverse deviations

.01 The actuary should not include a margin for adverse deviations when the circumstances affecting the work require a best estimate calculation. [Effective December 15, 2019]

.02 The actuary should include margins for adverse deviations when the circumstances affecting the work require such margins. A non-zero margin should be sufficient, without being excessive, and should have the effect of increasing the benefits liabilities or reducing the reported value of the offsetting assets, the computation of which falls within the scope of the work of the actuary. In addition, the provision resulting from the application of all margins for adverse deviations should be appropriate in the aggregate. [Effective February 1, 2018]

.03 If the actuary is required by legislation, regulation, or the funding policy of the plan to use a margin for adverse deviations that is outside the range that the actuary considers appropriate, the actuary may use such an imposed assumption, but the actuary should disclose that the margin is outside of the appropriate range and disclose the reason for using such margin. [Effective December 15, 2019]
Standards of Practice

.04 The actuary’s decision with respect to margin for adverse deviations may reflect considerations such as:

- Funding policy of the public personal injury compensation plan;
- Relative importance placed on the balancing of competing interests compared to the achievement of full funding;
- Underlying adaptability of the plan to changes in financial position;
- Legislative requirements regarding margins;
- Intergenerational equity among employers and other groups;
- Level of uncertainty inherent in the assumptions;
- Level of reliability or credibility of the data or historical information upon which the assumptions are based;
- Asset/liability mismatch risk;
- Propensity for ad hoc changes to be made to plan conditions; and
- Legislative or other restrictions on the ability to mitigate past losses.

.05 Examples of situations where the circumstances affecting the work might require a best estimate calculation include:

- Legislation governing the plan may require a best estimate calculation; or
- The plan’s funding policy may recognize the monopoly nature of the plan and place a high priority on equity among generations, employers, and other groups.

5380 Gain and loss analysis

.01 The actuary should conduct a gain and loss analysis, including a comparison of actual and expected experience for the period between the prior calculation date and the current calculation date. [Effective February 1, 2018]

.02 The actuary should also conduct a reconciliation of the surplus or deficit position of the plan, provided that such reconciliation is in accordance with the terms of the engagement. [Effective February 1, 2018]
.03 The actuary’s analysis would include all material gains and losses. At a minimum, the actuary’s gain and loss analysis would consider the impact of any significant changes to the assumptions or methods used, any significant changes to the benefits or policies of the plan, legislative changes, investment returns on the plan’s assets different from the assumed basis (if reconciling the surplus or deficit position of the plan), and any other areas where the difference between actual and expected experience is significant.

.04 The actuary would report a change in assumption if the current assumption differs nominally from the corresponding prior assumption, unless the change in the nominal amount results from the application of the same calculation method. For example, if certain rates used in the valuation are based on historical claims experience and calculated using the same averaging formula, the difference in assumed rates between the calculation date and the prior calculation date would not normally be considered as a change in assumptions. Nevertheless, the actuary may choose to disclose the effect of the updated rate assumption on the valuation results.

5390 Sensitivity Testing

.01 The actuary should perform sensitivity testing of adverse scenarios, to illustrate and aid the understanding of the effect of adverse changes to assumptions. [Effective February 1, 2018]

.02 The adverse scenarios that the actuary tests should include at least

- A decrease of 100 basis points in the gross discount rate used for the valuation; and
- An increase of 100 basis points in the assumed general rate of inflation while maintaining the gross discount rate at the value used in the underlying valuation. [Effective December 15, 2019]

.03 The actuary should consider other scenarios that, in the actuary’s judgment, represent plausible material risks to which the plan may be exposed, and provide sensitivity testing of those scenarios where appropriate given the circumstances affecting the work. [Effective December 15, 2019]

.04 When selecting the assumptions and scenarios for sensitivity testing, the actuary would consider the circumstances affecting the work, and would select those assumptions that have a material impact on the benefits liabilities. The actuary may consider testing integrated sensitivity scenarios; for example, the effect of a deep and prolonged recession.
The actuary may also perform sensitivity testing of favourable scenarios.

### 5395 Reporting

.01 For work pursuant to section 5300, the actuary should prepare a report in accordance with the circumstances affecting the work. [Effective December 15, 2019]

.02 An external user report on work pursuant to section 5300 should

- State the calculation date and the prior calculation date;
- Identify the legislation or other authority under which the work is completed;
- Describe any significant terms of the appropriate engagement that are material to the actuary’s work, including the purpose of the work;
- Describe the sources of data, benefit provisions, and policies used in the work, and any limitations thereon;
- Summarize the data used for the valuation, the data tests conducted to assess the accuracy and completeness of the data used in the work, issues regarding insufficient or unreliable data, and any assumptions and methods used in respect of insufficient or unreliable data;
- Describe the plan’s benefits, significant policies, and relevant administration practices, including the identification of any amendments made since the prior calculation date, and the effect of such amendment on the benefits liabilities;
- Describe any pending definitive or virtually definitive amendment, policy change, or change to administration practice, confirm whether or not such amendment or change has been reflected in the benefits liabilities, and identify the effect of such amendment or change on the benefits liabilities;
- Identify any significant changes to the relevant statute, strategic direction, or management policy, or any significant appeal decision that changes management policy or practice, since the prior calculation date and the consequent effect on the benefits liabilities;
- Describe the assumptions and methods used to calculate the benefits liabilities;
- Summarize the benefits liabilities;
• Disclose any imposed margins that the actuary has used in accordance with paragraph 5370.03 that, in the opinion of the actuary, are outside of the appropriate range;

• Report the aggregate provision for adverse deviations included in the benefits liabilities or state that there is no provision for adverse deviations where that is the case;

• Describe the treatment of benefit liabilities for self-insured employers;

• Disclose subsequent events of which the actuary is aware, whether or not the events are taken into account in the work, or, if there are no significant events of which the actuary is aware, include a statement to that effect;

• Describe and quantify the gains and losses between the prior calculation date and the current calculation date, and provide an analysis and explanation of the significant gain and loss items;

• Describe the treatment of the liabilities for occupational disease claims;

• Describe the sources of information on the plan’s assets;

• Describe the plan’s assets, including their market value, the assumptions and methods used to value the assets, and a summary of the assets by major category;

• Report the financial position at the calculation date;

• Describe the determination of new injury costs or required revenue for periods following the calculation date;

• Report the estimate of new injury costs or required revenue for a specified period following the calculation date; and

• If required by the terms of an appropriate engagement, provide an opinion on the sufficiency of proposed premium or assessment rates.

[Effective December 15, 2019].

.03 If the report does not include the results of the sensitivity testing that was completed, the actuary should prepare a separate report for the management of the public personal injury compensation plan that does include such sensitivity testing results.

[Effective February 1, 2018]
An external user report for work pursuant to section 5300 should provide the following five statements of opinion, all in the same section of the report and in the following order:

- A statement regarding data, which would usually be, “In my opinion, the data on which the valuation is based are sufficient and reliable for the purpose of the valuation.”;

- A statement regarding assumptions, which would usually be, “In my opinion, the assumptions are appropriate for the purpose of the valuation.”;

- A statement regarding methods, which would usually be, “In my opinion, the methods employed in the valuation are appropriate for the purpose of the valuation.”;

- A statement regarding appropriateness, which would usually be, “In my opinion the [amount of the benefits liabilities and estimated funding requirements] make appropriate provision for all personal injury compensation obligations given the plan’s funding policy.”; and

- A statement regarding conformation, which should be, “This report has been prepared, and my opinions given, in accordance with accepted actuarial practice in Canada.” [Effective December 15, 2019]

An external user report should be sufficiently detailed to enable another actuary to examine the reasonableness of the valuation. [Effective December 15, 2019]

The wording in square brackets in paragraph 5395.04 is variable and other wording may be used based on the terms of the engagement for the funding valuation.

The circumstances affecting the work may result in a deviation from accepted actuarial practice in Canada. For example, the applicable legislation or the terms of the engagement may require that the actuary use a margin for adverse deviations that is outside the range that the actuary considers appropriate, or require that the actuary exclude the benefits liabilities in respect of certain occupational disease claims. In such case, the actuary would disclose such deviation in the report.
The descriptions required in an external user report may be satisfied by reference to another report where appropriate. For instance, the liability estimate for potential future occupational disease claims or future administrative expenses may be based on a previous study of the plan’s experience that is updated periodically. The details underlying these estimates could be incorporated by referencing the last study on which they are based rather than incorporating that material directly into the valuation report. Similarly, a report prepared for one purpose (e.g., funding) may reference material in a report prepared for another purpose (e.g., financial reporting) where appropriate.

An internal user report may appropriately abbreviate the reporting requirements for an external user report. The degree of abbreviation would take into consideration the circumstances affecting the work and the intended audience.

The actuary’s advice on funding may describe a range for required revenue or expected new injury costs. Funding requirements may be expressed in dollars or as a percentage of assessable payroll.

   6410  General.............................................................................................................. 6028
   6420  Reporting: External User Report ................................................................. 6031
6100 Scope

.01 The standards in part 6000 apply as follows:

- Section 6200 applies to advice that an actuary provides regarding the funding, funded status, financial position, or the financial condition with respect to a post-employment benefit plan, except where such advice relates to items covered by section 6300 or section 6400;

- Section 6300 applies to advice that an actuary provides regarding the funding, funded status, financial position, or the financial condition with respect to the wind-up, in full or in part, of a post-employment benefit plan; and

- Section 6400 applies to advice that an actuary provides regarding financial reporting of a post-employment benefit plan’s costs and obligations in the employer’s financial statements, or the post-employment benefit plan’s financial statements, or the financial statements of a trust associated with the post-employment benefit plan, where the calculations and advice are provided in accordance with an applicable financial reporting standard.

For the purposes of determining whether section 6300 applies, the wind-up of a post-employment benefit plan would involve the termination of future benefits for some or all plan members, the termination of some or all plan benefits and the distribution of some or all of the plan’s assets, if any. Examples of work with respect to wind-ups include the calculation of benefit plan costs or entitlements:

- When a benefit trust is being replaced with an insured arrangement;

- Where assets from a company’s liquidation may be provided as cash in lieu of employee benefit plans upon insolvency or upon the wind-up of a post-employment benefit plan trust; and

- Where the plan sponsor offers cash in lieu of future benefits.

The cessation of benefit accruals or termination of a post-employment benefit plan, not involving the termination of plan benefits and distribution of plan or other assets, would not constitute a plan wind-up. For example, the closure of a post-employment benefit plan to future new members would not constitute a wind-up.
The standards in sections 6200 through 6400 apply to an actuary’s advice with respect to a post-employment benefit plan that provides benefits other than pension benefits to the plan’s members and their covered spouses and dependants, whether funded or not, whether insured or not, and whether in the private or public sector. Such plans include any arrangement that provides:

- Long-term employee benefits (and compensated absences) including long-service leave or sabbatical leave, jubilee or other long-service benefits, long-term disability benefits, and profit sharing, bonuses, and other deferred compensation such as retiring allowances that are to be paid far enough into the future to be considered to be a post-employment benefit (long-term employee benefits would generally include benefits that commence or continue to be payable more than 12 months after the initial incident that caused the benefit to be paid; for example, long-term disability benefits);

- Short-term employee benefits (and compensated absences) that accumulate or vest, such as accumulated sick days or vacation days that can be saved in one period and drawn or paid out in another period;

- Benefits to which plan members become entitled when they are no longer actively at work, such as post-employment life insurance or post-employment health care; and/or

- Termination benefits payable to an employee as a result of termination of employment, if some or all of the benefits are payable on or after the date of termination of employment.

The standards in sections 6200 through 6400 do not apply to an actuary’s advice with respect to any arrangement that is:

- A plan within the scope of part 3000 Pension Plans, part 5000 Public Personal Injury Compensation Plans, or part 7000 Social Security Programs;

- A short-term employee benefit plan such as wages, salaries, and social security contributions, paid annual vacation/leave and paid sick leave, profit sharing and bonuses (if payable within 12 months of the end of the period to which they relate) and non-monetary benefits (such as medical care, housing, cars, and free or subsidized goods or services) for current employees that do not accumulate or vest;

- A post-employment benefit plan whose benefits are all guaranteed by a life insurer; or

- A social security program such as the Canada Pension Plan and Québec Pension Plan.
.04 The standards in sections 6200 through 6400 also apply to an actuary’s advice to an employer with respect to the self-insured element of a public personal injury compensation plan that covers the employees of that employer; for example, self-insured workers’ compensation plans.

.05 An actuary’s advice with respect to a post-employment benefit plan may relate to items such as:

- Required or recommended funding of the plan;
- Projected cash flows of the plan with or without future new entrants;
- Determination of the actuarial present value of the projected or accrued benefits of the plan with or without future new entrants;
- Determination of amounts for financial reporting of a plan’s cost; or
- Determination of the obligations for reporting in the employer’s financial statements, or the plan’s financial statements, or the financial statements of a trust associated with the plan.
# 6200 Advice on the Funding, Funded Status, Financial Condition, or Financial Position of a Post-Employment Benefit Plan

## 6200.01
This section 6200 applies to advice that an actuary provides regarding the funding, funded status, financial position, or the financial condition with respect to a post-employment benefit plan, except where such advice is with respect to:

- The wind-up, in full or in part, of a post-employment benefit plan; or
- The financial reporting of a post-employment benefit plan’s costs and obligations in the employer’s financial statements, or the post-employment benefit plan’s financial statements, or the financial statements of a trust associated with the post-employment benefit plan, where the calculations and advice are provided in accordance with an applicable financial reporting standard.

## 6210 General

| .01 | The actuary’s advice with respect to a post-employment benefit plan should take account of the circumstances affecting the work. [Effective February 1, 2018] |
| .02 | The actuary should select an actuarial cost method that is consistent with the circumstances affecting the work. [Effective February 1, 2018] |
| .03 | The actuary should select an asset valuation method, where applicable, that is consistent with the circumstances affecting the work. [Effective February 1, 2018] |
| .04 | The actuary’s advice with respect to a post-employment benefit plan should take account of the post-employment benefit plan’s benefit provisions at the calculation date, except that the actuary may reflect a pending amendment to the post-employment benefit plan that increases the value of its benefits. [Effective June 30, 2013] |
| .05 | The actuary’s advice with respect to a post-employment benefit plan should take account of all relevant data, including historical claims experience. [Effective June 30, 2013] |
| .06 | The actuary should select assumptions that are consistent with the circumstances affecting the work. [Effective February 1, 2018] |
| .07 | The actuary should determine the next calculation date and the actuary’s advice should cover at least the period between the calculation date and the next calculation date. [Effective June 30, 2013] |
Circumstances affecting the work

.08 For the purposes of section 6200, the circumstances affecting the work would include:

- The terms of the appropriate engagement under which the work is being performed; and
- The application of the law to the work.

.09 The terms of an appropriate engagement would specify whether the actuary’s advice relates to:

- The funded status or the funding of the post-employment benefit plan or a combination thereof;
- The calculation of the actuarial present value of future benefits payable from a post-employment benefit plan;
- The calculation of the expected future cash flows from a post-employment benefit plan; or
- Other financial information with respect to the post-employment benefit plan that is actuarial in nature.

.10 The terms of an appropriate engagement may specify the use of a particular actuarial cost method and/or a particular asset valuation method.

.11 The terms of an appropriate engagement may specify that the actuary’s advice may be related to the entire plan, or to a portion of the plan, or to a selected group of members only.

Actuarial cost methods

.12 Actuarial cost methods include, among others:

- Cost allocation methods, which allocate the actuarial present value of projected benefits among time periods, including attained age actuarial cost methods, entry age actuarial cost methods, aggregate actuarial cost methods, and individual level premium actuarial cost methods;
- Benefit allocation methods, which allocate a portion of the actuarial present value of projected benefits to a time period, including the accrued benefit actuarial cost method, the unit credit actuarial cost method, and the projected unit credit actuarial cost method; and
- Forecast actuarial cost methods, which allocate a portion of the actuarial present value of projected benefits to the forecast period based on:
  - The actuarial present value, at the calculation date, of projected benefits at the end of the forecast period, including, if appropriate, benefits for those who are expected to become members between the calculation date and the end of the forecast period;
minus

• The actuarial present value of projected benefits at the calculation date;

plus

• The actuarial present value, at the calculation date, of benefits expected to be paid during the forecast period.

**Asset valuation methods**

.13 If the plan has assets, the use of an asset valuation method that produces an asset value different from market value may be appropriate depending on the circumstances affecting the work. For example, the use of a smoothed asset value may be appropriate to moderate the volatility of contribution rates for purposes of advice on funding.

.14 The value of assets may be, subject to specific requirements for different types of valuation, any of:

- Their market value;
- Their market value adjusted to moderate volatility in investment returns;
- The present value of their cash flows after the calculation date; and
- Their value assuming a constant rate of return to maturity in the case of illiquid assets with fixed redemption values.

**Plan provisions**

.15 The actuary would determine the plan provisions with sufficient accuracy for the purposes of the valuation. Sources of information on plan provisions include:

- Current plan documents;
- Funding or underwriting arrangements;
- Collective bargaining agreements;
- Information regarding past practices;
- Cost-sharing arrangements between the plan sponsor(s) or plan administrator and plan members; and
- Communication between the plan sponsors or plan administrator and the plan members.

Prior plan provisions may be needed to analyze claims information from periods prior to the calculation date.

.16 The actuary would consider all benefits that are to be payable under the post-employment benefit plan and would include provision for all such benefits expected to be paid under the plan.
Anticipated amendment or deferred recognition of a pending amendment

.17 The actuary’s advice on a post-employment benefit plan may, subject to disclosure, reflect an expected amendment to the plan if the amendment is definitive or virtually definitive, and the amendment increases the plan’s benefits. For example, the plan sponsor may have a regular pattern of increasing the dental fee guide schedules that the post-employment benefit plan uses for its benefit limit. The actuary’s advice would normally reflect continued adoption of such increased limits.

.18 If, at the calculation date, an amendment to the post-employment benefit plan is definitive or virtually definitive, and:

- If the effective date of the amendment is during the period for which the report gives advice on funding, then the advice on funding up to the effective date may disregard the amendment, but the advice on funding after the effective date would take the amendment into account; or
- If the effective date of the amendment is after the period for which the report gives advice on funding, then the advice on funding may disregard the amendment.

.19 The effective date of the amendment is the date at which the amended benefits take effect, as opposed to the date when the amendment becomes either definitive or virtually definitive.

.20 If an actuary is aware of an expected amendment to the post-employment benefit plan, but does not reflect the amendment in the work, then the actuary would report the event in accordance with the requirements for the disclosure of subsequent events.

Data

.21 In addition to the current plan membership and asset data, if relevant, the actuary would collect information on historical claims experience, such as nature of absence and benefit levels. Data may come from the plan sponsor or plan administrator or other sources, such as insurance carriers, brokers, or external third-party plan administrators.

.22 In identifying the data needed, the actuary would bear in mind the pertinent benefits (e.g., those applicable during retirement, disability, or following termination of employment). If applicable, the actuary may obtain claims data split by plan, by age, by location, by status (retiree, inactive, spouse, etc.) and by type of expense (drug, hospital, payment for loss of income, etc.).
.23 Where appropriate, in analyzing any relevant historical claims data, the data would be adjusted to reflect the trend in the cost of benefits between the reference period and the calculation date. Where appropriate, the actuary would also adjust past experience results to reflect non-recurring influences such as changes in the benefits offered, significant changes in the demographics of the group, changes in government programs, or unusual claims.

.24 Available data may have limited value or low credibility. Where the benefit cost for former members or current retirees is not fully credible or does not reasonably represent the likely benefit cost for similar future groups, the actuary may rely on the experience of other members or other sources of data that the actuary considers reasonable and relevant. Such other data would be adjusted appropriately for the expected differences between these groups and the group from which the data were drawn.

.25 The actuary may project data, including membership data and data with respect to claim costs from the effective date of the data to the calculation date, using appropriate extrapolation techniques. The actuary would not normally extrapolate membership data more than three years from the effective date of the membership data. The actuary may also use recent credible claims experience in the extrapolation.

Assumptions

.26 In establishing the assumptions, the actuary would usually assume the continuation of the current provisions and practices of government programs, but anticipate the effect of legislative changes scheduled to be implemented at a future date. The actuary may also present alternative results reflecting different scenarios of the future. If the purpose of the valuation is such that the effect of anticipated future government changes is to be taken into account, the actuary would make appropriate assumptions in respect thereof.

.27 In determining claim costs assumptions, where necessary, the actuary would consider available claims experience with regards to items such as:

- Claimant age, member status, coverage category, and benefit type;
- Credibility; and
- Relevance to future periods and future benefit provisions.
The assumption with respect to the future claims trend rate, where necessary, may be divided into short-term and longer-term components. The short-term component would often be based on the level experienced in the recent past by the plan and plan members. The longer-term component would be consistent with the assumption regarding future changes in benefit programs and general economic conditions such as nominal Gross Domestic Product growth. The actuary would determine the period of time required to transition from the short-term trends to the longer-term trends and when the short-term trends may need to be revised.

In situations where there is not sufficient data with respect to claim costs—for example if the post-employment benefit plan has only a small number of members or does not yet have any members in payment status—the actuary may develop the applicable assumptions based on experience with other similar plans.

Discount rate

For post-employment benefit plans that are not funded, in selecting the best estimate assumption for the discount rate, the actuary would reflect the yields on fixed income investments, considering the expected future benefit payments of the plan and the circumstances affecting the work.

Expenses

The actuary’s advice on a post-employment benefit plan would take account of expenses, including whether or not they are expected to be paid from the post-employment benefit plan’s assets, if any.

The actuary would consider, as part of the claims experience, the administration costs related to the adjudication of the claims including any related general administration expenses charged by the party adjudicating the claims and all applicable taxes. The actuary would also consider other expenses related to the post-employment benefit plan.

Next calculation date

The next calculation date is the latest date for which the actuary considers the advice with respect to a post-employment benefit plan to be applicable. The actuary would take into consideration the terms of an appropriate engagement in determining the next calculation date, but the next calculation date would not normally be more than three years after the current calculation date.
6220  Advice on Funding or Funded Status

.01 If the actuary is providing advice with respect to the funding and/or funded status of a post-employment benefit plan that is pre-funded in some manner, the actuary should select either best estimate assumptions or best estimate assumptions modified to incorporate margins for adverse deviations to the extent, if any, required by the terms of an appropriate engagement. [Effective February 1, 2018]

.02 Advice on funding or funded status may include:

- Advice regarding the amount of assets to be earmarked, whether or not segregated, to cover post-employment benefit commitments;
- Advice regarding a systematic method of accumulating funds to provide the post-employment benefit commitments; or
- Advice on the funding implications of a plan amendment.

.03 The terms of an appropriate engagement may specify applicable objectives of funding, which may include a formal or informal funding policy.

.04 Objectives of funding specified by the terms of an appropriate engagement may include considerations such as the security of benefits and related provisions for adverse deviations, the allocation of contributions among time periods, and/or inter-generational equity.

.05 Depending on the circumstances affecting the work, the actuary's advice on funding may describe a range of contributions.

Discount rate

.06 If the actuary's advice relates to the funding or funded status of a post-employment benefit plan, in selecting the best estimate assumption for the discount rate, the actuary may either:

- Take into account the expected investment return on the assets, if any, of the post-employment benefit plan at the calculation date and the expected investment policy after that date; or
- Reflect the yields on fixed income investments, considering the expected future benefit payments of the post-employment benefit plan and the circumstances affecting the work.
In establishing the discount rate assumption, the actuary would assume that there will be no additional returns achieved, net of investment expenses, from an active investment management strategy compared to a passive investment management strategy except to the extent that the actuary has reason to believe, based on relevant supporting data, that such additional returns will be consistently and reliably earned over the long term.
6230 Reporting: External User Report

.01 An external user report on work pursuant to section 6200 should:

- Describe any significant terms of the appropriate engagement that are material to the actuary’s advice;
- Include the calculation date, the report date, and the next calculation date, if applicable;
- Describe the sources of membership data, plan provisions, the post-employment benefit plan’s assets, if any, and historical claims data, if any, and the dates at which they were compiled;
- Describe the membership data and any limitations thereof, and any assumptions made about missing or incomplete membership data;
- Describe the tests applied to determine the sufficiency and reliability of the membership data and plan asset data for purposes of the work;
- Describe the assets, if any, including their market value and a summary of the assets by major category;
- Describe the post-employment benefit plan’s provisions, including the identification of any pending definitive or virtually definitive amendment of which the actuary is aware, and the manner in which any such amendments have been reflected in the actuary’s advice;
- Disclose subsequent events of which the actuary is aware, whether or not the events are taken into account in the work, or, if there are no subsequent events of which the actuary is aware, include a statement to that effect;
- State the type of valuation undertaken under the terms of the appropriate engagement;
- For any one valuation undertaken, describe and quantify the gains and losses between the prior calculation date and the calculation date;
- For any one valuation undertaken, report the effect on the key results of the valuation of using a discount rate 1.0% lower than that used for the valuation; and
- For any one valuation undertaken, where relevant, report the effect on the key results of the valuation of using an assumed future claims trend rate 1.0% higher than that used for the valuation. [Effective February 1, 2018]
.02 For each valuation undertaken by the actuary, the external user report should:

- If there is no provision for adverse deviations, include a statement to that effect;
- Describe the claims administration expenses or other plan expenses that are included in the work; and
- Report the results of the valuation. [Effective March 31, 2015]

.03 An external user report that provides advice on funding should:

- Describe the rationale for any assumed additional returns, net of investment management expenses, from an active investment management strategy, included in the discount rate assumption;
- Describe the determination of contributions or a range of contributions between the calculation date and the next calculation date; and
- If contributions are fixed by the terms of the post-employment benefit plan or other governing documents (e.g., a collective agreement), then either:
  - Report that the contributions are adequate to fund the post-employment benefit plan in accordance with its terms; or
  - Report that the contributions are not adequate to fund the post-employment benefit plan in accordance with its terms; and
    - Describe the contributions required to fund the post-employment benefit plan adequately in accordance with its terms;
    - Describe one or more possible ways in which benefits may be reduced such that the contributions would be adequate to fund the post-employment benefit plan in accordance with its terms; or
    - Describe a combination of increases in contributions and reductions in benefits that would result in the funding being in accordance with its terms. [Effective June 30, 2013]
.04 An external user report should provide the following four statements of opinion, all in the same section of the report and in the following order:

- A statement regarding membership data, which should usually be, “In my opinion, the membership data on which the valuation is based are sufficient and reliable for the purpose of the valuation.”;
- A statement as to assumptions, which should usually be, “In my opinion, the assumptions are appropriate for the purpose(s) of the valuation(s).”; 
- A statement as to methods, which should usually be, “In my opinion, the methods employed in the valuation are appropriate for the purpose(s) of the valuation(s).”; and
- A statement as to conformity, which should be, “This report has been prepared, and my opinions given, in accordance with accepted actuarial practice in Canada.” [Effective June 30, 2013]

.05 An external user report should be sufficiently detailed to enable another actuary to examine the reasonableness of the valuation. [Effective June 30, 2013]

**Significant terms of appropriate engagement**

.06 Significant terms of the appropriate engagement may include matters such as:

- The use of a specified actuarial cost method;
- The use of a specified asset valuation method, where applicable;
- The exclusion of benefits for purposes of a valuation;
- The extent of margins for adverse deviations, if any, to be included in selecting assumptions; and
- The funding policy, which may include pay-as-you-go funding.

**Membership data**

.07 The actuary would describe any assumptions and methods used in respect of insufficient or unreliable membership or census/employee data.

.08 The actuary may describe limitations on the tests conducted in the review of the data which has been determined to be sufficient and reliable for purposes of the valuation(s). For example, the actuary may describe that the data tests will not capture all possible deficiencies in the data and reliance is also placed on the certification of the plan sponsor or plan administrator as to the quality of the data.
Methods

.09 For each valuation included in the external user report for which there was a prior valuation, the description of the actuarial cost method would include a description of any change to the actuarial cost method used in the prior valuation and the rationale for such change.

.10 For each valuation included in the external user report for which there was a prior valuation, the description of the method to value the assets, if any, would include a description of any change to the asset valuation method used in the prior valuation and the rationale for such change.

Types of valuations

.11 An external user report with respect to a post-employment benefit plan would normally include information on only one valuation, which is typically a going concern valuation. To the extent that the external user report provides information with respect to multiple valuations, the actuary would include information with respect to the types of valuations required by the circumstances affecting the work.

Assumptions

.12 For each valuation included in the external user report for which there was a prior valuation, the description of assumptions would include a description of any changes to the assumptions used in the prior valuation.

.13 For each valuation included in the external user report, the description of the assumptions would, if appropriate for the circumstances affecting the work, describe:

- The development of the assumed claim costs;
- The claims experience information used to develop the assumed claim costs; and
- The extent to which the claims experience information has influenced the selection of the assumed future cost trend rates.

Relevant results of the valuation

.14 The results of the valuation will depend on the purpose(s) of the valuation and the circumstances affecting the work. The results of the valuation may include such information as:

- The present value of projected benefits;
- The present value of projected benefits allocated to periods up to the calculation date;
- The projected cash flows; and/or
- The service cost for periods following the calculation date.
Reporting gains and losses

.15 The reported gains and losses for a valuation would include the gain or loss due to a change in the actuarial cost method or a change in the method for valuing the assets, if any, and each significant change in assumptions and plan provisions determined at the calculation date. If an amendment to the post-employment benefit plan prompts the actuary to change the assumptions, the actuary may report the combined effect of the amendment and the resultant change in assumptions.

Sensitivity analysis

.16 When following the recommendations to illustrate the effect of a change in discount rate, trend rate or other assumption on a valuation, the actuary would maintain all other assumptions and methods as used in the underlying valuation.

Reference to other reports

.17 The disclosures required in the external user report may be incorporated by reference to another actuarial valuation report prepared in accordance with accepted actuarial practice with the same calculation date.

Statements of opinion

.18 Where different statements of opinion apply in respect of different purposes of the valuation, the above requirements may be modified but would be followed to the extent practicable.

.19 While a separate statement regarding assumptions would usually be included in respect of each purpose of the valuation, the statements regarding assumptions may be combined where the statements do not differ among some or all of the valuation’s purposes. The report would indicate clearly which statement regarding assumptions applies to each of the valuation’s purposes.

.20 While a separate statement regarding methods would usually be included in respect of each purpose of the valuation, the statements regarding methods may be combined where the statements do not differ between some or all of the valuation’s purposes. The report would indicate clearly which statement regarding methods applies to each of the valuation’s purposes.
6300 Full or Partial Wind-up Valuation

.01 This section 6300 applies to advice that an actuary provides with respect to the wind-up (termination of future benefits for some or all members, the termination of some or all plan benefits, and the distribution of some or all of the plan’s assets, if any), in full or in part, of a post-employment benefit plan. Examples of work with respect to wind-ups include the calculation of benefit plan costs or entitlements:

- When a benefit trust is being replaced with an insured arrangement;
- Where assets from a company’s liquidation may be provided as cash in lieu of employee benefit plans upon insolvency or upon the wind-up of a post-employment benefit plan trust; and
- Where the plan sponsor offers cash in lieu of future benefits.

.02 This section 6300 does not apply in situations where the post-employment benefit plan is no longer available for future members but accrued benefits are not being settled.

6310 General

.01 The actuary’s advice with respect to a post-employment benefit plan that is being wound up, in full or in part, should take account of the circumstances affecting the work, and assume the plan is being wound up at the calculation date. [Effective February 1, 2018]

.02 The actuary should take account of subsequent events up to the cut-off date. [Effective June 30, 2013]

.03 The post-employment benefit plan’s assets, if any, should be valued at liquidation value. [Effective June 30, 2013]

.04 The actuary should take account of the post-employment benefit plan’s benefit provisions at the calculation date, except that the actuary may reflect a pending amendment to the post-employment benefit plan. [Effective June 30, 2013]

.05 The actuary’s advice with respect to a post-employment benefit plan should take account of all relevant data, including historical claims experience. [Effective June 30, 2013]
.06 The actuary should select assumptions that:

- Are either best estimate assumptions or are best estimate assumptions modified to incorporate margins for adverse deviations to the extent, if any, required by the terms of an appropriate engagement;
- Are selected as at the cut-off date; and
- Reflect the expected method of benefit settlement. [Effective February 1, 2018]

.07 Unless it is expected that expenses will not be paid from the post-employment benefit plan’s assets, the actuary should select an explicit assumption regarding the expenses of wind-up and either offset the resulting expense provision against the post-employment benefit plan’s assets, if any, or add the resulting expense provision to the post-employment benefit plan’s liabilities. Expenses may include administration costs (which may be incurred from a third-party administrator or an insurer), or other expenses. [Effective June 30, 2013]

Scope

.08 This section does not prescribe the manner in which:

- Benefit entitlements would be determined;
- Funding obligations would be determined; or
- The post-employment benefit plan’s assets, if any, would be allocated between the employer(s) and the members or among members themselves.

.09 Rather, those issues would be determined in accordance with the law, the plan provisions or governance documents, or by an entity empowered thereunder to make that determination. It may be appropriate, however, to use the results of the valuation to address one or more of those issues, or to disclose their resolution in the report.

Circumstances affecting the work

.10 For the purposes of section 6300, the circumstances affecting the work would include:

- Whether the actuary’s advice relates to the funding, funded status, financial position, or the financial condition of the post-employment benefit plan, or a combination thereof;
- Whether the actuary’s advice relates to the present value of expected future benefits under the post-employment benefit plan;
- The terms of the appropriate engagement under which the work is being performed; and
- The application of the law to the work.
Cut-off date

.11 The cut-off date would be the date up to which subsequent events would be recognized in the valuation.

Partial wind-up

.12 A partial wind-up occurs when a subset of the members terminates membership in circumstances that require wind-up with respect to those members. Such wind-up does not apply to the continuing members, although it may also be necessary, for other reasons, to value the benefits of the continuing members.

.13 The standards for a partial wind-up are the same as the standards for a full wind-up.

Assumptions

.14 The selection of the assumptions would normally be determined in accordance with the law (if applicable), the plan provisions or governance documents, or by an entity empowered thereunder to make that determination.

.15 The actuary may need to consider various appropriate tax treatments for calculations prepared for wind-ups of post-employment benefit plans.

Expenses

.16 The actuary would consider as part of the claims experience the administration costs related to the adjudication of the claims, including any related general administration expenses charged by the party adjudicating the claims and all applicable taxes. The actuary may also consider other expenses related to the post-employment benefit plan.

Plan provisions

.17 The actuary would determine the plan provisions with sufficient accuracy for the purposes of the valuation. Sources of information on plan provisions include:

- Current plan documents;
- Funding or underwriting arrangements;
- Collective bargaining agreements;
- Information regarding past practices;
- Cost-sharing arrangements between the plan sponsor(s) or plan administrator and plan members; and
- Communication between the plan sponsors or plan administrator and the plan members.

Prior plan provisions may be needed to analyze claims information from periods prior to the calculation date.
.18 The actuary would consider all benefits that are to be payable under the post-employment benefit plan and would include provision for all such benefits expected to be paid under the plan.

6320 Reporting: External User Report

.01 If a previous external user report was prepared with respect to the wind-up, the actuary should describe and quantify the gains and losses between the prior calculation date and the calculation date. [Effective June 30, 2013]

.02 An external user report should:

- Include the wind-up date, the calculation date, the cut-off date, and the report date;
- Describe the events precipitating the wind-up, of which the actuary is aware, that affect the terms of the wind-up, the benefit entitlements, or the valuation results;
- Describe the sources of membership data, plan provisions, and the post-employment benefit plan’s assets, if any, and historical claims data, if any, and the dates at which they were compiled;
- Describe the membership data and any limitations thereof, including any assumptions made about missing or incomplete membership data;
- Describe the tests applied to determine the sufficiency and reliability of the membership data and plan asset data for purposes of the work;
- Subject to any applicable privacy legislation:
  - Include the detailed individual membership data; or
  - Include an offer to provide detailed individual membership data on request to the plan sponsor or the plan administrator;
- Describe the liquidation value of the assets, if any, and a summary of the assets by major category;
- Describe the post-employment benefit plan’s provisions, including an identification of:
  - Any amendments made since any previous external user report with respect to the plan which affect benefit entitlements; and
Standards of Practice

- Any subsequent events or post-wind-up contingent events, of which the actuary is aware, which affect benefit entitlements;

- Report the explicit assumption regarding the expenses of wind-up or justify the expectation that expenses will not be paid from the post-employment benefit plan’s assets, if any;

- Report the funded status at the calculation date, and state whether an updated report will be required in the future;

- If applicable, report the settlement value for each plan member when settlement is to be made by cash payments to the member;

- Disclose subsequent events of which the actuary is aware, whether or not the events are taken into account in the work and, if there are no subsequent events of which the actuary is aware, include a statement to that effect;

- State that the funded status at settlement may differ from that contained in the report, unless the report includes the funded status at the time of final settlement;

- If the actuary relies upon direction concerning unclear or contentious issues:
  - Describe each such issue;
  - Describe the direction relied upon or, where appropriate, a summary thereof; and
  - Identify the person providing such direction and the basis of authority of such person;

- Describe any post-wind-up contingent events that may affect the distribution of the post-employment benefit plan’s assets, if any;

- Describe whether a recalculation of the value of benefit entitlements is required at settlement;

- Where a member has a choice of settlement options that the member has not yet made, describe the assumptions made regarding such choice;

- If applicable, describe the method to allocate the post-employment benefit plan’s assets among classes of members and the method to distribute surplus;
• Describe the actuary’s role in calculating settlement values, including the assumptions and methods used for their calculation; and

• Describe the sensitivity of the valuation results to the post-employment benefit plan’s investment policy and to market conditions between the report date and the settlement date. [Effective February 1, 2018]

03 An external user report should include the following four statements of opinion, all in the same section of the report and in the following order:

• A statement regarding membership data, which should usually be, “In my opinion, the membership data on which the valuation is based are sufficient and reliable for the purpose of the valuation.”;

• A statement regarding assumptions, which should usually be, “In my opinion, the assumptions are appropriate for the purpose(s) of the valuation(s).”;

• A statement regarding methods, which should usually be, “In my opinion, the methods employed in the valuation are appropriate for the purpose(s) of the valuation(s).”; and

• A statement regarding conformity, which should be, “This report has been prepared, and my opinions given, in accordance with accepted actuarial practice in Canada.” [Effective June 30, 2013]

04 The external user report should be sufficiently detailed to enable another actuary to examine the reasonableness of the valuation. [Effective June 30, 2013]

Dates

05 The wind-up date of the post-employment benefit plan would be determined by the plan administrator or the plan sponsor or others with responsibility to wind up the plan, based on the plan provisions, the law, and the circumstances of the wind-up.

06 The calculation date of the funded status would usually be the wind-up date.

07 For a particular member, the date of calculation of benefit entitlement would depend on the circumstances of the wind-up and the terms of the post-employment benefit plan, and may be the date of termination of employment, the date of termination of membership, the wind-up date, or another date.
Nature of wind-ups

.08 The purpose of a wind-up valuation may be to determine, or to provide the basis for determining:

- The funded status of the post-employment benefit plan;
- The total value of the benefit entitlements of all members prior to taking account of the funded status of the post-employment benefit plan;
- Any required additional funding;
- The amounts and methods of determining benefit entitlements, including any adjustment required due to a wind-up deficit;
- The amount and method of distribution of a wind-up surplus; or
- Payout for loss of benefit entitlements upon insolvency.

.09 A wind-up may be complex and may take a long time. Delays may require a series of reports by the actuary. Since the funded status or other available funds for the post-employment benefit plan at the final settlement date may affect whether benefit entitlements can be settled in full, the reflection of subsequent events in each report would be critical.

Membership data

.10 The finality of wind-up would call for the actuary to obtain precise membership data. The membership data are the responsibility of the plan sponsor or plan administrator. However, if the actuary is working with incomplete, unreliable, or missing data the actuary would make assumptions regarding the data. The actuary may, if the circumstances dictate, include a provisional sum in the wind-up valuation with respect to missing members if the actuary believes that additional members might have benefit entitlements under the post-employment benefit plan but their membership information is missing.

Assumptions

.11 The selected assumptions would:

- In respect of benefit entitlements that are assumed to be settled by purchase of insurance, reflect single premium rates; and
- In respect of benefit entitlements that are assumed to be settled in some other manner, reflect the manner in which such benefits would be settled.
.12 If future benefits depend on continued employment, the actuary would consider reflecting contingent events. For example, if a member is eligible for post-retirement benefits only if the member remains in employment until age 55, the actuary may make an assumption as to the probability of this event occurring and the member’s benefit may be discounted for the probability of the event occurring.

.13 Wind-up expenses usually include, but are not limited to:

- Fees related to the preparation of the actuarial wind-up report;
- Legal fees;
- Insurer or adjudicator administration expenses; and
- Custodial and investment management expenses.

.14 The actuary would either net wind-up expenses against the post-employment benefit plan’s assets, if any, or add the assumed wind-up expenses to the post-employment benefit plan’s liabilities in calculating the ratio of assets to liabilities as a measure of financial security of the benefit entitlements, unless the expectation is that expenses will not be paid from the post-employment benefit plan’s assets, if any. However, an exception may be made for future custodial and investment management expenses, which may be netted against future investment return in the treatment of subsequent events.

Subsequent events

.15 Ideally, in a wind-up valuation, all subsequent events would be reflected. This ensures that the funded status is presented as fairly as possible as of the report date. However, it would be impossible to recognize subsequent events right up to the report date. Accordingly, the actuary would select a cut-off date that is close to the report date.

.16 The actuary would ascertain that no subsequent events have occurred between the cut-off date and the report date that would change the funded status significantly; otherwise the actuary would select a later cut-off date. For clarity, a subsequent event may be material yet not be so significant as to require selection of a later cut-off date.

.17 It may be appropriate to have more than one cut-off date. For example, the actuary may select one cut-off date for the active membership data and another cut-off date for the inactive membership data.
.18 Common subsequent events are:

- Contributions remitted to the plan;
- Expenses paid from the post-employment benefit plan’s assets, if any;
- Actual investment return on the post-employment benefit plan’s assets, if any;
- Change in assumptions;
- Corrections to the membership data; and
- Deaths of members or other significant plan experience.

Use of another person's work

.19 Some aspects of the wind-up may be unclear to the actuary or contentious. Examples are:

- The determination of the wind-up date;
- The members, former members, or recently terminated members to be included in the wind-up;
- Whether or not to assume salary increases or health care cost trend rate in determining benefit entitlements;
- Eligibility for benefits payable only with the consent of the plan sponsor or plan administrator;
- The liquidation value of the post-employment benefit plan’s assets, if any;
- The method to allocate the post-employment benefit plan’s assets, if any, among members; and
- Whether or not wind-up expenses are to be paid from the post-employment benefit plan’s assets, if any, or included in the calculation of the liabilities or expected future benefits.

.20 To decide those aspects, the actuary may rely upon direction from another person with the necessary knowledge, such as legal counsel or the employer, or the necessary authority, such as the plan sponsor or plan administrator. The actuary would consider any issues of confidentiality or privilege that may arise.

Statements of opinion

.21 Where different statements of opinion apply in respect of different purposes of the valuation, the above requirements may be modified, but would be followed to the extent practicable.
6400 Financial Reporting of Post-Employment Costs

.01 This section 6400 applies to advice that an actuary provides regarding financial reporting of a post-employment benefit plan’s costs and obligations in the employer’s financial statements, or the post-employment benefit plan’s financial statements, or the financial statements of the trust associated with the post-employment benefit plan, where the calculations and advice are provided in accordance with an applicable financial reporting standard.

6410 General

.01 For financial reporting purposes, the actuary should use methods and assumptions for the value of assets, if any, and post-employment benefit obligations that are appropriate to the basis of financial reporting in the employer’s or post-employment benefit plan’s or trust’s financial statements, as applicable, and that are consistent with the circumstances affecting the work. [Effective February 1, 2018]

Circumstances affecting the work

.02 For the purposes of section 6400, the circumstances affecting the work would include:

- The terms of the appropriate engagement under which the work is being performed; and
- The application of the law to the work.

.03 The actuary would reflect the financial reporting standards specified by the terms of the appropriate engagement. Where financial reporting standards require methods and assumptions to be established by the preparers of the financial statements, the actuary would use the methods and assumptions specified by the preparers of the financial statements.

Plan provisions

.04 The actuary would determine the plan provisions with sufficient accuracy for the purposes of the valuation. Sources of information on plan provisions include:

- Current plan documents;
- Funding or underwriting arrangements;
- Collective bargaining agreements;
- Information regarding past practices;
- Cost-sharing arrangements between the plan sponsor(s) or plan administrator and plan members; and
- Communication between the plan sponsor or plan administrator and the plan members.

Prior plan provisions may be needed to analyze claims information from periods prior to the calculation date.
The actuary would consider all benefits in accordance with the terms of the appropriate engagement that are to be payable under the post-employment benefit plan and would include provision for all such benefits expected to be paid under the plan.

**Anticipated amendment or deferred recognition of a pending amendment**

The actuary’s advice on a post-employment benefit plan may reflect an expected amendment to the plan if the amendment is definitive or virtually definitive, as appropriate based on the applicable financial reporting standard.

The effective date of the amendment is the date at which the amended benefits take effect, as opposed to the date when the amendment becomes either definitive or virtually definitive.

If an actuary is aware of an expected amendment to the post-employment benefit plan, but does not reflect the amendment in the work, then the actuary would report the event in accordance with the requirements for the disclosure of subsequent events.

**Data**

In addition to the current plan membership and asset data, if any, the actuary would collect information on historical claims experience, such as nature of absence and benefit levels. Data may come from the plan sponsor or plan administrators or other sources, such as insurance carriers, brokers, or external third-party plan administrators.

In identifying the data needed, the actuary would bear in mind the pertinent benefits (i.e., those applicable during retirement, disability, or following termination of employment). If applicable, the actuary may obtain claims data split by plan, by age, by location, by status (retiree, inactive, spouse, etc.) and by type of expense (drug, hospital, payment for loss of income, etc.).

Where appropriate, in analyzing any relevant historical claims data, the data would be adjusted to reflect the trend in the cost of benefits between the reference period and the calculation date. Where appropriate, the actuary would also adjust past experience results to reflect non-recurring influences such as changes in the benefits offered, significant changes in the demographics of the group, changes in government programs, or unusual claims.

Available data may have limited value or low credibility. Where the benefit cost for former members or current retirees is not fully credible or does not reasonably represent the likely benefit cost for similar future groups, the actuary may rely on the experience of active members or other sources of data that the actuary considers reasonable and relevant. Such other data would be adjusted appropriately for the expected differences between these groups and the group from which the data were drawn.
The actuary may project data, including membership data and data with respect to claim costs from the effective date of the data to the calculation date, using appropriate extrapolation techniques. The actuary would not normally extrapolate membership data more than three years from the effective date of the membership data. The actuary may also use recent credible claims experience in the extrapolation.

Assumptions

The assumptions that the actuary uses would be best estimate assumptions, unless otherwise specified in the relevant financial reporting standards or as otherwise selected by the preparers of the financial statements.

In determining initial claim costs assumptions, the actuary would consider available claims experience with regards to items such as:

- Claimant age, member status, coverage category, and benefit type;
- Credibility; and
- Relevance to future periods and future benefit provisions.

In situations where there are insufficient data with respect to claim costs—for example, if the post-employment benefit plan has only a small number of members or does not yet have any members in payment status—the actuary may develop the applicable assumptions based on experience with other similar plans.

If the actuary is determining the assumption with respect to the future claims trend rate, where necessary, it may be divided into short-term and longer-term components. The short-term component would often be based on the level experienced in the recent past by the plan and plan members. The longer-term component would be consistent with the assumption regarding future changes in benefit programs and general economic conditions such as nominal Gross Domestic Product growth. The actuary would determine the period of time required to transition from the short-term trends to the longer-term trends.

Expenses

The actuary’s advice on a post-employment benefit plan would take account of expenses, including whether or not they are expected to be paid from the post-employment benefit plan’s assets, if any.
Benefit commitments

.19.1 The actuary would include in the valuation of the post-employment benefit obligations the effect of a commitment to provide benefits not specified in the terms of the plan to the extent stipulated by the preparers of the financial statements.

.20 The actuary would consider, as part of the claims experience, the administration costs related to the adjudication of the claims including any related general administration expenses charged by the party adjudicating the claims and all applicable taxes. The actuary may also consider other expenses related to the post-employment benefit plan.

Extrapolations

.21 The actuary may extrapolate results of an earlier valuation using appropriate extrapolation techniques. The actuary would not normally extrapolate valuation results more than four years from the effective date of the membership data.

6420  Reporting: External User Report

.01 An external user report should:

- Include the calculation date and the report date;
- Describe the sources of membership data, plan provisions, the post-employment benefit plan’s assets, if any, and historical claims data, if any, and the dates at which they were compiled;
- Describe the membership data and any limitations thereof, and any assumptions made about missing or incomplete membership data;
- Describe the tests applied to determine the sufficiency and reliability of the membership data and plan asset data for purposes of the work;
- Describe the assets, if any, including their market value and a summary of the assets by major category and the method used to value the post-employment benefit plan’s assets;
- Describe the post-employment benefit plan’s provisions, including the identification of any definitive or virtually definitive pending amendment of which the actuary is aware, and whether or not such amendment has been reflected in determining the plan’s obligations;
- Describe any material accounting policies relevant to the work;
• Describe any commitment to provide benefits beyond the terms of the plan reflected in the valuation of post-employment benefit obligations;

• Disclose subsequent events of which the actuary is aware, whether or not the events are taken into account in the work, and, if there are no subsequent events of which the actuary is aware, include a statement to that effect;

• Include all other provisions as required for disclosure purposes as per the terms of the appropriate engagement, such as:
  ▪ Reporting the funded status at the calculation date and the applicable service cost or expected cost of new claims;
  ▪ Describe any contingent benefits provided under the post-employment benefit plan and the extent to which such contingent benefits are included or excluded in determining the funded status and the service cost;
  ▪ Describe any benefits that are not contingent benefits and that have been excluded in determining the funded status and the service cost;
  ▪ Describing the method and period selected in connection with any amortizations;
  ▪ If the valuation is an extrapolation of an earlier valuation, describe the method and any assumptions for, and the period of, the extrapolation; and
  ▪ Stating whether or not the valuation and/or extrapolation conforms with the actuary’s understanding of the financial reporting standards specified by the terms of an appropriate engagement. [Effective May 1, 2019]

.02 An external user report should provide the following four statements of opinion, all in the same section of the report and in the following order:

• A statement regarding membership data, which should usually be, “In my opinion, the membership data on which the valuation is based are sufficient and reliable for the purpose of the valuation.”;

• A statement regarding assumptions which should usually be, “In my opinion, the assumptions are appropriate for purposes of the valuation.”;

• A statement regarding calculations, which should usually be, “In my opinion, the calculations have been made in accordance with my understanding of the requirements of [name financial reporting standard]”; and

• A statement regarding conformity, which should be, “This report has been prepared, and my opinions given, in accordance with accepted actuarial practice in Canada.” [Effective March 31, 2015]
An external user report should be sufficiently detailed to enable another actuary to examine the reasonableness of the valuation. [Effective June 30, 2013]

**Membership data**

.04 Any assumptions and methods used in respect of insufficient or unreliable membership data would be described.

**Reference to other external reports**

.05 The descriptions required in the external user report may be incorporated by reference to another actuarial valuation report prepared in accordance with accepted actuarial practice in Canada.

7100 Scope

01. Part 1000 applies to work within the scope of this part 7000.

02. The standards in part 7000 apply to an actuary when performing or reviewing, advising on, or opining on work related to social security programs.

03. In Canada, the social security programs include the Canada Pension Plan (CPP), the Québec Pension Plan (QPP), the Old Age Security (OAS) program, and other similar plans that fall under the definition of social security program.

04. The standards in part 7000 do not apply to programs established solely or primarily for government employees, to workers’ compensation programs, or to programs that primarily provide health insurance or property and casualty insurance.
7200 General

7210 Circumstances affecting the work

.01 The actuary’s work on the valuation of benefit liabilities or other items contained in the financial statement of a social security program, or on the financing arrangements of a social security program, should take into account the circumstances affecting the work. [Effective February 1, 2018]

.02 The circumstances affecting the work would include

- terms of the relevant statute, regulations, and other binding authorities;
- relevant accounting standards and policies; and
- terms of an appropriate engagement under which the work is being performed;

and the circumstances affecting the work may include the financing policy of the social security program.

.03 The terms of an appropriate engagement would define the role of the actuary and the purpose of the work. The work of the actuary may include the provision of advice on the financing of the social security program, its financial condition, and any other actuarial item required under the terms of an appropriate engagement.

.04 The terms of an appropriate engagement may specify applicable policies of the social security program relevant to the work of the actuary. These policies may include a formal or informal financing policy, an accounting policy, and an investment policy.

.05 Significant terms of an appropriate engagement may stipulate one or more of

- use of a specified asset value or method of asset valuation; and
- use of a specified financing method based on a pre-determined financing objective.

.06 Objectives of financing specified by the terms of an appropriate engagement may include, but are not limited to, a specific funding target, the security of benefits, a principle of equity among generations, and/or a stable contribution rate over the long term.

.07 The actuary would take into account established practice (if relevant) when no law exists with regard to certain benefit provisions or financial measures (for example, the basis for future indexation of retirement benefits).
7220 Data

.01 Where sufficient, reliable, and relevant data are not available for the valuation of a specific benefit, the actuary should make appropriate assumptions and/or introduce appropriate methods to compensate for any perceived deficiencies in the data. [Effective October 15, 2017]

.02 Sufficient, reliable, and relevant data may not be available to the actuary in various circumstances, for example,
  - a newly established social security program;
  - the relevant statute may have been amended to provide a new or revised benefit;
  - an applicable policy of the social security program may have been recently revised; or
  - the social security program administration practices may have recently changed.

.03 Where the data are not sufficient, not fully reliable, and/or not sufficiently relevant to expected future experience for a specific benefit, the actuary may consider taking one or more of the following actions:
  - introducing appropriate assumptions regarding missing, incomplete, or unreliable data; and
  - adjusting data and historical experience for the purpose of the work, as appropriate, to remove any perceived distortions, such as the effect of historical inflation or one-time benefit changes.

.04 For a newly established or substantially changed social security program, the actuary would take into account other relevant information, including relevant experience of comparable social security programs.
7310 Methods

.01 The actuary should value the social security program assuming that it continues indefinitely as a going concern. [Effective October 15, 2017]

.02 The actuary should select an actuarial cost method that is consistent with the circumstances affecting the work. [Effective February 1, 2018]

.03 The actuary’s work should take into account the benefits, relevant policies, and administration practices of the social security program, as of the calculation date, and should take into account any virtually definitive amendment to these items that is expected to have a material effect on benefits, unless the circumstances affecting the work require otherwise. [Effective February 1, 2018]

.04 The actuary would use a valuation methodology that is consistent with the financing method used for the social security program. Two methods are available:

- An open group methodology, under which contributions and benefits of both current and future participants are considered, is most appropriate for pay-as-you-go and partially funded social security programs and may also be used for social security programs that are meant to be fully funded; and

- A closed group methodology, under which only current participants are considered, with or without their assumed future benefit accruals and contributions, is only appropriate for a fully funded social security program that is meant to be fully funded.

.05 For a social security program that is meant to be fully funded, the actuary would:

- Measure the funded status of the social security program under a closed group methodology; and

- If also using an open group methodology, disclose the relationship between the social security program’s current assets and the present value of its future contributions and the present values of its current and anticipated future liabilities over the projection period.
.06 Based on the circumstances affecting the work, the actuary may judge an alternative valuation methodology to be more appropriate. That approach would be used with justification communicated in the report.

.07 The projection period used in the actuary’s work should be sufficient considering the circumstances affecting the work. [Effective February 1, 2018]

**Amendments and subsequent events**

.08 The actuary’s valuation of the social security program would reflect all virtually definitive amendments of which the actuary is aware on the calculation date, including those amendments with an effective date after the calculation date. Where the circumstances affecting the work require otherwise, the actuary may exclude the effect of a known virtually definitive amendment, but the actuary would disclose the effect of such amendment.

**7320 Assumptions**

.01 The actuary should select assumptions that reflect the projection period and the expectation that the social security program will continue indefinitely as a going concern, but may adjust such assumptions to reflect short-term considerations, where appropriate. [Effective October 15, 2017]

.02 The actuary should select either best estimate assumptions or best estimate assumptions modified to incorporate margins for adverse deviations to the extent, if any, mandated by law or by the circumstances affecting the work, and should provide the rationale for the decision made with respect to the inclusion or exclusion of margins. [Effective February 1, 2018]

.03 Where a social security program has a policy or history of providing ad hoc adjustments to contributions or to benefits, or a periodic update of parameters of the program, such as the maximum insurable earnings, the actuary should recognize such policy or history when valuing the social security program by selecting assumptions consistent with such policy or history as appropriate, unless a virtually definitive decision to discontinue such adjustments or updates has been taken by the social security program. The actuary should value the social security program with and without any assumed ad hoc adjustments. [Effective October 15, 2017]
The actuary would consider any automatic balancing mechanisms that exist in a social security program when selecting the assumptions. The actuary would consider to what extent the social security program is “immunized” from the volatility of some variables by the automatic balancing mechanisms.

**7330 Economic Assumptions**

**.01** The needed economic assumptions may include

- the discount rate;
- the expected rate of investment income;
- the expected investment and administrative expenses;
- the expected rate of general inflation;
- the expected real wage growth;
- the expected labour force participation rate; and
- the expected unemployment rate.

**.02** The economic assumptions needed would depend on the nature of the benefits that are being valued, and may vary by year.

**.03** The actuary would develop and disclose separate nominal assumptions, but may prefer to complete the calculations using rates that are net of inflation, net of expenses or net of some other factor.

**.04** When determining the best estimate assumption for the expected rate of investment income, the actuary would take into account the expected pattern of risk-free rates of return, the expected additional investment return on the assets of the social security program at the calculation date, if any, and the expected investment policy after that date. The actuary would provide justification for the expected additional investment return. Possible justifications include

- additional returns over risk-free rates expected to be earned on non-risk-free fixed income assets of the type and quality owned on the reporting date and expected to be acquired pursuant to the investment policy of the social security program;
- additional returns over risk-free interest rates expected to be earned on other types of investments, including publicly traded common or preferred equities, private placements, real estate, and private equity; and
- projected composition of the investment portfolio in future years.
In establishing the assumption for the expected rate of investment income, the actuary would assume that there would be no additional returns achieved, net of investment expenses, from an active investment management strategy compared to a passive investment management strategy except to the extent that the actuary has reason to believe, based on relevant supporting data, that such additional returns will be consistently and reliably earned over the long term.

05 The expected investment expenses would depend on the investment policy of the social security program and the types of investments held and projected to be held in the future.

.06 The assumed expected rate of investment income need not be a flat rate but may vary from period to period.

7340 Non-economic Assumptions

.01 When setting non-economic assumptions, the actuary would reflect all material contingencies.

.02 The needed non-economic assumptions may include

- the benefit take-up rates;
- the expected fertility rate;
- the expected migration rate; and
- the expected mortality and morbidity rates.

7350 Margins for Adverse Deviations

.01 The actuary should not include any margins for adverse deviations when the circumstances affecting the work require a best estimate calculation. [Effective February 1, 2018]

.02 The actuary should include one or more margins for adverse deviations when the circumstances affecting the work require such margins. A non-zero margin should be sufficient, without being excessive. The overall provision for adverse deviations resulting from the application of all margins for adverse deviations should be appropriate in the aggregate. [Effective February 1, 2018]

.03 If the actuary is required by the circumstances affecting the work to use a margin for adverse deviations that is outside the range that the actuary considers appropriate, the actuary may use such imposed assumption, but the actuary should disclose that the margin is outside of the appropriate range and disclose the reason for using such margin. [Effective February 1, 2018]
Examples of situations where the circumstances affecting the work might require an unbiased calculation include

- the legislation governing the social security program requires an unbiased calculation; or
- the social security program’s financing policy requires the use of best estimate assumptions.

Examples of situations where the circumstances affecting the work might require the inclusion of one or more margins for adverse deviations include

- the relevant legislation or financing policy requires inclusion of margins for adverse deviations; or
- the level of uncertainty or volatility around a particular assumption is high, and not considered to be sufficiently mitigated by the underlying adaptability of the social security program.

Where the actuary includes a margin for adverse deviations, the actuary would provide the rationale for inclusion of the margin and for the selection of the specific amount of the margin. The rationale may include considerations such as

- the financing policy of the social security program;
- the relative importance placed on the balancing of competing interests (e.g., benefit security versus cost of the social security program);
- the level of uncertainty inherent in the assumption;
- the level of reliability or credibility of the data or historical information upon which the assumption is based;
- the asset/liability mismatch risk; and
- the legislative or other restrictions on the ability to mitigate past adverse experience.

7360 Sensitivity Testing

The actuary should perform sensitivity testing of adverse scenarios to illustrate plausible material risks to which the social security program may be exposed and to aid in the understanding of the effect of adverse changes to assumptions. [Effective October 15, 2017]

The actuary may also perform sensitivity testing of favourable scenarios.
.03 When selecting the assumptions and scenarios for sensitivity testing, the actuary would consider the circumstances affecting the work, and would select those assumptions that have a material impact on the valuation. The actuary may consider the use of testing of integrated sensitivity scenarios, for example, the effect of a deep and prolonged recession.

.04 Assumptions tested may include, but are not limited to, the following:

- investment rate;
- real wage growth;
- labour force participation rates; and
- mortality rates.
7400  Experience Analysis

.01  The actuary should conduct an experience analysis, including a comparison of actual and expected experience for the period between the prior calculation date and the current calculation date. [Effective October 15, 2017]

.02  The actuary should conduct a reconciliation of the main results of the social security program valuation between the prior calculation date and current calculation date. The reconciliation should include an analysis and itemization of the changes in the methodology and assumptions used, legislative amendments that occurred, or other components of the valuation that contributed to the change in the main results. [Effective October 15, 2017]

.03  The actuary’s analysis would include all significant experience variations. At a minimum, the actuary’s analysis would consider the impact of any significant changes to the assumptions or methods used, any significant changes to the benefits or policies of the social security program, gains or losses due to investment returns on the social security program’s assets, legislative changes, and any other areas where the difference between actual and expected experience is significant.
7500 Reporting on the Valuation of a Social Security Program

.01 For work pursuant to this part, the actuary should prepare a report that:

- states the calculation date and the report date of the actuarial opinion given;
- identifies the legislation or other authority under which the work is completed;
- describes the significant terms of the appropriate engagement that are material to the actuary’s work, including the purpose of the work;
- describes the sources of the participants data, program provisions and policies, and assets, if any, and the dates at which they were compiled;
- describes the data used for the valuation and any limitations thereof, and any significant assumptions made about insufficient or unreliable data;
- describes the social security program’s provisions, significant policies, and relevant administration practices, including the identification of any amendments made since the prior calculation date, and the effect of such amendments on the program’s financial condition;
- describes the social security program’s source(s) of financing;
- describes any automatic balancing mechanisms of the social security program;
- describes any definitive or virtually definitive amendment, policy change or change to administration practice, confirms whether or not such amendment or change has been reflected in the valuation, and identifies the effect of such amendment or change on the program’s financial condition;
- discloses any subsequent events of which the actuary is aware, whether or not the events are taken into account in the work, or, if there are no subsequent events of which the actuary is aware, include a statement to that effect;
- describes the nature and extent of material risks faced by the social security program, and the approach taken by the actuary to assess those risks;
- states that the assumptions are best estimates, where that is the case, or discloses the aggregate provision for adverse deviations in the results, where the assumptions include margins for adverse deviations;
• describes the methodology used to assess the financial condition of the social security program at the calculation date. The description of the methodology should specify:
  ▪ whether it is based on a closed or open participants group, and
  ▪ how any automatic balancing mechanisms, if present, are incorporated;
• presents the projections of the components of the program’s cash flows, including the contributions, benefits, administrative expenses, and investment income, if any;
• presents the key results of the valuation with and without any assumed ad hoc adjustments;
• states the key contribution rates required for the social security program, if applicable;
• describes and quantifies a reconciliation of the actual and expected experience with respect to the assets, if applicable, expenditures, and key contribution rates or other indicators of the social security program from the prior calculation date to the current calculation date; and
• describes sensitivity or scenario testing performed for key assumptions and reports the results of such testing.

Depending on the terms of the engagement, the report should:
• state the prior calculation date and next calculation date, as applicable;
• describe the social security program’s assets, if any, including their market value, the assumptions and methods used to value the assets, and a summary of the assets by major category;
• state the financial condition of the social security program; and
• if the social security program is meant to be fully funded, state:
  ▪ its funded status at the calculation date under a closed group methodology;
  ▪ if also using an open group methodology, the extent to which the social security program’s current assets and the present value of its future contributions cover the present values of its current and anticipated future liabilities over the projection period under an open group methodology;

and describe the differences between the above two measures. [Effective February 1, 2018]
The report should provide the following five statements of actuarial opinion, all in the same section of the report and in the following order:

- A statement regarding the data, which would usually be, “In my opinion, the data on which the valuation is based are sufficient and reliable for the purpose of the valuation.”;

- A statement regarding the assumptions, which would usually be, “In my opinion, the assumptions used for the purpose of the valuation are reasonable and appropriate, both individually and in aggregate.”;

- A statement regarding the methods, which would usually be, “In my opinion, the methods employed in the valuation are appropriate for the purpose of the valuation.”;

- If applicable to the mandate, a statement certifying the required key contribution rates or other measures to finance the social security program. The statement may take the form of:

  “Based on the results of this valuation, I hereby certify that the [name(s) of key contribution rate(s) and/or other measure(s)] to finance the [name of social security program] is [X.XX]% for the year [YYYY] and thereafter”;

- A statement regarding conformity to accepted actuarial practice, which should be, “This report has been prepared, and my opinions given, in accordance with accepted actuarial practice in Canada.”

The report should be sufficiently detailed to enable another actuary to examine the reasonableness of the valuation and to enable stakeholders, policymakers, and other interested parties to make informed decisions regarding the social security program.

There are several measures the actuary may use to present the results, including

- projected cash flows and ending positions,
- discounted cash flows, and/or
- contribution rates required.
05 The actuary may be asked to answer questions regarding the financial condition of the social security program, such as the estimated effect from changing an assumption used in the most recent valuation. In such instances, the actuary would specify the purpose and scope of the work and any limitations or constraints that apply to the interpretation of the results of the work compared to the results of the most recent valuation. If an actuarial opinion is required for such work, the actuarial opinion would be similarly adjusted.

06 The circumstances affecting the work may result in a deviation from accepted actuarial practice in Canada. For example, the applicable legislation or the terms of engagement may require that the actuary use a margin for adverse deviations that is outside the range that the actuary considers appropriate. In such case, the actuary would disclose such deviation in the report, and if practical, useful, and appropriate under the terms of the engagement, report the results of applying accepted actuarial practice.
Revised Draft Educational Note

Assessing Eligibility for the Premium Allocation Approach Under IFRS 17 for Property & Casualty and Life & Health Insurance Contracts

Committee on Property and Casualty Insurance Financial Reporting and Committee on Life Insurance Financial Reporting

December 2020

Document 220103

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the Standards of Practice; and as such, the actuary should cross-reference with current Standards. To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.
MEMORANDUM

To: Members in the Property and Casualty and Life and Health Insurance Practice Areas

From: Steven W. Easson, Chair
Actuarial Guidance Council
Sarah Chevalier, Chair
Committee on Property and Casualty Insurance Financial Reporting
Marie-Andrée Boucher, Chair
Committee on Life Insurance Financial Reporting

Date: December 7, 2020

Subject: Revised Draft Educational Note – Assessing Eligibility for the Premium Allocation Approach Under IFRS 17 for Property & Casualty and Life & Health Insurance Contracts

The Committee on Property and Casualty Insurance Financial Reporting (PCFRC) and the Committee on Life Insurance Financial Reporting (CLIFR) have prepared this draft educational note to provide guidance on assessing the eligibility of insurance contract groups for the application of the simplified premium allocation approach (PAA) within the scope of the International Financial Reporting Standard 17 – Insurance Contracts (IFRS 17).

This draft educational note is relevant to the IFRS 17 valuation of all insurance contract groups, including Property & Casualty (P&C) and Life & Health (L&H), which are potentially eligible for the PAA.

The draft educational note is structured into eight sections, plus three appendices. Section 1 introduces the option of measuring the liability for remaining coverage (LRC) using the PAA rather than the general measurement approach (GMA). Section 2 provides an overview of the three key criteria for eligibility of the PAA, which are discussed in detail in the next three sections:

- Section 3: Determining whether the contracts in a group each have a coverage period of 12 months or less.
- Section 4: Performing the assessment of “would not differ materially” for the LRC determined using the GMA and the PAA.
- Section 5: Understanding the meaning of “significant variability in the fulfilment cash flows.”
The remaining sections address additional considerations relating to onerous contracts, reinsurance, and subsequent assessments of similar contracts in new groups. The appendices provide illustrative examples supporting the concepts discussed in Sections 4 and 5.

A preliminary version of the draft educational note was shared with the following committees in the second quarter of 2020:

- Committee on Risk Management and Capital Requirements (CRMCR);
- Committee on the Appointed/Valuation Actuary (AA);
- International Insurance Accounting Committee (IIAC);
- Worker’s Compensation Committee.

A preliminary version of the draft educational note was also shared with the staff of the Accounting Standards Board (AcSB) to broaden consultations with the accounting community. Given that this draft educational note provides actuarial guidance rather than accounting guidance, the AcSB staff review was limited to citations of and any inconsistencies with IFRS 17. CIA educational notes do not go through the AcSB’s due process and therefore, are not endorsed by the AcSB.

The draft educational note was also was presented several times at the AGC in the months preceding this request for approval.

The PCFRC and CLIFR feel that they have addressed the material comments received by the various committees.

This draft educational note is written primarily from the perspective of Canadian actuaries and is not intended to duplicate any other guidance. Additional information that provides further detail can be found in the International Actuarial Association guidance and other Canadian Institute of Actuaries (CIA) documents. The draft educational note Compliance with IFRS 17 Applicable Guidance provides guidance to actuaries when assessing compliance with IFRS 17. It is applicable to all draft educational notes pertaining to IFRS 17 and members are encouraged to review it prior to reading any draft educational note related to IFRS 17.

The creation of this cover letter and draft educational note has followed the AGC’s protocol for the adoption of educational notes. In accordance with the CIA’s Policy on Due Process for the Approval of Guidance Material Other than Standards of Practice and Research Documents, this draft educational note has been prepared jointly by the PCFRC and CLIFR and has received final approval for distribution by the AGC on July 14, 2020.

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the
Standards of Practice; and as such, the actuary should cross-reference with current Standards.
To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.

If you have any questions or comments regarding this draft educational note, please contact Sarah Chevalier at sarahchevalier@axxima.ca or Marie-Andrée Boucher at mboucher@eckler.ca.

1. Introduction

IFRS 17 establishes principles for the recognition, measurement, presentation, and disclosure of insurance contracts. The purpose of this draft educational note is to provide actuaries with practical application guidance on assessing whether a group of insurance contracts meets the required eligibility criteria for use of the premium allocation approach (PAA) to measure the liability for remaining coverage (LRC) under IFRS 17 Insurance Contracts (IFRS 17). This draft educational note is relevant to the valuation of all insurance contract groups, including property & casualty (P&C) and life & health (L&H) groups potentially eligible for measurement under the PAA.

References to specific paragraphs of IFRS 17 are denoted by IFRS 17.XX, where XX represents the relevant paragraph number, except that direct quotes from the IFRS 17 standard are as shown in the standard (i.e., paragraph XX).

Under IFRS 17, the general measurement approach (GMA) is the default approach applicable to LRC, as described in IFRS 17.32:

32 On initial recognition, an entity shall measure a group of insurance contracts at the total of:

(a) the fulfilment cash flows, which comprise:

(i) estimates of future cash flows (paragraphs 33-35);

(ii) an adjustment to reflect the time value of money and the financial risks related to the future cash flows, to the extent that the financial risks are not included in the estimates of the future cash flows (paragraph 36); and

(iii) a risk adjustment for non-financial risk (paragraph 37).

(b) the contractual service margin, measured applying paragraphs 38-39.

The PAA is a simpler and less costly approach to apply than the GMA, as there is no need to estimate fulfilment cash flows under the PAA, nor is it necessary to identify and amortize a contractual service margin (CSM). Instead, the LRC is measured as described in paragraph 55:

55 Using the premium allocation approach, an entity shall measure the liability for remaining coverage as follows:

(a) on initial recognition, the carrying amount of the liability is:

(i) the premiums, if any, received at initial recognition;

(ii) minus any insurance acquisition cash flows at that date, unless the entity chooses to recognize the payments as an expense applying paragraph 59(a); and

(iii) plus or minus any amount arising from the derecognition at that date of:

---

1 Acknowledgement: In developing this draft educational note, the Committees referred to limited sections of a position paper developed by the Insurance Bureau of Canada (IBC), in consultation with their member companies, audit firms and regulatory authorities. We wish to thank the IBC for making this work available to us.
1. any asset for insurance acquisition cash flows applying paragraph 28C; and
2. any other asset or liability previously recognized for cash flows related to the group of contracts as specified in paragraph B66A.

The valuation of the Liability for Incurred Claims (LIC) for groups eligible for the PAA is also subject to a minor simplification in respect of discounting, as indicated in IFRS 17.59(b). The LIC simplification is not addressed in this draft educational note, as it is out of scope for assessing PAA eligibility.

2. **Decision Points**

In determining PAA eligibility for insurance and reinsurance contracts, refer to IFRS 17.53–54 (emphasis added):

53 **An entity may simplify the measurement of a group of insurance contracts using** the premium allocation approach set out in paragraphs 55–59 if, and only if, at the inception of the group:

(a) the entity reasonably expects that such simplification would produce a measurement of the liability for remaining coverage for the group that would **not differ materially** from the one that would be produced applying the requirements in paragraphs 32–52; or

(b) the coverage period of each contract in the group (including insurance contract services arising from all premiums within the contract boundary determined at that date applying paragraph 34) is one year or less.

54 The criterion in paragraph 53(a) is not met if at the inception of the group an entity **expects significant variability in the fulfilment cash flows** that would affect the measurement of the liability for remaining coverage during the period before a claim is incurred. Variability in the fulfilment cash flows increases with, for example:

(a) the extent of future cash flows relating to any derivatives embedded in the contracts; and

(b) the length of the coverage period of the group of contracts.

The following decision tree illustrates the various decision points in determining PAA eligibility. Eligibility is assessed as at the inception date of the group of contracts.
Section 6 addresses PAA eligibility for groups of onerous contracts.

For non-onerous groups, the actuary considers the first decision point related to the coverage period of the contracts. If the coverage period for all contracts in the group is one year or less, the group is automatically eligible for the PAA based on IFRS 17.53(b).

For groups that include contracts that have a coverage period exceeding 12 months, the PAA eligibility assessment is performed at inception of the group of contracts; it is contingent upon the expectation that the PAA estimate of the LRC would not differ materially from the GMA calculation of the LRC at all reporting dates within the coverage period of the group as per IFRS 17.53(a). This expectation would be based on an assessment of both (1) the expected future values of the GMA LRC, and (2) reasonably likely fluctuations in future values of the GMA LRC that consider expected variability in fulfilment cash flows (FCF) as per IFRS 17.54.

An expectation of significant variability in the FCF would not by itself make a group ineligible for the PAA, but would disqualify the group from PAA eligibility if such variability is expected to create a material difference between the PAA and GMA estimates of the LRC.

With respect to the analysis of whether the entity expects significant variability in the FCF, the need for systematic quantitative testing of significant variability increases with the length of the coverage period of the group of contracts.

Key issues for the actuary in determining eligibility for using the PAA are:

- determining whether the contracts in a group each has a coverage period of 12 months or less (Section 3);
- performing the assessment of “would not differ materially” (Section 4); and
- understanding the meaning of “expects significant variability in the fulfilment cash flows” (Section 5).
From a practical perspective, it may be efficient to analyze PAA eligibility for groups with coverage exceeding 12 months using the last two steps noted above, which are detailed in Sections 4 and 5. If the GMA and PAA estimates of the LRC differ based upon expected future estimates of the FCF, the group would not be eligible for the PAA, and there would be no need to assess the impact of variability in the FCF.

3. Coverage Period Considerations

Contracts with a coverage period of one year or less are automatically eligible for the PAA, according to IFRS 17.53(b). The coverage period is assessed based on the criteria outlined in IFRS 17.34 (as shown below), based on the facts and circumstances of the contracts in the group:

34 Cash flows are within the boundary of an insurance contract if they arise from substantive rights and obligations that exist during the reporting period in which the entity can compel the policyholder to pay the premiums or in which the entity has a substantive obligation to provide the policyholder with insurance contract services (see paragraphs B61–B71). A substantive obligation to provide insurance contract services ends when:

(a) the entity has the practical ability to reassess the risks of the particular policyholder and, as a result, can set a price or level of benefits that fully reflects those risks; or

(b) both of the following criteria are satisfied:

(i) the entity has the practical ability to reassess the risks of the portfolio of insurance contracts that contains the contract and, as a result, can set a price or level of benefits that fully reflects the risk of that portfolio; and

(ii) the pricing of the premiums up to the date when the risks are reassessed does not take into account the risks that relate to periods after the reassessment date.

Often the contract boundary is obvious based on the facts and circumstances of the contracts. Many P&C and Group L&H contracts are renewable annually, and therefore these types of contracts might be a natural choice for application of the PAA. Creditor insurance, travel insurance, and other individual L&H contracts with short contract boundaries may also be potential candidates for the PAA approach. As noted in IFRS 17.34, if the entity can reprice the risks of all contracts in the group within one year, without restrictions, the contract boundary is generally one year or less, which would make the contract automatically eligible for the PAA under IFRS 17.53(b) because the contract boundary would denote the end of the coverage period for the LRC.

However, the following is a partial list of additional factors that could influence the contract boundary and the length of the coverage period:

- If there are restrictions on the entity’s ability to reprice that extend beyond a year (e.g., rate guarantees of longer than a year, or caps on the amount of rate action that the entity
can take), then the coverage period would likely extend beyond one year. In these circumstances, the onus would be on the entity to demonstrate that a PAA estimate of the LRC is not significantly different than a GMA estimate of the LRC. See Sections 4 and 5 below.

- Some contracts may allow both parties to unilaterally terminate the contract within 12 months, yet still have some of the repricing restrictions described in the previous bullet. In this situation, the coverage period could be less than one year if the termination provision has commercial substance (see IFRS 17.2) – this means the entity has the practical ability to terminate the contract after considering all the substantive rights and obligations of the contract.

- Some contracts, such as Group L&H contracts, typically have multiple coverages with different contract boundaries. The contract boundary under IFRS 17.34 would be determined by the coverage with the longest boundary, unless the contracts have a termination provision that shortens the contract boundary to less than 12 months as per the previous bullet. This may affect the automatic eligibility criteria for the group of contracts (coverage period 12 months or less) and/or the assessments of “would not differ materially” or “significant variability” discussed in Sections 4 and 5 respectively.

- The coverage period would include all insurance coverage, plus any investment-return or investment-related services, per the amended definition of insurance contract services in IFRS 17 Appendix A. Such investment services would generally not be part of most contracts with short coverage periods, but could exist in contracts that include, for example, amounts on deposit or experience rating refund obligations.

- Some short-term contracts may provide consequential insurance coverage (i.e., coverage consequent to a claim being incurred) that might extend the coverage period. For example, P&C automobile coverage and Group L&H Long Term Disability (LTD) contracts both provide disability coverage for claims incurred within a short contract boundary. The resulting disability payments can extend many months or years beyond the period in which a claim can be incurred. If these disability payments are considered settlement of a claim (i.e., LIC) or insurance coverage under a separate annuity contract\(^2\), the coverage period would not be extended. However, if the disability payments indicate continuation of insurance coverage (i.e., LRC under the original contract), the coverage period would be extended until all claims have been exhausted.

\(^2\) It can be argued that LRC treatment for Group LTD creates consequential insurance coverage under the original contract, which would extend the coverage period. However, it can also be argued that disabled life annuity coverage is implicitly provided under a separate contract between the entity and the disabled individual, because the parties to the obligations are different (entity and group sponsor for the initial contract, versus entity and the disabled individual for the second contract) and because the entity’s obligations under the second contract persist beyond the termination of the first contract. The debate is outside the scope of this paper.
4. **Assessing “would not differ materially”**

4.1 **Background**

The PAA is a relatively simple method of determining the LRC, devised to approximate the results of the GMA. The intended applicability of the PAA is for insurance contracts with short coverage periods, as discussed in the previous section. If a group of contracts does not meet the 12-month coverage period criterion, the entity may still be eligible to use the PAA for the group if the entity can demonstrate, at the inception of the group, that the PAA would produce an estimate of the LRC that “would not differ materially” from the measurement of the LRC under the GMA. This criterion would apply for the LRC at the inception of the group and the expected LRC at each future accounting period within the coverage period.

IFRS 17.54 states that the assessment of PAA eligibility would include an assessment of whether the entity “expects significant variability” in the fulfilment cash flows that would affect the measurement of the LRC. Variability of fulfilment cash flows in this context is discussed in Section 5, but it is important to note that the entity may assess variability as an integral part of the assessment of “would not differ materially.”

4.2 **Determination of Thresholds**

Materiality is an entity-specific aspect of relevance that is based on the nature and/or magnitude of the items to which the information relates in the context of an individual entity’s financial report (see International Accounting Standards (IAS) 1 and IAS 8 for details). In the context of assessing PAA eligibility, appropriate (materiality) thresholds may differ for groups based on their relative size. The actuary would consult with the entity’s management regarding the thresholds used for assessing PAA eligibility.

The actuary would use judgment in determining whether measurement differences between the two approaches differ materially:

- **Quantitative assessment:** The actuary would use judgment to determine an appropriate internal policy that includes thresholds (such as a percentage and dollar threshold) for performing this assessment. For example, the actuary may first compare the LRC under the two measurement approaches for each reporting period and assess the dollar amounts of the differences in measurement relating to these groups of contracts. Based on this assessment, the actuary may conclude that the PAA estimate does not differ materially from the GMA estimate, including consideration of variability of cash flows discussed in Section 5 of this draft educational note. Alternatively, if there are differences above this threshold, then the actuary may conclude that the GMA would be used.

- **Qualitative assessment:** In some cases, the actuary may be able to make a qualitative assessment for certain groups of contracts if the outcome of the “differ materially” assessment is obvious or in situations in which a qualitative assessment is considered sufficient:
  - Groups of contracts in which the total measurement is substantially lower than the tolerable dollar threshold amount.
Groups of contracts that are very similar to groups for which a more formal assessment has been done.

Groups of contracts renewing with characteristics consistent with those when an initial assessment was performed.

In cases such as these, there may be no need for a quantitative assessment. Both quantitative and qualitative assessments are performed at a group of contracts level. Reasonable and supportable information is required to initially determine portfolios and profitability groups, which are then used in the PAA eligibility assessment. How contracts are grouped, including contracts with different coverage periods, may also influence the results of the PAA eligibility assessment.

Judgment is required to determine an appropriate internal policy on assessment of PAA eligibility, including establishment of thresholds. When such judgment is significant, it would be disclosed in accordance with IAS 1 paragraph 122, which requires disclosure of judgments that management has made in applying accounting policies that have the most significant effect on the amounts recognized in the financial statements. In addition, IFRS 17.97(a) requires disclosure of which criteria in IFRS 17.53 the entity has met for contracts to be eligible for the PAA.

The illustrative case study in Appendix A presents a possible interpretation of applying materiality considerations.

4.3 Assessment of Differences in the LRC

The guidance in IFRS 17.53(a) states that the comparison between the two measurement approaches considers only the “measurement of the [LRC] for the group.” Therefore, eligibility for the PAA is based on a comparison at inception of the expected balance at each future reporting date within the coverage period of the LRC for a group of contracts under the PAA versus the corresponding expected balance of the LRC under the GMA. Although the test is conducted only at inception, the assessment is whether the PAA would produce a reasonable approximation to the GMA over the duration of the coverage period (i.e., at each future reporting date within the coverage period).

As the requirements of IFRS 17.32-52 apply, the FCF in the GMA are based on probability-weighted estimates of future cash flows, adjusted to reflect the effect of discounting and risk adjustment for non-financial risk (risk adjustment).

The actuary would test the PAA eligibility for the group in its entirety (as opposed to a single contract issued on the inception date of the group) and would consider all the contracts that are expected to be included in the group. Since the PAA eligibility test is performed at inception, the contracts to be issued and included in the group are not known at the time the test is performed. Nonetheless, the projected FCF would consider the expected timing of issuance of the contracts. The actuary may consider historical patterns of issued premium volume, if available. A common assumption is that contracts are written uniformly throughout the year with no significant seasonality in the issuance of policies. If such an assumption is appropriate, the projected FCF would consider that 25% of contracts are written each quarter.
in a group which spans contracts issued over a one-year period. The timing of claim and expense assumptions would be consistent with the timing of premiums issued.

Under the PAA, the estimate of the LRC at any point in time is a relatively simple calculation: the PAA LRC would generally be the premium received less expenses and amortizations for services rendered\(^3\). Per IFRS 17.B126, amortization of the LRC would be based on the passage of time, or based on the timing of incurred insurance service expenses if significantly different than passage of time.

Under the GMA, the estimate of the LRC would involve calculation of the FCF and the CSM. Despite the greater complexity in the GMA calculation, the basic premise of the LRC (to make provision for unexpired coverage) is the same under both approaches, and thus the LRC under both approaches would tend to be similar, especially for short coverage periods.

A simple illustration of the comparison of LRC under the PAA and GMA is provided in Appendix B (ignoring variability in the FCF, which is addressed in Section 5 and Appendix C). For illustrative purposes, each of the groups shown is assumed to be comprised of a single insurance contract. Two sets of examples are shown. In the first set of examples (B1), quarterly premiums are received and the associated claims are incurred and paid uniformly in the same quarter throughout the coverage period. In these examples, the GMA and PAA estimates of the LRC are identical regardless of the discount rate.

In the second set of examples (B2), the claims are incurred and paid quarterly, as above, but premiums are received annually. When the time value of money is assumed to be zero, the resulting GMA and PAA estimates of the LRC remain identical. However, a non-zero time value of money creates a difference in the LRC estimate versus the PAA estimate (which does not consider the time value of money). Such a difference is unlikely to be significant if the timing between premiums and associated claims is relatively short.

The simple examples ignore the risk adjustment, which is unlikely to introduce significant differences between the PAA and GMA estimates of the LRC, as the release of the risk adjustment would generally follow a pattern reasonably similar to amortization of the PAA LRC.

If the FCF has a significant non-linear pattern, that pattern would be reflected in both the GMA LRC (via the FCF) and the PAA LRC (via the B126 requirement noted above). However, the amortization of CSM may not follow the same non-linear pattern, thereby giving rise to differences between the PAA and GMA estimates of the LRC.

Notwithstanding the conclusion illustrated in Appendices B and C that the PAA and GMA estimates are likely to be reasonably similar for short coverage periods (prior to considering variability in the FCF), the assessment of “would not differ materially” would always be subject to the entity’s own materiality thresholds. Differences between the PAA and GMA estimates generally increase with the length of the coverage period, and with variability in the FCF which is addressed in the next section.

\(^3\) Unless a financing adjustment is made. Under the PAA, per IFRS 17.56, there is no obligation to adjust for the time value of money unless the claims associated with the premium are more than a year apart.
5. Significant Variability in the Fulfilment Cash Flows

Groups of contracts for which the coverage period of each contract is one year or less are eligible for the PAA based on IFRS 17.53(b) and accordingly no assessment of variability of the FCF is required.

For groups with longer coverage periods, the PAA estimate of the LRC may be materially similar to the GMA LRC calculated using probability-weighted cash flows in the FCF, but this alone is not sufficient to meet the requirement in IFRS 17.53(a). Specifically, IFRS 17.54 requires an entity to consider significant variability in the FCF at the level of groups of contracts. As noted in Section 4.1, the entity may assess variability and its expected effect on the measurement of the FCF as an integral part of the assessment of “would not differ materially” described in Section 4.

There is no explanation of “significant variability in fulfilment cash flows” in IFRS 17 itself, IFRS 17 Basis for Conclusions or IFRS 17 Effects Analysis. Variability is significant if it is reasonably expected to result in significant differences in the measurement of the LRC between the PAA and GMA at any point during the coverage period.

The FCF include a probability-weighted estimate of future cash flows and the effect of discounting, as well as risk adjustment. Any assumptions about these three components may influence the variability of the FCF and therefore the variability of the GMA estimates, but not necessarily that of the PAA estimates.

Judgment based on the facts and circumstances of the group would determine whether qualitative or quantitative testing would be required. Systematic quantitative testing of variability is not required unless such variability is expected to be significant in the context of estimating the FCF over the coverage period. IFRS 17.54 refers to examples of elements which are expected to contribute to variability in the FCF:

- IFRS 17.54(a) refers to embedded derivatives, and
- IFRS 17.54(b) refers to the length of coverage period.

Embedded derivatives are not typically found in Canadian P&C products or in Group L&H products and are not discussed in this draft educational note.

Differences in estimates between the two measurement methods typically increase with increases in the length of the coverage period. A number of factors may cause differences between the LRC under the PAA and/or the GMA over the coverage period, and might include the following considerations:

- Variability in the probability-weighted future cash flows during the unexpired risk period, illustrated in Appendix C, Example C1, which could increase with the length of the coverage period, including (but not limited to):
  - Experience over the expired portion of the coverage period may drive changes in assumptions related to the remaining coverage (e.g., a major court decision that affects the application of minor injury guidelines related to auto insurance); and
Changes in the environment (e.g., legal, social, economic) or interpretation of policy language (resulting from a jury decision or court interpretation) that may drive more or fewer claims over the remaining coverage period.

- Exposure to material variability in discount rates or yield curves over the remaining coverage period. See Appendix C, Examples C2 and C3.
- Any resulting effect of the above changes in assumptions on the risk adjustment, if warranted.

To satisfy the IFRS 17.54 criteria, judgment and/or testing would be required to determine whether variability resulting from the above considerations could result in variances (between the PAA and GMA estimates of the LRC) that exceed the entity’s materiality thresholds. Only variability that is expected to occur at subsequent measurement dates in the remainder of the coverage period would be considered.

The premise of the IFRS 17.54 requirement is that variability in the cash flows may affect the GMA LRC, but would not affect the PAA LRC, therefore potentially leading to a material difference between the two estimates. It is important to note, however, that potential changes in the FCF may be mitigated to a great extent by offsetting changes in the CSM, negating much of the difference in the GMA LRC relative to the PAA LRC. This is illustrated in Appendix C, Example C1.

Conversely, changes in discount rates affecting the FCF would not adjust the CSM (per IFRS 17.B97(a)); this is illustrated in Appendix C, Examples C2 and C3. Changes in discount rates could create a potentially significant difference between the GMA and PAA estimates of the LRC for coverages that have a long claim settlement period (such as disability benefits under Group LTD or P&C auto contracts) as illustrated in Example C3, where estimates of FCF are sensitive to the effect of discounting.

The degree of judgment in determining how much testing, if any, would be required to assess the requirement in IFRS 17.54 would depend on facts and circumstances specific to the group of contracts being measured and the entity issuing the group of contracts. Considerations could include:

- **Length of the coverage period:** The shorter the coverage period, the less likely that significant changes in assumptions would occur in a period which could trigger a difference between the GMA LRC and the PAA LRC. For example, in Example C1, the actuary might qualitatively conclude that significant assumption changes are unlikely in the midst of a two-year contract based on stability of past experience, and any moderate assumption changes are unlikely to create a significant difference between the GMA LRC and the PAA LRC. However, for contracts with much longer coverage periods, or long claim settlement periods, the actuary may not be able to come to a similar conclusion without additional quantitative stress testing of the impacts of potential assumption changes.

- **The entity’s materiality threshold(s):** If simple stress tests, such as those in Appendix C, are considered plausible and the resulting difference in the LRCs exceed or come close...
to the entity’s materiality threshold, the actuary may need to do more quantitative testing to determine whether the group passes the requirement in IFRS 17.54.

For typical Canadian products, a qualitative assessment may be sufficient in the following circumstances. However, as noted in Section 4.2, judgment is required to determine an appropriate internal policy on assessment of PAA eligibility, including establishment of thresholds.

- For products with coverage periods marginally exceeding the one-year threshold (e.g., two-year automobile policies, or Group L&H contracts with rate guarantees marginally longer than one year), the PAA estimates of the LRC are expected to be very similar to the GMA estimates. For these types of products, it is unlikely, but not impossible, that variability in the cash flows would affect the group’s eligibility for the PAA. See Appendix C, Example C1 for a numerical illustration, and Example C3 for potential caveats related to contracts with long claim settlement periods.

- Some types of variability (such as a change in expected premium volume) are expected to have a proportional effect on both the PAA and GMA estimates, and therefore need not be examined in detail. One example of this type of variability could be multi-year contracts where premiums reflect seasonal claims patterns.

Conversely, longer-term multi-year Canadian products (e.g., commercial construction policies, extended warranty products, title insurance and Group L&H contracts with multi-year rate guarantees or rate caps) may experience significant variability in the FCF due to the length of the coverage period. The LRC measured using the GMA can be affected by a larger range of eventual changes in assumptions used to estimate the FCF, whereas the LRC measured using the PAA may not be affected to the same extent as noted above. Quantitative assessment may be required for these products.

6. **Onerous Contracts**

If a group of onerous contracts is determined to be eligible for the PAA based on IFRS 17.53–54, the LRC based on the PAA is increased to reflect a loss component, as described in IFRS 17.57. Accordingly, the PAA estimate for an onerous group is, by definition, equal to the GMA estimate at inception.

Furthermore, if at any time during the coverage period, facts and circumstances indicate that a group of insurance contracts is onerous, the PAA LRC would be increased to reflect a loss component as described in IFRS 17.57–58.

Therefore, the eligibility test in IFRS 17.53(a) would always be passed for onerous contracts, as there could never be a material difference between the PAA and GMA estimates of the LRC.

7. **Reinsurance**

There is no difference between primary insurance and reinsurance contracts issued with regards to the PAA eligibility. For reinsurance contracts issued, the eligibility criteria of IFRS 17.53 apply. IFRS 17.69 and IFRS 17.70 pertain to reinsurance contracts held:
69 An entity may use the premium allocation approach set out in paragraphs 55–56 and 59 (adapted to reflect the features of reinsurance contracts held that differ from insurance contracts issued, for example the generation of expenses or reduction in expenses rather than revenue) to simplify the measurement of a group of reinsurance contracts held, if at the inception of the group:

(a) the entity reasonably expects the resulting measurement would not differ materially from the result of applying the requirements in paragraphs 63–68; or

(b) the coverage period of each contract in the group of reinsurance contracts held (including insurance coverage from all premiums within the contract boundary determined at that date applying paragraph 34) is one year or less.

70 An entity cannot meet the condition in paragraph 69(a) if, at the inception of the group, an entity expects significant variability in the fulfilment cash flows that would affect the measurement of the asset for remaining coverage during the period before a claim is incurred. Variability in the fulfilment cash flows increases with, for example:

(a) the extent of future cash flows relating to any derivatives embedded in the contracts; and

(b) the length of the coverage period of the group of reinsurance contracts held.

For reinsurance contracts held, the LRC includes the FCF related to the underlying contracts expected to be issued in the future to the extent that the ceding entity has substantive rights to receive services from the reinsurer related to the future underlying contracts.

If the coverage period exceeds one year, then the criteria of IFRS 17.69(a) and IFRS 17.70 for a group of reinsurance contracts held are used to assess PAA eligibility. The PAA eligibility for reinsurance contracts held is assessed separately from the PAA eligibility for the related underlying insurance contracts covered by reinsurance. The considerations described in Sections 2 to 5 for insurance contracts apply equally for reinsurance contracts.

Reinsurance contracts held that are written on a one-year risk-attaching basis could have a contract boundary of up to two years, assuming all underlying insurance contracts have a coverage period of one year and are written throughout the year. Therefore, such reinsurance contracts held do not meet the requirement of coverage period of one year or less for automatic eligibility for the PAA. Consequently, a group of reinsurance contracts held may not be automatically eligible for the PAA (and therefore subject to the GMA) while the underlying contracts are automatically eligible for the PAA.

8. **Subsequent Assessments of Similar Contracts in New Groups**

In theory, entities are expected to perform the PAA eligibility assessment for each new group of contracts at inception of the group. In practice, a quantitative test may not be required for each
subsequent group of contracts if the entity has already performed quantitative calculations for similar groups of contracts with substantially the same characteristics and measurement factors (e.g., discount rates and the amount and timing of claims). In such cases, the actuary may use judgment to make a qualitative assessment that the measurement factors have not changed since the previous quantitative assessment and that the prior judgment is still appropriate. Key assumptions, calculations and judgments underlying the assessment would be documented.

A new assessment for subsequent groups may be required if market conditions change significantly from the original assessment. For example, changes in interest rates, inflation, auto reforms, prescription drug reforms or the introduction of expensive new prescription drugs, or new types of claims could result in different conclusions in the assessment.

If the eligibility criteria are met for a group of contracts, the PAA is used for the duration of the contracts within the group. However, subsequent modifications to the terms of those contracts may result in the group no longer being eligible for the PAA. In this case, the original contracts are de-recognized and recognized as new contracts in accordance with IFRS 17.72.
9. Appendix A – Case Study (Illustrative)

This case study presents a possible interpretation of applying materiality considerations. It is for illustrative purposes only. In practice, an entity would define its own materiality level or threshold.

Background

- An entity has annual insurance revenue of $100 million.
- Contracts issued by the entity are either 12-month contracts, or 24-month contracts.
- The entity’s contracts are assigned to four portfolios (A, B, C, and D).
- For contracts issued in year 1, those in Portfolio A are divided into two groups, one of which (A-2) consists of contracts that are onerous at initial recognition.
- There are no onerous contracts in Portfolios B, C or D.
- For each of the resulting five groups, an estimate of the LRC has been derived based on each of the PAA and GMA.

(Amounts in $000’s)

The differences shown above (PAA estimates less GMA estimates) are based on estimates as at the inception at each group.

- Corresponding differences at the end of years 1, 2 and 3 were determined to be less than the differences at inception, and therefore are not considered further in this illustrative example of PAA eligibility assessment.
- As discussed in the portfolio-by-portfolio commentary that follows, consideration was also given to the effect on the LRC of potential variability the entity would reasonably expect, as per IFRS 17.54.

Thresholds

The entity selected three thresholds for assessing PAA eligibility of each group:

- Threshold #1 – Coverage period of each contract in the group ≤12 months as per IFRS 17.53(b).
• Threshold #2 – Annual insurance revenue for the group is ≤$1 million (or 1% of the entity’s aggregate annual premium), in which case the group is considered to be eligible for the PAA.

• Threshold #3 – The dollar difference (absolute value) between the GMA and PAA estimates of the LRC for the group is ≤ the group’s share of an aggregate threshold of $5 million. For illustrative purposes, the group’s share (allocation) of the aggregate amount is calculated on the basis of annual revenue times the estimated expected loss ratio, as shown in Table 2:

(Amounts in $000’s)

Dollar differences between the GMA and PAA estimates of the LRC are used as the basis for applying Threshold #3. Dollar differences are calculated at inception and at each future reporting period in the coverage period, taking into consideration the expected pattern of insurance contracts issued which are expected to be included in the group.

Judgment is used in determining portfolios and groups of insurance contracts, and these may not be established by the actuary. Nonetheless, the actuary determines thresholds that apply at the group level and are consistent with the premium volume in the various groups in order to avoid systematically relying on Threshold #2 to meet eligibility requirements. Judgment would need to be applied to determine the appropriate level of Threshold #2 based on the granularity at which the groups are formed. For example, in the extreme case where groups would be determined at the contract level, applying Threshold #2 may not be appropriate, but Threshold #3 might be; hence Threshold #3 can act as a check and balance on Threshold #2.

**Assessment of Eligibility**

Applying the level of aggregation requirements of IFRS 17, five groups of contracts have been identified, pertaining to four portfolios, as described below. The results of the eligibility testing are summarized in Table 3.

• Portfolio A: Two groups with only 12-month policies and with a combined annual insurance revenue of $64 million.
  - Group 1: Not onerous
    - No policies longer than 12 months and so **eligible for the PAA**.
    - A GMA estimate is not required.
o **Group 2: Onerous**
  - No policies longer than 12 months and so **eligible for the PAA**.
  - A GMA estimate is required in order to determine the loss component required for an onerous group.

- Each of the remaining groups has a mix of 12-month and 24-month contracts. None of these groups have been identified as onerous.
  - **Portfolio B: One group with annual insurance revenue of $1 million**
    - The insurance revenue is within the ≤ $1 million threshold and so the PAA estimate is assumed to be a reasonable approximation of the GMA (i.e., any difference is considered insignificant).
    - This group is **eligible** for the PAA.
  - **Portfolio C: One group with annual insurance revenue of $15 million**
    - The insurance revenue is above the ≤ $1 million threshold and so the eligibility is based on the assessment of the GMA vs PAA.
    - The difference between the GMA and PAA measurement of the LRC is determined to be less than the group’s share of the aggregate threshold of $5 million (i.e., $375,000 from Table 1 vs $800,000 from Table 2), thus meeting the criterion to “not differ materially”. Furthermore, the actuary performed a qualitative assessment of significant variability in future FCF and concluded that no significant differences in projected claims, expense, discount rate and risk adjustment assumptions is expected to give rise to material differences between the GMA and PAA estimates over the coverage period.
    - This group is **eligible** for the PAA.
  - **Portfolio D: One group with annual insurance revenue of $20 million**
    - The insurance revenue is above the ≤ $1 million premium threshold and so the eligibility is based on the assessment of the GMA vs PAA.
    - The difference between the GMA and PAA measurement of the LRC is determined to be greater than the group’s share of the aggregate threshold of $5 million ($1,000,000 from Table 1 vs $776,000 from Table 2), thus failing to meet the criterion to “not differ materially”. Based on this result, the actuary did not perform further testing related to significant variability.
    - This group is **not eligible** for the PAA.

(Amounts in $000’s)
10. Appendix B – Measurement Differences due to Time Value of Money

Illustration 1

Consider a group consisting of a single insurance contract with a two-year coverage period. Premiums of $100 are payable at the beginning of each quarter. The expected loss ratio is 80%, with all claims associated with the quarterly premium assumed to be incurred in the middle of the quarter, and fully paid in that quarter. There is equal coverage in each quarter. To simplify the example, the risk adjustment is zero, and there are no expenses.

The PAA LRC would be calculated as follows:

<table>
<thead>
<tr>
<th>Time 0</th>
<th>premiums rec’d</th>
<th>revenue recognized</th>
<th>LRC</th>
</tr>
</thead>
<tbody>
<tr>
<td>End Q1/01</td>
<td>$100</td>
<td>$100</td>
<td>$0</td>
</tr>
<tr>
<td>End Q2/01</td>
<td>$100</td>
<td>$100</td>
<td>$0</td>
</tr>
<tr>
<td>End Q3/01</td>
<td>$100</td>
<td>$100</td>
<td>$0</td>
</tr>
<tr>
<td>End Q4/01</td>
<td>$100</td>
<td>$100</td>
<td>$0</td>
</tr>
<tr>
<td>End Q1/02</td>
<td>$100</td>
<td>$100</td>
<td>$0</td>
</tr>
<tr>
<td>End Q2/02</td>
<td>$100</td>
<td>$100</td>
<td>$0</td>
</tr>
<tr>
<td>End Q3/02</td>
<td>$100</td>
<td>$100</td>
<td>$0</td>
</tr>
<tr>
<td>End Q4/02</td>
<td>$100</td>
<td>$100</td>
<td>$0</td>
</tr>
</tbody>
</table>

The following examples show how the above PAA LRC calculations would compare to GMA LRC calculations, with and without discounting in the GMA LRC.

- Example B1a illustrates the progression of the GMA LRC over the two-year coverage period, assuming the GMA discount rate is zero for simplicity, and further assuming that actual experience corresponds to expectations. The GMA LRC\(^4\) is equivalent to the PAA LRC at initial assessment and each subsequent measurement point.

<table>

<td>$0.00</td>
<td>$0.00</td>
</tr>
</tbody>
</table>

\(^4\) The coverage units and CSM amortization factors used in these examples are shown at the end of Appendix C in Table C-4.
• Example B1b is exactly the same as example B1a, except the annual discount rate used in the GMA calculation of the LRC is 5%. Note that the GMA LRC remains equivalent to the PAA LRC at initial assessment and each subsequent measurement point in this example because the claims associated with the premium are incurred in the same reporting period.

Illustration 2: Annual Premiums

Consider the same insurance contract as in illustration 1, except premiums of $400 are payable at the beginning of each year rather than $100 payable quarterly.

The PAA LRC in this example would be calculated as follows:

Example B2a illustrates the progression of the GMA LRC over the two-year coverage period, assuming the GMA discount rate is zero for simplicity, and assuming that actual experience corresponds to expectations. The GMA LRC is equivalent to the PAA LRC at initial assessment and each subsequent measurement point.
Example B2b is exactly the same as example B2a, except the annual discount rate used in the GMA calculation of the LRC is 5%. Note that introduction of discounting in the GMA creates a difference in the estimate of the LRC relative to the PAA when premiums and associated claims are recognized in different reporting periods, as illustrated in the following table:

To satisfy the IFRS17.53(a) criteria, the entity would need to assess whether the expected differences between the GMA and PAA estimates of the LRC at future reporting dates are immaterial, based on the entity’s materiality thresholds.
11. **Appendix C – Variability in Fulfilment Cash Flows**

Consider the same insurance contract as in Appendix B, Illustration 1: an insurance contract with a two-year coverage period. Premiums of $100 are payable at the beginning of each quarter. The expected loss ratio is 80%, with all claims associated with the quarterly premium assumed to be incurred in the middle of the quarter, and fully paid in that quarter. There is equal coverage in each quarter. To simplify the example, the risk adjustment is zero, and there are no expenses.

The PAA LRC would be calculated as in Table B1, with a zero LRC at the end of each quarter.

Example C1 extends example B1b to illustrate the impact of potential variability in the cash flows. All assumptions remain the same as example B1b, except the expected loss ratio increases from 80% to 90% at the beginning of year 2. The PAA LRC would not change, whereas the GMA LRC would, creating a differential between the two estimates. The change in FCF is partially offset by a change in CSM.

Example C2 also extends Example B1b, this time to illustrate the impact of potential variability in the discount rate for contracts with a short settlement period. All assumptions remain the same as example B1b, except the discount rate drops from 5% to 4% in Q1/02. The PAA LRC would not change, but the GMA LRC would change, creating a difference between the two estimates. That difference is likely to be greater for contracts with longer claims settlement patterns than the one illustrated.

### Table C1 - GMA Calculations - 5% discount rate - shock to expected loss ratio in Q1/02

<table>

<td>$80</td>
</tr>
</tbody>
</table>

In Example C1, the CSM at the end of Q1/02 would be calculated as follows:

<table>
<thead>
<tr>
<th>CSM impact in Q1/02 would be calculated as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSM beginning of Q1/02</td>
</tr>
<tr>
<td>Interest accretion</td>
</tr>
<tr>
<td>adjustment for change in FCF * ($29.46) offset to increase in FCF (PV of $30)</td>
</tr>
<tr>
<td>Amortization of CSM</td>
</tr>
<tr>
<td>CSM end of Q1/02</td>
</tr>
</tbody>
</table>

* calculation is ($80.47 + $0.99 - $29.46) * 25.46% amortization factor (see Table C-4)

Example C2 also extends Example B1b, this time to illustrate the impact of potential variability in the discount rate for contracts with a short settlement period. All assumptions remain the same as example B1b, except the discount rate drops from 5% to 4% in Q1/02. The PAA LRC would not change, but the GMA LRC would change, creating a difference between the two estimates. That difference is likely to be greater for contracts with longer claims settlement patterns than the one illustrated.
Example C3 also extends example B1b, this time to illustrate the impact of potential variability in the discount rate for contracts with a long settlement period. All assumptions remain the same as Example C2, except the drop in the discount rate from 5% to 4% causes the FCF to increase from $80 to $84 (as the present value of a long series of payments to settle claims is sensitive to the discount rate). The PAA LRC would not change, whereas the GMA LRC would, creating a difference between the two estimates, again with the difference greater for contracts with longer claims settlement patterns than the one illustrated. Unlike Example C1, the change in FCF is not offset by a change in CSM, per IFRS 17.B97(a).

| Table C2 - GMA Calculations - 5% discount rate drops to 4% in Q1/02 - short claims settlement period |
|---------------------------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| Expected Cashflows             | GMA     | PAA     | Dollar  |
| Time 0                         |         |         |         |

| Q2/02 ($100)                   | $80     | $80     | $80     |
| Q3/02 ($100)                   | $80     | $80     | $80     |
| Q4/02 ($100)                   | $80     | $80     | $80     |
| FCF                            | $157.10 | $157.10 | $157.10 |
| CSM                            | $0.00   | $0.00   | $0.00   |
| LRC                            | $0.00   | $0.00   | $0.00   |
| LRC Difference                 | $0.00   | $0.00   | $0.00   |
| End Q1/01 ($100)               | $80     | $80     | $80     |
| End Q2/01 ($100)               | $80     | $80     | $80     |
| End Q3/01 ($100)               | $80     | $80     | $80     |
| End Q4/01 ($100)               | $80     | $80     | $80     |
| End Q1/02 ($100)               | $80     | $80     | $80     |
| End Q2/02 ($100)               | $80     | $80     | $80     |
| End Q3/02 ($100)               | $80     | $80     | $80     |
| End Q4/02 ($100)               | $80     | $80     | $80     |

Example C3 also extends example B1b, this time to illustrate the impact of potential variability in the discount rate for contracts with a long settlement period. All assumptions remain the same as Example C2, except the drop in the discount rate from 5% to 4% causes the FCF to increase from $80 to $84 (as the present value of a long series of payments to settle claims is sensitive to the discount rate). The PAA LRC would not change, whereas the GMA LRC would, creating a difference between the two estimates, again with the difference greater for contracts with longer claims settlement patterns than the one illustrated. Unlike Example C1, the change in FCF is not offset by a change in CSM, per IFRS 17.B97(a).
The CSM amortization factors used in the examples in Appendices B and C are shown in Table C-4:

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members.
MEMORANDUM

To: Members in the life and health insurance and P&C insurance areas

From: Faisal Siddiqi, Chair
Standards and Guidance Council

Les Rehbeli, Chair
Committee on International Insurance Accounting

Date: September 13, 2018

Subject: Draft Educational Note: Comparison of IFRS 17 to Current CIA Standards of Practice

The Committee on International Insurance Accounting (IIAC) has prepared this draft educational note to identify the key differences in the measurement of insurance contract liabilities between IFRS 17 and current CIA Standards of Practice and supporting guidance.

The information presented in this draft educational note is intended to alert Canadian valuation practitioners to key items that will affect their work. Additional information that provides more detail appears in International Actuarial Association (IAA) guidance or other CIA documents. This draft educational note is not intended to be a complete guide, but rather a roadmap for change that identifies the key similarities and differences between IFRS 17 and current valuation approaches in Canada. This draft educational note is consistent with the draft of International Actuarial Note (IAN) 100 received by the IIAC for comment on March 28, 2018, and will remain as draft until IAN 100 is finalized.

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members.

In accordance with the Institute’s Policy on Due Process for the Approval of Guidance Material other than Standards of Practice and Research Documents, this draft educational note has been prepared by the IIAC and received approval for distribution from the Standards and Guidance Council on September 4, 2018.

Questions or comments regarding this draft educational note may be directed to Les Rehbeli at les.rehbeli@oliverwyman.com or to Lesley Thomson at lesley.thomson@sunlife.com.

1. **Introduction**

International Financial Reporting Standard (IFRS) 17 *Insurance Contracts* is a new standard that will become effective in Canada on January 1, 2021. IFRS 17 establishes principles for the recognition, measurement, presentation, and disclosure of insurance contracts within the scope of the standard.

IFRS 17 specifies the basis for measurement (valuation) of insurance contract\(^1\) liabilities. While there are many similarities to the current CIA Standards of Practice for valuation of insurance contract liabilities, there are also many differences.

This draft educational note provides actuaries with an overview of the similarities and significant differences of IFRS 17 measurement of liabilities compared to current practice in Canada. This draft educational note is not a comprehensive guide to IFRS 17. Actuarial guidance is provided or will be provided by the following sources:

- International Actuarial Association (IAA);
- CIA Committee on Life Insurance Financial Reporting (CLIFR);
- CIA Committee on Property and Casualty Insurance Financial Reporting (PCFRC); and
- CIA Committee on Workers’ Compensation.

This draft educational note focuses on life and property and casualty (P&C) insurance contracts. Workers compensation contracts are not discussed in this educational note, as the CIA Committee on Workers’ Compensation is producing separate guidance on this topic.

2. **IFRS 17 Overview and Comparison to Current Practice**

IFRS 17 applies to any contract that is classified as an insurance contract, regardless of whether the issuing entity is an insurer. IFRS 17.B2–B30 provides guidance on the definition of an insurance contract. Most Canadian policies that are currently classified as insurance contracts will continue to be classified as insurance contracts under IFRS 17, although there are a few exceptions. Section 3 provides additional detail on this topic.

Many Canadian life insurance contracts contain features that are akin to investment contracts or service contracts. IFRS 17 requires the entity to review insurance contracts and identify any embedded derivatives, investment components, and service components and assess whether those components are *distinct* (as defined in IFRS 17.B31–B32). Section 4 provides additional detail on this topic.

The measurement of insurance contract liabilities under IFRS 17 includes three “building blocks”:

---

\(^1\) The term “insurance contracts” as used in this draft educational note includes all contracts within the scope of IFRS 17 (i.e., including investment contracts with discretionary participation features and reinsurance contracts held).
1. **Present value of future cash flows.** Conceptually, this is similar to the current CIA liability without provisions for adverse deviations (PfADs), although there are several important differences as discussed in sections 6–8.

2. **Risk adjustment for non-financial risk.** Conceptually, this is similar to current CIA PfADs for non-economic risk, with differences as discussed in section 9.

   The sum of the present value of future cash flows and the risk adjustment for non-financial risk is called the *fulfilment cash flows (FCF).*

3. **Contractual service margin (CSM).** The CSM represents the unearned profit from a group of insurance contracts. At contract inception, if the FCF including all cash flows of the contract (i.e., including acquisition expenses and all premiums) is less than zero, the CSM is established to offset that negative amount so there is no front-ending of profit. The CSM is then released into income as services are provided. The CSM is a new concept versus current CIA standards, which allow front-ending of profit at issue.

The general measurement approach described in IFRS 17 (which we will refer to as the GMA in this educational note) is the default approach to valuation. *Insurance contracts with direct participation features* (as defined in IFRS 17.B101) are subject to some different requirements (called the variable fee approach (VFA) in this educational note) as discussed in section 5.

Furthermore, there is an option to use the simplified *premium allocation approach (PAA)* for contracts meeting the eligibility requirements in IFRS 17.53. The PAA is available for short term contracts (coverage period of one year or less), and may also be available for longer duration contracts if the PAA provides a reasonable approximation to measurement under the GMA over the life of the contract. See section 5.

### 3. Classification of Contracts

#### 3.1 General

According to IFRS 17, an insurance contract is “a contract under which one party (the issuer) accepts significant insurance risk from another party (the policyholder) by agreeing to compensate the policyholder if a specified uncertain future event (the insured event) adversely affects the policyholder.” The definition of “insurance risk”, the meaning of “significant” in this context, and other guidance clarifying the classification of contracts is in IFRS 17.B2–B30.

IFRS 4 was effective in Canada on January 1, 2011. Since then, classification of contracts in Canada has been guided by the educational note *Classification of Contracts under International Financial Reporting Standards*, June 2009 (209066).

Contract classification under IFRS 17 is largely the same as IFRS 4. The only difference is described in IFRS 17.BC67, which says that the time value of money should be considered when assessing whether insurance risk is significant.

#### 3.2 Life and Health Insurance

For most life and health insurance products in Canada, classification is not expected to change under IFRS17. For convenience, appendix A provides a summary of the classification of common Canadian life and health insurance products.
3.3 P&C Insurance

P&C contracts provide coverage for all risks other than life, including automobile, property and liability insurance. Such contracts that satisfy the definition of an insurance contract under IFRS 4 would generally continue to fall within the scope of IFRS 17.

3.4 Reinsurance

Reinsurance contracts issued are treated in the same manner as direct written contracts under IFRS 17. Classification under IFRS 17 would be the same as under IFRS 4 except as discussed in IFRS 17.BC67 as noted above.

Reinsurance contracts held (i.e., ceded) are treated as separate contracts under IFRS 17 and therefore will require their own classification (rather than just being cash flows of the direct underlying contract as under IFRS 4).

Under IFRS 17, lapse risk and expense risk in a direct written contract are not considered insurance risks, because the risk is created by the contract itself (i.e., lapse/expense cannot be an insured event). However, the transfer of lapse or expense risk from one entity to another would meet the definition of insurance risk from the perspective of the entity assuming the risk. Therefore, it is possible for a reinsurance contract issued (i.e., assumed) to be within the scope of IFRS 17 while the corresponding contract that transfers risk to the reinsurer is not.

Also, because reinsurance contracts held are treated as separate contracts under IFRS 17, there will not necessarily be a one-to-one correspondence between a reinsurance contract held and its underlying direct contract(s). In particular, the “contract” might be the entire reinsurance treaty, covering cessions over a number of years.

4. Separation of Contract Components

4.1 General

IFRS 17 requires identification of certain components within insurance contracts and, if distinct, separate measurement and reporting of those components. The following chart summarizes:
The comparison of these IFRS 17 requirements to current (IFRS 4) requirements is as follows:

- **Embedded derivatives**: under IFRS 4, the entity has options for separate reporting that are not available under IFRS 17.
- **Distinct investment components**: under IFRS 4, separate reporting of deposit components is permitted but not required under certain conditions, and there is no requirement to identify deposit components if separate reporting is not elected.
- **Non-distinct investment components**: under IFRS 4, there is no requirement to identify deposit components that are not eligible for separate reporting.
- **Service components**: under IFRS 4, separate reporting is not permitted, and there is no requirement to identify service components (whether distinct or not).

### 4.2 Embedded Derivatives

Guidance for the identification of embedded derivatives and the criteria for whether they are distinct is in IFRS 9 *Financial Instruments*. This guidance is the same as the corresponding current guidance in International Accounting Standard (IAS) 39. If an embedded derivative is found to be non-distinct, the entire contract is measured under IFRS 17 and there are no special presentation or disclosure requirements for the embedded derivative component. Distinct embedded derivatives would be measured under IFRS 9 *Financial Instruments* and reported with investment contracts in the financial statements.

Under IFRS 4, the entity had the option to separate some non-distinct embedded derivatives, while under IFRS 17, separation is required for distinct embedded derivatives and prohibited for non-distinct embedded derivatives.
Also, IFRS 4 included an exception for a policyholder option to surrender an insurance contract that was not carried forward to IFRS 17. However, it is expected that this change will have no impact in practice, because surrender options would not be distinct from the host contract.

### 4.3 Investment Components

Examples of non-distinct investment components include the cash surrender value of a life insurance contract, term certain payments in a life contingent annuity contract, and the account value (net of any surrender charges) of a universal life insurance contract.

The insurance contract including non-distinct investment components would be measured under IFRS 17. However, insurance revenue and insurance service expenses reported in the Statement of Financial Performance (the income statement) exclude the portion related to the non-distinct investment components. For revenue, this will require splitting expected claims between amounts payable only on death (death benefit minus surrender benefit) and amounts payable on either death or surrender (surrender benefits).

Guidance for determining whether investment components are distinct or not appears in IFRS 17.B31–B32. Examples of investment components that might be distinct include dividends on deposit, and funds held under underwriting agreements. Distinct investment components would be measured under IFRS 9 Financial Instruments and reported with investment contracts in the financial statements.

Appendix B includes examples of investment components and considerations for determining whether they are distinct.

### 4.4 Service Components

Guidance for identifying whether service components are distinct is in IFRS 17.B33–B34. Distinct service components would be measured under IFRS 15 Revenue from Contracts with Customers and reported with other service contracts on the financial statements.

An example of a possible distinct service component is claims adjudication services provided along with reinsurance protection. Note that the assessment of whether this service component is distinct would be performed both by the reinsurer (for the reinsurance contract issued) and the cedant (for the reinsurance contract held). There is no requirement for the assessment to be the same, even if the reinsurer and the cedant belong to the same group of entities.

There is no need to identify non-distinct service components.

Appendix C includes examples of service components.

### 5. Selection of Measurement Approach for Liability for Remaining Coverage

#### 5.1 Overview

Under IFRS 17, contracts are measured using the general measurement approach (GMA) with the following exceptions, which are discussed further in the sections of this draft educational note that follow:
• Contracts satisfying the criteria in IFRS 17.53 may be measured using the premium allocation approach (PAA). Note that the liability for incurred claims (LIC) would be measured using the GMA (but without CSM); only the liability for remaining coverage (LRC) is measured using the PAA.

• Insurance contracts with direct participation features (IFRS 17.B101) are measured using the variable fee approach (VFA).

• Reinsurance contracts held are measured using either the GMA or the PAA. However, there are some differences in measurement that apply to reinsurance contracts held as outlined in IFRS 17.63-70. Reinsurance contracts held are never measured using the VFA.

Note that reinsurance contracts held (i.e., ceded) are measured as separate contracts under IFRS 17, and it is possible for a reinsurance contract held to be measured using a different method than the underlying direct contracts being ceded.

5.2 Premium Allocation Approach (PAA)

The PAA is a simplification of the GMA that may be used for any contracts with a coverage period of one year or less, and any longer contracts where measurement under the PAA would not differ materially from the GMA over the life of the contract. Eligibility for the PAA is assessed at inception of the group of contracts. Considerations in assessing whether the PAA would provide a reasonable approximation to the GMA can be found in IFRS 17.54, chapter 9 (Premium Allocation Approach) of International Actuarial Note (IAN) 100 of the IAA, and appendix D of this draft educational note.

The PAA simplification applies to the LRC only. The LIC is measured using the GMA (but without CSM).

If the PAA is selected, the LRC at issue is equal to premiums received (i.e., unearned premiums (UEP) less premiums receivable), less (if elected) deferred acquisition costs (DAC). The entity has the accounting policy choice to expense or defer acquisition costs (IFRS 17.59(a)) if the coverage period is one year or less. The LRC for subsequent periods follows the pattern of UEP less premiums receivable less DAC. LIC would be established using the GMA (but without CSM) for any incurred claims, including claims incurred but not yet reported or settled as of the valuation date.

Under current practice, the LRC is analogous to the present value of future cash flows with PfADs for non-economic risk for life insurance, and to premium liabilities for P&C insurance. For life insurance, UEP less DAC can be used whenever it provides a reasonable approximation to the explicit valuation approach. For P&C insurance, the booked liability is the higher of UEP less DAC and the explicit valuation. The following differences between IFRS 17 and current practice are worth noting:

• Criteria: IFRS 17 allows the PAA approach to be used for all contracts with a coverage period of one year or less, with no requirement to assess whether the PAA is a reasonable approximation to the GMA. Current CIA standards would allow UEP minus
DAC to be used only if it is a reasonable approximation to the explicit valuation approach.

- **Deferral of acquisition costs:** IFRS 17 allows the entity to choose whether to defer acquisition costs or expense them directly if the coverage period is one year or less. Current CIA standards require deferral of acquisition costs for life insurance (through extending the term of the liability), while for P&C contracts, there is no deferral of acquisition costs in the explicit valuation, but deferral if UEP less DAC is held.

- **Amount of deferrable acquisition costs:** The amount of acquisition expenses considered deferrable could be different. IFRS 17 allows deferral of acquisition expenses considered directly attributable to the portfolio of insurance contracts.

- **Discounting of the LRC:** IFRS 17 allows the entity to choose not to reflect the time value of money (i.e., discount cash flows) if the coverage period is one year or less or the coverage period is longer but the effect of discounting is not significant. Current CIA standards require the time value of money to be taken into account, either directly or, for life insurance, as part of the assessment of whether UEP minus DAC is a reasonable approximation to an explicit approach.

- **Discounting of the LIC:** Under IFRS 17, if the entity applies the PAA to the LRC, the time value of money and the effect of financial risk can be ignored in measuring the LIC if the LIC cash flows are expected to be paid or received in one year or less from the date the claims are incurred.

### 5.3 Variable Fee Approach (VFA)

The term “variable fee approach” (VFA) as used in this draft educational note refers to the special requirements related to the measurement of insurance contracts with direct participation features (direct par) as defined in IFRS 17.B101. Measurement of the liability for direct par contracts is based on the same building blocks as the GMA, but with special treatment of the CSM (and other comprehensive income (OCI)) if this presentation option is elected. Note that the term “participation features” in IFRS 17 is a different concept from “participating policy” as defined in the Canadian Insurance Companies Act.

### 5.4 Measurement Approach for Typical Canadian Products

Most Canadian individual life insurance products would be valued using the GMA.

The VFA approach would likely apply to segregated fund contracts and possibly some participating life insurance contracts. Also, some variable or index-linked universal life products could meet the definition of direct par contracts.

The PAA approach would be an option (for the LRC) for most P&C contracts. Many P&C contracts would have a coverage period of one year or less and therefore be eligible automatically. P&C contracts with longer terms (e.g., many Québec auto contracts have a two-year term) might also be eligible for the PAA, but the entity would need to assess the appropriateness of the approximation to the GMA. Some P&C products, such as warranty or mortgage default contracts, may not be eligible, due to either the length of the contracts or the
year-to-year variation in claim occurrence that is typically observed, as these factors may indicate the PAA is not a reasonable approximation to the GMA.

The PAA would also be an option (for the LRC) for many group life and health contracts, as these typically are annually renewable. Sometimes, group contracts provide rate guarantees for longer than one year, and in such cases the entity would need to assess whether the PAA approach produces a reasonable approximation to the GMA.

Generally speaking though, if the UEP minus DAC approximation is currently used for reporting, there is a good chance that the PAA would produce a reasonable approximation to the GMA. Further, if the current approach is to use UEP minus DAC with an adjustment (e.g., premium deficiency reserve), it might be appropriate to use the PAA with the same adjustment under IFRS 17.

Appendix E contains a list of typical Canadian products and the measurement approach that might be used. An entity would assess each of its contracts to determine which approach is most appropriate.

6. Measurement Considerations

6.1 Level of Aggregation

IFRS 17 requires entities to identify portfolios of contracts, which comprise contracts subject to similar risks and managed together. Contracts in different product lines would generally not be in the same portfolio as they would not be expected to have similar risks (IFRS 17.14). Portfolio is the level of aggregation at which accounting policy choices (e.g., whether to apply the OCI option) apply. Note that reinsurance contracts held would be in different portfolios than the underlying direct contracts because the risks are not similar.

IFRS 17 also requires portfolios of contracts to be divided into groups of contracts according to IFRS 17.16–23. Group is the unit of account for the measurement of the CSM and some presentation requirements (e.g., IFRS 17.78). Under IFRS 17, contracts cannot be split into components (e.g., for different coverages) and assigned to different groups. However, a (legal) contract would be split into different contracts if needed to reflect the substance of the contractual rights and obligations (IFRS 17.2).

In Canada, because there is currently no CSM, there is no analogous requirement to “group” contracts. As a result, it is common to measure coverages separately, and sometimes report them on separate lines of the financial statements. Under IFRS 17, cash flows for different components/coverages can still be projected and measured separately, but each component/coverage would be allocated to the appropriate group(s) for the purpose of measuring CSM and the presentation requirements of IFRS 17.78. This could create significant administrative hurdles, especially combined with the requirement to measure liabilities using premiums received rather than premiums due.

IFRS 17 does not specify the level of aggregation to determine the risk adjustment for non-financial risk, though it would be consistent with the compensation the entity requires for bearing uncertainty (IFRS 17.37). That is, it would be set at the level that best represents the entity’s view (i.e., taking diversification benefits into account or not) of the compensation.
required to bear uncertainty. If determined at a higher level of aggregation than group, the risk adjustment for non-financial risk would be allocated to the different groups in a reasonable manner. Under current CIA standards, PfADs should be appropriate in aggregate, but this takes into account both financial and non-financial risk and there are varying practices in how diversification benefits are recognized. Therefore, there could potentially be a change to the level of aggregation at which the risk adjustment for non-financial risk (analogous to PfADs for non-economic risk) is set.

Other than expenses, there is no specific requirement regarding the level at which assumptions are set under IFRS 17. Assumptions can be set at the level that is most appropriate to estimate future cash flows, with future cash flows allocated to groups in a reasonable way. This is the same as current CIA standards, so it is unlikely that changes will be required.

The level of aggregation for expenses (both future cash flows and deferred acquisition expenses) in the measurement of liabilities under IFRS 17 is portfolio. Expenses considered directly attributable to a portfolio are then allocated to groups within the portfolio. Under current CIA standards, there is no specific level of aggregation set for expenses, though in practice, portfolio (or something similar) is likely the level at which expenses are set, so little change is expected other than the new requirement to allocate expenses to groups.

However, the requirement to include acquisition expenses in presentation and measurement of liabilities is new, so the identification of directly attributable acquisition expenses for portfolios is new (see section 7.4). The level of aggregation for IFRS 17 reporting (disclosure) purposes might also necessitate some administrative changes. For example, incurred claim liabilities that are currently reported in aggregate (e.g., for reinsurance contracts held) might need to be separated among groups to meet the requirements of IFRS 17.78.

6.2 Contract Boundary

IFRS 17.33 requires the entity to identify the contract boundary (IFRS 17.34) for each contract so that only cash flows related to claims incurred within the boundary of the contracts in the group are included in the estimates of future cash flows.

For most contracts, the contract boundary under IFRS 17 will be evident, and equal to the term of the liability (life insurance) or the term of the policy (P&C insurance). Fully guaranteed whole life insurance, for example, would have a contract boundary that extends to the end of the life of the policyholder. Typical group life and health and P&C contracts that are annually renewable would have a contract boundary that ends at the next renewal date.

Possible differences from current practice include the following:

- Bias towards conservatism: For life insurance contracts, the concept of contract boundary is similar to the term of the liability. Where the term of the liability is uncertain, or where extending the term of the liability would increase the liabilities, current CIA standards require the actuary to be conservative. For example, paragraph 2320.03 requires the actuary to include future renewals only if the resulting liability is larger; and paragraph 2320.19 urges the actuary to err on the side of caution where the
term is not obvious. However, there is no such concept in IFRS 17, which could lead to a difference between the term of the liability and the contract boundary. For example, if a renewal (at which the term of the liability/contract boundary might end) is expected to be loss-making (even though the entity has the right to increase premiums to avoid loss), the loss would be included in the IFRS 4 liabilities, but not in the IFRS 17 liabilities.

- **Consideration of rights and obligations of both parties:** Under IFRS 17, the rights and obligations of both parties to the contract are considered when determining the contract boundary, while under current CIA standards, only the rights and obligations of the entity are considered. For example, if the entity has the right to compel the policyholder to pay premiums, the IFRS 17 contract boundary would not end, while the IFRS 4 term of the liability would end if extending the term would reduce the liabilities.

- **Coverages within contracts:** The treatment of coverages within a contract may be different. For life insurance contracts, current CIA standards (paragraph 2320.19) require the actuary to consider the substance of the contract over the legal form in assessing the term of the liability. For example, a certificate under a group insurance contract that in substance is a collection of individual contracts (such as a creditor or association contract) would be considered as though it were an individual contract, each with its own term of liability. By contrast, under IFRS 17, one contract can have only one boundary, which in this case would be determined based on the terms and conditions of the group contract. However, IFRS 17 does require separation of contracts if required to reflect the substance of the obligations (IFRS 17.2) and cash flows are only within the contract boundary for coverages that create substantive rights or obligations at the reporting date (IFRS 17.34). Therefore, in practice there might be few changes required because of this difference.

- **Constraints on repricing:** The identification of contract boundary becomes more difficult when the entity is partially constrained in its ability to terminate or adjust the contract. IFRS 17.23, B62–B67 provide considerations for making this assessment. Generally, the considerations are similar to current practice, focusing on the extent of constraint placed on the entity, and the practical ability of the entity to make changes. However, one important difference is that the intent of the entity (to reprice or not) is not considered in setting the contract boundary under IFRS 17; rather, only the rights and obligations of the entities are considered. Also, under IFRS 17, in assessing the “practical ability” of the entity to make changes, commercial considerations would be ignored if the same considerations apply to new contracts.

- **Extension of term of liability for deferred acquisition costs:** Current CIA standards (life) allow extension of the term of the liability to account for deferred acquisition costs. This is common in the valuation of segregated fund products and some short duration group life and health contracts. Under IFRS 17, there is no corresponding concept because acquisition costs are considered directly in the measurement of liabilities.

- **Segregated funds with material guarantees:** Where segregated fund contracts contain material constraints, current CIA standards (paragraph 2360.07) require the term of the
liability be set to maximize the liability. The purpose of this adjustment is to ensure consistency with the treatment of similar segregated fund contracts without material constraints. This concept does not apply in IFRS 17. The contract boundary would be the full duration of the segregated fund contract if the entity has no right to adjust the contract. Whether cash flows associated with future deposits would be included depends on whether substantive rights or obligations associated with those future deposits exist at the reporting date. Generally speaking, if future deposits are treated the same as deposits on new contracts, they would be excluded.

- Segregated funds supported by hedging strategy: Where hedging is used to manage segregated fund risk, current CIA standards permit the term of the liability to be extended under certain conditions. The existence of hedging is irrelevant to the determination of the contract boundary; however, IFRS 17 accomplishes the same objective through IFRS 17.B115–B116.

Examples of products for which the contract boundary determined under IFRS 17 is potentially different from the term of the liability under current practice include the following:

- Fully guaranteed individual life insurance contracts: The contract boundary would generally be the same as the term of the liability, and would be the lifetime of the individual contract. For insurance contracts with the option to convert to different coverages, the term of the liability under CIA standards would end at the date of conversion unless the conversion is expected to have a cost. Under IFRS 17, the contract boundary of such contracts would include the boundary of the coverage to which the contract converts.

- Adjustable individual life insurance contracts: The term of the liability would normally be the earliest date at which the entity can adjust the contract, unless extending the term increases the liability. Under IFRS 17, the contract boundary would be the earliest date at which the entity can adjust either the individual contract or the portfolio of contracts to which the individual contract belongs, with the added constraint given by IFRS 17.34(b)(ii) that “the pricing of the premiums for coverage up to the date when the risks are reassessed does not take account the risks that relate to periods after the reassessment date”. If the product was priced by taking into account all of the future cash flows (e.g., level premiums), then the contract boundary would extend to the end of the life of the policyholder.

- Group employer/employee contracts: Typical contracts are annually renewable, although some contracts offer premium rate guarantees that extend beyond one year. The term of the liability under current practice would typically be the next renewal date, extended to account for premium rate guarantees if that increases the liability, and also sometimes extended to allow for deferred acquisition costs. Under IFRS 17, the contract boundary would be the date at which the premium rate guarantees expire.

- Cancellable contracts: If contracts are cancellable without penalty by both parties, the term of the liability under current practice would extend beyond the cancellation date if
that increases the liability unless it is expected that the contract will be cancelled. Under IFRS 17, the contract boundary would be the cancellation date.

- Group creditor/association contracts: Current practice varies on these products. Some entities view the individual certificates under the group contracts as individual contracts, each with its own term of the liability. Others might view the contracts as group contracts, and look solely to the terms of the group contract to determine the term of the liability. Under IFRS 17, a contract has a single boundary regardless of underlying components or coverages.

- Segregated fund contracts and annuity contracts: As noted above, the contract boundary will often be different than the current term of the liability, and would be determined based solely on the contract guarantees. For deferred annuity contracts that are classified as insurance contracts, the term of the liability under current practice would typically end at the date the credited interest rate is reset. Under IFRS 17, the contract boundary extends for the length of the insurance coverage.

- Title insurance: Title insurance is insurance against defects in the title to land or buildings. Under current Canadian practice, the insured event (the defect) is considered to have occurred before the contract was written, so the liabilities consist solely of claim liabilities (LIC under IFRS 17). Under IFRS 17, title insurance is described as “insurance against the discovery of defects in the title”. As such, the insured event is discovery of the defect, so the contract boundary extends for as long as the policyholder owns the property or holds the mortgage on the property (depending on the type of title insurance policy). Insurance contract liabilities will include both LRC and LIC.

- Onerous contracts: If a contract has terms and conditions that are guaranteed and these will result in an onerous contract, then under IFRS 17 the entity would need to recognize the liability as soon as it is bound by the terms of the contract, which could be prior to the effective date of the contract. This may be different from current practice.

- Reinsurance contracts held: IFRS 17 requires reinsurance contracts held to be measured as separate contracts, including separate determination of the contract boundary. By contrast, under current CIA standards, the term of the liability is determined for the underlying direct contract only, and reinsurance cash flows are projected consistent with the term of the underlying direct contract, based on the assumption that the direct writer and the reinsurer exercise their contractual rights (e.g., the right to reprice or recapture) to their advantage (paragraph 2120.32). Under IFRS 17, it is possible for the boundary of a reinsurance contract held to be different than the boundary of the underlying direct contract(s). However, the boundary of a reinsurance contract held (ceded) will always be the same as the boundary of the corresponding reinsurance contract issued (assumed), because the rights and obligations of both parties are considered in determining the contract boundary.

---

2 Under discussion. Similarly, treatment of coverages that can be withdrawn at any time.
7. **Probability-Weighted Cash Flows**

7.1 **Comparison to Current Practice**

IFRS 17.33 describes requirements for estimates of future cash flows to be incorporated in the GMA. In particular, estimates of future cash flows represent the probability-weighted mean of the full range of possible outcomes, considering all reasonable and supportable information available at the reporting date without undue cost or effort.

The concept of probability-weighted cash flows is broadly aligned with current practice to determine best estimate cash flows. It is unlikely that major changes to current processes will be required.

Below is a list of examples where differences from current practice might occur:

- **Assumptions that include implicit margins for adverse deviations (MfADs):** IFRS 17 requires separate disclosure of the risk adjustment for non-financial risk. In current practice, the distinction between “best estimate” and “with PfAD” is not always quantified, though much of this would have been identified with Life Insurance Capital Adequacy Test (LICAT).

- **Cash flows that vary with assumptions related to financial risk:** (for example, credited rates on universal life contracts tied to economic scenarios, or cash flows linked to inflation). Current practice is to separate “best estimate” assumptions (e.g., the CIA-prescribed base economic scenario as defined in subsection 2330) from MfADs. However, under IFRS 17, provisions for financial risk are included in the present value of future cash flows on a market consistent basis. Stochastic modelling of market consistent economic parameters may be needed in these situations to determine the probability-weighted cash flows under IFRS 17.

- **Policyholder options:** Estimates of future cash flows take into account policyholder behaviour including the expected effect of anti-selection. This is true under current CIA standards, though the distinction between “best estimate” and “PfAD” is sometimes blurred. Also, if policyholder behaviour is expected to be linked to assumptions related to financial risk, the provision for financial risk would be included in the present value of future cash flows (rather than in PfADs).

- **Future taxes:** IFRS 17 excludes income taxes from estimates of future cash flows. This is different from current CIA standards, which require consideration of future income taxes. Premium taxes and investment income tax\(^3\) are included as expenses of administering the contract under current practice, and this is expected to continue to be the case under IFRS 17.

- **Expenses:** Current CIA standards require the liability to include provision for ongoing policy-related expenses. IFRS 17 has a similar requirement, but restricts the expenses included in the valuation to those “directly attributable” to the portfolio. For life and health insurance, IFRS 17 “directly attributable” expenses will likely be a subset of the

---

\(^3\) Under discussion
expenses included under current practice, but for P&C insurance, more expenses might be included in IFRS 17 than under current practice. Under IFRS 17, expenses related to reinsurance (ceded) are attributable to portfolios of reinsurance contracts held. IFRS 17 requirements for reflecting changes in unit expenses (e.g., for changes in economies of scales) are similar to those in current CIA standards.

Also, IFRS 17 requires the identification of directly attributable acquisition expenses for initial measurement of the CSM and ongoing presentation (see section 7.4). Under current CIA requirements, acquisition expenses are only needed for valuation when DAC is used, and it is likely that directly attributable expenses under IFRS 17 will be a subset of those used for current DAC. For blocks where DAC is not used, the identification of directly attributable acquisition expenses will be new.

- **Reinsurance contracts held**: IFRS 17 requires reinsurance contracts held to be measured separately from the underlying direct contract(s), including separate consideration of the contract boundary. This can lead to different cash flows being included in the valuation. For example, if the terms of a reinsurance treaty are guaranteed with (say) a 90-day cancellation notice, then cash flows associated with expected (new) cessions over the next 90 days would be included in the measurement of the reinsurance contract held even though there is no corresponding underlying direct contract liability. This requirement is unlikely to have a significant impact on the measurement of the liability, but it could affect the CSM (which is separately reported).

- **Risk of non-performance by the issuer of the reinsurance contract**: Provision for the risk of non-performance by the reinsurer is included in both IFRS 17 and current CIA liabilities. In current Canadian practice, this provision may be implicit in the liability net of reinsurance. Under IFRS 17, this provision is included in the liability for reinsurance contracts held. IFRS 17.63 says the risk of non-performance includes “losses from disputes”. As with current practice, this refers to losses from known disputes and not the risk of losses arising from future disputes.

### 7.2 Treatment of Catastrophic Scenarios

IFRS 17.B40 states that “the scenarios developed shall include unbiased estimates of the probability of catastrophic losses under existing contracts.” In principle, all possible scenarios (both favourable and unfavourable) are to be considered in the analysis, along with an estimated probability, which may be very low.

Current practice often does not take explicit consideration of potential catastrophes and the associated probability. Outliers are often excluded or adjusted from experience if they are judged not to be representative of the true underlying distribution (usually because by including the observed event in the experience, too much weight is given to the observed event). Effectively, by making these adjustments, the actuary is assigning a low probability to the occurrence of that event, which is consistent with IFRS 17. Similarly, by not making explicit adjustment to reflect the potential for a catastrophic event that was not observed during the experience period, the actuary is assigning a low estimated value to such an event.
7.3  Cash Flows That Vary with Assumptions Related to Financial Risk

The projection of cash flows that vary with assumptions related to financial risk might require modification from current practice, which is often based on deterministic “best estimate” scenarios prescribed in the current CIA standards or on real-world stochastic scenarios that meet certain calibration criteria. These scenarios are not necessarily consistent with market prices as required under IFRS 17.

Estimates of cash flows that vary with assumptions related to financial risk would be consistent with market prices at the measurement date, which will include provision for financial risk. Possible approaches include the use of replicating portfolios or stochastic modelling with risk-neutral parameters. Alternatively, provisions for financial risk can be made by adjusting the discount rate as discussed in section 8.

7.3.1  Universal Life Contracts

Universal life contracts often include features that are similar to financial options and that vary with market conditions. Some examples include the following:

- Credited interest rates on policyholder account values are generally linked to the returns, minus a spread, of indices available to the policyholder as investment options.
- Minimum interest rate guarantees, the value of which vary according to current and projected interest rates.
- Performance and persistency bonuses that vary according to the past financial performance of the contract and/or the persistency of the policyholder (e.g., bonus that becomes effective after a certain duration, under certain conditions).

Current common practice is to project the universal life cash flows under the prescribed interest rate scenarios in current CIA standards and to establish a liability based on the most adverse scenario. The liability ascribed to these financial options is therefore unlikely to be consistent with market prices. Stochastic modelling with risk-neutral scenarios or replicating portfolio techniques may be needed.

Some best estimate policyholder behaviour assumptions may vary according to market parameters (e.g., lapse or future premium persistency could depend on projected market conditions or amount of funds available). IFRS 17 does not introduce any new requirements to vary policyholder behaviour assumptions with market conditions. However, if policyholder behaviour assumptions are linked to market conditions, the resulting cash flows under IFRS 17 will be different from current practice, as they would include provision for financial risk consistent with market prices.

7.3.2  Segregated Fund Guarantees

Segregated fund guarantees are similar to options on defined underlying items, and therefore need to be valued consistent with market prices. Stochastic modelling techniques currently used in segregated fund valuations will continue to be appropriate under IFRS 17, although the scenarios used to determine the probability-weighted cash flows would need to be market
consistent rather than real world. Unlike current Canadian practice, the IFRS 17 FCF would be the same regardless of whether or not the guarantees are hedged.

Comments similar to those for universal life (above) can apply to policyholder behaviour assumptions that vary according to market conditions.

7.3.3 Index-Linked Payments

Some annuity or disability insurance payments are indexed based on a defined, published index such as the Consumer Price Index (CPI), often subject to some floors and caps. Under current Canadian practice, the indexation is linked to the deterministic scenario being valued. Under IFRS 17, inflation might be considered a market variable and, if so, would require projections to be consistent with market prices.

Consider the following example of three different annuities, each with different payment indexation:

1. Flat 2% per year indexation.
2. Indexation of annuity payments based on 100% of the CPI movement.
3. Same as item 2 but with a floor of 0% and a cap of 5%.

In the first example, cash flows would simply be projected based on contractual indexation. Market prices are not considered because indexation does not depend on any market variable.

In the second example, indexation does depend on a market variable, and thus consistency with market prices is required by IFRS 17. Since the relationship with the market variable remains the same regardless of the actual CPI-index level, implied forward CPI could be used to reflect market information.

The third example is more complicated because of the presence of floors and/or caps. Risk-neutral stochastic modelling may be needed to estimate the liability consistent with market prices.

7.3.4 Expense Inflation

Under current practice, assumed expense inflation is often tied to interest rate scenarios, but need not be. Similarly, IFRS 17 recognizes that assumptions about inflation are sometimes assumptions related to financial risk (e.g., if based on an index of prices (e.g., CPI) or interest rates) and sometimes not assumptions related to financial risk (IFRS 17.B128).

In situations where assumptions about inflation are related to financial risk, consistency with market prices would be required by IFRS 17. Similar to index-linked payments where the relationship between the cash flow and the market variable remains unchanged regardless of the market variable’s level, market prices can be reflected by using future implied inflation rates.

7.3.5 Participating Insurance

Projected policyholder dividends under participating contracts are linked to the projected market environment and reflect the ability to pass experience to policyholders. Conceptually, this is the same requirement as in current CIA standards. Many actuaries approximate this by
assuming that current economic conditions persist and the current dividend scale is maintained, with separate testing to ensure that the policyholder dividend scales contain sufficient room to absorb adverse movements in market conditions.

IFRS 17 introduces one significant difference to current Canadian practice, which is that the cost of financial guarantees is included in the present value of future cash flows, and not in the risk adjustment for non-financial risk. Currently, provisions for economic risk would be included as a component of PfAD. This will need to change.

7.4 Deferrable Acquisition Expenses

Under IFRS 17, acquisition cash flows need to be included in the present value of future cash flows in order to calculate the CSM at initial recognition. Acquisition cash flows are defined as “cash flows arising from the costs of selling, underwriting and starting a group of insurance contracts that are directly attributable to the portfolio of insurance contracts to which the group belongs”. Only expenses that are directly attributable to a portfolio of contracts, such as commissions and some direct expenses, are included in the estimates of future cash flows. Other acquisition expenses are recognized as incurred.

The inclusion of acquisition expenses in the present value of future cash flows reduces the CSM, and results in the deferral of those expenses to be recognized in profits later, through the release of the CSM over the coverage period of the group of contracts. This is similar to the DAC asset that is held on the balance sheet and amortized over time for some products under IFRS 4. However, the deferred expenses are part of the insurance contract liabilities through a reduction in the CSM, rather than held as a separate asset.

As the CSM is calculated at the group level, acquisition expenses attributed to a portfolio need to be allocated to the groups within that portfolio.

The portion of expenses that is deemed “directly attributable” to the portfolio will affect the CSM and the loss taken at initial recognition of contracts. Higher attributable acquisition expenses reduce the CSM and increase the likelihood of a group being onerous at initial recognition.

Directly attributable expenses also affect presentation (insurance revenue and insurance service expenses) per IFRS 17.B125.

8. Discounting

8.1 Comparison to Current Practice

Under current CIA standards, the approach to discounting is discussed in subsection 2240 for P&C insurance and subsection 2330 for life and health insurance.

Under IFRS 17, the relevant paragraphs on discount rates are 36, 56 (for the PAA) and B72–B85. IFRS 17 does not differentiate between P&C and life and health in setting discount rates.

Under IFRS 17, discount rates are set for cash flows that do not vary based on the returns on any underlying items. Adjustments are made to reflect the impact of financial risk that is not otherwise included in estimates of cash flows (IFRS 17.36) and to reflect variability of cash flows not otherwise reflected (IFRS 17.B74).
This section expands on the differences between current practice and IFRS 17, beginning with a summary of current practice.

**8.1.1 Current Practice: P&C**

Current CIA standards require the valuation of insurance contract liabilities to consider the time value of money and to include a PfAD to account for the uncertainty around the selected discount rate(s), claims development patterns, and reinsurance collectability.

The discount rate(s) represents the expected investment return (portfolio yield) on the assets chosen to support the policy liabilities, and will depend on the asset characteristics including the following:

- Assets owned at the calculation date;
- The allocation of those assets and related investment income among lines of business;
- The method of valuing assets and reporting investment income;
- Yields on assets acquired after the calculation date;
- Capital gains and losses on assets sold after the calculation date;
- Investment expenses; and
- Asset risks including credit-related events, default, impairment, or restructuring of obligations by the issuer of the invested assets at the calculation date.

Although discount rates may vary from one claim grouping to the next, from one future period to the next, or from one underlying accident or underwriting period to the next, it is common to select an aggregate portfolio of assets to generate a single discount rate for all years and product lines. Additionally, it is common practice to select a single discount rate to be applied to both net premium liabilities and net claim liabilities, but there is no requirement to do so.

The ceded policy liabilities are shown as recoverable amounts (assets) on the entity’s balance sheet, and as such they are not supported by invested assets. The discount rate used to determine the present value of the ceded policy liabilities is generally selected from the following or a combination thereof:

- The discount rate selected for the present value of the net policy liabilities;
- A risk-free rate; and
- The discount rate used by the assuming entity.

The actuary would add an explicit PfAD for the uncertainty around the selection of the discount rate(s) including consideration for unknown asset risk (including credit/default risk and liquidity risk), mismatch risk between payment of claims and availability of liquid assets, and uncertainty in estimating the payment pattern of future claims.

**8.1.2 Current Practice: Life and Health**

Current CIA standards require insurance contract liabilities to be valued using the Canadian Asset Liability Method (CALM). Under CALM, there is no direct discounting of liabilities. Instead,
CALM sets the value of the insurance contract liabilities equal to the current statement value of supporting assets required to satisfy the obligations, taking into account reinvestment/disinvestment.

The data required to calculate the CALM value of the insurance contract liability include the following:

- Liability cash flows;
- Cash flows for the invested assets that support the insurance contract liability;
- A risk-free (government) yield curve as of the valuation date;
- The projected level of credit spreads, asset deterioration and investment expenses by asset type;
- Investment return for non-fixed income investments; and
- Reinvestment/disinvestment assumptions:
  - The entity’s investment strategy (i.e., assumptions around how the entity will reinvest cash at maturities and disinvest assets as required over the life of the insurance contract liabilities).
  - CIA prescribed interest rate scenarios (for example, the base scenario for interest rates includes the implied forward interest rates for the first 20 years and grades to a prescribed ultimate reinvestment rate (URR) at year 60 and beyond. Between year 20 and year 60, there is a prescribed methodology for grading between the 20-year observed point and the prescribed URR.)

While CALM does not result in explicit discount rates, it is common practice to solve for an equivalent discount rate that, when applied to the insurance contract liability cash flows, will give the same liability. This may be done either by solving for a level discount rate, or more commonly, by solving for a vector of yearly rates that can be interpreted as the expected annual portfolio return on the assets supporting the insurance contract liability. This would not be the same discount rate that would result from the application of IFRS 17.

8.2 Cash Flows That Do Not Vary with Returns on Underlying Items

Under IFRS 17, discount rates for cash flows that are fixed (i.e., that do not vary with returns on underlying items) are based on a liquidity-adjusted risk-free discount rate curve. This discount rate curve may be developed using either a bottom-up approach or a top-down approach.

Under either approach, two key differences from current practice are that the discount rates do not depend on the assets used to support the liabilities (e.g., investment expenses are ignored) and there are no reinvestment/disinvestment assumptions. The discount rate curve is set to reflect the characteristics of the liability cash flows (i.e., liquidity\(^4\), currency, timing) only.

---

\(^4\) The question of how to treat liquidity characteristics that change over time is under discussion.
8.2.1 Bottom-up Approach

Under the bottom-up approach, a risk-free discount curve is adjusted by adding an illiquidity premium to reflect the characteristics of the insurance contract liabilities. This approach requires the following judgments/estimates:

- Should the risk-free discount curve be based on government bond rates or swap rates?
- What is the longest duration risk-free asset for which there is a reliable yield (i.e., price from deep, liquid, and transparent markets)?
- How would risk-free rates be estimated beyond the observable period (i.e., ultimate rate, extrapolation technique, etc.)?
- How would the illiquidity premium be estimated?

The above has two similarities to current practice for life and health insurance. (1) a current risk-free curve is used; and (2) there is a need to extend the yield curve beyond the observable period.

For cash flows denominated in Canadian dollars, the risk-free curve under CALM uses the first 20 years of the current risk-free curve in the Canadian market (which is usually a government bond curve). This same approach could be used for IFRS 17 if 20 years is considered the longest duration for which there is a reliable yield.

The CALM method for extending the risk-free yield curve beyond the first 20 years prescribes a URR and a method for interpolating between the 20-year term and the URR. This approach might be used as a reference point for how to extend the risk-free curve beyond the observable period for IFRS 17.

There is no existing requirement under current CIA standards to identify an explicit illiquidity premium in the discount rates. An illiquidity premium is implicitly included; however, it would reflect the liquidity characteristics of the assets supporting the liabilities rather than the liquidity characteristics of the liabilities. Nevertheless, this might provide a way to estimate the illiquidity premium for the IFRS 17 discount rates.

Note that the liquidity characteristics of reinsurance contracts held would be assessed separately from the liquidity characteristics of the underlying direct contracts.

8.2.2 Top-down Approach

Under the top-down approach, a reference portfolio of assets is selected with characteristics that are similar to those of the insurance contract liability. For example, the current spot rate implied by a 20-year Canadian corporate bond might be selected as a reference for a 20-year Canadian liability cash flow. The current yields on the reference assets are then adjusted to remove any characteristics of the asset(s) that are not relevant to the liability, the primary examples being credit risk and market risk.

This approach requires the following judgements/estimates:

- What is the longest duration of reference assets for which there are reliable yields (i.e., prices from deep, liquid and transparent markets)?
• How would rates be estimated beyond the observable period?
• How would the reference portfolio be selected?
• How would the yield on reference portfolios be adjusted for characteristics that are not relevant to the insurance contract liability?

For the reference portfolio, the entity might view its current asset portfolio or target asset mix as having similar currency and liquidity characteristics to those of the liabilities and conclude that this provides an appropriate reference portfolio. If the entity were to take this approach, a partial link would be created between the entity’s own assets and the liability discount rate. However, there is no requirement to choose the reference portfolio from assets held.

The yield on the reference portfolio would be adjusted to remove the portion of the yield related to credit risk on the assets. One possible approach would be to use the asset default assumptions (with MfAD) that are currently used for valuation, with possible adjustments to be consistent with current market prices at the valuation date (e.g., if default assumptions are based on long-term averages). Another possible approach would be to use the assumptions used to set impairment provisions under IFRS 9, increased to include provision for uncertainty and adjustments if needed to be consistent with current market prices.

The yield on the reference portfolio would also be adjusted to remove any market risk premium. In practice, this means that non-fixed income assets would be unlikely to be included in the reference portfolio.

The yield on the reference portfolio might also be adjusted to account for differences in liquidity characteristics between the reference portfolio and the insurance contract liabilities. However, IFRS 17.B81 indicates that such adjustment is not required if the reference portfolio reasonably reflects the liquidity characteristics of the liabilities.

8.3 Reflecting Financial Risk

According to IFRS 17.36, discount rates are used to "... adjust the estimates of future cash flows to reflect the time value of money and the financial risks related to those cash flows, to the extent that the financial risks... are not included in the estimates of cash flows".

This means that the impact of financial risks on cash flows can be incorporated directly in the estimates of future cash flows or through the discount rate, or some combination thereof. In any case, the approach to reflecting financial risk would be as consistent as possible with observable market prices at the valuation date (IFRS 17.B44). In particular, unlike current practice, there is no provision for reinvestment/disinvestment risk in the IFRS 17 valuation.

IFRS 17.B46 describes the replicating portfolio technique, where the value of the liability is set equal to the fair value of an asset portfolio whose cash flows exactly match (in all scenarios) the liability cash flows. This technique is similar to the application of CALM (though limited to observable market prices) and can be applied to a portion of the liability cash flows. Paragraph B47 further says that though the replicating portfolio technique is not required, if a replicating portfolio exists for some of the cash flows, the technique chosen would be unlikely to lead to a materially different measurement.
It is useful to consider two different ways in which cash flows are affected by financial risk:

- Cash flows can vary based on returns on underlying items (usually assets). By this we mean the asset returns that are “passed-through” to policyholders in products such as segregated funds, participating insurance, and some universal life contracts. Some of these contracts would meet the definition of insurance contracts with direct participation features (B101) and some would not.

- Cash flows can vary with assumptions related to financial risk, such as expense cash flows varying with inflation. Other examples are lapse rates that vary with future interest rates and minimum guaranteed credited rates.

8.3.1 Cash Flows That Vary with Returns on Underlying Items

IFRS 17.B74(b) says: “Cash flows that vary based on the returns on any financial underlying items shall be (i) discounted using rates that reflect that variability; or (ii) adjusted for the effect of that variability and discounted at a rate that reflects the adjustment made.” IFRS 17.B75 continues: “The variability is a relevant factor regardless of whether it arises because of contractual terms or because the entity exercises discretion, and regardless of whether the entity holds the underlying items”, which clarifies that IFRS 17.B74(b) is not limited to contracts with direct participation features but applies to all products where returns on underlying items are passed-through to policyholders.

For the portion of cash flows where asset returns are passed-through to policyholders, the replicating portfolio technique would suggest that the discount rate be chosen such that the value of those liability cash flows equals the fair value of the underlying assets. This is similar to a CALM valuation that starts with an account value or segregated fund or a ring-fenced participating block of assets, and then adds the other portions of the liability. For contracts with direct participation features, the entity’s share of the underlying items (IFRS 17.B104(b)(i)) would also be measured this way.

IFRS 17.B77 clarifies that there is no requirement to split the estimated cash flows into those that vary based on the returns on underlying items and those that do not; however, it would often be straightforward to split them when starting from the current valuation approach.

8.3.2 Cash Flows that Vary with Assumptions Related to Financial Risk

Cash flows that vary with assumptions related to financial risk can be handled through the discount rate or through the cash flows. However, in either case the approach would be as consistent as possible with observable market prices, and IFRS 17 suggests stochastic modelling techniques and risk-neutral measurement techniques for achieving that objective (IFRS 17.B48,B77). Particular mention is made of the need to recognize the cost of options and guarantees, even when those guarantees are out-of-the-money (IFRS 17.B48, B76).

For financial risk that is fully hedged, the current valuation would include the cost of hedging the risk, which would be a reasonable basis for the IFRS 17 valuation provided the current provision is consistent with current market prices.

For financial risk that is not fully hedged, the current valuation would typically include provisions based on projected “real-world” scenarios of financial risk variables. These
approaches would generally not comply with the IFRS 17 requirement to be consistent with observable market prices. The IFRS 17 provision would be the same regardless of whether the risk is hedged or not.

9. **Risk Adjustment for Non-financial Risk**

IFRS 17 requires the entity to adjust the present value of future cash flows to reflect “the compensation that the entity requires for bearing the uncertainty about the amount and timing of the cash flows that arises from non-financial risk” (IFRS 17.37).

The corresponding concept in the current CIA Standards of Practice is the PfAD, which takes account of the effect of uncertainty of the assumptions and data in determining the liability.

While the concepts are similar, there are important differences. One difference is that the IFRS 17 risk adjustment for non-financial risk only includes provision for non-financial risk, while PfADs cover uncertainty in both economic and non-economic assumptions. Under IFRS 17, provisions for financial risk (i.e., cash flows that vary with assumptions related to financial risk and liability timing, currency and liquidity) are included in the present value of future cash flows, either by adjusting cash flows or adjusting the discount rate. However, there are no provisions for financial risk related to the assets supporting liabilities, such as investment expenses and reinvestment (asset-liability mismatch) risk.

Another difference is that the IFRS 17 risk adjustment for non-financial risk depends on the entity’s own compensation requirements for taking risk, rather than exclusively on the uncertainty of the estimated future cash flows. This could result in entities setting different risk adjustments for non-financial risk for similar groups of insurance contracts. Therefore, to facilitate comparison among entities, IFRS 17 requires entities to disclose the confidence level to which the risk adjustment for non-financial risk corresponds, which is an entirely new requirement.

The entity can apply different methods to determine the risk adjustment for non-financial risk, such as the “cost of capital” method or the “confidence level” method, or any other method that satisfies the criteria laid out in IFRS 17.B91. Information on various methods of setting risk adjustments can be found in the Risk Monograph published by the IAA, and section 6 (Risk Adjustments for Non-Financial Risk) of IAN 100.

The table below compares the requirements for establishing PfADs and risk adjustments for non-financial risk:
<table>
<thead>
<tr>
<th><strong>Measurement Objective</strong></th>
<th><strong>IFRS 17</strong></th>
<th><strong>Current CIA Standards</strong></th>
<th><strong>What’s changed?</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Compensation required by entity to bear uncertainty.</strong></td>
<td>Amount required to provide for the <strong>effect of uncertainty.</strong></td>
<td>Focus on <strong>compensation required</strong>, not just the effect of uncertainty.</td>
<td></td>
</tr>
</tbody>
</table>

| **Scope** | Non-financial risk only. | Financial and non-financial risks. | No asset related MfADs, such as asset default, investment expenses or reinvestment risk (C3). |

| **Method** | Various, at entity discretion. | Assumptions that are more conservative than best estimate (often MfADs). | For non-economic assumptions, current approach can continue to be used, with adjustment if required to reflect entity-specific compensation requirements. Other methods are also permissible. |

| **Diversification Benefit** | Reflected, based on diversification that the entity considers when setting compensation requirements. | Reflected due to requirement that assumptions/liabilities be appropriate in aggregate. In practice, often given no explicit consideration or considered only within a line of business. | Diversification between financial risks and non-financial risks ignored. Entity’s view of diversification may be different than diversification reflected in PfADs. |

### 9.1 Reflecting Uncertainty in the Risk Adjustment for Non-financial Risk

IFRS 17 does not specify the method that an entity uses to determine the risk adjustment for non-financial risk, but outlines the characteristics of an appropriate risk adjustment in IFRS 17.B91. These characteristics are similar to those described in current CIA Standards of Practice and though the criteria do not match exactly, it is clear that the same basic principles apply. The main difference is that IFRS 17 requires the entity’s view of the cost of risk (i.e., compensation required for bearing uncertainty) to be taken into account in setting the risk adjustment for non-financial risk. This is described in IFRS 17.B87 as the compensation required to make the entity indifferent between fulfilling a liability that has a range of possible outcomes arising from non-financial risk, and fulfilling a liability that will generate fixed cash flows with the same expected present value. This could mean, for example:

- The additional amount (in excess of the present value of future cash flows) required by the entity to accept the liability, at a confidence level reflecting the entity’s cost of risk (confidence level method); or
• The return expected by the owners of the entity on the capital that would be set aside to fulfil the liability (cost of capital method). The capital in this context would typically be based on solvency considerations, and therefore at a much higher confidence level than the risk adjustment. The expected return (cost of capital) would be applied to the projected capital requirements to determine the risk adjustment for non-financial risk.

In assessing the entity’s view of the cost of risk, the actuary would take into consideration the entity’s enterprise risk management framework.

9.2  Considerations for Using PfADs to Determine Risk Adjustment for Non-financial Risk

As noted above, the underlying principles for determining the risk adjustment for non-financial risk are similar to those used to set CIA PfADs. Therefore, the current PfADs for non-economic assumptions may be a good starting point for setting the risk adjustment for non-financial risk. The following considerations would be taken into account:

• Is the current level of PfAD consistent with the compensation the entity requires for bearing uncertainty?
• Are the diversification benefits included in current PfADs consistent with those that would be reflected in IFRS 17?
• How would the confidence level (to satisfy disclosure requirement of IFRS 17.B92) inherent in the current PfADs be determined?
• IFRS 17 requires reinsurance contracts held to be measured as separate contracts. How would the PfAD appropriate to the net liability be split between the direct and ceded contracts?
• Are any adjustments needed for pass-through features?

9.2.1  Current Level of PfAD Versus the Compensation the Entity Requires

Current CIA PfADs are intended to provide for a similar level of uncertainty (sufficient without being excessive) across different risks and products for all entities. In selecting an MfAD within the recommended range, a lower/higher MfAD provides for less/more uncertainty but not for a lower/higher level of confidence or entity-specific compensation required for bearing the uncertainty. Therefore, if using CIA PfADs to determine the IFRS 17 risk adjustment for non-financial risk, adjustment would be needed if the entity-specific view of the compensation required to bear uncertainty is different from that of typical Canadian entities.

For example, it is possible that the entity would be satisfied with a lower level of compensation than implied by the current level of PfAD. In other words, the entity may be constrained to hold the current level of PfAD because of current CIA standards, even though they would otherwise accept a lesser provision. In a situation like this, the risk adjustment for non-financial risk might be lower than the PfAD for non-economic assumptions.

9.2.2  Diversification Benefits

IFRS 17.B88 requires the risk adjustment for non-financial risk to reflect the degree of diversification benefit the entity includes when determining the compensation it requires for
bearing non-financial risk. Current CIA standards (paragraph 2120.07) also suggest consideration of diversification benefits, though in practice this is often done implicitly or only within product lines, and would include consideration of both financial and non-financial risk. Therefore, if using CIA PfADs to determine the IFRS 17 risk adjustment for non-financial risk, adjustment might be needed to achieve the objectives of IFRS 17.

9.2.3 Confidence Level Disclosure

IFRS 17.B92 requires disclosure of the confidence level of the risk adjustment for non-financial risk. The purpose of this disclosure is to allow users to compare risk adjustments across entities by distinguishing differences arising from different levels of uncertainty from differences arising from different entity-specific views of the compensation required to bear uncertainty.

As discussed in section 9.2.1, current CIA PfADs are intended to provide for a similar level of uncertainty and hence a similar confidence level. Current CIA standards do not specify this confidence level and in practice there will be variation in confidence levels across entities (especially in the treatment of diversification benefits).

However, assumptions used for Dynamic Capital Adequacy Testing and LICAT, which are intended to cover confidence levels of approximately 95–99 and 99.5 (based on normal distributions) respectively, may provide a reference point.

Given the above, it may be reasonable to assume that the confidence level inherent in current CIA PfADs for non-economic risk is approximately 85–90. In the absence of more reliable information (which might be available from, e.g., the entity’s Own Risk and Solvency Assessment), this range can be used to help estimate the initial confidence level disclosure on transition to IFRS 17.

Note that the purpose of the confidence level disclosure is to help users understand and compare financial statements. In this context, it is important for the reported confidence level to be comparable among entities. This is the sole purpose of providing the benchmark above.

9.2.4 Reinsurance Contracts Held

IFRS 17 requires reinsurance contracts held to be measured separately from the underlying direct contract(s) and, in particular, the risk adjustment for non-financial risk is determined separately. IFRS 17.64 clarifies that the risk adjustment for non-financial risk on a reinsurance contract held represents the amount of risk transferred from the entity to the reinsurer. Therefore, unlike other contracts, the risk adjustment for non-financial risk on a reinsurance contract held reduces the liability (or increases the asset).

Under current CIA requirements, the PfAD for non-economic assumptions is set at a level appropriate for the liability net of reinsurance, and there is no requirement to split it between the direct contract and the reinsurance ceded contract. However, the information to split it might be readily available; for example, in proportion to the face amount.

Note that a proportionate split is appropriate only if, as is typically the case, the entity takes into account the existence of reinsurance in establishing the compensation required for bearing uncertainty.
9.2.5 Effect of Pass-Through Features

Some products have features that share risk with policyholders. Under current CIA standards, entities take these features into account in assessing the PfAD required. For example, an entity could establish an MfAD at the low end of the CIA range (or even below the low end in the case of participating life insurance business), depending on the extent of pass-through features. This concept also exists in IFRS 17, to the extent that the “compensation an entity requires” takes account of the existence of the pass-through features. Therefore, the current CIA approach would be consistent with IFRS 17 unless the entity ignores (some or all) pass-through features in determining the compensation it requires for bearing uncertainty.
Appendix A: Contract Classification for Canadian Life and Health Products

<table>
<thead>
<tr>
<th>Product</th>
<th>Analysis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Term Life/Whole Life/Par/Endowment</td>
<td>• Payment on insured event (death) is fixed but timing is uncertain, so would be classified as insurance contracts.</td>
</tr>
</tbody>
</table>
| Payout Annuities                       | • All payout life contingent annuities would be classified as insurance contracts, including those with term certain periods. On transition to IFRS 17, if the annuitant is deceased and payments are continuing under the term certain period, the annuity remains an insurance contract.  
  • Guaranteed-only (i.e., term certain) annuity contracts from issue would be classified as investment contracts. Also, if a block of annuities is acquired from another entity, contracts where the annuitant is deceased and payments are continuing under the term certain period would be classified as investment contracts. |
| Deferred Annuities                     | • Deferred annuities with minimum guaranteed annuity purchase options would be classified as insurance contracts unless the guarantee has no commercial substance.  
  • Deferred annuities without minimum guaranteed annuity purchase options would normally be classified as investment contracts.  
  • For deferred annuities where the only guarantee is to pay book value (or the higher of book value and market value) on death, the guarantee may be considered a waiver of surrender charges on death, which is not considered insurance risk under IFRS 17 (refer to IFRS 17 B.18 to B.23 for further discussion). Therefore, such contracts may be classified as investment contracts. |
| Universal Life and Variable Universal Life | • Contracts usually contain significant insurance (mortality) risk, therefore would be classified as insurance contracts.  
  • No specific threshold is provided on what constitutes “significant”, though examples in drafts of IFRS 17 suggest that a death benefit of 101% of the account value does not constitute “significant” insurance risk.                                                                                                 |
<p>| Segregated Funds without Guarantees    | • Generally these are not insurance contracts as there is no transfer of insurance risk, and they would be classified as investment contracts.                                                                                   |</p>
<table>
<thead>
<tr>
<th>Product</th>
<th>Analysis</th>
</tr>
</thead>
</table>
| Segregated Funds with Guarantees                       | • Generally insurance contracts, but analysis would be done on the type of benefit to assess whether the guarantee is purely a financial risk option or a waiver of surrender charge, neither of which is considered insurance risk.  
  • Guaranteed minimum death benefits (GMDB) – Minimum payout in the event of death. Death is the insured event, and the payment on death could be more than the policyholder fund.  
  • Guaranteed minimum income benefits (GMIB) – This is similar to an annuity contract where survivorship is the insured event, and payment on survival could result in a loss to the entity.  
  • Guaranteed minimum accumulation benefits (GMAB) – The benefit is paid on maturity similar to an endowment product. The amount paid is uncertain and the entity can pay more than the fund in certain scenarios.  
  • Payment on the insured event of an amount higher than the policyholder fund is not in itself sufficient to conclude the contract transfers significant insurance risk (for the same reason that waiver of surrender charges on death does not constitute insurance risk). |
| Group Insurance Contracts                              | • Group life, accidental death, health and disability insurance contracts would be classified as insurance contracts unless refund or hold harmless agreements mean there is no significant insurance risk transferred.  
  • ASO (administrative services only contracts) with risk pooling would be classified as insurance contracts.  
  • ASO contracts without pooling (e.g. employee benefit programs, including life, accidental death, health and disability benefits) would be classified as service contracts. |
<p>| Employee Benefit Plans/Defined Benefit Pensions        | • Out of scope of IFRS 17 (IAS 19).                                                                                                                                                              |</p>
<table>
<thead>
<tr>
<th>Product</th>
<th>Analysis</th>
</tr>
</thead>
</table>
| Reinsurance Contracts                 | • Classification of reinsurance contracts issued is the same as insurance contracts issued (direct).  
• Reinsurance contracts held are classified separately from the underlying direct contract(s).  
• The transfer of non-insurance risk (e.g., lapse or expense risk) from an entity to a reinsurer exposes the assuming entity to insurance risk.  
• If a reinsurance contract does not expose the entity to the possibility of a significant loss on a present value basis, that contract is nevertheless deemed to transfer significant insurance risk if it transfers substantially all of the insurance risk relating to the reinsured portions of the underlying insurance contracts. |
| Credit Insurance Contracts            | • Credit life and disability insurance may be either individual policies or certificates of group insurance contracts. Such contracts would be classified as described above.  
• Credit related guarantees, other than for death or disablement, are not considered insurance contracts unless the issuer has previously asserted explicitly that it regards the contract as an insurance contract and has irrevocably elected to account for such contracts as insurance contracts. Otherwise, such contracts would be classified as investment contracts. |
| Disability (Individual and Group)     | • Would be classified as insurance contracts.  
• Liabilities for claims in settlement are liabilities for incurred claims (LIC), and remain LIC on transition to IFRS 17. However, if a block of claims in settlement is acquired from another entity, the nature of the insurance risk is such that the liability would become a liability for remaining coverage (IFRS 17.B5). |
| Critical Illness                      | • Would be classified as insurance contracts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
### Appendix B: Examples of Investment Components in Canadian Life and Health Contracts

<td>If distinct, i.e. readily available to the contract holder through other means (B34), cash flows would be separated, measured under IFRS 15, and included with other service contracts in the financial statements. If not distinct, the cash flows would not be separated.</td>
</tr>
</tbody>
</table>

| **Group Insurance contracts and ASO contracts** | |
| ASO – pure | IFRS 15 applies to pure ASO, since entity has no insurance risk and provides administrative, claims, and processing services, while the group contract holder assumes all the insurance risk, and pays for all services and claims. Absent any insurance features, IFRS 9 applies to any account balances. |
| ASO – with insurance | AoD arising from annual accounting of the ASO might be a distinct investment component. If so, it would be separated, measured under IFRS 9 and included with other investment contracts in the financial statements. The service component of the contract might be distinct under IFRS 17.34. If so, it would be separated, measured under IFRS 15, and included with other service contracts in the financial statements. The remaining components of the contract would not be separated. |
| Policy and contract administration, and claims adjudication, processing and administration | If distinct, i.e. readily available to the contract holder through other means (B34), cash flows would be separated, measured under IFRS 15, and included with other service contracts in the financial statements. If not distinct, the cash flows would not be separated. Also see IFRS 17 illustrative examples IE51-IE55. |
### Appendix D: Situations where PAA is Unlikely to be a Reasonable Approximation to GMA

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Reasoning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Patterns of the expected incurred claim costs and the release of the risk adjustment are significantly different during the coverage period.</td>
<td>The PAA approach reduces the LRC in line with the pattern for incurred claim costs only.</td>
</tr>
<tr>
<td>The pattern of expected incurred claim costs is strongly uneven and the CSM is significant under the GMA and the coverage period is more than one year.</td>
<td>The CSM is released in accordance with the insurance service provided which is based on coverage units for the duration of coverage. If the coverage provided by a contract is even over the coverage period then the CSM would be expected to be amortized evenly. For the PAA, a strongly uneven pattern of expected incurred claims would result in an uneven pattern of premium allocated to each period. The size of the CSM would then determine the significance of this difference.</td>
</tr>
<tr>
<td>The longer the expected payout pattern is for the coverage and/or the higher the interest rate environment.</td>
<td>Significant variability in the cash flows may occur during the coverage period if the time value of money is significant in the GMA. For long claim payment periods, even a small change in interest rates could significantly change the value of the LRC. In a high interest rate environment, interest rates tend to be more volatile, and discounting can make up a significant portion of the LRC even for shorter claim payment periods.</td>
</tr>
<tr>
<td>In a high interest rate environment and there is no significant financing component and the premium is due within a year of providing the relevant coverage.</td>
<td>In this situation an entity is not required under the PAA to reflect the time value of money in the LRC but would be required to do so under the GMA.</td>
</tr>
<tr>
<td>There is a significant investment, service, or other non-insurance component to the contract, or there is a significant profit-sharing component.</td>
<td>These are complications in which PAA might be less likely to provide a reasonable approximation to the GMA.</td>
</tr>
<tr>
<td>The cost of any embedded options or derivatives is significant.</td>
<td>See IFRS 17.54(a).</td>
</tr>
<tr>
<td>Scenario</td>
<td>Reasoning</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Coverage is deferred.</td>
<td>While the PAA would likely require the LRC to accrete interest, the longer the deferral period the greater the mismatch is likely to occur between the GMA and the PAA. The GMA would continue to update expectations of future cash flows while the PAA would only adjust for changes in the timing for incurred claims in the coverage period per IFRS 17.B127.</td>
</tr>
<tr>
<td>Longer duration contracts generally.</td>
<td>For many reasons already highlighted, the longer the coverage period, the greater the variability in the fulfillment cash flows under the GMA.</td>
</tr>
<tr>
<td>Cancellation of policies within the coverage period are significant or lapses through non-payment of future premiums are an issue, when premium has been paid upfront.</td>
<td>Under the PAA, premium is allocated based on the passage of time or incurred claims if the expected pattern of release from risk is significantly different from the passage of time; there is no reflection of cancellations or return of premium. The GMA on the other hand, reflects expected return of premiums and expected lapses and changes in them during the coverage period for the LRC.</td>
</tr>
</tbody>
</table>

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members.
MEMORANDUM

To: All members in the Life and Property and Casualty Practice Areas
From: Steven W. Easson, Chair
Standards and Guidance Council
Michelle Lindo, Chair
Committee on Risk Management and Capital Requirements
Date: December 5, 2019
Subject: Draft Educational Note—Financial Condition Testing
Deadline for comments: February 28, 2020

The Canadian Institute of Actuaries (CIA) published its last revised educational note on Dynamic Capital Adequacy Testing (DCAT) in November 2017. This draft educational note has been renamed and updated to reflect revisions to the Standards of Practice (SOP) – Insurance, Section 2500 – Financial Condition Testing (FCT), which was approved by the Actuarial Standards Board (ASB) on September 10, 2019, with an effective date of January 1, 2020.

Background

The objectives of the revisions to Section 2500 Dynamic Capital Adequacy Testing are to:

• Provide a more robust approach to satisfy the federal and provincial insurance acts requirement to report on the expected future financial condition of an insurance entity.

• Allow for a better alignment with Own Risk and Solvency Assessment (ORSA) regulatory requirements as they relate to work needed to report on the expected future financial condition of an insurance entity.

Insurers’ specific size, complexity, and other circumstances may have a significant influence on the appropriate level of harmonization between Section 2500 and ORSA. The changes to Section 2500 do not prescribe the level of harmonization, nor does the draft educational note.

Changes to the SOP

Changes to the SOP include:

a) Renaming of Dynamic Capital Adequacy Testing (DCAT) to Financial Condition Testing (FCT);

b) Revised threshold testing of the base scenario to internal target capital ratio(s) as determined by ORSA rather than regulatory supervisory level(s);
c) Testing of “satisfactory financial condition” using both going concern and solvency scenarios;
   • The threshold for “going concern” scenarios is the minimum regulatory target.
   • The threshold for “solvency” scenarios is that the statement value of assets is sufficient to cover the statement value of the liabilities.

d) Three options for the opinion of the actuary:
   • Satisfactory;
   • Satisfactory subject to...;
   • Not satisfactory.

e) Elimination of specifications on the number of years for the review of the recent financial position and forecast period;

f) Removal of the detailed listing of risk categories;

g) Distinction made between ripple effects (which may include management’s routine actions) and corrective management actions; and

h) Ability to harmonize with ORSA.

Updates to the draft educational note

The draft educational note provides additional guidance to the actuary on the above topics in the revised SOP. Notable updates include:

   a) Recommended minimum percentiles for going concern and solvency scenarios.
   b) A decision grid to illustrate the options for the opinion of the appointed actuary.
   c) Typical forecast periods are provided, but the choice would be subject to the judgment of the actuary, relevant to the scenario, and consistent with ORSA, if applicable.
   d) Retention of risk categories but moved to appendices.
   e) Examples of ripple effects and corrective management actions – acknowledging that the classification of a ripple effect or a corrective action would depend on the circumstances of the insurer.
   f) Suggestions for possible integration with ORSA in a consolidated report.
   g) Recommended that the FCT report contain a minimum of three adverse scenarios (at least one going concern and two solvency scenarios).

Process

In accordance with the CIA’s Policy on Due Process for the Approval of Guidance Material Other than Standards of Practice and Research Documents, this draft educational note has been prepared by a working group of the Committee on Risk Management and Capital Requirements (CRMCR), and has received approval for exposure to the membership by the Standards and Guidance Council on December 3, 2019.
Responsibility of the actuary

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members.

Working group

CRMCR would like to acknowledge the contribution of the working group that assisted in the development of this draft educational note: David Kroach (Chair), Nicolas Beaudoin, Marisa Chan, David Gourlay, Marc-André Harvey, Ritchie Hok, Bruce Langstroth, Anh Tu Le, Michelle Lindo, Christian Nadeau-Alary, and Valerio Valenti.

Your feedback

Feedback on all aspects of the proposed changes, as well as suggestions for other changes not presented in this draft educational note, are encouraged.

Interested parties are invited to submit their feedback on this draft educational note by February 28, 2020. Comments should be directed to Michelle Lindo at MLindo@munichre.ca.

1. **Introduction**

The primary purpose of this document is to provide guidance and support to actuaries of life and property and casualty (P&C) insurers in performing Financial Condition Testing (FCT) analyses in accordance with the Standards of Practice (SOP) – Insurance, Section 2500.

According to paragraphs 2520.01 to 2520.04 of the SOP:

The appointed actuary should make an investigation at least once during each financial year of the insurer’s recent and current financial position and financial condition, as revealed by financial condition testing for selected scenarios.

The appointed actuary should make a report of each investigation in writing to the insurer’s board of directors (or to the appropriate committee of the board such as audit committee, risk committee, etc., if they so delegate) or its chief agent for Canada. The report should identify possible actions, and reasons for those actions, for dealing with any threats to satisfactory financial condition that the investigation reveals. The actuary should also comment on the consistency of the results of the investigation and possible actions with the own risk and solvency assessment (ORSA).

The appointed actuary should ensure that the investigation is current. The investigation should take into consideration recent events and recent financial operating results of the insurer.

The timing and frequency of the appointed actuary’s investigations would be sufficient to support timely corrective actions by management and the board of directors or chief agent for Canada.

FCT is one of a number of stress-testing processes that would fit within the insurer’s overall risk management process. The FCT process allows management to understand implications the business plan has on capital and provides awareness of the significant risks to which the insurer is exposed. The principal goals of the FCT are to identify possible threats to the financial condition of the insurer and appropriate risk management or corrective actions to address those threats, while considering the ORSA solvency analysis, conclusions, and recommendations. The FCT process should not be viewed as merely a compliance exercise.

Stress testing includes scenario testing and sensitivity testing (refer to the glossary in Office of the Superintendent of Financial Institutions (OSFI) Guideline E-18 – Stress Testing, or to l’Autorité des marchés financiers (AMF) Stress Testing Guideline, for definitions). Stress testing has the following goals:

1. Risk identification and control – stress testing may exist at various levels within an insurer, ranging from risk mitigation policies at a detailed or portfolio level to adjusting the institution’s business strategy. It can be used to address institution-wide risks and consider concentrations and interactions between risks in stress environments that might otherwise be overlooked. Knowing the sources of threat will help advise the insurer where it is most vulnerable and should strengthen monitoring systems.

2. Provide a complementary risk perspective to other risk management tools – stress tests would complement risk quantification methodologies that are based on complex, quantitative models using historical data and estimated statistical relationships. Stress-
testing outcomes can provide insights about the validity of statistical models at high confidence intervals such as those used to determine value at risk (VaR).

Stress testing can help the insurer assess possible changes in the economic and financial environment. Stress tests can also help detect vulnerabilities, such as unidentified risk concentrations or potential interactions between types of risk, that could threaten the viability of the institution, which may be concealed when relying purely on statistical risk management tools based on historical data. Stress testing can also be used to assess the impacts of customer behaviour arising from options embedded in products, particularly where the behaviour in extreme events is not well understood.

3. Support capital management – stress testing would form an integral part of an institution’s internal capital management where rigorous, forward-looking stress testing can identify severe events, including a series of compounding events or changes in market conditions.

4. Improve liquidity management – stress testing would be a central tool in identifying, measuring, and controlling funding liquidity risks, in particular for assessing the institution’s liquidity profile and the adequacy of liquidity buffers in case of both institution-specific and market-wide stress events.

It is essential that the board of directors or chief agent and senior management are involved in the determination of the stress scenarios and understand the key findings of the stress tests to develop and implement risk mitigation strategies. Risk concentration would be considered throughout the stress-testing process.

FCT has the following key elements:

- Development of a base scenario.
- Analysis of the impact of adverse scenarios.
- Identification and analysis of the effectiveness of corrective management actions to mitigate risks.
- A report on the results of the analysis and recommendations to the insurer’s management and the board of directors or chief agent.
- An opinion signed by the Appointed Actuary (AA) indicating the financial condition of the insurer.

The subsequent sections of this document cover the following:

- Method – this section provides guidance on the FCT process, forecast period, and approaches to developing the base scenario and adverse scenarios.
- Modelling – this section identifies key elements to be considered in building an FCT model used to project the financial results under the base and selected adverse scenarios.
- Reporting – this section provides guidance on key elements to be considered in reporting the results of FCT, along with an outline of a typical report.
- Appendices – discussion and analysis of life insurer and property and casualty insurer risk categories.
2. Method

Process

The FCT is used for risk identification and control, and assesses threats to an insurer’s financial condition while ORSA enhances an insurer’s understanding of the interrelationships between its risk profile and capital needs. The ORSA is a more comprehensive process that also addresses other risk management elements such as operational and strategic risks. Both processes share the commonality of relating risk to capital and are complementary, so some level of consistency between the two processes would be expected. The AA would assess the level of consistency necessary in such areas as, but not limited to, the modelling of ripple effects, the selection of adverse scenarios, the forecast periods, and the consistency of messages.

It is fundamental to this process, and to the proper interpretation of results, to understand that the projected capital position under various scenarios may become inadequate during the forecast period. This is not in itself an indication of current or anticipated difficulties. It is the specific degree and timing of capital depletion that indicate the risks to which the insurer is particularly sensitive. This, together with the results under the base scenario, would guide the insurer as to the necessity of revising the business plan or preparing for contingencies.

To perform FCT, it is necessary to understand the regulatory capital minimum(s) and the insurer’s internal target capital requirements. If the internal target is established using a different capital benchmark, it would be translated to the equivalent internal target ratio(s) under the current regulatory regime. It is recommended that the AA verify the current regulatory requirements for his or her own insurer’s situation and review any applicable guidelines and educational notes. The AA would also understand the risk categories (see Appendices A and B for potential risk categories to be considered) posing the most significant threats to the insurer, including the impact of any ripple effects.

Approach

A typical approach would include the following steps:

- Review of operations for recent years and of the financial position at the end of each of them. The number of years reviewed depends on its relevance to the future financial position.
- Development and modelling of the base scenario. As stated in the SOP, this would normally be consistent with the insurer’s business plan.
  - Assess potential risks and identify those that are relevant to the insurer’s circumstances. Sensitivity testing may be used to determine the relevant risk categories warranting further analysis.
  - In the event of a new regulatory requirement or change in standards, it may be necessary to perform additional analysis as the sensitivities to certain risk factors may change.
- Selection of adverse scenarios requiring further analysis for relevant risk categories to be applied across all business and product lines:
  - Development and modelling of adverse scenarios likely to significantly impact the
insurer’s regulatory capital level and surplus. The scenarios may be single-risk scenarios, or integrated scenarios resulting from a combination of single-risk scenarios. The stress tests would cover a range of scenarios, including non-historical scenarios. Sensitivity testing or stress testing may be used to determine the adverse scenarios.

- Identification and modelling of associated system-wide interactions and feedback effects (ripple effects and macroeconomic effects) caused by a change in assumptions triggered by the scenario.

- Depending on the insurer’s circumstances, the board of directors or chief agent and management may also be interested in situations that cross other break points, in which case further stress testing may be beneficial.

- Selection of scenarios for inclusion in the report from those modelled showing the greatest sensitivities. For each scenario that would result in a threat to satisfactory financial condition, identification of possible corrective management actions and presentation of financial condition results with and without such actions. In addition, commentary would be included on the rationale for those actions and the extent to which such actions are necessary and achievable and why they are expected to mitigate and/or eliminate the threats to satisfactory financial condition. Any possible constraints on identified corrective management actions would be taken into account.

- Identification of possible regulatory actions for each scenario that would result in a threat to satisfactory financial condition. For best practices purposes, it would be preferable to also identify possible regulatory actions that may be triggered as a result of falling below any threshold set by the regulator(s).

Recent and current financial position

Paragraph 2520.05 of the SOP states the following:

The investigation would review operations of recent years and the financial position at the end of each of those years.

The review would include the statement of income and source of earnings (if available) for each year and the financial position at the end of each year, including the balance sheet and the results of the applicable regulatory tests of capital adequacy. The AA would analyze recent trends in these statements and investigate the circumstances and key factors contributing to those trends to ensure awareness of the reasons underlying any such recent trends and report on these findings.

Forecast period

Paragraph 2520.15 of the SOP states the following:

The forecast period for a scenario would be sufficiently long to be aligned with the risk emergence and the recognition of impacts through the accounting and solvency results, and to capture the effect of management actions.

The SOP does not prescribe a minimum length for the forecast period. However, the following would be considered:

- The forecast period would be long enough to incorporate the full effect of an adverse scenario on the financial condition of an insurer, including ripple effects, and long enough to
assess the recovery period of any corrective management actions.

- The length of the forecast period would be aligned with the risk emergence and the recognition of impacts through accounting and solvency (e.g., the horizon over which accounting impacts are recognized may be different than those for capital, such as those related to segregated fund guarantees).

- A typical forecast period for an insurer is three to five fiscal years. It is recommended that the AA use judgment in assessing the forecast period and describe the reasoning in the report.

- Consistency of the forecast period with similar analysis, such as the ORSA.

**Materiality standard**

The standard of materiality would usually be less rigorous than that used for valuation of the insurer’s policy liabilities and, if practical, the AA would discuss it with the insurer’s management. In selecting a materiality standard, the AA would also consider:

- The size of the insurer.

- The financial position of the insurer. The standard of materiality would become more rigorous in examining a base scenario where capital adequacy is closer to the target regulatory requirement.

- The nature of the regulatory test. For example, if the test is measuring required capital, the materiality standard might be expressed as a percentage of the required capital.

For more guidance on materiality, refer to subsection 1240 of the Standards of Practice.

**Base scenario**

According to paragraph 2520.17 of the SOP:

The base scenario would be a realistic set of assumptions used to forecast the insurer’s financial position over the forecast period. Normally, the base scenario would be consistent with the insurer’s business plan. The actuary would accept the business plan’s assumptions for use in the base scenario unless these assumptions are so inconsistent or unrealistic that the resulting report would be misleading. The actuary would report any material inconsistency between the base scenario and the business plan.

The standard does not necessarily imply that the projected financial results and future financial positions would be identical to the projections prepared at the time the insurer’s business plan was approved. Typically, there is a difference between the timing of the starting balance sheet date for the FCT analysis and the timing when the business plan was approved. During this time, events may have occurred that lead to definitive changes in assumptions. As stated above, the projection of the future financial condition would reflect any material change that has occurred during this time. The projected financial results and future financial positions may continue to be consistent with the business plan while still recognizing the following:

- Sales distribution assumptions that differ from those expected in the business plan.

- Recent management decisions not anticipated or discussed in the business plan.
• Changes in the capitalization of the insurer not expected in the business plan.

• The impact on future experience, where appropriate, due to actual recent experience, assumptions, or decisions as described above.

If differences are material, a reconciliation of the base scenario to the business plan would be included in the FCT report. It is expected that significant deviations from assumptions in the insurer’s plan approved by the directors, as well as significant deviations in the results for the forecast period, would be documented. Where differences in the base scenario are not due to a recent reforecast of the business plan, the AA would run the business plan as an additional scenario to ascertain the deviations in the results and explain the rationale for the changes. Any differences between the business plan and the base scenario would, typically, also affect all adverse scenarios.

Clear reporting of assumptions made regarding capital injections is essential. There will be some situations where capital injections are a basic part of an insurer’s business plan; for example, when the business plan calls for an insurer to grow quickly or is intending a major initiative in a new sphere of operations. In any scenario where capital injections are assumed, it is expected that the AA would comment on the action in the FCT report and is comfortable that such injections are both realistic and reasonable.

Adverse scenarios

According to paragraphs 2520.18 and 2520.19 of the SOP:

An adverse scenario is developed by stress testing the assumptions used in forecasting the business plan, including the determination of insurance contract liabilities, with regard to risk factors that may trigger potential threats to the insurer’s financial condition. The number and types of adverse scenarios may vary among insurers and over time for a particular insurer.

The actuary would consider material, plausible risks or events to the insurer. Reverse stress testing can help assess whether certain risk factors need to be tested, on the grounds that certain risk factors could never deteriorate to the point where they would be a threat to the insurer’s financial condition. The actuary can thereby determine whether a material, plausible risk or event exists for the insurer over the forecast period.

An insurer would consider the impact of a range or series of adverse scenarios of varying nature or severity and its ability to meet the specified thresholds indicated for going concern and solvency scenarios. The actuary would consider threats under adverse scenarios that include, but are not limited to, the common risk categories for life and P&C insurers as listed in Appendices A and B in order to develop adverse scenarios to be modelled. The AA would select adverse scenarios from those modelled showing the greatest sensitivity to be examined in further detail, considering associated ripple effects. Any modelled scenario that causes the insurer to fall below, or come close to, the defined threshold during the forecast period would be subject to further examination and reporting. The AA would consider the ORSA, the insurer’s stress testing program, any scenario prescribed by the regulator, and whether the circumstances of the insurer result in the need to examine other risk categories.

Adverse scenarios build on the assumptions and actual experience already reflected in the base scenario. This is particularly true if the first part of the projection of the base scenario already reflects some adverse conditions that have been experienced. If the base scenario does not reflect
adverse experience already seen (because this is projected to improve in the future), the adverse scenarios would not be more favourable than the actual experience to date.

If possible, policy liabilities would be revalued or appropriately estimated for each adverse scenario for each year of the projection. Revaluation only at the end of the forecast period may be a suitable compromise if the actuary believes, given the financial position at the end of the forecast period, that the financial condition would be satisfactory throughout the forecast period.

Scenarios would be framed in the context of the key thresholds being tested when consolidating results. In situations where it is unclear as to the severity of the scenario, the AA would use judgment to determine the appropriate grouping and therefore threshold to be tested.

Both deterministic and stochastic models can be used to perform the analysis. For risks where no stochastic models with predictive capabilities are available, the AA would consider the variability in historical results and credibility of data, among other things, in selecting scenarios.

Reverse stress testing may be used as a means to develop adverse scenarios and determine how far risk factor(s) in question have to change in order to drive the insurer below the scenario thresholds and evaluating if that degree of change is plausible and helps insurers better understand the impact of business vulnerabilities. Reverse stress testing begins with the assumption that a specific outcome occurs, in the instance of a solvency scenario where the insurer’s surplus becomes negative during the forecast period. A sequence of events in a scenario, whether concurrent or over a period of time, producing the desired outcome are identified, where the events may or may not be more severe than those seen historically. An evaluation is then performed to determine whether that degree of change is plausible in the context of what is being tested. The results of reverse stress testing can also help with strategic business decisions, contingency planning (i.e., corrective management action), and designing risk management arrangements.

It is expected that the AA would report on the considerations for determining the adverse scenarios, including any consideration of reverse stress testing. The stress testing performed as part of the ORSA and any other similar analysis could be considered in the selection of the adverse scenarios, or vice versa. The stress testing performed by the insurer can be harmonized for FCT, ORSA, and any other testing. It is expected that adverse scenarios showing the greatest sensitivities would be discussed in the report in detail.

The regulator might request other FCT analyses be conducted, including additional adverse scenarios and longer forecast periods.

**Solvency scenarios**

According to paragraph 2520.18.1 of the SOP:

A solvency scenario is a plausible adverse scenario if it is credible and has a non-trivial probability of occurring. The actuary may use percentile rankings of outcomes to determine whether a solvency scenario is both plausible and adverse.

In a solvency scenario an insurer would be expected to test the occurrence of events that are of such severity that it tests its ability to maintain a positive surplus position even when taking into consideration corrective management actions.

A solvency scenario employs a plausible adverse scenario, recommended at a minimum of the 95th
percentile over the scenario horizon. Although this guideline suggests this minimum, it is recommended that analysis be performed at even higher confidence levels. If the AA is unable to ascertain the percentile severity of the scenario, the AA would be comfortable that the scenario is of sufficient adversity to appropriately test the relationship of the insurer’s statement value of assets to its liabilities.

A solvency scenario could align with the level of shocks used in the Own Risk and Solvency Assessment analysis.

**Going concern scenarios**

According to paragraph 2520.19.1 of the SOP:

> A going concern scenario is an adverse scenario that is more likely to occur and/or less severe than a solvency scenario, and could include risks not considered in solvency scenarios.

In a going concern scenario an insurer is assumed, through its developing capital position, ripple effects, and corrective management actions, to be able to maintain operations and meet its obligations while maintaining regulatory capital in excess of regulatory minimum levels. The scenario would maintain sufficient capital resources, as defined in the OSFI Regulatory Capital and Internal Capital Targets Guideline (A-4) or in the AMF Capital Adequacy Requirements for Life and Health Insurance (CARLI) or Minimum Capital Test (MCT) guidelines, to meet or exceed minimum regulatory levels of capital required to support their risks.

A going concern scenario would utilize an adverse scenario at a lower percentile and lower severity than that used for solvency scenarios over the scenario horizon. Typically testing would be performed using a minimum of the 90th percentile. If the AA is unable to ascertain the percentile severity of the scenario, the AA would be comfortable that the scenario is of sufficient adversity to appropriately test the insurer’s regulatory capital ratio(s). Relative to assumptions used in a solvency scenario, a going concern scenario may examine the same type of stressed assumption(s) but alter it in some manner to reduce its severity and/or assume it is more likely to occur. Examples include, but are not limited to, testing a smaller stressed assumption(s) over the same horizon or a more gradual deterioration in the stressed assumption(s).

**Management actions**

Management responses to stress impacts may be classified as either ripple effects or corrective management actions. As the distinction between the two is critical to the development of the opinion statement, the actuary will need to carefully assess the appropriate categorization of the management actions.

Such actions could include but are not limited to:

- Repricing of insurance products.
- Regular policyholder dividend scale updates.
- Adjustments to non-guaranteed product elements.
- Suspending dividend payments, capital reductions, and transfers to the parent or home office, where applicable.
- Raising additional capital or adopting an approved plan to raise additional capital if and when
needed within a reasonable time frame, or, in the case of a branch, requesting transfer of adequate funds from the parent company.

- Strengthening risk management practices.
- Mitigating the risk causing the capital shortfall.
- An increased level of monitoring and reporting of the insurer’s capital position.

The AA would inform management of potential regulatory actions and repercussions and would consider when it may be appropriate to model or calculate the financial impact of such actions. The financial impact of regulatory actions could be significant, and the board of directors or chief agent may be particularly interested in seeing the modelled impact in the analysis. The AA would consider actions that could be taken by the Canadian regulator(s) as well as by regulators in foreign jurisdictions. Such regulatory action and associated management response would consider the local assessment of solvency regardless of the insurer’s worldwide solvency position as measured by Canadian regulatory standards. If the impact of potential regulatory action has been modelled in a recent FCT or ORSA analysis, it may not be necessary to model the impact again in a current FCT. This would be reasonable if the AA believes the scenario results have not changed materially and the regulator response and impact would be consistent with the earlier work.

Similarly, the AA would inform management on potential rating agency actions and possible repercussions but would not necessarily model or calculate the financial impact of such actions, unless the AA thought it would be beneficial to include.

It is recognized that actions considered routine by one insurer may not be considered routine by another. Actions that may be classified as routine are those the insurer considered to be a component of standard policies and procedures and remain within the range of accepted actions.

**Ripple effects**

A ripple effect is an event or incident that occurs when an adverse scenario triggers a change in one or more interdependent assumptions or risk factors and includes policyholder actions, management’s routine actions, and regulatory actions. The following are examples:

- Post-event epidemic mortality following a catastrophic event. A change in mortality unrelated to the catastrophe would not be considered a ripple effect but would be considered under a separate risk category.

- Following a severe catastrophe event, the post-event information would not only affect the claims stemming directly from the catastrophe but also other claims occurring in the area in and surrounding the catastrophe.

- Steady and continued deterioration in mortality versus that assumed in valuation and/or new business pricing assumptions, which would likely result in a routine reprice in new business rates to reflect emerging experience.

- The management action response to deteriorating mortality or morbidity experience on group insurance written on a one-year term-renewable basis, or deteriorating loss ratios in certain lines of P&C insurance, which may take the form of premium rate increases, tightening of underwriting, modification of benefit definitions, etc.
• Adjustments to assumptions used in the base scenario that may no longer be appropriate in
the adverse scenario being tested.
• The insurer’s expected management routine response to adversity.
• Regulatory actions, both by Canadian and foreign regulator(s), and especially under any
adverse scenario where the insurer fails to meet the supervisory target capital requirement.
• Rating agency actions, in scenarios the AA thought it would be beneficial to include due to
significant changes in capital or surplus.
• Likelihood of changes in planned capital injections or distributions.

Corrective management actions

Paragraphs 2520.29 and 2520.29.1 state:

For each of the adverse scenarios that would result in a threat to satisfactory financial
condition, the actuary would identify possible corrective management actions that would lessen
the likelihood of that threat, or that would mitigate that threat, if it materialized.

Consideration would also be given to the effectiveness of possible corrective management
actions in a volatile or stressed environment.

Actions not considered by the insurer in the normal course of business and which require escalation
to senior management or the board of directors beyond routine management actions and the
normal course of such requests would be classified as corrective management actions.

While corrective management action(s) can be used in both going concern and solvency scenarios,
for the solvency scenarios in particular, the AA would consider the insurer’s ability to sufficiently
control completion of the action in a volatile or stressed environment. The involvement of third
parties in the management action could reduce the ability of the insurer to control such actions;
however, the presence of existing policies and processes and/or successful completion of such
actions in the past could provide the AA with a level of comfort that such actions are within the
insurer’s control and will provide the expected result. Examples of situations where the AA may
consider whether the management of the insurer has sufficient control include:

• The ability to issue debt or preferred shares at a given price or volume.
• The ability to incorporate price adjustments given any action or inaction of its competitors
  and potential repercussions from policyholders.
• A parent company’s ability to inject capital due to increased demands from other business
  units or a subsidiary’s ability to remit amounts to a parent company.
• The ability to develop a hedging program where no capabilities currently exist.

Integrated scenarios

According to paragraph 2520.22 of the SOP:

The actuary would construct integrated scenarios by combining two or more risks factors whose
combination gives rise to an adverse scenario.

An integrated scenario is a type of adverse scenario that results when two or more adverse
scenarios are combined. The integrated scenarios could be a combination of low-probability scenarios, or low-probability scenarios combined with a higher-probability adverse scenario. The adverse scenarios to be combined may be based on correlated or uncorrelated risk factors but the resulting integrated scenario would remain plausible and would consider associated ripple effects. It is recommended that at least one integrated scenario be tested.

3. Modelling

Modelling is normally required to test the capital adequacy of the insurer.

**Basic requirements of the model**

Typically, the model reproduces key elements from the financial statements, such as:

- Balance sheet
  - Assets (investments, reinsurance recoverables, and other assets)
  - Liabilities (insurance contract liabilities, other liabilities, debt)
  - Retained earnings/surplus
- Income statement
  - Revenues/premium income
  - Policy benefits/claims
  - Expenses
  - Income taxes
  - Preferred share dividends
  - Investment income
- Applicable regulatory measure of capital adequacy
- Source of earnings

The model would be valid on an accounting basis. The AA would verify the validity of the model, specifically that:

\[
\text{Statement of income} = \text{cash flows} + \text{change in balance sheet items}
\]

Financial results would be consistent among the various parts of the model as well as from year to year. This would be true for major items such as invested assets, policy liabilities, and surplus.

The insurer may use more than one model depending on the lines of business and jurisdictions. The modelling capability needs to be sufficiently flexible to enable the AA to assess risks within each risk category.

**Model validation**

The validity of the model is typically tested with the base scenario. Unless extraordinary changes are occurring in the insurance environment or in the business written by the insurer, it is expected that there would be continuity from the actual financial results of the most recent year to the first projected year and subsequent years such as in the following components:
• Cash and invested assets;
• Policy liabilities;
• Surplus;
• Accounts payable;
• Accounts receivable;
• Deferred income tax amounts; and
• Major cash flow items.

When building a new model, a possible approach to check the validity of the model is to use as input the data prior to the most recent actual year and use the experience of the last year to set the parameters. The result from the model could then be compared to the actual results. If the results between actual and projected are found to be sufficiently close, the model may be acceptable. The AA would determine in advance acceptable differences in assets, liabilities, surplus, premium, investment income and net income.

When updating an existing model, a retrospective check on validity may be made. Each year after the actual results have been determined, differences between actual and base scenario model results would be justified.

The model would also be reasonable for all adverse scenarios. Evaluating the difference between the results of two scenarios is a good way to assess the ability of the model to quantify changes in key results under different sets of assumptions. The AA would verify that the magnitude and direction of change in key elements of the model is consistent with the change in assumptions.

**Approach in determining adverse scenarios**

The approach used to determine adverse scenarios may be stochastic, deterministic, or a combination of the two.

- **Stochastic:** certain risks are ideally modelled stochastically, such as those related to capital markets and those where the statistical loss distribution may be inferred and percentiles for results readily determined.
- **Deterministic:** the adverse scenarios are selected judgmentally by the AA, based on considerations such as variability in historical results or credibility of data.
- **Combination:** certain risks may be modelled stochastically and the results then used to derive a deterministic scenario that reproduces the desired stochastic results. The deterministic scenario would then be used as the adverse scenario for further analysis.

Examples of risks that are usually modelled stochastically include the following:

- Segregated fund—see the research paper *Use of Stochastic Techniques to Value Actuarial Liabilities under Canadian GAAP* (August 2001).
- Exposure to catastrophe estimated from catastrophe modelling software.

**Modelling of ripple effects**

The model would allow for the quantification of ripple effects of adverse scenarios. There are two
possible approaches to generate the ripple effects:

- Automatically generated by the model.
- Manually created by the AA by modifying the appropriate assumptions.

For example, for a P&C insurer, the model could be built such that reinsurance rates will automatically increase in the year following a catastrophe – alternatively, the AA may manually modify the relevant parameters. For a life insurer, increases in new money interest rates may provide an incentive for some policyholders to lapse products that do not adjust, or slowly adjust, policy elements to changes in interest rates. The change in lapse rate could be modelled automatically based on changes in interest rates, or the AA could make the adjustment manually.

Organizational considerations

The AA would make an investigation of the insurer’s financial condition. Although the modelling may be done by line of business, business unit, or geographical area, in order for the AA to report on the financial condition of the insurer, for regulatory reporting, the model results would be aggregated at the legal entity level.

Some assumptions are normally established at a high level, as they would be applied throughout the model. The following are possible examples:

- Economic parameters – interest rate levels, inflation, capital appreciation, and unemployment levels.
- Demographic parameters – overall trend in mortality or morbidity for a life insurer.

It is expected that the assumptions underlying economic and demographic parameters be consistent within each scenario and between scenarios (unless being specifically tested by the scenario).

It may be helpful to do modelling at the levels where management decisions will be taken (e.g., business units, geographical areas, product lines). For life insurers, it may also be informative to examine changes to the sources of earnings. It is desirable that the model have the ability to focus on a particular line of business, division of the company, fund, or territory. Since it is likely that models constructed for FCT purposes will also be used for corporate planning, the model would be sufficiently flexible to reflect any reasonable changes in insurer operations that management may want to test with additional scenarios.

The objective in designing the structure of the model is to facilitate the projection of the insurer’s operations under different scenarios. The insurer will have its own legal structure, and, within that, a management structure around which it will plan and monitor its financial results. In organizing the model, it is necessary to reflect this structure and determine where constraints apply and at which level within the hierarchical structure of the model parameters are best set.

In designing the structure for the model, the size and complexity of the organization will dominate. At a corporate level, capital infusions, shareholder dividend payments, income taxes, required surplus, investment of surplus, and corporate expenses, such as head office lease and overhead costs, would be modelled. In a single-product-line insurer, these may be combined with the product projection.

In the more complex organization, while similar issues arise as in the single-product-line insurer, the need to segment the model arises. This may be driven by size, or certain products may be more
Draft Educational Note

December 2019

efficiently modelled using different tools or techniques. Alternatively, there may be a desire to analyze specific units separately.

To derive model segments, the AA may consider the following:

- **Management** – this usually reflects the management structure. The business is subdivided into units and cost structures and management reports have been developed around them. Existing plans are assembled and decision-making is centered on these units. These units will combine products and possibly investment units. Subsidiaries and foreign operations would fall into this category.

- **Product** – this is usually the smallest subdivision of business considered. For life insurers, cash flow projections are usually already available, and the model may be built using these as the foundation. For P&C insurers, products with similar characteristics may be grouped together.

- **Investment** – usually investment segments are defined based on asset categories. Investment income allocation follows the investment structure. This method of subdivision would combine a number of similar assets for investment purposes.

It may be desirable to have further breakdowns within a segment to take into consideration different investment strategies or instruments that are exposed to distinctly different risks. These will require at least separate parameters and may need different modelling techniques or valuation methods.

The interrelationship of insurance and investment cash flows feeding the asset model is critical. Cash available needs to be established before investment decisions can be implemented.

For P&C insurers, the modelling of investment may follow the insurer’s investment strategy rather than be product specific.

It may be desirable that calculation of taxes and required surplus be done at a divisional level of the model on a stand-alone basis. However, when results are consolidated, these will have to be redone on a consolidated basis. This implies that such data as necessary would be transferred to the corporate model to facilitate these calculations.

4. **Reporting**

The FCT report enables the AA to communicate the current and expected future financial position of the insurer. Significant investment in time and effort are required to develop the projection and analysis. The outcome of this investment is the report and the discussion, analysis, and management actions captured within. An interpretative report is more useful than a purely quantitative report.

The primary purpose of the report is to communicate the significant risks to which the insurer is exposed and possible actions that could be taken to mitigate those risks. The audience for this report is the board of directors or an appropriate committee of the board (audit committee, risk committee, etc.) if they so delegate, as well as the regulator. In the case of a Canadian branch of a foreign insurer, the audience is the chief agent for Canada.

It is recommended that the FCT report would include a minimum of three scenarios including at least one going concern scenario and two solvency scenarios. It is also recommended that the actuary not concentrate the analysis on only one risk category for all the scenarios.
The actuary would discuss the report with senior management. The AA’s challenge is to provide pertinent information in a comprehensible fashion to individuals with different backgrounds and qualifications. The report would be in writing, but an additional oral report that permits questions and discussions is expected. The report would need to consider the timing of other reporting such as ORSA to ensure consistent conclusions.

It may be useful to prepare a supplementary analysis for discussions with management. Any such analysis would contain consistent findings with the report.

The AA may prepare a single report independently on the FCT or, if deemed appropriate, a consolidated report with the ORSA analysis. The level of integration of the FCT and ORSA is a decision for the insurer to make. If the insurer chooses to maintain separate FCT and ORSA reports, the FCT would be consistent with the most recent ORSA report. A consolidated report would include the AA’s independent FCT opinion. Development of a consolidated report would consider the insurer’s size and its complexity of businesses as well as the impact of significant change in accounting and capital regimes.

Considerations supporting integration of FCT and ORSA include but are not limited to:

- ORSA-defined internal target ratios which is a key component in the development of the AA’s opinion. Should internal target ratios evolve over the duration of the projection it would be appropriate to assume an internal target ratio that is different than the one provided in ORSA.
- ORSA’s usefulness in assessing the going concern nature of adverse scenarios.
- Efficiencies such as:
  - Consistent timing;
  - General reporting needs such as collection of data, analysis, management discussions, production of reports, internal and external party reviews of reports; and
  - Overlapping requirements such as comprehensive stress scenario testing.
- A comprehensive view of both regulatory and own capital requirements that can better inform decision-making and management action.

Integration may encounter challenges that include but are not limited to:

- Oversight for FCT lies with the AA whereas for ORSA it is the board and senior management.
- FCT follows a prescribed regulatory basis while ORSA reflects own models and assumptions. The differences in bases of calculation may make efficient integration of models and processes difficult.
- Areas of the organization responsible for FCT may differ from those coordinating ORSA, increasing the cost of coordination and change management.

The AA would apply judgment to the insurer’s circumstances on how to integrate the FCT and ORSA reports to reduce redundancy, ensure metrics are complementary and the report comprehensive. Commonalities may be applicable to both an FCT-only report and a consolidated report with ORSA:

- When there are a number of related legal entities in a group, consideration to the number of
reports is needed. There are circumstances where a single FCT report covering multiple related legal entities may be appropriate. In order for this to be the case, the following conditions would generally be met:

1. There is a common audience (or significant overlap) for all legal entities involved.
2. The regulator(s) that supervise(s) the various legal entities agree(s) that a single consolidated report is acceptable or required.
3. The FCT report includes the consolidated results, but also includes relevant results at the legal entity level.

• The report would include the actuary’s FCT opinion overall and for each legal entity. The Standards of Practice and the regulator(s) require a signed opinion on the insurer’s financial condition.

Paragraph 2520.09 of the SOP states:

The insurer’s financial condition would be satisfactory if throughout the forecast period,

• Under the solvency scenarios, the statement value of the insurer’s assets is greater than the statement value of its liabilities;
• Under going concern scenarios, the insurer meets the regulatory minimum capital ratio(s); and
• Under the base scenario, the insurer meets its internal target capital ratio(s) as determined by the ORSA.

The opinion is considered satisfactory even if corrective management actions under control of the insurer, as detailed in the FCT report, are recommended in order to meet any threshold. However, disclosure of the corrective management action(s) needed to maintain satisfactory financial condition of the insurer would be required. A not satisfactory opinion follows if any of FCT thresholds are not met, even with corrective management actions in control of the insurer, or if that corrective management action is not reasonably assured to meet threshold levels.

The AA would consult the capital guidelines and rules of the regulator(s) to assess when and what type of intervention may be initiated if the financial condition of the insurer is not satisfactory.

The report would identify any and all transfers assumed to occur between legal entities, including any risk-sharing agreements between legal entities or between a legal entity and a parent company, dividends to parent companies, capital infusions into legal entities, etc., whether in the base scenario or in the adverse scenarios. If a given legal entity requires a capital infusion in any of the scenarios, the report would include discussion on the likelihood of such infusions actually being made.

The report need not include any commentary on the development and/or validity of the regulatory capital formula used. In most cases it will suffice to disclose the following:

• The applicable federal and/or provincial regulatory formula(s).
• For insurers subject to target capital requirements under multiple jurisdictions, the rationale for using the selected formula.
• The target requirement used in the projections and the rationale.

The report and any discussion materials presented would reflect what is important to the insurer’s board of directors or chief agent. The following is an illustrative outline of possible elements of a comprehensive FCT report. Suggestions to integrate with ORSA are also included. A consolidated report would include the guidance from OSFI Guideline E-19 or from AMF Capital Management Guideline.

1. Executive summary
The executive summary provides a high-level overview of the results of the FCT analysis, including the following:

• Summary of the results of the base and selected adverse scenario results.
• Recommendations for management to mitigate or eliminate risk.
• Assessment of the events since the previous FCT report was submitted.
• Commentary on management’s action in response to the recommendations in the previous year’s FCT report, if appropriate.
• Other significant findings.

If a consolidated report with ORSA is developed, the following would also be included:

• Commentary on consistency of results and possible actions with ORSA.
• Highlights of the ORSA results and internal targets.

2. FCT opinion
The AA would include a signed opinion on the future financial condition of the insurer. The opinion would reflect the particular circumstances of the insurer. The opinion is required in both an FCT-only report and a consolidated report with ORSA. A decision grid is provided below to highlight the decision points for each type of opinion:

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Threshold</th>
<th>Is the threshold test under the scenario passed?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base</td>
<td>Insurer’s regulatory capital ratio(s) =&gt; Internal target ratio(s) as determined by the ORSA</td>
<td>Yes (with realistic plan to pass ratio)</td>
</tr>
<tr>
<td>Going Concern</td>
<td>Insurer’s regulatory capital ratio(s) =&gt; Regulatory minimum capital ratio(s)</td>
<td>Yes (with or without ripple effects)</td>
</tr>
<tr>
<td>Solvency</td>
<td>Statement value of the insurer’s assets &gt; Statement value of its liabilities</td>
<td>Yes (with corrective action and actuary is comfortable) No OR Yes (with corrective action but actuary is not comfortable)</td>
</tr>
</tbody>
</table>

3. Introduction
The introduction provides a forum to inform the user about the purpose and basis for the FCT report, consisting of the following:
• Oversight role of FCT and the purpose and scope of the report.

If a consolidated report with ORSA is developed, the following would also be included:
• Oversight role of ORSA and the purpose and scope of this component of the report.

4. Results

The AA would provide details around the results of the testing performed:
• Discussion and summary of the FCT base and selected adverse scenario results.

If a consolidated report with ORSA is developed, the following would also be included:
• Discussion of the ORSA base and selected adverse scenario results.

5. Capital management and adequacy measurement

The AA would explain the nature of the test used to measure the financial condition of the insurer, including the following:
• Definition of satisfactory financial condition used in FCT.
• Definition of minimum capital ratio requirements.
• Definition of the internal target ratio as determined by ORSA and description of the requirements if they change over the projection period.
• Materiality standard.

6. Background discussion

This section would provide an overview of the insurer and the economic environment during the forecast period, including such things as the following:
• Summary of the nature of the insurer’s business, products, and target markets.
• Review of recent and current financial position.
• Discussion of any key events or initiatives affecting the insurer in the recent past and any associated expected future developments.
• Description of economic assumptions.
• Discussion of the current and expected market condition.
• Discussion of prior year’s FCT results, recommendations, and corrective management actions, if appropriate.

7. Base scenario

A clear description of the base scenario used in the FCT analysis would include the following:
• Description of the model or process used to project the base scenario.
• Description of main assumptions.
• Description of the internal target(s).
• Discussion of consistency of the base scenario with the insurer’s business plan.
• Description of capital plans, especially any capital injections or strategic initiatives.

• Discussion of key financial results, including key income statement and balance sheet items, and capital test results. A desirable approach would be to display the results for each year in the projection.

8. Adverse scenarios

This section would provide detailed descriptions of the selected scenarios posing the greatest risk to the insurer as well as any modelled scenario for which the insurer falls below the defined thresholds. An overview describing the process used to identify the scenarios would be useful. For each adverse scenario, the following items would be included where applicable:

• Description of the risk being tested, key assumptions used, why the risk is significant to the insurer, and how this was determined.

• Comparison to prior year’s FCT, and consistency of the selected scenarios with the prior year’s results.

• Description of stress-testing results on an FCT basis.

• Description of key financial results and the change from the base scenario.

• Description of management actions that may be taken including reasons for such inclusion.

• Description of any ripple effects reflected in the scenario.

• Description of any changes in the capital injections or distributions from those assumed in the base scenario, and results with and without these capital changes.

• Clear reporting of results with and without the impact of corrective management actions to aid the audience in appreciating the effectiveness, practicality, and adequacy of the risk mitigating strategy.

• Discussion of possible regulatory actions, whether Canadian or from foreign jurisdictions, and repercussions if the scenario results fall below the target capital level, in the absence of any change in the base scenario capital injections, capital distributions, or other corrective management actions.

• Discussion of possible reactions of rating agencies and repercussions, when applicable, if the insurer’s capital is severely strained.

• Discussion of changes in the adverse scenarios selected compared to the prior report’s selection.

• Discussion on whether additional scenarios other than those reported in ORSA were used and the reasoning behind those additional scenarios.

If a consolidated report with ORSA is developed, the following should also be included:

• Description of ORSA stress-testing results.

• All of the above, as appropriate on an ORSA basis.

9. Conclusions and recommendations

Overall conclusions from the FCT analysis would be presented, including a brief description and
summary of the results of the base and selected adverse scenarios and highlights of the most significant risks to capital adequacy and threats to satisfactory financial condition. Any findings leading to follow-up actions would be discussed. It may also be appropriate, and consistent with best practices, to make one or more recommendations, particularly with respect to corrective management actions that are intended to better manage or mitigate risk exposures.

10. Appendices

The primary purpose of the FCT report is to inform the insurer’s board of directors or chief agent, and management of potential threats to future financial conditions and possible actions that may mitigate those threats, so a qualitative report is best to achieve this end.

However, it would be desirable for the AA to include some detailed financial results from the application of the FCT model. Typically, the model creates key elements and pages from the financial statements and copies of such exhibits for the base scenario and each of the selected adverse scenarios for the forecast period allow users to review the FCT results in more detail.

In a consolidated report with ORSA, the appendix would contain the methods and assumptions of own risk capital assessed. It could also include an overview of an insurer’s enterprise risk management framework.
Appendix A – Discussion and analysis of life insurer risk categories

This appendix outlines major risk categories that would be considered for life insurers and possible adverse trends. Each risk category section provides guidance about ripple effects, with possible corrective management actions listed where relevant.

The actuary would assess various risk categories and identify those that are relevant to their circumstances, including, but not limited to:

- Mortality;
- Morbidity;
- Persistency and lapse;
- Market (includes interest rate, equity, real estate, and currency);
- Inflation;
- Credit;
- Reinsurance;
- New business;
- Expenses;
- Government and political issues;
- Off-balance-sheet items; and
- Related companies.

Recent industry and insurer historical experience and the outlook for the future could be considered in determining a range of possible future experience. The Appointed Actuary may want to look at historical data such as CIA or other economic statistical data as a guide to help determine the possible deterioration of the risk.

The AA may also consider systemic risk as a cause of some of the other risks. As an example, the failure or downgrading of one or more significant insurers in the market could result in marketing and/or reputational risk for the other insurers. The AA may also consider liquidity and operational risks, likely as ripple effects associated with other adverse scenarios.

Liquidity is the availability of funds, or assurance that funds will be available, to honour cash outflow commitments (both on- and off-balance sheet) as they fall due. Liquidity risk is the inability to meet financial commitments as they fall due, through ongoing cash flow or asset sales at fair market value. Under some adverse scenarios, cash flow results may fall outside the targets set in a liquidity risk management policy, in which case examining ripple effects and possible management responses may be beneficial.

The AA may wish to consider operational risks, although the quantitative measurement of operational risk is still in its infancy and investigations may be more qualitative in nature. Systems and internal control procedures that may function well under normal day-to-day operations may begin to break down under adverse scenarios developed as part of FCT or ORSA. As well, business continuity plans may not consider scenarios that are as adverse as those developed as part of the
FCT analysis. Other sources of information that may be useful in examining operational risk might be rating agencies (e.g., new product risk) and the Society of Actuaries.

If a life insurer writes P&C business and the P&C business represents a material risk for the insurer, the AA would consider all risks covered in the P&C section of this draft educational note. If the P&C risk is not considered material by the AA, the AA would provide an explanation as to why it is not considered material. This is especially the case for some chartered life insurance companies operating in Québec.

Finally, the Dynamic Financial Condition Analysis Handbook of the Society of Actuaries is a good supplemental reference for risk areas and adverse scenarios that may be relevant for a given insurer, beyond those covered here.

1. Mortality risk

Annuity and insurance contracts tend to react very differently to adverse scenarios, so the testing of mortality for those lines of business would be done separately.

For insurance business, adverse mortality may arise from a variety of causes, including:

- An absolute increase in mortality rates, likely for a specific period of years and arising from an epidemic or other catastrophe.
- A steady and continued deterioration in mortality, arising from anti-selective lapse experience as new and more competitive products are offered, and also due to a weakening in underwriting standards.
- A steady and continued deterioration in mortality versus that assumed in valuation and/or new business pricing assumptions, which may include mortality improvement assumptions that are not fully realized.
- A misestimation of expected experience due to a lack of credible experience data.
- For death-supported insurance policies (i.e., policies where a decrease in mortality rates increases policy liabilities), a steady and continued decrease in mortality rates, arising from changes in medical treatments and/or changes in policyholder lifestyles, at a different rate than assumed.

For annuity business, adverse mortality may arise from a variety of causes, including:

- A steady and continued decrease in mortality rates, arising from improvement in medical treatments and/or changes in annuitant lifestyles, at a faster pace than that assumed.
- A misestimation of expected experience due to a lack of complete experience data.

The AA would consider whether such adverse mortality will be temporary or permanent in nature. Where appropriate, the impact would be reflected through a recalculation of policy liabilities.

The AA would consider possible ripple effects such as changes in sales levels and/or persistency following any pricing or benefit adjustments.

Possible management actions could include the following:

- For adjustable products, changing premiums and/or benefits (delay before management actions, partial adjustment for the adverse mortality experience).
• Adjusting the price of new business.
• Seeking reinsurance solutions.

2. **Morbidity risk**

Adverse morbidity includes the following:

- Increases in incidence rates for disability, medical, dental, critical illness, and other coverage; and
- Decreases in the rate of claim termination.

These may arise from a variety of causes, some of which include the following:

- A prolonged high-unemployment recessionary environment leading to both sharply increased incidence rates and low claim termination rates for disability.
- An increase in incidence rates without increasing death rates (for example, in the case of non-life-threatening epidemic or accident rates) or increased rates of diagnosis of critical illness as a result of sensitive diagnostic technologies.
- Improved treatment for diseases that decrease associated death rates.
- Court rulings that limit the insurer’s ability to adjudicate claims.
- Retrenchment of government social security programs.
- Escalation in dental and medical costs.
- Misestimation of expected experience due to a lack of credible experience data.

The AA would consider possible ripple effects, such as the following:

- Constraints to rate increases as the industry reacts slowly in implementing renewal rate increases.
- Rate guarantees that limit or delay required rate increases.
- Increases in anti-selective lapses that dampen or nullify the effect of rate increases.
- Adverse publicity/reputation damage arising from claim or underwriting practices, leading to decreased sales of new business.

Possible management actions could include items such as the following:

- Increasing rates; and
- More active claims management.

3. **Persistency and lapse risk**

Generally, persistency risk exists when cash value does not equal the policy liability. When cash value is higher, the risk is that lapses will exceed those assumed. When the policy liability is higher, the risk is that lapses will be less than those assumed. In examining the persistency and lapse risks, it is prudent to assume that both these adversities may happen concurrently. Generally, the appropriate level of lapses would be assessed for each product line.

Causes of adverse persistency and lapse include the following:
• Premium changes, including amount and payment pattern.
• Dividend scale changes.
• Changes in distribution system.
• A new product introduced to the market by a competitor.
• Changes in underwriting and/or qualification criteria for preferred/select classes.
• Changes in premium rates in the market.
• A lack of confidence in the insurer that may be caused by a sudden downgrade by external rating agencies, combined with extensive publicity.
• A misestimation of expected experience due to a lack of credible experience data.

Ripple effects for persistency and lapse risk could include the following:
• Worsened mortality or morbidity, which may be caused by anti-selection.
• Mismatch of asset and liability cash flows.
• Increased unit expenses.
• Worsened liquidity risk (for example, a “run on the bank” situation).
• Reduction in insurer’s new business while, at the same time, the insurer could not proportionately reduce its expenses.
• Inability to borrow or renew any external capital or debt.
• Changes in the expected mix of business.

4. **Market and credit risk**

In consideration of market and credit risks, the AA may want to review available historical data. Adverse scenarios may arise from a variety of sources, including the following:

• Changes in future rates of interest.
• Increases in losses from defaults on debt securities.
• Poor returns and/or declines in value of equities or real estate.
• Counterparty defaults on derivatives.
• Loss or significant decline of value for other major asset categories.
• Concentration risks, including geography (e.g., impact of natural disasters), asset class, industrial sector, subsidiaries, individuals.
• Poor returns and/or declines in the value of a subsidiary.
• Fluctuations in currency values.
• Market value deterioration in segregated fund assets.

The AA would test the impact of potential adverse scenarios on liabilities and surplus across all lines of business in aggregate.
When there is a mismatch between the cash flow pattern of assets and liabilities, there will be a need to reinvest positive cash flows, and to borrow or liquidate assets to fund negative cash flows. Future rates of interest can vary substantially and can adversely affect surplus. As a result, the value of derivatives will also be impacted. Where they are used as hedges, they will help mitigate adverse impacts.

In assessing the impact of changes in interest rates, the AA would consider both the current mismatch position as well as any possible mismatch in the future. This will depend on the maximum position allowed by the insurer’s investment policy and the most aggressive position that has been taken in the past by the insurer.

Parallel and non-parallel shifts in the yield curve, both on a sudden and a gradual basis, would be considered. Stochastic modelling as well as deterministic scenarios could be considered. The AA could also examine additional deterministic scenarios or more extreme tail results under stochastic modelling than are already reflected in the development of adverse scenarios.

Changes in future interest rates will affect not only future rates of reinvestment and market values, but also the pattern of the cash flows. For example, this can occur with asset-backed securities, callable bonds, and on policies with cash surrender values.

Future interest rates may also affect the spread that can be achieved on both new business and the fixed interest rate business where rate resets are being made.

Sustained low levels of interest rates could also affect the insurer’s ability to support minimum long-term guarantees embedded in both insurance and annuity products.

Future interest rate levels will also affect the amount and mix of new business for guaranteed fund and segregated fund products. Interest rate levels will also affect the number of surrenders, transfers between funds, and shifts between portfolio average and new money products. The movement and financial exposure will depend on surrender charges and market value adjustments embedded in these products. Particular consideration would be given to assessing the effect of a “run-on-the-bank” scenario.

For participating insurance, universal life, and adjustable premium business, considerations would include the following:

- The impact on the proportion of fixed income assets backing participating business and the duration of those assets, and that of key competitors.
- Dividend actions of competitors.
- The ability and willingness of management to maintain or change dividend scales.
- Reviewing premiums and charges of universal life products.
- Related policyholder actions such as surrender levels and potential litigation.
- The impact on the level of new sales.

For segregated funds, drops in market value may affect the payment of benefits (or the likelihood of future payment of benefits) relating to the existence of guarantees of minimum segregated fund performance. Considerations would include the following:

- The extent of minimum performance guarantees provided on death or maturity.
• The extent of hedging operations or reinsurance to mitigate the risk.
• The existence of product features such as resets that will affect the risk.
• The existence of volatile funds, fund-switching privileges, guarantees on a “per policy” basis, or high management expense ratios (MERs).

The AA may consider an integrated scenario in which a combination of the following events occurs:
• A drop in the market value of debt securities resulting from an increase in the yield curve.
• A decline in equities caused by a significant drop in the S&P/TSX index or any other significant stocks index.
• A significant decline in the value of real estate.
• A significant decline in the value of the largest subsidiary.

The AA would consider how to reflect the effect of such events in determining policy liabilities and also consider expected pricing actions. The ripple effects could vary depending on whether the results are insurer-specific or industry-wide. The following are possible ripple effects:
• Exposed risk positions as a result of counterparty default.
• A ratings downgrade of the insurer that leads to decreased sales and increased surrenders.
• Liquidity issues or forced asset liquidation risk issues caused by large sustained credit-related losses either through defaults or severe asset downgrades.
• Counterparty defaults on derivatives.
• Decreased policy owner dividends that could lead to higher surrenders.
• Increased disability claims frequency and severity due to deterioration of economic conditions.

Possible management actions may include the following:
• A shift in the investment strategy;
• Dynamic hedging programs; and
• A review of premium rates.

5. Inflation risk

Inflation can pose a significant risk to an insurer in many ways: a sustained increase in disability, pension or other benefits that are linked to the Consumer Price Index or similar price indices; a sudden increase in drugs and health care costs covered by health insurance policies; and an increase in absolute expenses and in-unit operating costs. Inflation rates and market interest rates tend to be correlated. A high-inflation scenario would normally be assumed to accompany a high-interest scenario, but consideration would be made to a scenario where this does not occur.

The AA would consider possible ripple effects, such as the following:
• A decrease in real rates of return.
• A rapid and sustained increase in market interest rates.
• Constraints to rate increases as the industry reacts slowly in implementing renewal rate increases.
• Rate guarantees that limit or delay required rate increases.
• Decrease in the rates of disability claim termination when inflation is higher than wage increases or when inflation occurs during a recession or a period of rising unemployment.

Possible management actions may include the following:

• Implementing rate increases, where possible;
• Reviewing the extent of the coverage and cost containment features;
• Reviewing the asset mix to increase real rates of return; and
• Reviewing policies, procedures, and staffing to control costs.

6. Reinsurance risk

Reinsurance risk arises from a reinsurer’s failure to meet its obligations, or from a change in market conditions causing an increase in rates, inadequate limits, or otherwise inadequate or unaffordable coverage. In this context, the term reinsurer is intended to include both reinsurers, if the entity is a primary insurer, and retrocessionaires, if the entity is itself a reinsurer.

Reinsurance terms on individual life cessions may be guaranteed for the life of the underlying policy. The primary risks for a ceding entity are outlined below.

• **Insolvency of a reinsurer** – the ceding entity’s exposure in the case where its principal reinsurer(s) become(s) insolvent would reflect an assumed realization percentage of assets to liabilities of the failed reinsurer, and any different treatment of various types of amounts owing from the reinsurer to the direct writer. The impact of a reinsurer’s insolvency may be mitigated by the following provisions:
  • The right of offset of amounts owing under all treaties between the companies.
  • The preferred position insurers will have relative to other creditors.
  • The right of recapture in the event of the reinsurer’s failure.
  • Access to amounts on deposit or assets in trust (or other similar arrangements) with the insurer, or letters of credit in respect of an unregistered reinsurer.

It would normally be appropriate to assume that the business previously ceded to the insolvent reinsurer could be successfully reinsured elsewhere, but possibly on less favourable terms. However, there may be certain unique features regarding the business involved that would make securing such replacement difficult.

• **Increases in reinsurance rates** – where a reinsurer takes market-wide action impacting all of its insurers operating in similar markets, such action would not necessarily pose competitive issues, as these insurers would all face an increase in reinsurance rates, possibly requiring repricing in a large segment of the marketplace. However, market-wide increases in rates may further adversely impact a particular insurer if it is operating with lower capital margins. In addition, where a reinsurer’s action is targeted to one specific insurer because of poor experience, necessary repricing could affect the level of sales.
• **Reduction in reinsurance capacity available for the financing of new business** – this could result in an increase in reinsurance costs and/or constraints on the amount of new business growth of the insurer.

• **Disputes over policy conditions** – the AA could consider a dispute over reinsurance policy conditions which results in a principal reinsurer denying coverage for a significant class of business or category of claims; for example, terrorism exclusions.

7. **New business risk**

One of the uncertainties facing an insurer is the volume of new business it will be able to write in the future. Volumes significantly different from those assumed can result in a capital position quite different from that expected. It may be equally important to examine both higher-than-expected and lower-than-expected levels of new business production. Even in the case where total business volumes have been estimated accurately, new business risk may still be present if the mix of business sold is different from that expected.

There are several events that could lead to a significant reduction in premium volume written by an insurer, including the following:

- A financial rating downgrade of the insurer or an affiliated company (particularly the parent), or some other event (including cyber or operational risks) similarly damaging to the insurer’s reputation.

- Entry of a new and strong competitor into an area where competition was previously weak, and/or increased competitiveness in the market due to higher use of advertising by competitors.

- Loss of a key distributor or even an entire distribution channel previously responsible for the production of a significant portion of an insurer’s business.

- Loss of a key client, such as a large group client representing a significant portion of an insurer’s group portfolio.

The most significant impact of lower-than-expected sales would be that the insurer is not able to cover its expenses, particularly when there is a large element of overhead and fixed expenses associated with marketing, underwriting, policy issue, and sales functions.

Ripple effects could include the following:

- Higher lapse rates on existing business.

- Poorer claims experience on the remaining business.

- Poorer coverage of maintenance expenses (resulting from both lower current sales as well as higher lapses on existing business).

- Ripple effects on associated lines of business to the affected line of business (for example, distribution channels primarily involved in one line of business may contribute to significant future sales in another line).

Possible management actions could include items such as the following:

- Reviewing bonuses paid to agents and brokers.
• Diversification into more than one line of business.
• Control over non-variable expense levels.
• Maintaining contingency action plans to be implemented in case one of these events occurs.

When the insurer has written a greater amount of new business sales than expected, this could lead to severe capital strain for the insurer. Events that could lead to a significant increase in premium volumes written by an insurer include the following:

• Unexpected success in a new product area or in beating previously stronger competition.
• Exit of a competitor from a product or market.
• Rate increase implemented by other companies leading to a fire sale for products still in the market at lower rates.
• Tightening of product features by other companies in the market.
• Change in reinsurance arrangements leading to a higher-than-expected retention on new business.

Ripple effects could include the following:

• Problems with management control over policy issue, underwriting, field expenses, financial reporting, etc., due to rapid growth (leading to future problems in claims and expenses as competition eventually catches up and volume levels return to normal).
• Future expected lapses, mortality, or morbidity could be different if sales are driven by old-generation products.

Possible management actions would include the following:

• Putting capital-raising plans in place with a parent company or with external sources.
• Contingency plans to be able to handle the increased volumes of business.
• Reviewing rates and underwriting guidance.
• Reviewing the use of reinsurance to mitigate the need for additional capital.
• Withdrawing a product or a line of business.

Normally, the base scenario would incorporate the new business projections of the insurer’s business plan and associated expense levels. Alternate scenarios would be heavily dependent on the specific insurer, varying in particular with the kind of market the insurer serves and the distribution channel employed to reach it. However, any alternate scenario would reflect not only the change in new business levels, but also the impact on expense coverage and any other possible ripple effects.

8. Expense risk

Expense assumptions are unique in that management has a greater level of influence here than on other assumptions. Even insurers who, historically, have aggressively managed expenses to budgeted targets may face major expense issues in some situations such as an unexpected variation in new business growth, litigation, or other developments. Insurers practising strict management of budgets to meet expense levels included in pricing may have different results from insurers that
manage budgets to other measures. The extent to which the insurer has demonstrated effective actions towards managing expenses in the past would be a consideration in how closely to relate expense levels under adverse scenarios to expenses in the base scenario.

Adverse expense scenarios and related ripple effects to which an insurer’s financial condition may be sensitive include the following:

- **Inflation** – a severe inflationary environment may cause a rapid increase in absolute expenses and in unit costs. It is also possible to have future expense increases due to internal factors unrelated to future interest rates and inflation rates.

- **Technological obsolescence** – new technologies may develop that deliver significant cost, delivery, or service benefits for those who can achieve economies of scale. For companies that do not make use of new technologies, expenses may rise relative to the competition. Such a scenario would also include the sales and termination impacts of technological obsolescence.

- **Court-awarded damages/data security or recovery** – potential high costs can result from court-awarded damages to plaintiffs relating to such matters as market conduct or the costs related to data security and recovery due to a cyberattack or breach. Resulting ripple effects include damaged industry reputation, ratings downgrades, lower sales, and higher terminations.

- **Industry or guarantee fund assessments** – further industry failures can precipitate higher assessments to companies in the industry. Ripple effects from such failures can include damaged industry reputation, flight to quality, lower sales, and higher terminations.

- **Company structure** – holding-company expenses may be allocated to subsidiary companies based on historical or projected relative profits. This could lead to a major change in the level of expenses allocated to the insurer based on the performance of one of the other companies in the enterprise. Within a single insurer, methods of allocating overhead expenses to different business units may produce changing expense levels over time. In an enterprise that has several insurance companies or business units that provide services to one another, the impact of cross-billing would be considered.

- **Mergers and acquisitions, or assumptions of new business** – reductions in unit expenses after a merger, acquisition, or assumption of a new block of business may be delayed or lower than projected in the base scenario. Possible ripple effects could include:
  - Changes in product pricing;
  - Low sales; and
  - Higher lapses.

9. **Government and political issues risk**

When the government makes changes to its policies or regulations, the implementation of such changes usually takes a considerable amount of time. This gives an insurer time to analyze the impact and take appropriate actions, if necessary. However, some changes can occur in a very short period and cannot be foreseen. There may also be cases where changes are effective retroactively without any grandfathering provisions. In such cases, the adverse scenario may be modelled in the
first year if the scenario is plausible in that time period.

The AA would likely focus on changes that are being discussed or proposed by government entities. However, in some situations it may be beneficial to consider other changes, particularly for certain lines of business that have a greater sensitivity to political intervention, and if those lines of business are material to the insurer.

Examples of adverse events:

- An increase in premium tax rates.
- An increase in taxation rates for corporations (income tax or capital gains tax).
- A prolongation of temporary taxes.
- New restrictions on registered retirement savings plans or registered retirement income funds that would have a direct impact on the level of new business for those products.
- Entry of other financial institutions into the life insurance industry (e.g., due to revisions to the Bank Act) that affect the amount of new business and lower profit margins due to increased competition.
- Possible new restrictions on the investment practices of life insurance companies (e.g., a restriction on the use of derivative products for speculation or hedging).
- The introduction of a new or modified public health care policy, which could decrease new sales or in-force business (e.g., the introduction of pharmacare).
- A change in regulatory solvency standards that increase the capital requirements.
- A reduction in the government’s need to borrow funds, which could affect the volume of government bonds available to the market.
- Political instability, which could lead to confiscation of assets, closure for new business, exchange controls, etc., particularly in foreign jurisdictions.
- Impact of cost shifting between public and private sectors or changes in coverage under public insurance plans.
- A change in law or regulation directly affecting an important product line (e.g., a change in tax law affecting the position of the policyholder, a change in capital or reserving requirements putting a particular type of product at a competitive disadvantage relative to products provided by other financial institutions or even other insurance providers, a restriction of information that may be used in underwriting).
- A change in legislation that restricts the use of some distribution channels.
- Benefits, premiums, or rate adjustments subject to regulation.

For a specific scenario, possible ripple effects may include the following:

- Increased litigation costs;
- Forced liquidation of assets due to cash flow strains;
- Increased regulatory monitoring;
• Increases in the policy liability; and
• Increases in reinsurance rates and/or non-availability of reinsurance of new business.

10. Off-balance-sheet items risk

There are numerous off-balance-sheet items that may place an insurer at risk. Often these items arise from new or evolving industry practices that, in future years, do get recognized on the balance sheet by the Chartered Professional Accountants of Canada (CPA Canada), the CIA, or regulators. The AA needs to be aware of emerging risks that may be relevant to the insurer during the forecast period and assess their potential threat to the insurer’s solvency.

Discussed below are examples of common off-balance-sheet items and their related risks that may be relevant to the insurer:

• **Derivative instruments** – the risks associated with derivatives include market risk, default risk, management risk, and legal risk:
  • Market risk includes marketability risk and basis risk. Marketability risk is the risk of not being able to cancel or unwind one’s contract when desired or at a favourable price. Basis risk is the risk that the derivative’s price behaviour does not act as expected, undoing the intended hedging benefits. The price behaviour of the instruments can change adversely when market conditions change. Market risk is best evaluated on a security basis and on a portfolio basis since some risks may not net against each other.
  • Default (or credit) risk is the risk that a loss will be incurred due to a default in making the full payments when due, in accordance with the terms of the contract.
  • Management risk is the potential for incurring material, unexpected losses on derivatives due to inadequate management supervision and understanding, systems, controls, procedures, accounting, and reporting.
  • Legal risk is the risk that the derivative agreement is not binding as intended.

• **Contingent liabilities or losses** – there are a variety of contingent liabilities to which an insurer may be exposed, such as tax, litigation, etc. The AA would consider the financial impact of adverse outcomes.

• **Letters of credit and pledged assets** – the insurer may be exposed to the risk that a lending institution defaults on payment under, for example, a letter of credit, or there is a call on assets pledged.

• **Capital maintenance agreements** – an insurer could be exposed to capital maintenance agreements it must honour for its subsidiaries (e.g., if an insurer has to guarantee a certain capital level in a subsidiary).

• **Employee and senior management benefits and liabilities not listed on the balance sheet** (e.g., pension plans, stock option plans) – this carries the risk of increasing costs.

11. Related companies risk

The related companies risk is the risk that the life insurance company may run into financial difficulties as a result of its subsidiaries’ or any other related entity’s financial difficulties. The related companies risk may also arise from a decision made by the controlling company that may be
unfavourable to the affiliate. For an insurer, being a part of a financial organization can be a potential source of strength, but it can also pose risks, particularly as a result of contagion. This risk could be integrated easily into other risk categories as a ripple effect and/or corrective management action or be considered as a separate scenario.

Factors to be considered include, but are not limited to, the following:

- The impact on the insurer if financial support is no longer guaranteed by the parent, or the insurer is unable to access additional capital or is obliged to continue to repatriate funds.

- The effect on the insurer of an impaired parent or affiliate within the group (e.g., the impact on funding sources available, such as lines of credit, intra-group funding, or access to external capital).

- The effect on the insurer of the inability to sell or close in a timely manner a subsidiary that is in financial difficulty (e.g., where the subsidiary shares the same brand, systems, and other infrastructure as the insurer).

- The implicit support of group companies through the reallocation of group overheads towards the insurance entity.

- The pressure on the insurer to support other group members financially (e.g., capitalizing subs to meet their local supervisory target capital requirement).

- The pressure on the insurer to comply with group requirements rather than the firm’s own strategy (e.g., with respect to investment mix).

- The effect on the insurer of a high degree of dependence on group resources (e.g., through intra-group outsourcing) to support the insurer’s critical operations.

- The effect on the insurer of a downgrade in the rating of the group or of other reputational issues.
Appendix B – Discussion and analysis of property and casualty insurer risk categories

This appendix outlines the major risk categories that would be considered by P&C insurers, and possible adverse trends. Each risk category section provides guidance about ripple effects, with possible management actions listed where relevant. The actuary would assess various risk categories and identify those that are relevant to their circumstances, including but not limited to the following:

- Claims frequency and severity;
- Policy liabilities;
- Inflation;
- Premiums;
- Reinsurance;
- Investment;
- Government and political issues;
- Off-balance-sheet items; and
- Related companies.

Two risk categories not included above are expenses risk and operational risk. Scenarios arising due to expenses risk are not common for most P&C insurers but may be significant for an insurer that is just starting up or winding down operations. Operational risk is an evolving area and the AA may be obliged to consider scenarios such as a major shutdown of operations or loss of a key individual in the organization.

For each relevant risk category, the AA would assess the plausible adverse scenarios that are likely to significantly affect surplus or that may cause the insurer to fall below the threshold during the forecast period.

The AA may also consider systemic risk. As an example, the failure or downgrade of one or more significant insurers in the market could result in marketing and/or reputational risk for the other insurers. The AA may also consider liquidity risk, likely as ripple effects associated with other adverse scenarios.

Depending on the insurer’s circumstances, the board of directors or chief agent and management may also be interested in various levels of not satisfactory condition, in which case further stress testing may be beneficial.

Once the relevant scenarios are tested, the AA would then select plausible adverse scenarios from those modelled showing the greatest surplus sensitivity for inclusion in the FCT report. Similarly, for any plausible modelled scenario that may trigger rating agency actions, the AA would discuss those with management.

If the P&C insurer manages life business and that life business represents a material risk for the insurer, the AA would consider all the risk categories covered in the life appendix of this draft educational note. If the AA does not consider the life risk important, an explanation would be
provided indicating why it is not considered material.

1. **Claim frequency and severity risk**

An insurer’s financial condition may be sensitive to increases in claim costs (including loss adjustment expenses). Future claims costs and loss ratios can differ significantly from the base scenario due to the following:

- **Single catastrophic event** – consider natural disasters (e.g., earthquakes, windstorms, floods, and hail), human-made events (e.g., terrorism), or any other single event affecting multiple policyholders that could have a material impact.

- **Single large claim** – consider the effect if policies/accounts with the largest probable maximum loss or maximum exposed policy limits (if more appropriate) have a full loss event.

- **Multiple catastrophic events** – consider two or more events affecting multiple policyholders where the joint probability of the events is approximately equal to the probability of a single catastrophic event.

- **Multiple large claims** – select a size of claim that would be considered large by the insurer, generally smaller than the insurer’s net retention. Using historical claims trended to current levels and adjusted for the insurer’s current exposure, the AA would estimate the frequency and severity distribution of these claims. The cumulative distribution may be estimated using assumed distributions or simulation techniques. The cumulative distribution would be constructed for net and gross claims.

- **Other frequency and severity** – model the loss ratio or frequency and severity of claims. Since catastrophes, large claims, and adverse development are considered in other scenarios, the AA could remove unusual claims from the data prior to their analysis. It is generally recommended that the variability of the normal accident year or underwriting year loss ratio, or the combined frequency and severity distribution, be examined. The AA may assume a distribution of claims and determine the appropriate adverse scenario.

- **Social inflation** – social inflation refers to the claims inflation resulting from changes in the likelihood of claimants bringing suit, the size of awards, the standards of liability, or the attitudes of claimants towards settlement of their claims. A significant sustained increase in the rate of social inflation would tend to lead to increases in the ultimate number or severity of unpaid liability claims and increases in the number or severity of future liability claims (both those related to the runoff of the unearned premium and those related to future new and renewal business). It would not normally be linked to a change in market interest rates.

Possible ripple effects may include the following:

- Insolvency of one or more reinsurers accounting for a significant portion of the insurer’s reinsurance coverage.

- Increases in the policy liabilities related to current reinsurance contracts that are swing-rated, have variable commission, or require reinstatements.

- Loss of reinsurance coverage for remainder of term.

- Increases in reinsurance rates or non-availability of reinsurance at the next renewal.
• Post-event inflation (i.e., a significant temporary increase in the cost of labour and materials) following a catastrophe resulting in increases to the ultimate cost of unpaid claims as well as future claims.

• Post-event inflation in regions not directly affected by the catastrophic event.

• Forced sale or liquidation of assets.

• Increased Property and Casualty Insurance Compensation Corporation (PACICC) assessments resulting from failure of other insurers.

• Rating agency downgrade.

Possible management actions may include the following:

• Reviewing reinsurance coverage, type, or contract terms at renewal.

• Implementing rate increases, where possible.

• Restricting writing in hazard-prone areas.

• Reviewing the target mix by line of business or jurisdiction.

• Reviewing the type of products offered, such as writing more subscription policies.

• Selling or reinvesting assets.

2. Policy liabilities risk

Policy liabilities are estimates of future amounts required to pay for claim liabilities and premium liabilities. For long-tail lines, estimates of the cost of future claims may depend upon the estimates of the unpaid claim liabilities. As such, underestimating the policy liabilities may have a concomitant effect on the estimates of future claims.

Where the underestimation of policy liabilities results from the occurrence of a catastrophe, this scenario would normally be covered under claim frequency and severity risk. Where the underestimation results from legislative change(s), this scenario would normally be covered under government and political issues risk.

Examples of adverse scenarios to which an insurer’s financial condition may be sensitive include the following:

• Selection of inadequate loss development factors, especially for new products or lines subject to legislative changes for which long-term development patterns are not available.

• Class actions and other mass torts, effective retroactively.

• Change in mix of business where a shift to longer-tailed lines of business may result in adverse development if selected loss development patterns do not reflect the shift.

• Claims paid faster than assumed in the base scenario, especially if large claims are paid earlier.

• Actual rate of return on investments supporting the liabilities significantly lower than assumed in the base scenario.

Possible methods to determine the adverse scenario include the following:
• Modelling the loss development factors with a statistical distribution and estimating the unpaid claims with factors at the desired adverse scenario percentile.

• Analyzing the insurer’s history of actual-to-expected development of unpaid claims. This would generally be done for all lines of business combined, although an analysis by lines of business may be appropriate for an insurer where the mix of business has changed significantly over the years. It may be appropriate to use industry data for a new insurer, or if the insurer has a significant volume in new lines of business. In estimating the adverse scenario, the AA may want to fit a distribution to the historical runoff data.

Stress testing may be useful to determine the magnitude of an understatement of unpaid claim liabilities or of an unanticipated large payment that would result in not satisfactory financial condition for the company.

Possible ripple effects may include the following:

• The effect on actuarial present value for scenarios affecting undiscounted policy liabilities.

• Increases in the policy liabilities related to current and past reinsurance contracts that are swing-rated, have variable commission, or require reinstatements.

• Increases in ultimate claim costs and claim expenses in connection with the runoff of the unearned premium for scenarios affecting claims liabilities.

• Increases in ultimate claim costs and claim expenses in connection with future new and renewal business.

• Forced sale or liquidation of assets.

• Rating agency downgrade.

Possible management actions may include the following:

• Settling claims faster by minimizing litigation or fast-tracking claims handling.

• Reviewing reserving and claim settlement guidelines.

• Implementing rate increases, where possible.

• Reviewing the target mix by line of business or jurisdiction.

3. Inflation risk

Claim costs and claim adjustment expenses are quite sensitive to inflation. Inflation in the insurance environment will generally be positively correlated with the general rate of inflation, as measured by the Consumer Price Index (CPI). There will, however, be changes in costs that will affect the insurance environment differently than the overall economy.

Claim costs may be affected by price increases extraneous to the insurance business. This excludes the effect of social inflation that is considered in risk category 1 (claim frequency and severity risk). Changes in inflation may be due to the following:

• A significant, rapid, and sustained increase in the general rate of inflation – in this scenario, inflation will lead to increases in the ultimate cost of settling claims (incurred and unpaid as well as future claims) as well as various related expenses. It would normally, but not always,
be linked to a rapid and sustained increase in market interest rates.

A scenario considering sustained inflation will tend to be based on a significant increase in trend over inflation projected in the base scenario. Ideally, the increase would be applied over the entire projection period. This would tend to be accompanied by an increase in market interest rate.

A possible method to determine an adequate level of increase in the inflation trend would be to look at historical changes in the CPI over three-year periods of time. The length of time considered would ideally be long enough to capture a large range of situations that can be applied to the projection period. The level of change in market interest rate would be based on the reasoning described in risk category 6 (investment risk).

- **A significant temporary increase in the cost of labour and materials following a catastrophe or other major event** – in this scenario, the ultimate cost of settling claims would increase following a catastrophe or other major industry event that did not directly affect the insurer. This scenario differs from the ripple effect for catastrophic event(s) in risk category 1 (claim frequency and severity risk) because the increased cost affects claims that were not the result of the event.

- **A severe recession in the economy** – in this scenario, economic conditions may lead to increases in the ultimate number of and cost of settling claims and loss adjustment expenses, for both current and future claims. This may be linked to a sustained increase in general inflation, unemployment level, or market interest rates.

Possible ripple effects may include the following:

- A rapid and sustained increase in market interest rates.
- Increase in operating expenses.
- Increase in reinsurance rates on current swing-rated contracts and on future contracts.

Possible management actions may include the following:

- Reviewing reinsurance coverage, type, or contract terms at renewal;
- Implementing rate increases, where possible;
- Reviewing the target mix by line of business or jurisdiction;
- Reviewing the type of products offered;
- Selling or reinvesting assets; and
- Adjusting the insurance to value or cost calculator.

4. **Premium risk**

An insurer’s financial condition may be affected by differences between actual business volume, type, or mix, and the respective assumptions in the business plan.

There are several categories of events that could have considerable impact on the volume, type, mix, and profitability of business written by an insurer. Some of these events are related to the underwriting and marketing environment and can result in unexpected reductions or increases in
premium volume. Inadequate pricing may also trigger significant changes in the premium volume or mix of business and is likely to compound the effect of scenarios triggered by other events. Any significant change in premium volume resulting from government or political actions would be considered under risk category 7 (government and political issues risk).

Stress testing may be useful to determine the magnitude of premium volume that would result in a not satisfactory financial condition for the insurer. Consideration would be given to the assumptions in the base scenario, and vulnerability of the insurer to the selected event given its size, marketing plan, and strategies.

**Premium volume significantly lower than the base scenario**

The reduction from the planned premium volume can be the result of lost business, reduced or inadequate rate level for some market segments, and/or uncompetitive pricing in some market segments.

Some events resulting in a significant reduction in premium volume include the following:

- Entry of a new and strong competitor into a market.
- Increased competitiveness in a market.
- Loss of a key distributor or even an entire distribution channel.
- Loss of a key client.
- Action by any influential entity (consumers, distributors, rating agencies, etc.) that affects the insurer’s reputation or growth negatively.
- Inability to implement planned premium rate increases.
- Non-competitive premium rates.

Possible ripple effects may include the following:

- An increase in loss ratio due to a soft market, inadequate pricing, or lost business that is relatively more profitable than the retained business.
- An increase in the fixed expense ratio.
- An increase for certain types of expenses (for example, more advertising costs to counter a very aggressive competitor).
- A shift in portfolio mix since the lost business could have a very different average premium or could be primarily from a specific market segment.
- An increase in reinsurance costs as a percentage of subject premium.
- Forced sale or liquidation of assets.

Possible management actions may include the following:

- Reducing personnel or slowing down hiring.
- Identifying other distributors for the insurer’s product(s).
- Implementing rate changes, where possible.
• Changing reinsurance coverage, type, or contract terms at next renewal.
• Underwriting actions in markets subject to increased competition.
• Changing the target mix of business of future lines of business.
• Adjusting the investment portfolio to mitigate cash flow strains.

**Premium volume significantly higher than the base scenario**

An increase from the planned premium volume can be the result of unexpected new business or inadequate (i.e., too competitive) rate level for some market segments.

Some events resulting in a significant increase in premium volume include the following:

• Withdrawal or failure of major competitors from a market.
• Appointment of a key distributor.
• Unexpected new business from a large client.
• Any action by any influential entity (consumers, distributors, rating agencies, etc.) that affects the insurer’s reputation or growth favourably.
• Unexpected success in a new product area, or against previously stronger competition.
• Premium rates set too low compared to the competition.

Possible ripple effects may include the following:

• A higher loss ratio on new business due to inadequate pricing.
• A shift in portfolio mix since the new business could have a much different average premium or could be primarily from a specific market segment.
• Higher expenses (hiring of employees, increased overtime, etc.) in the short term as well as in the long term.
• Increased PACICC and pool assessments.
• Increased reinsurance costs.

Possible management actions may include the following:

• Implementing rate changes, where possible.
• Underwriting actions (e.g., restrictions on new business, withdrawal) in unprofitable markets.
• Reviewing the distribution channels.
• Reducing certain types of expenses (for example, advertising costs).
• Using reinsurance to mitigate capital strain.

5. **Reinsurance risk**

An insurer’s financial condition may be adversely affected by a reinsurer’s failure to meet its obligations to the insurer, or from a change in market conditions causing an increase in reinsurance rates, inadequate reinsurance limits, or otherwise inadequate or unaffordable reinsurance
coverage. In this context, the term reinsurer is intended to include both reinsurers, if the entity is a primary insurer, or retrocessionaires, if the entity is itself a reinsurer.

Adverse scenarios arising from reinsurance risk include the following:

- **Reinsurer insolvency** – the impact of reinsurer insolvency would reflect an assumed “recoverable percentage” of assets to liabilities of the failed reinsurer, and any different treatment of various types of amounts owing from the reinsurer to the ceding entity. The impact may be mitigated by right of offset to amounts owing under all treaties between the two entities, by the preferred position insurers will have relative to other creditors of a failed reinsurer, by the special termination clause in the event of failure, and by any amounts on deposit or in trust with the insurer, or letters of credit in respect of an unlicensed reinsurer. It would normally be appropriate under this scenario to assume that the business currently ceded to the failing reinsurer could be successfully reinsured elsewhere (possibly on less favourable terms), unless there is something unique about the business involved that would make securing such replacement reinsurance difficult.

Reinsurer insolvency can be due to the circumstances of a specific reinsurer (such as undervaluation of older liabilities), or it could be systemic to the industry due to a major global event or series of global events (e.g., terrorist attack, natural disaster, etc.).

In developing this scenario, the AA would take into account the following considerations:

- Affiliated versus non-affiliated reinsurers – the AA may be better able to assess the likelihood of insolvency if a reinsurance arrangement consists of an inter-company pooling agreement or reinsurance with an affiliated company, as opposed to external reinsurance.
- Rating of reinsurers – reinsurers with weaker rating from rating agencies could be more likely to fail than reinsurers with stronger rating.
- Registered versus non-registered reinsurers – although non-registered reinsurers may have deposits in Canada covering known liabilities, access to funds to cover unknown liabilities may be more difficult to secure.
- Concentration of reinsurance – this involves the failure of a reinsurer with a significant share of the ceded liabilities.

Stress testing may be useful to determine a plausible scenario. The exposure to the reinsurers would be calculated in terms of unpaid claims, including incurred but not reported (IBNR), but less amounts payable to, and security held from, the same reinsurers. The AA may evaluate the impact of default of some of these reinsurers based on level of participation, financial stability, and rating.

- **An increase in reinsurance rates or a reduction in reinsurance commission** – this scenario considers situations where reinsurance action is systemic in nature, due to the overall insurance environment. This is in contrast with ripple effects considered in risk categories 1, 2, and 4, where the reinsurer action is taken in response to situations unique to the insurer, such as poor experience.
- **Reduction in capacity** – this scenario contemplates a reduction in the availability of
reinsurance over the forecast period.

- **Disputes over policy conditions** – the effect on an entity of disputes with reinsurers may be similar to the effect of reinsurer insolvency. To differentiate between these scenarios, however, the AA would consider a dispute that results in a principal reinsurer denying coverage for a significant class of business or category of claims, such as a terrorism occurrence.

Possible ripple effects may include the following:

- Increase in reinsurance rates arising from the need to obtain replacement reinsurance coverage.
- Reduced availability of reinsurance.

Possible management actions may include the following:

- Changing the reinsurance structure.
- Diversifying participants on the reinsurance program.
- Retaining a greater proportion of business to decrease the reinsurance cost.
- Changing reinsurers.
- Reducing primary policy limits.

6. **Investment risk**

Changes in economic conditions have the potential to significantly impact an insurer’s financial situation. For example, rapid changes in interest rates, exchange rates, and economic growth rates can affect the insurer’s financial condition by leading to concomitant changes in the following:

- The market value of debt and equity securities;
- The default rates on debt securities;
- The match between cash flows from assets and liabilities; and
- The creditworthiness of derivative counterparties.

Adverse scenarios in respect of deterioration of asset values may come from a variety of sources, including the following:

- A significant change in the yield curve;
- An increase in the default rate on debt securities;
- A decrease in the returns and/or value of equities;
- A decrease in the returns and/or value of real estate;
- A decrease in the returns and/or value of subsidiary;
- A significant change in foreign exchange rates; and
- A decrease in the returns and/or value of other major asset categories.

The AA may consider integrated scenarios involving a combination of these events. For example, in the event of a severe market shock, the creditworthiness of derivative counterparties may go down
at the same time the exposure in the re-margining agreement goes up. A period of market turbulence or a shock to market liquidity would be among the scenarios considered.

In selecting appropriate assumptions to determine the adverse scenario, the AA may want to refer to the CIA’s Report on Canadian Economic Statistics. For example, the AA may base an assumption on the largest one-year decline in equities, or the largest three-year average increase in interest rate. It is important, however, to keep in mind the starting position of the current economic environment.

Alternatively, the AA may use a stochastic model for economic changes, if one is available.

Possible ripple effects may include the following:

- Forced sale or liquidation of assets;
- Significant positive or negative cash flows impacting the insurer’s liquidity position;
- Negative change on derivative positions;
- Default by counterparty on derivatives;
- Rating agency downgrade;
- A liquidity crisis caused by large, sustained default losses;
- Increase in the frequency or severity of claims due to the deteriorating economic conditions; and
- Change in discount rate used for calculating actuarial present value of policy liabilities.

Possible management actions may include the following:

- Selling or reinvesting assets;
- Changing the investment strategy;
- Repositioning derivative tools;
- Reducing the amount of business underwritten;
- Implementing rate increases, where possible; and
- Reducing costs through layoffs, consolidation of branch offices, or other similar actions.

7. Government and political issues risk

The implementation of a government’s policies or regulations usually takes a long time. This normally allows an insurer time to analyze the impact(s) and take the appropriate actions. Time for analysis and action may not be available where implementation of changes occurs quickly, is not foreseen, or is made retroactively effective. In these cases, the adverse scenario may be modelled in the first partial year modelled if the scenario is plausible in that time period.

Adverse scenarios to which an insurer’s financial condition may be sensitive include the following:

- A rate freeze or rollback of rates by a government body or regulator on lines of business and jurisdictions in which rates are subject to regulatory approval.
- A change to regulations regarding use of rating variables that may impact the adequacy of
rates and availability of insurance on lines of business and jurisdictions in which rates are subject to regulatory approval.

- A change to legislation that prescribes levels of insurance coverage, such as automobile accident benefits.
- An increase in taxation rates or rules for corporations, such as income tax, capital gains tax deductions, or offshore income.
- Nationalization or privatization of a line of business in a jurisdiction.
- A change to legislation that creates or restricts distribution channels.
- A change in regulatory solvency standards that could increase the capital requirements for property and casualty insurers.
- Political instability that leads to confiscation of assets, closure for new business, exchange controls, etc., particularly in foreign jurisdictions.

Possible ripple effects may include the following:

- Deterioration of loss ratio;
- Increased litigation costs;
- Reduced availability of insurance to the public;
- Increased volume of industry pools resulting in increased assessments;
- Increased regulatory monitoring or filing of rates;
- Forced sale or liquidation of assets;
- Problems with reinsurance coverage;
- Increased policy liabilities related to current reinsurance contracts that are swing-rated, have variable commission, or require reinstatements; and
- Increased reinsurance rates or non-availability of reinsurance at the next renewal.

Possible management actions may include the following:

- Reducing the volume of business written by restricting sales or broker force, freezing new business, or withdrawing from the jurisdiction or line of business;
- Creating or expanding a separate company or distribution channel;
- Reviewing the target mix by line of business or jurisdiction; and
- Reviewing reinsurance coverage, type, or contract terms at next renewal.

8. **Off-balance-sheet items risk**

There are numerous off-balance-sheet items that may adversely affect an insurer’s financial condition. Often these off-balance-sheet items arise from new or evolving industry practices that, in subsequent years, do get recognized on the balance sheet by the CPA Canada, the CIA, or regulators. Therefore, the AA needs to develop awareness of any emerging risk that may be relevant to the insurer during the forecast period and assess its potential threat to the insurer’s financial condition.
Possible scenarios of off-balance-sheet items and their related risks include the following:

- **Structured settlement** – when a property and casualty insurer purchases an annuity to satisfy a structured settlement, it is exposed to the credit risk associated with the insolvency of the insurer selling the annuity.

- **Contingent liabilities or losses** – there are a variety of contingent liabilities to which an insurer may be exposed, such as tax, litigation, etc.

- **Letters of credit and pledged assets** – the insurer may be exposed to the risk that a lending institution defaults on payment under, for example, a letter of credit, or a call on assets pledged.

- **Capital maintenance agreements** – an insurer could be exposed to capital maintenance agreements it must honour for its subsidiaries.

- **Derivative instruments** – the risks associated with derivatives are discussed in more detail below:
  - Market risk includes liquidity risk and basis risk. Liquidity risk is the risk of not being able to cancel or unwind one’s contract when desired or at a favourable price. Basis risk is the risk that the derivative’s price behaviour does not act as expected, undoing the intended hedging benefits. The price behaviour of the instruments can change adversely when market conditions change. Market risk is best evaluated on a security basis and on a portfolio basis since some risks may not net against each other.
  - Default (or credit) risk is the risk that a loss will be incurred due to default in making the full payments, when due, in accordance with the terms of the contract.
  - Management risk is the potential for incurring material, unexpected losses on derivatives due to inadequate management supervision and understanding, systems, controls, procedures, accounting, and reporting.
  - Legal risk is the risk that the derivative agreement is not binding as intended.

- **Pension underfunding** – the insurer could be exposed to the potential impact of unfunded liabilities.

Possible ripple effects may include the following:

- Forced sale or liquidation of assets.
- Significant positive or negative cash flows, affecting the insurer’s liquidity position.

Possible management actions may include the following:

- Selling or reinvesting assets;
- Changing the reinsurance strategy;
- Repositioning of derivative tools; and
- Reducing costs through layoffs, consolidation of branch offices, or other similar actions.

9. **Related companies risk**

It is possible that adverse scenarios in a related company may have a concomitant impact on the
insurer’s financial condition. The choice of adverse scenarios for this risk will tend to be based on actual company organizational structures. Related company risk may also be considered in creating integrated scenarios with other risk categories.

In this context, an insurer’s financial condition may be sensitive to the following:

- **A reduction in reliance on the parent company for financial support** – typically, such a situation would arise when a group’s financial resources are needed to support a financially impaired parent or affiliate company.

- **An increase in the provision of financial support to the parent** – in this situation, funds the company expected to have for its own purposes are now needed to support other entities in the group.

- **A high level of dependency on group operational resources** – this situation would consider disruptions in services (computer systems, actuarial, etc.) provided by related companies.

- **A rating agency downgrade reflecting difficult financial conditions at the group level.**

Possible ripple effects may include the following:

- Management focus on group rather than company priorities, potentially delaying remedial action;

- A need to provide for service disruptions; and

- Regulator action to protect local policyholders.

Possible management actions may include the following:

- Finding alternative sources of funds for operational support;

- Adjusting premium volumes and mix of business;

- Reviewing reinsurance coverage purchased to mitigate capital strain;

- Reviewing the target mix by line of business or jurisdiction;

- Reviewing type of products offered; and

- Selling or reinvesting assets.
The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the Standards of Practice; and as such, the actuary should cross-reference with current Standards. To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.
MEMORANDUM

To: Members in the property and casualty insurance area
From: Steven W. Easson, Chair
Actuarial Guidance Council
Houston Cheng, Chair
Committee on Property and Casualty Insurance Financial Reporting

Date: April 22, 2020
Subject: Draft Educational Note: IFRS 17 – Actuarial Considerations Related to P&C Reinsurance Contracts Issued and Held

The Committee on Property and Casualty Insurance Financial Reporting (PCFRC) has prepared this draft educational note to summarize some of the accounting and actuarial implications affecting reinsurance contracts issued and reinsurance contracts held as a result of the upcoming implementation of the International Financial Reporting Standard 17 (IFRS 17 or the Standard) requirements.

The background on accounting treatment of reinsurance contracts outlined in this draft educational note is at a high level; additional information that provides more detail on this topic can be found in International Actuarial Association (IAA) guidance or other CIA documents. The draft educational note Compliance with IFRS 17 Applicable Guidance provides guidance to actuaries when assessing compliance with IFRS 17. It is applicable to all draft educational notes pertaining to IFRS 17 and members are encouraged to review it prior to reading any draft education note related to IFRS 17.

The purpose of this draft educational note is to provide the reader with possible interpretations of the Standard, without advocating any particular approach. Each topic presented in this document addresses the implications of the Standard for either a reinsurance contract issued, a reinsurance contract held, or both: level of aggregation, fulfilment cash flow projections, insurance revenue recognition, estimation of the Liability for remaining coverage (LRC), onerous contracts identification and recognition, and residual market mechanisms.

Various stakeholders were consulted prior to releasing this draft educational note: the CIA Committee on Life Insurance Financial Reporting (CLIFR), the CIA Committee on the Appointed/Valuation Actuary (AA), the CIA Committee on Risk Management and Capital Requirements (CRMCR), the Accounting Standards Board (AcSB), the International Insurance Accounting Committee (IIAC), the Committee on Workers Compensation (CWC), and the Group Insurance Practice Committee.
The creation of this cover letter and draft educational note has followed the Actuarial Guidance Council’s (AGC’s) Protocol for the adoption of educational notes. In accordance with the Institute’s **Policy on Due Process for the Approval of Guidance Material other than Standards of Practice and Research Documents**, this draft educational note has been prepared by the PCFRC and has received approval for distribution from the Actuarial Guidance Council on April 14, 2020.

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the Standards of Practice; and as such, the actuary should cross-reference with current Standards. To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.

Questions or comments regarding this draft educational note may be directed to Simon Guénette (Chair of the working group) at sguenette@odysseyre.com or Houston Cheng at hhcheng@kpmg.ca.

1. Introduction

International Financial Reporting Standard 17 Insurance Contracts (IFRS 17 or the Standard) establishes principles for the recognition, measurement, presentation, and disclosure of insurance contracts. The purpose of this draft educational note is to provide practical application guidance on Canadian-specific issues related to actuarial considerations under IFRS 17 for property and casualty (P&C) reinsurance contracts issued and reinsurance contracts held. In this draft educational note, the use of the notation IFRS 17.XX refers to specific paragraphs of IFRS 17, where XX represents the paragraph number.

The International Accounting Standards Board (Board) issued an exposure draft in June 2019 that proposed amendments to IFRS 17, including amendments specifically related to the topic of reinsurance contracts held. Furthermore, the Board has tentatively made decisions on the proposed amendments on the topic of reinsurance at its December 2019 meeting. The details of the proposed amendments are described in section 5.3.3 – Reinsurance Contracts Held – Recovery of Losses on Onerous Groups of Underlying Insurance Contracts.

As noted in IFRS 17.4, all references to insurance contracts also apply to reinsurance contracts held\(^1\), unless otherwise indicated by specific references to insurance contracts issued\(^2\) or as described in IFRS 17.60 through IFRS 17.70\(^3\) for reinsurance contracts held. This draft educational note addresses both reinsurance contracts issued and reinsurance contracts held.

Appendix A of IFRS 17 defines a reinsurance contract as:

> An insurance contract issued by one entity (the reinsurer) to compensate another entity for claims arising from one or more insurance contracts issued by that other entity (underlying contracts).

Where an entity enters into reinsurance contracts to cede insurance risk associated with underlying insurance contracts, the reinsurance contracts held by the ceding entity are recognized and presented in the statement of financial position\(^4\) and in the statement of financial performance\(^5\) separately from the underlying insurance contracts (IFRS 17.78 and IFRS 17.82).

This draft educational note is structured as follows:

- Level of aggregation;
- Actuarial calculations related to fulfilment cash flows;

---

1. Reinsurance contracts held are often referred to as reinsurance ceded.
2. Reinsurance contracts issued are often referred to as reinsurance assumed. Throughout this draft educational note, the term “insurance contracts issued” encompasses all types of insurance contracts (i.e., both primary insurance contracts issued and reinsurance contracts issued).\(^3\) Under the proposed amendments, this reference will become IFRS 17.70A.
3. Under the proposed amendments, this reference will become IFRS 17.70A.
4. The statement of financial position is often referred to as the balance sheet.
5. The statement of financial performance is often referred to as the income statement.
• Insurance revenue considerations;
• Liability for remaining coverage (LRC): premium allocation approach (PAA) and general measurement approach (GMA) considerations;
• Onerous groups identification and recognition – insurance and reinsurance contracts issued; and
• Accounting treatment of residual market mechanisms.

This draft educational note supplements the following:

• CIA Exposure Draft: *Incorporate changes required by the adoption in Canada of IFRS 17, including Principles of International Standard of Actuarial Practice 4 – Actuarial Practice in Relation to IFRS 17 Insurance Contracts, into the Canadian Standards of Practice* (Document 218076, May 2018); and

• Chapter 9 – Reinsurance of the CIA Draft Educational Note *Application of IFRS 17 Insurance Contracts* (Draft IFRS 17 Application EN), which provides general guidance about reinsurance contracts issued and reinsurance contracts held. The Draft IFRS 17 Application EN adopts without modification the *International Actuarial Note 100 Exposure Draft* (IAN 100 ED) of the IAA.

In addition, the following draft educational notes may serve as additional useful guidance to actuaries:

• CIA Draft Educational Note: *Comparison of IFRS 17 to Current CIA Standards of Practice* (Document 218117, September 2018);

• CIA Draft Educational Note: *Assessing Eligibility for Premium Allocation Approach Under IFRS 17 for Property & Casualty and Life & Health Insurance* (Draft PAA Eligibility EN);

• CIA Draft Educational Note: *Risk adjustment for P&C insurance companies* (Draft PCFRC Risk Adjustment EN);

• CIA Draft Educational Note: *IFRS 17 Discounting and Cash Flow Considerations for P&C Entities* (Draft PCFRC Discounting EN);

• CIA Draft Educational Note: *Liability for remaining coverage* (Draft PCFRC LRC EN).

In writing this draft educational note, the PCFRC adhered to the following guiding principles:

• Consider Canadian-specific perspectives rather than simply repeating international actuarial guidance;

• Develop application guidance that is consistent with IFRS 17 and applicable Canadian actuarial Standards of Practice and educational notes without unnecessarily narrowing the range of practice allowable under IFRS 17; and

• Consider practical implications associated with the implementation of potential approaches and methods; in particular, ensure that due consideration is given to options that do not require undue cost and effort to implement.
2. Level of Aggregation

Under IFRS 17, insurance contracts are aggregated into portfolios of insurance contracts (portfolios) comprising contracts subject to similar risks and managed together (IFRS 17.14). Portfolios are divided into groups of insurance contracts (groups) considering, amongst other things, the expectation regarding the net cash flow of the contracts at initial recognition (i.e., whether the contracts are expected to be onerous).

IFRS 17.47 states, in part, that:

An insurance contract is onerous at the date of initial recognition if the fulfilment cash flows allocated to the contract, any previously recognised acquisition cash flows and any cash flows arising from the contract at the date of initial recognition in total are a net outflow. (...)

2.1. Portfolios and Groups

Based on IFRS 17.16:

An entity shall divide a portfolio of insurance contracts issued into a minimum of:

(a) a group of contracts that are onerous at initial recognition, if any;

(b) a group of contracts that at initial recognition have no significant possibility of becoming onerous subsequently, if any; and

(c) a group of the remaining contracts in the portfolio, if any.

It should be noted that there is no limit regarding the number of groups contained within a given portfolio. IFRS 17.24 states: “An entity shall establish the groups at initial recognition, and shall not reassess the composition of the groups subsequently.” At subsequent valuation, a group of insurance contracts issued that was deemed non-onerous at initial recognition may still become onerous subsequently (or vice versa) if the expectation regarding the future net cash flows of the group changes from positive to negative (or vice versa).

Based on the proposed amendments to IFRS 17 that were related to simplified balance sheet presentation issued by the Board in June 2019 and the subsequent December 2019 Board meeting discussions, insurance contract assets and insurance contract liabilities on the statement of financial position would be presented at the portfolio level rather than at the group level. In the statement of financial position, the portfolios that are in an asset position are presented separately from those that are in a liability position, assuming that the proposed amendment is adopted by the Board. For a given portfolio, the liability for incurred claims (LIC) and the LRC are reported on a combined basis in the statement of financial position.

Note that, even though the measurement of the liabilities is required at the group level, fulfilment cash flows can be estimated at a more or less granular level and then aggregated or allocated to the group level if deemed more appropriate. For example, the entity may determine that Ontario auto is a group, and the actuary may initially estimate liabilities at a coverage level and then aggregate results to the group level. See further discussion in Section 2.2 – The Insurance Contract as the Smallest Unit of Account.
The level of aggregation for reinsurance contracts held is assessed independently from the underlying insurance contracts issued. The level of aggregation requirements for insurance contracts, outlined in IFRS 17.14 through IFRS 17.24, also apply for reinsurance contracts (both issued and held). However, for reinsurance contracts held, IFRS 17.61 replaces references to onerous contracts in those paragraphs with a reference to contracts on which there is a net gain on initial recognition. For a group of reinsurance contracts held, there is no unearned profit but instead a net cost or net gain on purchasing the reinsurance. Therefore, reinsurance contracts held cannot be onerous, as indicated in IFRS 17.68.

For reinsurance contracts held, the level of aggregation (i.e., groups or portfolios) may differ from the level of aggregation of the underlying insurance contracts covered. In many cases, a single reinsurance contract held covers many underlying groups or portfolios. It may therefore be reasonable for a portfolio or a group to consist of a single reinsurance contract held, whereas a portfolio or group of a single underlying P&C insurance contract would be unusual.

2.2. The Insurance Contract as the Smallest Unit of Account

Under IFRS 17, the lowest unit of account is the insurance contract. In most cases, it is not permitted to disaggregate individual insurance contracts for the purposes of assessing eligibility for the PAA, identifying groups that are onerous, or financial reporting.

Some reinsurance contracts (issued and held) cover more than one line of business under a single contract. These reinsurance contracts, often referred to as multi-line reinsurance contracts, can take various forms, such as excess-of-loss, aggregate stop-loss, and proportional reinsurance.

IFRS 17 itself does not mandate any change to the actuarial methodologies or processes currently used to estimate the obligations associated with claims that have occurred (i.e., undiscounted fulfillment cash flows associated with the LIC). Thus, the actuary’s choice of segments, which are often referred to as lines of business, for the reserving analysis is not necessarily affected by IFRS 17.

Under IFRS 17, each contract would normally be assigned to a specific portfolio and group. For multi-line reinsurance contracts (issued and held), the actuary has three options for assigning those contracts including:

- Aggregating reinsurance contracts based on the predominant exposure covered;
- Creating a portfolio or group containing hybrid or multi-line contracts; or
- Separating the reinsurance contracts into sub-contracts and assigning those sub-contracts to separate groups and possibly portfolios. This option may only be acceptable if the insurer is able to prove that a single legal reinsurance contract was bound solely for the administrative convenience of the policyholder (in this case, the insurer) and the price is simply the aggregate of the standalone prices for the different reinsurance covers provided. (See Agenda Paper 01 (login required) prepared by the Board staff for the February 6, 2018 TRG).

Under the first option, one acceptable methodology is to assign each multi-line reinsurance contract based on its dominant exposure as measured by expected losses, which may be
determined from a pricing analysis. For example, if the majority of the expected losses for a multi-line reinsurance contract covering both casualty and property exposures is driven by casualty exposures, then one approach is to assign such contract to a casualty portfolio and to a casualty group even though the contract also covers property exposures (albeit to a lesser extent).

3. Actuarial Calculations Related to Fulfilment Cash Flows

Estimates of the fulfilment cash flows, which include discounting and risk adjustment for non-financial risk (RA), are used for:

- Determining the LIC;
- Determining the LRC when using the GMA; and
- Estimating the loss component (LC) of an onerous group (regardless of use of GMA or PAA).

The definition of the LC and the accounting for groups deemed onerous are found in Section 6.1 – Accounting for Groups Deemed Onerous.

3.1. Estimation of the LIC

The LIC consists of the fulfilment cash flows related to past services, which is often referred to as earned business. The LIC is estimated by projecting the fulfilment cash flows for earned business, which comprise:

- An unbiased current estimate of future cash flows (at the “expected value (ie the probability-weighted mean) of the full range of possible outcomes.” per IFRS 17.33(a));
- An adjustment to reflect the time value of money; and
- A RA.

3.2. Discounting and Cash Flows Considerations

A separate CIA draft educational note will address the topic of discounting under IFRS 17: Draft PCFRC Discounting EN. The discussion in this draft educational note is therefore limited to topics affecting reinsurance contracts issued and reinsurance contracts held.

For entities using the GMA, consistency of measurement for reinsurance contracts held and the underlying contracts is addressed in IFRS 17.63:

In applying the measurement requirements of paragraphs 32–36 to reinsurance contracts held, to the extent that the underlying contracts are also measured applying those paragraphs, the entity shall use consistent assumptions to measure the estimates of the present value of the future cash flows for the group of reinsurance contracts held and the estimates of the present value of the future cash flows for the group(s) of underlying insurance contracts. In addition, the entity shall include in the estimates of the present value of the future cash flows for the group of reinsurance contracts held the effect of any
risk of non-performance by the issuer of the reinsurance contract, including the effects of collateral and losses from disputes.

Assumptions selected for the estimation of the present value of the future cash flows for the LIC and the LRC (both PAA and GMA) would normally be consistent between reinsurance contracts held and the underlying insurance contracts. Reference to “consistency” and “consistent assumptions” does not necessarily imply identical assumptions.

Board staff response for TRG (#S40):

Paragraph 63 of IFRS 17 requires an entity to use consistent assumptions to measure the estimates of the present value of the future cash flows for the group of reinsurance contracts held and the estimates of the present value of the future cash flows for the group(s) of underlying insurance contracts. This consistency is required to the extent that the same assumptions apply to both the underlying contracts and the reinsurance contracts held. This requirement does not require/permit the entity to use the same assumptions used for measuring the underlying contracts when measuring the reinsurance contracts held if those assumptions are not valid for the terms of the reinsurance contracts held. If different assumptions apply for the reinsurance contract held, the entity uses those different assumptions when measuring that contract.

Consistent assumptions can produce differences between the estimates of fulfilment cash flows for insurance contracts issued and the estimates of fulfilment cash flows for reinsurance contracts held. These differences can arise from different sources, such as:

- Contract grouping;
- Contract boundaries;
- Discount rates; and
- RA.

### 3.2.1. Risk of Non-Performance by the Issuer of the Reinsurance Contracts

As noted in the previous section, for the measurement of reinsurance contracts held, IFRS 17.63 states:

... the entity shall include in the estimates of the present value of the future cash flows for the group of reinsurance contracts held the effect of any risk of non-performance by the issuer of the reinsurance contract, including the effects of collateral and losses from disputes.

When estimating the LIC, and when estimating the LRC under the GMA, the actuary would determine a probability-weighted provision to account for the risk of non-performance of the reinsurer, including consideration for reinsurer default, coverage dispute, and other risk of non-performance. These considerations are similar to those included in the former CIA requirements for provision for adverse deviations (PfAD) for recovery from reinsurance ceded prior to the implementation of IFRS 17. The determination of the IFRS 17 provision, however, may be different. Under IFRS 17, the reinsurance counterparty risk would be included in the
measurement of the estimates of future cash flows for reinsurance contracts held (i.e., it is not calculated separately).

Thus, the risk of non-performance by the issuer of the reinsurance contracts is incorporated as a decrease to the estimates of future cash inflows for reinsurance contracts held. The actuary may choose to estimate this provision separately before combining it with the fulfilment cash flows. Separation of the expected cash flows may facilitate discussions with senior management as well as audit and peer review of the actuarial analyses.

When estimating the risk of non-performance, the actuary would consider:

- The financial strength of the reinsurers;
- The history of claims and coverage disputes with reinsurers; and
- The risk of contagion across various reinsurance arrangements.

### 3.3. Estimation of the RA

A separate CIA draft educational note will address the topic of RA: Draft PCFRC Risk Adjustment EN. The discussion in this draft educational note is therefore limited to topics affecting reinsurance contracts issued and reinsurance contracts held.

#### 3.3.1. The RA associated with reinsurance contracts held

The RA associated with reinsurance contracts held is described in IFRS 17.64, which states:

> Instead of applying paragraph 37, an entity shall determine the risk adjustment for non-financial risk so that it represents the amount of risk being transferred by the holder of the group of reinsurance contracts to the issuer of those contracts.

Chapter 9 of the Draft IFRS 17 Application EN addresses the issue of the RA for reinsurance contracts. Question 9.9 asks: “How is the reinsurance held risk adjustment for non-financial risk determined?” The response states:

> A specific definition for the determination of the risk adjustment for reinsurance contracts held is provided that replaces the general definition in paragraph 37 used for insurance and reinsurance contracts issued in the standard. Under the definition for reinsurance held, the quantum of the risk adjustment for non-financial risk represents the amount of risk being transferred by the holder of a group of reinsurance contracts to the issuer of those contracts (paragraph 64).

The risk adjustment for the reinsurance held can therefore conceptually be thought of as the difference in the risk position of the entity with (i.e., net position) and without (i.e., gross position) the reinsurance held. As a result, the appropriate risk adjustment for the reinsurance held could be determined based on the difference between these amounts.

For reinsurance held, because the risk adjustment for reinsurance held is defined based on the amount of risk transferred to the reinsurer, the risk adjustment for reinsurance held will normally create an asset. On this basis, where a reinsurance
contract held is reported as an asset the risk adjustment will have the effect of increasing the value of the asset, and will decrease the liability value where the reinsurance contract held is reported as a liability.

When estimating the present value of future cash flows and the RA, the actuary has three options:

- Estimate the gross\(^6\) and the net\(^7\), and then calculate the ceded\(^8\) as a difference;
- Estimate the gross and the ceded, and then calculate the net as a difference; or
- Estimate the net and the ceded, and then calculate the gross as a sum.

The RA reflects the compensation that the entity requires for bearing the uncertainty related to non-financial risks and is apportioned to insurance contracts issued and reinsurance contracts held. Ultimately, the key concepts underlying the RA are:

- The RA for the insurance contracts issued represents the compensation that the entity requires for bearing the non-financial risk associated with writing those contracts, and
- The RA for the reinsurance contracts held accounts for the non-financial risk transferred from the cedant to the reinsurer(s).

Any method that meets these concepts would generally be acceptable.

### 3.3.2. Actuarial input on the RA and the role of judgment in estimating the RA

Questions 4.4 and 4.5 of the Draft IFRS 17 Application EN are focused on the role of actuarial input on the RA and the role of judgment in estimating the RA. In responding to these questions, the collaboration required between the actuary and the entity’s management is addressed.

The response to Question 4.4 regarding the role of actuarial input on the RA states:

This actuarial input falls into four parts and can:

- assist in understanding and assessing the risk aversion of the entity ..., as it relates to the uncertainty and variability of insurance cash flows, and in understanding the extent to which the entity considers “the degree of diversification benefit the entity includes when determining the compensation it requires for bearing that risk” [paragraph B88(a)].
- provide quantitative measures to help evaluate the variability inherent in the insurance contracts being valued and the uncertainty which underlies such quantitative measures.
- assist in designing an approach to assess a value in terms of the compensation for bearing risk that reflects the entity’s risk aversion, in the context of the

---

\(^{6}\) “Gross” in this context refers to contracts issued by an insurer or reinsurance contracts issued by a reinsurer.

\(^{7}\) “Net” in this context refers to the difference: gross minus ceded.

\(^{8}\) “Ceded” in this context refers to reinsurance contracts held.
relevant risks, and in the context of the diversification affecting the compensation for such risks.

- provide explanations and insights to help in communicating the understandings and judgments involved, such that the entity’s board and management can have the appropriate level of direction and oversight regarding how the risk adjustment is determined.

The response to Question 4.5 concludes with:

In general, it will be important that the entity’s board and management properly understand the process and the judgments used to determine the entity’s risk adjustment and how their oversight and management roles and responsibilities are being satisfied.

4. Insurance Revenue Considerations

Under IFRS 17, the concept of insurance revenue for reinsurance contracts issued may differ from the concept of earned premium due to:

- Seasonality adjustments that are reflected under IFRS 17 if the expected pattern of release of risk during the coverage period differs significantly from the passage of time;
- Reinstatement premiums that are contemplated in the original reinsurance contract and collected following an insured event are generally applied against insurance service expenses under IFRS 17; and
- Some ceding commission expenses on proportional reinsurance treaties might be included as part of insurance revenue, insurance service expense, or possibly as part of the investment component.

IFRS 17.86 indicates that income or expenses from a group of reinsurance contracts held, other than insurance finance income or expenses, may be presented either:

- As a single amount (i.e., net presentation); or
- Separately as amounts recovered from the reinsurer and an allocation of premiums paid (i.e., gross presentation).

4.1. Insurance Revenue Accruals – Reinsurance Contracts Issued

IFRS 17.B126 states that when an entity applies the PAA, insurance revenue for the period is the amount of expected premium receipts allocated to the period. For proportional reinsurance contracts issued, there are many instances where the reinsurance coverage starts before premium is received by the reinsurer. For example, the first bordereau\(^9\) on a proportional reinsurance contract issued having an effective date of January 1 may not be received by the reinsurer until May or June (i.e., more than four or five months after contract inception).

---

\(^9\) “Bordereau” in this context refers to the invoice received by the insurer in relation to a proportional treaty.
such instances, an accrual (i.e., expected premium receipt) is used to estimate the insurance revenue reported in the statement of financial performance of the reinsurer.

4.2. Insurance Revenue Recognition Pattern

According to IFRS 17.B126, under the PAA, the allocation of insurance revenue to each period of coverage is based on either the passage of time or the expected timing of incurred insurance service expenses (i.e., based on the seasonality of losses). IFRS 17.B126 states:

When an entity applies the premium allocation approach in paragraphs 55–58, insurance revenue for the period is the amount of expected premium receipts (excluding any investment component and adjusted to reflect the time value of money and the effect of financial risk, if applicable, applying paragraph 56) allocated to the period. The entity shall allocate the expected premium receipts to each period of coverage:

(a) on the basis of the passage of time; but

(b) if the expected pattern of release of risk during the coverage period differs significantly from the passage of time, then on the basis of the expected timing of incurred insurance service expenses.

Examples of reinsurance arrangements where a uniform insurance revenue recognition pattern based on the passage of time may not be applicable include:

- Risk-attaching proportional treaties;
- Catastrophe treaties with material seasonality (e.g., hurricane); and
- Catastrophe treaties with low attachment points and limits for which the exposure may be heavily concentrated in specific months of the year (e.g., hail, flood, and forest fire).

If a new earning pattern is implemented along with IFRS 17, consideration would be given to applying a consistent approach for the calculation of earned premiums if that basis is used as part of the reserving analysis (e.g., Bornhuetter-Ferguson or expected loss ratio method). Consistency between the two methodologies will reduce the amount of explanations and reconciliations that the actuary would be required to perform.

4.3. Income or Expenses Presentation Requirements

Based on the economic effect of amounts exchanged between the reinsurer and the cedant, reinstatement premium and commission may have to be recorded as either insurance revenue, insurance service expense, or possibly as part of the investment component. IFRS 17.86 states:

An entity may present the income or expenses from a group of reinsurance contracts held (see paragraphs 60–70), other than insurance finance income or expenses, as a single amount; or the entity may present separately the amounts recovered from the reinsurer and an allocation of the premiums paid that together give a net amount equal to that single amount. If an entity presents separately the amounts recovered from the reinsurer and an allocation of the premiums paid, it shall:
(a) treat reinsurance cash flows that are contingent on claims on the underlying contracts as part of the claims that are expected to be reimbursed under the reinsurance contract held;

(b) treat amounts from the reinsurer that it expects to receive that are not contingent on claims of the underlying contracts (for example, some types of ceding commissions) as a reduction in the premiums to be paid to the reinsurer; and

(c) not present the allocation of premiums paid as a reduction in revenue.

### 4.3.1. Reinstatement Premiums

Following the occurrence of an insured event, the ceding company may be required to pay a reinstatement premium to be covered for additional events that may occur during the remainder of the reinsurance contract term. For the purpose of this draft educational note, two types of reinstatements are described: reinstatements contemplated in the original reinsurance contract and additional negotiated reinstatements.

#### 4.3.1.1. Reinstatements Contemplated in the Original Reinsurance Contract

If a ceding entity makes the accounting policy choice to present separately the amounts recovered from a reinsurer and the premiums paid to the reinsurer, the cash flows related to mandatory reinstatement premiums paid are normally considered as an offset to the amounts recovered from the reinsurer. For the reinsurer, given that the amounts exchanged are contingent on claims, the reinstatement premiums collected would be accounted for as a reduction to the insurance service expense.

#### 4.3.1.2. Additional Negotiated Reinstatements

Additional reinstatements can be negotiated as part of a separate reinsurance contract. This type of reinsurance contract is usually negotiated after the occurrence of one or more covered events to ensure that the ceding company remains covered after all contractual reinstatement limits provided in the original reinsurance contract are exhausted. An additional negotiated reinstatement to the reinsurance contract is normally considered outside of the scope of the original reinsurance contract (i.e., the terms are determined and priced independently from the original reinsurance contract and the reinsurer is not obligated to accept the reinstatement premium). As a result, the insurance revenues generated by this new reinsurance contract are considered independent from the claims incurred previously. The premium related to this reinsurance contract are therefore accounted for as reinsurance held by the ceding company and as insurance revenue for the reinsurer.

### 4.3.2. Commissions for Reinsurance Contracts Issued

Based on IFRS 17.86, if an entity makes the accounting policy choice to present separately the amounts recovered from the reinsurance contracts held and an allocation of the premiums paid for the reinsurance contracts held, the ceding entity shall:
... treat amounts from the reinsurer that it expects to receive that are not contingent on claims of the underlying contracts (for example, some types of ceding commissions) as a reduction in the premiums to be paid to the reinsurer...

In general terms, the ceding commission (or portion of the ceding commission) paid by the reinsurer to the ceding company that is not contingent on the claims of the underlying contracts would be accounted for as a reduction to insurance revenue in the statement of financial performance of the reinsurer. However, the portion of the commission that is contingent on claims would be accounted for, in the statement of financial performance of the reinsurer, as either an offset to insurance service expense or as an investment component.

Amounts exchanged between the issuer of a reinsurance contract (i.e., the reinsurer) and the holder of a reinsurance contract (i.e., the cedant), such as profit-sharing or sliding scale commission adjustments, may need to be reported as investment components if they are paid after the initial premium is received, and if they are repaid to the policyholder (in this case the cedant) in all circumstances (including when an insured event does not occur and on cancellation of the contract).

The definition of investment component from the Standard may require reinsurance companies to book a portion of the ceded commissions as investment component. In June 2019, the Board issued the following revised definition of investment component: “The amounts that an insurance contract requires the entity to repay to a policyholder in all circumstances, regardless of whether an insured event occurs.”

4.3.3. Premium Adjustments Reflecting the Adjusted Exposure Base

According to IFRS 17.B65:

Cash flows within the boundary of an insurance contract are those that relate directly to the fulfilment of the contract, including cash flows for which the entity has discretion over the amount or timing. The cash flows within the boundary include:

(a) premiums (including premium adjustments and instalment premiums) from a policyholder and any additional cash flows that result from those premiums.

Premium adjustments related to services rendered in past periods, and reflecting any adjustments to the exposure base (e.g., gross net earned premium) are normally independent from the cedent loss experience. These premiums adjustments would therefore be accounted for as insurance revenues in the financial period in which they are received. This can be the year in which services are rendered or a subsequent year.

4.4. Reconciliation with Accounting Standards from Other Jurisdictions

Some insurers and reinsurers licensed in Canada operate as part of international groups with a head office domiciled in a jurisdiction that is not required to comply with IFRS 17. The

---

10 Note that a similar definition was included in the original Standard: “The amounts that an insurance contract requires the entity to repay to a policyholder even if an insured event does not occur.”
consolidated financial reporting for these insurers may, in some cases, remain in their head office’s jurisdiction reporting framework (e.g., US generally accepted accounting principles (GAAP)). In these circumstances, the actuary may be required to produce an estimation of liabilities under two separate bases: IFRS 17 for local Canadian regulatory reporting purposes and the financial reporting framework required in the jurisdiction of their head office. In such cases, the actuary may be required to assess the effect and explain any differences in accounting methodologies. For example, undiscounted fulfilment cash flow estimates associated with the LIC for reinsurance contracts issued and reinsurance contracts held under IFRS 17 would, in most cases, reconcile with assumed and ceded unpaid claims under US GAAP. Any differences between the two figures would need to be understood and explained.

5. LRC: PAA and GMA Considerations

The LRC consists of the obligation that relates to future services (i.e., the unexpired portion of the coverage period), which is often referred to as unearned business. The LRC can be estimated using the GMA or the PAA, if the option is available and the entity elects to use this approach.

5.1. Estimation of the LRC

Based on IFRS 17.55, under the PAA, at initial recognition, the LRC is calculated as premiums received, which are equivalent to the unearned premiums less premiums receivable, minus the insurance acquisition cash flows, unless the entity chooses to recognize insurance acquisition cash flows as expenses as they are incurred in accordance with IFRS 17.59(a).

Assuming that the entity has no financing component and no investment component, the LRC at the end of each subsequent reporting period is calculated as:

- The amount of the LRC carried at the start of the reporting period;
- Plus any premiums received in the period;
- Minus insurance acquisition cash flows, unless the entity chooses to recognize insurance acquisition cash flows as expenses as they are incurred in accordance with IFRS 17.59(a);
- Plus any amounts related to the amortization of insurance acquisition cash flows recognized as expense in the reporting period, unless the entity chooses to recognize insurance acquisition cash flows as expenses as they are incurred in accordance with IFRS 17.59(a);
- Minus any amounts recognized as insurance revenue for coverage provided in the period.

Any LC on onerous groups are included in the LRC.

Under the GMA, the LRC is calculated as the sum of the fulfillment cash flows related to future services and the contractual service margin (CSM). The CSM represents the projected unearned profit on a group. The CSM for reinsurance contracts held is determined in the same manner as for insurance contracts issued, but instead of reflecting the unearned profit, the CSM is the expected “net cost or net gain on purchasing the group of reinsurance contracts held” (IFRS
17.65). Thus, unlike the CSM for underlying insurance contracts, the CSM on reinsurance contracts held can be positive or negative.

More information about the CSM calculation and amortization is provided in Section 5.3.1 – Coverage Units and the CSM.

5.2. PAA Eligibility

The topic of PAA eligibility is covered in detail in a separate CIA draft educational note: Draft PAA Eligibility EN. Thus, similar to the topics of discounting and RA, this draft educational note is limited to a discussion of PAA eligibility related to reinsurance contracts issued and held.

5.2.1. PAA Eligibility for Reinsurance Contracts Issued

The PAA eligibility assessment for reinsurance contracts issued is similar to the assessment for primary insurance contracts. For reinsurance contracts issued, the analysis is based on IFRS 17.53, which states:

An entity may simplify the measurement of a group of insurance contracts using the premium allocation approach set out in paragraphs 55–59 if, and only if, at the inception of the group:

(a) the entity reasonably expects that such simplification would produce a measurement of the liability for remaining coverage for the group that would not differ materially from the one that would be produced applying the requirements in paragraphs 32–52; or

(b) the coverage period of each contract in the group (including coverage arising from all premiums within the contract boundary determined at that date applying paragraph 34) is one year or less.

In accordance with IFRS 17, the estimated LRC for a group of reinsurance contracts issued may be calculated using the PAA if all contracts within the group have a coverage period of one year or less. If any contract within the group has a coverage period greater than one year, the PAA would only be used to estimate the LRC if the PAA provides a reasonable approximation of the GMA.

5.2.2. PAA Eligibility for Reinsurance Contracts Held

For reinsurance contracts held, IFRS 17.69 states similar considerations:

An entity may use the premium allocation approach ... to simplify the measurement of a group of reinsurance contracts held, if at the inception of the group:

(a) the entity reasonably expects the resulting measurement would not differ materially from the result of applying the requirements in paragraphs 63–68; or

(b) the coverage period of each contract in the group of reinsurance contracts held ... is one year or less.
The considerations above for reinsurance contracts held are very similar to the considerations outlined for reinsurance contracts issued.

5.2.3. Considerations Related to Loss-Occurring vs. Risk-Attaching Reinsurance Treaties

For loss-occurring reinsurance contracts where the coverage period can be easily defined as one year or less based on the contract’s effective date and expiry date, entities can opt to use the PAA.

For 12-month risk-attaching reinsurance treaties covering underlying insurance contracts with terms of 12 months, the reinsurance coverage would usually span two loss occurrence years, assuming that underlying contracts are underwritten throughout the year. Such risk-attaching treaties provide coverage that extends beyond a one-year coverage period.

When the coverage period of reinsurance contracts is greater than one year, entities have to determine PAA eligibility by demonstrating that the measurement of the LRC does not differ materially between the GMA and the PAA.

5.2.4. Determination of Coverage Period for Reinsurance Contracts Issued or Held

Reinsurance contracts have a variety of features that the actuary would consider when determining the coverage period. Options to extend the reinsurance contract may affect the contract boundary and therefore the PAA eligibility. Alternatively, cancelation provisions may shorten the contract boundary to the extent that they are available to both parties (reinsurer and cedant). These cancelation provisions would also impact the assessment of PAA eligibility.

On the topic of coverage period and contract boundary, IFRS 17.34 states:

... A substantive obligation to provide services ends when:

(a) the entity has the practical ability to reassess the risks of the particular policyholder and, as a result, can set a price or level of benefits that fully reflects those risks; or

(b) both of the following criteria are satisfied:

(i) the entity has the practical ability to reassess the risks of the portfolio of insurance contracts that contains the contract and, as a result, can set a price or level of benefits that fully reflects the risk of that portfolio; and

(ii) the pricing of the premiums for coverage up to the date when the risks are reassessed does not take into account the risks that relate to periods after the reassessment date.

Contractual cancellation provisions of reinsurance contracts issued and held would be considered when assessing PAA eligibility. To the extent that cancellation provisions are available to both parties (i.e., the reinsurer and the cedant), they may have the effect of shortening the contract boundary. As a result, such cancelation provisions would generally increase the likelihood of the reinsurance contract being PAA eligible. For example, some multi-year reinsurance contracts have a cancel and re-write provision at the option of the cedant.
These types of reinsurance contracts are normally considered long-term (i.e., more than one year), and therefore PAA eligibility assessment is required.

Non-contractual cancellations (e.g., early contract termination following the sale of an entity, loss portfolio transfers, novations, and commutations) normally occur after the reinsurance contract inception date. These types of cancellations are usually unknown at inception and would not affect PAA eligibility. Non-contractual cancellations are requested by one of the parties bound by the reinsurance contract and agreed by the other(s).

In the case of an early termination and/or commutation, the accounting is fairly simple. The insured party regains ownership of all ceded assets and liabilities (i.e., the LIC and LRC). In parallel, the assets and liabilities held by the reinsurer in relation to the reinsurance contract issued are considered settled.

Depending on the circumstances, a loss portfolio transfer or novation may need to be accounted for as an acquired portfolio. The CSM for an acquired portfolio is amortized over the expected settlement period.

5.3. GMA Considerations

5.3.1. Coverage Units and the CSM

For insurance contracts and reinsurance contracts issued, the CSM represents the unearned profit that the entity will recognize as it provides services in the future (IFRS 17.38).

For reinsurance contracts held, the concept of CSM is modified. According to IFRS 17.65:

- The requirements of paragraph 38 that relate to determining the contractual service margin on initial recognition are modified to reflect the fact that for a group of reinsurance contracts held there is no unearned profit but instead a net cost or net gain on purchasing the reinsurance.

The CSM for reinsurance contracts held is determined in the same manner as for insurance (or reinsurance) contracts issued, but the CSM can be positive or negative. According to IFRS 17.68, “reinsurance contracts held cannot be onerous.” Therefore, the cost of reinsurance contracts held is normally recognized over the life of the reinsurance contract.

In the statement of financial position, the CSM is booked as part of the LRC. The CSM is released consistent with the quantity of benefits provided and the expected duration of the group.

According to IFRS 17.B119:

- An amount of the contractual service margin for a group of insurance contracts is recognised in profit or loss in each period to reflect the services provided under the group of insurance contracts in that period ... The amount is determined by:

(a) identifying the coverage units in the group. The number of coverage units in a group is the quantity of coverage provided by the contracts in the group, determined by considering for each contract the quantity of the benefits provided under a contract and its expected coverage duration.
(b) allocating the contractual service margin at the end of the period (before recognizing any amounts in profit or loss to reflect the services provided in the period) equally to each coverage unit provided in the current period and expected to be provided in the future.

(c) recognizing in profit or loss the amount allocated to coverage units remaining in the period.

The coverage units would therefore be calculated consistently with the amount of benefits provided. For a standard loss occurring reinsurance treaty, this may imply a straight line CSM release pattern. For an adverse development reinsurance contract, the coverage units may be based on the expected amounts of underlying claims\(^1\), and for a risk attaching treaty, the coverage units may be based on the underlying policies renewal pattern (i.e., the parallelogram method).

### 5.3.2. Potential Timing Mismatch: Reinsurance Contract Held Evaluated under the GMA

In many reinsurance contracts held, neither party has the right to cancel the contract unilaterally without a valid reason (e.g., fraud or material misrepresentation). In most cases, cancellation must be mutually agreed upon.

When estimating the LRC for reinsurance contracts held valued under the GMA, the ceding company would include all projected cash flows, including those related to underlying contracts that have not yet been issued, unless the reinsurance contract includes unilateral cancellation conditions. Failure to do so would contradict the fundamental principle of IFRS 17 that all future cash flows within the boundary of each contract in the group are reflected in the measurement of an insurance contract.

The projected fulfillment cash flows for reinsurance contracts held extend to the entire exposure period (e.g., up to two years for a risk-attaching contract). The fulfillment cash flows of the subject contracts only include those underlying contracts for which insurance revenues have been recognized as per IFRS 17.25 (recognition). For example, at the end of the first quarter, assume that a primary insurer has written 25% of its policies (based on uniform writings throughout the year) and that the LRC for the underlying contracts is evaluated using the GMA. This means that 25% of the expected full year revenues would be recognized. However, the fulfillment cash flows on the risk-attaching reinsurance contract held as of January 1 would include the projected cash flows on 100% of the policies expected to be written throughout the year. Note that this issue only occurs if the entity is using the GMA to estimate the LRC for reinsurance contracts held.

The actuary and management would need to understand this potential inconsistency and be able to explain any implication on the financial statements of the organisation.

---

\(^1\) Additional information about coverage units and CSM amortization for adverse development reinsurance contract can be found in the IFRS 17 TRG staff paper of May 2018.
5.3.3. Reinsurance Contracts Held – Recovery of Losses on Onerous Groups of Underlying Insurance Contracts

For underlying insurance contracts that are expected to be onerous at initial recognition, IFRS 17 requires a company to recognize the expected losses when the group becomes onerous.

The recovery of losses from reinsurance contracts held covering onerous groups of underlying contracts has been addressed in the proposed amendments to IFRS 17 issued by the Board in June 2019 and the subsequent tentative approval at the Board meeting on December 11–12, 2019. Based on the amendment, an entity would adjust the CSM of a group of reinsurance contracts held, and as a result recognize income, when the entity recognizes a loss on initial recognition of an onerous group of underlying insurance contracts, or on addition of new onerous contracts to that group.

The proposed calculation of the income would require an entity to determine the amount of a loss recovered from a reinsurance contract held by multiplying:

- The loss recognised on the group of underlying insurance contracts; and
- The percentage of claims on underlying insurance contracts the entity expects to recover from the reinsurance contract held.

The proposed amendment does not affect the accounting for insurance contracts issued. It only affects the timing of loss recognition (gains for the ceding company) for reinsurance contracts held.

The intent of the proposed amendment is to recognize the expected losses from onerous insurance contracts issued and the recoveries of those losses from reinsurance contracts held that cover those same underlying onerous contracts in the same financial period. However, the proposed amendment might not perfectly correct the revenue matching issue if the reinsurance held is accounted for under the GMA.

Under the GMA with no unilateral cancellation rights, the expected cash flows (and expected profit or losses) of a given contract are projected for the entire contract period. In a simple example of a 12-month loss-occurring reinsurance contract held, the contract boundary is 12 months. However, at interim valuation periods, the cedant will only have written a fraction of the subject business. The expected gain from the reinsurance contract held might therefore outweigh the expected loss on the underlying onerous contracts. This potential mismatch is described in detail in 5.3.2 – Potential Timing Mismatch: Reinsurance Contract Held Evaluated under the GMA.

6. Onerous Contracts Identification and Recognition – Insurance and Reinsurance Contracts Issued

Based on IFRS 17.47, “an insurance contract is onerous at the date of initial recognition if the fulfilment cash flows allocated to the contract... are a net outflow.”

For reinsurance contracts held, the concept of onerous groups does not exist (IFRS 17.61). Under the GMA, the CSM for reinsurance contracts held is determined in the same manner as for insurance contracts issued, but the CSM can be positive or negative.
The remainder of this section applies equally to insurance contracts and reinsurance contracts issued.

6.1. Accounting for Groups Deemed Onerous

The LC is defined as the expected net outflow of an onerous group. The LC is booked as part of the LRC in the statement of financial position. On the statement of financial performance, the effect of the LC is recognized as insurance service expense.

When estimating the LC under both the PAA and the GMA, the expected net outflow is projected for the entire contract period. In other words, the LC is calculated based on the projected full-term premium. Moreover, the fulfilment cash flows include the effect of discounting and RA.

The LC is reported as part of the LRC. IFRS 17.50–52 requires an entity to make a systematic allocation of the subsequent changes in fulfilment cash flows between the LC portion of the LRC and the LRC, excluding the LC.

6.2. Recognition of LC on Onerous Groups

According to IFRS 17.25:

An entity shall recognise a group of insurance contracts it issues from the earliest of the following:

(a) the beginning of the coverage period of the group of contracts;

(b) the date when the first payment from a policyholder in the group becomes due; and

(c) for a group of onerous contracts, when the group becomes onerous.

Initial recognition will therefore take place either at the effective date of the group or at the date when the first payment from the policyholder becomes due unless the group is onerous, in which case initial recognition will take place earlier, with the earliest possible date for initial recognition being the “issue date” (which is the date the terms of the contract are set and the parties are bound). In many cases, this means that the recognition of the LC on onerous groups may need to be made prior to the effective date of the insurance or reinsurance contract issued. For example, assume a contract issued with an effective date of January 1, 20X3 is bound during the last week of December 20X2. If the entity is aware that this contract is onerous when bound, then the entity would book a LC in the financial statements as of December 31, 20X2.

6.3. Onerous Contracts Assessment under the PAA

IFRS 17.18 states that for contracts issued to which an entity applies the PAA, the entity shall assume no contracts in the portfolio are onerous at initial recognition, unless facts and circumstances indicate otherwise.

6.3.1. Onerous Contracts: Initial Recognition

Contracts measured using the PAA are presumed to be profitable at initial recognition unless management identifies facts and circumstances that indicate otherwise. Similarly, for
subsequent measurement, an onerous contract test is only required if there are facts and circumstances indicating that a group may be onerous.

IFRS 17 does not provide specific guidance about what facts and circumstances need to be considered in assessing whether a contract (or group) is onerous, and thus management’s judgment is required. Facts and circumstances would generally be expected to comprise information that is readily available to senior management and the finance function as part of the regular financial reporting and planning processes. Financial planning, as used in this context, includes review of pricing insight and decisions to the extent that these influence operational planning, forecasting, and reporting to stakeholders. Information that would constitute facts and circumstances could include:

- Forward-looking analyses of expected performance compared to historical performance (such as expected loss ratio or combined ratio measures);
- Strategic pricing objectives (such as loss leaders or diminished margins due to competitive pressures); and
- Significant changes to the expected costs of fulfilling insurance contracts (such as economic or regulatory changes that affect expected cash flows).

Testing of the fulfilment cash flows may be counter to the simplification sought by applying the PAA. Insurers could therefore define an indicator to test whether a group might potentially be onerous. A metric such as the combined ratio may be an option to identify onerous groups. The indicator may vary by line of business and account for the estimated combined effect of the discounting and RA. The actuary may assist management in establishing these indicators. A complete estimation of the fulfilment cash flows would only be needed when a certain threshold is reached for the indicator.

For some reinsurers, contract level pricing information may be available to senior management. In those instances, management may choose to consider individual reinsurance contract level pricing information to identify onerous contracts.

6.3.2. Onerous Contracts: Subsequent Measurement

Based on IFRS 17.17:

If an entity has reasonable and supportable information to conclude that a set of contracts will all be in the same group applying paragraph 16, it may measure the set of contracts to determine if the contracts are onerous ... and assess the set of contracts to determine if the contracts have no significant possibility of becoming onerous subsequently...

If management identifies a group that is onerous at any point before its effective date, the group would be recognized at the date at which it is deemed onerous, and a LC would be estimated for that group.

---

Applying the PAA, a group that was deemed non-onerous at initial recognition may be determined to be onerous at subsequent measurement due to changes in facts and circumstances that are unfavourable to the group. Examples of situations that may affect the expected profitability of a specific group include:\(^{13}\):

- Judicial or legal findings (e.g., landmark court cases);
- Changes in the regulatory environment;
- Shifts in the economic environment (e.g., trends, interest rates);
- Allocation of expenses; or
- Changes in the RA in total or in the allocation of the RA\(^{14}\).

Similarly, a group that was deemed onerous at initial recognition may, at a later date, be determined to not be onerous due to changes in facts and circumstances that are favourable to the group.

7. Accounting Treatment of Residual Market Mechanisms

The Facility Association (FA) administers, on behalf of its members, several residual market mechanisms. These residual market mechanisms are:

- Facility Association Residual Market (FARM);
- Risk Sharing Pools (RSPs); and
- Uninsured Automobile Funds (UAFs).

The accounting treatment of each mechanism under IFRS 17 is the responsibility of each member company (referred to collectively as “FA membership”). It is therefore up to the membership to reach a consensus on the accounting treatment of FARM, RSPs, UAFs, and the Plan de Répartition des Risques (PRR) in Québec.

Research conducted by FA confirmed that each of the residual market mechanisms above involves insurance contracts, and therefore IFRS 17 applies.

For the FARM and UAFs, the research conducted by FA\(^{15}\) concluded that the insurance contracts are issued by the “collective” of the FA membership. FA administers the contracts but is not the actual entity to which the insurance risk is transferred to – the insurance risk is transferred to the FA membership. On this basis, the current accounting treatment continues under IFRS 17 (i.e., members account for their share of FARM and UAF insurance contracts as direct business (i.e., insurance contracts issued).

---

\(^{15}\) Research conducted by FA can be found at the following address: [http://www.facilityassociation.com/IFRS17-research.asp](http://www.facilityassociation.com/IFRS17-research.asp).
For the RSPs, an original insurance contract is issued by one of the FA members, who then, under a second and separate transaction, transfers some or all of the insurance risk from that contract to the “collective” of the FA membership. In this case, FA is administering the process, but it does not assume any insurance risk directly. When IFRS 4 was introduced, the previous accounting treatment was allowed to continue. This treatment was such that the transaction from the original issuing member to the collective was a novation\textsuperscript{16} type transfer, so that the original issuer was able to remove the insurance from their balance sheet. The issue with this accounting treatment is that one of the parties (i.e., the policyholder) is unaware of the second transaction (i.e., the transfer of the risk from the insurer to the RSPs).

Research conducted by FA concluded that the RSPs do not truly represent a transfer of the underlying insurance contract but rather represent a transfer of some or all insurance risk that is transferred from the original policyholder to the issuing member. As such, FA believes that it would not qualify for transfer accounting but would qualify for reinsurance accounting.

\textsuperscript{16} A novation involves the transfer of contractual rights and obligations from one party to another with all three parties agreeing to the terms (i.e., the original two parties to the contract and the new party that is accepting the transfer of contractual rights).

MEMORANDUM

To: Members in the Property and Casualty Insurance Practice Area

From: Steven W. Easson, Chair
Actuarial Guidance Council

Sarah Chevalier, Chair
Committee on Property and Casualty Insurance Financial Reporting

Date: December 7, 2020

Subject: Revised Draft Educational Note: IFRS 17 Discount Rates and Cash Flow Considerations for Property and Casualty Insurance Contracts

The Committee on Property and Casualty Insurance Financial Reporting (PCFRC) has prepared this draft educational note to provide guidance related to setting and applying discount rates (including cash flow considerations) for the purposes of calculating the present value of estimates of future cash flows under IFRS 17.

This draft educational note is structured in sections as follows:

- Sections 1 and 2, respectively, provide an introduction and a list of the terminology used in this draft educational note.

- Sections 3 through 7 illustrate various considerations in determining an entity’s fulfilment cash flows, including selecting an IFRS 17 discount curve.

- Sections 8 through 13 provide additional guidance around the application of discount rates, measuring changes in discounting assumptions, and other aspects of financial statement presentation.

- Section 14 describes the illustrative examples set out in Appendices 1 through 7, detailed in the Excel file that forms part of this draft educational note.

This draft educational note is focused on the Canadian market, economic environment, and products. Similar considerations and approaches could be used for setting the discount rates for other currencies. It is written from the perspective of Canadian actuaries and is not intended to duplicate any other guidance. Additional information that provides more details can be found in IAA guidance or other CIA documents. The draft educational note Compliance with IFRS 17 Applicable Guidance provides guidance to actuaries when assessing compliance with IFRS 17. It is applicable to all educational notes pertaining to IFRS 17 and members are encouraged to review it prior to reading any educational note related to IFRS 17.

A preliminary version of the draft educational note was provided to the following committees for their review and comments, and presented at the Actuarial Guidance Council (AGC) in the months preceding its approval:
• Committee on Life Insurance Financial Reporting (CLIFR)
• Committee on Risk Management and Capital Requirements (CRMCR)
• Committee on the Appointed/Valuation Actuary
• International Insurance Accounting Committee (IIAC)
• Committee on Worker’s Compensation
• Group Insurance Practice Committee
• ASB’s Designated Group on IFRS 17.

A preliminary version of the draft educational note was also shared with the staff of the Accounting Standards Board (AcSB) to broaden consultations with the accounting community. Given this educational note provides actuarial guidance rather than accounting guidance, the AcSB staff review was limited to citations of and any inconsistencies with IFRS 17. CIA educational notes do not go through the AcSB’s due process and therefore, are not endorsed by the AcSB.

The subcommittee feels that it has addressed the material comments received by the various committees.

Although most P&C cash flows are within the observable period, this draft educational note refers to discount curves in the unobservable period, based on guidance developed by CLIFR in respect of discount rates for Life and Health Insurance Contracts.

The creation of this cover letter and draft educational note has followed the Actuarial Guidance Council’s Protocol for the Adoption of Educational Notes. In accordance with the Institute’s Policy on Due Process for the Approval of Guidance Material other than Standards of Practice and Research Documents, this draft educational note has been prepared by PCFRC and has received approval for distribution from the AGC on August 11, 2020.

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the Standards of Practice; and as such, the actuary should cross-reference with current Standards. To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.

If you have any questions or comments regarding this educational note, please contact Sarah Chevalier at sarahchevalier@axxima.ca.

1. Introduction

IFRS 17 Insurance Contracts (IFRS 17) establishes principles for the recognition, measurement, presentation, and disclosure of insurance contracts. The purpose of this draft educational note is to provide practical guidance on Canadian-specific issues relating to discounting estimates of future cash flows for property and casualty (P&C) insurance companies under IFRS 17. References to specific paragraphs of IFRS 17 are denoted by IFRS 17.XX, where XX represents the paragraph number.

As indicated in IFRS 17.B72 and summarized below, various discount rates are used for applying IFRS 17. Chapter 3 of the CIA draft educational note (EN) *Application of IFRS 17 Insurance Contracts* (IFRS 17 Application EN) provides general guidance about discount rates. The draft educational note *IFRS 17 Application* adopts without modification International Actuarial Note 100 Exposure Draft (*IAN 100 ED*) of the International Actuarial Association (IAA).

Guidance in respect of each of these applications is provided in Question 3.2 of the CIA IFRS 17 Application EN:

Under IFRS 17, insurance contract liabilities include the liability for remaining coverage (LRC) and the liability for incurred claims (LIC). Fulfilment cash flows for these liabilities, when calculated using the general measurement approach (GMA), are described in IFRS 17.32(a), which states that the fulfilment cash flows comprise:

(i) estimates of future cash flows;

(ii) an adjustment to reflect the time value of money and the financial risks related to the future cash flows, to the extent that the financial risks are not included in the estimates of the future cash flows; and

(iii) a risk adjustment for non-financial risk.
This draft educational note provides practical application guidance and illustrative examples (basic and with options) on issues relating to determining discount rates and other discounting assumptions and applying such assumptions to the LIC for P&C insurance contracts. In respect of LRC for P&C entities, the discount rate guidance in this draft educational note should be read in conjunction with the draft educational note being developed by PCFRC to address all aspects of LRC.

This draft educational note supplements the following:

- CIA Revised Exposure Draft (Document 220036, March 2020): *Incorporate changes required by the adoption in Canada of IFRS 17 Insurance Contracts, including Principles of International Standard of Actuarial Practice 4 – Actuarial Practice in Relation to IFRS 17 Insurance Contracts, into the Canadian Standards of Practice*.

In addition, the following draft educational notes are referenced in the commentary that follows and may serve as additional useful guidance to actuaries:

- CIA Draft Educational Note (September 2018): *Comparison of IFRS 17 to current CIA standards of practice*.

- CIA Draft Educational Note (forthcoming): Liability for remaining coverage for Property and Casualty Insurance Contracts (PCFRC LRC EN).

In writing this draft educational note, PCFRC followed the following guiding principles:

- Consider Canadian-specific perspectives rather than simply repeating international actuarial guidance.

- Develop application guidance that is consistent with IFRS 17 and applicable Canadian actuarial Standards of Practice and educational notes without unnecessarily narrowing the choices available in IFRS 17.

- Consider practical implications associated with the implementation of potential approaches and methods; in particular, ensure that due consideration is given to options that do not require undue cost and effort to implement.

2. Terminology

The following terminology is used in this draft educational note:

- **Discount rate**: Rate used to discount the estimates of future cash flows which is consistent with the timing, liquidity and currency of the insurance contract cash flows.
A discount rate may be a single rate, or a curve of rates varying by duration. “Discount rate curve” and “yield curve” are used interchangeably in this draft educational note.

- **Estimates of future cash flows**: Future undiscounted cash flows arising from the insurance contracts or reinsurance held contracts.

- **Forward rate**: The interest rate implied by the yield curve over a given future period. Mathematically, the forward rate over time \([n-1, n]\) is

\[
s_n = \frac{(1 + y_n)^n}{(1 + y_{n-1})^{n-1}} - 1,
\]

where \(y_n\) denotes the spot rate for maturity \(n\). The forward rate over time \([n-1, n]\) can be conceptualized as the interest rate that equates the strategies of

- investing in the \(n\)-year spot rate, and
- investing in the \((n-1)\)-year spot rate and then in the forward rate.

- **Fulfilment cash flows**: Present value of the estimates of future cash flows plus the risk adjustment for non-financial risk (risk adjustment).

- **Insurance finance income or expense**: The change in the carrying amount of the group of insurance contracts arising from the effect of the time value of money and changes in the time value of money and financial risk. This may be separated into three components, as follows, although it is not a requirement to do so:

  - Unwinding of discount: Insurance finance expense arising from the release of the effect of discounting at a subsequent measurement date due to the passage of time.
  - Changes in discounting assumptions: Insurance finance income or expense arising from changes in discount rates at a subsequent measurement date.
  - Changes in the effect of financial risk other than discounting (unlikely to be relevant to P&C insurance contracts).

- **Liquidity premium**: Adjustment made to a liquid risk-free yield curve to reflect differences between the liquidity characteristics of the financial instruments that underlie the (risk-free) rates observed in the market and the liquidity characteristics of the insurance contracts. The term “liquidity premium” in this draft educational note has the same meaning as the term “illiquidity premium” in the IFRS 17 Application EN.

- **Payment pattern**: Expected pattern of payment of future cash flows.

- **Present value**: Future cash flows discounted to the valuation date.

- **Reference portfolio**: A portfolio of assets used to derive discount rates based on current market rates of return, adjusted to remove returns related to risk characteristics embedded in the portfolio that are not inherent in insurance contracts. For cash flows of insurance contracts that do not vary based on the returns on the assets in the reference portfolio, such adjustments may include:
• adjustments for differences between the portfolio and the insurance contract cash flows in respect of the timing, currency and liquidity of cash flows; and
• excluding premiums for credit risk and which are relevant only to the assets included in the reference portfolio.

• **Spot rate:** The current interest rate available for a cash flow with a given time to maturity.
• **Yield curve:** The set of spot rates as a function of time to maturity.
• **Yield to maturity:** The annual rate of return of a bond (or group of bonds) assuming that the investor holds the bond(s) until the maturity date(s).

This draft educational note applies to the LRC and the LIC of insurance and reinsurance contracts issued and reinsurance held contracts.

### 3. Determining estimates of future cash flows

Unless specified otherwise, “ceded” refers to reinsurance held, and “net” refers to net of reinsurance held.

Under IFRS 17, fulfilment cash flows are required in respect of insurance contracts issued, reinsurance contracts issued and reinsurance contracts held. Depending on the organization of the available data and the correspondence between the direct and reinsurance held groups, the actuary may choose to estimate the future cash flows pertaining to reinsurance contracts held by subtracting net future cash flows (i.e., net of reinsurance held) from gross future cash flows (i.e., insurance and reinsurance contracts issued). When doing so, the implied ceded cash flows would be assessed for reasonableness.

The actuary may consider the following:

• **Data availability:** If there is sparse or limited data for ceded claims, it may not be possible or appropriate to directly estimate the present value of ceded cash flows.
• **Cash flow volatility:** Different approaches may be warranted for different segments of business depending on the volatility of cash flows by segment.
• **Reinsurance held:** Consideration would be given to the type and consistency of an entity’s reinsurance held. For example, it may not be appropriate to use the net basis as a starting point if the entity’s retention has changed significantly over the experience period.

Estimates of future cash flows are typically determined by applying payment patterns to selected estimates of future unpaid losses (prior to consideration of the time value of money) on an accident year, policy year, or underwriting year basis using a set of actuarial assumptions and methods.

In accordance with IFRS 17.63, the expected future cash flows of reinsurance contracts held would consider the non-performance of the issuers of the reinsurance contracts. The non-performance includes elements such as delay in payments, default, effect of collateral, and
dispute. The actuary would refer to additional details provided in the PCFRC Reinsurance EN.

IFRS 17.B65 specifies that cash flows within the boundary of an insurance contract are those that relate directly to the fulfilment of the contract, including cash flows for which the entity has discretion over the amount or timing. Examples of such cash flows include claim handling costs (i.e. ULAE), receivables, payables, reinstatement premiums and contingent commissions.

3.1 Selecting a payment pattern

Loss payments and estimates of ultimate losses are generally divided into homogeneous business segments for the selection of payment patterns. For this purpose, losses may include loss-related expenses (allocated/external loss adjustment expenses and unallocated/internal loss adjustment expenses), or separate payment patterns may be derived for each of these elements.

Consideration is given to the following:

- The business segments used for the analysis of the liabilities on an undiscounted basis, and which may not correspond to the entity’s insurance contract portfolios.
- The payout period (i.e., the length of time over which payments are expected to be made for a segment of claims).
- The existence of a predetermined schedule of payments for a segment of claims.

Selected payment patterns are normally derived from the entity’s historical experience. To the extent that an entity’s historical experience does not exist (e.g., for a new segment), is not relevant (e.g., changes in claims handling practices) or does not have a reasonable level of credibility (e.g., very low claims volume or significant volatility in claims experience), it may be necessary to evaluate other related or external experience. To the extent possible, such other experience would reflect the expected payment and timing characteristics of the segment under consideration.

Within a segment, payment patterns may vary by accident, policy or underwriting period to reflect changes in legislation, mix of business, reinsurance, or operations (such as claims settlement practices).

Selected payment patterns would reflect the actuary’s best estimate with regards to the timing and amount of payments. It may be appropriate to assume that the payment pattern for indemnity and/or external (allocated) claims adjustment expenses also applies to internal (unallocated) claims adjustment expenses.

The payment pattern reflects the timing of expected salvage, subrogation, reinsurance recovery, and loss transfer amounts as applicable. Cash flows would normally be consistent between the reinsurance contracts held and the underlying insurance contracts written on a direct or gross basis, subject to consideration of any significant recovery lag and the treatment of ceding commissions and ceded claims-related expenses. Consequently, gross, ceded, and net payment patterns are likely to be similar for a given line of business if the entity’s reinsurance is in the form of quota-share reinsurance.

Expected payment patterns are frequently derived by segment based on a review of the
historical ratios of paid claims to selected ultimate claims at successive maturity ages. Alternatively, the expected payment patterns may be derived directly from the selected paid development factors if such factors are consistent with the selected ultimate claims.

An example of payment pattern is provided in Appendix 1.

Additional considerations specific to the selection of payment patterns for LRC are addressed in the forthcoming draft educational note: Liability for Remaining Coverage for P&C insurance contracts.

3.2 Timing of future payments

To determine the expected timing of future payments, the actuary may refer to payment timing studies based on the entity’s own data and claims settlement practices. It is common to determine annual, semi-annual, or quarterly payment patterns and assume that payments will, on average, be made in the middle of each period. For example, if the selected payment pattern is annual, the actuary frequently assumes that, on average, payments are made in the middle of each period (i.e., at 6, 18, 30, etc. months) for the purpose of discounting estimates of future cash flows. The mid-period assumption may not be appropriate for books of business with uneven exposures, which may occur when claims are subject to seasonality or for books of business experiencing significant change in volume, or very short payment patterns.

4. Determining discount rates

4.1 Discount rates

Discount rates are described in IFRS 17.36 as having the following characteristics:

(a) reflect the time value of money, the characteristics of the cash flows and the liquidity characteristics of the insurance contracts;

(b) be consistent with observable current market prices (if any) for financial instruments with cash flows whose characteristics are consistent with those of the insurance contracts, in terms of, for example, timing, currency and liquidity; and

(c) exclude the effect of factors that influence such observable market prices but do not affect the future cash flows of the insurance contracts.

Further considerations are provided in IFRS 17.B72–B85.

IFRS 17 permits an entity to use either of two methods to determine the discount rates to be used for the valuation of insurance contract liabilities (IFRS 17.B80–B81):

• A bottom-up approach whereby a liquid risk-free yield curve is adjusted “to reflect the differences between the liquidity characteristics of the financial instruments that underlie the rates observed in the market and the liquidity characteristics of the insurance contracts.”

• A top-down approach whereby the yield to maturity of a reference portfolio of assets is adjusted “to eliminate any factors that are not relevant to insurance contracts.” Under this approach, the liquidity characteristics of the reference portfolio would reasonably reflect the liquidity characteristics of the cash flows, but the entity “is not required to adjust the
yield curve for differences in characteristics of the insurance contracts and the reference portfolio.

**Discount Rate Models**

<table>
<thead>
<tr>
<th>Bottom-Up</th>
<th>Top-Down</th>
</tr>
</thead>
<tbody>
<tr>
<td>Risk-Free Yield</td>
<td>Credit Risk</td>
</tr>
<tr>
<td>IFRS 17 Discount Rate</td>
<td>Market &amp; Other Risks</td>
</tr>
<tr>
<td>Liquidity Premium</td>
<td>Factors not relevant to insurance contracts</td>
</tr>
</tbody>
</table>

It is possible for the two approaches to lead to the same discount rate, but they may result in different discount rates due to limitations on the way in which adjustments are calculated. Under IFRS 17, an entity will not be required to reconcile the discount rates determined under the two approaches.

The selection of one approach over the other depends on a number of considerations, such as the characteristics of the liability cash flows (including the duration of claim payments), the availability of suitable data, the investment environment, and how frequently the discount rate is expected to be updated.

Also presented in this draft educational note is an approach to the derivation of liquidity premiums using a top-down approach applied to a reference portfolio. The resulting liquidity premiums are then used in a bottom-up approach.

\[
\text{IFRS 17 Discount Rate} = \text{Risk-Free Rate}^1 + \text{Reference Portfolio Liquidity Premium}^2
\]

1. Risk-free rate as at the valuation date, based on the bottom-up approach.
2. Liquidity premium, derived at a date that may not be the same as the valuation date, and based on the top-down approach.

As indicated by the formula above, this is fundamentally a bottom-up approach, but the use of a reference portfolio to derive a liquidity premium curve incorporates certain important features of a top-down approach. One key advantage of this hybrid approach is that it blends the use of a robust model for estimating liquidity premiums, which can be updated periodically as appropriate (e.g., annually or quarterly), with the use of readily available Canadian risk-free yield curves, which are updated weekly.
IFRS 17 does not specify whether the entity should use a single discount rate or a discount rate curve. This draft educational note describes the derivation of discount rate curves (i.e., rates that vary by duration), although such a curve may be converted into a single equivalent discount rate for calculation purposes or for information only.

4.2 **Bottom-up approach**

The bottom-up approach is illustrated in the figure below:

<table>
<thead>
<tr>
<th>Bottom-Up Discount Rate</th>
<th>Risk-Free Rate</th>
<th>Liquidity Premium</th>
</tr>
</thead>
</table>

The main advantage of using the bottom-up approach is the availability of risk-free yield curves. The main drawback to this approach is the need to derive a liquidity premium if or when a non-zero liquidity premium is required.

4.2.1 **Risk-free rate**

Government of Canada (GoC) bonds are considered to be risk-free due to the low probability of default of the Canadian government. Other options are available (such as a swap curve), but these options were not explored as they have limited applicability in Canada.

Potential sources for GoC bond rates include the following publicly-available data:

- Government of Canada spot yield curves (current rates).
- Forward 1-year Government of Canada rates (forecast rates).

Government of Canada zero-coupon bond rates have the following advantages over the other two sources:

- Timeliness of data, which is updated weekly.
- Availability of the data at a reasonable level of granularity, with maturities ranging from 0.25 years to 30 years in quarterly increments, and thus there is limited need to interpolate or extrapolate values.

4.2.2 **Liquidity premium (theoretical)**

The following excerpt from Question 3.15 in Chapter 3 (Discount Rates) of the IFRS 17 Application EN pertains to the quantification of the liquidity characteristics of insurance contracts:

The adjustment to reflect the liquidity characteristics of the insurance contracts has been broadly termed the illiquidity premium. Highly liquid insurance contracts would have a low (or even no) illiquidity premium while very illiquid contracts would have a higher illiquidity premium.

Data relating to illiquidity premium of insurance contracts is generally not directly available in the market. Looking beyond insurance contracts, market prices for liabilities
where the issuer of debt has the possibility to redeem the debt early are also very limited.

A theoretical approach to determine the illiquidity premium is to assess possible replicating portfolios.

The use of replicating portfolios is theoretically feasible but generally impractical due to the requirement to “exactly match the insurance contract cash flows in all scenarios.” Thus, replicating portfolios are not considered in this draft educational note.

The following practical estimation approaches for estimating illiquidity premiums are described in Question 3.15 in the IFRS 17 Application EN:

- Using a reference portfolio and determining its illiquidity premium using top-down techniques.
- Comparing yields on illiquid to liquid assets, both with same or similar degree of credit risk.

The first of these approaches (i.e., use of a reference portfolio) was selected for illustrative purposes in Appendix 2. The use of a reference portfolio to derive liquidity premiums is described later in this draft educational note.

4.3 Top-down approach

The top-down approach is illustrated in the formula below:

\[
\text{Top-Down Discount Rate} = \text{Reference Portfolio Rate} - \text{Credit Risk, Market Risk & Other Adjustments}
\]

The main advantage of the top-down approach is that it does not require the explicit derivation of a liquidity premium. A disadvantage of this approach is the potential complexity of the derivation of a reference portfolio rate and applicable adjustments (such as a credit risk adjustment), particularly if the discount rate is expected to be updated frequently.

4.3.1 Selection of a reference portfolio

As described in Question 3.18 in the IFRS 17 Application EN:

An entity may determine appropriate discount rates for insurance contracts using a top-down approach (paragraph B81). Under this approach, discount rates are based on current market rates of return of a reference portfolio of assets which are adjusted to remove risk characteristics embedded within the reference portfolio but that are not inherent in insurance contracts. These adjustments are discussed in Questions 3.19 and 3.20.

IFRS 17 does not require that adjustments to the yield curve be made for residual differences in liquidity characteristics of the insurance contracts and the reference portfolio. Nonetheless, an entity may still adjust the yield curve for these differences, as discussed in Questions 3.14–3.17.
Such adjustments would be appropriate if the liquidity characteristics of the assets in the chosen reference portfolio are not reasonably consistent with the liquidity characteristics of the insurance contracts.

Reference portfolios are key to the top-down approach. If properly adjusted for all risks that are not inherently part of insurance contracts, then the remaining difference relative to a risk-free rate is largely attributable to the asset liquidity premium.

As indicated in IFRS 17.B85, IFRS 17 does not specify restrictions on the reference portfolio of assets used in applying IFRS 17.B81 (top-down approach). However, fewer adjustments would be required to eliminate factors that are not relevant to the insurance contracts when the reference portfolio of assets has similar characteristics.

The reference portfolio may be based on actual assets held by the entity or on a theoretical portfolio of assets.

Factors that may differ between a reference portfolio and insurance contracts include:

- liquidity
- investment risk (e.g., credit risk, market risk)
- timing
- currency risk

Liquidity risk and investment risk are addressed in Sections 4.5 and 4.4, respectively.

In selecting the reference portfolio, the actuary would assess the consistency of the timing of payments between the assets in the reference portfolio and the insurance contract liabilities. For example, if the reference portfolio includes bonds with coupons, the actuary may make adjustments to reflect the timing of both the coupon payments and principal repayment if such adjustment is expected to materially affect the selection of discount rates. Potential approaches include:

- considering the duration (rather than the time to maturity) of the securities in the reference portfolio; and
- constructing a reference portfolio that explicitly considers both coupon payments and principal repayments, rather than a simplified approach based only on principal repayments.

Currency risk might be addressed by selecting a reference portfolio made up of investments denominated in the same currency as the insurance contracts.

### 4.4 Reference portfolio discount rate

#### 4.4.1 Credit risk adjustment

For debt instruments, the effect of credit risk (if non-trivial) is eliminated from the total bond yield. According to Question 3.19 in the IFRS 17 Application EN, the effect of credit risk usually comprises two components: the expected credit losses and the unexpected credit losses (i.e.,...
compensation for bearing that risk). The credit risk adjustment includes default risk and downgrade risk.

A bond default occurs when the bond issuer fails to make an interest or principal payment within the specified period. In the case of default, the bondholders will be able to recover part of the value of the bond.

In a downgrade scenario, a bond that is downgraded to a level below investment grade (or other selected threshold) may result in the disposition of the bond below its current value.

There is a wide range of practice to estimate the required deduction for credit risk inherent in bond yields. Observed practices include:

- market-based approach;
- structural model techniques; and
- historical distribution techniques.

Note that several approaches used to estimate the deduction for credit risk are complex, particularly with regards to the unexpected credit risk. Potential approaches for the derivation of the unexpected default risk include:

- default risk at a probability level greater than the mean (e.g., 90th percentile); and
- default risk derived as a multiple of the expected default risk (e.g., twice the expected value).

Examples of application are presented in Appendix 2.

Similarly, unexpected downgrade risk (if not assessed as part of the default risk) may be incorporated by increasing the downgrade risk adjustment by a selected margin (e.g., five basis points).

### 4.4.2 Market risk and other adjustments

As per IFRS 17.881, “an entity shall adjust that (reference portfolio) yield curve to eliminate any factors that are not relevant to the insurance contracts.” A market risk adjustment is generally not required if the reference portfolio is comprised solely of bonds.

IFRS 17 does not require that adjustments to the yield curve be made for residual differences in liquidity characteristics of the insurance contracts and the reference portfolio. Nonetheless, an entity may adjust the yield curve for those differences.

### 4.5 Liquidity premium based on reference portfolio

A combined approach is illustrated in the equation below:

\[
\text{IFRS 17 Discount Rate} = \text{Risk-Free Rate}^1 + \text{Reference Portfolio Liquidity Premium}^2
\]

1. Risk-free rate as at the valuation date, based on the bottom-up approach.
2. Liquidity premium, derived at the reference portfolio date, a date that may not be the same as the valuation date, and based on the top-down approach.
Risk-free rates as at the valuation date are comparable to those at the reference portfolio date, which are used to derive the liquidity premium as described below.

After calculating the yield to maturity on the reference portfolio and the corresponding credit risk adjustments, the liquidity premium is calculated as shown below:

| Reference Portfolio Liquidity Premium = Top-Down Discount Rate – Risk-Free Rate |

The liquidity premium used in the rates to discount the insurance contract liabilities may differ from the liquidity premium derived from the reference portfolio. As described in Question 3.15 in the IFRS 17 Application EN:

... What follows is an example of a simple method used to relate the illiquidity premium of insurance contracts to the asset portfolios:

Assume liability illiquidity premium = r * asset portfolio illiquidity premium + constant illiquidity premium difference where the constant term and multiplicative factor (r) is set based on either judgment or data if any is available. In the selection of the factor differing market environments may be taken into consideration. For example, using a high multiplicative factor (r) and a constant = 0 may not produce a convincing result during a credit crisis. It would be difficult to justify insurance contracts having a higher illiquidity premium than the return on assets available for investment earning the illiquidity premium. This, however, is not a directly relevant factor in setting the illiquidity premium level.

The above approach is based on a top-down approach. For those using bottom-up there may be a discernible relationship between the level of the illiquidity premium and other market data such as the level of risk-free rates and/or the level of credit spreads. For example, there may be a different illiquidity premium in a 10% rate environment than in a 5% environment. However, if analysis showed the same level of credit spreads in these disparate environments then the level of illiquidity premiums in these environments might be the same.

The combination of the multiplicative factor (r) and the additive constant defines the relationship between the liquidity of the reference portfolio assets and the liquidity of the insurance contracts. In the illustrative example in Appendix 2, the reference portfolio yield is adjusted to remove the estimated credit risk, and the remaining spread over risk-free rates is considered to be attributable to the liquidity premium. In this example, no adjustments are considered necessary. Accordingly, r is set to 100% and the constant is set to 0.

Another way of presenting the relationship between the liquidity of the reference portfolio assets and the liquidity of the insurance contracts is as suggested in the draft educational note IFRS 17 Discount Rates for Life and Health Insurance Contracts (June 2020). In this case, the liquidity premium is expressed as a fixed percentage of asset reference portfolio spread over risk-free rates and an additional constant adjustment to reflect the difference between the liquidity characteristics of the insurance contract and the asset reference portfolio.

\[ \text{Liquidity Premium} = r \times \text{asset reference portfolio spread over risk free} + \text{constant} \]
The multiplicative factor \( r \) represents the portion of the asset spread that relates to the liquidity premium.

The constant in the formula is to account for the liquidity difference between assets in the reference portfolio and the insurance contracts. The application of the constant adjustment depends on the combination of reference portfolio and the liquidity characteristics of the insurance contracts.

### 4.6 Liquidity of P&C insurance contract liabilities

IFRS 17.36 states that the discount rates applied shall reflect the liquidity characteristics of the insurance contracts.

The following guidance is from Question 3.14 of the IFRS 17 Application EN:

In order to understand the nature of insurance contract liquidity characteristics one may consider the liquidity characteristics of other financial instruments: in the context of fixed income financial instruments, liquidity is the ability to convert the asset into cash or extinguish the liability on demand. The liquidity arises from either call or put options embedded into the instrument or the marketability of the instrument.

BC193 specifically draws the parallel between insurance contracts and fixed income financial instruments and suggests that liquidity characteristics of insurance contracts be viewed from the perspective of the features embedded within the contract. This view is also echoed in the IAA Discount Rate Monograph which, on page 38 of section IV, states: *the liquidity of a liability is a function of the basic contract provisions, and especially any options that might exist for the policyholder that would impact the uncertainty regarding the amount and timing of payments.*

This answer addresses the liquidity characteristics of insurance contracts from the perspective of the contract’s features. Some practitioners ask if the liquidity characteristics of insurance contracts should be assessed from the insurer’s perspective. The motivation of this view is BC194 which suggests that the motivation of including a liquidity premium is the entity’s ability, or lack thereof, to sell / put the contract. The focus of IFRS 17 in general is on the insurance contract features and as such this answer explores liquidity from the perspective of the contract’s features.

Note that this answer focuses on qualitative assessments of insurance contact liquidity. See response to Question 3.15 for a discussion on the quantitative assessment of illiquidity premium.

Contract features that may influence the liquidity of an insurance contract include:

- **Exit costs**: all else being equal, a contract with exit costs (e.g., surrender charges / penalties) is likely to be more illiquid than one without. Note exit is contemplated as voluntary exit / cancellation of contract and occurrence of the insured event is not considered a contract exit, as contemplated in this response.
• **Inherent value / value build-up**: If a contract’s pricing / construction is such that there is negligible / no inherent value then, other than any exit costs, it is likely to be considered liquid. If on exit of a contract there is:
  o little inherent value in the contract and there are no costs to exit the contract then the contract could be considered to be liquid;
  o little inherent value in the contract and there are costs to exit the contract then the contract could be considered to be illiquid.

For example, yearly renewable general insurance contracts, whose design builds negligible value and are without exit costs, are likely to be considered liquid. [emphasis added]

For contracts with no cash value, increasing risk and level premium payment, longer contract boundaries are potentially less liquid than contracts with shorter boundaries as the extended boundary potentially leads to greater inherent value / value build-up. To illustrate this a twenty-year term insurance contract could be viewed as less liquid than a two-year term insurance contract.

• **Exit value**: all else being equal, a contract where upon exit all / a large part of the value build-up is paid out is more liquid than one that pays out none or a small part of the value build-up. If on exit of a contract there is:
  o value in the contract and the policyholder receives all / a large part of the value of the contract, then the contract may be considered to be liquid.
  o value in the contract and the policyholder receives no / a small part of the value of the contract, then the contract may be considered to be illiquid.

**Liability for incurred claims might be considered illiquid as there is no potential avenue for the policyholder to obtain the exit value yet there is tangible inherent value (else a claim would not have been made.)** [emphasis added]

The assessment of liquidity of P&C insurance contract liabilities is subject to judgment in the interpretation of IFRS 17 and related guidance. Guidance in this regard is evolving, and changes in that guidance resulting from new interpretations of IFRS 17 may lead to revisions to the assessments described below.

**4.6.1 Insurance contracts and reinsurance contracts issued**

For the purposes of this draft educational note, the LRC and LIC for particular products are identified as either “liquid” or “illiquid.” An actuary may determine that it is appropriate to consider “degrees” of liquidity. The “perceived liquidity” is subject to consideration of specific contract provisions that may affect the liquidity of the LRC.

The following table describes the categorization of liquidity of the insurance contract of LRC and LIC. For each category, there are examples of non-standard P&C products that may require special consideration. Furthermore, an actuary would consider specific contract provisions that may have a bearing on the liquidity of insurance contract liabilities.
<table>

The following table contains descriptions of certain non-standard P&C products that may require special consideration in the context of the valuation of the LRC.

<table>
<thead>
<tr>
<th>P&amp;C Product</th>
<th>Description</th>
<th>Perceived Liquidity</th>
</tr>
</thead>
</table>
| Title       | • Lump-sum premium earned at issuance.  
• No cancellation options available that would result in any return of premium, as the policyholder is already beneficiary of the title search that was used to determine the status of the title. | Illiquid |
| Mortgage    | • Lump-sum premium at the issuance of the mortgage.  
• If mortgage is pre-paid or discharged, policyholder is not entitled to any premium refund. | Illiquid |
| Contract surety | • Policyholder cannot cancel the policy because the policyholder is not the beneficiary of the policy.  
• The contract expires after the completion of the project (or after completion of all projects specified in the policy). | Illiquid |
| Fidelity and fiduciary surety | • In most cases, the policy is mandatory but the policyholder may cancel the policy if the obligation ends or if the policyholder finds a more attractive policy. | Liquid |
| Warranty | • In most provinces, contracts are cancellable, and the policyholder would be entitled to a pro-rated refund.  
• In some provinces, the contract might not be cancellable, in which case it would be considered illiquid. | Liquid |

4.6.2 Liquidity of reinsurance contracts held

The general concepts outlined above in respect of insurance contracts also apply to reinsurance contracts held (ceded) and reinsurance contracts issued (assumed).
For a group of reinsurance contracts or treaties, the liquidity of the LRC is evaluated on the basis of the ability of the purchaser of the reinsurance to cancel the reinsurance contract before its expiry date and to receive value. Most reinsurance contracts have a one-year term with limited provision for early cancellation by either party. Treaty-specific cancellation provisions are considered for the purposes of assessing liquidity.

In most cases, the LIC for a group of reinsurance contracts is likely considered illiquid based on the inability of the purchaser of reinsurance to influence the timing of claim payments.

4.6.3 Single liquidity premium

According to Chapter 3 (Question 3.16) in the IFRS 17 Application EN:

Insurance contracts exhibiting different features may have different exit costs, inherent value and/or exit value. As such, products are expected to have different illiquidity premiums. Products within the same portfolio, however, may have similar illiquidity premiums/characteristics since they are similar risks. An entity may elect to use a single average illiquidity term structure across products within a given portfolio.

By extension, it is reasonable for an entity to elect to use a single weighted average liquidity term structure (i.e., liquidity premium curve) for the LRC and LIC of a given portfolio.

P&C actuaries generally assess the LIC and LRC separately for a given portfolio and for its underlying groups. Furthermore, for P&C contracts, the unexpired portion of the contracts and the incurred claims generally exhibit different liquidity characteristics: the first being generally liquid and the second being illiquid. Consequently, it is intuitive to consider that the liquidity premium or that the yield curve could be different to discount the LIC or the LRC.

However, the IFRS 17 standard does not preclude the actuary from using a single liquidity premium or a single yield curve for both the LIC and LRC for a given portfolio. IFRS 17 refers to the liquidity characteristics of the insurance contracts and not of the liquidity characteristics of the LIC or of the LRC.

Consequently, the liquidity characteristics of P&C contracts for a given portfolio could be seen as the combination of:

- a portion that is liquid (unexpired portion and contracts with no claims); and
- a portion that is illiquid (expired portion of the contracts with claims incurred).

An approach with a single liquidity curve applied to both LIC and LRC could provide the following benefits:

- **Fewer yield curves to manage.** Generally, it is operationally simpler to reduce the number of calculations. This could reduce the number of curves to manage by half.

- **Single view of the profitability of portfolios.** The valuation of the fulfilment cash flows of the portfolios and groups would be more consistent when transitioning from LRC to LIC. This is especially true for long-tail coverages like auto accident benefits and auto bodily injury.
The unwinding of the discount could differ from the investment results of the investments supporting the LIC.

4.7 Duration of the observable market for discount rates

The observable market in Canada is 30 years. For additional details, please refer to Section 1 within Chapter 1 of the CLIFR draft educational note: *IFRS 17 Discount Rates for Life and Health Insurance Contracts*.

4.8 Long-term discount rate (unobservable ultimate rate)

To determine discounting assumptions beyond the observable period, please refer to Section 2 within Chapter 1 of the CLIFR draft Educational Note: *IFRS 17 Discount Rates for Life and Health Insurance Contracts*.

5. Reference curves

5.1 Introduction

The language related to discount rates in the IFRS 17 standard is brief and principles-based. The principles-based nature of the standards could lead to a wide range of practice amongst actuaries, particularly when setting discount rates beyond the observable period. Consequently, CLIFR and PCFRC have created parameters for a set of reference curves to facilitate comparison among entities of discount curves, particularly in the unobservable period.

In some instances, it is expected that the actuary would compare the present value of the estimates of future cash flows obtained using the selected discount curve with the present value obtained when using the reference curve parameters for the unobservable period. Most P&C cash flows are within the observable period, and therefore this comparison would not be required unless there are cash flows beyond the observable period. When there are estimates of future cash flows in the unobservable period, it is expected that the actuary would compare:

- The present value of the estimates of future cash flows obtained using the company’s own curve; and
- The present value obtained when using the reference curve parameters for the unobservable period, and the company’s own curve parameters in the observable period.

This chapter presents reference curves for insurance contracts that are deemed to be liquid and illiquid and outlines how these curves are constructed in the observable period and beyond the observable period.

This draft educational note only defines reference curves for liquid and illiquid cash flows. An entity may have grouped its insurance contracts in more than two liquidity categories. To the extent an entity has more than two discount curves, the actuary would use judgment to derive the reference curve that would apply to the insurance contracts that fall between the liquid and illiquid categories.
5.2 Defining the reference curve

In this section, the reference curves are defined for liquid and illiquid insurance contracts based on the following parameters:

- The length of the observable period.
- The risk-free rate and liquidity premiums for the observable period.
- The ultimate risk-free rate, the ultimate liquidity premiums and the approach used to interpolate between the last observable point and the ultimate point.

5.2.1 Defining the reference curve in the observable period

In the observable period, for terms up to 30 years, the risk-free rates are derived from the GoC debt securities.

The last observable point is set at the 30-year term based on GoC debt securities and the findings described in Chapter 1 of CLIFR’s draft educational note: *IFRS 17 Discount Rates for Life and Health Insurance Contracts*. The actuary would not deviate from the 30-year observable period for insurance contracts sold in Canada and in Canadian currency.

The reference curve liquidity premiums for liquid insurance contracts (e.g., amounts on deposit, or LRC for most P&C products) are set using provincial bonds as a reference portfolio and a credit risk adjustment. For each term up to 30 years, the liquidity premium is defined as the interest rate spread of the portfolio, adjusted for credit risk, over the risk-free rate derived from the GoC debt securities. This is approximately equivalent to a liquidity premium equal to 90% of the provincial bonds spread.

The reference curve liquidity premiums for illiquid insurance contract liabilities (e.g. Term 100, or LIC for most P&C products) are set using Canadian investment grade corporate bonds (those with credit ratings of no less than BBB) as a reference portfolio, adjusted with a constant to reflect the fact that these insurance contracts are less liquid than corporate bonds, and a credit risk adjustment. For each term up to 30 years, the liquidity premium is defined as 0.50% + 75% of the Canadian investment grade bonds spread over the risk-free rate derived from the GoC debt securities.

The resulting reference curves in the observable period are therefore:

a. Liquid curve: Risk-free rate + 90% of provincial bonds spread

b. Illiquid curve: Risk-free rate + 0.50% + 75% of Canadian investment grade bonds spread

5.2.2 Defining the reference curve in the unobservable period

Guidance on the reference curve in the unobservable period is provided in Section 2 within Chapter 2 of the CLIFR draft educational note: *IFRS 17 Discount Rates for Life and Health Insurance Contracts*.
5.3 Other considerations

5.3.1 Insurance finance expense versus investment income

There could be cases where the expected return on the assets of the insurer is lower than the discount rate applied to the estimates of future cash flows which would lead to the investment income for the assets supporting the insurance contracts being lower than the insurance finance expense. The actuary would understand the implications of setting discount rates that create a negative bias in investment results.

5.4 Suggested disclosures in the Appointed Actuary’s report

The discount curve applied to the estimates of future cash flows is a significant assumption impacting many aspects of the financial statements. The discount curve will be a driver of the fulfilment cash flows, the CSM at initial recognition and the insurance finance expense. As a result, it is recommended that the actuary include information in the Appointed Actuary’s report to outline the methodology used to develop the discount curves for all insurance contracts in-force.

5.4.1 Discount curves within the observable period

For discount curves that do not extend beyond the observable period, the information provided would include a description of the methodology used to set the discount curves for all currencies, and would cover the points outlined below:

1. The last observable point.
2. The derivation of the liquidity premiums in the observable period.
3. The derivation of reference curves used for liabilities, if any, that fall between the liquid and illiquid categories described in this draft educational note.
4. For insurance contracts issued in Canadian currency, it is recommended that the actuary comment in general terms on the extent to which the discount curve differs from the reference curve described in Section 5.2.1. A quantitative comparison is not required.

5.4.2 Discount curves beyond the observable period

Recommended disclosures that relate to discount rates in the unobservable period are outlined in Section 4 within Chapter 2 of the CLIFR draft educational note: *IFRS 17 Discount Rates for Life and Health Insurance Contracts*.

6. Discounting the estimates of future cash flows

In accordance with IFRS 17.36, discount rates are expected to vary with the timing of the cash flows. The use of a yield curve rather than a single discount rate is one way to satisfy this requirement. Using a yield curve, the expected future cash flows at a given payment maturity are discounted using the rate from the yield curve with the corresponding maturity.

To discount the estimates of future cash flows, four assumptions are required:

- The undiscounted liability amount (Section 3).
- The expected payment pattern of the undiscounted liability amount (Section 3.1).
• The expected timing of future payments (Section 3.2).
• The yield curve consistent with the characteristics of future cash flows (Section 4).

7. Applying the risk adjustment and determining the fulfilment cash flows

The actuary is responsible for including a risk adjustment in the fulfilment cash flows. The risk adjustment is determined by the entity in accordance with IFRS 17. See the PCFRC Risk Adjustment EN for further details.

The fulfilment cash flows are calculated as follows:

Fulfilment cash flows = Discounted estimates of future cash flows + Risk adjustment

8. Locked-in yield curve

Locked-in yield curves refer to yield curves determined at the initial recognition of the group of contracts. Under IFRS 17, locked-in yield curves are used for three purposes:

• Adjusting and accreting interest on the CSM, which is a component of the LRC when the GMA is used.
• Systematic allocation of insurance finance expense to the income statement if the entity chooses to disaggregate the insurance finance income or expense between profit and loss and other comprehensive income (OCI).
• The entity uses the PAA and there is a significant financing component, as defined in IFRS 15 paragraphs 60-61.

In the context of financial reporting for P&C insurance contracts, locked-in yield curves are typically not used unless:

• the entity uses the GMA to determine the LRC for some or all groups of insurance contracts; or
• the entity elects the OCI option for some or all portfolios of insurance contracts.

Locked-in yield curves are determined in the same manner as current yield curves as described in Section 4.

In accordance with IFRS 17.B72, if the insurance contract liabilities for the group are initially measured using the GMA, the locked-in yield curves are determined at the date of initial recognition of the group of contracts. Based on Question 3.41 of the IFRS 17 Application EN, three approaches, amongst others, may be used to determine the locked-in yield curves for a group of contracts:

• Determine the locked-in yield curve for each contract within the group based on each contract’s respective issue date and carry calculations at the contract level.
• Determine the locked-in yield curve at the date of initial recognition of the group of contracts (i.e., at the issue date of the first contract included in the group) and carry calculations at the group level.
• Determine the locked-in yield curve using a weighted average discount curve based on
the issue dates of the various contracts in the group and carry calculations at the group
level.

Based on IFRS 17.B72(e)(iii), for groups of contracts applying the PAA, the locked-in yield curves
used for the OCI option are determined at the date of the incurred claims. It may be reasonable
for the actuary to determine the locked-in yield curve for the group at the average date of
incurred claims for the group. The actuary would consider the reasonableness of this
assumption based on the expected seasonality of claims associated with contracts in the group
as well as the economic environment during the locked-in period. For example, if interest rates
vary significantly during the locked-in period, the yield curve as at the average date may not be
appropriate.

9. Insurance finance expense

Under IFRS 17, incurred claims and directly attributable expenses create insurance expenses
that are accounted for in two separate lines of the income statement:

• The insurance service expense.
• The insurance finance expense.

IFRS 17.87(a) and (b) state:

Insurance finance income or expenses comprises the change in the carrying amount of the
group of insurance contracts arising from:

(a) the effect of the time value of money and changes in the time value of money; and
(b) the effect of financial risk and changes in financial risk; (…)

In this draft educational note:

• The “effect of the time value of money” is referred to as the unwinding of the discount and
represents the release of the effect of discounting at a subsequent measurement date due
to the passage of time.
• The “effect of changes in the time value of money” is referred to as the effect of changes in
discounting assumptions and represents the variation in the liability due to changes in the
yield curve relative to prior expectations.

IFRS 17 does not require these two components to be calculated separately, however some
companies may have an internal requirement to disclose the effect of changes in the discount
curve (market yield adjustment). Additionally, it may be easier to understand the insurance
finance expense as being composed of unwinding and effect of changes in discounting
assumptions.

10. Unwinding of discount

The release of the effect of discounting during a reporting period can be conceptualized as the
difference between discounting the cash flows to the beginning of the period and discounting
to the end of the period. Equivalently, the unwinding can be calculated by applying unwinding rates to the beginning of period present value cash flows.

The unwinding of discount does not include the effect of changes in discounting assumptions, however discounting assumptions at a given reporting date may include current expectations about how the discount curve will change over time. Three possible methods for calculating unwinding are presented below, each corresponding to a different a priori assumption about future discount rates.

### 10.1 Constant yield curve

This method calculates the unwinding expense using the same discount curve at the beginning and end of the period. It corresponds to the a priori assumption that the discount curve will remain the same at the end of the period.

The equivalent unwinding rates are the forward rates implied by the discount curve (see forward rate formula in Section 2). Calculating the unwinding expense by multiplying the forward rates by the beginning of period discounted cash flows will produce the same result as calculating the unwinding expense as the difference between the cash flows discounted to the beginning and end of the period.

Notes:

(*) Assuming end of year cash flows

(5) = (2) discounted to beginning of 2021 using (3)

(6) = (2) discounted to beginning of 2022 using (4)

### 10.2 Unwinding using spot rates

This method calculates the unwinding expense using an end of period discount curve that is equal to the beginning discount curve shifted by one period. That is, the 2-year spot rate becomes the 1-year spot rate, the 3-year spot rate becomes the 2-year spot rate, and so on. The equivalent unwinding rates are the beginning of period spot rates.
(1) Time                      2021  2022  2023  2024  2025  Total

(8) Unwinding rates = (3)  1.2%  1.8%  2.3%  2.5%  2.7% 
(9) Unwinding expense = (5) * (8)  1.19  1.74  2.15  2.26  2.36  9.70 

Notes: 
(*) Assuming end of year cash flows 
(5) = (2) discounted to beginning of 2021 using (3) 
(6) = (2) discounted to beginning of 2022 using (4) 

10.3 Expectations hypothesis

The expectations hypothesis proposes that the term structure of interest rates is solely determined by market expectations of future interest rate changes. Under the expectations hypothesis, the forward rates implied by the current yield curve represent the sequence of expected future single period spot rates.

This method calculates the unwinding expense using the end of period discount curve that is predicted by the expectations hypothesis. The equivalent unwinding rate is the one-period spot rate (i.e., one-year spot rate for annual reporting frequency, one-month spot rate for monthly reporting). Formulas for calculating the a priori ending discount curve can be found in Appendix 6 (Income Statement Calculations) in the excel file of illustrative examples.

11. Effect of changes in discounting assumptions

The effect of changes in discounting assumptions in the insurance finance income or expense encompasses changes in the yield curve relative to a priori assumptions, but not changes in payments patterns and changes in risk adjustment (which belong in the insurance service expense).
The calculation of the effect of changes in discounting assumptions would be consistent with the unwinding methodology used.

An illustrative calculation is provided in Appendix 6.

12. **Financial statement presentation**

12.1 **Statement of financial position**

The LIC presented in the statement of financial position is calculated using current discount rates. For each portfolio of contracts, the combined LIC and LRC are calculated. The statement of financial position separately presents:

- portfolios of insurance contracts issued that are assets;
- portfolios of insurance contracts issued that are liabilities;
- portfolios of reinsurance contracts held that are assets; and
- portfolios of reinsurance contracts held that are liabilities.

In addition, the entity establishes an accounting policy that addresses the OCI option in accordance with IFRS 17.88:

[...] an entity shall make an accounting policy choice between:

(a) including insurance finance income or expenses for the period in profit or loss; or

(b) disaggregating insurance finance income or expenses for the period to include in profit or loss an amount determined by a systematic allocation of the expected total insurance finance income or expenses over the duration of the group of contracts [...]

Based on IFRS 17.B130, if the entity elects the OCI option, the accumulated other comprehensive income (AOCI) includes the difference between the fulfilment cash flows calculated at current rates and the provision calculated at locked-in rates. There are no amounts related to insurance contracts in AOCI if the entity does not elect the OCI option.

12.2 **Statement of comprehensive income**

Total portion of the insurance service expenses relating to the LIC are calculated as follows:

Claim and expense payments in the period
+ LIC at the end of the period
- LIC at the beginning of the period

For financial reporting and note disclosure purposes, total incurred claims and expenses are broken down into several components, as follows:

Insurance service expense (P&L)
+ Insurance finance expense (P&L)
+ Insurance finance expense (OCI)

The change in the discounted cash flows from the beginning to the end of the period can be conceptualized as coming from the following sources:
1. Discounting to the end of the period instead of the beginning (unwinding of discount).
2. Update of the discount curve (effect of changes in discounting assumptions).
3. Update of the cash flow assumptions (insurance service expense).

The various components of incurred claims are affected by the order of the calculation. While IFRS 17 does not prescribe an order of calculation, the above order is thought to be consistent with the requirements of IFRS 17. In particular, if the cash flows are updated first, the amounts incurred in the current period would need to be excluded from insurance finance calculations. This is because these amounts are measured for the first time at the current report date using current discount rates, so they are not impacted by the change in discount rate or passage of time.

The complexity of the calculation of the insurance service and insurance finance expense may depend on the accounting requirements tied to the entity’s accounting policy choices. As described in Section 9, two accounting policy choices that affect the calculations are the measurement approach selected for LRC (i.e., the GMA or the PAA) and the OCI option.

The following tables summarize three possible approaches for calculating the breakdown of incurred claims and expenses for financial reporting, depending on the accounting policy choices made by the entity. The approaches are ordered in increasing order of complexity.

<table>
<thead>
<tr>
<th>OCI option</th>
<th>PAA for LRC</th>

</tbody>
</table>

The following terminology is used in the next section:
- \( \text{AOCI}(0) = \text{AOCI at the beginning of the period} \)
- \( \text{AOCI}(1) = \text{AOCI at the end of the period} \)
- \( \text{PVCF}(\text{CF}_i, \text{PV}_i, \text{DC}_i) = \text{present value of the estimates of future cash flows} \)
  - \( \text{CF} = \text{cash flow assumptions as at beginning or end of period} \) (subscript 0 or 1)
  - \( \text{PV} = \text{present value as at beginning or end of period} \) (subscript 0 or 1)
  - \( \text{DC} = \text{discount curve} \)
    - Subscript 0 or 1 indicates beginning or end of period respectively
    - Subscript RF indicates a rolled-forward curve, i.e., the a priori predicted curve for the end of period using beginning of period discounting assumptions
    - Subscript L0 indicates a locked-in curve at the beginning of the period; L1 indicates the locked-in curve rolled-forward to the end of the period
- RA = risk adjustment

</tr>
</tbody>
</table>

Approach #3 could be considered if the entity also uses the GMA for its LRC to align financial reporting for the CSM with the financial reporting for the fulfilment cash flows in the LRC and LIC.

In Approach #2, the locked-in curve would be rolled-forward using assumptions consistent with the unwinding method chosen.

Example calculations are presented for Approaches 1 and 2 in Appendix 7 to this draft educational note.
The approaches shown above assume that an unwinding expense and an expense arising from changes in discounting assumptions is not calculated on the risk adjustment portion of the fulfilment cash flows, however this option is illustrated in Appendix 6. The calculation would be made based on the accounting policy choice elected by the entity, in accordance with IFRS 17.81 which states:

An entity is not required to disaggregate the change in the risk adjustment for non-financial risk between the insurance service result and insurance finance income or expenses. If an entity does not make such a disaggregation, it shall include the entire change in the risk adjustment for financial risk as part of the insurance service result.

Approaches to determining the insurance service and insurance finance expenses other than those described in this draft educational note may be suitable. The actuary is encouraged to discuss alternate financial presentations with their auditors.

13. Acceptability of allocations

The acceptability of allocations is specifically noted in IFRS 17.24, which states:

To measure a group of contracts, an entity may estimate the fulfilment cash flows at a higher level of aggregation than the group or portfolio, provided the entity is able to include the appropriate fulfilment cash flows in the measurement of the group ... by allocating such estimates to groups of contracts.

Paragraph 117 of the Basis for Conclusions IFRS 17 Insurance Contracts states:

Hence, IFRS 17 allows an entity to estimate the fulfilment cash flows at whatever level of aggregation is most appropriate from a practical perspective. All that is necessary is that the entity is able to allocate such estimates to groups of insurance contracts so that the resulting fulfilment cash flows of the group comply with requirements of IFRS 17.

The actuary may perform the valuation of liabilities on a basis other than the portfolios and groups used for financial reporting. The actuary may need to develop methodologies to allocate estimates of the LIC to portfolios and groups of contracts.

14. Illustrative example

14.1 Overview

The appendices include two detailed LIC application examples, organized as follows:

- A more complex example allowing the user to determine:
  - The unwinding method among the three presented in Section 10;
  - Whether the OCI option is elected; and
  - Whether the risk adjustment is disaggregated between the insurance service and the insurance finance result.

- A simplified example, assuming that the entity uses the constant yield curve approach to calculate the unwinding expense, does not elect the OCI option and does not elect to
disaggregate the risk adjustment between the insurance service and insurance finance result.

14.2 Appendix 1: Selection of payment pattern

This Appendix allows the user to enter assumptions related to the payment pattern of the cash flows.

14.3 Appendix 2: Selection of yield curve assumptions

In the illustrative example detailed in the appendices, the selected IFRS 17 discount rate was derived as follows:

- Development of reference portfolio yield curve based on Canadian bonds.
- Adjust reference portfolio yield curve to eliminate credit risk (no market risk or other risk adjustments required).
- Determine the liquidity premium curve by subtracting the risk-free curve (valued at the same date as the reference portfolio) from the adjusted reference portfolio yield rate.
- Interpolate and extrapolate the liquidity premium values as required.
- Add the selected liquidity premium curve to the current risk-free curve.

14.3.1 Reference portfolio yield curve

The bonds are grouped by maturity. While some of the bonds include coupon payments, the existence of such coupon payments is not assumed to create a material inconsistency between the timing of the cash flows in the reference portfolio and those of the insurance contract liabilities. For each maturity group, the approach derives an estimated yield to maturity based on the market price per $100 of face value at the accounting date, the coupon rate (and timing of coupons), and the maturity date for each bond in the group. In the absence of details regarding the par value or value at maturity of the bonds, the par value is assumed equal for each bond in the portfolio.

Table 2 in Appendix 2A shows the estimated yield to maturity by credit rating (Federal, Provincial & Canada Housing Trust, AAA, AA, A, and BBB) and by average time to maturity in 1-year increments from 0.5 years to 9.5 years, and in 5-year increments from 9.5 years to 27.5 years. Refer to Section 14.6 for additional commentary regarding the results presented in Table 2.

To estimate liquidity premiums reflecting different levels of liquidity, two distinct reference portfolios were created. The first reference portfolio is made up of GoC bonds, and provincial bonds (including Canada Housing Trust considered to be equivalent to provincial bonds), all of which are assumed to be highly liquid investments. The second reference portfolio is made up of investment-grade corporate and municipal bonds, which are lower liquidity investments than the first group. The last column in Table 2 shows the estimated yield to maturity attributable to the second reference portfolio, comprised of investment-grade corporate and municipal bonds, each assumed to have the same par value. Alternatively, the yields to maturity by credit rating
may be combined by applying selected weights, with the weights varying by average time to maturity, or as illustrated in Table 2, with the same weights applying across all maturity dates.

14.3.2 Credit risk adjustment

In the reference portfolio approach, a credit risk adjustment is applied to each individual bond, depending on the credit rating of the bond. The credit ratings assigned by Bank of America Merrill Lynch are based on an average of Standard & Poor’s (S&P), Moody’s and Fitch pertaining to bonds denominated in US dollars (there being limited credit risk data available regarding Canadian-denominated bonds). For consistency, the same sources for credit risk adjustments were used. Due to the lack of credible credit risk adjustment data from Fitch, only historical data from S&P and Moody’s was used to calculate the credit risk adjustments. Table 3 in Appendix 2A shows the cumulative expected probabilities of default by credit rating, and time to maturity, corresponding to the cells for which a yield to maturity is shown in Table 2.

IFRS 17 requires that the credit risk adjustment encompass unexpected credit risk as well as expected credit risk. The example in Appendix 2 presents two approaches for the derivation of the unexpected credit risk:

- Table 4A – Selected credit risk at a probability level greater than the expected value, and specifically shown at the 90th percentile.
- Table 4B – Selected credit risk derived as a multiple of the expected default risk, specifically shown as twice the expected.

The bonds are grouped by maturity, and a yield to maturity with credit risk adjustment estimated for each group (Appendix 2A, Table 6). In the sample calculation shown below Table 6, a recovery rate of 38.4% is applied to the cash flow associated with a defaulting bond. The recovery rate is based on Moody’s US-based default study: Corporate Default and Recovery Rates 1920-2017 and represents a long-term average across credit ratings and durations.

The credit risk adjustments in basis points (bps) for each group are shown in Appendix 2, Table 7. The adjustments are computed as the yield to maturity with no credit risk adjustment less the yield to maturity after the credit risk adjustment (as described above).

Consideration is also given to the probability that a bond will be downgraded, and particularly if that downgrade causes the rating to fall below a threshold credit rating selected for the reference portfolio. If that were to occur, an adjustment would be considered to reflect a loss upon disposition of the bond. Downgrade risk and its potential effect on credit risk are not included in the example.

14.3.3 Market risk and other adjustments

As per IFRS 17.B81, “an entity shall adjust [the reference portfolio] yield curve to eliminate any factors that are not relevant to the insurance contracts”. A market risk adjustment is not required if the reference portfolio is comprised solely of bonds, which is the basis selected for the purpose of this draft educational note.
14.3.4 Determining the liquidity premium

Risk-free rates as at the valuation date are compared to the credit-adjusted yields from the reference portfolio to determine the liquidity premium. In the illustrative example, the liquidity premium applied to the insurance contract liabilities is assumed to be the same as that derived from the reference portfolio without further adjustment.

14.4 Appendix 3: Projection of undiscounted and discounted cash flows – current yield curve

Appendix 3 contains an example of the calculation of discounted cash flows:

- Column (1) presents the undiscounted liability amount, which represents the total estimate of future cash flows.
- Column (2) presents the expected schedule of future cash flows based on the selected payment pattern.
- Line (7) presents the selected yield curve.
- Line (8) presents the expected timing of future cash flows.

Column (3) contains the cash flows discounted using the current yield curve.

If the entity elects the OCI option, the future cash flows are projected by issue year. The actuary may estimate these directly from the data, or allocate cash flows determined on an accident year basis to issue years. For the purpose of the illustrative example, cash flows from accident years were allocated to issue years assuming that one issue year spans two accident years (e.g., the cash flows associated with issue year 2018 as 50% and 50% of the cash flows from accident years 2018 and 2019 respectively).

14.5 Appendix 4: Projection of undiscounted and discounted cash flows – locked-in yield curve

Appendix 4 is similar to Appendix 3 and presents the cash flows by issue year discounted at locked-in rates. The example assumes that the entity uses the PAA and the locked-in rate is assumed to be the rate applicable at the average incurred date of the claims in the group (e.g. for issue year 2018, the locked-in date is assumed to be December 31, 2018 if the group consists of one-year policies written uniformly throughout the year).

For the most recent issue year (i.e. issue year 2022 in the example), the exposure is not fully earned and therefore the average claim date, and correspondingly the locked-in yield curve, would be subject to change until the coverage is fully earned.

14.5.1 Appendix 5: Summary of LIC

This appendix presents a summary of the estimates of future cash flows, the discounted cash flows, the risk adjustment, and the fulfilment cash flows. For the purpose of this example, the risk adjustment is assumed to be a percentage of the discounted cash flows.
14.5.2 Appendix 6: Calculation of insurance finance expense and Appendix 7: Financial statement entries

An illustration of full financial statement entries is provided in Appendices 6 and 7. Calculation details are provided in Sections 10 to 12.

14.6 Sources of data for illustrative examples

14.6.1 Reference portfolio

The reference portfolio model illustrated in Appendix 2 uses the Bank of America Merrill Lynch (BAML) Canada Bond Market Index at December 2018. From the BAML data, the following bond subsets were created, each grouped by time to maturity.

- A Canada Bond subset, including bonds issued by Canadian federal agencies.
- A Provincial & CHT Bond subset, in which all issuers but one are direct provincial issuers, and most have a credit rating of AA by at least one major rating agency. Canada Housing Trust (CHT) is a quasi-government issue and was included in this subset after consideration of its characteristics and market values.
- Four corporate/municipal bond subsets, based on credit ratings of AAA, AA, A, and BBB. The issuers in these subsets include quasi-governmental entities.

The table below, shows the number of bonds in the BAML Canadian Bond Market Index at December 2018, by subset and by time to maturity.

</table>
Bonds maturing up to 31 December 2028 were grouped in 1-year maturity increments, each assumed to have a time to maturity at the mid-point of the group (i.e., 0.5 years up to 9.5 years). Bonds maturing on or after 1 December 2029 were grouped in 5-year maturity increments, each assumed to have a time to maturity at the midpoint of the group (i.e., 12.5 years up to 27.5 years). Bonds maturity beyond 30 years were excluded. The reference portfolio constructed on this basis is referred to in the remainder of this paper as the “December 2018 BAML Reference Portfolio.”

The BAML Index does not include market or par values, but market values were obtained for about 85% of the bonds referenced below from iShares (Core – Canadian Universe Bond Fund). These market values were not used directly in this analysis but were used as the basis for selecting the weights to combine various categories of bonds.

For illustrative purposes only, the December 2018 BAML-based Reference Portfolio was converted into a December 2022 reference portfolio by adding five years to the valuation date and the maturity date of each bond. The market prices at December 31, 2022 were assumed to be equal to the actual market prices at December 31, 2017.

14.6.2 Risk-free rates

Government of Canada zero-coupon bond yield curves as of December 31, 2018 (used to derive the liquidity premium in Section 4.4).

bankofcanada.ca/rates/interest-rates/bond-yield-curves/

14.6.3 Credit default and downgrade risk

There is insufficient Canada data to use as the basis for estimating either of the credit default risk and downgrade risk. Instead, the Committee relied on global studies published by Moody’s and S&P. Defaults analyzed by Moody’s include bonds from North America (about 75%), Europe (about 15%), and Latin America/Asia Pacific/Africa/Middle East (about 10%). S&P have a comparable distribution of bonds.

ii) S&P 500® AA Rated Corporate Bond Index
iii) S&P 500® A Rated Corporate Bond Index
Draft Educational Note

IFRS 17 Risk Adjustment for Non-Financial Risk for Property and Casualty Insurance Contracts

Committee on Property and Casualty Insurance Financial Reporting

May 2020

Document 220063

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the Standards of Practice; and as such, the actuary should cross-reference with current Standards. To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.
MEMORANDUM

To: Members in the property and casualty insurance area

From: Steven W. Easson, Chair
Actuarial Guidance Council

Houston Cheng, Chair
Committee on Property and Casualty Insurance Financial Reporting

Date: May 8, 2020

Subject: Draft Educational Note: IFRS 17 Risk Adjustment for Non-Financial Risk for Property and Casualty Insurance Contracts

The Committee on Property and Casualty Insurance Financial Reporting (PCFRC) has prepared this draft educational note to provide practical application guidance on Canadian-specific issues relating to the IFRS 17 risk adjustment for non-financial risk for property and casualty (P&C) insurers. Guidance from this draft educational note would be considered with the following CIA educational notes:

- CIA draft educational note Application of IFRS 17 Insurance Contracts; and
- PCFRC guidance on matters relating to IFRS 17, when such guidance is issued as draft educational notes.

The PCFRC acknowledges the exposure draft status of IFRS 17, and the evolving nature of international actuarial guidance. Nevertheless, the PCFRC believes this draft educational note has sufficient content to be beneficial to Canadian actuaries implementing IFRS 17.

The purpose of this draft educational note is to provide the reader with possible interpretations of the Standard, without advocating any particular approach. Each topic presented in this document addresses the implications of the standard for risk adjustment for non-financial risk: general considerations, quantile techniques, cost of capital method, margin method, combining approaches and methods and quantification of the confidence level.

The draft educational note Compliance with IFRS 17 Applicable Guidance provides guidance to actuaries when assessing compliance with IFRS 17. It is applicable to all educational notes pertaining to IFRS 17 and members are encouraged to review it prior to reading any educational note related to IFRS 17.

Various stakeholders were consulted prior to releasing this draft educational note: the CIA Committee on Life Insurance Financial Reporting, the CIA Committee on the Appointed/Valuation Actuary, the CIA Committee on Risk Management and Capital Requirements, the Accounting Standards Board, the International Insurance Accounting

1740-360 Albert, Ottawa, ON K1R 7X7 J 613-236-8196 ☎ 613-233-4552
head.office@cia-ica.ca / siege.social@cia-ica.ca cia-ica.ca
Committee, the Committee on Workers Compensation, and the Group Insurance Practice Committee.

The creation of this cover letter and draft educational note has followed the Actuarial Guidance Council’s protocol for the adoption of educational notes. In accordance with the Canadian Institute of Actuaries’ Policy on Due Process for the Approval of Guidance Material other than Standards of Practice and Research Documents, this draft educational note has been prepared by the PCFRC and has received approval for distribution from the Actuarial Guidance Council on April 14, 2020.

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note, however, that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the Standards of Practice; and as such, the actuary should cross-reference with current Standards. To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.

Questions or comments regarding this draft educational note may be directed to Houston Cheng at hhcheng@kpmg.ca or Veronika Molnar (chair of the subcommittee) at veronika.molnar@aviva.com.

**Appendix 2:** Simplified Calculation of RA based on CoC Method ............................................................. 32
1. Introduction

IFRS 17 Insurance Contracts (IFRS 17) establishes principles for the recognition, measurement, presentation, and disclosure of insurance contracts. The purpose of this draft educational note is to provide practical application guidance on Canadian-specific issues relating to the IFRS 17 risk adjustment for non-financial risk (RA) for property and casualty (P&C) insurers. References to specific paragraphs of IFRS 17 are denoted by IFRS 17.XX, where XX represents the paragraph number.

The requirement for the RA, which is a defined term in IFRS 17 Appendix A, is set forth in IFRS 17.37:

An entity shall adjust the estimate of the present value of the future cash flows to reflect the compensation that the entity requires for bearing the uncertainty about the amount and timing of the cash flows that arises from non-financial risk.

Further clarification is provided in IFRS 17.B86–B92. These paragraphs emphasize that the RA relates only to non-financial risk. Insurance risk, lapse risk, and expense risk are listed as examples of risks that are included, whereas operational risks and market risks are excluded. IFRS 17.B91 clearly states that IFRS 17 does not prescribe the estimation technique(s) used to determine the RA, and IFRS 17.B92 notes that “an entity shall apply judgement.”

IFRS 17.B91 states that the RA would have the following characteristics:

(a) risks with low frequency and high severity will result in higher risk adjustments for non-financial risk than risks with high frequency and low severity;

(b) for similar risks, contracts with a longer duration will result in higher risk adjustments for non-financial risk than contracts with a shorter duration;

(c) risks with a wider probability distribution will result in higher risk adjustments for non-financial risk than risks with a narrower distribution;

(d) the less that is known about the current estimate and its trend, the higher will be the risk adjustment for non-financial risk; and

(e) to the extent that emerging experience reduces uncertainty about the amount and timing of cash flows, risk adjustments for non-financial risk will decrease and vice versa.

The RA is explicitly included in the insurance contract liabilities and is disclosed per the requirements of IFRS 17.100–107 and IFRS 17.119.

Chapter 4 of the CIA Draft Educational Note Application of IFRS 17 Insurance Contracts (Draft Ed Note IFRS 17 Application) provides general guidance about the RA. The Draft Ed Note IFRS 17 Application adopts without modification the exposure draft of the proposed International Actuarial Note (IAN) 100 – Application of IFRS 17 Insurance Contracts of the International Actuarial Association (IAA).
In this draft educational note, “approach” is used to denote an overall way of addressing the RA, whereas “technique” and “method” refer to the detailed process (including calculations) to determine and allocate (if necessary) the RA.

Within the IAA guidance, Question 4.3 of the Draft Ed Note IFRS 17 Application states (emphasis added):

**This general guidance means that there is no single right way for an entity to set the risk adjustment.** In general, there are other important considerations that will be relevant to how an entity determines its approach to estimating the risk adjustment:

- consistency with how the insurer assesses risk from a fulfilment perspective;
- practicality of implementation and ongoing re-measurement; and
- translation of risk adjustment for disclosure of an equivalent confidence level measure.

Therefore, a variety of methods are potentially available, although their ultimate usage depends on the extent to which they meet the criteria above, given the specific circumstances of the company. Potential methods include, but are not limited to, quantile techniques such as confidence level or CTE [conditional tail expectation], cost of capital techniques, or even potentially simple techniques such as directly adding margins to assumptions or scenario modelling.

Regardless of the estimation technique, the actuary would ensure that the resulting RA represents the compensation the entity requires for accepting uncertainty in the amount and timing of the cash flows arising from non-financial risk (uncertainty related to non-financial risk). This draft educational note provides specific application guidance, as well as background and general information, to help inform Canadian actuaries when exercising judgment for derivation of the RA.

Equally important to understanding the objective of this draft educational note is understanding what the draft educational note is not intended for. Consistent with IFRS 17, this draft educational note:

- does not prescribe which approach or method to use for the RA in the aggregate or for the RA by portfolio of insurance contracts (portfolio) or group of insurance contracts (group);
- does not include statistical detail of the methods included herein;
- does not include detailed descriptions of how any given approach or method would be applied;
- does not contain an exhaustive list of the approaches or methods that may be acceptable for deriving the RA. For additional detail (including underlying statistical theory) regarding quantile techniques, the cost of capital method, internal models, and diversification, all of which may be important for the actuary responsible for deriving
the RA, the actuary is referred to the basic educational material of the actuarial societies as well as the IAA monograph titled Risk Adjustment for Insurance Contracts under IFRS 17 (IAA Risk Adjustment monograph); and

- does not address the issue of the Appointed Actuary’s (AA’s) Expression of Opinion.

In writing this draft educational note, the PCFRC Risk Adjustment Subcommittee followed these guiding principles:

- Consider Canadian-specific perspectives rather than simply repeating international actuarial guidance;
- Develop application guidance that is consistent with IFRS 17 and applicable Canadian actuarial standards of practice and educational notes without unnecessarily narrowing the choices available in IFRS 17; and
- Consider practical implications associated with the implementation of potential approaches and methods; in particular, ensure that due consideration is given to options that do not require undue cost and effort to implement.

2. Transition from IFRS 4 to IFRS 17

Prior to the effective date of IFRS 17, insurance contract liabilities are subject to IFRS 4, as guided by current CIA Standards of Practice and educational notes. As such, discussion in this draft educational note about processes under IFRS 4 (such as the use of margins for adverse deviations (MfADs)) pertain to Canadian accepted actuarial practice prior to the adoption of IFRS 17.

In Measurement of Liabilities for Insurance Contracts: Current Estimates and Risk Margins, the IAA states that risk margins can serve two distinct purposes:

1. As the reward for risk bearing, measured in terms of the inherent uncertainty in the estimation of insurance liabilities and in the future financial return from the contract; or

2. In a solvency context as the amount to cover adverse deviation that can be expected in normal circumstances, with capital to cover adverse deviations in more unusual circumstances.

The current MfADs used under IFRS 4 can be classified as meeting the second purpose above, whereas the RA can be classified as meeting the first. Although the approach selected to derive the RA may, in the end, be similar to the approach used under IFRS 4, IFRS 17 requires the RA to reflect the compensation the entity requires for taking on risk as opposed to margins that cover adverse deviations.

If the actuary uses IFRS 4 MfADs as the starting point for calculating the IFRS 17 RA, then the actuary would assess the questions posed in Section 9.2 of the draft educational note Comparison of IFRS 17 to Current CIA Standards of Practice:

---

• Is the current level of PfAD [provision for adverse deviations] consistent with the compensation the entity requires for bearing uncertainty?

• Are the diversification benefits included in current PfADs consistent with those that would be reflected in IFRS 17?

• How would the confidence level (to satisfy disclosure requirement of IFRS 17.B92) inherent in the current PfADs be determined?

• IFRS 17 requires reinsurance contracts held to be measured as separate contracts. How would the PfAD appropriate to the net liability be split between the direct and ceded contracts?

• Are any adjustments needed for pass-through features?

The CIA Standards of Practice relevant to IFRS 4 may provide insight for establishing margins under IFRS 17.2 In the margin-setting process for a given group, the actuary would look to the risk exposure of the broader entity to consider whether there are potential diversification benefits to reflect in the entity’s RA. (See Section 3.2.2.) As noted previously, IFRS 17 does not “specify the estimation technique(s) used to determine” the RA. Some Canadian actuaries may find it operationally efficient to continue to apply margins either to derive the total RA or to allocate the RA between portfolios and/or groups. However, other considerations, such as the suitability of the margins to reflect an entity’s requirement for compensation and the margins’ associated confidence level, which is required for disclosures, would also be considered. Use of margins would be acceptable if the resulting RA satisfies the five characteristics defined in IFRS 17.B91. Note that existing Canadian IFRS 4 guidance for setting MfADs is based on similar considerations.

In practice, most Canadian entities are unlikely to have previously identified a specific metric or set of metrics that explicitly defines the compensation the entity requires for bearing non-financial risk. Such metrics or articulation of risk appetite, if they exist, would likely consider all risks including financial risks and thus not be directly comparable to the scope of the RA. Therefore, the actuary would need to justify how the selected margins and/or the resulting confidence level of the RA reflect the entity’s compensation required for the uncertainty related to non-financial risk.

3. General Considerations

3.1 Measurement Approach

In supporting an insurer to achieve the requirements specified in IFRS 17.37, the actuary would (1) understand the compensation required by the entity for the uncertainty related to non-financial risk and (2) develop an RA that reflects such compensation. The compensation the entity requires is a subjective assessment of an entity’s own risk appetite.

There is more than one way for an entity to develop a price for that risk. Questions 4.9 and 4.13 in the Draft Ed Note IFRS 17 Application provide further general guidance. The answers to these questions refer to the entity’s pricing as a potential reference point for measuring the entity’s

---

2 Further detail contained in Appendix 1.
risk aversion and/or compensation requirements. The actuary would consider whether the compensation the entity requires reflects any pricing concessions due to competitive market pressure and/or price discounting in pursuit of aggressive market positioning. One view is that the actual pricing is market observable evidence of the compensation the entity requires. An alternative view is that an entity may temporarily accept other than its theoretical steady-state compensation requirements, and that the RA would reflect the latter.

It is necessary that the RA at each reporting date satisfies the overall requirements of IFRS 17 for measurement, presentation, and disclosure of insurance contracts. Measurement requirements are based on the IFRS 17 unit of account (i.e., RA for a single contract or group), whereas presentation and disclosure requirements tend to be at a higher level (RA for the aggregation of portfolios or the confidence level for the entity per IFRS 17.119). In selecting a particular approach, the actuary would consider the accounting measurement requirements for the RA as well as the aggregated presentation and disclosure requirements. (Section 3.7 addresses RA requirements specific to the premium allocation approach (PAA).)

### 3.1.1 Measurement Requirements Related to the RA – Unit of Account

The unit of account for IFRS 17 is the group or the insurance contract, and the measurement requirements (and some presentation and disclosure requirements) are applied at that level. For the RA, the unit of account has the following implications:

- The RA is determined on initial recognition and at each reporting date and reported for each group (IFRS 17.32 and IFRS 17.40);
- The RA for a group influences the measurement of the contractual service margin (CSM) and/or the loss component for the group at initial recognition (IFRS 17.38) and subsequent measurement (IFRS 17.B96(d)); and
- For contracts initially recognized in a period, the RA is required to satisfy the grouping requirements of IFRS 17.16 (i.e., to identify onerous contracts) unless the PAA measurement is used in which contracts are assumed to not be onerous unless facts and circumstances indicate otherwise.

IFRS 17.24 allows the fulfilment cash flows (of which the RA is a part) to be determined at a higher level of aggregation than the group and then allocated to the relevant groups, provided that the allocations result in appropriate fulfilment cash flows in the measurement of the group.

### 3.1.2 Disclosure Requirements Related to the RA – Aggregate/Entity Level

While the measurement requirements of IFRS 17 require an RA for each unit of account, most of the presentation and disclosure requirements of IFRS 17.78–109 are typically met at a more aggregated level, such as portfolio or entity level.

IFRS 17.117(c)(ii) specifically requires disclosure of the approach (which using the terminology of this draft educational note would also include method) used to determine the RA, and IFRS 17.119 requires disclosure of the confidence level corresponding to the reported RA. Depending on the approach and method used, the confidence level will be either an explicit input to the RA calculation or an implicit result of the calculation.
3.1.3 Selection of a Measurement Approach

The actuary may view the aggregate entity level perspective as the primary basis for determining the RA (perhaps driven by disclosure requirements or aligned at the level at which the entity thinks about compensation). With an aggregate approach, the actuary would need to allocate the total RA to the units of account to satisfy the IFRS 17 measurement requirements. Some of the methods described in this draft educational note are more aligned with an aggregate approach (e.g., quantile techniques) than with an approach focused on the unit of account.

Alternatively, the actuary may develop the RA at the unit of account level to more directly facilitate the measurement requirements of IFRS 17. The margin method can be used for a unit of account approach. To the extent that the entity chooses to reflect the benefits of diversification in its RA, the margins would be developed such that they reflect diversification among the non-financial risks across the entity’s units of account. The sum of the RA calculated at the unit of account level would be the entity’s aggregate RA.

3.2 Diversification, Allocation, and Aggregation

The entity’s perspective on diversification affects both the amount of the RA and the assessment of the confidence level of the RA. Diversification may arise from the different types of insurance risk (e.g., reserve, underwriting, and catastrophe), among portfolios, and among related entities. The mechanics of how the actuary reflects diversification benefits may differ depending on whether the actuary uses an entity level or unit of account approach.

The entity may consider the potential diversification among types of insurance risks when calculating the RA for the liability for incurred claims (LIC) even if an explicit RA is not calculated for the liability for remaining coverage (LRC) for contracts for which PAA is applied. In determining the RA, the actuary would consider the non-financial risks associated with future service (i.e., LRC) and past service (i.e., LIC).

3.2.1 Diversification and Allocation in an Aggregate Approach

To the extent that an entity level perspective is taken as the primary approach, the aggregate risk distribution would reflect the entity’s perspective of the benefits of diversification among its component risks. For example, the entity would assess the degree of diversification that it expects arising from underwriting, reserve risk, and catastrophe risk to the extent facts and circumstances warrant or management so chooses.

Incorporating diversification can be based upon statistical or empirical analyses, expert judgment, or causal relationship. The more uncertain the diversification benefit, the less likely such benefit would be fully reflected in the aggregate risk distribution. Two common methods used by actuaries to quantify the effect of diversification are correlation matrices and copulas.

The Insurance Bureau of Canada’s *Handbook for Economic Capital Modelling* states the following about correlation matrices:

> Correlations are often used in explicitly modelling dependencies. Correlation is the degree to which statistical distributions (and thus risks) are related to each other. Correlation must take a value between -1 (perfect negative correlation) and +1
(perfect positive correlation). A correlation matrix is simply a matrix in which the correlations between pairs of data are specified. Correlation matrices must be symmetric, which means that the correlation between risks A and B is the same as the correlation between risks B and A in the correlation matrix. Correlation matrices must also be positive semi-definite (PSD). For example, if a correlation of +1 is chosen between risks A and B and risks A and C, a correlation of -1 between A and C is not logical; this results in a non-PSD matrix.3

If using correlation matrices, the actuary would consider the confidence level of the RA to ensure that the correlation factors still apply at the selected confidence level. Furthermore, the correlation factors would be considered in the context of the entity’s own circumstances; the use of a “one size fits all” correlation matrix may not be appropriate.

The IAA Risk Adjustment monograph discusses copulas as follows:

The joint distribution of a set of random variables contains all the information about their individual (marginal) distributions and dependence structure. Dependence is a property of their copula. Copulas allow one to deal with the dependence among random variables separately from their marginal distributions. The estimation of the multivariate distribution is decoupled into estimation of the marginal distributions, which is more robust, and the estimation of the dependence relationship, which may have scarce data on which to rely. This decoupling is achieved with a copula function.4

For further information, see the IAA Risk Adjustment monograph.

The compensation the entity requires for non-financial risk would determine the confidence level at which the entity chooses to set its RA. The benefits of diversification reflected in an aggregate RA calculation are passed down to the unit of account via an allocation process.

The actuary may allocate the RA to groups directly (using a proportional or other method) or indirectly (by calibrating margins such that a unit of account calculation aggregated across all groups yields the same RA as the entity level calculation). In both direct and indirect allocations, the sum of the RA for all units of account would be equal to the aggregate entity level RA.

IFRS 17 prescribes neither the aggregation nor allocation techniques. While this draft educational note includes descriptions and examples of some approaches and methods, it is beyond the scope of this draft educational note to provide an exhaustive list. The CIA published a research paper on Risk Aggregation and Diversification in April 2016; and more generally, the Enterprise Risk Management section of the CIA website contains additional resources on aggregation and diversification.

3.2.2 Diversification and Aggregation in a Unit of Account Approach

When the RA is developed at the unit of account level, the entity’s aggregate RA is equal to the sum of the RA for all units of account. The RA developed independently for one particular unit

---

of account may or may not reflect the benefits of diversification with other units of account of the entity.

To the extent that diversification between different portfolios within an entity and/or diversification between related entities are considered in pricing, there would be clear support that reflecting similar diversification in the RA directly reflects the compensation the entity requires. If pricing does not account for diversification between portfolios and/or entities, then justification for including such diversification in the RA could prove more difficult and would depend on the particular facts and circumstances of the entity. Ultimately, the level of the RA for any given group is a matter of judgment, and the actuary would ensure that the resulting aggregate RA reflects the compensation the entity requires for uncertainty related to non-financial risk.

To the extent that the benefits of diversification are fully reflected in the assumed underlying probability distribution but are not fully reflected in the calculation of the entity’s RA, the resulting confidence level of the RA would be higher than had the full benefits of diversification been passed down to the unit of account level. Expressed another way, the more conservative the view an entity takes in applying diversification at the unit of account level, the higher will be the resulting RA and its reported confidence level.

3.2.3 Diversification between Entities

Question 4.10 in the Draft Ed Note IFRS 17 Application presents two different perspectives on diversification when a parent entity is composed of subsidiary entities.

One perspective is that each subsidiary entity would assess the compensation it requires for its own non-financial risks independent of any potential diversification with risks across the collective entities. The assumed probability distribution underlying the calculation of the confidence level of the subsidiary entity’s RA would not reflect between-entity diversification. The parent entity would either: (1) apply a diversification benefit at the parent entity level such that the RA of the parent would be less than the sum of the RA of the subsidiaries or (2) simply sum the RA of the subsidiary entities. The confidence level of the parent entity RA would be higher in the second approach than the first.

Another perspective is that the diversification benefits of the parent entity would be reflected at the subsidiary entity level. Thus, the assumed probability distribution underlying the calculation of the confidence level of the subsidiary entity’s RA would reflect between-entity diversification, and the degree of diversification credit reflected in the subsidiary’s RA calculation would affect the confidence level of the subsidiary’s RA. The parent entity RA would be the sum of the subsidiary entity RA.

With either perspective, the method used would be consistent from period to period and reflect how the level of risk is considered and managed by the entity.

The Transition Resource Group for IFRS 17 (TRG) has discussed the topic of diversification between entities in their May 2018 meeting; while TRG discussions are not official guidance they do provide practical information and background on issues. The TRG meeting notes are
available as an IFRS® publication in *Summary of the Transition Resource Group for IFRS 17 Insurance Contracts meeting held on 2 May 2018*.

### 3.3 Reinsurance Held

Under IFRS 17, the RA on reinsurance held is reported as a positive asset. In effect, the reinsurance RA represents the risk ceded to the reinsurer. Reinsurance credit risk is reflected through a reduction in expected cash flows, not through the RA.

Under IFRS 17, insurance contract liabilities (including liabilities on reinsurance contracts issued) are reported separately from liabilities on reinsurance contracts held. Where an explicit disclosure of the RA is required, the RA is also reported separately. In this draft educational note, “gross RA” refers to the RA included in insurance contract liabilities (including reinsurance contracts issued) and “ceded RA” refers to the RA included in liabilities for reinsurance contracts held. This concept is articulated in IFRS 17.64, which specifically requires an explicit RA for ceded reinsurance contracts:

> Instead of applying paragraph 37, an entity shall determine the risk adjustment for non-financial risk so that it represents the amount of risk being transferred by the holder of the group of reinsurance contracts to the issuer of those contracts.

This separation of gross and ceded RA may not always be intuitive. This issue is addressed in Question 9.9 of the Draft Ed Note *IFRS 17 Application*:

> A specific definition for the determination of the risk adjustment for reinsurance contracts held is provided that replaces the general definition in paragraph 37 used for insurance and reinsurance contracts issued in the standard. Under the definition for reinsurance held, the quantum of the risk adjustment for non-financial risk represents the amount of risk being transferred by the holder of a group of reinsurance contracts to the issuer of those contracts (paragraph 64).

The risk adjustment for the reinsurance held can therefore conceptually be thought of as the difference in the risk position of the entity with (i.e., net position) and without (i.e., gross position) the reinsurance held. As a result, the appropriate risk adjustment for the reinsurance held could be determined based on the difference between these amounts.

For reinsurance held, because the risk adjustment for reinsurance held is defined based on the amount of risk transferred to the reinsurer, the risk adjustment for reinsurance held will normally create an asset. On this basis, where a reinsurance contract held is reported as an asset the risk adjustment will have the effect of increasing the value of the asset, and will decrease the liability value where the reinsurance contract held is reported as a liability.

The RA reflects the compensation the entity requires for uncertainty related to non-financial risk and would be apportioned to gross and ceded insurance contract liabilities. Ultimately, the key concepts underlying the RA are:
• the gross RA (i.e., pertaining to insurance contracts including reinsurance contracts issued) represents the compensation for non-financial risk that the entity requires for writing those contracts; and

• the ceded RA (i.e., pertaining to reinsurance contracts held) represents the non-financial risk transferred from the entity to the reinsurer(s).

Any method that respects these concepts would generally be acceptable.

Reinsurance is a hedge against the risk in the insurance contract. Theoretically, where the price of reinsurance is proportional to the level of risk being hedged (i.e., ceded) from the entity’s perspective and where the majority of portfolios and years of claims reserves are subject to the same ceded percentages, then the ceded RA may be proportional to the gross RA (depending on the potential effect of diversification). The gross RA would be unaffected by the presence of reinsurance unless the reinsurance hedge affects the level of compensation required on the insurance contract.

In practice, an entity’s reinsurance portfolio will likely contain a mix of proportional contracts (at potentially different ceding percentages by portfolio and/or by year) as well as excess of loss or other forms of reinsurance contracts. From the entity’s perspective, when the price of reinsurance is not proportional to the level of risk being hedged, the ceded RA may not be proportional to the gross RA. The cost of the reinsurance may be viewed as evidence of the price the entity is willing to pay to be relieved of risk and therefore indicative of the entity’s compensation requirements related to the uncertainty of the risk being ceded.

3.4 Discount Rate

IFRS 17 provides no direction regarding the discounting of the RA. IFRS 17.B90 states: “[T]he risk adjustment for non-financial risk is conceptually separate from the estimates of future cash flows and the discount rates that adjust those cash flows.” Furthermore, IFRS 17.B92 states: “[A]n entity shall apply judgement when determining an appropriate estimation technique for the risk adjustment for non-financial risk.”

Consequently, the use (or absence) of discounting and the method of determining discount rates, if applicable, are at the discretion of the entity. More than one discounting method is possible. Regardless of the discounting method chosen, the actuary would maintain a consistent method between reporting periods.

Changes in discount rates will affect the current value of the RA if the derivation of RA requires the use of discounting. Under IFRS17.81, the entity is not required to bifurcate the change in RA into its component pieces (i.e., change in undiscounted provision for non-financial risk vs. change in effect of discounting). If not bifurcated, the entire change in RA is presented as part of the insurance service result, and the entire change in RA related to future services adjusts the CSM.

3.5 Time Horizon

The appropriate time horizon for calculating IFRS 17 RA is the lifetime of the uncertainty in the insurance contract cash flows.
Actuaries using an internal model\(^5\) for determining the RA would be aware that there may be no link between the confidence level corresponding to the RA and the confidence level underlying the internal model. For example, the result of an internal model calibrated to cover risks at a confidence level of value at risk (VaR) 99.5 percentile over a one-year horizon is conceptually very different than an RA calculation calibrated to a lifetime horizon. The RA would generally be calculated at a lower percentile over a longer time horizon than the economical capital resulting from the internal model, and thus the two amounts would not likely be comparable. For an actuary to use an internal model for determining the RA, the internal model would need to be re-calibrated to reflect any differences in time horizon and confidence level.

When using a cost of capital method, the capital amounts held over the lifetime of the insurance contract cash flows would be estimated. Conceptually, there is some confidence level that relates to the insurance contract lifetime cash flows selected for such modelling. The difference between the selected contract cash flows and the best estimate cash flows represents the amount of capital that the entity would use in calculating the cost of capital.

Actuaries using a margin method would consider the volatility of the cash flows over the lifetime of the insurance contract runoff.

### 3.6 Disclosure Requirements

#### 3.6.1 Disclosure of Reconciliations

General IFRS 17 disclosure requirements are outlined in IFRS 17.93 through IFRS 17.132. Elements specific to the RA include the requirement to disclose a reconciliation of the movement in the RA from the opening balance to the closing balance (IFRS 17.100 for PAA and IFRS 17.101 for GMA)\(^6\) and the requirement to disclose significant judgments and changes in judgments used in the calculation of the RA (IFRS 17.117).

#### 3.6.2 Disclosure of the Confidence Level

Disclosure requirements for the confidence level are noted in IFRS 17.119:

An entity shall disclose the confidence level used to determine the risk adjustment for non-financial risk. If the entity uses a technique other than the confidence level technique for determining the risk adjustment for non-financial risk, it shall disclose the technique used and the confidence level corresponding to the results of that technique.

---

\(^5\) The term “internal model” is often used interchangeably with “economic capital model.” The International Association of Insurance Supervisors states: The term “internal model” refers to “a risk measurement system developed by an insurer to analyse its overall risk position, to quantify risks and to determine the economic capital required to meet those risks”. Internal models may also include partial models which capture a subset of the risks borne by the insurer using an internally developed measurement system which is used in determining the insurer’s economic capital.

\(^6\) Disclosures required by OSFI are expected to be more granular than those required by IFRS 17. For example, experience by coverage for automobile insurance policies is expected to be required by OSFI.
It is reasonable to infer that IFRS17.119 refers to the entity’s aggregate RA, and it would be at the discretion of the entity to disclose the confidence level of RA at levels lower than the entity.

With respect to determination of the confidence level, question 4.18 in the Draft Ed Note IFRS 17 Application states:

In order to determine confidence levels, it is necessary to be able to locate the value of the fulfilment cash flow of a collection of insurance contracts on the probability distribution of the present value of the cash flows for the contracts. If that probability distribution is not explicitly derived as part of the valuation process, some method or model might be needed to estimate the percentiles of that combined portfolio distribution at the amount that reflects the risk adjustment. The extent of the analysis needed for such estimation is likely to require judgment.

Potential techniques for the determination of the confidence level range from full stochastic modelling to a relatively simple assumption about the shape of the underlying probability distribution.

Determining the confidence level corresponding to the RA may be operationally burdensome; nevertheless, the confidence level is a required disclosure under IFRS 17. Therefore, the actuary would need to assess the practicality, cost, and effort associated with the selected method. In particular, it is possible that parameterization of a full stochastic model may require so many assumptions that it could lead to spurious accuracy in the resulting calculation of the confidence level. In many situations, a more simplified approximation technique may provide an equally reasonable estimate of the confidence level at much less cost and effort. The degree of rigour is an entity-specific decision subject to the judgment of the actuary and agreement of the auditor.

Regardless of the technique selected, the actuary would be aware that the quantification of the confidence level is an estimate, given the unobservable nature of the full probability distribution of the present value of the cash flows. The actuary would make users of the information aware that the quantification is based on certain methods and assumptions and take care to apply those methods and assumptions consistently from period to period.

Disclosure requirements specific to PAA are described in Section 3.7.

3.7 RA under PAA

An estimate of the LRC calculated under the general measurement approach (GMA) includes RA, whereas an estimate of the LRC calculated under PAA does not. Regardless of whether the LRC is calculated under PAA or GMA, the LIC requires an explicit RA. The fact that the treatment of the RA differs for the LRC and the LIC may complicate the calculation and/or disclosure of the confidence level required by IFRS 17.119.

For an entity using PAA, an explicit RA calculation for the LRC is not required for financial reporting purposes for groups that are not deemed onerous. To establish a trigger for onerous contracts, an estimate of an RA would be determined. An explicit RA calculation is required to calculate the loss component for groups of contracts that may be onerous. If the calculations
confirm that the insurance contracts are onerous, the entity is required to separately disclose the LRC excluding any loss component and the loss component; disclosure of an explicit RA amount, however, is not required. If the calculations confirm that the contracts are not onerous, the only disclosure required is the LRC excluding loss component under PAA.

As the LIC is always measured as the fulfilment cash flows relating to incurred claims\(^7\), the calculation of RA is always required. Disclosure requirements for the LIC specify a split between LIC excluding RA and RA at the entity level, because entities will have to consider what level of disaggregation is appropriate in order to achieve the general disclosure objective in IFRS 17.93.

For entities where the primary (or only) measurement approach for the LRC will be PAA, the actuary would likely seek a method to estimate the RA for testing onerous contracts that maximizes operational efficiency. In situations where the RA is mainly driven by volatility in the cash flows associated with claim activity and where the cash flows associated with premium activity for the LRC are subject to volatility, the actuary may approximate the RA required for the LRC of onerous groups by using the RA derived for the LIC. In practice, the actuary would consider the volatility associated with the LRC, but facts and circumstances of an entity may be such that this approximation has limited applicability.

The requirement to reflect diversification applies regardless of the entity’s selected measurement approach (i.e., GMA vs. PAA). Thus, the considerations described in Section 3.2 apply for entities adopting PAA. Regardless, the calculations may be more challenging as the RA may not be explicitly calculated for the LRC.

4. Quantile Techniques

As noted previously, this draft educational note does not contain an exhaustive list of methods nor does it contain detailed statistical background and descriptions. The actuary is referred to the IAA \textit{Risk Adjustment} monograph, which was developed explicitly for purposes of IFRS 17.

4.1 Introduction

Quantile techniques, including VaR and CTE, may be used to assess the probability of the adequacy of the fulfilment cash flows and thus to quantify the RA. One key advantage of a quantile technique is that it directly satisfies the IFRS 17 disclosure requirements regarding confidence level corresponding to the RA. The IAA \textit{Risk Adjustment} monograph states: “A key advantage of the quantile techniques is that the mathematics enable risks to be represented graphically which creates ease and convenience in understanding the result. A disadvantage is that if misrepresented, it may introduce spurious accuracy.”

Assessment of the confidence level corresponding to the RA would generally require underlying assumptions of the risk distribution. Given a risk distribution, both VaR and CTE can be calculated. It is important for the actuary to recognize that a VaR calculation may not capture the risk for a particularly skewed distribution of cash flows, which are common for certain P&C

---

\(^7\) While the LIC is often described as always being measured under the GMA, for groups of contracts where the LRC is measured under PAA there are some differences in the measurement and disclosure requirements for LIC as well. See IFRS 17.59(b) and IFRS 17.97-109 for further details.
risks, and thus may not be an appropriate method to use. For further discussion of the use of VaR and CTE for RA, the actuary is referred to the IAA Risk Adjustment monograph.

This section provides a high-level overview of possible methods to generate a risk distribution and describes how quantile techniques (including VaR and CTE) are applied to determine the RA. Detailed theoretical background information and implementation guidance for quantile techniques are beyond the scope of this draft educational note.

4.2 Generating a Distribution

To generate a distribution of the underlying future cash flows, different methods may be considered:

- Fit future cash flows for non-financial risks to a suitably skewed probability distribution (e.g., lognormal or gamma distribution);
- Monte Carlo simulation;
- Bootstrapping; and
- Scenario modelling.

Each of these are described briefly below.

4.2.1 Probability Distribution for Present Value of Cash Flows

Under IFRS 17, the actuary would estimate an unknown variable (i.e., fulfilment cash flows), which conceptually is derived from an analysis of the full range of possible outcomes of the contractual cash flows. In practice, however, it may be extremely difficult to observe the full range of possible outcomes or the underlying probability distribution that defines the full range of possible outcomes. The actuary may therefore assume the shape of the underlying probability distribution. For example, the actuary may assume a lognormal or gamma distribution, both of which exhibit skewness. There are many other distributions that may appropriately represent the characteristics of an entity’s cash flows; however, it is beyond the scope of this draft educational note to provide an exhaustive list.

4.2.2 Monte Carlo Simulation

Non-financial risks can be modelled stochastically. The Monte Carlo method may be used to repeatedly simulate a random process for relevant risk variables of (such as reserving, underwriting, and catastrophe risk) covering a wide range of possible situations. In general, thousands of simulations are typically generated under the Monte Carlo method to reduce sampling variability. The actuary is able to derive a probability distribution based on the resulting simulations of the entity’s aggregate risks. This enables the RA to be set at the target percentile level of the observed distribution.

In modelling insurance risk stochastically, the actuary would consider parameter risk, process risk, and model risk. For further information, the actuary is referred to the IAA Risk Adjustment monograph.
4.2.3 Bootstrapping

The IAA Risk Adjustment monograph describes bootstrapping as follows:

This is a resampling technique where historical observations are used to create stochastic scenarios. Rather than a hypothetical distribution, this technique relies on historical information as potential future observations. As an example, to estimate the variability of the sample mean in the original data set, sampling with replacement to generate multiple future populations may create an appropriate distribution of sample means. For non-life insurance reserves, this approach has also been used to generate the probabilities of uncertain outcomes. However, in many applications some sort of normalization would be appropriate to remove such factors as seasonality, or adjust for exposure. This technique has merit because it may more closely resemble what historical data has shown can happen. This method also does not restrict the recognition of heavy tails or other observations that depart from theoretical distributions. However, it may be a poor approximation for small samples and it relies heavily on the fact that each sampled variable is independent from another. Another disadvantage is that the variability of outcomes for future cash flows may not be adequately represented by historical observations in a particular data set, particularly for low frequency, high severity outcomes or other unusual events.8

4.2.4 Scenario Modelling

Scenario modelling is mentioned as an alternative technique in Question 4.14 of the draft Ed Note IFRS 17 Application for reflecting qualitative risk characteristics “provided suitable extreme scenarios are included.” Instead of different assumptions applied to each risk, a combination of assumptions or a scenario reflecting multiple non-financial risks may be applied to the underlying insurance contracts. In practice, however, the actuary may have difficulty calibrating appropriate scenarios for purpose of the RA.

Financial condition testing (FCT)9 is one example of scenario modelling. FCT is a process of analyzing and projecting trends in an insurer’s capital position given its current circumstances, considering adverse scenarios that are severe but plausible. The materiality threshold for an FCT analysis is generally higher than the materiality associated with a liability calculation for financial reporting purposes. Therefore, the actuary would be cautious in applying the techniques used to complete an FCT analysis for the determination of an RA.

4.3 Measuring Risk

Once a distribution is generated, both VaR and CTE can be calculated or observed.

4.3.1 VaR

The VaR technique can be summarized in the following three steps:

---

9 Effective January 1, 2020, FCT replaced dynamic capital adequacy testing. See Section 2500 of the standards of practice for further information.
1. Entity determines the target confidence level at which it determines its compensation required (e.g., \(x^{th}\) percentile);

2. VaR is determined such that the probability of the present value of actual cash flows being less than VaR is \(x\%\); and

3. RA is then determined as VaR at \(x^{th}\) percentile less the mean of present value of probability-weighted cash flows.

The VaR technique is similar to the technique frequently used for economic capital calculations (such as own risk and solvency assessment, ORSA). An entity’s existing VaR techniques may be applied to the calculation of RA. There are, however, important differences including:

- **Risk profile** – Economic capital typically includes all risks faced by the entity, whereas the RA only reflects non-financial risk.

- **Time horizon** – Economic capital tends to be calculated over a one-year time horizon, whereas the time horizon for the calculation of the confidence level of the RA would reflect all cash flows within the contract boundaries (i.e., the lifetime horizon, where lifetime is limited by the contract boundary). The entity may, if it so chooses based on its own compensation requirements, determine the level of the RA based on one-year shocks, but the associated confidence level would be calibrated against a lifetime horizon.

- **Comparability** – Economic capital is often calculated at a higher percentile (e.g., 99.5%) over a one-year time horizon. The confidence level of the RA would generally reflect a lower percentile over a longer time horizon. As such, the two amounts are generally not directly comparable.

### 4.3.2 CTE

The CTE method can be summarized in the following three steps:

1. Entity determines the target confidence level at which it determines its compensation required (e.g., \(x^{th}\) percentile).

2. From the probability distribution, an entity can determine:
   - A. Conditional mean of the present value of future cash flows beyond the target percentile; and
   - B. Mean of the present value of probability-weighted cash flows.

3. RA is then determined as the difference between A and B.

Question 4.14 of the draft Ed Note *IFRS 17 Application* does not explicitly mention a CTE technique. However, it mentions that “... it may be possible to incorporate allowance for correlation and skewness effects.” To address skewness, a suitably skewed probability distribution and/or CTE technique may be applied.
4.4 Aggregation and Allocation

Once the aggregate percentile level and resulting aggregate RA are derived from a quantile technique, the actuary would allocate the RA to the groups per the requirements of IFRS 17.24 and perhaps to more granular levels for the purpose of determining initial groups per IFRS 17.16 and IFRS 17.47. As noted previously, IFRS 17 does not prescribe the allocation method. Possible solutions range from simple proportional allocation to more sophisticated weightings based upon analyses of the component risks.

Alternatively, instead of producing a distribution of the future cash flows for the entire entity, the VaR or CTE may be calculated for each non-financial risk and then aggregated using a correlation matrix. See further details about allocation in Section 7.

5. Cost of Capital Method

5.1 Introduction

In a cost of capital method, the RA is based on the compensation that the entity requires to meet a target return on capital. In this calculation, three elements are required:

1. Projected capital amounts, which are used to determine the level of non-financial risk\(^ {10}\) during the duration of the contract;
2. Cost of capital rate(s), which represent the relative compensation required by the entity for holding this capital; and
3. Discount rates, which are used to obtain the present value of future compensation required. The actuary may use similar discount rates for the RA calculation as are used for other IFRS 17 calculations (such as discounting the LIC).

This method has the benefit of being conceptually close to the definition of the RA and potentially allows allocation of the RA at a more granular level assuming a more granular allocation method for capital amounts. On the other hand, the cost of capital (CoC) method may be operationally complex, as the projection of capital requirements is an input to the liability calculation.

Whereas the general formula for the CoC is simple, there are a variety of ways to determine its components. A practical method to determine the compensation required by the entity is the method used for pricing purposes (i.e., the way an entity determines compensation in its day-to-day operations). Alternatively, an entity may prefer to define the compensation required on a more theoretical basis. Both methods are discussed in this section.

In addition to the CoC calculations described below, there are simplified ways in which the CoC concept could be applied to estimate the RA. One such example is presented in Appendix 2.

---

10 Capital applicable amount can usually be broken down between reserve risk and underwriting risk. In theory, there could be other risks that would attract capital that would not fall under reserve risk and underwriting risk, including market risk and general operational risk.
5.2 General Formula

The general formula for the RA based on a cost of capital method is:

\[ RA = \sum_t \frac{r_t \times C_t}{(1 + d_t)^t} \]

where,

- \( C_t \) is the average capital amount for the period \( t \);
- \( r_t \) is the selected cost of capital rate for the period \( t \);
- \( r_t \times C_t \) is the compensation required by the entity for the period \( t \); and
- \( d_t \) is the selected discount rate(s), reflecting a yield curve, if appropriate.

Considerations for defining \( C_t \) and \( r_t \) are discussed in the following sections.

5.3 Capital (\( C_t \))

As noted, a practical approach for a given group of insurance contracts is to determine the capital requirement with the capital model used for pricing purposes. Other capital models, such as the regulatory capital model (e.g., minimum capital test (MCT)) of the entity or an internal model, may be used as long as such model is consistent with the view of the entity regarding compensation. In selecting a capital model, the actuary would consider the entity’s risk appetite with respect to capital, which may be expressed as an internal or operating target.

The actuary would use a regulatory capital model or internal model with caution as these models may not be appropriate to calculate the entity’s capital requirement for RA purposes. (See Sections 3.5 and 4.3.1 for further details.)

Furthermore, the capital requirement would be adjusted to reflect the following considerations:

- Removal of the capital component(s) related to risks other than the non-financial risks in scope of the RA (such as market risk or general operational risk);
- Diversification if not specifically addressed in the capital model being used; and
- Consideration of risk-sharing mechanisms (e.g., reinsurance and Facility Association) reflected in the estimates of future cash flows.

The actuary would derive a method to allocate the capital requirement (initially determined by considering the diversification at an aggregate level) to the most granular level. At a minimum, the actuary would allocate the capital requirement by group to meet IFRS 17 requirements. Literature includes other capital allocation methods, such as the pro rata, continuous/discrete marginal, and the Shapley method, none of which are described in this draft educational note.

5.4 Cost of Capital Rate (\( r_t \))

The cost of capital rate is traditionally designed as the weighted average cost of capital for an entity that considers all sources of capital minus the rate that could be earned on surplus. Among the sources of capital, the cost of capital for common shareholders (or equivalent stakeholders) is the most complex to define.
A practical approach is to use target rates of return on capital by capital source and their respective weights that are consistent with management’s view (i.e., used for pricing or as corporate targets). Target rates of return on capital may vary by portfolio, product, etc. Even if these rates of return are not supported by cost of capital theory, they may still represent the compensation required by the entity.

Alternatively, theoretical cost of capital rates may be determined by the entity based on the following considerations:

- The cost of capital would depend on the entity’s risk aversion.
- The amount of capital would reflect the level of risk (i.e., uncertainty). If the entity requires different compensation for similar risks in different portfolios, the difference would be reflected in the cost of capital rate rather than the amount of capital.
- The cost of capital rate may be defined as a rate that represents the profit required for a given quantity of risk (risk perceived by the shareholders). Then, this rate is applied to an amount of capital measured by a capital model. In theory, when the capital model used measures perfectly the risks perceived by the shareholders, it would be reasonable and practical to apply the same cost of capital rate to all lines of business, products and risks, etc. In practice, however, capital amounts measured by models are generally simplified measures of the underlying risks and it may be appropriate to adjust the cost of capital to compensate for this.
- The risk-adjustment is a pre-tax item yet cost of capital requirements are often-stated on an after-tax basis. The actuary would ensure that the calculations are internally consistent.

5.5 Reinsurance Held

Section 3.3 of this draft educational note discusses general considerations with respect to reinsurance held. A specific consideration in the cost of capital method is the need to develop cost of capital rates on a gross of reinsurance basis. For this purpose, it may be practical to use the cost of capital rate net of reinsurance. This is consistent with the considerations articulated in Section 3.3. From a theoretical standpoint, the third bullet point in Section 5.4 suggests that it is expected that the cost of capital remains unchanged when there is a change in the risk profile (e.g., ignoring all reinsurance), unless the capital model inadequately captures the risk perceived by the shareholders.

6. Margin Method

Under a unit of account approach with a margin method, the actuary would select margins that reflect the compensation the entity requires for uncertainty related to non-financial risk. The “compensation the entity requires” would be quantified through the margin-setting process, which is not necessarily based on a specified confidence level.

For IFRS 17 disclosure purposes, the actuary would calculate the confidence level corresponding to the resulting RA (i.e., sum of the indicated RA resulting from the selected margins). The confidence level disclosure would be an output (not an input) of the process. To meet actuarial
standards of practice for examining the reasonableness of a calculation’s result, the actuary may choose to use a quantile technique to compare with the RA resulting from the margins, taking into consideration the sufficiency and reliability of the data input and paying particular attention to items such as the trend, mean, median, symmetry, skewness, and tails of underlying distributions.

7. Combining Approaches and Methods

The combination of multiple approaches and methods may take many forms. Question 4.23 in the Application of IFRS 17 Insurance Contract states:

- There is no requirement to use a single model or approach for all the business or all the risks. An entity may use a mix or blend of methods to set risk adjustments across different businesses provided such an approach makes appropriate allowance for diversification and is done in a way that can be reasonably disclosed and explained to external auditors and is relevant to users (which is likely the biggest hurdle to a mixed model approach).

One possible way to combine methods under a unit of account approach is to use VaR for groups with less skewed distribution and the cost of capital method or margins for groups with highly skewed distributions, where the VaR does not provide a reasonable estimate of the RA. In this example, the actuary would still need to determine the overall confidence level for disclosure purposes. Moreover, the actuary would ensure that the aggregate RA from these different methods achieves the entity’s compensation requirement for the uncertainty related to non-financial risk.

7.1 Aggregate/Entity-Level Approach

Under an aggregate approach, the primary methods for calculating the aggregate RA are a quantile technique and the cost of capital method. The margin method may be appropriate for an aggregate RA if a single margin can be selected to reflect the compensation the entity requires for bearing the risk associated with the underlying portfolios. In addition, margins may be used to allocate the aggregate RA to the unit of account level.

7.1.1 Aggregate Approach Using a Quantile Technique

The actuary may allocate the aggregate RA using margins that are calibrated to ensure that the sum of the RA calculated at the unit of account level is equal to the aggregate RA calculated via a quantile technique. Other allocation methods are also possible. In choosing a reasonable approach, the actuary has discretion to consider operational efficiency.

If using margins, the actuary would periodically review and recalibrate the margins. The actuary may choose to limit change in the margins outside of the periodic review cycle (which may be annually) only if the resulting confidence level corresponding to the RA drifts away from the target confidence level by more than a pre-defined threshold.

7.1.2 Aggregate Approach Using Cost of Capital Method

Margins may be calibrated to replicate an aggregate RA derived from a cost of capital method. These margins could be a practical alternative to a principles-based cost of capital calculation,
given that the latter may be very difficult to execute in production within typical financial reporting deadlines.

A cost of capital method may be a useful input into calibration of the level of the margins by portfolio. Margins may be developed to produce RA by portfolio that are proportional, or approximately proportional, to the capital requirements by portfolio. Actuarial judgment would dictate whether a goal of proportionality is appropriate given the facts and circumstances particular to the entity.

To comply with presentation and disclosure requirements, the confidence level corresponding to the resulting RA would be calculated.

7.2 Hybrid Approach

There may be many different forms of hybrid approaches that incorporate the unit of account and aggregate perspectives and various methods (e.g., quantile, cost of capital, and margins).

One possible hybrid approach is described in this section.

First, assume that the entity’s risk management policy specifies a target range for the confidence level corresponding to the aggregate RA. This target range would represent the aggregate compensation the entity requires for the uncertainty related to non-financial risk.

Next, assume that the actuary calculates a total RA and its associated confidence level using margins established for each portfolio (or group) as a starting point, with adjustments for diversification.

To the extent that the sum of the RA produced by the selected margins do not result in an aggregate RA that is within the target range set out by policy, the margins would be re-calibrated to ensure that the entity level RA was within the range.

Given the uncertainties associated with estimating confidence levels and the dispersion in estimates of RA that may result from the use of different approaches and methods, this particular example in which a range of target confidence level is established by the entity offers an important operational advantage. Calibrating the RA within a sufficiently wide target range may lessen some of the concerns with the precision (or lack thereof) for confidence level calculations.

The actuary could follow a similar hybrid approach that incorporates the cost of capital method or margin method instead of a quantile method. As such, the actuary may calculate the aggregate RA based on a range of target cost of capital rates, and the margins would be calibrated accordingly.

8. Quantification of the Confidence Level

8.1 Quantile Technique as Primary Method

Where a quantile technique is the primary method for determining the amount of the RA, there is no need for a separate process to calculate the confidence level corresponding to the RA.

Given the requirement of a probability distribution to calculate the quantile technique RA, the resulting confidence level of the selected RA would be directly available. Thus, a quantile
technique that is used as the primary method for calculation of the RA directly satisfies the IFRS 17 disclosure requirements in IFRS 17.119.

8.2 Quantile Technique as Secondary Method

If the primary method for determination of the RA is the cost of capital, the margin method, or some other method, then the actuary would need a secondary method to quantify the confidence level corresponding to the RA to satisfy the disclosure requirement. As noted in Question 4.18 of the Draft Ed Note IFRS 17 Application, this would usually require some information about the underlying probability distribution of the present value of future cash flows. The term “future cash flows” used throughout the remainder of this section is understood to be the present value of future cash flows.

As noted previously, the distribution of future cash flows for P&C insurance is typically skewed. In the following example, a lognormal distribution is assumed for presentation purposes only. Lognormal distributions are commonly used in P&C insurance to model claim size, as the distribution is positively skewed and the random variables take on only nonnegative values. The purpose of the example is to illustrate how a quantile technique may be applied. In practice, the actuary would select the distribution(s) that most adequately fits the entity’s cash flows.

A lognormal distribution can be defined by its parameters \((\mu, \sigma)\), where the parameters represent the mean and standard deviation of the normally distributed variable \(\log X\) and not that of \(X\). Any point on the distribution can be identified if these two parameters are known. For lognormal distributions, the mean and standard deviation can be used to derive parameters \((\mu, \sigma)\).

Random variable \(X\) has a lognormal distribution with parameters \((\mu,\sigma)\) if, and only if, \(\log X\) is normally distributed with mean \(\mu\) and variance \(\sigma^2\). Therefore, the lognormal variable \(X\) can be expressed as \(X = e^{\sigma Z + \mu}\), where \(Z\) is the standard normal random variable. The lognormal cumulative distribution function is

\[
F_X(x) = \begin{cases} 
0 & \text{if } -\infty < x \leq 0 \\
\Phi \left( \frac{\log x - \mu}{\sigma} \right) & \text{if } 0 < x < \infty \quad (-\infty < \mu < \infty, \sigma > 0)
\end{cases}
\]

The continuous lognormal variable \(X\) has probability density function:

\[
f_X(x) = \begin{cases} 
0 & \text{if } -\infty < x \leq 0 \\
\frac{1}{\sigma \sqrt{2\pi x}} \exp \left( -\frac{1}{2} \left( \log x - \mu \right)^2 / \sigma^2 \right) & \text{if } 0 < x < \infty
\end{cases}
\]

The best estimate liability (BEL) represents the mean or central tendency of the distribution. Ideally, the actuary would have a method to derive the standard deviation of the assumed distribution of future cash flows, but in practice this may be difficult. The practical problem is that it will likely be impossible to independently observe the standard deviation of the distribution of future cash flows.
One potentially reasonable approach is that the standard deviation of the distribution for specific portfolios can be derived from the insurance risk factors in the MCT. (See Section 8.3.) Using the standard deviation from the MCT and the BEL as the mean parameters, \((\mu, \sigma)\) can be derived by using the formulas below.

The mean, variance, and skewness follow directly:

\[
E[X] = e^{\mu + \frac{\sigma^2}{2}}
\]
\[
\text{Var}[X] = (e^{\sigma^2} - 1)e^{2\mu + \sigma^2}
\]
\[
\text{Sk}[X] = (e^{\sigma^2} + 2)\sqrt{e^{\sigma^2} - 1}
\]

The actuary may also explore other approaches to define the standard deviation. For example, the actuary may be able to turn to the entity’s internal model if such model is sufficiently robust and can be recalibrated to reflect the time horizon and risk appetite required by the RA.

8.3 Calibration Using MCT

This section refers to OSFI’s MCT and the Branch Adequacy of Assets Test (BAAT). The description is also applicable to the MCT of the Autorité des marchés financiers (AMF).

A practical advantage of using the MCT as a calibration point is operational efficiency to leverage existing processes in the quantification of the confidence level. A potential disadvantage is that the estimated confidence level may not be appropriate for a particular entity.

The insurance risk factors in the MCT consider claim liabilities and premium liabilities and are based on a review conducted in 2013. In the event that OSFI updates the MCT risk factors, the considerations underlying the revised factors would potentially change the calculations.

Per OSFI,

To develop the new factors, OSFI undertook a variability analysis based on incurred and paid data to assess the insurance premiums and claims risks. For unpaid claims, OSFI performed a variability analysis between the estimated and the actual amount of losses using two methods: lognormal and bootstrap. For premium liabilities, OSFI’s variability analysis was built based on pure loss ratio data, assessing variability in ultimate loss ratios by line of business for each accident year. A correlation study between lines of business was also performed to determine the level of diversification credit.\(^{11}\)

The following are links to OSFI’s documentation of the variability analysis:

The risk factors were established at a confidence level of VaR 99.5% with an explicit adjustment for diversification. The factors were reduced by approximately 45% for claims liabilities and 11% for premium liabilities to account for risk diversification. Per OSFI, the “correlation study demonstrated that premium liabilities by lines of business are more correlated compared to claims liabilities; therefore a lower diversification credit was applied.”

Use of the MCT risk factor as the second point on the distribution requires the following considerations:

- The appropriate level of diversification when aggregating multiple lines and potentially LIC and LRC; the actuary would consider the entity’s mix and volume of business.

- Adjustment for volatility due to size and other considerations relative to the “average” entity included in the OSFI review. For example, smaller entities tend to exhibit greater relative volatility than larger entities due to increased process and parameter risk, all else being equal.

With the assumption of a lognormal distribution and removing diversification based on the MCT factors, the following table shows the indicated standard deviation by line of business for the LIC and the LRC. The standard deviations should correspond reasonably well with unpaid claims and premium liabilities. The MCT risk factors were scaled to the average of the four largest entities included in the OSFI review. The risk factors were also reduced by OSFI’s estimate of the average MfAD for each line of business.

</table>

In its variability analysis, OSFI determined that a portion of the volatility depended inversely on the size of the entity and the remaining portion of the volatility was not dependent on the size of the entity, with the proportions varying by line of business. These proportions are not disclosed in the OSFI analysis. To the extent that individual entity characteristics differ from the average of the four largest entities contained in the 2013 OSFI analysis, the actuary would adjust the volatility accordingly. Diversification would be included based on entity-specific considerations.

These calculations represent rough approximations of a lifetime 65th, 75th, and 85th percentiles (selected as examples not recommendations) based on the MCT. The findings in the preceding table represent an approximation in a context where an entity has no better information to
derive a second percentile point on the distribution of the present value of future cash flows over a lifetime horizon and excludes the effect of diversification across lines of business and between the LIC and the LRC. It is important to note that the calibration of the MCT factors reflects a large entity’s relative volatility. To the extent that these parameters are different in a particular entity’s RA calculation, the actuary would adjust the percentile factors accordingly. Significant differences are possible. The actuary would take care to check the reasonability of the standard deviations based on the MCT factors considering the facts and circumstances of the entity.
Appendix 1: Margins – Brief Summary of IFRS 4 CIA Standards of Practice

Subsections 2250 through 2270 of the CIA Standards of Practice\(^\text{12}\) provided guidance to actuaries in setting margins for adverse deviations prior to the effective date of IFRS 17. While no longer binding after the effective date of IFRS 17, this guidance might be helpful to actuaries in quantifying the degree of uncertainty in non-financial assumptions, and by extension quantifying the compensation for non-financial risk that the entity might require.

Under Subsections 2250 through 2270, the range of margins for claims development was between 2.5% and 20% of the best-estimate assumption. Selections above this range would be appropriate in situations such as:

- Unusually high uncertainty; and
- Unusually low best estimate resulting in an unreasonably low dollar provision for adverse deviations.

Selections below this range would be appropriate in situations such as:

- Coverage that is reserved at the stop loss limit.

Considerations for placement in the ranges would have been similar to those noted in IFRS 17.B91.

Appendix 2: Simplified Calculation of RA based on CoC Method

Simplified CoC calculations, such as the example presented in this appendix, could be an alternative way to estimate the RA that allows insurers to use the general CoC concept. The example included in this appendix may provide a more intuitive way to estimate the RA for insurers that have a profit margin or combined ratio target instead of a target return on equity (ROE).

The basic concept is that the target profit margin is allocated between reserve risk, underwriting risk, and other risks that are not relevant to the RA.

The profit margin could be directly determined, in the case of an entity with a target profit margin or combined ratio, or calculated for an entity with a target ROE and premium to surplus ratio. Standard formula can be used to convert a target ROE and a premium to surplus ratio to a target profit margin. A simple formula using ROE, corporate income tax, investment income on surplus, and premium to surplus ratio is:

\[
\text{Profit Margin on Premium} = \frac{\text{Target ROE}}{(1-\text{Tax})} \cdot \text{Investment Income on Surplus} \div \text{Premium to Surplus Ratio}
\]

Next, the total profit margin is split between underwriting risk, reserve risk, and other risks that are not relevant to the RA, based on the proportion of the capital allocated to each of these risks. The actuary may rely on ORSA or other processes used to allocate capital to reserve risk, underwriting risk, and other risks.

Using these types of calculations, the actuary would recognize that underwriting risk disappears once the coverage is expired and reserve risk diminishes over time as claims are settled. Thus, using amounts derived from the profit margin on premium, to estimate the RA:

- The LRC is assigned both the profit margin associated with underwriting risk and reserve risk; and
- Given that the underwriting risk does not exist for the LIC, the LIC is assigned only the profit margin associated with reserve risk.

The RA amount associated with the LIC (i.e., premium multiplied by the profit margin associated with reserve risk) would wind-down in an appropriate manner to reflect the settlement of claims. Assuming that the reserve risk is correlated to the amount of claims that are outstanding and unreported, the actuary could calculate the present value of future cash flows at the beginning of each time period (i.e., the expected reserves) and then determine the present value of this stream of cash flows. As a result, the reserve risk profit margin unwinds as the present value of the stream of present values unwind. This is comparable to the rate at which the RA decreases in the traditional CoC calculations. The applicable profit margin is the RA at that point in time for the LIC.
With these calculations, the confidence level for the RA is based on the distribution of the present value of cash flows, which could be shaped significantly different for LIC versus LRC for some P&C coverages.

Some potential limitations of this approach:

- The proportion of capital allocated to each risk may vary by portfolio or group;
- The profit margin may vary by portfolio or group (different ROE targets and/or different premium to surplus ratios);
- The approach still requires a confidence level to be determined for disclosure purposes, which requires a distribution of the present value of cash flows;
- The approach requires the projection of cash flows for the unwinding of the reserve risk;
- Changes in the allocation of capital by portfolio or group, or by risk, over time, which may result as a change in mix or volume of business, could result in changes in indicated RA; and
- Changes in profit margins objectives could result in changes in RA for prior policy years.

**Illustrative Example**

Assume that an insurer has only one line of business that it prices with a 10% profit margin. Further assume that a robust ORSA model indicates that capital is allocated 50% for underwriting, 30% for reserve, and 20% for other risks.

The profit margins associated with the different risk categories are 5% for underwriting risk, 3% for reserve risk, and 2% for other risks.

The LRC RA would then be calculated as 8% of premium (5% for underwriting risk plus 3% for reserve risk).

The LIC RA for a given policy year would start off at 3% of expired premium and decrease over time, which as a percentage of the present value of future cash flows could be a higher or lower value than the LRC RA.
The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the Standards of Practice; and as such, the actuary should cross-reference with current Standards. To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.
MEMORANDUM

To: Members in the property and casualty insurance practice area

From: Steven W. Easson, Chair
Actuarial Guidance Council

Sarah Chevalier, Chair
Committee on Property and Casualty Insurance Financial Reporting

Date: September 18, 2020

Subject: Educational Note – 2020 Guidance to the Appointed Actuary and Valuation Actuaries for Property and Casualty Insurers

The Committee on Property and Casualty Insurance Financial Reporting (PCFRC or the Committee) has prepared this educational note to provide guidance to the Appointed Actuary and valuation actuaries (referred to as “actuaries” in the rest of this note) in several areas affecting the valuation of the 2020 year-end insurance contract liabilities and other responsibilities of the Appointed Actuary of Property and Casualty insurers for Canadian generally accepted accounting principles (GAAP) purposes. The guidance in this educational note represents a majority view of the PCFRC members on appropriate practice consistent with the Standards of Practice.

The educational note is structured in nine sections and two appendices. The nine sections provide guidance on recent and emerging guidance and issues. Appendix A contains a list of relevant educational notes and reference documents. Appendix B provides an update on IFRS 17.

A preliminary version of this educational note was shared with the following committees for their review and comments:

- Committee on Life Insurance Financial Reporting (CLIFR)
- Committee on Risk Management and Capital Requirements (CRMCR)
- Committee on the Appointed/Valuation Actuary (AAC)
- International Insurance Accounting Committee (IIAC)
- Committee on Worker’s Compensation
The educational note was also presented to the Actuarial Guidance Council (AGC) in the months preceding its approval. The Committee feels that it has addressed the material comments received by the various committees.

The creation of this cover letter and educational note has followed the AGC’s protocol for the adoption of educational notes. In accordance with the Institute’s Policy on Due Process for the Approval of Guidance Material other than Standards of Practice and Research Documents, this educational note has been prepared by PCFRC and has received approval for distribution from the AGC on September 8, 2020.

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the Standards of Practice; and as such, the actuary should cross-reference with current Standards. To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.

Some guidance provided last year is still appropriate and has been duplicated in this educational note. The guidance is labelled as unchanged. Other guidance has been modified, either to reflect recent developments or to improve clarity and is labelled as modified.

Questions or comments regarding this educational note may be directed to Sarah Chevalier at sarahchevalier@axxima.ca.

Appendix A – References ........................................................................... 11
Appendix B – IFRS 17 ............................................................................... 13
1. Introduction (unchanged)

The Committee on Property and Casualty Insurance Financial Reporting (PCFRC) of the Canadian Institute of Actuaries (CIA) prepared this educational note to provide guidance to property and casualty (P&C) actuaries in the valuation of insurance contract liabilities. This note reviews relevant standards of practice (SOP) and other educational notes and discusses current issues affecting the work of corporate actuaries. Links to all the CIA documents referenced in this educational note are provided in Appendix A.

2. Guidance to members on specific situations (unchanged)

From time to time, CIA members seek advice or guidance from the PCFRC. The PCFRC strongly encourages such dialogue. CIA members are assured that it is proper and appropriate for them to consult with the chair or vice-chair of the PCFRC.

CIA members are reminded that responses provided by the PCFRC are intended to assist them in interpreting the SOP, educational notes, and Rules of Professional Conduct (Rules), and in assessing the appropriateness of certain techniques or assumptions. A response from the PCFRC does not constitute a formal opinion as to whether the work in question is in compliance with the SOP and Rules. Guidance provided by the PCFRC is not binding upon the member.

3. Standards of Practice (modified)

The SOP are subject to revision from time to time. At the time of writing this educational note, references to the Rules of Professional Conduct (Rules) and to the SOP correspond to the versions effective December 1, 2020. No changes were made to Sections 1000 and 2000 since the version effective January 1, 2020.

While all the Rules and SOP are important, your attention is directed to the following that are particularly relevant:

- Subsection 1240 – Materiality
- Section 1400 – The Work including subsection 1460 – Quality Assurance
- Section 1500 – Another Person’s Work; including subsection 1530 – Review or repeat of another actuary’s work
- Section 1600 – Assumptions and Methods
- Section 1700 – Reporting
- Section 2100 – Insurance Contract Valuation: All Insurance
- Section 2200 – Insurance Contract Valuation: Property and Casualty Insurance
- Section 2400 – The Appointed Actuary
- Section 2500 – Financial Condition Testing (replaces the section on Dynamic Capital Adequacy Testing, effective January 1, 2020). Revisions were made to SOP Section 2500 effective January 1, 2020 with the objective to provide a more robust approach to the requirements for the report prepared by the Appointed Actuary on the expected future financial condition of an insurance entity and to better align with the Own Risk and
Solvency Assessment (ORSA) regulatory requirements. The section was renamed to “Section 2500 – Financial Condition Testing.”

4. Recent guidance (new)

This section contains a list of guidance material published recently to assist actuaries in their year-end valuation of insurance contract liabilities and Financial Condition Testing (FCT) work. No recent guidance material was published in relation to year-end valuations. The following educational notes were published recently and provide relevant guidance with respect to the FCT:

- Educational Note: Guidance for the 2020 Reporting on Capital and Financial Condition Testing for Life, P&C, and Mortgage Insurers (April 2020). This document is prepared annually by the Committee on Risk Management and Capital Requirements (CRMCR).

5. COVID-19 (new)

The COVID-19 outbreak was first identified in Wuhan, China, in December 2019. During the first quarter of 2020, various outbreaks were identified around the world. The World Health Organization declared it a pandemic on March 11, 2020.

As the COVID-19 situation continues to evolve, actuaries would pay close attention to all guidance and updates from the Office of the Superintendent of Financial Institutions (OSFI), the Autorité des marchés financiers (AMF), and the CIA.

The CIA is engaged in informing members about COVID-19, through a hub on its website. Actuaries are encouraged to visit the hub regularly as it contains analyses, webcasts, links and articles that are relevant to actuarial practice in the face of the current situation.

6. Financial Condition Testing (new)

The CRMCR published a new educational note – Financial Condition Testing in April 2020, with a transitional effective date of January 1, 2020. This educational note provides guidance on how to interpret the revised SOP and summarizes the major changes from the prior SOP on DCAT. It also addresses the goals of stress testing providing details from OSFI and AMF guidelines. Appendix B of the FCT educational note contains a discussion of various P&C risk categories to be considered by the actuaries while conducting the FCT.

In December 2019, the CRMCR also published an educational note supplement: Updated Guidance for the 2019 Reporting on Capital and Financial Condition Testing for Life and P&C Insurers that addresses the transition from DCAT to FCT effective January 1, 2020.
In April 2020, the CRMCR published an educational note called *Guidance for the 2020 Reporting on Capital and Financial Condition Testing for Life, P&C, and Mortgage Insurers*. This note provides an overview of guidance to actuaries in several areas affecting the reporting of the 2020 regulatory capital requirements and financial condition testing for insurers operating in Canada. Section 5 of this note (“Considerations for the 2020 Financial Condition Testing (FCT)”) contains key changes in the SOP: Section 2500, guidance for transition from DCAT to FCT in 2020, support for dealing with the upcoming changes due IFRS 17 with respect to FCT forecasts, and special considerations due to COVID-19 for the 2020 FCT.

There is no impact from IFRS 17 – Insurance Contracts on the 2020 year-end actuarial valuation; however, actuaries are encouraged to refer to the [IFRS 17 blog](https://cianet.ca) on the CIA website (login required) for up-to-date summaries of CIA activities and links to relevant sources of information regarding IFRS 17. The International Accounting Standards Board® (the Board) decided to delay the effective date of IFRS 17 by another year, to January 1, 2023, and issued the final amendments to IFRS 17 in June 2020.

Please refer to Appendix B for information about the development of SOP, guidance, and capital requirements for financial reporting periods under IFRS 17.

8. **Regulatory guidance (modified)**

We remind actuaries to refer to updated communications from provincial and/or federal insurance regulators regarding insurance contract liabilities valuation and FCT reporting.

8.1. **Office of the Superintendent of Financial Institutions (OSFI) Requirements (modified)**

**OSFI Annual Memorandum for Actuarial Reports on P&C Business**

OSFI issues an annual [Memorandum to the Appointed Actuary](https://cianet.ca). Actuaries would consult this memorandum for complete instructions from OSFI.

**Capital requirements**

References in this section of this educational note to OSFI’s minimum capital test (MCT) for Canadian insurers are also intended to encompass comparable requirements for Canadian branches of foreign insurers, i.e., the Branch Adequacy of Assets Test (BAAT).

The [MCT Guideline](https://cianet.ca) currently in effect was issued by OSFI in November 2018 with an effective date of January 1, 2019. This 2019 [MCT Guideline](https://cianet.ca) increased the margin required for reinsurance ceded to unregistered reinsurers and introduced a transition period for this increase. Guideline A-4 [Regulatory Capital and Internal Capital Targets](https://cianet.ca) sets out OSFI’s expectations with respect to the setting of insurer-specific internal target capital ratios and how such targets relate to the assessment of capital adequacy within the context of OSFI’s supervisory framework. Guideline E-19 [Own Risk and Solvency Assessment](https://cianet.ca) sets out OSFI’s expectations with respect to an insurer’s own assessment of its risks, capital needs, and solvency position and for setting internal targets.
**Guideline E-15 Appointed Actuary: Legal Requirements, Qualifications, and Peer Review**

A full peer review of both the Appointed Actuary’s Report (AAR) and the FCT report is required every three years. In addition, OSFI expects the reviewer to undertake a limited scope annual review in the interim years and to prepare and file a report annually.

**Guideline B-9 Earthquake Exposure Sound Practices**

OSFI requires insurers to file the [Earthquake Exposure Data Form and instructions](#) by May 31 of each year using the Regulatory Reporting System.

**8.2. Requirements of the Autorité des marchés financiers (AMF) (modified)**

**AMF Annual Guides for Actuarial Reports on P&C Business**

The AMF issues specific guides to actuaries of Québec-chartered insurers for both the valuation of insurance contract liabilities and FCT. The actuaries would consult these guides for the complete requirements from the AMF.

The AMF guide regarding the mandatory insurance contract liabilities report is updated annually and it addresses regulatory requirements and the report’s expected content and prescribed layout. The AMF guide also mandates prescribed exhibits for reporting results of the actuaries’ valuation. Prescribed exhibits include the unpaid claims and loss ratio analysis exhibits for which specific instructions are also available along with the guide.

**Capital Requirements**

In December 2019, the AMF published its revised MCT guideline, which came into effect on January 1, 2020. The changes were limited to adaptations made necessary by the coming into force of the Insurers Act and minor edits or clarifications.

After the Insurers Act came into effect in June 2019, the AMF published two new MCT guidelines regarding the solvency requirements respectively of self-regulatory organizations and reciprocal unions authorised to carry on insurer activities. These guidelines were revised as of January 1, 2020 and are for the most part very similar to the current 2020 MCT guideline for traditional insurers, but with necessary adaptations.

The FCT guide replaces the DCAT guide. This document is updated annually and addresses the same general aspects as the guide on the valuation of insurance contract liabilities. When completing the FCT report, actuaries are advised to be aware of the latest developments in the calculation of the MCT ratio. The AMF requires the actuaries to annually disclose the insurer’s internal capital target ratio, and the FCT guide states that the actuaries would take care to detail the methodology and assumptions used in the determination of the internal capital target ratio.

Actuaries of Québec-chartered insurers would also be aware that AMF requires insurers to file the earthquake exposure data by April 15 of each year, using the AMF Earthquake Exposure Data Form and instructions and based on latest year-end exposure.

Actuaries would be expected to be familiar with any subsequent revision to the capital requirements and incorporate them where applicable.
**Integrated Risk Management Guideline and Capital Management Guideline**

There has been no change to the Integrated Risk Management Guideline published by AMF in 2015, to accompany the publication of its Capital Management Guideline. These guidelines are meant to give specific expectations regarding capital and risk management.

The AMF expects actuaries to be involved in the own risk and solvency assessment (ORSA) mechanism, especially with regards to setting the internal capital target and stress testing as a complementary tool to FCT.

The AMF also expects the application of the ORSA mechanism to be the subject of an official report to the board of directors at least once a year, or more often if the financial institution’s risk profile changes significantly, and assesses the degree of compliance to these guidelines as part of its supervisory framework.

9. **Emerging issues and other considerations** *(modified)*

It is important for actuaries to be aware of current or emerging issues that could affect valuation of insurance contract liabilities. Some of these considerations might also affect the FCT. Several considerations are discussed below.

9.1. **Product reforms** *(modified)*

Actuaries would consider the potential effect that product reforms may have on both the valuation of insurance contract liabilities and on the FCT. For example, the actuaries would consider the potential impact, if any, of the proposed transition to a no-fault automobile insurance framework in British-Columbia.

9.2. **Recent judicial, legislative, and political events** *(modified)*

Regular communication with claims professionals is essential to the work of the actuaries. These discussions would encompass the potential effect of recent court decisions, judicial events, legislative changes, and political events that may be relevant to the valuation of insurance contract liabilities and FCT.

Prior annual guidance to actuaries contains reference to historical court cases that may still be relevant for the actuaries’ work.

Actuaries would also consider any changes to the provincial or federal tax system or rates that need to be incorporated into valuation or FCT work.

9.3. **Catastrophic events** *(unchanged)*

From time to time, catastrophic events occur that have the potential to affect actuaries’ estimate of claim liabilities and, in some cases, the premium liabilities. Events that are considered catastrophic on an industry-wide basis may not have a catastrophic effect for a given insurer, while smaller industry events may. The extent to which any event is significant in the context of the valuation of a specific insurer’s insurance contract liabilities depends on the nature of the insurer’s business, its exposure in the affected region, policy wordings, and the date on which the event occurred.
The actuaries would consider the effect of extreme events on the following:

- Additional costs on other losses due to post-event inflation in the region as well as the rest of the country.
- The payment pattern and any change that the event may have on paid claims.
- Unallocated loss adjustment expenses (ULAE) estimates that may need to be tempered to the extent that the factor used to calculate the provision is a ratio to unpaid losses.
- Margins for adverse deviations, particularly for recovery from reinsurance ceded.

9.4. **Climate change (unchanged)**

Weather-related disasters are occurring with greater frequency and magnitude than the industry has experienced in the past. In the transition period to a new climate reality, further estimation of the impact on claims is anticipated among new claim risks that will evolve within the actuaries’ mandate as it relates to setting claims reserves and capital requirements. The recently released [CIA public statement](https://www.cia.org/cia/publication) on climate change supports disclosure on climate risks on a mandatory basis by 2021 and voluntary compliance immediately. Additional resources from the [Climate Change and Sustainability Committee](https://www.cia.org/cia/publication) can be found on the CIA website.

Appendix B – IFRS 17

The following information discusses the development of SOP, guidance, and capital requirements for financial reporting periods under IFRS 17.

Standards of Practice

In May 2017, the IASB published the draft standards for IFRS 17, Insurance Contracts. The implementation date is expected to be fiscal years beginning on or after January 1, 2023. The Board discussed amendments to IFRS 17 Insurance Contracts in its recent meetings, in response to concerns and challenges raised by stakeholders as IFRS 17 is being implemented. The final amendments to IFRS 17 were published in June 2020. For the most current information please see the Board website.

The Canadian Accounting Standards Board has indicated its intention that, once adopted by the IASB, and subject to its due process, IFRS 17 will be adopted without modification for the valuation of insurance contracts in Canadian generally accepted accounting principles (GAAP) financial statements.

The International Actuarial Association (IAA) released International Standard of Actuarial Practice 4 (ISAP 4) on IFRS 17 Insurance Contracts in November 2019. ISAP 4 covers actuarial practice in support of valuation of insurance contract liabilities in accordance with IFRS 17. The changes proposed in the CIA exposure draft align the SOP with the requirements of IFRS 17 and incorporate the guidance of ISAP 4. These developments require changes to the Canadian SOP, as the valuation methods under IFRS 17 are significantly different from the current methods of valuation of insurance contract liabilities in Canada.

The Actuarial Standards Board (ASB) published the following document in March 2020: *Revised Exposure Draft to Incorporate changes required by the adoption in Canada of IFRS 17 Insurance Contracts, including Principles of International Standard of Actuarial Practice 4 – Actuarial Practice in Relation to IFRS 17 Insurance Contracts, into the Canadian Standards of Practice*.

The CIA is very active in this area, with several committees involved in reviewing the IFRS 17 standards and related guidance.

The CIA Committee on International Insurance Accounting (IIAC) under the International Affairs Council has the following mandate with regards to international accounting and actuarial standards for the valuation of insurance and related products:

- Monitor developments and ensure that news of relevant and material developments is dispersed appropriately within the CIA.
- Recommend where specific additional Canadian guidance may be helpful, and if so, assist in its development.
- Where relevant and appropriate, provide input from a CIA perspective to the international governing bodies.

Guidance

The IAA is developing an International Actuarial Note (IAN 100). The CIA Standards and Guidance Council (SGC, now called the Actuarial Guidance Council (AGC)) has reviewed the
current exposure draft of IAN 100 and released it as a draft educational note Application of IFRS 17 Insurance Contracts in February 2019. This draft educational note is intended to assist CIA members in the application of IFRS 17.

Additional guidance to members has been developed by the CIA, in the form of educational notes and reports. At this time, the following guidance material have been published:

- Draft educational note: IFRS 17 Discount Rates and Cash Flow Considerations for Property and Casualty Insurance Contracts (August 2020)
- Draft educational note: Assessing Eligibility for Premium Allocation Approach Under IFRS 17 for Property & Casualty and Life & Health Insurance (July 2020)
- Draft educational note: IFRS 17 Risk Adjustment for Non-Financial Risk for Property and Casualty Insurance Contracts (May 2020)
- Draft educational note: IFRS 17 – Actuarial Considerations Related to P&C Reinsurance Contracts Issued and Held (April 2020)
- Draft educational note: IFRS 17 – Compliance with IFRS 17 Applicable Guidance (January 2020)
- Draft educational note: IFRS 17 Estimates of Expected Loss Ratios for the Minimum Capital Test (August 2019)
- Draft educational note: Comparison of IFRS 17 to Current CIA Standards of Practice (September 2018)

The following guidance material is currently being developed (expected to be published in 2021):

- Draft educational note: Liability for Remaining Coverage;
- Draft education note: Fair Value (Joint working group with CLIFR);
- Report on expenses (Joint working group with CLIFR); and
- Report on disclosures (Joint working group with CLIFR).

The guiding principles for the development of educational notes and reports are:

- To consider Canadian-specific perspectives and address gaps in the IAN 100.
- Provide application guidance that is consistent with the IFRS 17 Standard and applicable Canadian actuarial SOP and educational notes, without unnecessarily narrowing the choices available in the IFRS 17 Standard.
- Consider practical implications associated with implementation of potential methods; in particular, ensure that due consideration is given to options that do not require undue cost and effort to implement.
The CIA is also engaged in educating members about IFRS 17, through webcasts, sessions at CIA meetings, and other forums. The CIA website has an IFRS 17 blog (log in required). This members-only resource center serves as a repository for everything about IFRS 17, including documents, links to important websites, and updates from the committees working to help members for this significant change. Moreover, the mandates of each of the subcommittees mentioned above can be found on the blog.

In February 2020, the CIA published IFRS 17 and the Appointed Actuary in Canada, authored by the vice-chair of the Designated group on the role of the AA under IFRS 17. This was an article written by a CIA member and, therefore, does not constitute formal guidance. This document examines the impact of IFRS 17 on the Canadian actuarial profession and the role of the valuation or appointed actuary in insurance companies, which is driving an extensive review and revision of SOP beyond those previously exposed.

**IFRS 9 Financial Instruments**

Most insurers will not adopt IFRS 9 until IFRS 17 becomes effective in 2023; however, some entities have already adopted IFRS 9, most notably those that are part of larger financial institutions, such as bank-owned insurers. For those entities, the actuary could have seen changes in the carrying value of assets that potentially affected the valuation.

**Draft Regulatory Capital Requirements and Returns (IFRS 17)**

OSFI and the AMF have issued draft regulatory capital requirements guidelines. A first quantitative impact study (QIS), related to the draft MCT guideline was conducted in October 31, 2019. A second version of the draft MCT guideline and a second QIS is scheduled for October 2020. Data and comments collected from that exercise will be used to finalize decisions on policy issues, calibrate the MCT guideline capital requirements, and determine whether any transition measures are required. Draft P&C returns that have been adapted to reflect changes related to IFRS 17 have also been circulated to industry.

**Considerations for FCT**

Based on the CRMCR Guidance for the 2020 Reporting on Capital and Financial Condition Testing for Life and P&C Insurers issued in April 2020:

> “In principle, FCT forecasts beyond January 1, 2023 should be produced under IFRS 17 and the updated regulatory capital requirements guidelines. However, neither the regulatory capital requirement guidelines nor IFRS 17 are final (the IASB issued a revised exposure draft on June 26, 2019 and plan to publish the final version in the second quarter of 2020)\(^1\), and therefore insurers may not yet be able to produce reliable financial projections under IFRS 17. In these circumstances, an appropriate practice would be to continue to perform FCT in 2020 using the current accounting standards, actuarial standards, and current regulatory capital guidelines, with additional qualitative analysis on IFRS 17. Quantitative analysis could also be added if available. If quantitative impact studies reveal potential issues based on the new standards, insurers may need to adjust their forecasts to reflect these changes.”

---

\(^1\) Note that the final IFRS 17 standards have been published in June 2020.
draft guideline in between filings of the FCT report, it would also be appropriate for the Appointed Actuary to describe these potential issues to the board or chief agent along with any potential mitigating actions, either in the FCT report or presentation, or through regular IFRS 17 updates.”
Educational Note

Consideration of Future Income Taxes in the Valuation of Policy Liabilities

Committee on Property and Casualty Insurance Financial Reporting

July 2005

Educational Notes do not constitute standards of practice. They are intended to assist actuaries in applying standards of practice in respect of specific matters. Responsibility for the manner of application of standards in specific circumstances remains that of the practitioner.
Memorandum

To: All Fellows, Affiliates, Associates and Correspondents of the Canadian Institute of Actuaries practising in Property and Casualty Insurance

From: Elaine Lajeunesse, Chairperson
Committee on Property and Casualty Insurance Financial Reporting

Date: June 27, 2005

Subject: Educational Note: Consideration of Future Income Taxes in the Valuation of Policy Liabilities

Please find enclosed a new educational note entitled, “Consideration of Future Income Taxes in the Valuation of Policy Liabilities”, which has been prepared by the Committee on Property and Casualty Insurance Financial Reporting. The purpose of this note is to provide guidance to actuaries in valuing the impact of future income taxes on policy liabilities of Property and Casualty insurers.

Tax specialists from the industry were consulted regarding the basis for determination of the asset for Future Income Taxes for balance sheet purposes.

In accordance with the Institute’s policy for Due Process, this educational note has been approved by the Committee on Property and Casualty Insurance Financial Reporting, and has received final approval for distribution by the Practice Standards Council.

Educational notes are covered under Section 1220 of the Standards of Practice. Section 1220 prescribes that “The actuary should be familiar with relevant educational notes and other designated educational material.” It further explains that a “practice which the notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation.” As well, “educational notes are intended to illustrate the application (but not necessarily the only application) of the standards, so there should be no conflict between them.”

All questions and comments should be addressed to Claudette Cantin at her Yearbook Address.

EL
CONSIDERATION OF FUTURE INCOME TAXES IN THE VALUATION OF POLICY LIABILITIES

Background

Please refer to two sections of the Standards of Practice (SOP) as follows:

Section 2130.15: The insurer’s accounting policy may report amounts related to the relevant policies and the assets which support their policy liabilities, such as [...] future tax liabilities and assets (for example, those in connection with the timing differences between accounting and tax liabilities).

Section 2210.02: Notwithstanding Section 2100 and this Section 2200, until standards have been developed, the actuary may ignore taxes in determining policy liabilities for property and casualty insurance.

The Practice Standards Council (“PSC”) requested that the Committee on Property and Casualty Insurance Financial Reporting (“the Committee”) develop a standard of practice addressing the consideration of future income tax for property and casualty companies, with a view to removing the above-noted exception. As illustrated below, however, income tax is unlikely to be a significant consideration for the valuation of property and casualty companies. Accordingly, the Committee intends to provide guidance to members by way of this educational note, rather than a standard of practice. Following the publication of this educational note, the PSC will remove the above-noted exception.

ASSET FOR FUTURE INCOME TAXES RELATED TO POLICY LIABILITIES

As detailed in Part XIV of Canadian Income Tax Regulations, the income tax deduction in respect of an insurer’s claim liabilities is equal to 95% of the lesser of the reported reserve and claim liability. As defined in Regulation 1408, reported reserve refers to the amount of the net claim liabilities carried by the insurer, and recorded in the insurer’s Annual Statement. Claim liability refers to the net claim liabilities determined in accordance with accepted actuarial practice (i.e., discounted to reflect the time value of money, and including explicit provisions for adverse deviations). Reported reserve and claim liability are net of amounts recoverable from reinsurers, and net of amounts recoverable in respect of salvage and subrogation.

By definition, then, the income tax deduction in respect of an insurer’s claim liabilities is less than the amount of the claim liabilities recorded in the Annual Statement. This creates a “future tax temporary difference” that gives rise to an asset for Future Income Taxes. This asset for Future Income Taxes represents the prepayment of tax as a result of the liability deducted for tax purposes being less than the amount reported on the balance sheet.

Where the effect of discounting this asset for Future Income Taxes (i.e., the asset for Future Income Taxes related directly to the amount of the policy liabilities) is material, the actuary’s estimate of the policy liabilities should be reduced accordingly.
EFFECT OF DISCOUNTING THE ASSET FOR FUTURE INCOME TAXES

The discussion that follows is limited to the portion of the asset for Future Income Taxes directly related to claim liabilities. A similar approach would be applied in the event that a portion of the asset for Future Income Taxes relates directly to premium liabilities.

It is anticipated that in most cases the effect of discounting the asset for Future Income Taxes would not be material to the valuation of a property and casualty insurer. In order to assess the appropriateness of that assumption, a reasonable approximation of the balance sheet effect can be derived as follows:

\[
\text{Estimated Effect of Discounting the Asset for Future Income Taxes} = \left[\text{Reported Reserve}^1 - 95\% \times (\text{lesser of Reported Reserve}^1 \text{ and Claim Liability}^1)\right] \\
\times \text{Future Income Tax Rate} \\
\times (1 - \text{Present Value Factor}^2)
\]

Note:
1. As per Canadian Income Tax Regulation 1408:
   - \text{Reported Reserve} = \text{net claims liabilities amount carried in the balance sheet}
   - \text{Claim Liability} = \text{net claims liabilities calculated in accordance with accepted actuarial practice.}
2. The present value factor referred to above is intended to reflect the time value of money based on the selected rate of return net of the margin for investment return rate. A reasonable approximation of the present value factor can be computed from the estimated claim liabilities, as illustrated in the attached examples.

The first example attached to this educational note is based on a situation where the \text{Reported Reserve} is equal to the \text{Claim Liability}. The asset for Future Income Taxes, and the effect of discounting that asset, would be higher if the \text{Reported Reserve} exceeded the \text{Claim Liability}, as illustrated in the second example.

The effect on an insurer’s income statement of discounting the asset for Future Income Taxes would be computed as the change in the balance sheet effect, as described above.

OTHER ASSETS FOR FUTURE INCOME TAXES OR LIABILITIES

The asset for Future Income Taxes and liabilities of property and casualty companies may include other components besides those relating directly to the amount of the policy liabilities. To the extent that they do not relate to the policy liabilities, the estimation of such other assets for Future Income Taxes or liabilities would not fall within the scope of the actuary’s valuation of the policy liabilities.
Estimated Effect of Discounting the Asset for Future Income Taxes

XYZ Property and Casualty Insurer

Example #1 - Reported Reserve = Claim Liability

(1) Actuary’s Estimates
   (a) Undiscounted Estimate 1,046,000

<td>0.9121</td>
<td>0.7781</td>
</tr>
</tbody>
</table>

Notes:

1. PfAD: Provision for Adverse Deviations.
2. The selected discount rates have been reduced by an investment return rate PfAD.
3. The estimated effect of discounting the asset for Future Income Taxes is expressed as a percentage of the actuary’s estimate of the net claim liabilities discounted in accordance with accepted actuarial practice, and including explicit provisions for adverse deviations.
4. The selected 4-year payout (70/15/10/5) results in an average duration of about 1 year.
5. The selected 10-year payout (25/20/15/12.5/10/7.5/5/2.5/2/1) results in an average duration of about 2.85 years.
Estimated Effect of Discounting the Asset for Future Income Taxes
XYZ Property and Casualty Insurer

Example #2 - Reported Reserve > Claim Liability

(1) Actuary’s Estimates
   (a) Undiscounted Estimate 1,046,000
   (b) Discounted Estimate Excluding PfADs 987,000
   (c) PfAD – Investment Return Rate 1,000
   (d) PfAD – Claims Development 10,000
   (e) PfAD – Reinsurance Recovery 2,000
   (f) Discounted Including PfADs 1,000,000

(2) Income Tax Amounts
   (a) Reported Reserve 1,078,000
   (b) Claim Liability 1,000,000

(3) Future Income Tax Rate 36%

(4) Present Value Factor = [(1b)+(1c)]/(1a) 0.9446

Estimated Effect of Discounting the Asset for Future Income Taxes
= [1,078,000 – (95% x 1,000,000)] x 36% x [1.0 - 0.9446] = $2,553

Estimated Effect As a % of Actuary’s Estimate
= [2,553 / 1,000,000] = 0.26%

Although the figures used in this example are for illustrative purposes only, the following table may be helpful in assessing the sensitivity of the result to certain key assumptions, namely the discount rate and duration of the liabilities.

Members should be familiar with educational notes. Educational notes describe but do not recommend practice in illustrative situations. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application (but not necessarily the only application) of the Standards of Practice, so there should be no conflict between them. They are intended to assist actuaries in applying standards of practice in respect of specific matters. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members.
MEMORANDUM

To: Members in the property and casualty insurance area

From: Pierre Dionne, Chair
       Practice Council
       Raul Martin, Chair
       Committee on Property and Casualty Insurance Financial Reporting

Date: March 7, 2017

Subject: Educational Note: Duration Considerations for P&C Insurers

This educational note has been prepared by the Committee on Property and Casualty Insurance Financial Reporting in accordance with the Institute’s Policy on Due Process for the Approval of Guidance Material other than Standards of Practice and Research Documents, and received final approval for distribution from the Practice Council on February 28, 2017.

This guidance was published previously in the 2013-2015 Guidance to the Appointed Actuary for Property & Casualty Insurers, and going forward will be available as a stand-alone educational note.

As outlined in subsection 1220 of the Standards of Practice, “The actuary should be familiar with relevant Educational Notes and other designated educational material”. That subsection explains further that a “practice that the Educational Notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation”. As well, “Educational Notes are intended to illustrate the application (but not necessarily the only application) of the standards, so there should be no conflict between them”.

Questions or comments regarding this educational note may be directed to Raul Martin at jscp@jscp.com.

PD, RM
Introduction and Scope

The Committee on Property and Casualty Insurance Financial Reporting (PCFRC) of the Canadian Institute of Actuaries (CIA) prepared this educational note to provide guidance to actuaries doing work for property and casualty (P&C) insurers related to duration of the insurer’s interest rate sensitive claim liabilities, premium liabilities and assets.

In this document, the term “P&C returns” refers to the uniform returns approved by the Canadian Council of Insurance Regulators. The term “MCT Guideline” refers to the Minimum Capital Test (MCT) Guideline issued by the Office of the Superintendent of Financial Institutions (OSFI) or the version approved for use by provincial regulatory authorities.

Duration has become an increasingly relevant topic for a variety of reasons, including but not limited to the following:

- The MCT Guideline requires the calculation of estimated duration of insurer’s interest-rate-sensitive assets, claim liabilities, and premium liabilities for purposes of the interest rate risk margin;
- Duration may be required for the estimation and selection of the margin for investment return rates in applying concepts from the educational note *Margins for Adverse Deviations for Property and Casualty Insurance*;
- Many insurers are employing the strategy to duration match liabilities to assets to help immunize the impact of relatively small shifts in the market yield curve on surplus; and
- Duration is a consideration in modelling market risk.

Furthermore, there are different interpretations on how duration is to be determined for certain asset classes (e.g., preferred shares).

Duration Defined

Duration is a concept or tool that is used to measure both the average maturity of a series of fixed future cash flows, as well as to measure the sensitivity that interest rate changes have on the present value of a series of future cash flows. The calculation of the duration will depend on the duration measure chosen. The three most common types of duration measures are the following:

- *Macaulay duration* is computed as the weighted average of the time to each cash flow payment, using the present value of the future cash flow payment as weights. The Macaulay duration is calculated as follows:
Macaulay Duration = \[ \frac{\sum_{t=0}^{n} t \times PVCF_t}{k \times \sum_{t=0}^{n} PVCF_t} \]

Where:

\( t \) = time to future cash flow payment
\( \text{yield} \) = market value yield to maturity of the cash flows consistent with \( k \) time period definition
\( k \) = number of periods, or payments, per year (e.g., \( k=2 \) for semi-annual periods)
\( n \) = number of periods until maturity (i.e., number of years to maturity times \( k \))
\( PVCF_t \) = present value of the cash flow in period \( t \) discounted at the yield rate or market value of securities

- **Modified duration** measures the sensitivity of the present value of a series of fixed future cash flows to changes in interest rates. It is calculated as the following:

\[ \text{Modified Duration} = \frac{\text{Macaulay Duration}}{1+\text{Yield}} \]

- **Effective duration** also measures the sensitivity of the present value of a series of fixed future cash flows and will give a similar estimate as the modified duration approach. In addition, the effective duration measures the fair value sensitivity of assets where interest rate changes would change future cash flows, such as in the case of interest rate derivatives, callable bonds, option embedded assets, etc. For example, bonds with embedded options may be called early, and therefore the yield to maturity would change on the bond and so the modified duration formula would no longer be an appropriate measure to use. The effective duration is calculated as the following:

\[ \text{Effective Duration} = \frac{\text{Fair value if yields decline} - \text{fair value if yields rise}}{2 \times \text{initial price} \times \text{change in yield in decimal}} \]

\[ \text{or Effective Duration} = \frac{V_- - V_+}{2 \times V_0 \times \Delta y} \]

\( \Delta y \) = change in yield in decimal
\( V_0 \) = initial fair value
\( V_- \) = fair value if yields decline by \( \Delta y \)
\( V_+ \) = fair value if yields increase by \( \Delta y \)

It is important to note that for the purpose of the MCT, the Macaulay duration is an intermediate step in the calculation of the interest rate sensitivity of an asset or liability and is *not* a measure of duration accepted by regulators. It is also necessary that the duration be
measured on an annual basis for the MCT interest rate margin calculation, as the application of the interest rate shock is measuring the impact of annual interest rate sensitivities. In other words, the definition of the duration needs to be consistent with the definition of the yield rate in terms of period of time, otherwise the results will be incorrect.

Also worth mentioning is that both the modified and effective durations provide only approximations of the sensitivity that changes in interest rates have on the present value of future cash flows. Both of these duration measures provide exact percentage changes for very small changes in interest rate (e.g., one basis point), but are generally less accurate for large changes, as the relationship between the change in interest rate and the change in present value of future cash flows is not linear. More accurate approximations of the impact of changes in interest rates on the present value of future cash flows can be achieved through considering the curvature (or convexity) of the price-yield relationship.

In an attempt to manage the effect that changes in interest rates have on their surplus position, insurers often endeavour to match the duration of their liabilities and assets. This approach is considered good practice. However, it can be demonstrated that there may be future cash flow shortfalls even in situations where the duration of liabilities and assets are perfectly matched. Accordingly, actuaries would consider future net cash flows as well as durations. The value of doing so is demonstrated in the educational note *Discounting and Cash Flow Considerations for Property and Casualty Insurers* (May 2016).

In the calculation of the interest rate risk margin, an interest rate shock factor is applied to the fair value of interest rate sensitive assets and liabilities and their duration. Actuaries are often involved in the calculation of the duration of liabilities and depending on the size of the insurer, may also be asked for support on the duration of assets.

Instructions on the calculation of the interest rate risk margin are provided in the MCT Guideline. The key points for the calculation of the duration are the following:

- Insurers may use either the modified duration or the effective duration to calculate the duration of assets and liabilities. However, the same duration methodology would apply to all assets and liabilities under consideration. Moreover, the same methodology is to be used consistently from year to year.
- Effective duration is the required measure when interest rate changes may change the expected cash flows.
- The portfolio duration can be obtained by calculating the weighted average of the duration for the assets or liabilities in the portfolio with the weights being proportional to the fair value of the cash flows or securities.

The following sections describe the theory and include some examples behind the calculations of duration of liabilities (both premium and claim) as well as assets.

**Duration of Interest-Rate-Sensitive Liabilities**

When evaluating the duration of the claim and premium liabilities, actuaries would consider the following:
• Assumptions underlying the duration calculation would be consistent with those underlying the discounting calculation (e.g., timing of payout) from the actuary’s valuation work.

• The duration may be calculated by line of business using the payout patterns used for discounting. The line of business durations would then be weighted, using actuarial present value (APV) as weights, to derive the total premium or claim liabilities duration. This point is illustrated in appendix A, sheets 2 through 4.

• Alternatively, the duration may be evaluated for all lines of business on a combined basis, with the use of the effective duration approach. This point is illustrated for the duration of premium liabilities in appendix C.

• When the change in interest rate is small, the modified duration and effective duration are approximately the same, and the effective duration can be used to assess the reasonableness of the calculation of the modified duration, or even as a proxy for modified duration if appropriate.

• For premium liabilities, the following additional considerations apply:
  ▪ The calculation would be adjusted for the future accident date; and
  ▪ The future accident date would be adjusted to reflect policy terms of other than 12 months.

• For the purposes of input into the MCT calculation, the duration would be net of reinsurance and net of salvage and subrogation.

Interest-rate-sensitive liabilities include those for which the values are determined on a present value (PV) or actuarial present value basis. In accordance with the MCT Guideline, the interest-rate-sensitive liabilities to be included in the calculation of the interest rate risk margin are those for which their fair value will change with movements in interest rates. The following liabilities are considered sensitive to interest rates and are to be included:

• Net unpaid claims and adjustment expenses; and

• Net premium liabilities.

Other interest-rate-sensitive liabilities may include certain types of structured settlements. As per the OSFI guideline D5 Accounting for Structured Settlements, insurers may be required to recognize Type II structured settlement arrangements as an unpaid claim liability on the balance sheet (versus Type I structured settlements which have a disclosure-only requirement). The challenge to actuaries is that the value of the purchased annuities for Type II settlements will flow through the actuarial data as a single lump sum payment which could cause an understatement of the overall duration if not adjusted for. The additional challenge to actuaries is that embedded in the settlement structure value is the assumption of the prevailing interest rate (which is an input into the modified duration calculation). So, in the absence of the real future cash flows and the interest rate, the actuary may need to make a simplified yet reasonable assumption on the underlying payment pattern in order to reasonably approximate
the underlying future cash flows, and may want to consider using the valuation discount rate to complete the modified duration calculation.

P&C insurers may require supervisory approval in order to be able to consider other liabilities in the calculation of the interest rate risk margin.

Refer to appendix A (sheets 2–3) for an example of the duration calculations for unpaid claim liabilities, and to appendix A (sheet 4) for an example of the duration calculations for premium liabilities. Appendix A (sheet 5) shows how the durations calculated in sheets 3 and 4 may be carried into the calculation of the interest rate risk margin in P&C returns.

Refer to appendix B for an illustration of the cash flow matching model to derive the duration of the claim and premium liabilities.

Appendix C is similar to appendix A (sheet 4) except that it illustrates the duration calculation for premium liabilities on an all-lines-combined basis using the effective duration approach. The interest rate risk margin would be amended to reflect the appropriate fields from appendix C.

**Duration of Interest-Rate-Sensitive Assets**

Actuaries may be asked to calculate the duration of the interest-rate-sensitive assets in the insurer’s portfolio, including for purposes of the calculation of the interest rate risk margin that is part of the MCT calculation. For most insurers, the main classes of interest-rate-sensitive assets are bonds and preferred shares. Refer to appendix A (sheet 1) for an illustrative duration calculation for fixed income securities.

Retractable preferred shares, and preferred shares with rate reset options, may lend themselves to the same duration calculation approach as bonds, particularly if a redemption date or rate reset date can be considered as equivalent to the maturity date of a bond.

As an alternative to the duration calculations referred to above, or to supplement the calculations for other classes of interest-rate-sensitive assets, actuaries may use estimates derived by the insurer’s investment specialists. Before using the work of the investment specialist, the actuary would review the information for reasonableness, and identify which duration formula was used (i.e., Macaulay duration, modified duration, or effective duration) in order to ensure consistency between asset and liability durations.

**Appendices**

The examples in the appendices are provided to assist actuaries in calculating durations for the purpose of the interest rate risk margin in the P&C returns. They are intended to be illustrative, rather than prescriptive. Also included is an example of the use of those estimates in the calculation of the interest rate risk margin in accordance with the MCT Guideline (see appendix A, sheet 5).

Recognizing the link between concepts addressed in this educational note and those addressed in other recently issued educational notes, the appendices include exhibits taken from those other educational notes, as indicated below:

</tbody>
</table>

### Step 3: Weighted duration for claims liabilities

<table>
<thead>
<tr>
<th>PV of Unpaid Claims</th>
<th>APV of Unpaid Claims</th>
<th>Modified Duration</th>
<th>Effective Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>151.1</td>
<td>156</td>
<td>0.7085</td>
</tr>
<tr>
<td>Liability</td>
<td>667.4</td>
<td>115</td>
<td>1.7863</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td>818.5</td>
<td>120</td>
<td><strong>938</strong></td>
</tr>
</tbody>
</table>

### Formulae

1. \( PV = \frac{1}{(1 + y - \Delta y)^2} \)
2. \( APV = \frac{1}{(1 + y)^2} \)
3. \( Modified\ Duration = \frac{PV \times APV}{PV + APV} \)
4. \( Effective\ Duration = \frac{1}{2 \times \Delta y} \times \frac{APV - PV}{APV} \)

### Notes

- From Appendix A, Sheet 2
- \( (3) = \frac{1}{(1 + y)^2} \)
- \( (4) = \frac{1}{(1 + y - \Delta y)^2} \)
- \( (5) = (3) \times (4) \)
- \( (6) = \text{Sum product of columns (2) and (5) divided by (5)} \)
- \( (7) = \frac{(6)}{(1 + y)} \)
- \( (8) = \frac{1}{(1 + y - \Delta y)^2} \)
- \( (9) = \frac{1}{(1 + y + \Delta y)^2} \)
- \( (10) = (3) \times (8) \)
- \( (11) = (3) \times (9) \)
- \( (12) = \frac{[(10) \text{ total} - (11) \text{ total}]}{[2 \times \Delta y] / [(5) \text{ total}]} \)
### Duration of Premium Liabilities

#### Yield \( (y) = \) 1.75%

#### Annual \( \Delta y = \) 0.10%

Premium Liabilities Macaulay Duration

The following is a deterministic approach to demonstrate that the duration of the net premium liabilities can be derived from the duration of a future accident year.

Assume the following:

- \( i \) = yield-to-maturity discount rate.
- Assume losses are uniformly distributed and premiums are annual and evenly distributed.
- Let \( t \) = timing of payments of a future accident year (0.5/1.5/2.5/etc.) from the valuation or calculation date. For simplification, assume there is only one payment made each year and that the first payment is made at the average accident date.
- \( P_t \) is your cash flow payment at time \( t \).
- Let \( x \) = difference between the mean accident date of a future accident year and the mean accident date underlying the unearned premium reserve = 1/6 (0.50 less 0.333).

\[
\text{Macaulay Duration}_{AY} = \frac{\sum_t tP_t (1 + i)^{-t}}{\sum_t P_t (1 + i)^{-t}}
\]

\[
\text{Duration}_{NPL} \approx \frac{\sum_t (t-x)P_t (1 + i)^{-(t-x)}}{\sum_t P_t (1 + i)^{-(t-x)}} = \frac{(1 + i)^x \sum_t tP_t (1 + i)^{-t} - x(1 + i)^x \sum_t P_t (1 + i)^{-t}}{(1 + i)^x \sum_t P_t (1 + i)^{-t}}
\]

\[
\approx \text{Macaulay Duration}_{AY} - x
\]

- Modified duration can then be calculated by dividing by \((1+i)\).
The following table summarizes the results from the monthly testing of the duration of the premium liabilities performed by the Sub-committee on Premium Liabilities Ed Note Revisions of the Committee on Property and Casualty Insurance Financial Reporting (PCFRC) against the following:

1. Previous CIA interpolation approach with the median average accident date;
2. Previous CIA interpolation approach with the mean average accident date;
3. New approximation using the duration of a future accident year minus an adjustment for accident dates using the mean (.3333); and
4. New approximation using the duration of a future accident year minus an adjustment for accident dates using the median (.2929).

Summary of Results - Difference versus exact monthly calculation

Members should be familiar with educational notes. Educational notes describe but do not recommend practice in illustrative situations. They do not constitute Standards of Practice and are, therefore, not binding. They are, however, intended to illustrate the application (but not necessarily the only application) of the Standards of Practice, so there should be no conflict between them. They are intended to assist actuaries in applying Standards of Practice in respect of specific matters. Responsibility for the manner of application of Standards of Practice in specific circumstances remains that of the members in the P&C insurance area.
To: All Fellows, Associates, Affiliates and Correspondents of the Canadian Institute of Actuaries

From: Tyrone G. Faulds, Chair
Practice Council
Pierre Dionne, Chair
Committee on Property and Casualty Insurance Financial Reporting

Date: June 9, 2011

Subject: Minor Amendment to Educational Note: Evaluation of the Runoff of P&C Claim Liabilities when the Liabilities are Discounted in Accordance with Accepted Actuarial Practice

The Committee on Property and Casualty Insurance Financial Reporting has revised the attached Educational Note. The primary purpose of this document is to provide guidance to property and casualty (P&C) actuaries who are required to prepare an evaluation of the runoff of the claim liabilities when claim liabilities are discounted.

In accordance with the Institute’s Policy on Due Process for the Approval of Guidance Material Other than Standards of Practice, this educational note has been prepared by the Committee on Property and Casualty Insurance Financial Reporting, and has received final approval for distribution by the Practice Council on June 9, 2011.

As outlined in subsection 1220 of the Standards of Practice, “The actuary should be familiar with relevant Educational Notes and other designated educational material.” That subsection explains further that a “practice which the Educational Notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation.” As well, “Educational Notes are intended to illustrate the application (but not necessarily the only application) of the Standards, so there should be no conflict between them.”

Additional guidance on discounting is available in Educational Note 210079 – Discounting, published by the CIA in November 2010.

If you have any questions or comments regarding this educational note, please contact Pierre Dionne at his CIA Online Directory address, pdionne@ccr.fr.

TGF, PD
INTRODUCTION
The primary purpose of this document is to provide guidance to property and casualty (P&C) actuaries who are required to prepare a comprehensive report on the valuation of the policy liabilities and an evaluation of the runoff of the claim liabilities.

When claim liabilities are derived on an undiscounted basis, the most common means used by actuaries to evaluate the runoff is through a comparison of the estimated ultimate incurred amounts at successive valuation dates. Another common approach is to compute the calendar year runoff as the amounts paid during the calendar year, plus the change in outstanding amounts from the prior valuation, which is consistent with the calculation of the calendar year incurred claims in the insurer’s income statement. These approaches must be modified or replaced in order to properly evaluate the runoff when the claim liabilities are derived on a discounted basis, in accordance with accepted actuarial practice.

The guidance provided in this note may be appropriate for the valuation of the runoff of other liabilities, including self-insured retention.

This document is divided into three sections:
- discussion of the basic approaches to the evaluation of runoff of claim liabilities,
- an accident year runoff model, and
- allocation of investment income between liabilities and surplus.

1. BASIC APPROACHES TO THE EVALUATION OF RUNOFF OF CLAIM LIABILITIES

1.1 Undiscounted Basis
The runoff, or calendar year emergence, is generally computed in one of two ways, both of which should produce the same result.

(a) Emergence in \( t \) with respect to accident years \( t-1 \) and prior
\[
= \text{(Ultimate amounts estimated at } t-1 \text{)} - \text{(ultimate amounts estimated at } t \text{)}
\]
This calculation can also be done on a policy year or underwriting year basis, except that the second term must be adjusted to exclude the portion of policy year \( t-1 \) that is earned in calendar year \( t \).

(b) Emergence in \( t \) with respect to accident years \( t-1 \) and prior
\[
= \text{(Claim liabilities at } t-1 \text{)} - \text{(Paid during } t \text{)} - \text{(Claim liabilities at } t \text{)}
\]
This calculation can also be done on a policy year or underwriting year basis, except that the second and third terms must be adjusted to exclude the portion of policy year \( t-1 \) that is earned in calendar year \( t \).

The choice of (a) or (b) depends on the available data, regulatory or management requirements, if any, and the actuary’s preference.

1.2 Discounted Basis
Equation (a) above, or the comparison of the estimated ultimate incurred amounts, may provide useful information regarding the discounted claim liabilities, but this approach is not readily
adjusted to encompass the effect of the time value of money, and the provision for adverse deviations.

Equation (b) in item 1.1 above would be modified by

discounting the amounts in the second and third terms to time \( t-1 \) (i.e., calculate the present value of the cash flows); or

subtracting a term for the portion of the investment income earned during calendar year \( t \) on assets supporting the liabilities.

These adjustments should produce equivalent results but the second approach is simpler, both in terms of the calculations and the presentation. The models presented in sections 2 and 3 of this document are based on the second approach.

For the purposes of the Appointed Actuary’s report, it would be useful to identify the components of the runoff (i.e., the contribution of the undiscounted claim liabilities, changes in the discount rate, and changes in the provision for adverse deviations).

2. ACCIDENT YEAR RUNOFF MODEL

The model is best illustrated through a simple calendar year (CY) example, as shown below.

<table>

<td>6,510</td>
<td></td>
</tr>
</tbody>
</table>

(Amounts in $000s)

(1) From exhibit—table 1.
(2) From exhibit—table 2.
(3) From exhibit—table 2.
(4) From exhibit—table 2 = average lines CY 5 and CY 6 for each accident year x annual yield.
   In this example, for accident year 5, the average outstanding claims was \(\frac{29,000 + 44,000}{2}\) or 36,500. In the example, the annual yield was 6%. So, \(6\% \times 36,500 = 2,190\). (Results presented in table 3.)

(5) From exhibit—table 4: line CY 6 \([(3) + (4)] – [(1) + (2)]\).

Section 3 of this document addresses the methodology and assumptions underlying the allocation of the investment income in column (4) above.

The model may be expanded to monitor the runoff over a period of time as shown in tables 5 and 6.

3. ALLOCATION OF INVESTMENT INCOME BETWEEN LIABILITIES AND SURPLUS

The investment income attributable to policy liabilities should be determined. If the assets are allocated (e.g., surplus vs. operations), then the runoff would be calculated consistent with that allocation. The basis for allocation would be consistent with the investment policy of the company and the basis used by the actuary in discounting the policy liabilities. The basis for allocation would be properly documented. In a situation where there is no formal allocation, the default yield rate would be based on the same calculation as used in the P&C-1 or P&C-2 exhibit 10.60. The actuary is referred to the Educational Note on Discounting (Document 210079—November 2010) for guidance on different approaches to select a discounting rate.

The investment income attributable to policy liabilities can be obtained by multiplying the selected yield rate by

- the average of the starting and ending values of
  - net unpaid claims
  - net unearned premium
  - gross DPAC
  - premium deficiency provisions
  - unearned commissions
  - agents, brokers and policyholders receivables
  - instalment premiums.

If the default yield rate is used for the allocation, then the investment income attributable to policy liabilities would be compared to the overall investment income. If necessary, the investment income on policy liabilities (using the total investment income as a cap) would be reduced and the yield for runoff purposes would be recalculated. This will happen if the invested assets are less than the policy liabilities less the respective receivables. If the overall investment income is negative, then the resulting negative yield should be used for runoff purposes, i.e., the runoff is penalized, again subject to cap, i.e., the negative investment income on policy liabilities would be capped per the overall negative investment income.

A simple approach to calculate the investment income attributable to assets backing the net unpaid claims is to multiply the investment yield by the mean net claim liabilities.

If necessary, the calculation of the investment income attributable to assets backing the net premium liabilities can be performed in a similar manner. The investable assets are considered to be equal to the net unearned premium plus the premium deficiency provisions and unearned
commissions, reduced by gross DPAC, agents, brokers and policyholders’ receivables and instalment premiums.

Educational Note

Committee on Risk Management and Capital Requirements

April 2020
Document 220058

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the Standards of Practice; and as such, the actuary should cross-reference with current Standards. To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.
MEMORANDUM

To: Members in the life, property and casualty insurance and mortgage insurance practice areas

From: Steven W. Easson, Chair
Actuarial Guidance Council
Michelle Lindo, Chair
Committee on Risk Management and Capital Requirements

Date: April 28, 2020

Subject: Educational Note: Guidance for the 2020 Reporting of Capital and Financial Condition Testing for Life, P&C, and Mortgage Insurers

Introduction

This educational note provides an overview of guidance to actuaries in several areas affecting the reporting of the 2020 regulatory capital requirements and financial condition testing of Life, P&C and mortgage insurers operating in Canada. In addition, the note provides an update on recently published educational notes and introductory information about potential changes in regulatory capital reporting. This educational note is not intended to replace the review of applicable guidelines by the actuary but provides a high-level summary of key changes and updates. The actuary should refer to regulators’ publications and to the relevant guideline(s) in order to ascertain whether the changes impact his or her situation. The guidance in this educational note represents a majority view of the members of the Committee on Risk Management and Capital Requirements (CRMCR) of appropriate practice consistent with the Standards of Practice.

As the COVID-19 situation continues to evolve, it is highly recommended that actuaries pay close attention to all guidance and updates from the Office of the Superintendent of Financial Institutions (OSFI), the Autorité des marchés financiers (AMF) and the Canadian Institute of Actuaries (CIA) as the information presented in this educational note may not fully capture all the impacts of the pandemic on timelines and regulatory requirements by the time of its publication.

The creation of this cover letter and educational note has followed the Actuarial Guidance Council’s (AGC’s) Protocol for the adoption of educational notes. In accordance with the Canadian Institute of Actuaries’ (CIA) Policy on Due Process for the Approval of Guidance Material Other than Standards of Practice and Research Documents, this educational note has been prepared by CRMCR, and has received final approval for distribution by the Actuarial Guidance Council on April 14, 2020.
The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members. As standards of practice evolve, an educational note may not reference the most current version of the Standards of Practice; and as such, the actuary should cross-reference with current Standards. To assist the actuary, the CIA website contains an up-to-date reference document of impending changes to update educational notes.

CRMCR would like to acknowledge the contribution of the working group that assisted in the development of this educational note: Christian Nadeau-Alary (Chair), Devon Esson, Steve Firman, Marc-André Harvey, Michelle Lindo, William Shi, and Sylvain St-Georges.

**Guidance to members on specific situations**

From time to time, CIA members may seek advice or guidance from CRMCR. Both the CIA and CRMCR strongly encourage such dialogue. CIA members would be assured that it is proper and appropriate for them to consult with the chair or vice-chairs of CRMCR.

CIA members are reminded that responses provided by CRMCR are intended to assist them in interpreting the CIA Standards of Practice, educational notes, and Rules of Professional Conduct in assessing the appropriateness of certain techniques or assumptions. A response from CRMCR does not constitute a formal opinion as to whether the work in question is in compliance with the CIA Standards of Practice. Guidance provided by CRMCR is not binding upon the member.

**Recent guidance**

The following are recent regulatory guidelines issued by OSFI and the AMF and relevant CIA educational notes and changes to the Standards of Practice (SOP):

- Educational Note: Financial Condition Testing (April 27, 2020)
- Revised Educational Note: Regulatory Capital Filing Certification for Life Insurers (July 12, 2018)
- Educational note: Life Insurance Capital Adequacy Test (LICAT) and Capital Adequacy Requirements for Life and Health Insurance (CARLI) (March 8, 2018)

The publications listed above can either be found on the OSFI website under Table of Guidelines, the AMF website under Guidelines – Insurers, or the CIA website under Publications. A list of some of the current guidelines, filing requirements, educational notes, and research papers related to capital management is available in the appendices.

Notable potential future changes

OSFI issued a draft 2020 LICAT Guideline in February for public consultation. OSFI expected to publish the final guideline by the end of June 2020 with immediate effect. Given the COVID-19 developments, the public consultation and finalization of the proposed updates related to this guideline is currently on hold until further notice. The AMF issued in December 2019 an updated CARLI guideline, but the further consultation and changes initially expected in spring 2020 are currently postponed until further notice, also due to the COVID-19 developments.

In 2019, OSFI issued proposed revisions to Guideline B-3: Sound Reinsurance Practices and Procedures as well as a Draft Guideline E-25: Internal Model Oversight Framework for comments.

- OSFI Draft Revised Guideline B-3: Sound Reinsurance Practices and Procedures (June 12, 2019);
- OSFI Draft Guideline E-25: Internal Model Oversight Framework, for P&C insurers (June 21, 2019)

OSFI expected to issue in 2020 Draft Guideline B-2: Large Exposure Limits for P&C insurers.

Given the COVID-19 situation, public consultations and finalization of Guidelines B-3, E-25, and B-2 are all on hold until further notice.
This educational note is organized in the following sections:

1. Life regulatory capital requirements for 2020 (modified) .......................................................... 6
2. P&C regulatory capital requirements for 2020 (modified) .......................................................... 7
3. Mortgage insurance regulatory capital requirements for 2020 (new) ........................................... 8
4. Considerations for the 2020 Own Risk and Solvency Assessment (ORSA) (unchanged) .......... 8
5. Considerations for the 2020 Financial Condition Testing (FCT) (modified) ................................. 9
7. OSFI Draft Guideline E-25: Internal Model Oversight Framework, for P&C insurers (modified) .............................................................................................................. 12
Appendix A: OSFI Documentation .................................................................................................. 14
Appendix B: AMF Documentation .................................................................................................. 15
Appendix C: CIA Guidance .............................................................................................................. 16

If you have any questions or comments regarding this educational note, please contact either Christian Nadeau-Alary (Chair of the working group) at Christian.Nadeau-Alary@tdassurance.com or Michelle Lindo at mlindo@munichre.ca.

SWE, ML
1. Life regulatory capital requirements for 2020 (modified)

The Office of the Superintendent of Financial Institutions (OSFI) and the Autorité des marchés financiers (AMF) introduced new regulatory capital frameworks called, respectively, Life Insurance Capital Adequacy Test (LICAT) and Capital Adequacy Requirements for Life and Health Insurers (CARLI), effective January 1, 2018 with revisions in 2019. OSFI and the AMF developed in collaboration LICAT and CARLI over a period of more than 10 years, in consultation with life insurers and other industry stakeholders. LICAT and CARLI were designed to “better align measures of risks with the economic reality faced by life insurers, thereby promoting appropriate risk management and business decisions.”

The guidelines provide the framework within which OSFI and the AMF assess whether a Life and Health insurance company maintains adequate capital and whether a company operating in Canada on a branch basis maintains an adequate margin. The guidelines describe the capital required using measures based on risks, and define the capital or the margin that is available to meet the minimum standard.

OSFI published a draft 2020 LICAT Guideline in February for public consultation. OSFI expected to publish the final guideline by the end of June 2020 with immediate effect.

Notable changes in the draft 2020 LICAT Guideline include the following:

• Sections 2.1.2.10 Other Items deducted from Gross Tier 1 and 9.1.1 Conditions for the par credit – Clarifications of expectations on the treatment of negative Dividend Stabilization Reserves or other similar experience leveling mechanisms.

• Sections 5.1.2 Stress scenarios, 9.1.2 Calculation of the par credit for a block and 9.3 Participating products that are contractually adjustable – Changes to the requirement for the par credit floor in the calculation of interest rate risk requirements.

Given the COVID-19 situation, work related to this guideline is currently on hold until further notice.

The AMF published an updated 2020 CARLI guideline, effective January 1, 2020. The objective of the update was to adapt the guideline to the new Quebec Insurers Act that came into effect in June 2019. Notable changes in the AMF’s 2020 CARLI guideline compared to AMF’s 2019 CARLI guideline were as follows:

• Section 2.1.2.7 Investments in capital instruments of P&C insurance company subsidiaries, dissimilar regulated financial subsidiaries and non-qualifying subsidiaries – Specified what a non-qualifying subsidiary is for the purpose of deducting capital from participation in capital instruments of non-qualifying subsidiaries.

Prior to the COVID-19 situation, further changes and consultation were expected later this spring regarding the 2020 CARLI guideline, including the changes included in the draft 2020 LICAT Guideline. These changes are currently postponed until further notice.

To address issues stemming from COVID-19, OSFI and the AMF announced the following actions with respect to LICAT in their respective news release (OSFI, AMF) of April 9, 2020:

- Loan payment deferrals due to COVID-19 will not increase capital requirements on related mortgages, leases or other loans.
- Approved premium payment deferrals will not increase capital requirements on outstanding premiums related to those deferrals.
- LICAT interest rate risk requirements for participating products to be smoothed over six quarters.

Additional changes may be included in the final version of 2020 LICAT Guideline and 2020 CARLI Guideline. Therefore, the actuary should refer to the final version of these guidelines to fully ascertain the changes and their impact.

2. P&C regulatory capital requirements for 2020 (modified)

OSFI’s Guideline A, Minimum Capital Test (MCT) for property & casualty insurance companies was originally implemented in 2003. The following year, the AMF implemented its own MCT, the Guideline on Capital Adequacy Requirements – Property and Casualty Insurance, largely harmonized with OSFI’s MCT guideline. Each year, OSFI and the AMF consider whether changes are required to improve the risk measures, address emerging issues, and encourage improved risk management.

The guidelines provide the framework within which OSFI and the AMF assess whether a P&C company maintains adequate capital and whether a company operating in Canada on a branch basis maintains an adequate margin. The guidelines describe the capital required using measures based on risks, and define the capital or margin that is available to meet the minimum standard.

OSFI is not expected to publish an updated version of the MCT guideline for 2020. Therefore, OSFI’s 2019 MCT guideline, effective January 1, 2019 remains valid for 2020. A notable change in OSFI’s 2019 MCT guideline comes into effect in 2020:

- Section 4.3.3.3 Margin required – Introduced a transition period for the increase in the margin required for reinsurance ceded to unregistered reinsurers from 15% to 20%.

After the Insurers Act came into effect in June 2019, the AMF published two new MCT guidelines regarding the solvency requirements for self-regulatory organizations and reciprocal unions that are authorized to carry on insurer activities. These new guidelines were, for the most part, very similar to the 2019 MCT guideline for traditional insurers, but with necessary adaptations. The AMF published updated 2020 MCT guidelines for Property and Casualty Insurance, Self-Regulated Organizations and Reciprocal Unions, all effective January 1, 2020. Notable changes in the AMF’s 2020 MCT guidelines compared to AMF’s 2019 MCT guidelines were as follows:

- Section 2.4 Interests in and loans to subsidiaries, associates and joint ventures – Specified what a non-qualifying subsidiary is for the purpose of using equity method of accounting for all interests in non-qualifying subsidiaries.
• Section 3.4.2.2 Margin required – According with the transition introduced in 2019, replaced the 15% margin required for reinsurance ceded to unregistered reinsurers with the 20% margin for ceded policy liabilities on business from direct policies, or assumed business with underlying direct policies, with an effective date of January 1, 2020 or later.

• Section 3.6 Earthquake risk exposure – Replace “Catastrophes” with “Earthquake risk exposure”.

To address issues stemming from COVID-19, OSFI and the AMF announced the following action with respect to MCT in their respective news release (OSFI, AMF) of April 9, 2020:

• Approved premium payment deferrals will not increase capital requirements on outstanding premiums related to those deferrals.

3. Mortgage insurance regulatory capital requirements for 2020 (new)

OSFI introduced a new regulatory capital framework for Mortgage Insurers called Mortgage Insurer Capital Adequacy Test (MICAT), effective January 1, 2019. The guideline combines the January 1, 2017 advisory Capital Requirements for Federally Regulated Mortgage Insurers (Advisory) and the relevant portions of the guideline Minimum Capital Test for Federally Regulated Property and Casualty Insurance Companies (MCT Guideline) into a single document.

The guideline provides the framework within which OSFI assesses whether a mortgage insurance company maintains adequate capital. The guideline describes the capital required using measures based on risks and defines the capital that is available to meet the minimum standard.

Property and casualty insurance companies that are not mortgage insurers will continue to determine their regulatory capital requirements using the MCT guidelines.

Given that the MICAT mainly consolidated existing guidance, it was not expected to have material impact on the regulatory capital for mortgage insurers and therefore, OSFI issued the MICAT in final form. There was no change to OSFI’s MICAT guideline in 2020.

To address issues stemming from COVID-19, OSFI announced the following action with respect to MICAT:

• Payment deferrals will not cause insured mortgages to be treated as delinquent or in arrears (news release of March 27, 2020).

• Approved premium payment deferrals will not increase capital requirements on outstanding premiums related to those deferrals (news release of April 9, 2020).

4. Considerations for the 2020 Own Risk and Solvency Assessment (ORSA) (unchanged)

As per Subsection 2430 of the Standards of Practice, the ORSA report is part of the information needed to provide an understanding of the insurer’s operations, its obligations, and the resources available to meet those obligations.

On September 10, 2019, the Actuarial Standards Board (ASB) approved the revised Standard of Practice (SOP) to incorporate changes to Section 2500 Dynamic Capital Adequacy Testing. One
of the objectives of the proposed revisions is to allow for a better alignment with ORSA regulatory requirements as they relate to work needed to report on the expected future financial condition of an insurance entity. Further information on the revised SOP can be found in the next section.

The following guidelines have been published by Canadian insurance regulators with regard to ORSA:

In addition, here are other actuarial publications on ORSA:

- *Report on the CIA ORSA Survey conducted in April 2015*.

### 5. Considerations for the 2020 Financial Condition Testing (FCT) *(modified)*

**Revised Standard of Practice: Section 2500 *(modified)*

On September 10, 2019, the ASB approved the revised *Standard of Practice* (SOP), with an effective date of January 1, 2020.

The objectives of the revisions to Section 2500 were to:

- provide a more robust approach to satisfy the federal and provincial Insurance Acts' requirement to report on the expected future financial condition of an insurance entity; and
- allow for a better alignment with own risk and solvency assessment (ORSA) regulatory requirements as they relate to work needed to report on the expected future financial condition of an insurance entity.

The key changes in the standard are summarized below:

- Name of the standard: Dynamic Capital Adequacy Testing (DCAT) is renamed as Financial Condition Testing (FCT).
- Definition of “satisfactory financial condition”: The threshold for the base scenario is changed to the internal target ratio(s) as determined by ORSA, rather than the regulatory supervisory level. It also tests two other thresholds: a) going concern, and b) solvency.
  - The threshold for “going concern” scenarios is the minimum regulatory target.
  - The threshold for “solvency” scenarios is that the statement value of assets is sufficient to cover the statement value of the liabilities.
- Opinion of the actuary is modified to link to ORSA internal target(s) and explicitly allow for an opinion of “satisfactory subject to” certain conditions. It also removes wording about reporting requirements related to scenarios tested and their description,
significant assumptions description, and the identification of key risk exposures.

- Recent financial position and forecast period: The most appropriate number of years is left for the actuary to decide, based on the facts and circumstances of the insurer and the analysis.

- Risk categories: The detailed listings of risk categories are removed.

- Distinction has been made between ripple effects (which may include management’s routine actions) and corrective management actions.

- General harmonization with ORSA, including a single report: Throughout Section 2500, wording is added to refer to ORSA or other processes where coordination could be beneficial.

The CRMCR drafted a revised educational note to provide additional guidance to the actuary on the above topics in the revised SOP. The draft educational note was exposed to the membership until February 28, 2020. The final version of the educational note, *Financial Condition Testing*, was approved by the Actuarial Guidance Council on April 14, 2020.

**Transition from DCAT to FCT in 2020 (unchanged from educational note supplement)**

The revised SOP, effective on January 1, 2020, applies to all FCT reports that are submitted to the regulator(s) on or after January 1, 2020. It is recognized that for the first year of the implementation of the SOP, methodologies, systems and processes may not be fully developed to perform the FCT as robustly as expected for future years. The Appointed Actuary may make reasonable simplifying assumptions and approximations to address these limitations if any. The simplifying assumptions and approximations would be described in the FCT report. If appropriate, the opinion of the Appointed Actuary may also reflect that the financial condition of the insurer is satisfactory subject to the simplifying assumptions and approximations.

The Appointed Actuary would assess compliance of the base scenario with current internal targets, and/or known or reasonable estimates of future changes in internal targets. It should be noted that per OSFI guideline E-19, “The assessment of adequacy of capital should also consider the capital needed to support an insurer’s longer term business strategies and, in particular, new business and planned growth. Considering this, an insurer should determine an appropriate level or range of capitalization at which it operates, set above its Internal Targets. In determining an operating level, an insurer should consider the impact of future planned, foreseen and likely potential changes to its risk profile due to changes in its operations, its business strategy or its operating environment. For example, it should consider a series of varying adverse scenarios and, at a certain operating level, assess the insurer’s ability to continue operating and not fall below its Internal Targets. It should also evaluate whether long-run Internal Targets are consistent with short-run goals, and adjust its operating levels as appropriate; recognizing that accommodating additional capital needs or additional risk mitigants can require significant lead time.” Similar expectations regarding the consistent assessment of internal targets with the insurer’s strategic and business plan are found in AMF’s Capital Management Guideline.
Transition to IFRS 17 (modified)

In May 2017, the International Accounting Standards Board (the Board) issued *IFRS 17 Insurance Contracts*, replacing *IFRS 4 Insurance Contracts*. The implementation date is expected to be the fiscal year beginning on or after January 1, 2023, with comparative financials produced for the immediately prior fiscal year. Insurers are proceeding with their implementation plans but some may not yet be able to reliably estimate financial statements based on the new standard.

The regulatory capital guidelines will be adapted to reflect changes related to IFRS 17. As part of a directed confidential consultation, OSFI and the AMF have issued draft regulatory capital requirement guidelines and conducted initial quantitative impact studies (QIS) for Life and P&C insurers, which were due on October 31, 2019. Given COVID-19 and until further notice, OSFI and the AMF have put on hold the directed consultation on the updated draft capital guidelines as well as the QIS that was planned for June 2020, as per their respective news releases (OSFI, AMF). The ability of insurers to estimate required and available capital will be impacted by their ability to estimate IFRS 17 financial statements.

In principle, FCT forecasts beyond January 1, 2023 should be produced under IFRS 17 and the updated regulatory capital requirements guidelines. However, neither the regulatory capital requirement guidelines nor IFRS 17 are final (the IASB issued a revised exposure draft on June 26, 2019 and plan to publish the final version in the second quarter of 2020), and therefore insurers may not yet be able to produce reliable financial projections under IFRS 17. In these circumstances, an appropriate practice would be to continue to perform FCT in 2020 using the current accounting standards, actuarial standards, and current regulatory capital guidelines, with additional qualitative analysis on IFRS 17. Quantitative analysis could also be added if available. If quantitative impact studies reveal potential issues based on the new draft guideline in between filings of the FCT report, it would also be appropriate for the Appointed Actuary to describe these potential issues to the board or chief agent along with any potential mitigating actions, either in the FCT report or presentation, or through regular IFRS 17 updates.

Special Considerations due to COVID-19 (new)

In light of recent developments due to COVID-19, insurers may experience unforeseen financial results due to market conditions and/or additional claim activity. The following excerpts from the revised section 2500 of the SOP may be relevant in this situation:

.03 The appointed actuary should ensure that the investigation is current. The investigation should take into consideration recent events and recent financial operating results of the insurer.

.13 The actuary would consider recent events and recent operating results of the insurer up to the date of the report.

.14 If an adverse event occurs between the date of the report and the date of its presentation to the insurer’s board of directors (or its chief agent for Canada), then the actuary would, at a minimum in the presentation to the insurer’s board of directors (or its chief agent for Canada), address the event and its potential implications on the results of the investigation. If appropriate, the actuary would redo the investigation.
Any adjustments made to the base scenario due to COVID-19 would typically also affect the adverse scenarios.

The research paper, *Considerations for the Development of a Pandemic Scenario*, may also be useful for the development of the base and/or adverse scenarios.

On June 8, 2018, OSFI issued a *Discussion Paper on OSFI’s Reinsurance Framework* that included proposals to enhance and clarify OSFI’s expectations for prudent reinsurance practices.

On June 12, 2019, OSFI issued proposed revisions to *Guideline B-3: Sound Reinsurance Practices and Procedures*. The revisions to the guideline reflect some of the proposals in the discussion paper, as well as comments received in response to the discussion paper.

More comments were collected regarding those revisions and were being assessed by OSFI in order to finalize the Guideline B-3 by the end of 2020. Given COVID-19, work related to this guideline is currently on hold.

Key changes to the draft guideline encourage insurers to better identify and manage risks arising from the use of reinsurance, particularly counterparty risk. Revisions to the guideline include that reinsurance payments flow directly to a cedant insurer in Canada, and reaffirm OSFI’s principles-based expectation that an insurer not cede substantially all of its risks. A federally regulated insurer’s (FRI’s) ceding limits should be set for its overall book of business, and may also be established by line of business, as appropriate. The draft guideline also includes a statement that OSFI will generally not recognize or grant credit for a foreign FRI’s reinsurance arrangement(s) when risks insured in Canada are ceded back to the foreign FRI’s home office through affiliated reinsurers.

Based on the draft guideline, some insurers may need to adjust aspects of their reinsurance programs. OSFI intends to offer information sessions when it releases the final guideline.

This guideline applies to insurers that have received approval to use an internal model to calculate MCT regulatory capital requirements for insurance risk. The guideline establishes OSFI’s expectations for insurers when they establish and maintain an oversight framework for the internal models.

The key elements of the draft guideline include:

- establishing a model oversight framework;
- periodic assessment of the framework via an internal model risk control (IMRC) process;
- documentation of the framework and IMRC process; and
- periodic review and assessment of the framework and the IMRC process by internal audit.
Given the COVID-19 situation, work related to this guideline is currently on hold.

Members should be familiar with Educational Notes. Educational Notes describe but do not recommend practice in illustrative situations. They do not constitute Standards of Practice and are, therefore, not binding. They are, however, intended to illustrate the application (but not necessarily the only application) of the Standards of Practice, so there should be no conflict between them. They are intended to assist actuaries in applying Standards of Practice in respect of specific matters. Responsibility for the manner of application of Standards of Practice in specific circumstances remains that of the member in the property and casualty insurance practice area.
Memorandum

To: Members in the Property and Casualty Insurance Practice Area

From: Tyrone G. Faulds, Chairperson
Practice Council

Kevin A. Lee, Chairperson
Committee on Property and Casualty Insurance Financial Reporting

Date: December 23, 2009

Subject: Educational Note: Margins for Adverse Deviations

In accordance with the Institute’s Policy on Due Process for the Approval of Guidance Material Other than Standards of Practice, this educational note has been prepared by the Committee on Property and Casualty Insurance Financial Reporting, and has received final approval for distribution by the Practice Council on December 23, 2009.

As outlined in subsection 1220 of the Standards of Practice, “The actuary should be familiar with relevant Educational Notes and other designated educational material.” That subsection explains further that a “practice which the Educational Notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation.” As well, “Educational Notes are intended to illustrate the application (but not necessarily the only application) of the Standards, so there should be no conflict between them.”

If you have any questions or comments regarding this educational note, please contact Kevin A. Lee at his CIA Online Directory address, kevin.lee@iao.aon.ca.

TGF, KAL
1. INTRODUCTION

Purpose

The purpose of this educational note is to provide guidance to actuaries in the selection of margins for adverse deviations for property and casualty (P&C) insurers. This educational note also provides useful guidance for an actuary conducting a valuation of policy liabilities (i.e., claim and premium liabilities) for an enterprise that is not an insurer but whose operations include benefits that an insurer may provide (e.g., self-insurers and captive insurers).

A margin for adverse deviations reflects the degree of uncertainty of the best estimate assumption. The Standards of Practice (paragraph 1740.42) state that

“Deviations of actual from expected experience may result from one or more of the following:

- error of estimation, which may be favourable or adverse. Except in the simplest cases, it is not possible to determine expected experience with complete confidence. Past experience data may be insufficient or unreliable. Future conditions may differ from the conditions that generated the past experience.
- deterioration or improvement of the expected experience as a result of influences which the actuary does not anticipate.
- statistical fluctuation, which also may be favourable or adverse.”

This educational note is meant to be sufficiently flexible to allow for future developments in this rapidly evolving field, particularly in light of International Financial Reporting Standards (IFRS) and the increasing use of stochastic techniques in the valuation of policy liabilities. Actuaries may derive margins for adverse deviations using an explicit approach for deterministic analyses of policy liabilities or using stochastic techniques. For deterministic analysis, the range of acceptable margins is set out in subsection 2260 of the Standards of Practice. For stochastic analyses, there is no specific statistical measurement or percentile mandated by the Standards of Practice for P&C insurance (Standards of Practice, subsection 2270). This differs from the Standards of Practice for life insurance which mandate the use of a conditional tail expectation (CTE) approach between CTE(60%) to CTE(80%). However, as presented later in this educational note (sections 8 and 9), some examples prepared by the Risk Margin Working Group (RMWG) of the International Actuarial Association (IAA), show that a range of CTE(60%) to CTE(80%) may be too high for many traditional P&C lines of insurance.

Actuaries are reminded that the purpose of margins for adverse deviations in an analysis of policy liabilities is to reflect the degree of uncertainty of the best estimate assumptions. Thus, the margins for adverse deviations are not expected to be so high that the probability of an unfavourable development is less than 1% or 5% (i.e., scenarios under dynamic capital adequacy testing).

Cost of Capital Methods

The focus of this educational note is on margins for adverse deviations that are derived either from deterministic or stochastic analyses. Some actuaries have recently suggested using a cost of capital approach as a further approach to determining margins for adverse deviations. This educational note, however, does not address a cost of capital method. While the Committee on Property and Casualty Insurance Financial Reporting (PCFRC) believes that costs of capital methods are an important area of future development for P&C actuaries, many unresolved issues surround the use of such methods. For example, actuaries are still grappling with the issue of the
basis to be used for the determination of capital. Options for capital include economic capital, regulatory required capital, rating agency capital, capital used for pricing, and other bases. Similarly, challenges remain to determine the cost basis, including how frequently the cost should be updated and whether it should vary by contract or claim type or by duration of contract or claim. Details regarding cost of capital methods and risk margins can be found in the April 15, 2009 report, Measurement of Liabilities for Insurance Contracts: Current Estimates and Risk Margins, prepared by the Risk Margin Working Group (RMWG) of the International Actuarial Association (IAA).¹

Topics for Future Research

Throughout this educational note, reference is made to the evolving environment within the actuarial community with respect to risk margins. There is continuing development in the area of stochastic valuation and statistical modeling techniques and capital requirements. International Financial Reporting Standards Phase II will have an important influence on risk margins. It is recognized that this educational note is unable to address all issues related to margins for adverse deviations. Two important areas that are not addressed are correlation and diversification. Nevertheless, both have a potential role to play in the development and assessment of margins for adverse deviations.

For the topic of correlation, we refer the reader to section 6.5 of the CIA’s August 2001 Research Paper, Use of Stochastic Techniques to Value Actuarial Liabilities under Canadian GAAP, prepared by the Working Group on the use of Stochastic Techniques (Working Group) of the Committee on Life Insurance Financial Reporting. It is recognized, however, that further guidance on the topic of correlation specific to the valuation of P&C insurance liabilities and the determination of provisions for adverse deviations would be valuable for P&C actuaries. As well, the sensitive topic of diversification has potential regulatory implications.

Finally, there continues to be some confusion with respect to the role of process risk and the extent to which it should be recognized in the determination of margins for adverse deviations. Thought leadership and guidance on all these topics would be valuable to P&C actuaries.

Organization of Educational Note

This educational note includes eleven sections.

1. Introduction
2. Terminology
3. Desirable risk margin characteristics
4. Three categories of margins for adverse deviations
5. Explicit assumptions - margins for adverse deviations using a deterministic analysis
6. Relevant statistical concepts
7. Stochastic techniques
8. Three P&C product examples

9. Quantile approaches  
10. Comparison of risk margin methods  
11. Documentation and reporting

**Information Sources**

In preparing this educational note, the PCFRC has relied extensively on the April 15, 2009 report, Measurement of Liabilities for Insurance Contracts: Current Estimates and Risk Margins, prepared by the RMWG of the IAA. Throughout the educational note, this IAA report is referred to as the “IAA Risk Margin Report.” The PCFRC has also relied on the feedback received from numerous CIA members in response to the June 5, 2009 notice of intent to revise Subsection 2250 Margin for Adverse Deviations of the Practice-Specific Standards for Insurers (P&C Insurance). These comments are interspersed throughout the educational note.

**2. TERMINOLOGY**

The Standards of Practice define the margin for adverse deviations as the difference between the assumption for a calculation and the corresponding best estimate assumption. The provision for adverse deviations is the difference between the actual result of a calculation and the corresponding result using best estimate assumptions. Outside of the context of the Standards of Practice, the provision for adverse deviations is commonly referred to as “risk margin”.

Paragraph 1740.40 of the Standards of Practice states that

“A margin for adverse deviations may be expressed as one of

the difference between the assumption used for the valuation and the best estimate assumption. For example, if the actuary expects the interest rate to be 10% and assumes 8%, then the margin for adverse deviations is 2%. The provision for adverse deviations is the dollar amount of increase that results from a margin for adverse deviations. For example, if that 2% margin for adverse deviations in the interest rate assumption increase liabilities from $100 million to $120 million, then the provision for adverse deviations is $20 million [or the dollar amount of increase that results from the application of the margin for adverse deviations].

a multiplier to the liabilities without provision for adverse deviations. For example, if the actuary sets claim liabilities equal to 1.1 x expected claim liabilities, then the margin for adverse deviations factor is 10% and the provision for adverse deviations is 0.1 x expected claim liabilities.

an addition to the liabilities without provision for adverse deviations, determined through scenario testing.

**3. DESIRABLE RISK MARGIN CHARACTERISTICS**

In its Second Liabilities Paper (2006, paragraph 57), the International Association of Insurance Supervisors (IAIS) addresses the issue of risk margins. The IAIS takes the position that “without prescribing any one method at this stage, the IAIS believes that any methodology for calculating the risk margin should share certain characteristics.” The paper continues,

…Irrespective of the particular methodology used, an appropriate method…should reflect the inherent uncertainty in the expected future cash flows and would be expected to exhibit the following characteristics:
a. The less that is known about the current estimate and its trend; the higher should be the risk margins
b. Risks with low frequency and high severity should have higher risk margins than risks with high frequency and low severity
c. For similar risks, contracts that persist over a longer timeframe should have higher risk margins than those of shorter duration
d. Risks with a wide probability distribution should have higher risk margins than those risks with a narrower distribution
e. To the extent that emerging experience reduces uncertainty, risk margins should decrease, and vice versa.

The International Accounting Standards Board (IASB) identified the same properties as being desirable (IASB Discussion Paper, 2007, Part 2: Appendix F, pages 34-35).

The IAA Risk Margin Report states that

“A risk margin methodology should:

1. Apply a consistent methodology for the entire lifetime of the contract;
2. Use assumptions consistent with those used in the determination of the corresponding current estimates;
3. Be determined in a manner consistent with sound insurance pricing practices;
4. Vary by product (class of business) based on risk differences between the products;
5. Be easy to calculate;
6. Be consistently determined between reporting periods for each entity that is, the risk margin varies from period to period only to the extent that there are real changes in risk;
7. Be consistently determined between entities at each reporting date, that is, two entities with similar business should produce similar risk margins using the methodology;
8. Facilitate disclosure of information useful to stakeholders;
9. Provide information that is useful to users of financial statements;
10. Be consistent with regulatory solvency and other objectives; and
11. Be consistent with IASB objectives.”

The characteristics cited by both the IAIS and the IAA are consistent with the characteristics noted in the actuarial Standards of Practice. According to paragraphs 1740.43 and 1740.44 of the Standards of Practice,

---

“A larger margin for adverse deviations (compared to the best estimate assumption) is appropriate if
the actuary has less confidence in the best estimate assumption,
an approximation with less precision is being used,
the event assumed is farther in the future,
the potential consequence of the event assumed is more severe, or
the occurrence of the event assumed is more subject to statistical fluctuation.”

“A smaller margin for adverse deviations is appropriate if the opposite is true.”

4. THREE CATEGORIES OF MARGINS FOR ADVERSE DEVIATIONS

For P&C insurance, the Standards of Practice set three categories of margins for adverse deviations,

claims development – the margin for claims development is a percentage of the claim liabilities excluding provision for adverse deviations.

recovery from reinsurance ceded – the margin for recovery from reinsurance ceded is a percentage of the amount deducted on account of reinsurance ceded in calculating the premium liabilities or the claim liabilities, excluding provision for adverse deviations.

investment return rates – the margin for investment return rate is a deduction from the expected investment return rate per year.

The Standards of Practice note that, according to how considerations so vary, the selected margins should vary between premium liabilities and claim liabilities, among lines of business, and among accident years, policy years, or underwriting years, as the case may be.

5. EXPLICIT ASSUMPTIONS – MARGINS FOR ADVERSE DEVIATIONS USING A DETERMINISTIC ANALYSIS

Subsection 2260 of the Standards of Practice applies to the selection of a margin for adverse deviations in a deterministic analysis. Specific levels of margins are set out for each of the three categories.

<table>
<thead>
<tr>

<td>200 basis points</td>
</tr>
</tbody>
</table>

The IAA Risk Margin Report refers to this Canadian approach to determining risk margins as “explicit assumptions.”

Paragraphs 2260.01 and 2260.03 of the Standards of Practice state

“The actuary should select a margin for adverse deviations for an assumption that is at least as much as the amount defined by the low margin for adverse deviations and is not excessive.”
2260.03 “Usually, a selection above the high margin for adverse deviations would be considered excessive.”

It is important to recognize that paragraph 2260.04 of the Standards of Practice specifically notes that there may be circumstances in which the selection of a margin for adverse deviations above the high margin would be appropriate “for unusually high uncertainty or when the resulting provision for adverse deviations is unreasonably low because the margin for adverse deviations is expressed as a percentage and the best estimate is unusually low.”

Margin for Claim Development

The following pages present numerous examples of considerations for the actuary when selecting a margin for adverse deviations. These considerations should not be viewed as an exhaustive list of all considerations, but rather as representative of key issues that the actuary would consider when selecting margins for each of the three categories. In some circumstances, the listed consideration may not be relevant or applicable. An actuary would often derive unique considerations specific to the organization for which he or she works.

For each consideration, there is a spectrum between the situation necessitating a low margin or a high margin. For many insurers, the particular circumstances for any one consideration may dictate the selection of a margin between the low and high values set out in the Standards of Practice. When an actuary is faced with a situation in which some considerations indicate a low margin and others indicate a high margin, the actuary would use professional judgment to determine the priority of considerations and the resulting final margin.

For the claims development margin, considerations are related to

- insurer’s operations (claims management, underwriting, and other),
- data on which the estimate is based, and
- line of business.

</table>

A change in the Standards of Practice effective December 31, 2009 increased the high margin of the claims development from 15% to 20%. While the previous Standards of Practice allowed for actuaries to select a margin above 15% in situations of unusually high uncertainty, in practice very few P&C actuaries selected margins for adverse deviations for claims development greater than 15%.

The intent of the increase in the high margin is to make clearer to P&C actuaries that selection of 20% in times of great uncertainty is acceptable. For example, it may be appropriate for an actuary to select a margin of 20% for the following:

- Automobile insurance in a specific province that is undergoing significant change due to tort reform or legal challenge to recently introduced tort reform,
- Introduction of a new line of business or operations in a new province for which there is limited relevant data from which to estimate policy liabilities,
- Significant change expected in future claims due to an increase in retentions and limited data for estimating the effect of such a change,
- Economic upheaval such as the financial crisis of the fall of 2008 and its effect on long-tail lines of insurance such as directors’ and officers’ liability.

The above examples are only intended to be illustrative of potential situations for which the actuary may choose to select a claims development margin greater than 15%. However, it is important to recognize that the above situations may not always necessitate a claims development margin greater than 15% and the decision will be based on the actuary’s assessment of the uncertainty around the mean estimate.

The change in the high margin from 15% to 20% was not intended to shift all selected margins for P&C insurers. Many actuaries currently select between 10% and 15% for many of the longer-tail lines of P&C insurance. These claims development margins are selected based on a review of the numerous considerations underlying the actuary's estimate of claim liabilities and premium liabilities. It is not expected that these margins would change simply due to the increase in the high margin. However, if there has been a notable change in the environment and in the
actuary’s assessment of the various considerations that influence the selection of the margin for adverse deviations, then a change may be justified.

**Margin for Recovery from Reinsurance Ceded**

The following table presents considerations for the actuary when selecting the margin for recovery from reinsurance ceded.

<table>

**Margin for Investment Return Rates**

The margin for adverse deviations for investment return rates addresses several different types of risk, such as

- mismatch risk between payment of claims and availability of liquid assets,
- error in estimating the payment pattern of future claims, and
- asset risk including credit/default risk and liquidity risk.

The following table summarizes considerations related to the selection of an explicit margin for investment return rates.

---

\(^3\) Balance sheet exposure is defined as: ceded unearned premium + outstanding loss recoverable from assuming company + amounts due from assuming company – amounts due to assuming company – cash or securities held as security from assuming company.

It is important for actuaries to recognize that in an economic environment of low interest rates, mismatch risk and credit/default risk remain nevertheless. While following Standards of Practice, an actuary could derive a discount rate adjusted by margin for adverse deviations that is less than 0%. In practice, actuaries may limit the discount rate to 0% in such situations.

Two alternative formula-based approaches for deriving the margin for investment return are described below. These approaches should not be considered to be an exhaustive list of acceptable methods, but rather as examples of the types of quantitative approaches actuaries could consider when determining the explicit margin for investment returns. These formulas assume a non-stochastic approach and thus the resulting margins would be subject to the limits set out in the explicit margin approach (i.e., low margin limit of 25 basis points and the high margin limit of 200 basis points).
Weighted Formula

The weighted formula relies on defined variables,

\[ i_{PM} = \text{interest rate for discounting based on notional matching of the individual insurer’s portfolio of assets to claim liabilities prior to margin for adverse deviations} \]

\[ i_{AM} = \text{interest rate for discounting after margin for adverse deviations} \]

\[ i_{RFM} = \text{interest rate of risk-free bonds, which reasonably match the payout of the claim liabilities, at least as measured by duration} \]

\[ k = \text{a factor between 0\% and 100\% to reflect a reasonable estimate as to the percentage by which } i_{RFM} \text{ would need to be adjusted to reflect a plausible shortening of the uncertain duration of the claim liabilities due to misestimation of the payment pattern coupled with a plausible shift in the yield curve.} \]

The formula for \( i_{AM} \), the interest rate for discounting after margin is

\[ i_{AM} = \text{minimum } (i_{PM}, i_{RFM} \times (1.00 - k)), \]

and, thus, the margin for investment return rate is defined to be

\[ \text{Margin for Adverse Deviations} = i_{PM} - i_{AM} = i_{PM} - \text{minimum } (i_{PM}, i_{RFM} \times (1.00 - k)). \]

This approach treats the market spread between the return on matched risk-free bonds and other investments as a risk premium (whether from liquidity risk, default risk, or other risks) which would be removed for discounting purposes. A high value of \( k \) would result in a higher margin for adverse deviations, and a low value of \( k \) would result in a lower margin. An advantage of using this type of formula is that it is easily adaptable to the principles-based approach of IFRS Phase 2.

Explicit Quantification – Three Margins

This approach estimates the margin for investment return as the sum of three margins,

- asset/liability mismatch risk margin,
- timing risk margin, and
- credit risk margin.

Asset/Liability Mismatch Risk Margin

The asset/liability mismatch risk margin is based on the formula,

\[ \text{coverage ratio} \times \frac{(\text{asset duration} - \text{liability duration})/\text{liability duration}}{\text{interest rate movement in run-off period}} \]

where,

\[ \text{coverage ratio} = \frac{\text{premium liability + claims liability}}{\text{investments + installment premiums}} \]
The actuary could estimate the interest rate movement in the run-off period based on a review of the interest rate movement over an extended period of time (e.g., twenty-five to fifty years).4

For example, assume the liability duration is two years. The actuary could then review the two-year change in investment rates as follows:

\[
Y_i = \text{base year yield,} \\
Y_{i+2} = \text{yield two years after } i, \\
(Y_{i+2} - Y_i) / Y_i = \text{two-year change.}
\]

The interest rate movement in the run-off period could be estimated by multiplying the base year yield for a risk-free bond with similar duration to the liabilities by one standard deviation of the change for the same duration. For example, assume that the base year yield for three-year government of Canada bonds is 2.68% and one standard deviation of the two-year changes is 29%. Then the interest rate movement in the run-off period is equal to 78 basis points (2.68% x 29%). If the coverage ratio is 100%, the asset duration is five years, and the liability duration is two years, then the asset/liability mismatch risk margin based on the formula is 117 basis points.

\[
[100\% \text{ coverage ratio} \times ((5 \text{ years} - 2 \text{ years}) / 2 \text{ years}) \times 78 \text{ interest rate movement}]
\]

**Timing Risk Margin**

The timing risk margin could be estimated using the formula for determining discounted liabilities.

\[
\text{Present Value (PV)} = \sum_{t}^{\infty} \frac{L_t}{(1.00 + d)^t},
\]

where \(L_t = \text{paid losses in } t,\)

\(d = \text{discount rate, and}\)

\[
\sum_{t}^{\infty} L_t = L
\]

\[
= \frac{L}{(1.00 + d)^D},
\]

where \(D = \text{duration of liabilities}\)

If the duration of liabilities, \(D,\) is shortened by 10%, then the reduction in discount is equivalent to decreasing the discount rate \(d\) by approximately 10%. More precisely,

\[
\frac{L}{(1.00 + \hat{d})^D} = \frac{L}{(1.00 + d)^{0.90D}},
\]

where \(\hat{d}\) is the discount rate adjusted for timing risk

---

If the liability duration is two years and the discount rate is 3.50%, then \( \hat{d} \) is 3.1445%, and consequently, the timing risk margin is 36 basis points (3.50% - 3.1445%).

**Credit Risk Margin**

The final component of this approach is the credit risk margin. The credit risk margin could be estimated by comparing the yield curves of high quality bonds, such as federal, provincial, municipal, utilities, the big five Canadian banks, and other corporate organizations. If a bond produces a higher yield than a risk-free government bond with similar maturity (i.e., a corporate bond generates higher yield than a Government of Canada bond with similar maturity), the investors in the bond market conclude that the issue of that corporate bond has credit risk. The extra yield on the corporate bond represents what the market considers to be credit risk spread; the latter is usually measured in basis points over the government bond with similar maturity.

For illustration purposes, assume that the portfolio has a credit risk margin of 40 basis points.

**Total Margin**

The total margin for investment return is equal to:

\[
\text{Asset/liability mismatch risk margin} + \text{timing risk margin} + \text{credit risk margin} = 117 + 36 + 40 = 193 \text{ basis points}
\]

**Other Considerations**

Investment expenses would be deducted from the portfolio yield before any calculations are performed. If the liabilities in a foreign currency are greater than the supporting assets in that foreign currency, then foreign exchange risk would be considered. Finally, if the bond portfolio is not sufficient to support the policy liabilities, the preferred and common stock expected total return rate would be included in the calculation.

Sometimes, bond investors demand liquidity and prefer government bonds over corporate bonds. This could increase the yield on corporate bonds as well as the difference between the bid and asked prices. However, this preference is difficult to quantify. Except in a chaotic market (e.g., September 2008 – March 2009), the extra yield due to poor liquidity would be ignored.

**6. RELEVANT STATISTICAL CONCEPTS**

The subject of risk margins has received extensive review by numerous international organizations in the past several years including the IAIS, the IASB, and the IAA. Increasingly, actuaries and other insurance professionals are turning to advanced statistical methods as well as internal models for the analysis of risk margins. It is important to recognize that these are evolving areas with ongoing research, both theoretical and practical, by actuaries working with P&C insurers.

It is not the intent of this educational note to present a detailed discussion of statistics. It is expected that actuaries using stochastic methods for the determination of margins for adverse deviations have expertise in the fundamentals of statistical modeling, which are not addressed in this educational note. This section, however, briefly describes key risk concepts needed to understand and evaluate stochastic risk margin approaches. These key concepts include a risk

\[\text{Much of this section is copied directly from the IAA Risk Margin Report.}\]
distribution, normal distribution, standard deviation, coefficient of variation (CV), skewness, and the rate at which claim or contract obligations, as applicable, are settled.

A risk distribution (or, simply, distribution) gives the probabilities that different outcomes of an uncertain process will occur. The normal distribution is a well known probability distribution. It has a form that requires two parameters, the mean (or probability-weighted average) that indicates its central point and the standard deviation that indicates its width or uncertainty. The normal distribution is sometimes described as well-behaved for the following reasons. First, it is symmetric in that, for each “good news” scenario, there is an identical and equally likely “bad news” scenario. Second, risk measures such as confidence levels and conditional tail expectations depend only on the standard deviation. Thus, there is a fixed relationship between risk measures based on standard deviation, confidence levels, or conditional tail expectations. Finally, the central limit theorem demonstrates that the sum of any set of homogeneous and uncorrelated risks will approximate the normal distribution as the number of risks increases to infinity.

However, the normal distribution is often not appropriate for P&C insurance situations, since there are rarely enough risks involved, individual risks are seldom symmetric, and the risks are usually correlated through inflation, environmental factors, court decisions, etc. The total claim distribution is only similar to “normal” in extremely large portfolios of risks with, at most, partial correlations involved.

The relative width of a risk distribution can be defined by its CV, which equals the standard deviation divided by the mean. This statistical measure is useful because a standard deviation of 1 million is small if the mean is 100 million, but large if the mean is 500,000. The CV is 1% in the first case and 200% in the second case.

Most P&C insurance risks have a high probability of having no claim or contract obligation during a reporting period. In some cases there may be a small probability of having a partial or small claim amount or obligation, with an even smaller probability of having a large claim. Statistically, distributions like this are described as having ‘positive skewness’ or being ‘skewed’. They involve a parameter that represents the degree of skewness (represented by $\gamma$, the Greek lower case gamma) that is greater than zero. The normal distribution, because it is symmetric, has zero skewness.

Combining many contracts in a pool or portfolio often reduces but does not eliminate skewness. For some types of coverage, natural catastrophe coverages, for example, combining contracts may not reduce skewness, since such loss events either do not occur or arise under many contracts simultaneously.

Another factor that can affect the value of a risk margin is the time it takes to settle a claim or contract obligation. The risk distribution and the settlement times can be related, as claims or obligations that take longer to settle often have greater skewness and larger CV.

7. STOCHASTIC TECHNIQUES

Stochastic simulations can be powerful techniques for quantifying risk exposures underlying P&C insurance policies. These methods generate many possible future paths for the underlying variables, thereby producing a probability distribution of values for the risks. Such techniques can permit a deep understanding of the risk/return profile and allow for effective pricing, valuation, and management. However, as with any sophisticated tool, users require a full understanding of stochastic risk modeling for successful implementation and rational interpretation.
Actuaries using stochastic approaches to determine margins for adverse deviations may also be using stochastic methods in their determination of policy liabilities (i.e., claim liabilities and/or premium liabilities). As it is beyond the scope of this educational note to address stochastic modeling techniques except as they apply to the determination of provisions for adverse deviations, the reader is referred to the CIA’s August 2001 Research Paper, Use of Stochastic Techniques to Value Actuarial Liabilities under Canadian GAAP prepared by the Working Group on the use of Stochastic Techniques (Working Group) of the Committee on Life Insurance Financial Reporting. Specifically, the PCFRC recommends a review of

- Section 3. When to Use Stochastic Simulation Methods for Actuarial Liability Valuation,
- Section 4. General Overview of the Stochastic Valuation Method for Actuarial Liability Valuation,
- Section 6.5. Correlation, and
- Section 7. Practical Issues.

As noted above, actuaries who derive margins for adverse deviations using stochastic methods may derive their estimate of policy liabilities using these same stochastic methods. There is a growing interest by P&C actuaries for the use of stochastic and advanced statistical techniques applied directly to the claim development triangles, such as the Thomas Mack method or the bootstrapping method. The Mack method derives formulas for the standard error of the reserves projected by the chain ladder method. The bootstrapping method is a sampling technique that generates empirical probability distributions by using sampling with replacement in historical data. The literature on these subjects is expanding rapidly. Many commercial P&C reserving software programs now contain these applications.

Actuaries using stochastic techniques for developing margins for adverse deviations would also take into account the considerations presented in section 5 of this educational note. For example, if an actuary’s stochastic analysis resulted in a claims development margin for adverse deviations of 5%, while a review of the considerations related to operations, data, and the line of business resulted in a high margin assessment, the actuary would then reconsider the selection of a 5% margin for adverse deviations. Similarly, if an actuary’s stochastic analysis resulted in a claims development margin for adverse deviations of 20%, while a review of the considerations related to operations, data, and the line of business resulted in a low margin assessment, the actuary would then reconsider the selection of a 20% margin for adverse deviations.

Actuaries considering a change from a deterministic approach to a stochastic approach for the determination of margins for adverse deviations would engage in discussions with the insurer’s management and auditors to determine if such a change in approach represented a potential change in accounting policy. An important consideration would be the materiality of any resulting change. Since stochastic techniques may be more subject to variability from valuation date to valuation date, ongoing communication between the actuary and the insurer’s management and auditors may be required.

When using stochastic models, it is important for the actuary to recognize that the provisions for adverse deviations do not cover the inherent or statistical volatility arising from a particular model. It is expected that large and small insurers would generate similar margins for adverse deviations when using the same model. The provisions do, however, cover the uncertainty in whether the actuary has the “right” model or “right” parameters. Thus, an actuary working with large volumes of data or more years of experience will likely have more confidence that the
selected model is “correct” and the resulting margins will likely be lower for larger volume or more established data than for smaller volume or less reliable data.

**Mandating Assumptions for Stochastic Techniques**

In the CIA 2001 Research Paper, the Working Group noted that it struggled with the issue of offering some prescription around the setting of assumptions. Offering “standard assumption corridors” for certain processes and/or risk factors would mean, by implication, that the actuary would have the responsibility to justify using values outside the given range. While this would offer valuable guidance to practitioners and might narrow the range of accepted practice, the working group concluded that establishing reasonable ranges for broad use (by life insurers) was impractical, inappropriate, and unmanageable for the reasons that

- it would entail very significant and time-consuming testing and review of experience data from across the industry,
- it would potentially require a large number of possible assumptions or variations in assumptions to be covered,
- it would be difficult to anticipate all the unique company circumstances that can legitimately affect the valuation results and therefore cause the prescription to be inappropriate,
- ranges would need periodic updating to reflect emerging experience, and
- it would undermine the integrity and responsibility of the Appointed Actuary.

These considerations are equally applicable to P&C insurers today, and so this educational note does not include mandated assumptions for the use of stochastic techniques. The actuary is reminded of his or her responsibility to ensure that the methods, assumptions and approximations used in the valuation of policy liabilities are reasonable and appropriate to the contracts being valued and furthermore that this responsibility is typically magnified when the valuation employs some form of stochastic testing.

**Sample Products**

Stochastic modeling will typically be of benefit when dealing with products characterized by skewed cost distributions with low frequency of occurrence, but high severity of impact and/or material variability in the cost distribution. For example,

- stop loss reinsurance,
- catastrophic P&C insurance risks,
- credit, warranty, and mortgage guarantee insurance, and
- long-tail lines of business such as professional liability.

**Stop Loss Reinsurance**

Individual stop loss cover is used by insurers to limit their risk exposure to the claims costs incurred by a specific covered insured to a threshold (or deductible) amount over a specified time period. Aggregate stop loss is used by insurers to limit their risk exposure to the claims costs incurred by an aggregated number or group of specific risks. Stop loss reinsurance may be evaluated by simulating the random variables that affect the insured event. The skewness of the cost distribution typically will increase as the threshold level is increased.
Catastrophic P&C Insurance Risks

Given the occurrence of an insured catastrophic event shortly before the valuation date, the actuary may find stochastic methods valuable for estimating claim liabilities. An insured catastrophic event may be evaluated by simulating the effects of the particular catastrophic event using stochastic models to provide a representation of the severity using methodologies based on various analytical, engineering, and empirical techniques.

Credit, Warranty, and Mortgage Guarantee Insurance

Credit, warranty, and mortgage guarantee are examples of P&C insurance lines in which coverage can extend for many years, and thus there can be significant premium liabilities at the financial reporting date. The financial results of these lines can be highly dependent on economic forces such as inflation, interest rates, and unemployment, with significant correlation between classes of business. As such, these lines of business can be subject to aggregation of losses driven by high frequency related to economic or other circumstances. While the claim liabilities and margins for adverse deviations may be estimated using traditional, deterministic approaches, stochastic modeling of the premium liabilities and their associated margins for adverse deviations may be more appropriate for these lines of insurance.

Long-tail lines of business

The distribution of unpaid liabilities for long-tail lines of business may be quite volatile and be subject to external forces such as inflation, both economic and social, judicial changes, and regulatory changes. Stochastic analyses of loss development factors and/or frequency and severity may be valuable to the actuary estimating claim and premium liabilities.

8. THREE P&C PRODUCT EXAMPLES

In order to compare the risk margin approaches on a consistent basis, the IAA Risk Margin Report presents a set of assumptions that covers a spectrum of insurance products. The following table summarizes the assumptions used by the RMWG of the IAA for three P&C insurance products.

<table>
<thead>
<tr>

</tbody>
</table>

The skewness, CV, and payment pattern are discussed in detail in Appendix C of the IAA Risk Margin Report. The risk distributions for the automobile third party liability (TPL) and general liability products are compound Poisson models represented by the normal power approximation with the selected skewness and CV. For these two lines, the normal power approximations are very similar to lognormal distributions with the selected CVs.

The RMWG notes that the risk distributions and settlement patterns used in the IAA Risk Margin Report are illustrative, as are the notional coverage descriptions. There is a range of variation
within each coverage, and there are coverages with characteristics that fall outside the range of these illustrations. In particular, a substantial portion of P&C premiums is for business with similar risk characteristics to Products A and B (personal and commercial property, respectively) but with a short settlement pattern. These short-tail lines, however, contribute a much smaller proportion of total liabilities.

The next two sections of the educational note refer to these three product examples.

9. QUANTILE APPROACHES

Establishing which statistical measurement is most appropriate for the determination of margins for adverse deviations based on stochastic techniques is an important decision. The difference between the selected measurement and the mean result (with explicit margin for adverse deviations applied to all non-stochastic variables) establishes the dollar provision for adverse deviations for the scenario tested assumptions.

This section discusses quantile approaches for the determination of margins for adverse deviations based on stochastic techniques. Specifically, the approaches addressed are:

- multiples of the standard deviation,
- percentile or confidence levels, also known as Value at Risk or VaR, and
- CTE, also known as Tail Value at Risk or TVaR.

These methods are among those suggested in the IAA Risk Margin Report and by the IASB (2007 Discussion Paper Part II Appendix F9, page 36-37).

Multiples of Standard Deviation

Simplicity and practicality are the two most often cited advantages of using a multiple of the standard deviation as a basis for determining the margin for adverse deviations.

Percentile or Confidence Levels

The use of confidence levels is currently the most common quantile method applied. Risk margin methods based on confidence levels express uncertainty in terms of the extra amount that must be added to the expected value so that the probability that the actual outcome will be less than the amount of the liability (including the risk margin) over the selected time period equals the target level of confidence. This level is also sometimes called the value at risk (VaR).

In Australia, general insurance (i.e., P&C insurance) is regulated by the Australian Prudential Regulation Authority (APRA) under the Insurance Act of 1973. Prudential Standard GPS 310 requires that provisions for insurance liabilities must include a risk margin above the central

---

6 Note that the IAA Risk Margin Report presents three other methods that are not included in this educational note: cost of capital methods, discount methods, and conservative assumptions in the current estimate producing implicit risk margins.

7 Although multiples of the second and higher moments of the risk distribution are identified as a type of approach that might be used to establish a value for risk margins, the IAA Risk Margin Report does not expand on this approach. Instead it notes that, “Variance, semi-variance or higher moment methods are not illustrated here, as there is currently no literature on their practical applications in determining risk margins for liabilities.”

8 GPS 310, Section 77 states that, “The valuation of insurance liabilities for each class of business must comprise… (c) risk margins that relate to the inherent uncertainty in the central estimate values for outstanding claim liabilities and premium liabilities.” Allowance for diversification or reinsurance or both can be made in determining the risk margin.”
estimate value of those liabilities. The risk margins are calculated for each class of business and the aggregate of those risk margins must be greater than

the margin that would give the provision a 75% level of sufficiency to meet the insurance liabilities, or

one half of the estimated standard deviation of the insurance liabilities of the insurer.

Singapore and South Africa also require that claim liabilities include a minimum provision for adverse deviations based on a 75% confidence level. While these three countries have set a 75% confidence level threshold in their respective insurance legislation, it is important to note that there is currently no generally accepted method (from a regulatory, accounting, or actuarial perspective) for determining an appropriate quantile for the purpose of determining risk margins.

CTE

The CTE is a conditional expected value based on downside risk and can be defined as the average of outcomes that exceed a specified value such as the $Q$th percentile. \(\text{CTE}(Q\%)\) is calculated as the weighted-average of the highest \((100-Q)\)% of the results from stochastic simulation. For example, a 75th percentile CTE result is the mean result of the 25% highest cost scenarios. By way of comparison, \(\text{CTE}(0\%)\) is, by definition, equal to the overall mean result since it is the average of all scenarios.

For life insurance, the Standards of Practice (paragraph 2320.51) state that

“If the selection of scenarios is stochastic, then the actuary would adopt a scenario whose policy liabilities are within the range defined by

the average of the policy liabilities which are above the 60th percentile of the range of policy liabilities for the selected scenarios, and

the corresponding average for the 80th percentile.”

Thus, the Standards of Practice for life insurers require that margins for adverse deviations be between \(\text{CTE}(60\%)\) and \(\text{CTE}(80\%)\).

The 2001 Research Paper states that,

“Setting the liabilities [for life insurers] in excess of \(\text{CTE}(80\%)\) would not normally be an acceptable practice as the resulting coverage would be excessive and inconsistent with GAAP. Provision for more catastrophic, implausible or unknown events is done through required capital, which would normally be established at a much higher CTE%.”

Unlike life insurance, there is no specific statistical measurement or percentile mandated by the Standards of Practice for P&C insurance. The examples prepared by the RMWG of the IAA, indicate that a range of \(\text{CTE}(60\%)\) to \(\text{CTE}(80\%)\) is likely too high for many traditional P&C lines of insurance.

Three P&C Product Examples

In the IAA Risk Margin Report, the risk margins for the three sample products are first presented as the number of standard deviations above the mean required to reach the selected confidence level and then as a percentage of the discounted current estimate. Recall that Product A is representative of automobile third party liability, Product B of “risky” general liability, and Product C of catastrophe coverage.

The risk margins illustrated in Tables 9.1 and 9.2 assume that the risk would be measured separately for each line of business based on the experience of the reporting entity alone.

Comparing the number of standard deviations to confidence levels,

If the risk distribution is normal, the number of standard deviations to achieve a particular confidence level would be constant between products.

Since the risk distributions for these contracts are not normal, the number of standard deviations from the mean to achieve a particular level of confidence decreases as the risk distribution becomes more skewed. For example, Table 9.1 shows that the number of standard deviations from the mean to achieve the 65% and 75% confidence levels decreases as the risk distribution becomes more skewed (i.e., reading down the column).

Conversely, in order to have the risk margin at the same multiple of the standard deviation for all contract types, the confidence level would be larger for distributions with more skewness.

Using a risk margin equal to a fixed number of standard deviations produces positive risk margins, even for highly skewed distributions.

In both tables above, for the extreme case (Product C), the risk margin for the 65% confidence level is negative, meaning that the 65% confidence level is lower, not higher...

---

9 Simulation analysis was conducted to reproduce the findings in the IAA Risk Margin Report. All findings were verified except the number of standard deviations at CTE(40%) and CTE(75%) for Product C. The values in Table 9.1 reflect the calculations prepared on behalf of the PCFRC and not those contained in the IAA Risk Margin Report.
than the mean of the distribution. This shows that at least for certain extreme distributions, use of confidence levels without some adjustment may not give appropriate risk measures. In Australia, for example, supervisory risk margins for general insurance are based on a 75% confidence level, subject to a minimum of one-half standard deviation.

Using CTE rather than confidence levels produces risk margins that are consistent with confidence level risk margins for the less skewed distributions, but does not decrease or produce negative risk margins with increasing skewness, even for the most skewed distributions.

Comparing the CTE to number of standard deviations, we note that if the standard deviation is considered as a risk measure, the results for the less skewed products are consistent with confidence level and CTE. For example, the 75% confidence level corresponds to approximately 0.65 standard deviation above the mean for products A and B. However, for the very risky product C, the CTE risk measures require a margin equal to more standard deviations than less skewed products. The CTE is therefore more risk sensitive than the number of standard deviations and may be a better risk measure for risks with skewness at the extreme end. Ultimately, it can be said that the number of standard deviations may be a more consistent measure for expressing profitability, while CTE is more relevant to measure security.

### Evaluation of Quantile Methods

In evaluating the various methods for developing risk margins, the IAA Risk Margin Report suggests that two aspects of insurance liabilities be considered to measure risk margin,

- time – the rate at which risk is released over time (i.e., settlement pattern), and
- shape – the risk distribution of possible outcomes around the mean value, at the reporting date, over a specified time horizon.

The IAA paper applies the term quantile methods to a group of methods that rely only on the *shape* aspect of risk. In the examples, shape was measured variously by standard deviation, confidence levels (VaR or percentiles), and CTE. For each of these shape measurement statistics, the method requires one parameter, number of standard deviations (e.g., 0.6), the confidence level (e.g., 75%), or the CTE level (e.g., 40%), respectively.

Comparing the three quantile methods illustrated in section 9, it is observed that within the range of most contracts the risk margin based on confidence levels does not increase with increasing skewness of the product risk distribution. Increasing margins with increasing skewness is a property that is considered desirable in a risk margin. In the examples, the CTE and standard deviation measures did behave as desired in that respect.

Products with longer settlement times tend to have riskier shapes than products with shorter settlement times, but there is no direct relationship between time and risk as measured by the quantile methods, according to the IAA paper. The IAA paper continues with the comment,

“A quantile method will have the same risk margin for a set of obligations that settles over five years as for a set of obligations that settle over two years, if both sets of obligations have the same shape parameter. For example, unpaid claims for a short tail liability product and for excess property product might each have a distribution of settlement amounts described by a log normal distribution with coefficient of variation of, say, 20%. While the property unpaid claims will settle over two years and the liability unpaid claims might settle over five years, both will have the same quantile based risk margins. This assumes the quantile method
is applied in the usual fashion. Applying an approach that varies with time would solve that issue.”

The addition of a measurement for parameter uncertainty is one possible enhancement to a stochastic analysis for the purpose of reflecting the time consideration. For longer-tail lines, there is generally an expectation of greater uncertainty, for example in the older development factors and/or tail factor. A greater degree of parameter uncertainty for liability than for the excess property (referring to the IAA example above) would lead to a greater margin for adverse deviations for liability using quantile approaches.

**Practical Issues and Partial Solutions of Quantile Approaches**

**Selection of Confidence Level or CTE Level**

While practice has developed in some countries, no theory or practice has yet developed to determine what confidence or CTE level relates directly to P&C insurance for the purpose of determining margins for adverse deviations.

**Different Confidence Levels for Different Products or During Claims Runoff**

As shown in the three product examples, it might be appropriate to use different confidence levels for different products. Note that an appropriate methodology to develop a specific level of overall confidence has not yet been developed and it is unclear whether it may exist. Varying the levels chosen by product emphasizes this difficulty. In addition, having different confidence levels by product may make it more difficult to achieve consistency.

During the course of claim runoff, the risk distribution may become wider and increasingly skewed; that is, there are fewer claims and the remaining claims may be larger. As a result, as with differences by product, different confidence intervals by claim runoff year may be necessary to maintain a consistent risk margin for a growing or declining portfolio.

While different confidence levels may be required for different products and years at different levels of maturity, a constant CTE level or a multiple of standard deviations approach might better achieve the desired simplicity.

**Sources of Risk Distributions and Treatment of Extreme Events**

The examples shown previously are based on theoretical distributions. In practice, risk distributions may be partly based on methods such as curve fitting and stochastic modeling.

One difficulty with these techniques is that there is usually insufficient or no information on the effect of extreme events. Among the approaches to address this problem are the use of weighted averages of possible scenarios of relevant extreme events (usually those not reflected routinely or at all in the available data), and judgmental analysis of particular operational or risk issues (e.g., new claims or underwriting systems or procedures).

In addition, the examples assume that estimates of the probabilities of all outcomes are available. In practice, a complete distribution may not be necessary. For example, there are statistical methods for estimating moments from the data without a deeper knowledge about the complete risk distribution. Also, it may be sufficient to identify the severity of events only at specified probability levels. Stress and scenario testing might be used to provide information regarding the events at the required levels of probability.
Moreover, the risk distribution needs to include provision for the possibility that the underlying model is incorrect in some respects. For example, in estimating expected property insurance outcomes, the assumption that extreme weather conditions are becoming more common may be appropriate. There are some techniques for addressing such risks, but this area remains a matter for ongoing research.

Nonetheless, the degree of potential unreliability of models, particularly for extreme events, even with the mitigation strategies noted above, remains significant, since quantifying this risk can be complicated.

Professional judgment and regulatory, accounting, and professional guidance may be required to determine the appropriate approach.

10. COMPARISON OF RISK MARGIN METHODS

This section of the educational note first presents a summary of observations regarding the various methods for determining margins for adverse deviations. The observations are followed by a comparison of the methods from a quantitative perspective and then from a qualitative perspective. The qualitative review includes a comparison of each method to the desirable characteristics of risk margins identified by the IAIS and the IAA.

**Summary Observations**

In the quantile family of methods, CTE approaches are theoretically more sound than confidence level approaches, with the differences being significant for products with more skewed risk distributions. Regulatory oversight or actuarial practice would apply higher confidence levels for products with risk distributions that are more highly skewed.

Explicit assumptions are best considered as useful approximations for implementing a quantile method. Consistency among insurance products and between insurance and other industries is challenging using a purely explicit assumption approach.

**Quantitative Comparison**

Quantitative comparisons of the methods show that

- for Product A, a CTE(40%) is similar to the 75% confidence level,
- Product B shows very different results for the 65% and 75% confidence levels. Similar to Product A, the 75% confidence level is close to the CTE(40%).
- for Product C, the range of possible risk margins is very wide. Use of the CTE measure or multiple of standard deviations in the quantile method avoids the negative risk margins that would be calculated using confidence levels.

The following table compares the examples from the methods described in section 9.

| Notional Coverage Type       | automobile third party liability | general liability “risky liability” | catastrophe coverage |

It is interesting to compare the indicated risk margins in the above table to the range of margins set out in subsection 2260 for deterministic analyses. For product A (automobile third party liability), all risk margin approaches result in a margin for adverse deviations that is within the 2.5% to 20% range. For product B (general liability “risky liability”), three of the approaches exceed the 20% high margin: 1.0 standard deviation, 90% confidence, and 75% CTE. For product C (catastrophe coverage), only the 75% confidence produces a margin for adverse deviations that is within the range specified in subsection 2260 for claims development.

A selection above the 20% high margin is still possible as mentioned in paragraph 2260.04 of the Standards of Practice, “A selection above this high margin for adverse deviations would be appropriate, however, for unusually high uncertainty”. Furthermore, paragraph 2270.03 of the Standards of Practice states, “a selection above the high margin for adverse deviations set out in paragraph 2260.02 may be appropriate when stochastic modeling indicates variability in estimates of policy liabilities that may not be identified using deterministic analysis.”

Qualitative Comparison

This final section compares the various risk margin approaches described in this educational note (i.e., explicit assumptions, multiple of standard deviation, confidence level, and CTE) with the desirable characteristics identified in section 3.

Compliance with the Five IAIS Characteristics

The five characteristics identified by the IAIS, from section 3, are repeated here for convenience.

a. The less that is known about the current estimate and its trend; the higher should be the risk margins.

b. Risks with low frequency and high severity should have higher risk margins than risks with high frequency and low severity.
c. For similar risks, contracts that persist over a longer timeframe should have higher risk margins than those of shorter duration.

d. Risks with a wide probability distribution should have higher risk margins than those risks with a narrower distribution.

e. To the extent that emerging experience reduces uncertainty, risk margins should decrease, and vice versa.

There are two possible interpretations of characteristic c. One interpretation is that

liabilities that persist over a longer timeframe have increased exposure to risks, and hence will have higher risk margins, than shorter tail liabilities that are otherwise exposed to similar risks. We call this c-1.

Another interpretation is that

for two sets of liabilities with the same riskiness in their distribution of ultimate settlement values (i.e., having similar risks) the risk margin should be higher for the liabilities that settle over a longer time period. We call this c-2.

For example, unpaid claims for short tail liability coverage and for excess property coverage might each have a distribution of settlement amounts described by a lognormal distribution with a coefficient of variation of 20%. The property unpaid claims will settle in two years; and the liability unpaid claims might settle in five years. From a quantile perspective the two sets of unpaid claims would have the same risk margin, without adjustment or refinement in the modelling process (i.e., adjustment for parameter uncertainty).

An assessment of the methods against these characteristics, which are referred to as the six extended IAIS characteristics, including both c-1 and c-2 follows.

Explicit Assumptions

Although explicit assumptions could be constructed in a manner to address the characteristics, they do not necessarily satisfy any of the characteristics. Each product would need its own set of assumptions.

As an implementation approach, explicit assumptions, selected by product, could be made to approximate the percentile method. If the approximation were sufficiently close, the explicit assumption approach would satisfy the characteristics to the same extent as the method it approximates.

Quantile Methods

All of the quantile methods fail characteristic c-2. Consider two products that have the same risk distribution for unsettled contract obligations at the reporting date, but have obligations that involve settlement over two different time periods. To comply with characteristic c-2 the margins would be different. However, the risk margins for the two products, based on the number of standard deviations, confidence level, CTE, or any method that relies only on characteristics of the risk distribution, would not be different.

In addition, the confidence level method does not necessarily satisfy characteristics (a), (b), (d) or (e). In section 9, we show that highly skewed distributions (e.g., Product C) can result in negative risk margins, as increasing skewness is accompanied by a decreasing rate of increase in
risk margins. More generally, the examples also show that, as distributions become more dispersed and more skewed, the risk margins implied by a fixed confidence level include fewer standard deviations. This violates the spirit of characteristics (a), (b), (d), and (e).

CTE and methods based on multiples of the standard deviation generally satisfy characteristics (a), (b), (d), and (e) better than do the confidence level method. Table 9 shows that the CTE method and multiples of standard deviation methods are consistent for the more well-behaved products (A and B), but that the use of CTE is more sensitive to increasing risk than is multiples of standard deviation. However, while CTE is more refined in that it can provide a better insight into the tail amounts, its general approach is similar to that of confidence levels.
### Compliance with IAA Desirable Characteristics

In the following table, we summarize the IAA characteristics (presented in section 3) and present an assessment of whether or not each method meets or can meet the objective.

</table>
All of the methods can be applied based on a consistent methodology for the entire lifetime of the contract. Moreover, to the extent that each of the methods utilizes assumptions relevant to current estimates, they would be implemented in a manner consistent with emerging experience as the experience affects the current estimates.

Within the current Canadian P&C environment, none of the methods is currently used extensively for pricing purposes. The fourth IAA desirable characteristic relates to consistency among classes of business. While, all methods vary by product based on risk differences in the product, the previous section expands on this discussion. A comparison of each method to the IAIS desirable characteristics shows that some methods are more responsive to the variability by product than others.

The fifth IAA desirable characteristic is ease of calculation. We consider the mechanical application of formulas or the use of models that require no judgemental inputs to be “easier” than methods that require judgement in addition to the calculations. Methods that require fewer simulations of future results are also characterized as easier than methods that require more extensive simulations of future results.

The minimum level of likely disclosure would be the amount of risk margin and the basis for deriving that amount. Any approach would allow for the minimum level of disclosure.

For the quantile methods, the methodology chosen and the key parameters in the calculations would be disclosed. Note that it is always a challenge to describe actuarial methods and parameters in a layperson’s terms. However, there is no method for which such disclosure would not be possible.

To the extent that market-consistency is required as a principle guiding the measurement or as a tool to enhance consistency based on an external benchmark, there are limitations in the methods presented in this educational note. None of the approaches resolve the issue that there may not be information about how market participants assess the risk to be measured.

11. DOCUMENTATION AND REPORTING

The Standards of Practice (subsection 1560) state, “Documentation is an integral part of work that affects the application of nearly all standards... Appropriate documentation describes the course of the work and the actuary’s compliance with accepted actuarial practice.” Thus, the actuary would document his or her process for determining margins for adverse deviations.

Documentation is important regardless of whether the actuary uses explicit assumptions or stochastic techniques for the determination of margins for adverse deviations. Actuaries following the explicit assumptions approach would document the considerations that were critical in their selection of margins for adverse deviations. Actuaries conducting stochastic analyses would document what components are modeled as random variables as well as the primary assumptions (e.g., selected distributions and parameters). The documentation for both explicit assumptions and stochastic techniques would include support for key decisions made by the actuary.

With respect to reporting, it would normally be in the user’s interest to be aware of the margins for adverse deviations selected by the actuary. Accordingly, it seems reasonable that the actuary would consider some disclosure regarding the margins for adverse deviations within the actuarial work product for both internal user and external user reports.
However, this consideration would also take into account the complexity of the concept of margins for adverse deviations, the potential importance of the concept to the user, as well as the sophistication of the user who will be receiving the work product. In some cases, it may be apparent that extensive discussion of the margins for adverse deviations is likely to give rise to misunderstanding and confusion. In other cases, full disclosure of the process and rationale for selecting the margins for adverse deviations may be appropriate.

According to subsection 1820 of the Standards of Practice – Reporting: External User Report,

1820.07 “Appropriate description and disclosure in a report strike a balance between too little and too much. Too little disclosure deprives the user of needed information. Too much disclosure may exaggerate the importance of minor matters, imply a diminution of the actuary’s responsibility for the work, or make the report hard to read.”

1820.08 “The appropriate criterion for description and disclosure is the question: ‘What qualitative and quantitative information best serves the user’s understanding and decision-making?’”

It is also important for the actuary to communicate with the insurer’s auditors, particularly regarding any significant change, either in the value of margins for adverse deviations or the process for determining such values.
Members should be familiar with educational notes. Educational notes describe but do not recommend practice in illustrative situations. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application (but not necessarily the only application) of the Standards of Practice, so there should be no conflict between them. They are intended to assist actuaries in applying standards of practice in respect of specific matters. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members.
MEMORANDUM

To: Members in the property and casualty insurance area

From: Pierre Dionne, Chair
       Practice Council

       Julie-Linda Laforce, Chair
       Committee on Property and Casualty Insurance Financial Reporting

Date: July 12, 2016

Subject: Second Revision – Educational Note: Premium Liabilities

This educational note has been prepared by the Committee on Property and Casualty Insurance Financial Reporting in accordance with the Institute’s Policy on Due Process for the Approval of Guidance Material other than Standards of Practice and Research Documents, and received final approval for distribution from the Practice Council on July 11, 2016.

As outlined in subsection 1220 of the Standards of Practice, “The actuary should be familiar with relevant Educational Notes and other designated educational material”. That subsection explains further that a “practice that the Educational Notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation”. As well, “Educational Notes are intended to illustrate the application (but not necessarily the only application) of the standards, so there should be no conflict between them”.

Questions or comments regarding this educational note may be directed to Julie-Linda Laforce at julielindalaforce@axxima.ca.

PD, JLL
1. Introduction

Appointed Actuaries (AA) for property & casualty (P&C) insurers in Canada are required to value insurance contract liabilities which include both claim liabilities and premium liabilities. Specifically, the Standards of Practice (SOP) state that

\[ 2130.01 \text{ The actuary should value the insurance contract liabilities and the reinsurance recoverables for the balance sheet and the changes in them for the income statement.} \]

In actuarial literature, much attention is given to the definition of claim liabilities. Premium liabilities are often defined by exception. The SOP has the following definitions:

\[ 1110.27.2 \text{ Insurance contract liabilities in an insurer’s statement of financial position are the liabilities at the date of the statement of financial position on account of the insurer’s insurance contracts, including commitments, which are in force at that date or which were in force before that date.} \]

\[ 1110.13 \text{ Claim liabilities are the portion of insurance contract liabilities in respect of claims incurred on or before the balance sheet date.} \]

\[ 1110.37 \text{ Premium liabilities are the portions of insurance contract liabilities that are not claim liabilities.} \]

The SOP provides additional details on premium liabilities in subsection 2230.

Specifically, premium liabilities include the expected costs in connection with the unexpired portion of the in-force insurance contract (i.e., incurred after the valuation date) and all other liabilities related to premium development adjustments (e.g., retro-rated premium, contingent profit commissions, etc.).

Elements to consider when analyzing premium liabilities generally include the following:

- Unearned premium reserve;
- Deferred policy acquisition expenses;
- Unearned (ceded) commission;
- Premium deficiency;
- Ceded deferred premium tax (applicable for inter-company pooling arrangements);
- Anticipated broker/agent commission;
- Expected adjustments (plus or minus) to swing-rated policies;
- Expected changes to premiums as a result of audits, late reporting, or endorsements; and
- Expected commission adjustments on policies with variable commissions.

Currently, premium liabilities are not shown explicitly in an insurer’s financial statements. Some elements of the premium liabilities are calculated by the insurer and carried in the P&C Annual Return, while others must be estimated by the AA.
It is the AA’s responsibility to evaluate the gross and net policy liabilities in connection with the unearned premium, including the assessment of the need for a premium deficiency reserve, and the maximum amount of deferrable policy acquisition expense.

The main elements related to premium liabilities are included in the regulatory expression of opinion in the AA report (see appendix D).

**Minimum Capital Test (MCT) Calculation**

Since 2012, the AA’s estimate of premium liabilities and the duration on these liabilities, net of reinsurance recoverables (the net premium liabilities), is used in the calculation of the Interest Rate Risk Margin in the MCT pages of the P&C Annual Return. With the MCT Guideline effective January 1, 2015, the estimated net premium liabilities is also used to derive the Insurance Risk Margin in the P&C Annual Return, replacing unearned premium as the basis for the calculation of a premium-related margin. The formula requires the Insurance Risk Margin to be calculated by class of insurance. In this context, “class of insurance” is intended to be consistent with definitions prescribed by the regulator for statutory financial reporting.

Appendices B and C provide guidance on the evaluation of the gross and net premium liabilities respectively, by class of insurance, and provide detail on the corresponding entries in the AA’s expression of opinion in appendix D.

**Definitions**

*Deferred policy acquisition expenses (DPAE but also referred to as DPAC or DAC):* Prepaid acquisition expenses which relate to the unexpired portion of the policy. These expenses are paid up front when the policy is issued but are not expensed on the income statement until the premium is earned. A deferred asset is set up for these prepaid expenses on the balance sheet. These expenses generally include broker/agent commissions and premium taxes but may also include an allocation of operating expenses such as renewal costs, advertising, licenses and fees, associations and dues, etc. The DPAE is an asset which recognizes the prepaid expenses over the policy period provided that such costs are recoverable from the equity in the net unearned premium reserve (UPR), as evaluated by the AA.

*Earning pattern:* Premiums should be earned on a basis consistent with the occurrence of losses. For most lines of business, losses are assumed to occur at a uniform rate during the year and premiums are earned on a pro rata basis over the term of the policy. However, for some lines of business this assumption is not appropriate. For example, most motorcycle losses occur during the period April to October and the earning pattern would recognize the timing of the loss exposure. Similarly, extended warranty premiums would be earned according to the expected payment of losses: for a three-year warranty premiums would be earned according to the expected payment of losses: for a three-year warranty there may be no exposure in year one if there is a manufacturer’s warranty in force. The exposure would be expected to increase in the second and third years.

*Equity in the gross unearned premium:* amount by which the gross UPR exceeds the gross policy liabilities in connection with unearned premium.

*Equity in the net unearned premium:* amount by which the net UPR plus unearned (reinsurance) commissions exceeds the net policy liabilities in connection with unearned premium.
**General expenses**: these expenses include operational overhead and servicing expenses that are not related to the acquisition of new or renewal business. These expenses generally come from the P&C Annual Return (page 20.30) and exclude loss adjustment and investment expenses.

**Maximum allowable DPAE**: is the maximum of the equity in the UPR and zero. If the equity in the net UPR drops below zero, then the booked DPAE is reduced to zero and a premium deficiency amount is required to be carried on the balance sheet for the difference. Section 3 discusses the determination of the maximum allowable DPAE.

**Policy liabilities in connection with unearned premium (premium liabilities)**: liabilities for future events consisting of the following items relating to the actuarial present value (APV) on the unexpired portion of the policies in-force at the valuation date:

- Future claims and adjustment expenses;
- Expected reinsurance costs based on anticipated contracts that are not yet underwritten; and
- Maintenance costs: i.e., administrative costs of servicing the in-force policies.

**Premium deficiency**: a provision that is determined by the AA when the equity in net UPR is negative. It is the amount which, when added to the net UPR and unearned (reinsurance) commissions, makes an appropriate provision for future costs arising from the unexpired portion of in-force policies.

**Unearned (ceded) commissions**: Unearned (reinsurance) commissions arise from commission revenue on reinsurance ceded premium. Quota-share reinsurance agreements generally provide for reinsurance commissions to be paid to the insurer by the reinsurer on the ceded premium. The reinsurance commission relating to the unexpired portion of a policy (i.e., the reinsurance commission on the unearned ceded premium) is carried as a liability. These unearned commissions generally include a total provision for broker/agent commissions, premium taxes, and other acquisition and servicing expenses.

**Unearned premium reserve (UPR)**: the written premium associated with the exposure remaining on the unexpired portion of the policy under a contract of insurance. The UPR at the valuation date usually is established based on the written premium, the policy term, and an assumed earning pattern.

2. **Policy Liabilities in Connection with Unearned Premium**

The largest component of the policy liabilities in connection with unearned premium relates to future claims and adjustment expenses. They are estimated by applying a selected expected loss ratio to the UPR. This evaluation is generally undertaken by line of business or using a business segmentation that is consistent with the analysis of claim liabilities.

In order to facilitate the MCT calculations referred to in section 1, the AA may wish to use a business segmentation which produces estimated future costs that can be aggregated to an Annual Return class of insurance level. An example provided in the appendices illustrates the estimation of the net premium liabilities by class of insurance for purposes of deriving the MCT insurance risk margin on page 30.64 of the P&C Annual Return.
Expected Losses

The evaluation of future expected loss ratios in connection with the unexpired portion of in-force policies is a critical aspect of determining the future expected losses. Many evaluation methods may be used depending on the complexity of the business segments and characteristics of the insurer. Projected loss ratios may be based on the AA’s valuation of claim liabilities, on the insurer’s budget, on the results of a ratemaking analysis or on an ad hoc analysis, as considered appropriate. Generally, future expected losses are based on the insurer’s recent experience adjusted to the period during which the unearned premium will be earned. The AA would consider the earning pattern underlying the calculation of the UPR, assess whether it reflects the exposure to risk, and select assumptions accordingly.

Examples of adjustments to the historical experience would include, but are not limited to, the following:

- Loss trends applied to adjust historical cost levels to the average accident date underlying the UPR;
- Expected legislative change impacts (including mandated benefit modifications);
- Recent court decision impacts relating to insurance coverage;
- Mix of business change impacts;
- On-level factors applied to adjust historical experience to the rate level underlying the UPR;
- Catastrophe and large losses loadings;
- Seasonality adjustments to the indicated expected loss ratios may need to be applied if the claims occurrence pattern is not uniform throughout the exposure period of the UPR (e.g., seasonal occurrences of hurricanes). Depending on the line of business, the seasonality adjustment may not be significant. However, for some portfolios (e.g., property catastrophe treaty reinsurance) seasonality may be a meaningful consideration; and
- Policy term assumptions taking into account the term of the policy and the future period covered by the UPR. For example, for policies with a term longer than 12 months (such as warranties or multi-year contracts), assumptions for the expected loss ratio need to take into consideration trends that are expected over the remaining term of these policies.

Various considerations for claim liabilities and premium liabilities are listed in the educational note Valuation of Policy Liabilities – P&C Insurance Considerations Regarding Claim Liabilities and Premium Liabilities.

Loss Adjustment Expenses

AAs may choose to include allocated loss adjustment expenses (ALAE) in their estimation of losses. If ALAE is not included with losses, an estimate of future ALAE would be derived by the
AA by applying an approach similar to the expected loss approach, or on another suitable basis consistent with the AA’s valuation of claim liabilities.

Similarly, AAs may choose to include unallocated loss adjustment expenses (ULAE) in their estimation of losses. If ULAE is not included with losses, an estimate of future ULAE would be derived by the AA on a suitable basis consistent with the AA’s valuation of claim liabilities. A typical calculation is to apply a ULAE ratio based on historical experience reflecting any expected changes in claims practices to the expected losses.

In order to facilitate the MCT calculations referred to in section 1, the AA may wish to consider the extent to which ALAE ratios and ULAE ratios might vary by Annual Return class of insurance.

**Expected Reinsurance Costs**

For the net policy liabilities in connection with unearned premium, in addition to the above considerations, the AA would also consider expected reinsurance costs. The manner to properly reflect reinsurance costs will depend on the type of reinsurance treaty and its terms and conditions.

For example, for a line of business covered by a proportional reinsurance treaty, the net unearned premium will be lower than the gross unearned premium and the loss ratio will be the same on a gross and net basis. For a line covered by an excess of loss treaty expiring at the valuation date, the gross and net unearned premium are the same and the ceded unearned premium is $0 at the end of the contract period. However, the cost of reinsurance in relation to the unexpired portion of the policies would be taken into account. The assumptions used would reflect the reinsurance rates and expected recoveries consistent with the reinsurance structure in place over the exposure period of the unearned premium.

**Maintenance Expenses**

Maintenance expenses also need to be included to reflect the future cost of servicing the policies in force. These expenses include expenses associated with endorsements, mid-term cancellations, changes in reinsurance contracts, etc. Maintenance expenses are generally expressed as a percentage of gross UPR and are evaluated as a portion of general expenses with typical ratios ranging from 25 percent to 50 percent.

In order to facilitate the MCT calculations referred to in section 1, the AA may wish to consider the extent to which general expense ratios vary by line of business based on the following considerations:

- The availability of historical and/or company plan expense information by line of business;
- Distribution model of the insurer;
- Characteristics of the insurer’s portfolio (e.g., two-year contracts); and
- Any other considerations.

Maintenance expense assumptions are usually consistent from year-to-year; but may vary in the event of rapid growth or changes in the insurer’s operations.
Discounting for Time Value of Money

Premium liabilities should be calculated on an APV basis, consistent with the SOP. The APV includes the time value of money and explicit provisions for adverse deviations (claims development, investment return rates, and recovery from reinsurance ceded) which is discussed below.

With regards to the time value of money, the cash flows other than losses and loss adjustment expenses (i.e., reinsurance costs and maintenance expenses) would also be considered but are not generally material to the calculation of the premium liabilities.

The discount rate for premium liabilities would generally be consistent with the discount rate used for discounting the claim liabilities, and generally would be based on a cash flow modelling of all policy liabilities including any premium payment lags (i.e., installment premiums).

The payment pattern for discounting premium liabilities would normally be consistent with that used for claim liabilities. As illustrated in appendix B, sheet 5, a future accident period payment pattern (for a given line of business) would typically be discounted to the valuation date for claims liabilities purposes. However, an adjustment would be required to reflect differences in the average accident date (AAD) of a future accident period versus the average accident date underlying the UPR (which is a partial accident period).

For example, assuming premium writings occur uniformly in a calendar year and the corresponding losses are also incurred uniformly throughout the year, the mean earning date and the mean accident date of a future accident year occurs at 0.50 years or halfway through the year. However, for the expected losses underlying the UPR, the average accident date is not as straightforward a calculation. This exercise involves calculating a weighted average or mean of the future accident dates using uniformly declining exposures as weights.

The average accident date or earning date of the UPR can be calculated by using integrals in calculating the weighted average.

Let \( x \) = future accident date underlying the UPR relating to 12-month policies

Let \( f(x) = \) the loss exposure earned on a given future accident date

\[ = 1 - x; \text{ where } 0 \leq x \leq 1 \]

And \( x = 0 \) is the valuation date and \( x = 1 \) is one year later (assuming annual policies) i.e., the last date the loss exposure exists.

Let the average accident (or earned) date equal \( \frac{\int_0^1 x f(x) dx}{\int_0^1 f(x) dx} \) integrating over the values 0 through 1, divided by the sum of the probability.

\[ \frac{\int_0^1 x f(x) dx}{\int_0^1 f(x) dx} = \frac{1}{3} \text{ year} \]

Thus, the average accident date or earning date of the UPR can be calculated as one-third of a year or four months (May 1 assuming a December 31 year end).

If the calculation were to be repeated for six-month policies, the results would show an average accident period of two months (or March 1 assuming a December 31 year end).
The median may be a reasonable approximation of the mean accident date. The median accident date is calculated using simple trigonometry assuming premiums and losses are uniformly distributed and the sides of the UPR triangle are set equal to 1.00. The equation to solve for the length of the triangle sides, x, that yields half the area of the triangle or \( \frac{1}{4} \) would be \( \frac{1}{2} x^2 = \frac{1}{4} \) or \( x = \sqrt{0.5} \). Note that the length of the triangle side is defined here as the time from the median accident date to the end of the period or time 1. Therefore, the desired timing from time 0 (or the valuation date) to the median accident date would be the complement or \( 1 - \sqrt{0.5} \) or 0.2929 years.

Once the average accident date underlying the UPR is determined, the present value may be derived directly from the present value of a future accident year, as illustrated in appendix B, sheet 5, by assuming that the present value of an average loss discounted to the accident date is equivalent to the present value of the UPR’s expected losses at its average accident date. The final adjustment is to then discount from the average accident date back to the valuation date. A mathematical proof for this approximation is shown in appendix A.

The revised educational note Discounting and Cash Flow Considerations for P&C Insurers provides additional guidance on discounting associated with premium liabilities.

Margins for Adverse Deviations (MfAD)

The SOP states that (emphasis added)

2250.02 The selected margin for adverse deviations should vary

- between premium liabilities and claim liabilities,
- among lines of business, and
- among accident years, policy years, or underwriting years, as the case may be,

according to how those considerations so vary.

The AA would consider different MfADs if premium liabilities and claim liabilities exhibit different levels of uncertainty. Generally, there would be more uncertainty for claims that have yet to occur such as those underlying the unearned premiums.

The educational note Margins for Adverse Deviations for Property and Casualty Insurance provides additional guidance on the selection of MfADs.

Examples

Illustrative examples of the evaluation of premium liabilities, gross and net, are presented in appendices B and C.

The key concepts discussed above are illustrated in these exhibits, including the derivation of losses and ALAE by line of business, the addition of ULAE, the estimated cash flows on a discounted basis, and the addition of provisions for adverse deviations. In the net calculation of the amount of the expected loss and ALAE, the cost of reinsurance coverage in relation to the unexpired portion of the policies in force is explicitly subtracted from the UPR before applying the expected loss ratio.
Further details regarding the calculation of the expected gross loss ratios, maintenance expenses, and discount factors are presented in appendix B, sheets 4, 5, and 6. A similar exercise would be followed for the net assumptions presented in appendix C.

These examples are for illustrative purposes only. Other approaches to estimate the various components of the policy liabilities in connection with unearned premium may be appropriate. For example, premium liabilities for a block of business that is renewing on a single date would have average payment dates different than in the examples presented.

3. **Premium Deficiencies and Maximum Deferrable Policy Acquisition Expenses**

The current presentation of the financial statements allows for the reporting of the premium deficiency on a net basis only. In some situations, the calculation of the equity in the gross UPR may provide valuable information that the AA may wish to discuss with management. The remainder of this section will refer to the calculation and presentation of the premium deficiency derived by assessing the equity in the net UPR.

A premium deficiency exists when the net policy liabilities in connection with unearned premium exceed the sum of net UPR and unearned (reinsurance) commissions. In this situation, a premium deficiency liability is established in the amount by which the estimated premium liabilities exceed the sum of the net UPR and unearned (reinsurance) commissions.

The maximum deferrable policy acquisition expenses are commonly referred to as the equity in the UPR. The AA is required to test the adequacy of premium liabilities in the insurer’s financial statements, including all future costs arising from the unexpired portion of in-force policies. The AA may do so by considering whether the carried DPAE is less than or equal to the equity in the UPR. In the event of a carried DPAE greater than the maximum estimated, the DPAE would be reduced to the maximum estimated amount. In the event of negative equity in the UPR, the DPAE would be reduced to zero and a premium deficiency would be required.

The previous section demonstrates how the AA calculates the policy liability in connection with unearned premium. The maximum deferrable policy acquisition expenses (net) is defined as follows:

\[
\text{Net UPR} + \text{Premium deficiency} + \text{Unearned (reinsurance) commissions} - \text{Net policy liabilities in connection with unearned premium}
\]

UPR, unearned (reinsurance) commissions and initial DPAE are usually provided by the insurer’s accounting department.

The equity in unearned premium is usually calculated on an all lines combined basis. On an all lines combined basis, deficiencies in some lines are offset by redundancies in other lines. This approach is appropriate on an ongoing concern basis to the extent that a company’s mix of business does not change significantly from year to year. It is appropriate since it is unlikely that
a company would stop writing its more profitable lines. However, the calculation can be done by line of business when segregation of different books of business is desired. In that case, it is possible to record a premium deficiency on one line of business with a partially offsetting DPAE on the other books of business.

Once the maximum deferrable policy acquisition expense is calculated it will be compared with the initial DPAE amount. If the initial DPAE is higher than the maximum deferrable, management is informed that the DPAE should be reduced to the maximum deferrable amount. In addition, any amount by which the net policy liabilities in connection with unearned premium exceed the sum of the net UPR and unearned (reinsurance) commissions would be recorded as a premium deficiency.

Example
The example in the appendices demonstrates the general calculation of the maximum policy acquisition expenses deferrable and determination of the premium deficiency on both a gross and net of reinsurance basis for a company that is required to book a premium deficiency on its balance sheet:

- Appendix B, sheets 1-3 illustrate the gross premium liabilities calculations. Although a gross premium deficiency is indicated, it is not reported on the balance sheet, however, these exhibits may still be useful for discussion with management.

- Appendix B, sheets 4-6 illustrate the supporting loss ratios, discount factor and maintenance expense ratio calculation for a given class of insurance (personal property) on a gross of reinsurance basis.

- Appendix C illustrates the net premium liabilities calculations. As seen on sheet 3, the initial DPAE would be reduced to zero in column (33) and a premium deficiency reserve, shown in column (34), would be posted equal to the amount by which the net premium liabilities exceed the sum of the net UPR and unearned (ceded) commissions.

- Appendix D shows the premium liabilities portion of the AA’s Expression of Opinion based on the figures from the example.

4. Other Net Liabilities and Unearned (Reinsurance) Commissions
“Other Net Liabilities” can be grouped into two major categories: those which relate to commission adjustments, and those which relate to premium adjustments, each of which is booked as a separate accrued liability on the balance sheet.

Contingent commissions (profit sharing commissions) are commissions that insurers pay their agents or brokers based on the profitability and the volume of business of individual producers (agents/brokers). These agreements vary by company and are often established over one- to three-year periods. Some commissions may be incurred as of the statement date and may need to be accrued.

Swing-rated contracts generate premium adjustments between insurers and reinsurers which are payable based on a pre-determined target loss ratio and the actual loss ratio of the book of
business reinsured. An example of a swing-rated contract giving rise to other net liabilities is provided below:

A reinsurance contract for a long-tail line of business incepting on October 31, 2012 has a 3 percent swing rate adjustment payable by the insurer to the reinsurer if the loss ratio exceeds 73 percent and a 3 percent swing rate adjustment payable by the reinsurer to the insurer if the loss ratio is below 67 percent. Payment is due three years following contract inception.

Assuming the reinsurance premium subject to the 3 percent adjustment is $1,000,000, the maximum swing rate adjustment would be in the amount of $30,000.

As at December 31, 2015 for example, the AA would evaluate the other net liabilities related to this contract. If the AA evaluates that the ultimate loss ratio subject to the reinsurance contract is 75 percent, then the other net liabilities would equal the future swing rate adjustment payable to the reinsurer of $30,000 and would be presented in the AA’s opinion.

A provision for retro-rated policy liabilities is booked when insurers issue policies for which the premium is adjusted yearly based on the actual experience on the policy. The final premium is not known until all losses are reported and settled. The provision to be accrued is equal to the difference (either positive or negative) between the estimated final premium and the cumulative paid premium at the valuation date.

Other examples of premium development to be evaluated as part of the premium liabilities are the following:

- Audit premiums where the final premium is not known until the coverage expires;
- Premium development on reinsurance assumed; and
- Premium development on retro-rated reinsurance ceded.

Communication with the accounting department is needed to ensure that the AA’s adjustments and the insurer’s accounting policy are consistent.

The sources of development on reinsurance assumed or ceded to be considered include, but are not limited to, the following:

- Changes in subject matter premium which is usually unknown until the end of the contract period;
- Swing-rated excess of loss treaties which call for a rate adjustment based on the loss experience during the coverage period; and
- Reinstatement premium for catastrophic or other layer (additional premium to be paid when the limit of coverage provided by the layer has been exhausted unless netted from expected claims recovery).

Some insurers with large quota share treaties may have significant unearned (reinsurance) commissions on their ceded unearned premiums. The unearned (reinsurance) commissions are booked as a liability and are earned pro rata over the terms of the policies.
5. **Subsequent Event Application in the Case of Premium Liabilities**

A subsequent event is defined in the SOP as “an event of which an actuary first becomes aware after a calculation date but before the corresponding report date.” The treatment of a subsequent event in the AA’s work is described as follows:

1. Work with respect to an entity, the actuary should take a subsequent event into account (other than in a pro forma calculation) if the subsequent event provides information about the entity as it was at the calculation date, retroactively makes the entity different at the calculation date, or makes the entity different after the calculation date and a purpose of the work is to report on the entity as it will be as a result of the event.

Subsequent events need to be analyzed in the context of claim liabilities and premium liabilities. Some subsequent events will be taken into consideration in the same manner in both claim and premium liabilities, while some events may only need to be taken into consideration in premium liabilities. For example, the educational note *Subsequent Events* discusses the case of the 1998 ice storm. The event occurred on January 5, 1998; it did not make the entity different at the valuation date of December 31, 1997 and therefore did not need to be recognized in claim or premium liabilities. However, it was recognized that the actual premium liabilities could be materially different from the expected premium liabilities and that this should be disclosed as a note to the financial statements.
Appendix A: Premium Liabilities Present Value Factor

Assume the following:

- Let $i$ = discount rate used in the valuation of claims liabilities based on a cash flow model that includes consideration of any premium payment lags (e.g., monthly installment plans);
- $PV_{AY}$ represents the present value of the future accident year losses to January 1 divided by the ultimate losses;
- $PV_{UPR}$ represents the present value of the losses underlying the UPR to January 1 divided by the ultimate losses;
- $PV$ represents the present value of an average loss discounted to the accident date divided by the amount of the ultimate loss;
- $0 < PV \leq 1$; and
- Assume losses are uniformly distributed and premiums are annual and evenly distributed.

$$PV_{AY} = \int_0^1 PV (1 + i)^{-t} dt$$

where $\int_0^1 (1 + i)^{-t} dt = \int_0^1 (1 - ti + (t)(t + 1)i^2 + \cdots) dt$

$\approx \int_0^1 (1 - ti) dt = 1 - i/2$

$PV_{AY} \approx PV \lfloor 1 - i/2 \rfloor$

$$PV_{UPR} = \frac{\int_0^1 PV (1-t)(1+i)^{-t} dt}{\int_0^1 (1-t) dt}$$

$= 2 PV \lfloor \int_0^1 (1 + i)^{-t} dt - \int_0^1 t (1 + i)^{-t} dt \rfloor$

where $\int_0^1 t (1 + i)^{-t} dt \approx \int_0^1 t (1 - ti) dt$

$= \int_0^1 (t - t^2 i) dt = \left[ \frac{t^2}{2} - \frac{t^3 i}{3} \right]_0^1 = \frac{1}{2} - \frac{i}{3}$

$PV_{UPR} \approx 2 PV \lfloor 1 - \frac{i}{2} - \frac{1}{2} + \frac{i}{3} \rfloor \approx PV \lfloor 1 - \frac{i}{3} \rfloor$

- Substituting the value of $PV$ from above we can solve for the $PV_{UPR}$ in terms of $PV_{AY}$
\[ PV_{UPR} \approx PV_{AY} \left[ \frac{1 - \frac{1}{2}}{1 - \frac{1}{3}} \right] \approx PV_{AY} \left[ 1 + \frac{i}{6} \right] \approx PV_{AY} \left( 1 + i \right)^{\frac{1}{6}} \]

where \( x \) = difference between the mean average accident date of an accident year and that of the UPR of 1/6 (i.e., 1/2 less 1/3).

If, however, the cash flow model used to derive the discount rate underlying the claim liabilities does not incorporate premium payment lags, then the following adjustment is required to the discount rate to reflect the decrease in anticipated investment income:

- Let \( k \) = the portion of the unearned premium supported by invested assets (or % of portfolio paid in full at inception) as of the valuation date;
- Let \( j = k \times i \), 0% ≤ \( k \) ≤ 100%;
- \( k = 100\% \) if all policies are paid in full at inception then \( j = i \); and
- \( k = 0\% \) if all policies are on an installment payment plan then \( j = 0 \) and no additional discount is needed to the valuation date.

\[ PV_{UPR} \approx PV_{AY} \left( 1 + i \right)^{\frac{5}{6}} \left( 1 + j \right)^{-\frac{33}{100}} \]
Members should be familiar with educational notes. Educational notes describe but do not recommend practice in illustrative situations. They do not constitute Standards of Practice and are, therefore, not binding. They are, however, intended to illustrate the application (but not necessarily the only application) of the Standards of Practice, so there should be no conflict between them. They are intended to assist actuaries in applying Standards of Practice in respect of specific matters. Responsibility for the manner of application of Standards of Practice in specific circumstances remains that of the members.
MEMORANDUM

To: All Fellows, Affiliates, Associates, and Correspondents of the Canadian Institute of Actuaries Practising in Property and Casualty Insurance

From: Pierre Dionne, Chair
Practice Council

Julie-Linda Laforce, Chair
Committee on Property and Casualty Insurance Financial Reporting

Date: October 15, 2015

Subject: Revised Educational Note—Subsequent Events

The Committee on Property and Casualty Insurance Financial Reporting of the Canadian Institute of Actuaries (CIA) has revised this educational note for use by property and casualty actuaries to provide additional guidance. The purpose of this educational note is to provide guidance in identifying subsequent events and in understanding appropriate courses of action for such events. In preparing this educational note, input was sought from insurance audit professionals at Deloitte, KPMG and PricewaterhouseCoopers.

In accordance with the Institute’s Policy for Due Process for the Approval of Guidance Material other than Standards of Practice, this educational note has been prepared by the Committee on Property and Casualty Insurance Financial Reporting, and has received final approval for distribution by the Practice Council on October 13, 2015. As outlined in subsection 1220 of the Standards of Practice, “The actuary should be familiar with relevant educational notes and other designated educational material.” That subsection explains further that a “practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation.” As well, “educational notes are intended to illustrate the application (but not necessarily the only application) of the standards, so there should be no conflict between them.”

If you have any questions or comments regarding this educational note, please contact Julie-Linda Laforce at julielindalaforce@axxima.ca.

   After the Reporting Period.................................................................................................. 27
1. Introduction

The Committee on Property and Casualty Insurance Financial Reporting of the Canadian Institute of Actuaries (CIA) prepared this educational note to provide guidance to property and casualty (P&C) actuaries in identifying whether events are subsequent events and in understanding appropriate courses of action for such events. This educational note focuses on subsequent events that are relevant to the actuary performing an actuarial analysis in support of financial reporting (e.g., insurance contract liabilities valuations supporting year-end and quarterly financial statements). It relies on the CIA’s current definitions and Standards of Practice related to subsequent events, and also relies extensively on definitions of the Chartered Professional Accountants of Canada (CPA Canada) and input from senior audit professionals specializing in insurance organizations.

Federal and provincial insurance acts require that the Annual Return of a P&C insurance company be accompanied by an actuarial report on the insurance contract liabilities. (Insurance contract liabilities refer to both claim liabilities and premium liabilities.) The financial statement contained within the Annual Return is to be prepared in accordance with International Financial Reporting Standards, which is one of the financial reporting frameworks included in Canadian generally accepted accounting principles (GAAP). Accordingly, accounting and actuarial standards are relevant when considering the appropriate treatment of subsequent events in financial reporting for P&C insurance companies. Key standards that deal with the treatment of subsequent events are IAS 10 Events After the Reporting Period in Part 1 IFRS of the CPA Canada Handbook – Accounting and subsection 1520 of the Standards of Practice.

This educational note begins with the definition of a subsequent event as contained in the Standards of Practice and examination of the accounting standards related to events after the reporting period, particularly the distinction between adjusting events and non-adjusting events, previously known as Type A and Type B events respectively. In considering events, a very important decision point for the actuary is materiality. Consequently, this educational note addresses materiality and refers the reader to the 2007 report from the CIA Task Force on Materiality. Next, the event decision tree is presented; this decision tree was added to the Standards of Practice in 2011 to assist actuaries in determining the appropriate course of action in response to an event.

To demonstrate the use of the event decision tree the educational note presents the following examples:

- Catastrophic event, such as Eastern Canada’s January 1998 ice storm;
- Judicial decision, such as the February 2008 Alberta court decision related to the 2004 automobile reforms;
- Failure of a reinsurer company from the ceding company’s perspective;
- Change in investment markets;
- Knowledge of missing claims;
- Late reported claim(s); and
- Change in insurance industry benchmarks.
The final section of this educational note focuses on communication between the actuary, company management, and the auditor at the company level as well as between our organizations at the profession level (i.e., CIA and CPA Canada). The pertinent sections of the Standards of Practice and the CPA Canada Handbook – Accounting are reproduced as appendices A and B, respectively.

2. Definitions and Standards of Practice

Subsection 1110 of the Standards of Practice defines a subsequent event as “an event of which an actuary first becomes aware after a calculation date but before the corresponding report date.” The calculation date is defined as the “effective date of a calculation; e.g., the balance sheet date in the case of a valuation for financial statements. It usually differs from the report date.” The report date is defined as the “date on which the actuary completes the report on his or her work. It usually differs from the calculation date.” Finally, the term “report” refers to “an actuary’s oral or written communication to users about his or her work.”

Subsection 1520 of the Standards of Practice provides guidance regarding the possible effect of subsequent events on the work of actuaries. Paragraph 1520.02 states that

... the actuary should take a subsequent event into account (other than in a pro forma calculation) if the subsequent event

- provides information about the entity as it was at the calculation date,
- retroactively makes the entity different at the calculation date, or
- makes the entity different after the calculation date and a purpose of the work is to report on the entity as it will be as a result of the event.

Since the scope of this educational note is limited to actuarial analyses supporting financial reporting, particularly in the context of annual and quarterly financial statements, the discussion focuses on the first two circumstances in the above list.

The CPA Canada Handbook – Accounting, Part 1 IFRS, IAS 10 Events After the Reporting Period, states:

Objective

1. The objective of this Standard is to prescribe:

(a) when an entity should adjust its financial statements for events after the reporting period; and

(b) the disclosures that an entity should give about the date when the financial statements were authorised for issue and about events after the reporting period.

The Standard also requires that an entity should not prepare its financial statements on a going concern basis if events after the reporting period indicate that the going concern assumption is not appropriate.
Scope

2 This Standard shall be applied in the accounting for, and disclosure of, events after the reporting period.

Definitions

3 The following terms are used in this Standard with the meanings specified:

*Events after the reporting period* are those events, favourable and unfavourable, that occur between the end of the reporting period and the date when the financial statements are authorised for issue. Two types of events can be identified:

(a) those that provide evidence of conditions that existed at the end of the reporting period (*adjusting events after the reporting period*); and

(b) those that are indicative of conditions that arose after the reporting period (*non-adjusting events after the reporting period*).

4 The process involved in authorising the financial statements for issue will vary depending upon the management structure, statutory requirements and procedures followed in preparing and finalising the financial statements.

5 In some cases, an entity is required to submit its financial statements to its shareholders for approval after the financial statements have been issued. In such cases, the financial statements are authorised for issue on the date of issue, not the date when shareholders approve the financial statements . . .

6 In some cases, the management of an entity is required to issue its financial statements to a supervisory board (made up solely of non-executives) for approval. In such cases, the financial statements are authorised for issue when the management authorises them for issue to the supervisory board . . .

7 Events after the reporting period include all events up to the date when the financial statements are authorised for issue, even if those events occur after the public announcement of profit or of other selected financial information.

**Note that the “reporting date” in the accounting standards is equivalent to the “calculation date” in the Standards of Practice (and not the “report date”).**

Under IFRS, the financial statements now disclose the date the financial statements were authorized for issuance by the entity (typically the date of approval by the Board) and the auditor’s report date will match that date. The actuary’s report date in the financial statements would typically be the same date.

Throughout this educational note, subsequent events are referred to as adjusting events or non-adjusting events according to the descriptions in IAS 10 *Events After the Reporting Period*, paragraphs 03 a) and b), respectively. In general, accounting standards require that an entity adjusts amounts recognized in its financial statements to take into account adjusting (subsequent) events and that the notes to the financial statements include disclosure of non-adjusting (subsequent) events.
The accounting treatment of adjusting events requires that “an entity shall adjust the amounts recognised in its financial statements to reflect adjusting events after the reporting period” (IAS 10, paragraph 8). For non-adjusting events, the accounting treatment states that

If non-adjusting events after the reporting period are material, non-disclosure could influence the economic decisions that users make on the basis of the financial statements. Accordingly, an entity shall disclose the following for each material category of non-adjusting event after the reporting period:

(a) the nature of the event; and
(b) an estimate of its financial effect, or a statement that such an estimate cannot be made. (IAS 10, paragraph 21).

The actuarial classification is similar to the accounting classification. Paragraph 1520.05 of the Standards of Practice states:

. . . depending on the classification, the actuary would either

  take that event into account, or

  report that event, but not take it into account.

These two options for action are similar to the accounting guidelines for adjusting (subsequent) events (i.e., take the event into account) and non-adjusting (subsequent) events (i.e., disclosure only). Furthermore, paragraph 1520.03 states that “The actuary should not take the subsequent event into account if it makes the entity different after the calculation date and a purpose of the work is to report on the entity as it was at the calculation date. Nevertheless, the actuary should report that subsequent event.” This is similar to the accounting requirement for non-adjusting events.

An event decision tree was added in 2011 to the Standards of Practice to assist the actuary in deciding how to reflect an event in the work, if the actuary determines that the event makes the entity different. In a financial reporting context, the event decision tree can be used to determine whether to take the event into account or to report (i.e., disclose) the event but not to take it into account. When working with the event decision tree, it is critical that the actuary keep in mind the concept of materiality.

3. **Materiality**

Paragraph 1340.03 of the Standards of Practice addresses the concept of materiality, in a general fashion, by stating that “an omission, understatement, or overstatement is material if the actuary expects it materially to affect either the user’s decision making or the user’s reasonable expectations.”

As part of an actuarial valuation of insurance contract liabilities, the actuary would determine a materiality level. The November 2007 report from the Task Force on Materiality notes that it is important to recognize what materiality is not. The report emphasizes that the concept of materiality is different from the concepts of:

- The range of reasonable values in an actuarial estimate; and
• The inherent uncertainty associated with actuarial estimates.

Subsection 1630 of the Standards of Practice, CIA/CICA Joint Policy Statement, requires communication regarding the materiality level between the actuary and the auditor. Paragraph 1630.10 states, in part:

The enquiring professional would

e) make the responding professional aware of the enquiring professional’s needs. This would include a discussion of:

i) the application of the concept of materiality to determine that the responding professional will be using a materiality level that is appropriate in relation to the enquiring professional’s materiality level in accordance with applicable professional standards . . .

While the actuarial materiality may differ from the materiality level selected by the auditor, the actuary would be aware of the audit materiality level. Generally, the materiality level selected by the actuary for the purpose of actuarial analysis in support of financial reporting would not be greater than the materiality level selected by the auditor.

From an auditor’s perspective, an adjusting event that is not material does not have to be reflected and a non-adjusting event that is not material does not require disclosure. If the actuary determines that an event is not material to the actuarial valuation of insurance contract liabilities, the actuary may not need to use the event decision tree. Nevertheless, the actuary would communicate to the auditor the details of such events since the auditor maintains various materiality thresholds. While actuarial standards may not require the actuary to change his or her analysis, the auditor may nevertheless have to consider the effect of the event.

4. Event Decision Tree

The next page presents the event decision tree from the Standards of Practice for determining the appropriate course of action in respect of a potential subsequent event. Actuaries may use this decision tree in the analysis of subsequent events for both claim liabilities and premium liabilities. As noted previously, when working with the event decision tree, it is critical that the actuary keep in mind the concept of materiality.
EVENT DECISION TREE

When did the actuary first become aware of the event?

- On or before calculation date
- Between calculation date and report date (i.e., a subsequent event)
- After report date

Reflect the event in the work

Does the event reveal a data defect or calculation error?

- Yes
  - Reflect the event in the work
  - (1520.01)
- No
  - No further action required

Would event have been reflected in the work if it were a subsequent event?

- Yes
  - Does the event invalidate the report?
  - No
    - No further action required
  - Yes
    - Withdraw or amend report
    - (1820.35)

Consider informing users but don’t reflect event in the work

What is the purpose of the work?

- Report on entity as it will be as a result of the event
- Report event but don’t reflect event in the work
- Report on entity as it was at the calculation date

Reflect the event in the work

- (1520.02 first inset wording)
- (1520.02 second inset wording)
- (1520.02 third inset wording)
Upon discovery of a potential subsequent event, the first question that the actuary would consider is when he or she obtained knowledge of the event.

4.1. Knowledge On or Before Calculation Date

According to the Standards of Practice, a subsequent event is an event of which an actuary first becomes aware after a calculation date but before the corresponding report date. Thus, if the actuary becomes aware of the event on or before the calculation date, the event is not a subsequent event and the actuary treats the event similarly to other information used in the valuation process.

4.2 Knowledge Between Calculation Date and Report Date

Events that occur between the calculation date and the report date are, by definition, subsequent events. If the actuary becomes aware of the subsequent event between the calculation date and the report date, the next question along the event decision tree is whether or not the event reveals a data defect or calculation error.

4.2.1 Data Defect or Calculation Error

Errors can arise in the data provided by the insurer for the analysis or in the actuary’s assumptions, calculations, and/or methodology. It is important to remember that the actuary’s judgment about materiality pervades virtually all work and affects the actuary’s decisions at all steps of the decision-making. If it is determined that the event exceeds the actuary’s materiality level and is the result of an error, then the actuary would make the appropriate correction (i.e., reflect the event in the work) and communicate the revised insurance contract liabilities estimate to both management of the insurer and the auditor. Correction and communication of a data defect or calculation error is required regardless of whether the error was discovered before or after the report date.

Paragraph 1520.01 of the Standards of Practice states, “The actuary should correct any data defect or calculation error that is revealed by a subsequent event.” As part of the Classification portion of subsection 1520, the Standards of Practice reiterates that it is the actuary’s responsibility to correct errors. Paragraph 1520.05 states, “The actuary would correct an error revealed by a subsequent event. The actuary would classify each subsequent event other than those which reveal errors . . .”

4.2.2 No Data Defect or Calculation Error

If the subsequent event does not reveal a data defect or calculation error, the next question the actuary asks is, “When did the event occur?”

4.2.2.1 On or Before the Calculation Date

The action to this branch of the event decision tree is similar to that described in section 4.1. The event is not classified as a subsequent event, and the actuary treats the event similarly to other information used in the valuation process.
4.2.2.2 After Calculation Date

If the event occurred after the calculation date, then the next question is related to the timing of when the entity becomes different. The two options in the event decision tree are: (1) on or before calculation date, and (2) after calculation date.

The response to this question is linked to the auditors’ classification of an event as an adjusting event or a non-adjusting event.

Adjusting (subsequent) events, which the accounting standards define as events that provide evidence of conditions that existed at the end of the reporting period, require the actuary to recalculate the insurance contract liabilities, both claim liabilities and premium liabilities, at the calculation date. In the context of the decision tree, these events would therefore be ones that make the entity different on or before calculation date. The actuary would then report the recalculated insurance contract liabilities to management and the auditor for incorporation into the financial statements.

Non-adjusting (subsequent) events, which the accounting standards define as events that are indicative of conditions that arose after the reporting period, require disclosure rather than change to the balance sheet and income statement. In the context of the decision tree these events make the entity different after the calculation date and the purpose of the work is to report on the entity as it was at the calculation date. The actuary would nevertheless recalculate the insurance contract liabilities so that management can include appropriate values in the necessary disclosures; however, the insurance contract liabilities reported in the financial statements would remain unchanged.

In conclusion, if the event makes the entity different on or before the calculation date, then the actuary reflects the event in his or her work. If the event makes the entity different after the calculation date, then in the context of financial reporting, a disclosure in the financial statement would be required.

As mentioned previously in section 2, the scope of this educational note is limited to actuarial analysis supporting financial reporting and therefore does not address subsequent events which make the entity different after the calculation date and where the purpose of the work is to report on the entity as it will be as a result of the event.

4.3 After Report Date

If the actuary becomes aware of the event following the report date, the event, by definition, is not a subsequent event. Nevertheless, the event could trigger three possible actions depending on the type of event and the magnitude of the effect of the event. The actuary may: (1) take no action, (2) inform users but not change the work, or (3) withdraw or amend the report.

The first question the actuary asks upon discovering an event after the report date is, “Would the event have been reflected in the work if it were a subsequent event?” If the answer to this question is no, then no further action is required by the actuary. If the answer is yes, the actuary considers whether or not the event invalidates the report. To invalidate the report, the event would either reveal a data defect or a calculation error, provide additional information about the entity which is the subject of the report as that entity was at the calculation date, retroactively make that entity different at the calculation date, or make that entity different
after the calculation date and a purpose of the work was to report on the entity as it would be as a result of the information. If the event does not invalidate the report, then the actuary would consider informing the user(s) but does not have an obligation to reflect the event in the work. For purposes of actuarial work that supports financial reporting, the auditor would expect to be informed by the actuary, particularly since the auditor would need independently to evaluate the effect of the event on the audit opinion. If the event does invalidate the actuary’s report, then the actuary would withdraw or amend his or her report.

5. Disclosure Requirements

Company management is ultimately responsible for the notes to the financial statements. However, following a non-adjusting (subsequent) event, the actuary often plays an important role in determining the estimates of insurance contract liabilities that are contained in such notes.

The actuary’s responsibility for disclosure with respect to subsequent events, both adjusting events and non-adjusting events, extends beyond simply the financial statements. Depending on the circumstances of the subsequent event, the actuary has varied means of communication. The actuary may present his or her findings orally through meetings with company management and/or presentations to the audit committee or the board of directors. The actuary would also include commentary regarding the subsequent event in written communication either in the actuary’s report or separate communication specifically addressing the subsequent event.

The February 1998 CIA educational note The Eastern Canada Ice Storm – Treatment in Financial Reporting included the following points for consideration for actuarial disclosure:

- A description of the nature of the event; and
- An estimate of the financial effect, when possible, or a statement that such an estimate cannot be made, including:
  - An estimate of the gross amount of claims (indemnities and loss adjustment expenses);
  - An estimate of the reinsurance recoveries;
  - An estimate of the reinsurance reinstatement premiums; and
  - A discussion about the impact of the event
    - On future insurance results of the entity;
    - On reinsurance risk of non-recovery from reinsurers; and
    - Other related events.

6. Examples

In order to illustrate the concepts described above, the following examples are analyzed using the event decision tree:

- Catastrophic event, such as Eastern Canada’s January 1998 ice storm;
- Judicial decision, such as the February 2008 Alberta court decision related to the 2004 automobile reforms;
• Failure of a reinsurance company from a ceding company’s perspective;
• Change in investment markets;
• Knowledge of missing claims;
• Late reported claim(s);
• Change in incurred value of a large loss; and
• Change in insurance industry benchmarks.

These examples are for illustrative purposes only. This list is not meant to be exhaustive. It is important to recognize that other types of subsequent events could affect insurance contract liabilities. The course of action following an actual event will depend on each insurer’s circumstances and the particular characteristics of the event itself. Unless stated otherwise in each example, the event is considered to be material to the insurer.

6.1 Catastrophic Event

The first example refers to the January 1998 ice storm in Eastern Canada. Depending on the geographical distribution of exposures, the financial effects of the ice storm may or may not have been material to a particular insurer. For many insurers with exposures in Eastern Canada, the financial effect of the ice storm was greater than the selected actuarial materiality level for the December 31, 1997, insurance contract liabilities valuation.

When did the actuary first become aware of the event?

The actuary would compare the date he or she became aware of the event to the calculation date. For this example, the calculation date for most insurers was December 31, 1997. The ice storm did not begin until January 5, 1998; therefore, actuaries did not know of the event before the calculation date (i.e., December 31, 1997). Since the ice storm occurred so early in January, for most actuaries knowledge of the event developed before the report date. Thus, the actuary proceeds along the middle branch of the event decision tree.

Does the event reveal a data defect or calculation error?

For the ice storm, the answer to this question is no.

When did the event occur?

The ice storm did not begin until January 5, 1998, which was after the calculation date of December 31, 1997.

Does the event make the entity different?

In February 1998, the CIA published an educational note titled The Eastern Canada Ice Storm – Treatment in Financial Reporting to provide guidance on the reporting of this event. The educational note concluded that:

The ice storm clearly does not retroactively make the insurance company different . . . Accordingly, the ice storm is an event that makes an entity different after the balance sheet date.

What is the purpose of the work?

The educational note concluded that
If the purpose is to report on the entity as it was, then the actuary would not take the event into account in the selection of methods and assumptions . . .

the actuary should report the event, making no further distinction on the nature and amount of the event, once the materiality hurdle has been passed, and it has been determined that it is not appropriate to amend methods and assumptions.

Both actuarial and accounting guidance are consistent in indicating that the appropriate course of action is to disclose the effect of the ice storm in the notes to the financial statements, but to make no changes to the calculations underlying the 1997 results.

The educational note also addressed the issue of premium liability.

It is clear that the actual premium liability will likely be larger than the premium liability anticipated as at December 31, 1997. However, this is not the key issue in the context of financial reporting under GAAP. The key issue is the purpose of the work, which is to report on the insurance company as it was on December 31, 1997.

6.2 Judicial Decision

This example uses the 2008 judicial decision related to automobile insurance reforms in Alberta. In February 2008, Alberta’s Court of Queen’s Bench struck down the $4,000 cap on non-pecuniary damages for people who suffer soft-tissue injuries in car accidents.

For insurers doing business in Canada but without a significant portfolio of Alberta automobile insurance, the court decision was not material and no action was required. For some insurers with significant exposures in Alberta, the court decision was still not material due to the methods for setting individual case reserves, the proportion of bodily injury claims in their current portfolio of outstanding claims, or because a provision had already been established. Even if there were no changes in actuarial calculations, many auditors required an affirmative statement from the actuary regarding the non-material impact of the Alberta court decision. For many insurers, however, the effect of the court decision was greater than the actuarial materiality level.

In certain circumstances, the question of materiality may lead the actuary to conclude that no action is required according to the Standards of Practice, but significant industry-wide events may, in practice, require the actuary to provide a statement for financial reporting purposes regardless of materiality. This statement may require a quantification of the effect on the insurance contract liabilities or a disclosure in the notes to financial statements.

When did the actuary first become aware of the event?

For most insurers, the calculation date in this example was December 31, 2007. Thus, since the court decision occurred on February 8, 2008, the answer to the first question is that actuaries became aware of the event after the calculation date.

Unlike the Eastern Canada ice storm, the court decision occurred in early February, not early January. Some insurers had already held their audit committee meetings. Some actuaries had already prepared their actuarial statements of opinion regarding insurance contract liabilities even though their actuarial report on insurance contract liabilities had not yet been issued.
There was extensive discussion between actuaries and auditors, both at the individual company level and at the industry level, as to what constitutes a report date. Is the report date the date of:

- The audit committee meeting to approve the financial statements;
- The actuarial statement of opinion;
- The actuarial report; or
- The auditor’s report on the financial statements (auditor’s report date)?

The general consensus of the auditors was that the report date was the date of the auditor’s report on the financial statements. According to the Standards of Practice, the actuarial report date is defined as the “date on which the actuary completes the report on his or her work.” There may be situations, such as Canadian branches, where the actuary’s report date is prior to the auditor’s report date. In the unusual circumstance of a significant event occurring after the actuary’s report date and before the auditor’s report date, the actuary and auditor will be expected to coordinate and decide upon necessary action.

**Between Calculation Date and Report Date**

Actuaries who became aware of the court decision prior to the report date would proceed along the middle branch of the event decision tree. The Alberta court decision was not related to a data defect or calculation error. Since the event occurred after the calculation date, the next question for the actuary who became aware of the court decision prior to the report date would be, “Does the event make the entity different?” While the conclusions were not consistent among all auditing firms and all insurers, most classified the Alberta court decision as an adjusting event, an event that provided further evidence of conditions that existed at the December 31, 2007 financial statement date. For an adjusting (subsequent) event, the actuary would take into account the effect of such an event in the calculation of the insurance contract liabilities at the calculation date. The accounting classification as an adjusting event aligns with the event decision tree branch “the event makes the entity different on or before calculation date.”

**After Report Date**

For actuaries who became aware of the Alberta court decision after the report date, the event is not classified as a subsequent event (according to paragraph 1110.49 of the Standards of Practice). They would answer the question: “Would the event have been reflected in the work if it were a subsequent event?” The answer to this question typically was yes. Thus, the final decision for actuaries was whether or not the event invalidated the report.

For some insurers with significant exposures in Alberta, the court decision did, in fact, invalidate the report. In these situations, actuaries had the option of withdrawing the December 31, 2007, insurance contract liabilities valuation report or amending it. For other insurers without a significant portfolio of Alberta automobile insurance, the court decision was not sufficiently material to invalidate the report. Therefore, many actuaries informed users in the financial notes but did not reflect the event in their work. The decision-making process was based on discussions between the actuary, the company management, and the auditor and depended upon the specific circumstances of each company.
6.3 Failure of a Reinsurance Company from the Ceding Company’s Perspective

The failure of an insurer’s reinsurer is cited in subsection 1520, Subsequent Events, of the Standards of Practice as an example of a situation where the classification is not clear. Paragraph 1520.16 states:

If the insolvency was the culmination of a gradual deterioration in the reinsurer’s financial circumstances, most of which had occurred before the calculation date but which was not apparent until revealed by the insolvency, then the insolvency provides information about the entity as it was at the calculation date. If the insolvency was precipitated by a catastrophe, then it provides information about a change in conditions which makes the entity different after the calculation date.

The example in this educational note assumes that the failure of the reinsurer is not due to the occurrence of a catastrophe but instead the gradual deterioration in the entity’s financial condition.

When did the actuary first become aware of the event?

This example assumes that the actuary becomes aware of the failure on January 15, which is after the calculation date of December 31 but before the report date. Thus, by definition the failure of the reinsurer is a subsequent event. Given that the actuary becomes aware of the event between the calculation date and the report date, the actuary uses the middle branch of the event decision tree.

Does the event reveal a data defect or calculation error?

The failure of the reinsurer is not considered an error in data, assumptions, calculations, and/or methodology.

When did the event occur?

Assume that the failure of the reinsurer occurred during the first week of January, which is after the calculation date of December 31. (Note, if the assumption was that the reinsurer failure occurred during the last week of December, the actuary would not treat the failure as a subsequent event and would incorporate the effect of the failure into his or her analysis.)

Does the event make the entity different?

This question is likely the most challenging for the actuary to answer. The response to this question determines whether or not the effect of the event is to be reflected in the work (i.e., included in the calculations of insurance contract liabilities) or only reported (i.e., included in disclosure). The response to this question determines whether the event is an adjusting or a non-adjusting (subsequent) event as defined by Canadian accounting standards.

Based on a review of the excerpt from the Standards of Practice initially cited in this example as well as the CPA Canada definition of an adjusting event, i.e., an event that provides evidence of conditions that existed at the end of the reporting period, the failure of the reinsurer is classified as an adjusting event and is taken into account in the insurance contract liabilities valuation by the actuary. The actuary would work in concert with the insurance company financial management as well as with the auditor to confirm the response to this final question.
6.4 Change in Investment Markets

This example assumes a precipitate drop in the stock market that occurs during the first week of January along with a reduction in fixed income yields. Paragraph 1520.16 of the Standards of Practice also cites this example as a situation in which the classification is not clear. It states, in part:

For financial reporting, one can argue that the stock market crash provides additional information about the entity as it was at the calculation date, because the crash is an indicator of the outlook for common share investments at that date; alternatively, one can argue that the crash makes the entity different only after the calculation date since it creates a new situation. The new situation would be reflected in the financial statements for the subsequent accounting period.

Different actuaries could come to different conclusions. When the situation is unclear, we suggest that the actuary discuss the issue with the auditor for further guidance.

When did the actuary first become aware of the event?

The drop in the stock market and investment yields occurs during the first week of January, which is after the calculation date of December 31. Since the change in the investment environment occurred in the first week of January, the assumption is that the actuary became aware of the event before the report date. The change in investment markets is considered a subsequent event since the actuary became aware of the event after the calculation date and before the report date. The actuary once again uses the middle branch of the event decision tree to determine whether and how to reflect the event in his or her work.

Does the event reveal a data defect or calculation error?

The drop in the stock market and investment yields is not an error in data, assumptions, calculations, and/or methodology.

When did the event occur?

The drop in the stock market and investment yields occurs during the first week of January, which is after the calculation date of December 31.

Does the event make the entity different?

As noted in the previous example, this last question represents one of the most challenging questions for the actuary. The CPA Canada standards define non-adjusting events as those events that are indicative of conditions that arose after the reporting period. Paragraph 11 of the CPA Canada Handbook – Accounting, Part 1 IFRS, IAS 10 Events After the Reporting Period, states:

An example of a non-adjusting event after the reporting period is a decline in fair value of investments between the end of the reporting period and the date when the financial statements are authorised for issue. The decline in fair value does not normally relate to the condition of the investments at the end of the reporting period, but reflects circumstances that have arisen subsequently. Therefore, an entity does not adjust the amounts recognised in its financial statements for the investments. Similarly, the entity does not update the
amounts disclosed for the investments as at the end of the reporting period, although it may need to give additional disclosure under paragraph 21.

The appropriate course of action, according to CPA Canada standards, is to disclose the effect of the decline in fair value of the investments but not to take account of the event in the calculation of insurance contract liabilities as at December 31.

6.5 Knowledge of Missing Claims

This example assumes that the actuary receives notice on August 5 that the June 30 claims database, which the actuary is using to perform a second-quarter insurance contract liabilities valuation, does not include data from a particular group of claims.

When did the actuary first become aware of the event?

August 5 (the date on which the actuary was informed of the missing claims) is after the calculation date of June 30 but before the report date. Thus, this example initially proceeds down the middle branch of the event decision tree.

Does the event reveal a data defect or calculation error?

This event represents an omission (i.e., an error) in the data provided by the insurer. Since the answer to this question is yes, there is only one course of action: a corrected analysis. As stated in paragraph 1520.01 of the Standards of Practice, “The actuary should correct any data defect or calculation error that is revealed by a subsequent event.”

It is important for the actuary to recognize that an error in data, assumptions, calculations, and/or methodology that is greater than the materiality level requires correction, even if correcting the error yields an estimate that is still within the range of reasonable values of the auditor.

Lack of Clarity in What Constitutes the Event

In this example, it is unclear whether the event is the late notice of the missing claims, which occurred in August (between June 30 calculation date and report date), or the actual claims themselves which occurred prior to the calculation date of June 30. The conclusion that the data is to be incorporated into the June 30 analysis is reached regardless of whether the actuary proceeds down the first or second branch of the event decision tree. If the event refers to the dates of the missing claims that occurred before the calculation date, then according to the event decision tree, the missing data are not treated as a subsequent event and the claims data are incorporated into the analysis. If the event refers to the actuary’s knowledge of the missing claims, the actuary proceeds along the middle branch and responds affirmatively to the question about a data defect or calculation error.

If the omission of data is discovered on August 16, which is usually after the report date, the event is not classified as a subsequent event and the actuary would proceed down the third branch of the event decision tree. The actuary would answer the question: “Would the event have been reflected in the work if it were a subsequent event?” The answer to this question is typically yes. The final decision would be whether or not the event invalidated the report. As stated in paragraph 1820.33 of the Standards of Practice, the report would be invalidated if the
event reveals a data defect or a calculation error. This event represents a data defect and thus the report would be invalidated.

6.6 Late Reported Claim(s)

Lags in reporting of claims activity often occur for reinsurers. Several weeks, and sometimes months, can elapse between the time the ceding company increases a case reserve and the excess notice is received by the reinsurer. This example assumes that for year-end reserving purposes, the reinsurer’s actuary relies on all notices received by December 29 from its ceding companies. Furthermore, it is assumed that the reinsurer receives notice on January 12 of a November 20 increase in case reserve from a three-year old claim that now exceeds the primary retention by more than $10 million.

When did the actuary first become aware of the event?
The actuary became aware of the event on January 12, which is after the calculation date of December 31 but before the report date. Thus, by definition this is a subsequent event.

Does the event reveal a data defect or calculation error?

It is important to recognize that the late reported claim in this example differs from the missing claims in the previous example. The late reported claim of the reinsurer is not classified as an error. Reinsurers routinely rely on data as of December 31 and receive updated claims information from brokers or ceding companies on new claims or case reserve changes occurring in December in early to mid-January. Thus, this example differs from the group of claims that were inadvertently excluded from the claims database in the missing claims example.

When did the event occur?
The increase in case reserve occurred on November 20, which is before the calculation date of December 31. According to the event decision tree, since the event (i.e., the increase in case reserve) occurred before the calculation date, the actuary would reflect the event in the work.

If the increase in case reserve occurred in early January instead, this event would be a subsequent event that would have occurred after the calculation date. According to the event decision tree, the event would then be a non-adjusting subsequent event as it makes the entity different after the calculation date and the actuary would disclose its impact in the report.

6.7 Change in Incurred Value of a Large Loss

This example assumes that the actuary receives notice on February 5 that the previously reported losses experienced a large change in value (large loss event). The change in value was recorded in the insurance claims database in mid-January.

When did the actuary first become aware of the event?
February 5 (the date on which the actuary was informed of the change in incurred value) and mid-January (the date on which the incurred value was recorded in the claims database) are both after the calculation date of December 31 but before the report date. Thus, this example proceeds down the middle branch of the event decision tree.
**Does the event reveal a data defect or calculation error?**

Change in incurred value is not considered an error in data, assumptions, calculations, and/or methodology. It is part of the normal course of business of insurer.

**When did the event occur?**

The change in incurred value occurred after the calculation date of December 31. (Note, if the change in value was in the last week of December, the actuary would reflect the actual value in the contract liabilities valuation.)

**Does the event make the entity different?**

In this situation, the entity is different after the calculation date. Knowledge of the change in incurred value was only known and recorded after the calculation date of December 31.

The actuary would assess whether the change in incurred value of the large loss even though in excess of its standard of materiality is foreseen as normal in the course of business and whether the loss development component of its Incurred but Not Reported (IBNR) exceeds the change in incurred value. In situations where the IBNR is sufficient, the actuary would deem the event as part of the normal course of business and not disclose the impact in its actuary’s report.

In an opposite situation when the IBNR would not be sufficient to absorb the change in incurred value of the large loss, the actuary may consider this event as a non-adjusting subsequent event and disclose the impact of its value in its report. Disclosure would also be communicated to the auditors.

It is also worth noting that the same conclusion would apply whether the change in incurred value of a large loss has a positive or a negative impact on the contract liabilities.

**6.8 Change in Insurance Industry Benchmarks**

Paragraph 1520.07 of the Standards of Practice states, in part:

> Examples of subsequent events that provide information about an entity as it was at the calculation date are

- publication of an experience study which provides information for selection of assumptions . . .

This final example assumes that the actuary is working for a relatively new company that does not yet have a reliable, credible database for development of actuarial assumptions for reserving purposes. Thus, the actuary relies on insurance industry benchmark information for the selection of loss development patterns and expected loss ratios for this company. Furthermore, the example assumes that the industry’s statistical agency releases new industry development data on July 15. In this situation, is the actuary required to analyze the new industry data for the purpose of conducting a June 30 reserve valuation, which the company uses for financial reporting purposes?

**When did the actuary first become aware of the event?**

July 15, the date at which the actuary became aware of the new industry data, is after the June 30 calculation date. Thus, the actuary proceeds down the middle branch of the event decision tree.
Does the event reveal a data defect or calculation error?
The release of new industry benchmarks is not considered a data defect or calculation error.

When did the event occur?
The event is the availability of new industry data. The new data became available July 15, which is after the June 30 calculation date.

Does the event make the entity different?
It is typically not expected that the release of new industry benchmarks would make the entity different. Generally, industry benchmark patterns, particularly loss development patterns, do not change dramatically from release to release. Since actuaries review the experience of multiple years when selecting benchmarks based on industry data, the addition of one year is not usually expected to change the actuary’s assumptions drastically. However, if the industry data are used for the selection of trend rates or expected loss ratios, changes in industry experience could be more significant, and the effect on selected assumptions could be material. It is incumbent upon the actuary to verify that the new industry information would not have a material effect on the estimate of insurance contract liabilities for the company.

It is expected that in most circumstances, the actuary would conclude that the effect of the subsequent event is unlikely to be material. Thus, in most circumstances, the actuary would not be required to incorporate the latest industry data in his or her calculations on that basis.

7. Communication Between Actuaries, Company Management, and Auditors

Strong communication between the actuary, company management, and the auditor is critical, particularly with respect to subsequent events. Subsection 1630 of the Standards of Practice, CIA/CICA Joint Policy Statement, requires communication regarding subsequent events between the actuary and the auditor. Paragraph 1630.10 states, in part:

The enquiring professional would:

  e) make the responding professional aware of the enquiring professional’s needs. This would include a discussion of . . .

  ii) subsequent events, to determine that the responding professional understands how they are to be treated and that he or she will consider the effect of matters that come to his or her attention up to the date of his or her report.

Therefore, the actuary would review the treatment of subsequent events with the auditor as well as with company management and consider the specific circumstances of the insurance company to ensure that the treatment is appropriate for the entity and that the audit and actuarial approaches are consistent.

The November 2007 report from the CIA Task Force on Materiality states: “An important part of knowing the user in communications between the actuary and the auditor may also be to understand what constitutes a material subsequent event to the accountant user who is also the preparer of general purpose public financial statements.”

Following a subsequent event that has the potential to affect many organizations in the insurance industry, the CIA and CPA Canada will also play a role in facilitating discussions and
decision making as to how to classify the event. Two examples of such events are the Eastern Canada ice storm in January 1998 and the Alberta court decision in February 2008. The discussions at the industry level, however, are not a substitute for discussion at the individual company level.
Appendix A

CIA Standards of Practice, 1520 Subsequent Events

.01 The actuary should correct any data defect or calculation error that is revealed by a subsequent event.

.02 For work with respect to an entity, the actuary should take a subsequent event into account (other than in a pro forma calculation) if the subsequent event

   provides information about the entity as it was at the calculation date,

   retroactively makes the entity different at the calculation date, or

   makes the entity different after the calculation date and a purpose of the work is to report on the entity as it will be as a result of the event.

.03 The actuary should not take the subsequent event into account if it makes the entity different after the calculation date and a purpose of the work is to report on the entity as it was at the calculation date. Nevertheless, the actuary should report that subsequent event. [Effective December 1, 2002]

Classification

.04 A subsequent event is relevant to the recommendation if it reveals an error, provides information about the entity, or is a decision that makes the entity different.

.05 The actuary would correct an error revealed by a subsequent event. The actuary would classify each subsequent event other than those which reveal errors and, depending on the classification, the actuary would either

   take that event into account, or

   report that event, but not take it into account.

Definitive and virtually definitive decisions

.06 A definitive decision means a final and permanent decision that is not tentative, provisional, or unsettled. It would be evidenced by an amendment to a benefits plan, a collective bargaining agreement, a binding exchange of letters between two contracting parties, a court order, a legislative bill that has been proclaimed, or the like. A virtually definitive decision is one that is virtually certain to become definitive, but that lacks one or more formalities like ratification, due diligence, regulatory approval, third reading, royal assent, or proclamation. However, a decision that still involves discretion at an executive or administrative level is not virtually definitive.
Entity

.06.1 Examples of entities are

- the pension plan, in the case of an actuary doing a valuation of a pension plan,
- the block of annuity business, in the case of an actuary calculating the insurance contract liabilities for an insurance company’s annuity business,
- a combination of the pension plan and the member’s specific data, in the case of the determination of a member’s individual entitlement under a pension plan, and
- the insurance company, in the case of an actuary valuing the insurance contract liabilities of an insurance company.

Event provides information about entity as it was or retroactively makes entity different

.07 Examples of subsequent events that provide information about an entity as it was at the calculation date are

- publication of an experience study that provides information for selection of assumptions,
- reporting to an insurer of a claim that was incurred on or before the balance sheet date, and
- adoption of a pension plan amendment prior to the calculation date of which the actuary becomes aware after the calculation date.

.08 Repealed

.09 Repealed

.10 Examples of events that retroactively make the entity different at the calculation date are definitive or virtually definitive decisions, made after the calculation date but effective on or before the calculation date, to

- wind-up a pension plan, partially or fully,
- sell a portion of a participating employer’s business and consequently to spin-off the corresponding members from the participating employer’s pension plan,
- amend the benefits of a pension plan,
- transfer a portion of an insurer’s policies to another insurer, or
- invoke a judicial decision that nullifies or significantly modifies the law affecting insurance claims.

.11 If an event provides information about the entity as it was at the calculation date or provides information that retroactively makes the entity different at the calculation date, the effect of the subsequent event on the work is the same as if the actuary first became aware of the information on or before the calculation date and the actuary would not report the event as a subsequent event. That is, the actuary would report the event only to the extent that the event would have been reported had the actuary first become aware of the information before the calculation date.
.12 Repealed

**Event makes entity different after**

.13 If the subsequent event makes the entity different after the calculation date, then the purpose of the work determines whether or not the actuary takes the event into account.

.14 If the subsequent event makes the entity different after the calculation date and the purpose of the work is to report on the entity as it will be as a result of the event, then the actuary would take that event into account and would describe it in reporting.

.15 If the subsequent event makes the entity different after the calculation date and the purpose of the work is to report on the entity as it was at that date, then the actuary would not take that event into account but would report the event since it would affect the entity’s future operations and the actuary’s subsequent calculations.

**Classification not clear**

.16 The classification of a subsequent event may be unclear, at least a priori, although the circumstances of the case and the actuary’s engagement may make it clear. The following are examples of such events.

- a precipitous fall in the stock market. For financial reporting, one can argue that the stock market crash provides additional information about the entity as it was at the calculation date, because the crash is an indicator of the outlook for common share investments at that date; alternatively, one can argue that the crash makes the entity different only after the calculation date since it creates a new situation. The new situation would be reflected in the financial statements for the subsequent accounting period.

- a salary freeze for employees who are members of a pension plan. If the salary freeze is a correction of excessive salaries, then it provides additional information about the entity as it was at the calculation date, because the freeze is an indicator of the outlook for salaries at the calculation date. If the salary freeze deals with a recent problem, then it indicates a change in conditions that makes the entity different after the calculation date. In either case, the actuary would consider the effect of the freeze on the employees’ pension benefits. It may be that the freeze will have a lasting effect. Alternatively, it may be that the freeze will be compensated for by higher salaries later on, so that the salary inflation assumption based on historical trends continues to be valid.

- default on a bond. If the default was the culmination of a gradual deterioration in its issuer’s financial circumstances, most of which had occurred before the calculation date but which was not apparent until revealed by the default, then the default provides additional information about the entity as it was at the calculation date. If the default was precipitated by a catastrophe, then it provides information about a change in conditions that makes the entity different after the calculation date.
insolvency of an insurer’s reinsurer. This is similar to default on a bond. If the insolvency was the culmination of a gradual deterioration in the reinsurer’s financial circumstances, most of which had occurred before the calculation date but which was not apparent until revealed by the insolvency, then the insolvency provides information about the entity as it was at the calculation date. If the insolvency was precipitated by a catastrophe, then it provides information about a change in conditions that makes the entity different after the calculation date.

.17 Repealed

Reporting

.18 Sometimes the actuary may consider it appropriate, or the terms of the work may require the actuary, to report an alternative and opposite calculation; i.e., an alternative calculation that does not take the subsequent event into account when the main calculation does, or that takes the subsequent event into account when the main calculation does not. For example, in a province for which the calculation date for a pension valuation following marriage breakdown is the date of separation, a subsequent event may be the early retirement of the plan member at some time between the calculation date and the report date. The actuary would consider reporting values assuming that this subsequent event had been an established intention at the calculation date, instead of or in addition to retirement scenarios otherwise recommended in the practice-specific standards. In such cases, the actuary would make the same calculations regardless of the purpose of the work but the reporting thereof would depend on the purpose of the work.
Appendix B

*CPA Canada Handbook – Accounting: IAS 10 Events After the Reporting Period*

**Objective**

1. The objective of this Standard is to prescribe:
   
   (a) when an entity should adjust its financial statements for events after the reporting period; and
   
   (b) the disclosures that an entity should give about the date when the financial statements were authorised for issue and about events after the reporting period.

   The Standard also requires that an entity should not prepare its financial statements on a going concern basis if events after the reporting period indicate that the going concern assumption is not appropriate.

**Scope**

2. This Standard shall be applied in the accounting for, and disclosure of, events after the reporting period.

**Definitions**

3. The following terms are used in this Standard with the meanings specified:

   *Events after the reporting period* are those events, favourable and unfavourable, that occur between the end of the reporting period and the date when the financial statements are authorised for issue. Two types of events can be identified:

   (a) those that provide evidence of conditions that existed at the end of the reporting period (*adjusting events after the reporting period*); and

   (b) those that are indicative of conditions that arose after the reporting period (*non-adjusting events after the reporting period*).

4. The process involved in authorising the financial statements for issue will vary depending upon the management structure, statutory requirements and procedures followed in preparing and finalising the financial statements.

5. In some cases, an entity is required to submit its financial statements to its shareholders for approval after the financial statements have been issued. In such cases, the financial statements are authorised for issue on the date of issue, not the date when shareholders approve the financial statements.

**Example**

The management of an entity completes draft financial statements for the year to 31 December 20X1 on 28 February 20X2. On 18 March 20X2, the board of directors reviews the financial statements and authorises them for issue. The entity announces its profit and selected other financial information on 19 March 20X2. The financial statements are made available to shareholders and others on 1 April 20X2. The shareholders approve the financial statements at
their annual meeting on 15 May 20X2 and the approved financial statements are then filed with a regulatory body on 17 May 20X2.

*The financial statements are authorised for issue on 18 March 20X2 (date of board authorisation for issue).*

6 In some cases, the management of an entity is required to issue its financial statements to a supervisory board (made up solely of non-executives) for approval. In such cases, the financial statements are authorised for issue when the management authorises them for issue to the supervisory board.

**Example**

On 18 March 20X2, the management of an entity authorises financial statements for issue to its supervisory board. The supervisory board is made up solely of non-executives and may include representatives of employees and other outside interests. The supervisory board approves the financial statements on 26 March 20X2. The financial statements are made available to shareholders and others on 1 April 20X2. The shareholders approve the financial statements at their annual meeting on 15 May 20X2 and the financial statements are then filed with a regulatory body on 17 May 20X2.

*The financial statements are authorised for issue on 18 March 20X2 (date of management authorisation for issue to the supervisory board).*

7 Events after the reporting period include all events up to the date when the financial statements are authorised for issue, even if those events occur after the public announcement of profit or of other selected financial information.

**Recognition and measurement**

**Adjusting events after the reporting period**

8 **An entity shall adjust the amounts recognised in its financial statements to reflect adjusting events after the reporting period.**

9 The following are examples of adjusting events after the reporting period that require an entity to adjust the amounts recognised in its financial statements, or to recognise items that were not previously recognised:

(a) the settlement after the reporting period of a court case that confirms that the entity had a present obligation at the end of the reporting period. The entity adjusts any previously recognised provision related to this court case in accordance with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* or recognises a new provision. The entity does not merely disclose a contingent liability because the settlement provides additional evidence that would be considered in accordance with paragraph 16 of IAS 37.

(b) the receipt of information after the reporting period indicating that an asset was impaired at the end of the reporting period, or that the amount of a previously recognised impairment loss for that asset needs to be adjusted. For example:
(i) the bankruptcy of a customer that occurs after the reporting period usually confirms that a loss existed at the end of the reporting period on a trade receivable and that the entity needs to adjust the carrying amount of the trade receivable; and

(ii) the sale of inventories after the reporting period may give evidence about their net realisable value at the end of the reporting period.

(c) the determination after the reporting period of the cost of assets purchased, or the proceeds from assets sold, before the end of the reporting period.

(d) the determination after the reporting period of the amount of profit-sharing or bonus payments, if the entity had a present legal or constructive obligation at the end of the reporting period to make such payments as a result of events before that date (see IAS 19 Employee Benefits).

(e) the discovery of fraud or errors that show that the financial statements are incorrect.

Non-adjusting events after the reporting period

10 An entity shall not adjust the amounts recognised in its financial statements to reflect non-adjusting events after the reporting period.

11 An example of a non-adjusting event after the reporting period is a decline in fair value of investments between the end of the reporting period and the date when the financial statements are authorised for issue. The decline in fair value does not normally relate to the condition of the investments at the end of the reporting period, but reflects circumstances that have arisen subsequently. Therefore, an entity does not adjust the amounts recognised in its financial statements for the investments. Similarly, the entity does not update the amounts disclosed for the investments as at the end of the reporting period, although it may need to give additional disclosure under paragraph 21.

Dividends

12 If an entity declares dividends to holders of equity instruments (as defined in IAS 32 Financial Instruments: Presentation) after the reporting period, the entity shall not recognise those dividends as a liability at the end of the reporting period.

13 If dividends are declared after the reporting period but before the financial statements are authorised for issue, the dividends are not recognised as a liability at the end of the reporting period because no obligation exists at that time. Such dividends are disclosed in the notes in accordance with IAS 1 Presentation of Financial Statements.

Going concern

14 An entity shall not prepare its financial statements on a going concern basis if management determines after the reporting period either that it intends to liquidate the entity or to cease trading, or that it has no realistic alternative but to do so.

15 Deterioration in operating results and financial position after the reporting period may indicate a need to consider whether the going concern assumption is still appropriate. If the going concern assumption is no longer appropriate, the effect is so pervasive that this Standard
requires a fundamental change in the basis of accounting, rather than an adjustment to the amounts recognised within the original basis of accounting.

16 IAS 1 specifies required disclosures if:
(a) the financial statements are not prepared on a going concern basis; or
(b) management is aware of material uncertainties related to events or conditions that may cast significant doubt upon the entity’s ability to continue as a going concern. The events or conditions requiring disclosure may arise after the reporting period.

Disclosure

Date of authorisation for issue

17 An entity shall disclose the date when the financial statements were authorised for issue and who gave that authorisation. If the entity’s owners or others have the power to amend the financial statements after issue, the entity shall disclose that fact.

18 It is important for users to know when the financial statements were authorised for issue, because the financial statements do not reflect events after this date.

Updating disclosure about conditions at the end of the reporting period

19 If an entity receives information after the reporting period about conditions that existed at the end of the reporting period, it shall update disclosures that relate to those conditions, in the light of the new information.

20 In some cases, an entity needs to update the disclosures in its financial statements to reflect information received after the reporting period, even when the information does not affect the amounts that it recognises in its financial statements. One example of the need to update disclosures is when evidence becomes available after the reporting period about a contingent liability that existed at the end of the reporting period. In addition to considering whether it should recognise or change a provision under IAS 37, an entity updates its disclosures about the contingent liability in the light of that evidence.

Non-adjusting events after the reporting period

21 If non-adjusting events after the reporting period are material, non-disclosure could influence the economic decisions that users make on the basis of the financial statements. Accordingly, an entity shall disclose the following for each material category of non-adjusting event after the reporting period:
(a) the nature of the event; and
(b) an estimate of its financial effect, or a statement that such an estimate cannot be made.

22 The following are examples of non-adjusting events after the reporting period that would generally result in disclosure:
(a) a major business combination after the reporting period (IFRS 3 Business Combinations requires specific disclosures in such cases) or disposing of a major subsidiary;
(b) announcing a plan to discontinue an operation;
(c) major purchases of assets, classification of assets as held for sale in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*, other disposals of assets, or expropriation of major assets by government;

(d) the destruction of a major production plant by a fire after the reporting period;

(e) announcing, or commencing the implementation of, a major restructuring (see IAS 37);

(f) major ordinary share transactions and potential ordinary share transactions after the reporting period (IAS 33 *Earnings per Share* requires an entity to disclose a description of such transactions, other than when such transactions involve capitalisation or bonus issues, share splits or reverse share splits all of which are required to be adjusted under IAS 33);

(g) abnormally large changes after the reporting period in asset prices or foreign exchange rates;

(h) changes in tax rates or tax laws enacted or announced after the reporting period that have a significant effect on current and deferred tax assets and liabilities (see IAS 12 *Income Taxes*);

(i) entering into significant commitments or contingent liabilities, for example, by issuing significant guarantees; and

(j) commencing major litigation arising solely out of events that occurred after the reporting period.

**Effective date**

23 An entity shall apply this Standard for annual periods beginning on or after 1 January 2005. Earlier application is encouraged. If an entity applies this Standard for a period beginning before 1 January 2005, it shall disclose that fact.

**Withdrawal of IAS 10 (revised 1999)**

24 This Standard supersedes IAS 10 *Events After the Balance Sheet Date* (revised in 1999).
The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members.
MEMORANDUM

To: Members in the life insurance or property and casualty insurance practice areas

From: Steven W. Easson, Chair
Standards and Guidance Council
Michelle Lindo, Chair
Committee on Risk Management and Capital Requirements

Date: December 11, 2019

This educational note supplement provides an update to Section 4, Considerations for Dynamic Capital Adequacy Testing (DCAT)/Financial Condition Testing (FCT) and Appendix C of the Educational Note: Guidance for the 2019 Reporting on Capital and Financial Condition Testing for Life and P&C Insurers published in August 2019.

In accordance with the Canadian Institute of Actuaries’ (CIA) Policy on Due Process for the Approval of Guidance Material Other than Standards of Practice and Research Documents, this educational note has been prepared by the Committee on Risk Management and Capital Requirements (CRMCR), and has received final approval for distribution by the Standards and Guidance Council on December 10, 2019.

The actuary should be familiar with relevant educational notes. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application of the Standards of Practice, so there should be no conflict between them. The actuary should note however that a practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members.

If you have any questions or comments regarding this educational note supplement, please contact Michelle Lindo at mlindo@munichre.ca.

SWE, ML
An update to Section 4 and Appendix C of the *Educational Note: Guidance for the 2019 Reporting on Capital and Financial Condition Testing for Life and P&C Insurers* is provided below.

**Revised Standard of Practice: Section 2500**

An exposure draft of the *Revision to the Standards of Practice to Incorporate Changes to Section 2500 Dynamic Capital Adequacy Testing* was approved by the Actuarial Standards Board (ASB) on January 18, 2019.

On September 10, 2019, the ASB approved the revised Standard of Practice (SOP), with an effective date of **January 1, 2020**.

The objectives of the revisions to Section 2500 were to:

- Provide a more robust approach to satisfy the federal and provincial insurance acts requirement to report on the expected future financial condition of an insurance entity; and
- Allow for a better alignment with own risk and solvency assessment (ORSA) regulatory requirements as they relate to work needed to report on the expected future financial condition of an insurance entity.

The key changes in the standard are summarized below:

- Name of the standard: Dynamic Capital Adequacy Testing (DCAT) is renamed as Financial Condition Testing (FCT).
- Definition of “satisfactory financial condition”: the threshold for the base scenario is changed to internal target rather than the regulatory supervisory level. It is also expanded to test two additional thresholds: a) going concern, and b) solvency.
  - The threshold for “going concern” scenarios is the minimum regulatory target
  - The threshold for “solvency” scenarios is that the statement value of assets is sufficient to cover the statement value of the liabilities
- Opinion of the actuary is modified to link to ORSA internal targets and explicitly allow for an opinion of “satisfactory subject to” certain conditions. It also removes wording related to scenarios tested and their description in the report, significant assumptions described in the report, and the identification of key risk exposures in the report.
- Recent financial position and forecast period: the most appropriate number of years is left for the actuary to decide, based on the facts and circumstances of the insurer and the analysis.
- Risk categories: the detailed listings of risk categories are removed.
- Distinction has been made between ripple effects (which may include management’s routine actions) and corrective management actions.
- General harmonization with ORSA: throughout Section 2500, wording is added to refer
to ORSA or other processes where coordination could be beneficial.

The CRMCR drafted a revised educational note, *Financial Condition Testing*, to provide additional guidance to the actuary on the above topics in the revised SOP. The draft educational note was approved for exposure to the membership by the Standards and Guidance Council on December 3, 2019.

**Transition from DCAT to FCT in 2020**

The revised SOP, effective on January 1, 2020, applies to all FCT reports that are submitted to the regulator(s) on or after January 1, 2020. It is recognized that for the first year of the implementation of the SOP, methodologies, systems and processes may not be fully developed to perform the FCT as robustly as expected for future mature years. The Appointed Actuary may make reasonable simplifying assumptions and approximations to address these limitations if any. The simplifying assumptions and approximations would be described in the FCT report. If appropriate, the opinion of the appointed actuary may also reflect that the financial condition of the insurer is satisfactory subject to the simplifying assumptions and approximations.

The appointed actuary would assess compliance of the base scenario with current internal targets, and/or known or reasonable estimates of future changes in internal targets. It should be noted that per OSFI guideline E-19, “The assessment of adequacy of capital should also consider the capital needed to support an insurer’s longer term business strategies and, in particular, new business and planned growth. Considering this, an insurer should determine an appropriate level or range of capitalization at which it operates, set above its Internal Targets. In determining an operating level, an insurer should consider the impact of future planned, foreseen and likely potential changes to its risk profile due to changes in its operations, its business strategy or its operating environment. For example, it should consider a series of varying adverse scenarios and, at a certain operating level, assess the insurer’s ability to continue operating and not fall below its Internal Targets. It should also evaluate whether long-run Internal Targets are consistent with short-run goals, and adjust its operating levels as appropriate; recognizing that accommodating additional capital needs or additional risk mitigants can require significant lead time.” Similar expectations regarding the assessment of internal targets consistently with the insurer’s strategic and business plan are found in AMF’s Capital Management Guideline.

**Transition to IFRS 17**

In May 2017, the International Accounting Standards Board (IASB) issued *IFRS 17 Insurance Contracts*, replacing *IFRS 4 Insurance Contracts*. The implementation date is expected to be fiscal years beginning on or after January 1, 2022, with comparative financials produced for the immediately prior fiscal year. Insurers are proceeding with their implementation plans but many may not yet be able to reliably estimate earnings and/or balance sheets based on the new standard.

The regulatory capital guidelines will be adapted to reflect changes related to IFRS 17. As part of a directed confidential consultation, OSFI and the AMF have issued draft regulatory capital requirements guidelines and conducted quantitative impact studies for Life and P&C insurers,
which were due on October 31, 2019. The ability of insurers to estimate required and available
capital will be impacted by their ability to estimate IFRS 17 financial statements.

In principle, DCAT/FCT forecasts beyond January 1, 2022 should be produced under IFRS 17 and
the updated regulatory capital requirements guidelines. However, neither the regulatory capital
requirement guidelines nor IFRS 17 are final (the IASB issued a revised exposure draft on June
26, 2019), and therefore many insurers are not yet able to produce reliable financial projections
under IFRS 17 and may not be able to do so for the foreseeable future. In these circumstances,
an appropriate practice would be to continue to perform DCAT in 2019 and FCT in 2020 using
the current accounting standards, actuarial standards, and current regulatory capital guidelines,
with additional qualitative analysis on IFRS 17. Quantitative analysis could also be added if
available. If the quantitative impact study revealed potential issues based on the new draft
guideline, and the insurer has not yet filed the DCAT/FCT report, it would also be appropriate for
the Appointed Actuary to describe these potential issues to the board or chief agent along with
any potential mitigating actions, either in the DCAT/FCT report or presentation, or through
regular IFRS 17 updates.

Memorandum

To: All Fellows, Affiliates, Associates and Correspondents of the Canadian Institute of Actuaries

From: Jacques Tremblay, Chairperson
Practice Council
Jacqueline Friedland, Chairperson
Task Force on Materiality

Date: October 31, 2007

Subject: Report – Materiality

This report was developed by the Task Force on Materiality of the Canadian Institute of Actuaries (CIA) for discretionary use by actuaries. Its purpose is to assist Canadian actuaries in considering various aspects of materiality as they provide professional services to their principals.

In accordance with the Institute’s Policy on Due Process for Approval of Practice-Related Material other than Standards of Practice, this report has been unanimously approved by the Task Force on Materiality and has received final approval for distribution by the Practice Council on October 10, 2007.

If you have any questions or comments regarding this report, please contact Jacqueline Friedland at jfriedland@kpmg.ca.

1. PREFACE

This report was developed by the Task Force on Materiality of the Canadian Institute of Actuaries (CIA) for discretionary use by actuaries. Its purpose is to assist Canadian actuaries in considering various aspects of materiality as they provide professional services to their principals. Concepts in this document are broadly applicable to actuaries conducting valuation, pricing, reserving and financial modeling analyses in all practice areas (including life, health, pension, and property/casualty).

This document serves as a first step in the development of Canadian-based literature on the topic. The last section of the document highlights issues that we believe are important for further research and discussion. The task force hopes to promote discussion of materiality within the entire Canadian actuarial profession. We are hopeful that, over time, such discussions might lead to the evolution of revised CIA Standards of Practice (SOP) and generally accepted practices regarding materiality in Canada.

Task force reports represent the views of the task force and do not necessarily represent the views of the CIA. Members should be familiar with task force reports. These reports do not constitute SOP and therefore are not binding. These reports may or may not be in compliance with SOP. Responsibility for the manner of application of SOP in specific circumstances remains that of the members in the various practice areas (i.e., life, health, pension, and property/casualty).

This document relies to a great extent on the American Academy of Actuaries (AAA) Discussion Paper titled “Materiality – Concepts on Professionalism” issued in 2006. We acknowledge the combined efforts of members of both the CIA and the AAA and their contributions to the research, analysis, and composition of this document. Members should note that the professional rules of the CIA differ from the corresponding codes of conduct of the AAA and that the differences might impose different professional obligations on the CIA member than on the AAA member.

The Task Force on Materiality presents these ideas with the expectation that they will be both useful and thought-provoking and will enhance the Canadian actuarial profession’s consideration of aspects of materiality in professional practice. Ultimately, it is the SOP that governs the responsibilities of actuaries in this area. However, the ideas and suggestions offered in this document are intended to assist actuaries in applying the SOP to their individual situations. The task force believes that expanded discussion of the concepts and suggestions offered in this document will benefit the profession.

2. PURPOSE AND SCOPE

This document is intended to stimulate thinking and discussion about materiality in the CIA. The purpose is not only to build upon what exists in the current SOP and what has already occurred in the property/casualty practice area but also to extend the discussion into other practice areas. The task force hopes to promote discussion of materiality within the entire Canadian actuarial profession. We are hopeful that, over time, such discussions might lead to the evolution of revised SOP and generally accepted practices regarding materiality in Canada.

Concepts in this document are broadly applicable to all practice areas (including life, health, pension, property/casualty). The considerations set forth here also apply to all
actuarial work, including that done by actuaries employed by an insurance company or other entity, as well as by consulting actuaries in assignments for their clients.

By sharing the thoughts of several experienced actuaries, the task force encourages each actuary to give appropriate consideration to the concepts and suggestions contained in this document. Ultimately, however, each actuary must decide how to fulfill professional responsibilities in this area according to current SOP.

In this respect, CIA members should take note of the fact that the Rules of the CIA refer directly to the concept of what is material in Rule 13. Rule 13 states: “A member shall comply with the procedures set out in Annotation 13-1 if the member becomes aware of any apparent material noncompliance by another member with the Rules or with the standards of practice.”

Much of the contents of this document relate to how the professional services of the CIA member are viewed by the users of professional services. Members should take note of their professional obligations under Rule 6 (Control of Work Product). Annotation 6-1 states: “Material prepared by a member may be used by another party in a way that may influence the actions of a third party. The member should recognize the risks of misquotation, misinterpretation or other misuse of such material and should take reasonable steps to ensure that the material is clear and presented fairly, and that the member is identified as the source of the material.”

CIA members should also consider the onus placed on them by Annotation 1-2 which states that “It is the professional responsibility of the member not to be associated with anything which the member knows or should know is false or misleading.” This document on materiality points out that it is the judgment of how information prepared by the actuary might affect the user’s decision making or the user’s reasonable expectations that is the key concept underlying materiality.

3. BACKGROUND

The concept of materiality is central to the reporting and interpretation of financial information. Loosely defined as “importance,” the question of whether or not something is “material” means, quite literally, whether or not it matters to the user of the information. When related to financial information, the question of materiality arises in the context of inclusion (whether or not an item needs to be considered), in the context of refinement (whether or not a number is accurate enough to convey its intended message), and in the context of disclosure (whether or not a fact needs to be reported).

Accountants have long recognized the issue of materiality and its role in the reporting of financial information. They have defined the concept in both qualitative and quantitative terms, although judgment, by necessity, plays a significant role as well. However, while the concept of materiality is of no less importance to the actuary’s work than it is to the accountant’s, and while the term and related concepts are pervasive in the actuarial literature, there is very little professional guidance for the actuary seeking to evaluate what is and what is not material – what does and does not matter – in a particular situation.

Materiality is a critical element of financial reporting for insurance contracts, employee benefit plans, and other financial instruments for which actuaries provide professional
services. Actuaries’ clients and employers, as well as other interested persons, may not always understand the differences between materiality from an accounting perspective, from their personal perspective, and materiality as it is understood and used by actuaries. Moreover, actuaries working in different practice areas may address materiality somewhat differently, and the guidance on materiality available to actuaries from organizations other than the CIA differs among the various practice areas.

Paragraph 1340.03 of the SOP, Materiality, states that “‘Material’ has its ordinary meaning, but judged from the point of view of a user, having regard for the purpose of the work.” While there is a current SOP related to materiality, many members of the CIA have expressed an interest in further guidance on the topic.

The CIA determined that it would be helpful to develop a document offering non-binding guidance on materiality. Therefore, the CIA’s Practice Council established the task force to prepare a document for broad dissemination to the membership. The purpose of the document is not to impose any new or revised requirements to the existing SOP, but to identify issues, enhance awareness, and assist actuaries and others toward a clearer understanding of the topics addressed in this document.

4. DEFINING MATERIALITY

Paragraph 1340.03 of the SOP contains the following generalized description of the concept of materiality:

...an omission, understatement, or overstatement is material if the actuary expects it materially to affect either the user's decision making or the user’s reasonable expectations.

Most descriptions of materiality emphasize that an omission or misstatement is material if the judgment of a reasonable person would have been changed or influenced by the inclusion or correction of the item, given surrounding circumstances.

The reader may find it helpful to keep this in mind when reading this document. Further discussion of the description of materiality appears in the next section, “Reflecting Upon Materiality: User is Key.”

In understanding what materiality is, it is also important to recognize what materiality is not. The task force wishes to emphasize that the concept of materiality is different from the concepts of:

- the range of reasonable values in an actuarial estimate; and
- the inherent uncertainty associated with actuarial estimates.

Sources of discussion to which actuaries have access include:

- actuarial and accounting guidance from other countries and from International Standards on Auditing;
- Actuarial Standards of Practice (ASOP) of the American Academy of Actuaries (AAA);
- Canadian Institute of Chartered Accountants (CICA);
- Financial Accounting Standards Board (FASB);
In the Appendix, we include a wide range of extracts from relevant literature to assist actuaries in their consideration of materiality.

Throughout this document, SOP refers to the Standards of Practice promulgated by the CIA, and ASOP refers to the Standards of Practice of the AAA. This document contains references to the Standards of Practice of both organizations due to the participation of members from both organizations in the research and development of the document.

5. **REFLECTING UPON MATERIALITY: USER IS KEY**

Subsection 1340 of the SOP provides a generalized description of “materiality.” This document does not seek to propose a universal definition of materiality for actuarial purposes. We preferred to focus on applying judgment about materiality. We were somewhat startled at the strong emphasis of the Merriam-Webster Online dictionary’s definition of “material - having real importance or great consequences” – and in particular the word “great.” Upon reading this definition, one immediately responds “to whom?”

User perspective is typically the key element in materiality determinations. In applying judgment to determine how to address materiality, the actuary normally focuses on the purpose of the work and its intended user(s). The definitions in the Appendix at the end of this document collectively appear to send the message: “know your user.” However, this is sometimes more difficult than it may seem, since it is quite common for actuarial work products to be used, in one way or another, by indirect users about whom the actuary cannot possibly be knowledgeable. Indeed, different users (including unintended users) may have different expectations regarding materiality.

In section 1800 of the SOP Reporting, the focus is on external user reports and internal user reports. The issue of intended and unintended users is not specifically addressed in the SOP. The ASOP 41 does address this specific issue. ASOP 41 states that the actuary is not responsible to unintended users with whom they did not intend to communicate. Notwithstanding the presence or absence of a specific SOP, actuaries may be found to retain some responsibility to assure that a report is not misused or misapplied by all users of the work product as stated in CIA Annotation 6-1 on Control of Work Product.

Having decided upon the selected materiality level for a particular assignment, the actuary might be well advised to test it by asking rhetorically “would my users come to a different conclusion or a different decision if I used some other materiality level?” Then
we immediately encounter the difficulty referred to above, i.e., the actuary cannot possibly be knowledgeable about all indirect users.

ASOP No. 41, *Actuarial Communications* provides an approach to resolve this difficulty. Section 2.5 thereof defines “intended audience” as “The persons to whom the actuarial communication is directed and with whom the actuary, after discussion with the principal (emphasis added), intends to communicate.” The rest of the definition makes it clear that, unless otherwise agreed, the principal is always part of the intended audience, and gives examples of others (such as regulators, policyholders and plan participants) who may be designated by the principal, with consent of the actuary, as members of the intended audience.

Section 2.6 of ASOP No. 41 defines “other user” as “Any user of an actuarial communication who is not a principal or member of the intended audience.” This framework provides valuable protection for the actuary, who is entitled to be in control at all times regarding the intended audience and therefore cannot be taken by surprise by the existence of “other users” about whom the actuary is ignorant. Note too that Section 3.5.2 of ASOP No. 41 provides that there is no obligation for the actuary to communicate with any person other than the intended audience. We recognize that ASOP are not binding on members of the CIA who are not also members of the AAA.

SOP Section 1800 Reporting requires the actuary to ensure that the form and content of the actuarial reporting are clear and appropriate to the particular circumstances. SOP paragraph 1820.14 states: “Description of the purpose of the work and its users permits another person to assess its appropriateness to his or her needs and may thereby avoid unintended use of the work.” Consequently, by taking due care as to who is included as part of the intended audience, the actuary is able to apply informed judgment in arriving at the selected materiality level. For example, if policyholders are included, then the actuary should have due regard of the fact that policyholders, in general, are likely to be less sophisticated than the actuary’s principal, regulators or investors.

In summary, the actuary who prepares the work (the “preparer”) is expected to take reasonable steps to ensure that the work does not mislead the intended users of the work. An evaluation of whether this threshold is met should consider: the intended users, their knowledge, and their situations. A clear statement by the preparer of both the intended users of the work product and the intended uses of the work product is a valuable tool to focus the attention of the preparer on what may be material.

6. CONSIDERATIONS IN THE DETERMINATION OF MATERIALITY

Paragraph 1340.02 states in part:

Judgment about materiality pervades virtually all work and affects the application of nearly all standards.

The appropriate degree of rigor in establishing or communicating the selected materiality level for a particular assignment may vary depending upon the needs, skill, sophistication, and experience of the intended audience for the actuary’s work. The Appendix at the end of this document contains numerous references as to how the selected materiality level might conceivably affect the user’s decision-making or reasonable expectations.
Materiality tends to be more task-specific than practice-specific. For example, we expect there to be more similarities in applying judgment about materiality to valuation type work among the various practice areas (life, health, pension, property/casualty) than we would when applying such judgment to valuation type work and product/rate development work within the same practice area.

Perhaps understandably, in light of regulatory scrutiny and the sophistication of users of actuarial work involving policy liabilities valuations as well as mergers and acquisitions transactions, actuaries in Canada appear to have more experience in applying judgment about materiality in the context of valuation work (used here to include not only statement reserves and merger/acquisition work but also portfolio transfers) than has been the case when setting rates. Nevertheless, the concepts of materiality are also applicable in product/rate development work.

There currently exists a difference in practice among actuaries with respect to the establishment of single or multiple materiality levels. Some actuaries develop a separate materiality level for data that is generally much smaller than the materiality level for the organization in total. For example, an actuary may choose a $25,000 materiality level for data and a $5 million materiality level for the organization’s total policy liabilities. The more common practice, however, is the selection of a single materiality level.

Returning to the user focus and the generalized description of materiality contained in subsection 1340 of the SOP, unless there are good reasons, an actuary would generally select one materiality level for a particular actuarial task or assignment, and there would not be separate materiality levels identified for data and the overall actuarial analysis. Although it may be appropriate to identify a separate “tolerance level” as a threshold for accuracy and completeness of data, this concept is separate from the matter of materiality and would not normally be referred to or labeled as a selected materiality level.

In the normal course of events, an actuary generally would not change the materiality level significantly from year to year or valuation to valuation. However, as an organization approaches a threshold or some external benchmark, an actuary may well choose to consider changing the approach or the degree of rigor applied when determining materiality. For example, if an insurance company is close to breaching regulatory action levels, many actuaries would agree that there are likely to be good grounds for changing the selected level of materiality.

In summary, when determining materiality, the user will want to keep in mind the following considerations frequently cited in discussions on materiality:

- The materiality level should be related to the purposes and intended uses of the work. The actuary should understand which financial values are usually important for the intended uses. For example:
  - For regulatory or solvency issues, the materiality level is typically related to statutory surplus or the solvency benchmark ratio;
  - For appraisal work, the materiality level is generally related to net worth, net income, or earnings per share;
• For DCAT work, the materiality level is expected to be less rigorous than for valuation work;
• For general purpose financial statement work, the materiality level is generally related both to net income and net capital (or net surplus);
• Exclusive reliance on quantitative benchmarks is inappropriate. A quantitative rule-of-thumb may be a starting point, but it must be reviewed to take into account the purpose of the work and the individual entity’s circumstances.
• The materiality level is also expected to vary according to other characteristics of the entity including but not limited to the:
  • Size of the entity;
  • Entity’s access to capital;
  • Stage of organizational life cycle;
  • Type of business (e.g., multi-line vs. single line, personal lines vs. commercial lines);
  • Net retention.

The materiality level will also vary according to the financial strength of the entity. In particular, paragraph 1340.04 of the SOP states: “The standard of materiality for work involving a threshold…would become more rigorous as the entity approaches that threshold.”

7. ACCOUNTING VS. ACTUARIAL MATERIALITY

As noted in the “Defining Materiality” section of this document, an actuary selects an appropriate materiality level based on his or her professional judgment as to the magnitude of an omission, understatement or overstatement that would cause the user to reach a different conclusion or follow a different course of action. An accountant or auditor working for the same entity would presumably base his or her selection of the materiality level on similar criteria. Some actuaries would argue that, at least in theory, the materiality level selected by the actuary would normally be close to that selected by the accountant or auditor given that the report was prepared for financial reporting purposes.

An important consideration for the “preparer” actuary to bear in mind might be that the “user” auditor is also a “preparer” of the general purpose financial statements. While the direct users of an appointed actuary’s report might be relatively sophisticated regulatory and auditing professionals, the “preparer” actuary should also consider how the auditor might use the report in communicating with the ultimate, less sophisticated, general purpose financial statement user.

According to SOP subsection 1630 CIA/CICA Joint Policy Statement (effective October 1, 2007), communication regarding materiality is expected between the actuary and the auditor. Paragraph 1630.10(e) states:
“The enquiring professional would:

…make the responding professional aware of the enquiring professional’s needs. This would include a discussion of:

(i) the application of the concept of materiality to determine that the responding professional will be using a materiality level that is appropriate in relation to the enquiring professional’s materiality level in accordance with applicable professional standards…”

As a practical matter, however, accountants and auditors may select a materiality level without first communicating with the actuary. For example, auditors of an insurance company attest to the existence and value of assets on the one hand (large numbers that are usually comparable with reserves, at least in the aggregate) and premium data and expenses on the other (which, by contrast, tend to be relatively smaller numbers, especially at the policy or contract level). Auditors may not always use the same materiality level when making these two attestations.

Good communication between the actuary and the auditor (for which specific guidance is offered in SOP Sections 1620 Auditor’s Use of an Actuary’s Work and 1630 CIA/CICA Joint Policy Statement) is likely to lead to selection of appropriate materiality levels by both actuary and auditor. If such materiality levels are not the same, good communication would facilitate the discussion of any differences with the intended audience.

An important part of knowing the user in communications between the actuary and the auditor may also be to understand what constitutes a material subsequent event to the accountant user who is also the preparer of general purpose public financial statements.

8. COMMUNICATION AND DISCLOSURE

Throughout this document, the main factor underlying the selection of a materiality level has been the impact on the user. It would normally be in the user’s interest to be aware of the materiality level selected and used by the actuary. Accordingly, it seems reasonable that the actuary would usually at least consider some disclosure regarding the materiality level within the actuarial work product.

However, this consideration must also take into account the complexity of the concept of materiality, the potential importance of the concept to the user, as well as the sophistication of the user who will be receiving the work product. In some cases, it may be apparent that any discussion of the materiality level is likely to give rise to misunderstanding and confusion. In other cases, full disclosure of the materiality level selected, as well as the rationale behind the selection, may be appropriate.

According to paragraphs 1820.07 and 1820.08 of the SOP:

Appropriate description and disclosure in a report strike a balance between too little and too much. Too little deprives the user of needed information. Too much may exaggerate the importance of minor matters, imply a diminution of the actuary’s responsibility for the work, or make the report hard to read.
The appropriate criterion for description and disclosure is the question: what qualitative and quantitative information best serves the user’s understanding and decision-making?

While subsection 1630 of the SOP, CIA/CICA Joint Policy Statement, requires communication regarding materiality between the actuary and the auditor, subsection 1340, Materiality, does not currently require disclosure of the selected materiality level. In actuarial work other than policy liabilities valuations and dynamic capital adequacy testing, it is currently left to the actuary’s professional judgment as to whether disclosure of the materiality level is appropriate for the user’s understanding of the actuarial work product, and to determine the nature and scope of appropriate disclosure under the circumstances.

According to paragraph 1340.03, “If practical, the actuary would discuss the standard of materiality with the user. Alternatively, the actuary would report the purpose of the work as precisely as possible, so that the user is warned of the risk of using the work for a different purpose with a more rigorous standard of materiality.” This approach will mitigate some of the actuary’s concerns towards unintended users who would use different materiality levels for their respective purposes. Observance of Section 1340 is made more likely if the intended users of the work product and uses of the work product are enumerated in the actuarial work product.

9. AREAS FOR FURTHER RESEARCH AND DISCUSSION

This document is intended to be a first step in an ongoing process of research and discussion on the topic of materiality. In preparing this introductory document, particular attention was paid to features of the Rules, Standards, and Statements applicable to members of the CIA. The task force has identified the following issues for further investigation and discussion:

- How does materiality relate to the range of reasonable results in an actuarial estimate?
- How does materiality relate to the inherent uncertainty associated with an actuarial estimate?
- Whether examples of the application of materiality in a variety of situations should be provided?
- Is there an impact on materiality if each and every assumption must stand on its own?
- Should the actuary treat materiality differently in an internal user report?
- Should the discussion on actuaries and auditors be expanded upon?
• With respect to communication:
  • Should the actuary consider not only disclosure about materiality but also the application of materiality?
  • What communication is required if there is no written report?

The task force presents the above list of items to be considered for example purpose only and not to limit future efforts.
APPENDIX A

HELPFUL REFERENCES REGARDING MATERIALITY

Peter D. Arthur, CA, CIA Open Forum #21: Unresolved Issues in Standards of Practice

A misstatement or the aggregate of all misstatements in financial statements is considered to be material if, in the light of surrounding circumstances, it is probable that the decision of a person who is relying on the financial statements and who has a reasonable knowledge of the business and economic activities would be changed or influenced by the misstatement or the aggregate of all misstatements.

ASOP No. 5, Incurred Health and Disability Claims

2.8 Material – Resulting in an impact, significant to the interested parties, on the affected actuarial incurred claim estimate.”

ASOP No. 17, Expert Testimony by Actuaries

2.7 Material – An item is material if it has an impact on the affected actuarial opinion, which is significant to the interested parties.”

ASOP No. 36, Statements of Actuarial Opinion regarding Property/Casualty Loss and Loss Adjustment Expense Reserves

Although the ASOP itself applies only to property/casualty work of a particular kind, Section 3.4 of the ASOP contains some useful ideas for action in all practice areas that actuaries may wish to consider when selecting standards of materiality. The section is reproduced here in full.

3.4 Materiality – In evaluating materiality within the context of a reserve opinion, the actuary should consider the purposes and intended uses for which the actuary prepared the statement of actuarial opinion. The actuary should evaluate materiality based on professional judgment, materiality guidelines or standards applicable to the statement of actuarial opinion and the actuary’s intended purpose for the statement of actuarial opinion. The actuary should understand which financial values are usually important to the intended uses of the statement of actuarial opinion and how those financial values are likely to be affected by changes in the reserves and future payments for losses and loss adjustment expenses. For example, materiality might be evaluated in terms of the specified reserve amount for which an opinion is being given. For a statement of actuarial opinion for an insurance company to be used for financial reporting to insurance regulators, materiality might be evaluated in terms of the company’s reported statutory surplus. As another example, for a statement of actuarial opinion to be used for an actuarial appraisal of an insurance company, it might be appropriate to evaluate materiality in terms of both the company’s net worth and annual net income, since both values are usually important factors in assessing the value of the company.
ASOP No. 41, Actuarial Communications

2.5 Intended Audience—The persons to whom the actuarial communication is directed and with whom the actuary, after discussion with the principal, intends to communicate. Unless otherwise specifically agreed, the principal is always a member of the intended audience. In addition, other persons or organizations, such as regulators, policyholders, plan participants, investors, or others, may be designated by the principal, with consent of the actuary, as members of the intended audience.

2.6 Other User—Any user of an actuarial communication who is not a principal or member of the intended audience.

3.1.2 Form and Content—The actuary should take appropriate steps to ensure that the form and content of the actuarial communication are clear and appropriate to the particular circumstances, taking into account the intended audience. To accomplish these actuarial communication objectives, the actuary should consider whether such actuarial communication should be made in an actuarial report. Factors to consider in making such a determination include the complexity of the actuarial engagement or assignment; the actuary’s perception of the significance of the actuarial findings; and relevant communication guidance in other ASOPs. Information included in previous actuarial communications that are available to the intended audience may be incorporated by reference, by the actuary, into an actuarial communication issued under this standard.

3.5.2 No Obligation to Communicate with Other Users—Nothing in this standard creates an obligation for the actuary to communicate with any person other than the intended audience.

Paragraph 1340.02 through to 1340.06 of the SOP

1340.02 Judgment about materiality pervades virtually all work and affects the application of nearly all standards. The words “materiality” and “material” seldom appear in the standards, but are understood throughout them. For example, the recommendation that approximation is appropriate if it does not affect the result means that it does not materially affect the result.

1340.03 Material” has its ordinary meaning, but judged from the point of view of a user, having regard for the purpose of the work. Thus, an omission, understatement, or overstatement is material if the actuary expects it materially to affect either the user’s decision making or the user’s reasonable expectations. Usually, however, the user does not specify a standard of materiality, so the judgment falls to the actuary. That judgment may be difficult for one or more of these reasons:

The standard of materiality depends on how the user uses the actuary’s work, which the actuary may be unable to foresee. If practical, the actuary would discuss the standard of materiality with the user. Alternatively, the actuary would report the purpose of the work as precisely as possible, so that the user is warned of
the risk of using the work for a different purpose with a more rigorous standard of materiality.

The standard of materiality may vary among users. The actuary would choose the most rigorous standard of materiality among the users.

The standard of materiality may vary among uses. For example, the same accounting calculations may be used for a pension plan’s financial statements and the financial statements of its participating employer. The actuary would choose the more rigorous standard of materiality between those two uses.

The standard of materiality depends on the user’s reasonable expectations, consistent with the purpose of the work. For example, advice on winding-up a pension plan may affect each participant’s share of its assets, so there is a conflict between equity and practicality. Similarly for advice on a policyholder dividend scale.

1340.04 The standard of materiality also depends on the work and the entity which is the subject of that work. For example:

A given dollar standard of materiality is more rigorous for a large than for a small entity.

The standard of materiality for valuation of an insurer’s policy liabilities is usually more rigorous for those in its financial statements than for those in a forecast in dynamic capital adequacy testing.

The standard of materiality for data is more rigorous for determining an individual benefit (such as in a pension plan wind-up) than for a valuation of a group benefits plan (such as a going-concern valuation of a pension plan’s liabilities).

The standard of materiality for work involving a threshold, such as a regulatory capital adequacy requirement calculation of an insurer or a statutory minimum or maximum funding level for a pension plan would become more rigorous as the entity approaches that threshold.

1340.05 The actuary would not report an immaterial deviation from a particular recommendation or other guidance in the standards except if doing so assists a user to decide if the standard of materiality is appropriate for that user.

1340.06 The recommendation applies to both calculation and reporting standards.
Judicial Application of Materiality Levels

The following excerpts have been selected from a sampling of cases in which the courts have defined materiality in the context of financial statements.

“Materiality is defined in the accounting literature as ‘[t]he magnitude of an omission or misstatement of accounting information that, in light of surrounding circumstances, makes it probable that the judgment of a reasonable person would have been changed or influenced by the omission or misstatement.’ (citation omitted) While the literature reflects that the 5 to 10 percent range relied on by the Commission is ‘useful’ (citation omitted), that literature also makes clear that there are no generalized standards for determining the materiality of a particular ‘judgment item’ (citation omitted), because a materiality decision is a qualitative one requiring consideration by an accountant of a wide range of information factors including, inter alia, the nature of the item under consideration; whether it arises from a routine or abnormal transaction; the size of the enterprise; and the company’s financial condition and trends in profitability. (citation omitted) Moreover, FAS Con 2 explicitly states that ‘[m]agnitude by itself, without regard to the nature of the item and the circumstances in which the judgment has to be made, will not generally be a sufficient basis for a materiality judgment.’” (citation omitted)

“The applicable legal standard regarding the materiality of omitted information is whether ‘there is a substantial likelihood that a reasonable shareholder would consider it important’ or ‘a substantial likelihood that the disclosure…would have been viewed by the reasonable investor as having significantly altered the total mix of information made available.’” (citation omitted)

“This determination [of materiality] is . . . based on whether there is a substantial likelihood that the misrepresentation would mislead a reasonable employee in making an adequately informed decision about if and when to retire. (citation omitted) [There are] a number of factors to consider when determining materiality, including ‘how significantly the statement misrepresents the present status of internal deliberations regarding future plan changes; the special relationship of trust and confidence between the plan fiduciary and beneficiary; whether the employee was aware of other information or statements from the company tending to minimize the importance of the misrepresentation or should have been so aware, taking into consideration the broad trust responsibilities owed by the plan administrator to the employee and the employee's reliance on the plan administrator for truthful information.’” (citation omitted)

FASB Statement No. 2 generally provides that quantitative and qualitative factors should both be considered when determining materiality. It further states that FASB has long emphasized that materiality cannot be reduced to a numeric formula. “The predominant
view is that materiality judgments can properly be made only by those who have all the facts. The Board’s present position is that no general standards of materiality could be formulated to take into account all the considerations that enter into an experienced human judgment.” Additionally, FASB Statement No. 2 provides that “Magnitude by itself, without regard to the nature of the item and the circumstances in which the judgment has to be made, will not generally be a sufficient basis for a materiality judgment.”

The omission or misstatement of an item in a financial report is material if, in the light of surrounding circumstances, the magnitude of the item is such that it is probable that the judgment of a reasonable person relying upon the report would have been changed or influenced by the inclusion or correction of the item.

**International Accounting Standard 1, “Presentation of Financial Statements”**

“Omissions or misstatements of items are material if they could, individually or collectively, influence the economic decisions of users taken on the basis of the financial statements. Materiality depends on the size and nature of the omission or misstatement judged in the surrounding circumstances. The size or nature of the item, or a combination of both, could be the determining factor.”

**International Accounting Standards**

“Users are assumed to:

- Have a reasonable knowledge of business and economic activities and accounting and a willingness to study the information in the financial statements with reasonable diligence;
- Understand that financial statements are prepared and audited to levels of materiality and that there is a relationship between the level of materiality used and the cost and timing of the audit;
- Recognize the uncertainties in the measurement of amounts based on the use of estimates, judgment and the consideration of future events;
- Make reasonable economic decisions on the basis of the information in the financial statements.

The determination of materiality, therefore, takes into account how users with such characteristics could reasonably be expected to be influenced in making economic decisions.

- When determining materiality in audits of financial statements or other historical financial information, prepared for a special purpose, the auditor considers the needs of specific users in the context of the objective of the engagement.
- Materiality is determined without regard to the degree of inherent uncertainty associated with the measurement of particular items. For example, the fact that the financial statements include very large provisions with a high degree of estimation uncertainty (e.g., provisions for insurance claims in the case of an insurance company, oil rig...
decommissioning costs in the case of an oil company, or more generally, legal claims against an entity) does not cause the auditor to determine the materiality level for the financial statements to be higher than for financial statements that do not include such inherent estimation uncertainties."

**Proposed International Standard on Auditing 320 (Revised)**

**Materiality in Planning and Performing an Audit**

*Materiality in the Context of an Audit*

5. The auditor’s consideration of materiality is a matter of professional judgment, and is affected by the auditor’s perception of the financial information needs of users of the financial statements. For the purposes of the audit, the auditor is concerned with misstatements, including omissions, which could reasonably be expected to influence the economic decisions of users taken on the basis of the financial statements. In this context, it is reasonable for the auditor to assume that users:

(a) Have a reasonable knowledge of business and economic activities and accounting and a willingness to study the information in the financial statements with reasonable diligence;

(b) Understand that financial statements are prepared and audited to levels of materiality;

(c) Recognize the uncertainties inherent in the measurement of amounts based on the use of estimates, judgment and the consideration of future events; and

(d) Make reasonable economic decisions on the basis of the information in the financial statements.

6. Furthermore, the auditor’s consideration of materiality is based on the common financial information needs of users as a group; the auditor does not consider the possible effect of misstatements on specific individual users, whose needs may vary widely.

7. Materiality depends on the size and nature of the misstatement judged in the surrounding circumstances. The size or nature of the item, or a combination of both, could be the determining factor.

*Use of Benchmarks in Determining Materiality*

11. Determining what is material to users of the financial statements requires the exercise of professional judgment. The auditor often applies a percentage to a chosen benchmark as a starting point in determining a materiality level for the financial statements as a whole.

12. When identifying an appropriate benchmark, the auditor has regard to factors such as:

- The elements of the financial statements (e.g., assets, liabilities, equity, income, expenses);
- Whether there are items on which the attention of the users of the particular entity’s financial statements tends to be focused (e.g., for the
purpose of evaluating financial performance users may tend to focus on profit, revenue or net assets);

- The nature of the entity, where the entity is at in its life cycle, and the industry and economic environment in which the entity operates;

- The size of the entity, nature of its ownership and the way it is financed (e.g., if an entity is financed solely by debt rather than equity, users may put more emphasis on assets, and claims on them, than on the entity’s earnings); and

- The relative volatility of the benchmark.

14. Having identified an appropriate benchmark, the auditor identifies relevant financial data to be used in determining materiality. The auditor ordinarily considers prior periods’ financial results and financial positions, the period-to-date financial results and financial position, and budgets or forecasts for the current period, taking account of significant changes in the circumstances of the entity (e.g., a significant business acquisition) and relevant changes of conditions in the industry or economic environment in which the entity operates. For example, when the auditor, as a starting point, determines materiality for a particular entity based on a percentage of profit before tax from continuing operations, circumstances that give rise to an exceptional decrease or increase in such profit may lead the auditor to conclude that materiality is more appropriately determined using a normalized profit before tax from continuing operations figure based on past results.

**Documentation**

26. The auditor should document:

(a) The materiality level for the financial statements as a whole;

(b) The materiality level for a particular class of transactions, account balance or disclosure, if applicable;

(c) The amount (or amounts) determined for purposes of assessing risks of material misstatement and designing further audit procedures;

(d) Any changes made to (a) – (c) as the audit progressed; and

(e) How the amounts in (a) – (d) were determined.

**Mary D. Miller, FCAS, MAAA, Actuary Ohio Department of Insurance**

“Materiality and the Actuary”, Casualty Loss Reserve Seminar, September 2005

Materiality reviewed in relationship to financial values that are important to the intended audience, for example:

- Regulator: statutory surplus; risk based capital; loss, LAE and unearned premium reserves; IRIS tests

- Appraisal: net worth (GAAP); net income; earnings per share

Materiality considerations:
• Single vs. multi-line company
• Net retention
• Single company vs. member of a group
• Access to capital
• Management
• Prior loss reserve runoff
• Financial strength

“Materiality and ASOP No. 36: Considerations for the Practicing Actuary”, CAS Committee on Valuation, Finance, and Investments

“No formula can be developed that will substitute for professional judgment by providing a materiality level for each situation.”

Possible quantitative matters that the actuary could consider in the initial phase of determining whether a particular item is material:

• Absolute magnitude of item that represents a correction or a differing result if reviewing the work of others
• Absolute magnitude of item for which data are not available or are incomplete
• Ratio of item to reserves or statutory surplus
• Impact of item on IRIS ratios
• Impact of item on risk-based capital results
• Likelihood or size of potential variation of ultimate actual results from current expectations
• Ratio of item to net income or net worth
• Impact of item on earnings per share

NAIC Financial Examiners Handbook

Planning materiality: starting point is 1% to 5% of surplus.

NAIC Accounting Practices and Procedures Manual

The Codification defines a material omission or misstatement of an item in a statutory financial statement as having a magnitude such that it is probable that the judgment of a reasonable person relying upon the statutory financial statement would be changed or influenced by the inclusion or correction of the item.

• Some items are more important than others and require closer scrutiny. These include items which may put the insurer in danger of breach of covenant or regulatory requirement (such as an RBC trigger), turn a loss into a profit, reverse a downward earning trend, or represent an unusual event.
• The relative size of the judgment item is usually more important than the absolute size. An example for this is a reserve amount that would
significantly impact the earnings of a small company but barely impact the earnings of a large company.

- The amount of the deviation of an item that is considered immaterial may increase if the attainable degree of precision decreases.

**SEC Staff Accounting Bulletin: No. 99 – Materiality**

The relevant portions of this SEC bulletin may be summarized as follows:

- The common practice of using quantitative thresholds as rules of thumb for materiality has no basis in law or accounting literature. Exclusive reliance on certain quantitative benchmarks to assess materiality in preparing financial statements … is inappropriate; misstatements are not immaterial simply because they fall beneath a numerical threshold.

- The use of a percentage as a numerical threshold, such as 5%, may provide the basis for a preliminary assumption regarding materiality. There is no objection to a “rule of thumb” as an initial step in assessing materiality.

- Both quantitative and qualitative factors should be considered.

- Experienced human judgment is necessary and appropriate.

- An item that is small in absolute magnitude may be important if its inclusion or modification would change someone’s conclusion about the basic financial condition of the company.

- Materiality should be considered both separately and in total. An example given considers materiality issues affecting revenues and expenses even though the difference in net income may net out to be small.

A matter is material if there is a substantial likelihood that a reasonable person would consider it important.
Report

Report of the CIA Task Force on the Appropriate Treatment of Reinsurance

Task Force on the Appropriate Treatment of Reinsurance

October 2007

Document 207081

Ce document est disponible en français

© 2007 Canadian Institute of Actuaries

Committee and task force reports represent the views of the committee or task force and do not necessarily represent the views of the Canadian Institute of Actuaries. Members should be familiar with committee and task force reports. These reports do not constitute Standards of Practice and therefore are not binding. These reports may or may not be in compliance with Standards of Practice. Responsibility for the manner of application of Standards of Practice in specific circumstances remains that of the members in the Life and Property and Casualty practice areas.
Memorandum

To: All Life and Property and Casualty Practitioners

From: Doug Tozer, Chairperson
Task Force on the Appropriate Treatment of Reinsurance
Jacques Tremblay, Chairperson
Practice Council

Date: October 3, 2007

Subject: Report of the CIA Task Force on the Appropriate Treatment of Reinsurance

Deadline for Comments: December 3, 2007

Over the last few years, securities and insurance regulators, rating agencies and media from around the world have been paying closer attention to reinsurance transactions. In particular, reinsurance transactions which tend to result in a reduced degree of risk transferred, sometimes referred to as Finite Reinsurance, have been under heavy scrutiny. In Canada, the Office of the Superintendent of Financial Institutions (OSFI) has become interested in the treatment of reinsurance, and has asked the Canadian Institute of Actuaries to look into this matter further.

The report that follows was prepared by the Task Force to provide guidance on reinsurance to the actuarial and insurance community in Canada. It provides a brief overview of reinsurance and risk transfer principles, paying attention to the emerging international consensus. It provides guidance on assessing risk transfer in a reinsurance contract for accounting and valuation purposes, and examines other related topics such as finite and financial reinsurance, side agreements, mirroring, bifurcation and reinsurance counterparty risk.

In accordance with the Institute’s Policy on Due Process for Approval of Practice-Related Material other than Standards of Practice, this research paper has been unanimously approved by the Task Force on the Appropriate Treatment of Reinsurance and has received final approval for distribution by the Practice Council on May 16, 2007.

This report, including recommendations and opinions paper, is being circulated for comments. After the comment period, it will be issued as an educational note. Please contact Doug Tozer at DTozer@municre.ca if you have any comments or questions.

RECOMMENDATIONS AND OPINIONS OF THE TASK FORCE ........................................... 26
INTRODUCTION
The Practice Council (PC), the Committee on Life Insurance Financial Reporting (CLIFR) and the Committee on Property and Casualty Insurance Financial Reporting (PCFRC) have reviewed the CIA Standards of Practice (SOP) addressing the topic of reinsurance. The focus of the review was on the adequacy of the SOP and the potential need for modifications, improvements or additional guidance. The PC, CLIFR and the PCFRC each concluded that the current SOP are adequate with respect to the treatment of reinsurance and that no immediate changes are necessary.

However, the PC, CLIFR and the PCFRC believe that more clarity and direction would be appropriate with respect to the definition of reinsurance and its eventual financial and capital treatment for an insurance entity. In this regard, in June of 2005, the PC issued a memorandum of guidance on the "Appropriate Treatment of Reinsurance". That memorandum summarized key principles and SOP pertaining to the appropriate treatment of reinsurance in actuarial work. It also announced the PC’s intention to form a task force, including external stakeholders, to examine reinsurance-related topics in greater depth. The task force was mandated to develop additional recommended guidance and to consider the need for potential modifications to SOP.

Specifically, the task force’s mandate is as follows:

The focus of the task force will be on finite reinsurance, the degree of risk transfer in reinsurance transactions, side agreements, stop loss arrangements and reinsurance counterparty risk. The task force will consist of Life and P&C actuaries from the Committee on Life Insurance Financial Reporting (CLIFR) and the Property and Casualty Insurance Financial Reporting Committee (PCFRC) and will invite participation from reinsurance practitioners, federal and provincial regulators, the Insurance Bureau of Canada (IBC), the Canadian Life and Health Insurance Association (CLHIA) and the Canadian Institute of Chartered Accountants (CICA). The task force will develop a research paper or an educational note on these matters. The task force will consider and suggest, if deemed necessary, potential modifications to the SOP.

The report is intended to supplement the CIA SOP in an effort to achieve some consistency in how actuaries deal with reinsurance. Probably the most important area of supplement is in the concept of risk transfer as the CIA SOP are silent in this area.

DEFINITIONS
The task force has concluded that International Financial Reporting Standard 4 (IFRS 4) contains the most comprehensive definitions relating to insurance and reinsurance and the ones that are most consistent with current Canadian Generally Accepted Accounting Principles (GAAP). Therefore, in this report the following definitions, which are based on the IFRS 4 definitions, are applicable:

Insurance contract: A contract under which one party (the insurer) accepts significant insurance risk from another party (the policyholder) by agreeing to compensate the policyholder if a specified uncertain future event (the insured event) adversely affects the policyholder. Compensation is defined by the insurance contract terms.

Insurer: The party that has an obligation under an insurance contract to compensate a policyholder if an insured event occurs.
Policyholder: A party that has a right to compensation under an insurance contract if an insured event occurs.

Insured event: An uncertain future event that is covered by an insurance contract and creates insurance risk.

Insurance risk: Risk, other than financial risk, transferred from a policyholder to an insurer. A new risk created by an insurance contract is not an insurance risk. In particular, lapse or persistency risk (i.e., the risk that the policyholder will cancel the contract earlier or later than the insurer had expected) is not an insurance risk because the payment to the policyholder is not contingent on an uncertain future event that adversely affects the policyholder.

Financial risk: The risk of a possible future change in one or more of a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract.

Reinsurance contract: A contract under which one party (the reinsurer) accepts significant reinsurance risk from another party (the cedant) by agreeing to compensate the cedant if specified uncertain future event(s) (the reinsured events) adversely affect the cedant. Compensation is defined by the reinsurance contract terms.

Reinsurer: The party that has an obligation under a reinsurance contract to compensate a cedant if a reinsured event occurs.

Cedant: A party that has a right to compensation under reinsurance contract if a reinsured event occurs.

Reinsured events: Uncertain future events that are covered by a reinsurance contract and create reinsurance risk.

Reinsurance risk: Risk, other than financial risk, transferred from a cedant to a reinsurer. A new risk created by a reinsurance contract is not a reinsurance risk. For Life Business, policyholder lapse or persistency risk (i.e., the risk that a policyholder will cancel the contract earlier or later than the insurer had expected) is a reinsurance risk because the payment to the cedant is contingent on uncertain future event(s) that adversely affect the cedant.

BACKGROUND

Overview of Reinsurance Concepts and Terminology

In order for this report to focus on the key issues it has been written assuming that the reader has a basic understanding of reinsurance concepts and terminology. Readers who wish to enhance their basic reinsurance knowledge are encouraged to refer to other sources. Two good sources are; Life, Health & Annuity Reinsurance (2005) by John E. Tiller, FSA, Denise Fagerberg Tiller, FSA, MAAA and Reinsurance (1997) by Strain Publishing.
Finite Reinsurance

The terms “finite reinsurance” and “financial reinsurance” are widely used but are difficult to define precisely. Generally speaking, “finite reinsurance” contracts are associated with the P&C reinsurance industry and have the effect of limiting the reinsurer’s downside loss, whereas “financial reinsurance” contracts are more common in the life reinsurance industry and they tend to be associated with signifying the motivational intention of the parties rather than limiting the reinsurer’s downside loss.

In the International Association of Insurance Supervisors’ (IAIS) Guidance Paper on Risk Transfer, Disclosure and Analysis of Finite Reinsurance, “finite reinsurance” is stated to be “a generic term used to describe an entire spectrum of reinsurance arrangements that transfer limited risk relative to aggregate premiums that could be charged under the contract.” The guidance paper goes on further to say that “…there is no accepted global definition of finite reinsurance…” The American Academy of Actuaries Risk Transfer Practice Note contains a similar assessment of “finite reinsurance” as it says “…there is no universally accepted definition of the term finite…” In general, “finite reinsurance” is used to denote reinsurance where risk transfer is, in some way, limited. The IAIS Guidance Paper on Risk Transfer, Disclosure and Analysis of Finite Reinsurance also contains additional definitions of “financial reinsurance” which indicate that this categorization of reinsurance contracts has financial and strategic motivations taking precedence over the insurance risk transfer motivation.

The task force concurs that the terms “finite reinsurance” and “financial reinsurance” are ambiguous terms and for that reason believes that classifying reinsurance contracts into “finite/financial” and “non-finite/traditional” is not useful and could possibly be misleading. Therefore, this report will not try to define “finite reinsurance” and “financial reinsurance” but rather it presents the various types of limitations that can exist in reinsurance contracts. Consequently, the remainder of this report does not use the terms “finite reinsurance” and “financial reinsurance.” The task force believes, however, that this report provides guidance on all reinsurance contracts including those contracts that can be described as “finite/financial.”

Reinsurance and the Actuary

CGAAP Valuation of Policy Liabilities

For both Life and P&C insurers, the valuation of policy liabilities is governed by the General SOP. Further guidance is provided in the practice-specific SOP including educational notes and other guidance.

Subsection 2130 of the SOP directs the actuary to establish liabilities that are consistent with the insurers accounting policy, and that consider the future net cash flow arising from in force policies at the balance sheet date. Paragraph 2130.05 specifies that the cash flows are net of reinsurance.

Consistency in the context of reinsurance treatment means that the actuary would ensure that the liabilities provide consistently for cash flows gross of reinsurance, and reinsurance cash flow. In valuing the features of a reinsurance contract, the assumptions used have to be consistent with the gross cash flows. For example, if the reinsurance contract specifies that a particular feature becomes triggered under a certain assumption, the actuary would reflect that feature consistent with the assumption made for the gross cash flow.
The actuary of the ceding company needs to consider the possibility that the reinsurer will exercise its options to its advantage (i.e., anti-select against the insurer), and vice-versa. This requires the actuary to test the various features of the reinsurance contract, assuming that each party exercises the option to their advantage. The final policy liability is generally the largest resulting liability. Although it is not directly stated, it is implied that in conducting these tests, the actuary would consider all cash flows arising from the reinsurance treaty.

Although not directly stated in the CIA SOP, the task force believes that it is strongly implied that:

a) the valuation considers all cash flows arising from the reinsurance contract;

b) all modifications and side agreements to the reinsurance contract are required to be considered; and

c) the credit rating of the reinsurer is to be taken into account.

Regulatory Capital Treatment of Reinsurance

Federally or provincially regulated Life and P&C insurers and reinsurers in Canada are required to determine their capital adequacy according to regulatory guidelines or regulations. The capital requirements are generally calculated using a factor-based approach, and as such, are not always well suited to recognizing the effects of reinsurance on the risk profile of the insurer. The factors are applied to exposure bases which are generally net of reinsurance but the treatment of reinsurance is a “black or white” decision (i.e., if a reinsurance contract is in place the ceding company receives 100% reinsurance credit).

Current Reinsurance Accounting Practice

Reinsurance Accounting and Deposit Accounting

When a contract is accounted for as reinsurance, all premiums, allowances and expenses under the contract are included in revenues and expenses, and claims recoveries under the contract are estimated in the valuation of insurance policy liabilities and are also included in revenues and expenses. This is referred to as “reinsurance accounting”, and when this is not appropriate under generally accepted accounting principles, “deposit accounting” must be applied to the contract instead.

Under “deposit accounting”, the premium paid or received is initially recorded as an asset or liability (the “deposit”). For contracts that do not transfer significant underwriting risk, the present value of expected recoveries is also reflected in the carrying value of the deposit, and changes in estimates of the deposit are included in interest income or expense. For contracts that transfer underwriting risk but no significant timing risk, the deposit changes to reflect the unexpired portion of coverage inherent in the premiums, which is reflected in expense, and also to reflect the present value of cash flows from future loss recoveries, which is included in losses for the period. The primary reference for deposit accounting is American Institute of Certified Public Accountants Statement of position 98-7, “Deposit Accounting: Accounting for Insurance and Reinsurance Contracts that Do Not Transfer Insurance Risk.”
**Relevant Accounting Standards**

In considering whether risk has been transferred under a reinsurance agreement, the actuary must be aware of the applicable accounting standards and related regulatory requirements that are applicable to the valuation of insurance policy liabilities.

There are currently three principal different sets of GAAP that may be relevant; Canadian GAAP, United States GAAP (US GAAP), and IFRS. In addition, Canadian regulatory requirements narrow the range of choices available within GAAP for P&C insurers. The rules applicable to reinsurance are summarized below.

**Canadian GAAP**

For P&C insurers, Accounting Guideline AcG-3 provides minimal guidance on reinsurance risk transfer, while for life insurers, CICA 4211 effectively embeds CIA standards and the Canadian Asset Liability Method (CALM) in Canadian GAAP. However, with the recent implementation of the Financial Instruments accounting rules of CICA 3855, a reinsurance contract that principally involves the transfer of financial risks is no longer exempt from the general accounting rules of CICA 4211 and CALM, and is required to be classified as a financial instrument. This will require life insurers to consider the classification of reinsurance arrangements that may transfer significant financial risks as well as insurance risks.

Both the non-life and life Canadian GAAP pronouncements make general statements that in order to account for a contract as reinsurance, the contract should transfer risk, and AcG-3 further states that the risk transferred should be insurance risk. Contracts that do not transfer insurance risk should follow deposit accounting. No quantitative tests or other detailed guidance are provided in authoritative Canadian GAAP literature.

As a result, life insurers have typically not applied any quantitative testing of risk transfer for reinsurance, and in the past, the commonly expressed view has been that this is not necessary since the classification of reinsurance does not affect the cash flows from reinsurance contracts one way or the other, when completing a CALM valuation.

In contrast, P&C insurers have been significantly affected by Canadian regulatory requirements, as described in the following section.

**Canadian Regulatory Requirements**

Canadian GAAP is required for financial reporting to Canadian regulators. However, regulators have the statutory right to specify the use of accounting rules that may not be in accordance with GAAP. To date, regulators have only acted to narrow the range of alternatives available under GAAP.

For P&C insurers, OSFI Guideline D-7 effectively imports US GAAP for assessing reinsurance risk transfer. This guideline incorporates language drawn from Statement of Financial Accounting Standards 113 (FAS 113), which is described in more detail below.

It should be noted that there is no OSFI requirement for life insurers similar to Guideline D-7, and so regulatory requirements for life insurers have not forced the use of US GAAP rules for reinsurance for life insurers.
United States GAAP

US GAAP pronouncements for reinsurance risk transfer are relatively complex and only a general conceptual summary is provided here. The principal source is FAS 113.

- FAS 113 makes a distinction between short-duration and long-duration insurance contracts, as follows.

- For **short-duration insurance contracts**, two tests must be passed to determine that risk has been transferred:

  a) “The reinsurer assumes significant insurance risk under the reinsured portions of the underlying contracts.”

  b) *It is reasonably possible that the reinsurer may realize a significant loss from the transaction.*

  A reinsurer shall not be considered to have assumed significant insurance risk under the reinsured contracts if the probability of a significant variation in either the amount or the timing of the payments by the reinsurer is remote.”

FAS 113 also provides that both the amount and timing of the reinsurer’s payments should depend on and directly vary with the amount and timing of claims settled under the reinsured contracts. Contract provisions that would delay timely reimbursement of claims could also rule out the use of reinsurance accounting, as can other risk-limiting contract features that limit the amount of loss to the reinsurer.

- For **long-duration insurance contracts** (typically life and health contracts), as for short-duration contracts, there must be a reasonable possibility that the reinsurer may realize a significant loss from assuming insurance risk, and that risk must come from the mortality risk and/or morbidity risk in the underlying insurance contracts.

  “Significant loss” is considered to mean a net overall loss on the reinsurance contract (measured based on the present value of cash flows), not just a significant claim under the contract. It can be difficult to meet this test in reinsuring inherently profitable blocks of business, even if there are no “finite/financial reinsurance” aspects to the agreement. As a result, it is possible that a contract that transfers insurance risk could nevertheless not qualify for reinsurance accounting under US GAAP.

- “Paragraph 11” exemption – FAS113.11 provides that if the amount of risk transfer is judged to be insufficient, reinsurance accounting can still be applied if the reinsurer has “stepped into the shoes” of the ceding insurer, so that the reinsurer has taken on “substantially all” of the insurance risk that is present. However, “substantially all” is strictly interpreted to mean effectively 100%, so that it cannot be used if there has been any modification of the risk, retention or participation features by the ceding company. This provision is effectively the only basis under which US GAAP would allow reinsurance accounting for the reinsurance of inherently profitable insurance contracts.

- Quantitative testing – There is an expectation that quantitative testing of cash flows would be used to demonstrate that sufficient risk has been transferred. While not part of any authoritative guidance, “at least a 10% chance of at least a 10% loss” is a commonly expressed rule-of-thumb. It is also accepted that in some instances, such as earthquake catastrophe coverage, a lower percent chance of a relatively larger loss would be acceptable.
International Financial Reporting Standards

International Financial Reporting Standards (IFRS) have been adopted as GAAP in most of Europe and in many other jurisdictions outside of the United States. The Canadian Accounting Standards Board has announced that it is intended that Canadian GAAP will converge with IFRS over time.

To date, IFRS does not provide complete guidance on the accounting measurements for insurance contracts, but further standards are under development in this area. However, current IFRS standards do include robust definitions of insurance contracts and other provisions relevant to reinsurance.

IFRS Standard 4 Insurance Contracts (“IFRS 4”) applies to all insurance contracts, including reinsurance contracts, and defines an insurance contract as:

“A contract under which one party (the insurer) accepts significant insurance risk from another party (the policyholder) by agreeing to compensate the policyholder if a specified uncertain future event (the insured event) adversely affects the policyholder.” (IFRS 4 Appendix A)

and further defines insurance risk as:

“Risk, other than financial risk, transferred from the holder of the contract to the issuer.” (IFRS 4 Appendix A)

Also, IFRS 4 B23 states that:

“Insurance risk is significant if, and only if, an insured event could cause an insurer to pay significant benefits in any scenario, excluding scenarios that lack commercial substance (i.e., have no discernible effect on the economics of the transaction). If significant additional benefits would be payable in scenarios that have commercial substance, the condition in the previous sentence may be met even if the insured event is extremely unlikely or even if the expected (i.e., probability-weighted) present value of contingent cash flows is a small proportion of the expected present value of all the remaining contractual cash flows.”

Also, IFRS 4 B19 (b) gives examples of items that are not insurance contracts:

“Contracts that have the legal form of insurance but pass all significant insurance risk back to the policyholder through non-cancellable and enforceable mechanisms that adjust future payments by the policyholder as a direct result of insured losses, for example, some financial reinsurance contracts or some group contracts.”

IFRS 4 does not provide quantitative guidance in assessing significance, and it requires that “an insured event could cause an insurer to pay significant benefits in any scenario,” rather than requiring that an overall loss on the reinsurance contract could plausibly arise as is the case under US Statement of Financial Accounting Standards 113. As a result, IFRS 4 appears to allow a wider range of reinsurance contracts to be given reinsurance accounting than would be the case under US GAAP. For example, it is clearer under IFRS 4 that catastrophe covers are expected to receive reinsurance accounting.
Normally, insurance and reinsurance contracts measured in accordance with Canadian actuarial practices will reflect all contractual rights or obligations, so that unbundling would be permitted but not required under IFRS. IFRS 4 provides that “unbundling” or “bifurcation” of a contract between insurance and deposit components is required if some contractual rights or obligations would not otherwise be recognized and measured in the balance sheet of the insurer, so long as the deposit component can be reliably measured. Unbundling is permitted but not required otherwise, and might be done if the preparer believes that this provides better disclosure.

THE CONCEPT OF RISK TRANSFER

Key Principles of Risk Transfer

Risk transfer can be a complicated subject to define and describe. Most insurance and reinsurance professionals believe they have an intuitive understanding of the concept of risk transfer from a high level but have probably not delved into the specifics. To set the stage for a deeper risk transfer understanding, the task force has identified the following four key principles that provide a framework for risk transfer and risk transfer assessment.

Risk Transfer Principle #1: There are several approaches that can be used to assess the existence of risk transfer.

There is no single test or rule that will be applicable in assessing the existence of risk transfer for each and every type of contract. In some contracts, it may be obvious that risk transfer exists even in the absence of any specific test.

Possible approaches to assessing risk transfer are discussed in detail throughout the remainder of this paper.

Risk Transfer Principle #2: Professional judgment will be required when assessing the existence of risk transfer.

Professional judgment will be either in the form of selecting appropriate historical data to study or in setting parameters for models that will be used to perform a quantitative test or in documenting qualitative assessments. For both Life and P&C reinsurance, actuaries and other relevant professionals will assess risk transfer.

SOP paragraph 2130.02 requires the actuary to “coordinate the valuation with the insurer’s accounting policy…so that the policy liabilities…conform to the presentation of the income statement.” This requirement means the Appointed Actuary must assess risk transfer for each reinsurance contract. If the Appointed Actuary does not reach a similar conclusion on risk transfer as is being presented in the financial statements then a qualified opinion must be considered.

Risk Transfer Principle #3: The entire agreement consisting of the reinsurance contract and all written and verbal agreements and correspondence must be considered in assessing the existence of risk transfer.

This principle is consistent with the valuation principle in the SOP. Risk transfer must be assessed based on all commitments the parties have made to each other regardless of whether those commitments are included as part of the reinsurance contract document. Reinsurance contracts are typically composed of a written contract and may contain one or more amendments that occur subsequent to the introduction of the reinsurance contract. Each of these needs to be
considered in assessing risk transfer regardless of whether they have been included in the reinsurance contract document or not.

A reinsurance contract could also be modified by verbal agreements or by other written documents that may not be obvious amendments. The actuary must make a reasonable effort to be informed of each and every commitment made by any authorized party. Further discussion on side agreement can be found later in this report.

**Risk Transfer Principle #4:** The existence of risk transfer must be assessed at inception of the contract and every time a change to the contract that significantly alters the expected future cash flows of that contract is made.

Risk transfer does not need to be continually assessed. Events that occur during the normal course of the contract do not trigger a need for a reassessment. An example of such a feature is the build up of a Claims Fluctuation Reserve. Another example is when the reinsurer earns significant profits over time such that if this level of profits had been included in the risk transfer assessment performed at issue then the risk transfer would be negated.

However, risk transfer may need to be reassessed any time a modification to the contract is made. Examples of changes requiring risk transfer reassessment are: a revision to the reinsurance premium rates, a revision to the coverage levels other than a linear increase or decrease in the quota share, the addition or deletion of a new insurance coverage, the addition or deletion of an option (e.g., recapture with or without penalty). Prior to reassessing risk transfer, the actuary would first review the previous assessment to determine if it is still applicable after the change.

**Assessing the “Existence” of Risk Transfer**

To begin the exercise of assessing the “existence” of risk transfer the actuary would ask the following question:

“Does the reinsurance contract protect the ceding company from negative financial impacts that result from one or more adverse events?”

If the answer is a clear “yes” then risk transfer exists and conversely if the answer is clearly “no” then risk transfer does not exist. There are, however, many situations where the answer to this question is not simple and the actuary must perform a risk transfer assessment in order to prove the existence of risk transfer.

Key principle #1 states, “There are several approaches that can be used to assess the existence of risk transfer. All approaches, however, fit into two broad categories that are generally recognized in developed global insurance markets when assessing risk transfer. These categories are a) Qualitative Assessment and b) Quantitative Testing.

The usual process would be for the actuary, or other relevant professional, to first, qualitatively assess if risk transfer is “reasonably self-evident”. If the actuary does not conclude that risk transfer is “reasonably self-evident” then the actuary must either expand the qualitative assessment or perform a quantitative test.

The actuary would not conclude that quantitative testing is always better proof than qualitative assessment or vice versa. The type of approach used will depend on the risk being transferred and the nature of the contract. There are situations where quantitative testing might lead to the wrong conclusion (e.g., a pandemic cover with a very high attachment point). In addition, the
actuary may find that a combined approach works best. For example, a qualitative assessment may be done for the overall contract with a quantitative test performed on one particular contract feature. One approach is often sufficient to prove the existence of risk transfer and several approaches rarely, if ever, sufficiently enhance the proof to justify the extra work.

Further discussion on how the actuary actually performs these assessments follows.

**Qualitative Assessment**

a) “Reasonably Self-Evident” Risk Transfer exists when it is intuitively obvious that the contract protects the cedant from future events that could adversely affect the cedant’s financial position. In assessing “reasonable self-evidence” the actuary would focus on answering the question “if the reinsured event happened is protection afforded” and not on how probable the event is or how much risk is transferred. Low frequency/high severity risks are commonly transferred in reinsurance contracts and comprise most of the “reasonably self-evident” class of contracts. Examples of these contracts are casualty excess of loss reinsurance where coverage is in excess of an attachment point and there is no cap on losses and specific event reinsurance such as natural catastrophe covers.

A “reasonably self-evident” qualitative assessment would be restricted to contracts that a) are done on arms-length terms, and b) where there are no potentially limiting risk transfer contract features as defined later in this paper. Contracts that do not meet these requirements must be assessed using either an expanded qualitative assessment (i.e., a separate assessment of the restrictive feature) or a quantitative assessment.

If the above conditions are met then the actuary can conclude that the reinsurance contract has “reasonably self-evident” risk transfer and minimal documentation is required.

The actuary would also be aware that for many “reasonably self-evident” risk transfer contracts, sophisticated computer models with which to perform a quantitative test may either not be available or may lead to inconclusive results.

b) If the above conditions are not met, then the actuary would next consider whether expanding the qualitative assessment will lead to a conclusion that risk transfer exists. This is typically the next step where a quantitative test usually can not be done either because relevant historical data are not available or the risk does not lend itself to mathematical models. Examples where an expanded qualitative assessment may be appropriate are reinsurance contracts with occurrence limits or contracts that would fit the “reasonably self-evident” conditions except they contain one or more potentially limiting features or are related party transactions.

In risk limiting feature situations, the actuary can typically qualitatively assess the restrictive feature by isolating the financial impact of the feature under one or more adverse scenarios. In situations where reliable historical data or computer models are not available to make this assessment, the actuary will need to develop other comparables. As well, for related party transactions, it is important to assess the market consistency of the reinsurance premium being charged in relation to the risk being transferred.

Qualitative assessments that are not “reasonably self-evident” usually require substantially more documentation to prove risk transfer exists. The actuary would err on the side of too much documentation rather than not enough in these situations.
Quantitative Testing

Quantitative testing is typically used to assess the existence of risk transfer when the risk being transferred lends itself to mathematical analysis and relevant data are available. Mortality reinsurance with an experience refund feature, quota share reinsurance with a sliding scale allowance and stop loss contracts are examples where quantitative testing is typically performed.

Computer models that perform scenario testing can be built to perform the test. In many cases, these models are derived from the pricing, valuation or Dynamic Capital Adequacy Testing (DCAT) work performed. Relevant data are either based on historical results of the business in question or similar business. Scenario testing can either be deterministic or stochastic and income statement, Conditional Tail Expectation (CTE) or Tail Value at Risk (TVAR) measures are all acceptable measures.

Commonly, quantitative tests will demonstrate that the cedant is “significantly” protected from adverse financial effects due to “plausible” insurance outcomes. “Significantly” and “plausible” will be defined based on the contract’s particular characteristics. “Significantly” is relative to the financial outcome of an adverse scenario while “plausible” is defined in the DCAT Educational Note.

In addition to compiling results of a quantitative test the actuary would document how the testing supports the risk transfer conclusion.

Assessing the “Extent” of Risk Transfer

Once it has been proven that a risk transfer exists, then the actuary needs to have a clear view on the extent of the risk transfer for liability determination and financial statement presentation.

For P&C business, traditionally frequency and severity of loss (and hence the presence of risk transfer) have been assessed separately. However, current thinking (e.g., US GAAP and OSFI Guideline D-7) is that frequency and severity would be combined when assessing risk transfer. The uncertainty in both timing and amount risk would be present for the contract to be treated as reinsurance. Timing risk can generally be determined by looking at the contract features.

For Life business, it is not necessary to assess the effects of the transfer of timing risk and amount risk separately nor is it necessary to separately assess frequency and severity since the CALM method will accurately reflect the combination of these. The challenge is to appropriately define future cash flows, which may be scenario dependent, particularly when the reinsurance contract contains potential risk limiting features.

For both Life and P&C business, consideration of the extent of the risk transfer is as important for regulatory capital calculations as it is for liability determination and financial statement presentation. Current regulatory capital requirements (i.e., Minimum Continuing Capital and Surplus Requirement (MCCSR) for Life insurers and Minimum Capital Test for P&C insurers) assume that risk transfer in a reinsurance contract is absolute (i.e., the reinsurance risk is completely and permanently transferred to the reinsurer). This assumption is usually appropriate when reinsurance contracts are written at market terms which are the vast majority of reinsurance contracts currently in the Canadian marketplace. However, regulatory capital formulas do not reflect the wide array of possible limitations on risk transfer that can exist in reinsurance contracts. One example of where regulatory capital formulas break down in this regard is where the reinsurer contains an option that allows it to unilaterally alter the terms of the reinsurance (e.g., the reinsurer can force early recapture or commutation of claims).
Limitations of Risk Transfer

There is a wide variety of reinsurance contracts currently used in the Canadian marketplace. Many of these contain features that have the potential of limiting the risk transfer from the cedant to the reinsurer. Generally, these features are integral parts of the reinsurance contract and without them the reinsurer may not be willing to accept the risk or the price would be prohibitively high to the ceding company. It is important to note, however, that the mere presence of any of these features in a reinsurance contract does not mean that risk has not been transferred. Rather, their presence is an indication that additional work needs to be performed by the actuary to assess the “existence” and “extent” of the risk transfer. Some of these limitations are obvious (e.g., a corridor in a stop loss contract) while others need further study (e.g., a contractual recapture at the option of either party under pre-set conditions). Following is a list of potential risk limiting features of reinsurance contracts that is intended to give the actuary an indication of the types of features that require specific analysis in order to determine both the existence and extent of risk transfer. This list is not meant to be exhaustive but rather it is illustrative.

The list is organized into two broad categories: a) Terms Set in Advance and b) Experience Based Renewals.

a) Terms Set in Advance

i) Profit sharing

“Profit sharing” provisions are interchangeably referred to as profit sharing, profit commissions, experience rating provisions or experience refund provisions. Typically, the assuming company is willing to offer profit sharing to the ceding company due to the asymmetry of the spectrum of possible results where in the absence of such a feature, the probability and/or magnitude of favourable scenarios far exceeds the probability and/or magnitude of unfavourable scenarios.

For Life reinsurance, profit sharing arrangements are prevalent in the reinsurance of Group Life and A&S business and to a much lesser extent in Individual Life reinsurance contracts. Profit sharing amounts are determined by a pre-agreed formula, and take into account premiums, claims, and expenses. Percentages of profit sharing vary, and are often related to the size of the reinsured block of business and/or the amount of profit that emerges from the calculation.

For P&C reinsurance, profit sharing in reinsurance contracts is most often encountered on proportional contracts. Profit commission will return a pre-agreed percentage of any profits to the ceding company. Profits will be determined according to a pre-defined formula that takes into account premiums, claims and expenses. Other forms of profit sharing, such as experience rating refunds and no-claims rebates, may also be encountered, but are not common in the Canadian marketplace.

When assessing risk transfer, the actuary would be careful when there is a pre-determined expectation of large profit sharing. Such an expectation might be indicative of insufficient risk transfer. Also, absence of a loss carry-forward provision (used in the determination of the refund amounts) might reflect an expectation of the reinsurer that the possibility of loss in any one accounting period is remote. And finally, negative
experience refunds (i.e., the ceding company makes the assuming company whole for its losses) can negate risk transfer to the assuming company.

ii) Adjustability of reinsurance premiums and/or commissions

In these situations the reinsurance contract will either limit or adjust the amounts payable by/to the reinsurer under the contract. A typical example would be an adjustable commission on a proportional contract (with or without debit/credit carry forward provision), where the final commission payable to the ceding company will be based on the experience of the contract, within a pre-established range. A swing rate on a non-proportional contract will work similarly to the adjustable commission, except that the “adjusted” reinsurance premium rate to be applied to the contract will be based on the loss experience, within a pre-agreed range. Other examples include limits or caps on loss ratios, and loss corridor provisions on proportional contracts, which work similarly to a sliding scale commissions.

iii) Pre-set limits to timing of payments

Some contract features which restrict the timing of payments may indicate an intention to limit risk transfer. For example, some contracts may contain payment schedules or funds withheld provisions which may indicate such an intention. These and other contract features, however, may exist to facilitate the administration of the treaty, and do not necessarily indicate an intention to limit risk transfer. A clause that requires cash settlement on a quarterly basis for example, does not necessarily imply that risk transfer is not present, as long as the quarterly settlement has no restrictions and reflects the entire amount due according to the reinsurance contract. Professional judgment will be required to determine if any contract features that influence the timing of payments actually limit risk transfer.

iv) Expected duration of contract

For Life reinsurance, the presence of early recapture options might indicate that reinsurance is not intended for a long period of time. Recapture charges are typically assessed if the cedant exercises their recapture option. These charges usually take one of two forms: charges that are independent of past profitability of the reinsurance contract (e.g., a fixed per thousand of in force recaptured) or dependent on past profitability of the reinsurance contract. When the charges are independent of past profitability, risk transfer is not likely limited as long as the factors are reasonable. A cedant’s motivation for this type of arrangement is typically a temporary need for capital, uncertainty regarding capital, or uncertainty with respect to a new product or product line. The cedant may be highly motivated to recapture business once their comfort level with the business increases. If the amount of the charges depends on past profitability, then this may be an indication that there has been limited intention to transfer risk on a permanent basis and further investigation is almost always necessary. For example, there is insufficient risk transfer if the assuming company can force recapture and is made whole for prior losses such as a deficit repayable on termination.

In P&C reinsurance, early recapture can be done through a commutation clause. Commutation clauses exist in most Ontario automobile excess of loss contracts, stating that accident benefit claims will be commuted back after a certain number of years, often
5 to 10 years. Other contracts allow commutation of claims or funds withheld after one or two years, sometimes in cases where no claims have been incurred. The funds withheld consist of a portion of the reinsurance premium that was paid into the fund and from which claims payments are made. This fund will be commuted back to the cedant when there are no claims. Generally, these clauses do not limit risk transfer but nevertheless the actuary would review these clauses when assessing risk transfer.

v) High front-end reinsurance commissions

For Life reinsurance, it is not uncommon to have reinsurance contracts that have payment schedules with high front-end allowances and accounts to which certain payments are applied. Such contracts may contain specific payment schedules, and therefore can be considered to have some element of financing. The presence of these provisions does not necessarily mean that risk transfer has been limited. High front-end allowances are often requested by cedants in order to offset their acquisition costs, especially when significant amounts of risk are reinsured. The cedant retains very little risk, and consequently may request significant up-front assistance in offsetting some of the cash costs associated with issuing a policy. Reinsurers are willing to support requests for high initial allowances, but are also keen to limit their lapse risk, which can create significant losses if early lapses are higher than expected. In these cases, the actuary should review the up-front reinsurance commissions to ensure they are reasonable.

vi) Counterparties

Contracts between companies that cede business back to the original cedant or an affiliate of the original cedant would be closely analyzed to ensure reserves and required capital is not being inappropriately arbitraged away.

vii) Other specific examples that the actuary should take care in assessing risk transfer are:

- coinsurance premiums that significantly exceed the premiums collected by the ceding company from its policyholders;
- Yearly Renewable Term (YRT) premiums that significantly exceed the ceding company’s valuation mortality assumption;
- reinsurance allowances significantly lower than the ceding company’s allocable direct expenses net of the reinsurer’s own expenses (if coinsurance premiums are on original terms);
- limits on proportional contracts, especially absolute dollar, on aggregate claims reimbursement (e.g., a cap on a single catastrophic event);
- stop loss contract whereby the attachment point is above the ceding company’s valuation assumption or there is a short termination notice (i.e., if experience is approaching the trigger, then the contract is cancelled and the trigger is reset at a higher level just to get capital relief);
- claims fluctuation reserves funded upfront where an extra premium is not justified;
- reinsurance between affiliated companies; and
- reinsurance transacted at non-market terms.
b) Experience Based Renewals

i) Future terms based on past experience

Reinsurance premium rates that are dependent on past experience are common. Where contracts are annually renewable, this does not limit the extent of the risk transfer. However, if reinsurance premium rates are guaranteed to recover any portion of prior year losses, then risk transfer is limited unless the ceding company has the ability to retain the business or place the reinsurance elsewhere.

Multi-year contracts where renewal is not at the cedant’s option would also be closely reviewed by the actuary. Although a multi-year contract does not restrict risk transfer by itself, this type of contract often includes other features that would limit risk transfer. For example, an excess contract may call for a significant increase in premium should there be a loss in a prior year, thereby virtually guaranteeing payback. Another example would be a proportional contract with a commission debit/credit carry forward provision.

ii) Forced renewals

These provisions require that if a contract is in deficit, that the cedant is obligated to cede future business to the reinsurer until at least the losses are eliminated. The purpose of these provisions is to prevent a cedant from moving the business before the reinsurer can recover the deficit. If the future business ceded is at market terms then it is possible that risk transfer is not limited but the actuary needs to assess each case individually.

OTHER ISSUES

Side Agreements

Reinsurance contracts may be modified or amended by other agreements, sometimes subsequent to the effective date of the original contract. These modification agreements, generally referred to as “amendments”, are clearly documented, sometimes in the form of a letter, and are usually included with or attached to the original reinsurance contract papers. In this report, amendments are considered part of the reinsurance contract.

For the purpose of this section, side agreements are agreements made between a cedant and a reinsurer that are not directly incorporated into the reinsurance contract. Side agreements can be either written or verbal. Side agreements can obscure or misrepresent the nature or intent of a reinsurance contract. In extreme situations, side agreements may even negate any true transfer of risk. As well, they can cause confusion and ambiguity in administration and at time of claim settlement.

In order to comply with the SOP, the actuary would pay special attention to all side agreements, particularly analyzing their intent, and be suspicious when there is an apparent lack of disclosure as it may indicate appropriate accounting treatment may not be followed. To reiterate a statement made under Key Principle # 3 – “The actuary must make a reasonable effort to be informed of each and every commitment made by any authorized party.”

A special case of a side agreement is one which places a requirement on the ceding company to enter into future reinsurance contracts with the reinsurer. Side agreements of this type could be an indicator that risk transfer on an existing contract is limited, possibly even non-existent, particularly if the requirement depends on the historical profitability of an existing reinsurance
contract. The task force feels that risk transfer is not impaired due to the existence of such a requirement provided the future reinsurance be transacted on market terms at that time. However, if the side agreement requires the future reinsurance agreement to be on non-market terms, then this likely leads to limited risk transfer under the current reinsurance agreement and the actuary would assess both the existence and extent of risk transfer as impacted by this option.

Both the Office of Superintendent of the Financial Institutions (OSFI) and the Autorité des Marchés Financiers (AMF) strongly discourage the use of side agreement used in conjunction with reinsurance contracts.

**Mirroring and Communication**

Conceptually speaking, ceded reinsurance liabilities determined by the cedant would be substantially similar to assumed reinsurance liabilities determined by the reinsurer for the same contract. If these liability amounts are exactly equal, it is often referred to as mirror reserving, or mirroring. The mirroring concept is based on the premise that both the cedant and the reinsurer would have exactly the same view of both the risk(s) being transferred and the value of those risk(s). In a rules-based accounting and valuation environment, where the method and assumptions used in liability determination are prescribed, this concept has considerable merit. For Life reinsurance, this is especially true in situations where the reinsurer has limited access to policy data. In such instances, the best source of liability calculations is, in fact, the ceding company. For P&C reinsurance, the reinsurer receives the case reserves from the ceding company, and could also rely on the ceded Incurred But Not Reported (IBNR) calculation from the cedant.

In the US, a few states require mirror reserving for statutory reserves. However, the prevailing opinion in the international actuarial community is that mirror reserving should not be required.

For Life reinsurance in Canada, in particular individual business, mirroring is likely to be inappropriate. First, each actuary is responsible for setting assumptions for all contingencies and for all cash flow payments based on his or her own best estimate assumptions. These best estimate assumptions are based at least, in some part, on each company’s experience and the actuary’s view of future experience. Differences can, and would, certainly occur for mortality, morbidity, lapse, expense and investment income assumptions. Expenses incurred and investment income earned by the cedant and the reinsurer will be different resulting in different valuation assumptions being used by each actuary. What may not be obvious is why there are differences in mortality, morbidity and lapse assumptions. In the cedant’s case, experience is based on its own observed mortality, morbidity and lapses, each of which is influenced by its underwriters, sales force, and product characteristics. The reinsurer’s experience, however, will be based on the concept of pooling of risks across companies, and the pooled experience that contributes to the assumptions of the reinsurer can, and likely will, be different from that of the cedant. As a result, legitimate differences do occur between the ceded and assumed reserves due strictly to assumption differences. Even if by coincidence the best estimate assumptions and margins for adverse deviations are similar enough that the initial ceded and assumed liabilities are close enough where it is perceived that mirroring is occurring, differences can, and likely will, emerge over time as assumptions or margins are revised to reflect the most recent experience.

For P&C reinsurance, although the reinsurer could easily rely on the cedant’s IBNR estimate for proportional business, each actuary may have his or her own view of the expected development
of the particular treaty. The reinsurer’s assumption will also be based on an aggregation of treaties, which will not necessarily develop similarly to the sum of the individual treaties. For non-proportional reinsurance, reliance on the ceding company’s estimate is further complicated by the layering since a reinsurer may not be participating on all layers, or may have a different share of each layer. A cedant’s IBNR estimate will also be based on a small amount of excess information such that the data set is too small to be credible, whereas the reinsurer will combine all treaties to produce more credible sets of data. This will usually result in a different set of assumptions.

Without a mirroring requirement and in the absence of communication between the actuaries, it is possible that the cedant and reinsurer actuaries have quite different views on the risk that is being transferred. This can result in material differences between the ceded liabilities determined by the cedant actuary and the assumed liabilities determined by reinsurer actuary. This may or may not be appropriate. A mirroring environment does not prevent these differences but it has the advantage of highlighting these differences quickly, as there is a process on at least an annual basis where there is a comparison of the reserves.

The task force’s view is that a principles-based environment does not have a “natural” safeguard that ensures the cedant and reinsurer actuaries have a similar view of the risk being transferred. There are, however, processes that can be put in place that mitigate or eliminate this concern. The most fundamental safeguard is one of data integrity. For Life reinsurance, a validation process that can and would be performed by the administration area involves a reconciliation at a high level of policy counts, reinsurance amounts at risk, and in-force premiums by, say treaty, will confirm at a minimum the inventory. This reconciliation in theory would reflect only timing differences, as most reinsurance in Canada is transacted electronically. Nonetheless, it does serve as a useful check.

For P&C reinsurance, it is often appropriate for cedant and reinsurer actuaries to confer on unusually large individual losses or recent catastrophic events in order to ensure that appropriate and sufficient provisions for losses are recognized. Often reinsurers do not have the same level of data as the cedants, as they are one step further removed from the client. Consequently reinsurers place considerable reliance on the cedant for access to this information.

For reinsurance that is transacted on a coinsurance or proportional basis, the contingencies generally mirror those of the ceding company. Again, it is important to identify the terms of coverage.

A second important safeguard is communication between the cedant and reinsurer actuaries. This is most important for reinsurance contracts that are customized to the cedant’s risk profile such that they are not necessarily straightforward. Such cases have the greatest opportunity for differences in interpretation. Mitigation techniques can involve communication between administration and pricing staff at both companies, but could also involve communication between the Appointed Actuaries of both the cedant and the reinsurer. It is the responsibility of the actuaries at both the cedant and reinsurer to ensure there is a common understanding of the risks being reinsured, and that the interpretation of those risks is consistent. Each would be familiar with the contracts, and it would be appropriate that, for any new arrangements that are outside what would be considered standard reinsurance arrangements, the actuaries of both companies concur on the risks transferred. For material or unusual reinsurance arrangements it is best practice for the actuaries of the cedant and the reinsurer to discuss the risk transfer aspects.
of the reinsurance contract at inception of the contract and any time afterwards where a material change has occurred to the contract.

**Bifurcation**

There has been considerable discussion recently in some jurisdictions over the bifurcation of contracts. Bifurcation involves separating contracts into their basic constituents, including identification of those portions that are insurance versus those that are not. One purpose of this is to identify those portions of contracts that might not have risk transfer elements. Those aspects of the contracts then would be considered non-risk-transfer, and might be subject to deposit accounting. This might negate some reserve or capital credits taken by the ceding companies.

In reality, reinsurance contracts are not intended to be bifurcated. They are only valid contracts in their entirety. Individual components would not necessarily be intended to be issued on their own. They are only intended to be available as part of an entire package.

Suppose Company A ceded business to Reinsurer B on a coinsurance basis. Suppose also that Company A received an upfront commission of 150% of the first year commission. In order for Reinsurer B to achieve its profit targets, it needs to charge a higher premium from Company A in the renewal years. Bifurcation, in an extreme sense, might suggest that each risk would be unbundled. In this instance, the recovery of the upfront commission would be unbundled from the pure insurance risk. It would then be required to be treated as a loan, and non-insurance accounting would prevail.

This example illustrates the potential impact of contract bifurcation. A reinsurer would never only offer a loan. An upfront commission or allowance is only obtainable by the ceding company if there is an accompanying risk contract. The upfront commission is the result of the ceding company wishing to defray some of its own upfront cash strain. One can also view this as the reinsurer in a coinsurance situation taking some share of the upfront underwriting costs, sales costs, and agent commissions that are incurred by the ceding company.

**Reinsurance Counterparty Risk**

While reinsurance reduces both earnings volatility and probability of ruin, it exposes the cedant to credit risk either because the reinsurer will be unable to pay claims or because the amount reimbursed will differ from that which the cedant has expected to collect.

The SOP require the actuary to consider all cash flows, including reinsurance cash flows, when setting reserves. Paragraph 2130.05 states:

> The comprised cash flow should include the effect of:
> retrospective premium, commission, and similar adjustments,
> experience rating refunds,
> reinsurance ceded,
> subrogation and salvage
> the exercise of policyholder options, and
> the deemed termination at the end of the term of its liabilities of each policy then in force.
The SOP further require the actuary to consider the financial condition of its reinsurers. Paragraph 2130.16 states:

As respects consistency, the actuary would, for example, ensure that the policy liabilities provide for any risk of asset depreciation (C-1 risk) and of interest rate change (C-3 risk) for any deposit liabilities which the actuary did not value and which are separately reported without such provision, and provide consistently for cash flow gross of reinsurance and reinsurance cash flow, except that reinsurance cash flow would also take account of the financial condition of the reinsurer.

Paragraph 2130.30 amplifies this:

The recovery on account of reinsurance ceded would take account of the financial condition of the reinsurer.

For P&C insurance, SOP Section 2200 provides specific direction on the valuation of policy liabilities. This section re-emphasizes that policy liabilities reflect reinsurance, but a specific margin for adverse deviations is required to be placed on the amount of reinsurance ceded. Paragraph 2250.05 specifies that margins for adverse deviations are required for recovery from reinsurance ceded, and 2250.08 and 2250.10 specify that the margin be determined as a percentage (0-15%) of the best estimate ceded claim and premium liabilities. The degree of margin depends on the actuary’s assessment of the uncertainty of recovery (e.g., as evidenced by the history of disputes with a reinsurer). This would also take into account the credit worthiness of the reinsurer’s.

For Life insurers, there is no further guidance related to reinsurance provided in section 2300.

The risk that future reinsurance receivables (or ceded unpaid claims) are not recoverable is to be provided within the policy liabilities. The intent of the SOP is that the policy liabilities include a provision for future reinsurer default, similar to any other default provision. Similar considerations apply when taking credit for future receivables from policyholders (including reinsurers) arising from deficit recoveries, experience rating, etc. (paragraph 2130.25).

This task force believes that in normal circumstances, any credit provision be represented as a margin against best estimate assumptions. In the event that likelihood is high that a future reinsurance receivable will not be realized in its entirety, it is the joint responsibility of the actuary and the accountant to ensure that such individual situations are reflected appropriately in the balance sheet.

When estimating if a credit provision is necessary, and the amount of such a provision, the actuary would consider the following factors:

- The rating from rating agencies such as Standard & Poor’s or A.M. Best;
- Any history of dispute on claims;
- Whether the reinsurer or book of business is in runoff;
- The expertise of the reinsurer;
- The diversification of the reinsurer;
- The quality of the reinsurer’s retrocession; and
• The MCCSR/TAAM ratio for a life reinsurer, or the MCT/BAAT ratio for a P&C reinsurer.

The above situation would be contrasted to the situation where the insurer has paid a claim and is awaiting money from the reinsurer (current reinsurance receivable). In such an instance, if a claim is in dispute, or the collection is outstanding for a certain number of months, accounting rules would dictate setting up a reserve for bad debt. Although the advice of the actuary may be sought for establishing this reserve, the bad debt account would not be part of the actuary’s estimate of policy liabilities.

Concentration risk is not intended to be the same as counterparty credit risk. Concentration risk is the risk of excess exposure to a single counterparty, and needs to be considered and addressed by the company’s risk management policies. Good risk management practice would include the monitoring of counterparty exposure, procedures for the approval of additional counterparties, and ongoing monitoring of counterparties either for credit or for impacts due to large-loss events.

RECOMMENDATIONS AND OPINIONS OF THE CIA TASK FORCE ON THE APPROPRIATE TREATMENT OF REINSURANCE

CIA Standards of Practice (SOP)

The task force believes that the current SOP, when properly applied, are adequate with respect to reinsurance. However, in an effort to provide further clarity and guidance with respect to reinsurance, the task force recommends that they be augmented in two ways:

- Consider adding a section to the SOP that explicitly states that when determining policy liabilities, the actuary must consider the entire policy contract along with any other contracts attached to, or subsequent to the contract, including reinsurance contracts and side agreements. While the task force members believe this is already implied by the SOP, we believe a direct statement addressing this “head on” adds further clarity.

- Consider eliminating differences between the Life and the P&C sections of the SOP, particularly with respect to the level of margins necessary to provide for reinsurance counterparty risk. For P&C insurance, a specific margin range is noted in subsection 2250 whereas the Life insurance sections are silent on this topic.

Principle versus a Rules-Based Approach

The task force members strongly believe that it is not advisable to espouse a rules-based approach in assessing the existence of risk transfer. A rules-based approach is not consistent with current Canadian and international accounting rules, and a rules-based approach cannot be comprehensive enough to capture all situations. In the case of potential risk limiting features, it would be impossible to anticipate the labelling, use, circumstances and effect of every risk limiting feature and as a result a rules-based approach would tempt practitioners to “manage to the test.” Rather, the task force members believe that maintaining the current principles-based framework for making professional judgement is the prudent approach.

Regulatory Capital Formulae

The task force members believe that as long as portions of regulatory capital formulae remain factor-based then they may not recognize the fact that risk transferred in a reinsurance contract is not always completely and permanently transferred. Moreover, the task force members believe that the assessment of complete and permanent risk transfer should be left to the judgement of the Appointed Actuary when making regulatory capital calculations. External Audit, External Actuarial Review and, for Life business, the MCCSR Report that is required beginning at 2006 year-end provide sufficient controls that reasonable judgement is being applied.

Mirroring of Liability Amounts

The task force members strongly believe that mirroring of liability amounts (sometimes referred to as “reserve mirroring”) by the cedant and the reinsurer is not appropriate for accounting purposes. Reserve mirroring is inconsistent with Canadian GAAP and IFRS principles and, in
the task force’s view, will in many cases lead to inappropriate liabilities for the reinsurer (assuming the reinsurer must mirror the amounts calculated by the cedant).

**Bifurcation of Reinsurance Contracts**

The task force members strongly believe that requiring bifurcation of reinsurance contracts into insurance and financial components is not appropriate for accounting purposes. Bifurcation is not required under Canadian GAAP and IFRS principles and the complexity, impracticality and cost of broad application of the bifurcation of reinsurance contracts in financial reporting is likely to greatly exceed any benefit derived from increased transparency.
Members should be familiar with educational notes. Educational notes describe but do not recommend practice in illustrative situations. They do not constitute standards of practice and are, therefore, not binding. They are, however, intended to illustrate the application (but not necessarily the only application) of the Standards of Practice, so there should be no conflict between them. They are intended to assist actuaries in applying standards of practice in respect of specific matters. Responsibility for the manner of application of standards of practice in specific circumstances remains that of the members.
MEMORANDUM

To: All Fellows, Affiliates, Associates, and Correspondents of the Canadian Institute of Actuaries

From: Pierre Dionne, Chair
       Practice Council
       Bob Howard, Chair
       Modelling Task Force

Date: January 26, 2017

Subject: Educational Note—Use of Models

A revised draft educational note was released to members on July 26, 2016. The task force thanks those who submitted comments. Based on the comments, there are a few clarifications and corrections in the final educational note below, but there are no major changes in thrust.

The subject that was commented on most frequently related to the definition of what is and what is not a model. Some objected to the classification found in section 1.2. The task force acknowledges that there is necessarily some vagueness in the definition of a model and that actuarial judgment is required, particularly near the border of what is and what is not a model. The task force believes that the main distinction contained in the definition is whether there is a simplification of reality as opposed to a calculation of reality itself.

In accordance with the Canadian Institute of Actuaries’ (CIA) Policy on Due Process for the Approval of Guidance Material Other than Standards of Practice and Research Documents, this educational note has been prepared by the Modelling Task Force, and has received final approval for distribution by the Practice Council on January 24, 2017.

As outlined in subsection 1220 of the Standards of Practice, “The actuary should be familiar with relevant Educational Notes and other designated educational material.” That subsection explains further that a “practice that the Educational Notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily accepted actuarial practice for a different situation.” As well, “Educational Notes are intended to illustrate the application (but not necessarily the only application) of the standards, so there should be no conflict between them.”
The members of the task force are Bob Howard (Chair), Michelle John, Pierre Laurin, Michelle Lindo, Simon Nelson, and Brenda Perras.

1 Background

1.1 Reference to Exposure Draft

This educational note is being released at the same time as a change to the General Standards on the use of models. This educational note is intended to be read along with the new standards. The standards address the main principles involved in an actuary’s use of models. The educational note expands on the principles to set out more specifics of how an actuary can ensure that good practice is being followed in the use of models. The intent of this educational note is to be principles-based rather than rules-based. The examples are intended to illustrate the principles rather than to describe a single correct way to do things.

The definitions in the Standards of Practice related to models are repeated here for convenience.

.31.1 Model is a practical representation of relationships among entities or events using statistical, financial, economic, or mathematical concepts. A model uses methods, assumptions, and data that simplify a more complex system and produces results that are intended to provide useful information on that system. A model is composed of a model specification, a model implementation, and one or more model runs. Similarly for “to model”. [modèle]

.31.2 Model implementation is one or more systems developed to perform the calculations for a model specification. For this purpose “systems” include computer programs, spreadsheets, and database programs. [implémentation du modèle]

.31.3 Model risk is the risk that, due to flaws or limitations in the model or in its use, the actuary or a user of the results of the model will draw an inappropriate conclusion from those results. [risque de modélisation]

.31.4 Model run is a set of inputs and the corresponding results produced by a model implementation. [exécution d’un modèle]

.31.5 Model specification is the description of the components of a model and the interrelationship of those components with each other, including the types of data, assumptions, methods, entities, and events. [spécifications du modèle]

1.2 Examples of Models

In most cases, it is clear what is and is not a model, but in some cases there can be uncertainty. However, the distinction is not necessarily important. An actuary ensures that all calculations are done with “due skill and care”. It would not be good practice to use any computer program without considering whether it was sufficiently accurate and suitable for the task.

The main distinction in the standards between a model and a calculation that is not a model is in the documentation required. The standards normally require some documentation for choosing and using a model. There is no requirement in the
standards of practice that an actuary keep any particular documentation of a calculation that is not a model, but for more significant or complex calculations, it may be prudent to retain some documentation.

Whether a model or not, the same standard of care in accuracy applies.

The two lists below are intended to give some examples of what is or is not a model, but neither list is definitive nor exhaustive. Their purpose is to clarify the definition, but ultimately classifying as a model or not will require judgment.

**Examples that are not Models**

1. Adding a column of numbers. There is no simplification of reality. The sum is reality itself. The same is true whether there are a few numbers or so many that they could not possibly be added manually.

2. Calculating a least-squares regression line. A regression line may be used in a model, but calculating a regression line itself is not a model.

3. Spreadsheets used to summarize and reformat information, typically for reporting purposes. The input may come from models, but the summarizing is not a model.

4. Calculating a life annuity factor where the formula and assumptions are prescribed, for example, by standards or regulation. This is not a model because the calculation does not allow for any discretion.

**Examples that are Models**

1. Calculating a life annuity factor where the actuary makes assumptions or where the actuary makes decisions about simplifications. This stands in contrast to example 4 above.

2. Dynamic Capital Adequacy Testing. This is a very complex model that may contain several submodels.

3. Generating a series of random events. The generation of a series of pseudo-random numbers is the application of an algorithm and not a model, but when those numbers are used to represent reality, the whole would be considered a model.

4. Creation of loss development factors (LDFs, also known as chain ladder) to estimate the ultimate incurred losses. While a simple model, the estimation of the age-to-age factors and the application of the ultimate factors are considered a model.

5. Generalized linear model (GLM) techniques used for segmenting an automobile book of business.

**1.3 Use or Development**

This educational note and the associated standards deal with the use of models but not with the development of models. There are robust bodies of knowledge around coding practices, change management, and process management that are typically employed in developing and modifying systems (including models), and actuaries will want to be
assured that good practices for model development and changes have been followed. However, this note focuses instead on tasks such as what is an appropriate model to use in a particular case, what assurance is there that there are no material errors in the model results, and how is the knowledge from the model best communicated to the user.

1.4 Model Risk and Risk Rating a Model

The concept of model risk is key to using a model effectively. Because a model is a simplification of reality, there is always risk in using a model. Model risk is focused not so much on the output of the model as on the inferences, opinions, and decisions that flow from the modelling.

Various strategies would be employed to mitigate model risk. These strategies are employed when actuaries do the following:

- Choose a model for a task;
- Use the model (one-time or ongoing) or oversee its usage; and/or
- Communicate results of that model.

In determining the potential mitigation activities, the actuary would consider the level of risk that the model poses; i.e., use a risk-based approach. Model risk exposure can be considered along two scales: severity and likelihood of failure in a model.

The first is the potential severity of a model failure, or “how bad can it be?” While it is difficult to quantify this, we can provide guidance in terms of looking at the following:

- The financial significance of the results that the model produces. Severity is greater for a model that is used for a major balance sheet item than for a model that is used to decide if a particular strategy is directionally correct.
- The importance of decisions being made using this model and how much the results of this model contribute to that decision. For example, one could be using several models to make a key decision, and in this case, each model’s individual contribution to the exposure is lower.
- Frequency of use. A model that is used frequently will have a much larger potential total severity than one used very infrequently because the same failure could be repeated many times until found. Conversely a model that is used infrequently is more subject to being misunderstood or misused than one that is used frequently.
- The non-financial impact. There could be a reputational impact and/or opportunity cost of getting it wrong. Even if there are no immediate financial outcomes, a model failure could lead a company to jeopardize its standing with regulators, competitors, and customers. A model failure could lead the company to miss a potential opportunity.
The second metric to consider is the likelihood of a model failure. This will generally be based on looking at the following:

- The complexity of the model. More complex models have greater potential for misuse and misunderstanding of the results, and there are many more calculations that need to be checked.
- Required level of knowledge and expertise of users. Inadequate knowledge and training of users could contribute to failures in the processing of the model, e.g., wrong inputs or failure to deal appropriately with known limitations. There could also be cases where the users misunderstand the model’s purpose and try to use it for another purpose for which it has not been tested.
- Adequacy of documentation.
- Sufficiency of testing.
- The degree of independence of the one validating the model from the developer of the model.
- Adequacy of peer review.

Typically, the actuary has limited control over severity. Also typically, the actuary can exert considerable control on likelihood through matters such as choosing better models, exercising greater care in validation, and employing tighter controls for model runs. Both the severity and the likelihood of potential model errors would be considered in risk rating the model.

(This educational note assumes that a risk rating is done, but there are acceptable alternatives. The essential point is to assess the risk of the model and determine the effort expected in validating and other model related tasks. When there are many models within a firm, a risk-rating scheme promotes efficiency and consistency. When there are few models, a risk-rating scheme may not be of benefit.)

Appendix 1 presents examples of risk rating a model out of many that are acceptable. The actuary is encouraged to follow an approach to risk rating that works well in his or her business. It is important to have a consistent approach to risk rating. The amount of effort in choosing, testing, validating, documenting, and controlling a model would reflect the risk rating. All models require some work to ensure that they are being used appropriately and accurately; those with higher risk ratings require more extensive work to mitigate model risk. When the risk rating is very low, little effort is warranted; when the risk rating is high a great deal of effort is warranted. In the extreme, a model may be unacceptable because its risk-rating is too high.

A protocol for periodically updating the risk-rating would normally be part of the risk-rating approach. The following considerations may guide the decision to update a risk-rating:

- Reassess if a model fails;
• Reassess on a regular cycle, e.g., every five years;
• Reassess when model use changes; and
• Reassess if the impact of results change greater than [some tolerance level set in advance].

2 Choice of Model

2.1 New (or Substantially Changed) Model

Before using any model, an actuary would become comfortable that it is well suited to the use that the actuary intends, that the model works correctly, that available data conform to the model requirements, and that the output is in a form that the actuary can use. The actuary would be alert to limitations in the model that may prevent it from providing reliable results under certain circumstances. The model’s risk rating is a key factor in determining the extent of the effort performed in deciding whether a model is acceptable. In particular, what is described below in this subsection is not to be taken as the minimum standard for all models. The amount of effort in each area would vary according to the risk rating.

Review Specification

The actuary will want to understand the model specification to verify that the methods used are sound, that assumptions that are embedded are appropriate, that the data can be provided in the form required, and that the model design contemplates all the necessary assumptions. For example, if valuing pension plans, the model needs to allow for a variety of forms of benefit, both immediate and deferred, and support the desired valuation method. The model would need a facility for adjusting the base mortality table, and it is desirable to support a two-dimensional improvement scale.

If using a third-party model, the actuary may have no access to the full specification. In this case the actuary will want to perform the appropriate tests to assess any important aspects not covered in the user’s documentation.

It is important to ensure that the format and interpretation of data available to use with the model coincides with or can be made to coincide with what is contemplated in the model specification. For example, some systems use sex codes 1=male and 2=female, but others use 1=female and 2=male. Some interest rates may be assumed to be effective annual, but others may be semi-annual compound.

Validate Implementation

The actuary cannot simply assume that the model correctly implements the specification. The actuary tests the model and ideally compares it with other tested models to verify the calculations. The greater the financial significance of the work for which the model is to be used, the more thorough the testing. It is good practice to keep documentation on the testing done. It is also good practice to maintain a set of test cases that can be run through the model or a new version of the model to verify that the
model is still correct. For a model with a higher risk-rating, it may be wise to run an entire live file through successive versions of the model.

There are many techniques that can be used in validation; not all techniques are appropriate to all models. Sensitivity is discussed at greater length in subsection 2.5. Backtesting may be helpful in some cases. Comparison to other models is useful when feasible.

The actuary would ensure that an adequate review was conducted on the model code and parameters used in the implementation. In many cases the actuary will have no access to the code, but the actuary can often ask the developer to describe what review was done to ensure that the code and hard-coded parameters are correct.

An actuary who is validating a model may consider having another actuary peer review his or her work.

*Dealing with Limitations*

Understanding limitations of models is important but rarely easy.

Actuaries would be aware of which events are independent of each other and which are correlated. For example, the mortality of individuals is normally independent, but lapse rates may be correlated to interest rates.

Actuaries would be alert to assumptions that are fixed or embedded in a model. For example if the income tax rate is hard-coded, the model cannot be used to assess sensitivity to changes in the tax laws.

Some approximations are not robust over a full range of potential outcomes. For example, if a mortality improvement scale which is two-dimensional is approximated by a one-dimensional improvement scale, the approximation may not be good enough for a pension plan of mostly young lives with long deferral periods, but it may be fine if most of the liability is for retired lives.

The actuary would understand the range of potential circumstances and uses for which the model was designed and tested. The model may appear to work correctly for all test cases, but it may not handle the full range of situations in the real world. A model may be appropriate for pricing, but it may not be able to handle all cases needed in valuation.

*Documentation*\(^1\) of Model Choice

It is good practice for the actuary to keep documentation on why he or she decided a particular model to be suitable, how it was determined to be sufficiently accurate, and what limitations, if any, were found.

\(^1\) *Documentation* refers to the actuary’s working papers and is distinct from internal or external user reports. Although documentation may not be made generally available, it is important that the documentation be available to those reviewing an actuary’s work and to those who later assume responsibility for the actuary’s work.
2.2 An Existing Model Used in a New Way

This subsection assumes that the steps in subsection 2.1 were previously followed for the model.

In this case, the actuary can be confident that the calculations are accurate, but the new application may be affected by limitations in the model that were not relevant in the initial application. Therefore, the actuary would consider what limitation, if any, is to be reviewed, perform appropriate testing, and document this work. The actuary would also consider whether the risk rating for the model has changed and, if it is higher, more validation work may be required. Completing this work effectively expands the range of standard applications for the model.

2.3 Models Approved for Use by Others

It commonly happens, particularly within a large firm, that one team validates a model that is to be used by others. It is generally appropriate for an actuary using a model to use the work of the others who validated the model, provided that the actuary agrees that the validation process was adequate.

The team doing the validation will typically disclose, at least in summary, that the steps in section 2.1 were followed. The actuary using the model would review the report on validation and retain evidence to show that the actuary is aware of the work done and is satisfied that the work was sufficient.

In some cases, an actuary may choose to rely on the validation done by others outside his or her firm. Unless the actuary has access to the documentation of the validation, the burden of proof for accepting such a validation would be higher than for a validation done within the firm.

2.4 Models Outside an Actuary’s Area of Expertise

Actuaries may need to use and/or rely on models outside of their expertise: for example, credit-scoring models, economic capital models, or enterprise risk management models that contain features and components outside the expertise of the actuaries using the models.

In these circumstances, the actuary would determine the appropriate level of reliance on other experts. In doing so, the actuary would consider the following:

- If the individuals on whom the actuary is relying are considered experts in their field of practice;
- The extent to which the model has been reviewed by experts in the applicable field; and
- The risk rating associated with the model.

The actuary would make a reasonable attempt to understand the following:
• The basic workings of the model including its inputs, outputs, and general approach;
• The testing and validation work that was completed; and
• The model’s complexity and the control framework used.

Further, the actuary would disclose, in the appropriate documentation and disclosures, any reliance on models created by other experts.

In cases where an actuary is required to use a model built using software in which he or she is not expert, the actuary would attempt to gain such understanding as to be convinced that the validation and control framework followed is sufficient to provide confidence in the results produced by the model.

2.5 Sensitivity Testing

Sensitivity testing is useful for validating a model, for understanding relationships between inputs and outputs, and for developing a sense of comfort with a model.

The actuary would consider the assumptions that will be input into the model. The actuary would test and observe the impact of varying these assumptions in validating the model.

The actuary would also consider testing a range of assumptions that may be outside the expected or currently observable range. The actuary can then observe if the model continues to operate soundly under these “what if”-type conditions. A simple example might be using zero or negative interest rates and ensuring the model result is theoretically correct.

The actuary would also ensure that the interplay between related assumptions is considered. For example, in a life insurance valuation model, a change to death rates impacts the mortality charge but also impacts the persistency of the block and may therefore have second-order impacts on the actuarial present value of the maintenance expense cash flows. The actuary would consider sensitivity testing assumptions singly and then in combination to ensure that the model works correctly and that he or she understands these interactions.

The actuary would be alert in the sensitivity testing to cases for which the relationship between input and output is non-linear or linear only over a limited range. In either case, the actuary would test a wider range of inputs so that the impact on output is more thoroughly understood.

Sensitivity testing is sometimes used to enhance the results produced by the actuary. In that case, the actuary may consider not only reporting on the chosen assumption but also on the sensitivity around that assumption. Aggregate risk models sometimes require dependency assumptions to model how different types of risk interact. The actuary usually would have to employ judgment in the choice of assumption to reflect dependency. Thus the actuary may produce results under one correlation matrix but disclose what happens under alternative correlation matrices.
The range of values tested would reflect the range of assumptions that is reasonably expected to be found in practice. Particularly in the case of stochastic models, it is important to test a range wide enough to cover the cases that would be generated randomly.

2.6 Preparing to Use the Model

Having chosen which model to use, the actuary will typically follow a set of steps before it can be used.

The model may require some customizing to fit the particular situation. Any changes to the specifications would be recorded, and any changes to the implementation would be tested.

Particularly in the case of a model that is used repeatedly and with a high-risk severity, it is good practice to document the process to be followed. Subsection 1540 provides relevant guidance on the control process. A process document might include the following:

1. Instructions for obtaining input data;
2. What authorization is required for setting input assumptions;
3. Step-by-step instructions on how to run the model;
4. Checks to be applied to model inputs and outputs;
5. Reconciliations required from prior runs; and
6. A flowchart of the process.

3 Minor Changes to a Model

When a model is changed, either section 2 or this section will apply. It is a matter of actuarial judgment which is more appropriate. If in doubt, it may be better to apply section 2.

Models are rarely static over time. A model may be changed to fix a bug, to change a hard-coded parameter, to handle a new situation, to reflect regulatory changes, etc.

Each time that a model is changed there is risk that the new feature will be implemented incorrectly, that something not planned to be changed will stop working correctly, that the documentation will be rendered inconsistent with the model, or that the change will not be correctly communicated to those who use the model.

At a minimum the actuary using a model that has been changed would be wise to run test cases through both the original and the changed model to verify that the differences, if any, are reasonable. If the changed model can handle cases not handled before, it may be useful to compare a new case handled by the changed model with a similar case handled by the previous version of the model.
The actuary may choose to rely on work done by others in validating a changed model in a manner similar to that described in section 2.3.

4 Use of Models

It is typical for an actuary to use the same model for a variety of cases, whether for valuation, pricing, or other purpose. Doing so makes good use of the actuary’s time and is economical for the client. To use the terms in the standard, the actuary produces many model runs (possibly varying data input and assumptions) with the same model specification and model implementation.

4.1 Validation of Data Input

Data need to be “sufficient and reliable”. It is assumed that there is a proper control process in place for obtaining the data to be used by the model. Subsection 1530 is directly relevant for data used in a model. The presence of faults in the input data represents a limitation in the model which may need to be disclosed. If the actuary does not assume responsibility for the data, then he or she would so report. Model risk increases when there are flaws in the data and may increase when the actuary assumes no responsibility for the data.

For example, if an insurance company is obtaining input to a valuation model for a material line of business, the actuary might consider the following:

**Sufficiency**

1. Do the data meet the requirements of the model specification?
2. If the model will be used repeatedly, are the data in a consistent format every time?

**Reliability**

1. Reconciliation to other sources (preferably audited):
   - For example, does an asset file reconcile to the balance sheet?
   - For example, do the total benefit/premium/records, etc., reconcile to data in other financial records of the company?
2. Summarize and compare input data to prior periods, if applicable.
3. Check and investigate data points that are outliers for possible errors. Examples are age 115, zero benefit, zero premium.
4. How are missing data handled? Is a data assumption made or is an error generated? Is it flagged?
5. Data assumptions would be reviewed periodically to assess their appropriateness.
6. Is the size of the data file consistent with prior periods?
4.2 Validation of Assumptions

In some cases, assumptions are not set through the model specification process but vary with each model run. In these cases, the input assumptions need to be as well controlled as the input data. Section 1700 is relevant for the assumptions required for a model run. The following considerations may be useful:

- Regular peer review (internal and external) of the assumptions.
- Are the intended assumptions the ones used in the model? Care should be taken with models used repeatedly that the assumptions are updated as needed on each model run.
- Are model assumptions unchanged unless they were meant to be changed?

4.3 Validation of Results

At a minimum, the actuary would ensure that the results of a model run are reasonable in light of the input. For models with higher risk rating, there would be stronger controls on the output. For many models, the following checks may be applied:

- Are outputs consistent with inputs? For example, do the output totals agree with the totals of input for number of lives or policies and the amount of insurance or income?
- How many errors were generated and what amount was involved? Is it within an established tolerance? Has the root cause of errors been identified and rectified to an acceptable tolerance?
- Are results as expected, both in direction and magnitude?
- If there are several model runs at different dates, are the latest results consistent with the trend?
- Are the results consistent with the impacts obtained from any sensitivity analysis that was conducted?
- Attribution analysis—has the change in the results from the prior period been explained?
- Testing the predictive value of the model using test data separately from data used for the parameterization.

4.4 Documentation

It is good practice for the actuary to retain documentation on the version of the model used and the inputs and outputs of the model. The model would not normally be mentioned in the user report. The actuary would not need to repeat in the documentation for a model run the issues dealt with when choosing that model.
4.5 Periodic Validation

It is good practice for the actuary to repeat the validation of a model periodically even if it has not been changed. (If the model has changed, see section 2 or 3.) A model with a higher risk-rating would be validated more frequently. A periodic validation can identify where assumptions or approximations, validated initially, are no longer appropriate and relevant in the current environment. An actuary new to a role in which an existing model has been routinely used would be wise to review the model and review the documentation of the model from the actuary’s predecessor.

4.6 Stochastic Models

In many respects, a stochastic model is the product of performing numerous runs of a deterministic model. As such, the recommendations of the other subsections of section 4 would generally continue to be followed. However, as indicated by 1540.09, when a stochastic model is used, additional consideration would be given to certain other elements.

When the model inputs and/or assumptions vary with each run, the actuary would ensure that the distribution of such inputs and/or assumptions is reasonable (e.g., in a model that forecasts pension valuations, is the distribution of valuation discount rates reasonable), paying particular attention to items such as the trend, mean, median, symmetry, skewness, and tails of such distributions. The actuary would also ensure that the correlation between each of the inputs and/or assumptions is appropriate. For example, in a model that forecasts pension valuations, is the correlation between valuation discount rates and government long bond yields appropriate? In an economic capital model, is the correlation between the unemployment rate and the gross national product appropriate?

Another question that could be addressed is the potential change of the correlation between variables at the mean as compared to the tail ends of the respective distributions. For example, for property and casualty (P&C) exposures, P&C lines of business are usually considered to be moderately correlated at the mean. However, in catastrophic and infrequent situations, the dependency assumption between casualty and property lines of business increases significantly.

In validating the results of a stochastic model, it is impractical and infeasible to review the results from every simulation. Instead, the actuary might typically review the following:

- The results from a carefully chosen sample of realized deterministic scenarios, covering an appropriate range of inputs and/or assumptions (e.g., a median-type scenario, a high-inflation-type scenario, a low-inflation-type scenario, etc.).
- The distribution of output results for reasonability, again paying particular attention to items such as the trend, mean, median, symmetry, skewness, and
tails of such distributions (e.g., in a model that forecasts pension valuations, is the distribution of forecasted funded status reasonable).

- Whether the results of the chosen deterministic scenarios are consistent with the distribution of stochastic results (e.g., are the results of the median-type deterministic scenario consistent with the median of the distribution of stochastic results).
- The relationships, or distributions of relationships, between certain inputs, assumptions and/or output results to ensure they are appropriate and internally consistent (e.g., in a model that forecasts pension valuations, is the distribution of the relationship between discount rates and funded status appropriate).
- Scenarios that lie near a boundary that is particularly important to the application; for example, a calculation of CTE99\(^2\) would be more concerned with scenarios in the far tail.

The actuary would be mindful that the result of a stochastic model is usually itself a statistical estimate that has its own mean and variance. The variance can be lessened by running more scenarios, but it cannot be eliminated. For example, if the purpose of the model is to estimate CTE99, two successive runs (with different random seeds) will usually give different results due to random fluctuation. Neither is the true answer; both estimates are equally valid. The fact that there is no single right answer presents challenges in communicating the results.

5 Reporting

The actuary is referred to section 1800 of the Standards of Practice for general guidance on user reports, both internal and external. The nature of the engagement (or assignment) will determine whether the model is mentioned in an actuary’s user report. In most cases, an actuary is engaged to express a professional opinion, such as an actuarial liability associated with a pension plan or the price for an insurance product. The actuary may use a model to inform the opinion, but it is not relevant to the user how the opinion was formed as long as it was done in accordance with accepted actuarial practice (i.e., modelling is incidental to the engagement). In other cases, an actuary is engaged to model a particular situation or to assess a model (i.e., the engagement involves modelling), and in those cases explicit comments on the model and its results would be relevant to the user.

\(^2\) Conditional Tail Expectation at 99 percent probability. That is, the mean of all scenarios that represent the worst 1 percent of results.
5.1 When Modelling is Incidental to the Engagement

The actuary would not normally mention the model unless there are limitations that need to be disclosed. The purpose of the model is to inform the actuary, who informs the user. The model is not intended to inform the user directly.

In cases where the model is not communicated to the user, one might say that the actuary bears the entire model risk.

5.2 When the Engagement Involves Modelling

In this case, the actuary would typically refer directly to the model. Whether the model is primary or secondary in the report would depend on whether the engagement was to model or assess a model or to form an opinion supported by modelling. As appropriate, the actuary's disclosure could range from describing the model and its results in considerable detail to comprising only a brief overview. The actuary may explain why the model was considered appropriate, but the work done in validation would not likely be mentioned. The actuary may have completed hundreds of model runs, but only those most relevant to the engagement would be mentioned in the report.

The actuary would disclose any relevant limitations in the model.

If model results are miscommunicated or misunderstood, it could lead to poor decision-making or other adverse consequences. Therefore, it is important to have clear and audience-specific communication of the intended use of the model, any limitations, and key approximations.

5.3 Limitations

In some cases the model may have limitations that bear directly on the ability of the actuary to fulfil the engagement. In such cases, regardless of the terms of the engagement, the actuary would disclose that a model was used and that the limitations of the model could materially impact the results. For example, if the actuary had any concerns with the quality of the data used in the model, the actuary would disclose those concerns, or if the model ignores or simplifies the treatment of a factor that the actuary considers relevant, the actuary would disclose that fact.

6 Hypothetical Examples

The following examples are not real but represent some typical situations that actuaries face. They are constructed by actuaries who have been in a similar situation and have given consideration to what would represent good practice in using a model. As with any example, these cannot be taken as prescriptive. Rather, they are intended to give actuaries a framework for addressing their own situations.

6.1 Life Insurance Valuation Using AXIS

Amy Anders has worked on the quarterly valuation of a block of non-par term insurance policies for the last two years. The company has just updated to a new version of AXIS.
The company has standard change management practices in place. Amy’s work related to the valuation model involves the following steps:

1. The model risk-rating is moderately high for several reasons: the potential impact on the company’s financial statements, amount of user customization in the model, and the level of expertise required to understand the model.

2. There have been control practices in place within the operating unit, in terms of change management practices, layers of documentation, and model review.

3. Her work with the new version of AXIS is therefore to do the following:
   a. Review the list of changes since the earlier version and establish an expectation of impact on the model. Identify if there is a need to isolate the impact on particular blocks of policies beyond some standard breakdowns.
   b. Convert the model and understand the impact on key outputs from the valuation. She decides to use the prior quarter-end data set per her company’s change management protocol. She reruns the batches from beginning to end and reviews the impact by plan, term structure, as well as a few other key product features. She notes that the overall impact was immaterial, but the impact was concentrated to a small plan that was newly introduced last year.
   c. This was consistent with her expectation, as there was a bug fix in the new version related to certain commission tables.
   d. She documents the changes in the company’s model version control system and puts comments in the data set notepad.
   e. She shares her documentation with teams who might use the model for dynamic capital adequacy testing (DCAT), Canadian asset liability method (CALM), economic capital, and other items in the future. She also shares the information with the pricing team.

6.2 Pension Valuation Using Third-Party Software

Paul Penny is a pension practitioner doing a regular valuation for a pension plan using his firm’s valuation software that is licensed from a third party. Paul has been with his firm for 10 years and did the previous valuation of this plan using the same third-party software, although it was using a prior release. Paul understands that the software was thoroughly vetted by an internal team of actuaries when it was initially licensed by his firm and that this team also vets subsequent releases, but this will be the first time he will personally be using the current release. Paul’s work related to the valuation model (distinct from doing the valuation itself) involves the following steps:

1. Paul considers whether the third-party software is the appropriate model for performing the valuation, and determines that it is.
2. Paul assesses the risk rating of the choice of model and comes to the conclusion that it is high, owing to the financial significance of the results to the users, the regulatory nature of the valuation filing, and overall reputational risk associated with the work.

3. Paul reviews the documentation provided by the third party to assess the extent of the changes between the release Paul used for the previous valuation and the current release. He pays particular attention to changes that could be applicable to the plan he is working on. Based on this assessment, Paul considers whether the principles of section 2 or section 3 would be most applicable.

4. In Paul’s opinion, the principles of section 3 are most applicable in this case. He is also of the opinion that this release revision represents a moderately-low risk activity.

5. Paul contacts his firm’s internal team that is responsible for licensing and vetting the software. They provide Paul with the quality control report from the third party, and he satisfies himself that appropriate regression testing was applied to the current release (and intermediate releases) and that the third party has rigorous controls for approving each release. The internal team also directs Paul to a source for internal working papers that indicates that they have reviewed the third-party’s reports and performed their own independent testing on a control group of plans.

6. Based on step 5, Paul is comfortable that the validation process for this release was adequate.

7. Paul retains a copy of the documentation noted in step 5 and evidence of his review in his working papers.

8. Paul proceeds with the valuation of the pension plan using the new release.

6.3 P&C Valuation Using the Chain Ladder Method

Claude Cousteau is valuing a block of automobile claim liabilities using the chain ladder method. His company developed software for implementing this method several years ago, and the software continues to be used without modification. Claude’s work related to the model involves the following steps:

1. Considers whether the current model is applicable, and decides that no modifications are required. The model is rated medium to high owing to the importance on the financial statements.

2. Updates the incurred loss triangles to include an additional valuation period.

3. Selects the types of averages (high/low, three year, five year, others) to be used for the age-to-age estimation.

4. Determines if the data has sufficient credibility to be used on its own or if benchmarks are required to supplement to historical data.

5. Reviews the historical age-to-age factors for anomalies and extremes.
6. Smooths and/interpolates the resulting age-to-age factors as required.
7. Selects the age-to-age factor based on the results of the model.
8. Reviews the tail factor and makes a determination of the tail factor value based on a documented methodology.
9. Runs the model to calculate the loss development pattern, which will be used to project the ultimate incurred losses.
10. Prints the result of the evaluation in appendices of the report, documenting the whole valuation of the liabilities.

6.4 Determination of the Value of Lost Wages for a Suit Involving Personal Injury

Ed Evans is an actuarial evidence actuary who has been engaged to determine a present value. Ed wrote the software for the model three years ago and tested and documented it thoroughly at that time. Ed recognized the model as important to his business because it is used for a significant proportion of his work. He has repeated the validation each time there has been a major change such as a new version of operating system or a new mortality table. He has used the model for dozens of similar cases and it remains valid. Ed’s current work related to the model involves the following steps:

1. Decide whether his standard model is applicable in this particular case, and determine that it is.
2. Enter the file reference for the case, the date of birth, the date of the accident, salary, and other parameters on the input screen for the program.
3. Run the model to calculate the present value.
4. Print the screen (showing input, output, and timestamp for the run) and file it.

6.5 Forecasting Capital Requirements Using a Spreadsheet Model

Ruth Rock has been assigned the task of forecasting quarterly capital requirements for a small reinsurer. In order to improve on the method used in prior years, Ruth decided to develop a new model using a spreadsheet, which will take inputs from the entity’s valuation output and finance department, as well as current yield curves and investment analysis. Ruth’s work related to the model involves the following steps:

1. Ascertain the risk-rating of the proposed model by considering what the model will be used for, financial significance, frequency of use, complexity, inputs, and outputs. In this case, a moderately high risk rating was assigned. Document the result.
2. Gather the inputs.
3. Confirm the inputs with other sources: e.g., capital form submitted to the regulator, income and balance sheet data, Bank of Canada website.
4. Decide on assumptions to be used regarding sensitivity of required capital to interest rate changes:
a) Sensitivity analysis; and  
b) Review actual impacts from prior periods.

5. Build the model using the prior year-end as the starting point, to forecast the next quarter (which is already past, but is being used as the initial validation of the model).

6. Validate and refine the model using several prior quarters. Highlight and document any limitations.

7. Document the process for updating the model.

8. Run the model in parallel with the prior method for a few quarters, and reconcile model output to actual results. Refine the model and update documentation if necessary.

9. Revalidate the model after year-ends, updating assumptions and documentation if necessary.

6.6 Using a New Economic Scenario Generator in an Internal Capital Model

Nigel Nyambi is the actuary in charge of the implementation of a new third-party vendor economic scenario generator (ESG) model for use in the economic capital calculation for segregated fund guarantees. Nigel’s project plan includes the following tasks:

1. Review the model features, limitations, controls, parameters, and outputs and document any concerns.

2. Review the scenarios produced by the vendor under various parameters to assess whether they are reasonable and meet the needs of the company; e.g., do the risk neutral scenarios produce market values that are consistent with Canadian market prices? Document the outcome of the assessment.

3. Risk rate the ESG model and document the outcome and rationale. The model is rated as high risk because of the following:
   a. There is a high variability of the segregated fund capital to different ESG scenarios;
   b. The ESG model is used for senior management and board reporting of capital;
   c. Although the reserves are currently small, this product is a key user of capital for the company; and
   d. The third-party software code is open and can be changed by a user.

4. Set up and parameterize the ESG model to produce risk-neutral and real-world scenarios with the prior quarter’s assumptions and parameters. Review the results produced.
5. Have the model validated by another person/team with the requisite knowledge and experience who is not part of Nigel’s reporting chain. Review the model validation report and fix any material issues.

6. Prepare for implementation, e.g., update process and controls documentation.

7. Implement model.
Appendix 1: Risk-Rating Schemes

There are many valid approaches to risk rating a model. The point is to assess how risky a model is so that the amount of work done to choose, validate, and document a model may be appropriate to the circumstances. Two are presented here as examples.

**A Uni-dimensional Approach**

For example, a small- to medium-sized direct life insurance company could use a table similar to the following to evaluate its valuation models.

Review each risk factor below and place the score (1 to 4) beside each risk factor. Add up the total score at the end of the table.

<table>
<thead>
<tr>
<th>Risk Factor</th>
<th>Score (1–4)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A. Size of block valued (percent of total actuarial liability):</strong></td>
<td></td>
</tr>
<tr>
<td>1. 0–2 percent</td>
<td>3</td>
</tr>
<tr>
<td>2. 3–5 percent</td>
<td></td>
</tr>
<tr>
<td>3. 6–10 percent</td>
<td></td>
</tr>
<tr>
<td>4. Greater than 10 percent</td>
<td></td>
</tr>
<tr>
<td><strong>B. Strategic importance of block valued:</strong></td>
<td></td>
</tr>
<tr>
<td>1. Closed to new business, run-off mode.</td>
<td>3</td>
</tr>
<tr>
<td>2. Minimal new business, infrequent re-pricing.</td>
<td></td>
</tr>
<tr>
<td>3. Moderate new business or new product line, or occasional re-pricing or product redesign.</td>
<td></td>

<td></td>
</tr>
<tr>
<td><strong>C. Complexity of model:</strong></td>
<td>2</td>
</tr>
<tr>
<td>1. Simple traditional-type product, few input files, single valuation method, single scenario, infrequent assumption updates.</td>
<td></td>
</tr>
<tr>
<td>2. More than one product line or valuation method, more frequent assumption updates.</td>
<td></td>
</tr>
<tr>
<td>3. More complex products with more product features (e.g., universal life), or many valuation methods, scenario-based assumptions.</td>
<td></td>
</tr>
<tr>
<td>4. Stochastic-type valuation with several scenarios and assumptions, complex products (e.g., segregated funds).</td>
<td></td>
</tr>
</tbody>
</table>
D. Expertise of model users and/or key person risk:

1. High level of understanding by model users—understand how the model works, products being valued, expected results. More than two persons capable of running, updating, and analyzing model results.

2. Good understanding of model and products by model user(s) and/or more than two persons capable of maintaining and explaining model results.

3. Some understanding of model and products by model user(s) and/or at least two persons can maintain/explain model.

4. Limited understanding of model and products by model user(s) and/or only one person capable of running, updating, and analyzing results.

| 2 |

E. Level of documentation and review:

1. Model fully validated and documented (assumptions, process, limitations, etc.), and documentation updated as needed with appropriate peer review and sign-offs.

2. Good documentation and frequent peer review.

3. Partial documentation and occasional peer review of model.

4. No documentation, model not peer reviewed.

| 3 |

**Total Score out of 20:**

13

Assessment of Score:

1—5 Minimal model risk—keep current practice, little or no changes needed

6—10 Lower model risk—reduce risk factors if possible, focusing on sections D and E

11—15 Moderate model risk—reduce risk factors if possible, focusing on sections D and E, by having more frequent reviews of models, updating documentation and training additional staff if appropriate

16—20 High model risk—high focus, immediate improvements or frequent model validation needed
A Two-Dimensional Approach

A model is assessed separately for severity and likelihood of failure, and the risk-rating is determined by balancing the two aspects.

THE CAP ON NON-PECUNIARY GENERAL DAMAGES:
Where is it going and how does it affect litigation?

Jim Davidson
MacMillan Rooke Boeckle

INTRODUCTION

On October 19, 2006, the Supreme Court of Canada dismissed the Leave to Appeal application in Lee v. Dawson\(^1\) without reasons. In doing so, the Supreme Court of Canada ended speculation that the time had come to revisit the cap on general damages.

This paper will review the cap on general damages and the key cases that have dealt with this issue over the past 30 years.

THE TRILOGY

The cap on non-pecuniary damages became law in Canada as a result of the 1978 trilogy of Supreme Court of Canada decisions in Andrews v. Grand & Toy Alberta Ltd.\(^2\), Teno v. Arnold\(^3\), and Thornton v. Prince George School District No. 57\(^4\).

In Andrews, Mr. Justice Dickson concluded that the time had come to stabilize and bring some consistency to awards for non-pecuniary or general damages. This was viewed as necessary for the following reasons:

\(^1\) [2006] S.C.C.A. No. 192
\(^3\) [1978] S.C.J. No. 8
1. The claim of a severely injured person for damages for non-pecuniary loss is virtually limitless. The fact that there is no objective yardstick for measuring such loss leaves this area open to inconsistent and widely extravagant awards.

2. Damages for non-pecuniary losses are not really "compensatory" as no money can provide true restitution. Accordingly, such damages should be viewed as simply providing additional money to make life more endurable.

3. Under the law, the plaintiff will be fully compensated for future loss of income and future care costs which are arguably more important for ensuring that the injured person is well cared for in the future.

4. Exorbitant awards for general damages can lead to an excessive social burden (i.e. unaffordable increases in insurance and social costs).

In order to bring stability to this area of the law, Mr. Justice Dickson essentially established a rough upper limit on awards for non-pecuniary loss. He did so with the following statement:

I would adopt as the appropriate award in the case of a young adult quadriplegic like Andrews the amount of $100,000. Save in exceptional circumstances, this should be regarded as an upper limit of non-pecuniary loss in cases of this nature.\(^5\)

There are two important observations that can be drawn from the reasons of Mr. Justice Dickson in Andrews.

The first observation is that a fundamental justification for imposing an upper limit on non-pecuniary losses is the underlying assumption that pecuniary losses will be fully compensated. This results in "a co-ordinated and interlocking basis for compensation."

\(^5\) [1978] S.C.J. No. 6 at p. 21
The second observation is the assumption that non-pecuniary claims in the most serious cases, if left unregulated, would lead to "extravagant" awards and a subsequent burden on society. On this point, Mr. Justice Dickson said the following:

This area is open to widely extravagant claims. It is in this area that awards in the United States have soared to dramatically high levels in recent years. Statistically, it is the area where the danger of excessive burden of expense is greatest.\(^6\)

This line of reasoning was further developed by Mr. Justice Spence in *Teno v. Arnold* as follows:

The very real and serious social burden of these exorbitant awards has been illustrated graphically in the United States in cases concerning medical malpractice. We have a right to fear a situation where none but the wealthy could own or drive automobiles because none but the wealthy could afford to pay the enormous insurance premiums which would be required by insurers to meet such exorbitant awards.\(^7\)

**SUBSEQUENT CASES**

*Fenn v. City of Peterborough*\(^8\)

This case came before the Ontario Court of Appeal in 1979, a little more than a year after the *trilogy* had been handed down by the Supreme Court of Canada.

In this case, the Court of Appeal seized on the words of Mr. Justice Dickson that the cap should not be exceeded *save in exceptional circumstances*. The Court of Appeal was dealing with a grievously injured plaintiff. There was little doubt that the plaintiff’s crushing and disabling injuries moved her at least the $100,000 plateau. The question before the Court was whether or not that plateau should be exceeded.

---

7 [1978] S.C.J. No. 8 at p. 28
8 [1979] O.J. No. 4312
In that case, the Court of Appeal relied on two factors which justified an award that was somewhat higher than $100,000. Firstly, the trial took place approximately 1 ½ years after the latest of the trials in the trilogy cases. It was assumed that there had been an appreciable erosion in the value of money. Secondly, it appeared that the plaintiff had suffered more substantial pain than any of the plaintiffs in the trilogy. Accordingly, the Court of Appeal determined that the appropriate figure for general damages in the case before it was $125,000.

This decision was not appealed and accordingly, the Supreme Court of Canada was never given an opportunity to comment on the reasons and conclusions of the Ontario Court of Appeal. It remains the only appellate level decision that exceeds the cap imposed by the trilogy

**Lindal v. Lindal**

In 1981, the same issue came before the Supreme Court of Canada in *Lindal v. Lindal*[^9]. The issue before the Court was narrow: Under what circumstances should a trial Judge exceed the rough upper limit of $100,000 for non-pecuniary losses established the trilogy.

At the trial level, the plaintiff was awarded $135,000, a figure in excess of the rough upper limit. This case was then appealed to the British Columbia Court of Appeal which allowed the appeal and reduced the amount of the award for non-pecuniary damages from $135,000 to $100,000 based on the trilogy.

The case was subsequently appealed to the Supreme Court of Canada and once again, Mr. Justice Dickson rendered that Court’s decision. Mr. Justice Dickson repeated the rationale in support of a rough upper limit as set out in his decision in *Andrews*. Mr. Justice Dickson re-iterated the point that such damages were not meant to

"compensate" the injured person but rather provide additional money to make life more endurable.

Accordingly, it was not proper to compare the nature of the injuries as between various plaintiffs to determine whether or not they were more or less seriously injured than those plaintiffs in the trilogy. Rather, the limit of $100,000 was to be viewed as the upper limit for all such similar cases. This would provide a measure of uniformity and predictability in this difficult area.

Finally, Mr. Justice Dickson indicated that the quantum of the award itself should not be increased to reflect the impact of inflation. Rather, the specific amount of $100,000 should be increased upon proof of, or agreement as to, the effect of inflation on that amount over time.

It is from this decision that the Courts have subsequently viewed the cap as $100,000 indexed for inflation to a precise point in time, which as of December of 2006 was $311,483.

*ter Neuzen v. Korn*\(^{10}\)

In 1995, the Supreme Court of Canada once again commented on the rough upper limit on non-pecuniary damages. In this case, the plaintiff had been infected with AIDS as a result of an artificial insemination. At trial, the jury awarded $460,000 for general damages. The Court of Appeal ordered a new trial on the basis that the award for general damages could not exceed the rough upper limit as set by the *trilogy*.

Mr. Justice Sopinka, writing for the Court, stated that the *trilogy* had imposed as a "rule of law" a legal limit for non-pecuniary damages in personal injury cases.\(^{11}\) Furthermore, Mr. Justice Sopinka indicated that the appropriate approach in cases where jury verdicts

\(^{10}\) [1995] S.C.J. No. 79  
\(^{11}\) [1995] S.C.J. No. 79 at p. 29
exceed the rough upper limit was for the Court to essentially substitute its own award for general damages at the amount of the cap.

With this decision, the rough upper limit evolved from a judicial policy directive to a "rule of law" which not only reinforced the Supreme Court of Canada's view on the rough upper limit but arguably further formalized it in law.

The Decisions in Lee v. Dawson

Trial Level
In Lee v. Dawson, a young plaintiff sustained an extremely serious brain injury as well as serious facial injuries. The jury awarded general damages of $2,000,000. After hearing arguments from counsel, the Trial Judge felt he was bound by the trilogy and reduced this award to $294,600 which was the indexed amount for the cap at that time.  

The plaintiff appealed seeking to restore the jury's verdict by arguing that the cap should not apply.

Court of Appeal
The main ground for the appeal was based on the equality provisions of Section 15 of the Charter. The plaintiff conceded that the Charter did not directly apply as this was litigation between private parties. However, the plaintiff relied upon a body of case law which held that the common law must conform to "charter values" and the cap essentially offended such "charter values". It was also noted that the trilogy predated the Charter and had never been subject to a Charter analysis.

In making this argument, the plaintiff essentially stated that the cap discriminated against seriously injured victims of negligence. In that regard, less seriously injured

---

12 [2003] B.C.J. No. 1532 at p. 3
13 See Hill v. Church of Scientology [1995] 2 S.C.R. 1130 at paragraph 95
victims of negligence were entitled to full compensation for pain and suffering. However, full compensation was denied to the most seriously injured victims of negligence as a result of the cap.

The plaintiffs also argued that seriously injured victims of negligence were also discriminated against when compared to seriously injured victims of other torts, for example, defamation where the cap on general damages did not apply. 14

The British Columbia Court of Appeal rejected this argument based on “charter values”. In doing so, they concluded that the plaintiff’s argument in this regard was flawed as general damages were never meant to provide “full” compensation to injured plaintiffs. In addition, the Supreme Court of Canada had held that the amount of award for general damages should not depend upon the seriousness of the injury or how it compared to the injury of other plaintiffs as illustrated by the following passage:

In Lindal v. Lindal, the Court defined the nature of non-pecuniary damage awards. The Court clearly indicated that the non-pecuniary awards are not fully dependent upon the gravity of the injury. Their purpose is not compensatory; rather, the objective is to provide a substitute for the lost amenities in an effort to improve the victim’s condition and to make the plaintiff’s life more bearable. 15

In attempting to compare seriously injured plaintiffs to less seriously injured plaintiffs in order to illustrate discrimination, the plaintiffs misapprehended the essential rationale for both awarding general damages and the need for the rough upper limit, namely bringing stability and predictability to awards for general damages while at the same time avoiding excessive awards and their corresponding social costs.

In addition to this Charter argument, the plaintiff also made a number of additional arguments as to why the cap should not apply, including the following:

---

• The Supreme Court of Canada used language in the trilogy suggesting that the rough upper limit was just that and not a strict rule of law.
• Considerations contemplated by the Supreme Court in the trilogy, such as skyrocketing awards and insurance premiums had proven to be false.
• The upper limit precluded juries from keeping up with the rapid pace of social, economic and technological change in society.
• The cap is inconsistent with modern community values, which are more accepting of disabilities than previously.
• The rough upper limit disregards juries and the importance of juries outweighs the hypothetical benefits that the guidelines might bestow.
• The establishment of the upper limit constitutes a radical change in the common law contrary to the accepted “incremental method” of achieving such changes.
• The cap produces unjust results for plaintiffs whose situations differ from the plaintiffs in the trilogy.
• Finally, the cap is simply arbitrary and lacking a logical foundation.

After highlighting these arguments, the Court of Appeal chose not to respond to the merits of these arguments but rather stated in a concluding paragraph the following:

I agree with the plaintiff and the intervenor that the time may have come for the rationalization or conceptional underpinning for having a rough upper limit on non-pecuniary damages to be re-examined. However, I am not persuaded that is open to this Court to proceed on the footing that the trilogy establishing the rough upper limit is not binding on us. Some of the submissions made by the appellant and the intervenor advocating a reconsideration of the rough upper limit seem to me to be compelling but, in the end, this Court cannot overturn the trilogy.

Certainly, anyone reading this paragraph is left with the impression that the British Columbia Court of Appeal was sympathetic to the plaintiff’s arguments for revisiting the rationale for the cap but simply felt that this was for the Supreme Court of Canada to decide.
Supreme Court of Canada

On October 19, 2006, the Supreme Court of Canada dismissed the plaintiff's application for Leave to Appeal. This was done without reasons. Accordingly, the rough upper limit remains the law in Canada.

Any discussion as to why the Supreme Court of Canada declined to hear the appeal in Lee v. Dawson is pure speculation. However, it is a probably safe to conclude that the Supreme Court continues to support the rationale for having a cap on general damages.

Perhaps the following 1981 quote from Professor Beverly McLachlin [as she then was] provides some insight in this regard:

The concept of "full compensation" does not provide a comprehensive rationale for damages for personal injuries. It is applicable only to pecuniary losses. It provides no theoretical justification for damages for non-pecuniary losses. Full compensation in relation to non-pecuniary losses is meaningless, and arguably dangerous, since such losses by their nature cannot be fully restored.16

Also, for an excellent discussion on the trilogy and a thesis in support of the cap, it is worthwhile to review Roger Oatley's 2005 article "Is It Time To Revisit The Trilogy". Essentially, Mr. Oatley argues that the cap works because it creates an economic climate where insurers continue to underwrite property and casualty insurance. This, in turn, ensures that "innocent people recover full compensation for economic loss within an economic context that has finite resources." It also supports a stable and predictable system of law in this area which is essentially fair to most people.17

---

**Cases To Which The Cap Does Not Apply**

There have been cases that have awarded general damages to plaintiffs in excess of the cap.

For example, in *S.Y. v. F.G.C.*\(^{18}\), the British Columbia Court of Appeal rejected the notion that the cap applied to claims for damages for sexual assaults.

In *Hill v. Church of Scientology*\(^{19}\) the Supreme Court decided that there was no cap for defamation and the plaintiff was awarded $300,000 in general damages.

In *Young v. Bella*\(^{20}\) heard October 20, 2005, the Supreme Court commented on the issue of the cap for non-pecuniary damage awards outside the personal injury context.

In that case, the Appellant was a university student taking courses toward her goal of being admitted to the School of Social Work and becoming a social worker. As a result of a missing footnote to her term paper, the Respondent professor speculated that the case study attached as an appendix might be a personal confession to having sexually abused children (a 'cry for help'), which gave rise to the release of this information to the child protection agency suggesting that she was a suspected child sex abuser. The information was also discussed amongst three university professors, communicated to the RCMP, social workers and her boyfriend's sister. The appellant sued the Defendant professor and University complaining that their actions 'combined to put in motion a series of events that would forever shape the course of [her] future by affecting her reputation in the community, her ability to complete her education and by reducing her income-earning capacity'.

---

\(^{18}\) (1996), 78 B.C.A.C. 209:

\(^{19}\) [1995] 2 S.C.R. 1130

A jury found the University's treatment of the appellant to be negligent and further found that as a result of this negligence her chosen career prospects had been destroyed; it awarded $839,400 in damages, including $430,000 in non-pecuniary damages. A majority of the Court of Appeal set aside the jury award.

The matter was appealed to the Supreme Court of Canada and it was argued that the cap should apply to the award for non-pecuniary damages. In rejecting this argument, the Supreme Court stated at page 17:

The respondents have not established why the policy considerations which arise from negligence causing catastrophic personal injuries, in the context of accident and medical malpractice, should be extended to cap a jury award in a case such as the present. This argument was rejected in relation to damages for defamation in Hill v. Church of Scientology of Toronto, [1995] 2 S.C.R. 1130, at paras. 170-76. In our view, the case for imposing a cap in cases of negligence causing economic loss is not made out here either. As Macfarlane J.A. commented in S.Y. v. F.G.C. (1996), 78 B.C.A.C. 209:

There is no evidence before us that this type of case has any impact on the public purse, or that there is any crisis arising from the size and disparity of assessments. A cap is not needed to protect the general public from a serious social burden, such as enormous insurance premiums.

From these passages it is quite clear that the "social costs" issue, as a reason for the cap, remains a paramount concern of the Supreme Court of Canada.

**Conclusion**

The cap on general damages imposed by the *trilogy* remains a "rule of law" in Canadian jurisprudence. The Supreme Court's very recent refusal to revisit this issue in *Lee v. Dawson* likely stands as a good indication that the cap will remain with us well into the future.

Furthermore, subsequent decisions demonstrate that the original rationale for the cap, particularly the concern regarding consequential social costs, remains valid and relevant to the Supreme Court of Canada 30 years later.
Facility Association

The Facility Association is a Canadian entity whose goal is to ensure that automobile insurance is available for every owner and licensed driver of motor vehicles who require it to legally operate their vehicles. The insurance industry created the Facility Association in June 1977 as an unincorporated, non-profit organization whose role is to administer the involuntary residual market of automobile insurance on behalf of the voluntary/private sector automobile insurance industry across Canada.

Every insurer licensed to write automobile liability insurance in any jurisdictions served by the Facility Association must become and remain a member of this organization. The Facility Association currently operates in the following provinces and territories: Alberta, New Brunswick, Newfoundland & Labrador, Northwest Territories, Nova Scotia, Nunavut, Ontario, Prince Edward Island, and Yukon. The only provinces in which it does not operate are the three provinces with provincial public automobile insurance (i.e., British Columbia, Manitoba and Saskatchewan) and Quebec.

Organization

The Facility Association, which also operates in Alberta under the name of “Market Availability Plan,” accomplishes its mission of ensuring automobile insurance availability through two types of risk sharing mechanisms: risk sharing pools and the more traditional residual market. It also administers the Uninsured Automobile Funds in the four Atlantic Provinces as required by the respective provincial Insurance Acts.

Facility Association

- Residual Market
- Risk Sharing Pools
- Uninsured Automobile Funds

In Quebec, the Groupement des Assureurs Automobiles (GAA) administers a risk sharing pool mechanism called the Plan de Repartition des Risques (P.R.R.) which essentially fulfills the same role as for those administered by the Facility Association in other provinces.

Facility Association Residual Market (FARM)

The FARM provides a residual automobile insurance market for owners and operators of personal and commercial motor vehicles who may otherwise have difficulty obtaining automobile insurance. It operates in all jurisdictions served by the Facility Association.

In each jurisdiction, the Facility Association contracts with a few member automobile insurance companies to issue and administer policies. These insurance companies, known as Servicing Carriers, also adjust claims on behalf of the Facility Association.

All policies written by the FARM through a Servicing Carrier are subject to the rates, rules, and classification of the Facility Association. These rates, rules, and classification require regulatory approval for all jurisdictions served by the FARM.
Facility Association

Under the FARM, agents and brokers who are unable to find automobile insurance coverage for one of their clients can contact a Servicing Carrier who will issue a Facility Association policy for the particular client. As a result, every policyholder insured through the FARM knows that their insurance policy is part of the residual market.

It is important to note that the Facility Association only allows Servicing Carriers to underwrite policies under its FARM mechanism if the policy includes at least the statutory minimum automobile coverage in the jurisdiction concerned and the particular risk is a “Residual Market Risk.” In all other cases, the agent or broker must place the risk with their voluntary insurance markets. The Facility Association’s Plan of Operation defines a Residual Market Risk as a risk which includes coverage in connection with:

1) any motor vehicle that is not a Private Passenger Vehicle; or

2) any Private Passenger Vehicle with respect to which an insurer to whom an application has been made to insure the risk is authorized at law to decline to issue or refuse to renew a contract of insurance in respect of such risk.

The financial results of the vehicles insured through the FARM are pooled among all insurance companies licensed to write automobile insurance in the province based on participation ratios described below. This is due to the fact that every insurance company licensed to write automobile insurance in a jurisdiction served by the FARM is required by law to belong to the Facility Association.

Risk Sharing Pools

The risk sharing pools allow automobile insurance companies to transfer certain of their personal automobile insurance exposures to an industry-wide pool. While these exposures do not qualify for the FARM, insurance companies believe that they represent a higher risk of loss. As such, risk sharing pools essentially act as industry-wide reinsurance mechanisms that are largely invisible to both consumers and intermediaries.

The Facility Association administers risk sharing pools in Ontario, Alberta, New Brunswick, and Nova Scotia. In each of these jurisdictions, member companies underwrite individual policies according to their own rates and rules. They then have the option of keeping such business for their own account or transferring it to the risk sharing pool based on certain minimum requirements. However, the act of transferring a specific risk to a particular risk sharing pool must be invisible to both the consumer and the insurance intermediary.

Similar to the FARM, the financial results of the risk sharing pools are pooled among all insurance companies licensed to write automobile insurance in the province, who are required by law to belong to the Facility Association.
Facility Association

The Uninsured Automobile Funds

In the four Atlantic Provinces (i.e., New Brunswick, Newfoundland & Labrador, Nova Scotia, and Prince Edward Island), the Facility Association also administers funds which provides financial compensation for damages to persons who cannot obtain satisfaction for their damages under a contract of automobile insurance and where there is no other insurance or where the other insurance is inadequate with respect to the damages claimed. The respective provincial Insurance Acts govern the payment of these claims.

The Facility Association monitors the investigation, defense and final settlement of these claims through the assistance of designated law firms and insurance companies.

Board of Directors and membership rights

The Board of Directors, composed of elected or appointed representatives from member insurance companies as well as insurance brokers, manages and controls the affairs and business of the Facility Association. The Board has the authority to implement many key decisions on behalf of the Facility Association. Some examples of these responsibilities, which are explained in further details in Facility Association’s Plan of Operation, are:

— Considering and approving suggested rate changes and rate filings

— Authorizing expenses

— Establishing and maintaining standards to be followed by Servicing Carriers and members using a risk sharing pool

— Appointing committees and sub-committees to assist them with specific issues

As mentioned above, every insurer licensed to write automobile liability insurance in any jurisdiction in which the Facility Association is qualified to operate is required to be a member of the Facility Association.

Members of the Facility Association may vote on matters submitted to them by the Board of Directors. A member’s total volume of automobile third party liability direct written premiums for the latest available full calendar year in all jurisdictions in which the Facility Association has operated determines the number of votes that it is entitled to. If a particular matter affects a single jurisdiction, then only members operating in such a jurisdiction can cast their votes, and the respective weight of their votes will depend on their premium volume in the jurisdiction.

For more information on the specific rules regarding the Board of Directors and the rights of member companies, please refer to the Facility Association’s Plan of Operation.
Facility Association

Participation Ratios and Sharing

The Facility Association’s Plan of Operation lists five classes of business that determine a member’s participation in the Facility Association:

1) Private passenger non-fleet non-pool automobile business

2) All automobile business other than that included in (1) or transferred to a risk sharing pool

3) Business transferred to a risk sharing pool other than a pool operated in Alberta, New Brunswick, or Nova Scotia and other than a catastrophic claim fund established to facilitate the payment of Ontario statutory accident benefits claims due from a specified insolvent insurer

4) Business transferred to a risk sharing pool operated in Alberta, New Brunswick, or Nova Scotia

5) All uninsured or unidentified motorist claims and all amounts expended in connection with a pool or catastrophic claim fund established to facilitate the payment of Ontario statutory accident benefits claims due from a specified insolvent insurer

The Facility Association uses each member’s participation ratio, which it determines separately for each of the above classes of business, to allocate the profit or loss for the each of the above classes of business at the end of each fiscal year. The basis of determination of the participation ratio varies by jurisdiction. According to the Plan of Operation, the Facility Association must determine the profit or loss separately for each accident year, in each jurisdiction.

Risk Sharing Pools

There are currently five risk sharing pools operating in Canada. The key purpose for each of these pools is to assist the member companies who provide automobile insurance under their normal rates and underwriting rules to certain owners and licensed drivers who represent a higher risk of loss when compared to the company’s overall portfolio.

The Facility Association, in its role as the administrator for all five risk sharing pools, dictates through its Plan of Operation the various rules that insurers should follow in order to participate in this risk transfer mechanism. Each of the risk sharing pools operates in one specific jurisdiction, and member companies operating in this jurisdiction can transfer risk into the pool.

It is important to understand that the Facility Association designed the risk sharing pools to promote stability in the marketplace by making it possible for companies to accept risks for which they believe that their prices are not totally adequate. Therefore, the general expectation is that risk sharing pools, by their very nature, will operate on an overall basis at a financial loss.

Every company shares in the financial results of a particular pool based on a participation ratio determined using a proportion of their total voluntary private passenger, non-fleet, third party liability direct earned exposures (car years) that is not ceded to a risk sharing pool for the applicable province. For Ontario, the participation ratio also depends on the number of risks ceded to the risk sharing pool. (Please refer to the Facility Association’s Plan of Operation for more details on the participation ratios.) As every automobile insurance company licensed to do business in a specific province is required to be a member of the Facility Association, a company who decides not to transfer any of its risks to the risk sharing pool will still be allocated a share of the total financial results of the pool.
Facility Association

There are five minimum requirements that a risk must meet in order to be eligible for transfer to one of the pools:

1) Each pool accepts only private passenger vehicles.

2) A residual market risk should be insured through the FARM and is therefore not eligible to for the risk sharing pools.

3) Each risk transferred into the pool should carry at least the minimum third party liability statutory limit required in the applicable province.

4) The member company must follow the appropriate classification and rating procedures and have requested all appropriate documentation.

5) The premiums charged for the insurance transferable to the pool must be the approved premiums for such a risk.

For each of the risks transferred, it is up to the member company who performs the underwriting to provide the coverages and limits that it finds appropriate for such a risk. However, each of the pools has specific limitations that define the proportion of each eligible risk that can be transferred to the pool. There are also limitations on the transfer of certain coverages (e.g., maximum limits or minimum deductibles). Member companies who decide to offer higher limits or lower deductibles must therefore carry the excess coverages on their own accounts.

One other common requirement for the pools’ operations relates to the actual transfer of premiums. For each risk, the transfer premium should be the premium actually charged by the insurance company for the applicable limit or deductible, net of premium payment service charges charged to the insured. The member company will then receive a percentage of the transferred written premium as an expense allowance to settle all incurred expenses including acquisition, operating and loss adjustment costs but not including premium tax and professional fees.

Finally, for each of the pools with specific restrictions on the total allowable transfer from each member company, the transfer limits are a percentage of the voluntary private passenger non-fleet third party liability direct written car years for the applicable province in the immediate preceding calendar year.

Ontario Risk Sharing Pool

The Facility Association established the Ontario Risk Sharing Pool in 1993. It was the first automobile risk sharing pool in Canada. This pool assumes business from Ontario member companies for Ontario risks only, subject to the minimum transfer requirements listed above.

One difference for the Ontario Pool is that the pool only covers 85% of every risk transferred while the remaining 15% stays in the account of the member company. All other pools cover 100% of the risks transferred, subject to the applicable maximum limits and minimum deductibles for the coverages provided.
Facility Association

To ensure that the Ontario Risk Sharing Pool does not serve as a marketing tool by member companies, the Facility Association has set the maximum total allowable transfer to 5% of the member’s voluntary private passenger non-fleet written exposures.

Alberta Risk Sharing Pool

The Facility Association administers two risk sharing pools in Alberta: a “Grid Pool” and a “Non-Grid Pool”. Both of these pools commenced operations on October 1, 2004 and assume business from Alberta member companies for Alberta risks only. One of the main differences between the two pools is the number of risks that companies may transfer to each.

The “Grid Pool” allows Alberta automobile insurance companies to transfer into the pool their private passenger insurance exposures that are subject to the statutory maximum premium. There is no limit to the number of risks that a member company can transfer into the Alberta “Grid Pool”. This is based on the philosophy that the law requires insurance companies operating in Alberta to accept risks for which they have no control over price, resulting in little to no control over the financial results for this particular book of business.

The “Non-Grid Pool” is similar to the Ontario Risk Sharing Pool. It allows member companies to transfer to the pool any eligible private passenger automobile insurance exposure they underwrite which exhibits higher risk characteristics. However, the Facility Association has set the maximum total allowable transfer to 4% of the member’s voluntary private passenger, non-fleet, written exposures that are not transferred to the Grid Pool. The purpose of the Non-Grid Pool is to help companies cope with the “take all-comers” environment in Alberta.

New Brunswick Risk Sharing Pool

The New Brunswick “First Chance” Risk Sharing Pool commenced operations on January 1, 2005. This pool assumes business from New Brunswick member companies for New Brunswick risks only, subject to the minimum transfer requirements previously described.

The New Brunswick Risk Sharing Pool provides a means for New Brunswick insurers to transfer private passenger automobile insurance exposures for which at least one household member is entitled to receive the “recently licensed drivers with good driving records” discount (also called the “First Chance” discount).

Similar to the Ontario Risk Sharing Pool and the Alberta Non-Grid Pool, the Facility Association set a maximum total allowable transfer of 8% of the member’s voluntary private passenger, non-fleet, written exposures for insurers participating in this pool.

Nova Scotia Risk Sharing Pool

The “Inexperienced Driver” Risk Sharing Pool is the most recent pool created by the Facility Association. It commenced operations on January 1, 2007. This pool assumes business from Nova Scotia member companies for Nova Scotia risks only.
Facility Association

The key characteristic of this pool is that it is designed to accommodate inexperienced drivers with good driving experience. Therefore, in addition to the minimum transfer requirements listed above, companies can only transfer risks for which at least one household member is a driver with less than six years of driving experience and who did not have any accidents or convictions over that period.

Similar to the Alberta Grid Pool, there is no limit to the number of risks transferred by members to the Nova Scotia Risk Sharing Pool.

Conclusion

The Facility Association is an organization that was created by and for the Canadian insurance industry. It serves a very important role in ensuring the availability of automobile insurance coverage for Canadian drivers. This study note summarizes some of the key elements of the operations of this organization. For further information and details regarding the topics covered above, please refer to the Facility Association’s Plan of Operation.
INTRODUCTION

Rating agencies provide two types of ratings: credit ratings for corporate, municipal, and government bonds and financial strength ratings for life and property-casualty insurers. Credit ratings for bonds are the primary work for Standard and Poor’s, Moody’s, and Fitch; insurance ratings are primary for A. M. Best’s. This syllabus reading focuses on insurance ratings, though it provides background information for credit ratings as well.

Bond ratings make securities markets more efficient by reducing information costs for investors and creditors. Securities underwriters and bond buyers expect issuers of bonds to obtain ratings from one or more agencies. A poor initial rating raises the yield needed to sell the bond, and a ratings downgrade may lower a bond’s market value.¹ If the debt is held by a bank (not publicly issued), the debt may be recalled if its rating falls below investment grade status. The firm issuing the debt may be forced to sell assets or cease operations.

Similarly, financial strength ratings make insurance markets more efficient by reducing information costs for agents and policyholders. These ratings are particularly important for insurers, assessing their ability to meet their claims obligations. Reinsurers may need investment grade ratings to retain consumers; independent agents use ratings to place policies with higher rated insurers. Ratings have entered even into regulatory and legal arenas. The Securities and Exchange Commission designated Moody’s, S&P, and Fitch as Nationally Recognized Statistical Rating Organizations who can provide ratings for certain securities regulations; other agencies have since been added. The NAIC Statement of Actuarial Opinion requires the Appointed Actuary to consider the ratings of reinsurers when evaluating uncollectible reinsurance recoverables. Some Canadian courts require A ratings for insurers writing life annuities to fund structured settlements.² Some insurance departments require an insurer to have an A- or better rating to write surety business. Statutory accounting values bonds with ratings of BB (Ba) or lower at market value, not amortized value. Risk-based capital (RBC) bond charges depend on the bond class, which is based on ratings by Moody’s and S&P.

Recent downgrades of highly rated debt, such as triple-A rated mortgage-backed securities in 2008-2009, and failures of some highly rated firms (Enron, Worldcom, AIG) have evoked criticism of rating agencies. A 2006 law now requires extensive disclosure of rating agencies methods, to help investors and creditors understand how agencies determine the ratings. The oligopolistic nature of the rating agency industry and the (perhaps) greater efficiency of free markets in determining bond yields has provoked questions about the use of ratings.

STRUCTURE OF THIS READING

This reading is geared to candidates for the CAS exams. It focuses on financial strength ratings of property-casualty insurers, with background information about bond ratings in other industries. It presents alternative views on disputed issues, such as the structure of the rating agency market: do the agencies make insurance markets more efficient by providing information that is hard to obtain or do they mimic public information?

Section 1 explains how rating agencies help policyholders and agents by assessing the financial strength of insurers and their ability to pay claims years in the future. (Bond ratings affect coupon rates and issue prices; they are not the same as financial strength ratings.) Rating agencies can influence the capital structure, reinsurance arrangements, and business volume of their insurer clients.

Section 2 explains the ratings process: review of public data by ratings analysts, interactive meetings where insurers’ managers portray themselves in favorable hues while providing hard data for the analyst’s report, and decisions by the ratings committee. Rating agencies balance objective, quantitative data that is consistent across insurers and qualitative information that reflects unique attributes. The agencies combine research by ratings analysts with the experience of ratings committees.

Rating agencies
Section 3 explains why ratings are vital for many property-casualty insurers: professional valuations of financial strength are efficient, many outside parties rely on the ratings, and few insurers are still unrated. High ratings are important requirements for reinsurance, surety, structured settlements, Homeowners, and some specialty lines. Many parties to insurance transactions, such as banks providing mortgages, property owners hiring building contractors, courts directing structured settlements, and clients of foreign reinsurers demand products from highly rated insurers.

Section 4 describes the meetings of ratings analysts with the insurer’s senior managers. The topics discussed focus on qualitative information not available from public data: corporate form (holding companies, affiliates), capital structure (debt-to-equity ratios); information flow between executives and line personnel; strategic objectives (growth vs profitability; standard vs niche markets); financial goals (risk adjusted return on capital, economic value added); recent acquisitions and divestitures (business synergies; cost savings; integration of corporate cultures); competitive strategies for underwriting, pricing, and distribution systems (strengths and weaknesses vs peers; unique attributes of insurers); reinsurance arrangements and catastrophe exposures.

Section 5 examines salient attributes of rating agency capital standards: risk measures, stochastic models, and principles-based systems. Capital standards provide benchmarks for rating analysts and objective measures for insurers. They differentiate the agencies’ methods, providing actuarial validation for the ratings and marketing tools to attract clients. They use up-to-date financial modeling: expected policyholder deficit and statistical distributions for risk measures, economic scenario generators for asset liability management, and discounted cash flow modes for reserving risk. Rating agency capital standards are now widely used for economic value added and return on risk adjusted capital, replacing the leverage ratios used previously.

Appendix A distinguishes financial strength ratings for insurers from debt ratings. A. M. Best’s has the longest experience with insurer financial strength ratings; S&P, Moody’s, and Fitch provide most debt ratings.

Appendix B covers the history and growth of the rating agencies. The advent of non-investment grade bonds in the late 1970’s, the increase in sovereign debt since the early 1980’s, and SEC rules led to rapid growth of the rating agencies in the past 30 years.

Appendix C reviews public perceptions of rating agencies: impartial judges of credit worthiness whose analysis of financial strength move markets or an oligopoly protected by barriers to entry paid by the firms they rate.

Appendix D provides exercises to help readers grasp the themes of this reading. The exercises give examples of the statements in the text of the reading.

Section 1: Rating Agencies Provide Material Benefits to Insurance Policyholders

Policyholders depend on the financial strength of insurers to fulfill long-term promises, but lack the expertise, resources, and time to examine insurers themselves. Rating agencies hire financial analysts, actuaries, and economists to assess the financial strength of insurers. Interactive meetings with senior insurance managers give them propriety information about operating strategy and competitive advantages. The willingness of insurers to pay for ratings and of agents and investors to base business decisions on these ratings testify to the public acceptance of the ratings. Firms pay handsomely to keep high ratings. Insurers may spend $1 million a year (or more) on ratings, consisting of fees to rating agencies and internal costs to prepare for rating agency meetings.

Some recent studies suggest that rating agencies do not respond as quickly as the bond and stock markets. Market traders immediately assess a firm’s financial strength, whereas rating agency analysts may not respond for months. New information about a firm’s operating performance leads to quick changes in stock values. In contrast, agency downgrades are slower; agencies prefer to wait until they verify their information.

Illustration: An insurer with a $200 million market value has $800 million of bonds with average durations of six and a half years. If interest rates rise 200 basis points, the insurer’s market value declines $100 million.
Investors bid down the insurer’s stock price, but rating agencies may not downgrade the insurer for half a year. An insurer’s investment portfolio is detailed in its Annual Statement, which is updated annually. The rating agency does not evaluate the insurer as quickly as investors do, and it may wait to downgrade the insurer to see if interest rates turn down.⁶

SECTION 2: RATINGS PROCESS COMBINES QUANTITATIVE DATA WITH QUALITATIVE VALUATIONS

Insurers are rated for their claims-paying ability, often to meet requirements of agents, banks, consumers, and courts. Unrated insurers can be at a disadvantage: independent agents hesitate to use them and some banks do not issue mortgages without property coverage from a rated insurer. Over 90% of insurers are rated by A. M. Best’s or another agency, and Best’s surveys are widely reviewed in the insurance industry. Insurers who do not pay for interactive ratings may receive public ratings, with less control over the information reviewed by the agencies and greater chance of errors.⁷

The ratings process is intrusive, time-consuming, and expensive. Ratings analysts meet with insurer officers responsible for underwriting, reserving, reinsurance, financial reporting, investments, risk management, and the insurer’s major lines of business. The insurer’s business strategy and internal management are clues to its resilience against adverse scenarios. The agencies focus on the quality of an insurer’s managers and business strategy. They do not judge if a particular underwriting or investment decision was wise, as random fluctuations and market movements distort observed results. They focus on the insurer’s managers: their knowledge of industry trends, their experience with adverse scenarios, and their handling of current problems.

Insurers decide the substance of their presentations, and they select the information they provide to agencies. Rating analysts may question the insurer’s views, but they generally avoid specifying the data they want. They evaluate the integrity of their clients: deceptive, misleading, or incomplete information may lead to poor ratings.

An interactive rating has five steps:

1. Background research by the ratings analyst and submission of proprietary data by the insurer.
2. Interactive meetings between ratings analysts and senior managers of the insurer.
3. Preparation of ratings proposal by lead analyst and submission of additional data by the insurer.
4. Decision by the ratings committee after presentation by the lead analyst.
5. Publication of rating on public web sites and provision of analysis to fee-paying subscribers.

Background to an interactive rating

1. Public ratings rely on public data only, with no input from the insurer; interactive ratings rely also on proprietary data and meetings with the insurer’s senior managers. If an insurer pays for an interactive rating one year but does not want an interactive rating the next year, the agency may issue a public rating based on published financial statements, SEC filings, earnings reports, and similar data. An insurer expecting a downgrade may refuse an interactive rating, but the agency may proceed with a public rating to inform investors (and other audiences) that the previous rating is no longer valid.⁸
Most insurers have financial strength interactive ratings, often from two or more agencies. An insurer already rated by A. M. Best’s may request another rating from S&P, Moody’s, or Fitch, for several reasons. The insurer may want to issue debt through a holding company and seeks a rating from an agency with more experience in debt ratings; it may be publicly traded and wants a rating from an agency better known to investors; it may be dissatisfied with its current rating and believes the second rating will be higher.

**The insurer prepares a presentation for the interactive meeting consistent with the agency’s outline.**

The rating agency assigns an analytical team to conduct basic research, using data from the insurer’s Annual Statements and GAAP reports of recent years: reserve estimates from Schedule P, reinsurance recoverables from Schedule F, investment portfolio from the asset schedules. The analysis is not shared with the insurer; it serves as a check on the insurer’s forthrightness and integrity and is used where the insurer’s submitted data are absent or dubious.

Public data are rarely sufficient for ratings analyses. For example, reinsurance data do not show attachment points and limits of in-force treaties; investment schedules have scant data on derivative securities; reserving schedules do not show the segmented data that insurers use for their estimates. Rating agencies ask insurers to disclose underwriting, reserving, investment, and operating performance along with supporting data.

Rating agency analysts generally specialize by industry. The rating team has a lead analyst familiar with the lines of business written by the insurer and one or more specialists. For example, if the insurer writes property exposures in Gulf Coast states, an analyst with expertise in windstorm models may join the team. If the insurer writes long-tailed lines of business, one analyst may be an actuary to prepare reserve analyses.

The rating agency requests certain presentations at the interactive meeting. Some are generic, such as business strategy and risk concentration guidelines, with a focus on information flow: how results are reported to executives and how directives are passed down to underwriters. Other topics are specific to insurers writing certain lines, such as how asbestos claims are handled or what reinsurance is used to control windstorm exposures. The insurer decides on the content of the presentation and may add additional topics.

For an initial meeting, rating agencies ask insurers to provide extensive background material. Some agencies provide checklists, to ensure complete information. The common types of requested information are:

- Statutory Annual Statements and GAAP financial statements for past five years.
  - Quarterly financial statements for the past year, if available.
- History of the company focusing on major events, such as mergers, acquisitions, and expansions.
  - Biographies of senior executives with their insurance industry experience.
- Investment strategy, policy, and guidelines, and
  - How the investment committee of the Board of Directors reviews investment department activities.
- Organizational charts covering corporate structure and senior manager reporting relations.
  - Capital structure showing debt issues by holding companies and affiliates.
- Product descriptions and business strategy for each line.

The substance of the qualitative information varies greatly. Business strategy by line may be a paragraph for one insurer and a report for another. Rating agencies evaluate how insurers respond to the requests for information: does the insurer honestly compare its performance with that of its peers or does it provide summary figures that are already publicly available?

The interactive meeting is like an intricate dance: the rating agency seeks the insurer’s knowledge of its risks and potential liabilities, and the insurer seeks the agency’s view of its financial strength. The agency reviews Schedule P figures but wants also the insurer’s reserve estimates, especially for exposures that are hard to estimate from publicly available data. During the interactive meeting, it compares the insurer’s estimates with its own valuations from public data. The public data are used to evaluate the integrity of the insurer. If the
insurer’s workers’ compensation reserve estimates agree with Schedule P figures, the rating agency is more likely to trust its asbestos and pollution reserve estimates.

For example, the rating agency adjusts reserves in long-tailed lines for adequacy and discounts them at a conservative discount rate. But reserve adequacy, investment yields, and loss payment patterns differ among insurers, so the rating agency wants the insurer’s analyses of reserve adequacy and discounting methods.

If the insurer has long-term debt through a holding company, goodwill, or substantial deferred tax assets, the rating agency computes net income after debt payments and taxes and re-states leverage ratios as a function of tangible equity capital.

An insurer should not withhold potentially damaging data that the analyst does not request. An insurer who strengthens year-end reserves after assuring a rating agency that its reserves are adequate loses credibility and worsens the agency’s reputation with investors. The agency may place the insurer on a ratings watch until its next meeting, and it is less likely to trust the insurer’s future reserve estimates. For insurers who need ratings each year, it is almost always better to inform agencies of likely problems before they become evident.

**Illustration:** Rating agencies use industry ratios of asbestos loss reserves to annual loss payments in recent years. If an insurer presents exhibits with low ratios that are not supported by data, the exhibits may not be presented to the rating committee. Some insurers tell rating analysts that the analysis is confidential and can not be shared. The analyst will not demand more information. But the analyst gives the rating committee a conservative (worst-case) estimate from industry figures, rather than the insurer’s figure. The estimate reserve is usually greater than the insurer’s own figures.

An insurer’s officers are reluctant to disclose weaknesses, and their lack of candor may harm the rating. Undisclosed credit problems that lead to future write-offs ruin the insurer’s credibility and may contribute to ratings downgrades. Informing rating agencies of expected write-offs of receivables before they occur may keep a good rating. Rating agencies who learn of adverse developments from the trade press after the management meetings often downgrade the offending firm.

Some insurers use a dry run with a ratings advisor. Financial underwriters such as Morgan Stanley serve as ratings advisors for firms issuing new debt, and actuarial consulting firms perform a similar role for insurers. The advisor takes the place of the rating agency, meets with the insurer’s senior managers, and tells them its impression of their presentation. The insurer’s managers may learn that their reticence harms the agency’s view of their integrity, and that they must supply hard data to support a high rating.

**A rating committee decides the rating; the rating analyst presents the insurer’s data to the committee.**

To promote consistency, the actual rating decision is made by a ratings committee, not an individual analyst. Rating analysts have different views on financial strength and rating factors. The lead analyst prepares a rating proposal for the committee, but the rating decision comes from the committee.

The rating committee has no permanent members; it is formed anew for each case from senior members of the agency. The insurer does not know its members, to avoid improper inducements. The ratings analyst is an intermediary, summarizing public data and proprietary information from interactive meetings into a report to the committee. The analyst may prepare an initial rating that is reviewed by the committee. Analysts are flexible in meetings with insurers, letting insurers volunteer information instead of eliciting data by intrusive cross-examinations. Some insurers mistakenly think that an analyst’s acceptance of an unsupported assertion is a positive sign. But the rating committee relies on hard data. Experienced insurers provide the analyst with convincing data supporting their story.

Agencies generally use a top-down approach, starting with economic and industry forecasts and proceeding to the insurer’s position among its peers. The committee evaluates underwriting cycles by line of business and
then the insurer’s own performance, risks, and management quality. The industry evaluation is made by senior officers of the rating agency, bringing more consistency into the ratings.

The rating analyst is the insurer’s advocate, and the insurer makes certain that he or she has the necessary supporting data. Knowledgeable insurers provide the rating agency analyst with the data needed for the report to the rating committee. The interactive meeting between the insurer and the analyst is the preparation for rating meeting between the analyst and the committee. Tangential material, such as slide presentations that are not backed by hard data, are not presented to the committee. Analysts collect data and information about the insurer to present to the rating committee. Analysts who receive inconsistent or incomplete data may present the information to the rating committee in a less favorable manner.

*Ratings and outlooks*

The committee decides on ratings by majority vote, though opinions of senior officers of the agency are often followed. But agencies hesitate to change ratings too quickly. Erroneous downgrades anger clients, who pay the agency’s fees; erroneous upgrades ruin the agency’s reputation with investors and agents.

Agencies delay downgrades by repeating the current rating with a negative outlook for several months. They reduce the rating only if the insurer cannot raise capital or otherwise assuage the committee’s concerns.

Initial ratings may be private or public; subsequent ratings are generally public. The rating agency informs the insurer of the committee’s decision. If the insurer requested an initial rating and the agency has not previously rated the insurer, the insurer either agrees to a press release or requests that the rating be kept private. Decisions of the committee are appealed only if the insurer believes a material error was made and provides data correcting the error.

If the agency has previously rated the insurer, the rating is posted on the agency’s website and released to the press. Initially, rating agencies required subscriptions to their ratings and charged subscribers for the rating information. But information travels fast in efficient capital markets and most users need only summary figures (such as the letter rating). Rating agencies now freely provide basic information, such as the letter rating, and require subscriptions for more detailed assessments of insurers’ solvency.

*Section 3: Ratings Are Essential for Many Property-Casualty Insurers*

Almost all insurers are rated, compared to a small percentage of firms in other industries; some large insurers have ratings from two or more agencies, despite their high cost. Other firms need ratings if they issue debt securities or are publicly traded. Most insurers have no debt and are not publicly traded, yet almost all are rated, for three reasons: (i) agents are wary of unrated insurers, since they might be financially distressed, (ii) third-parties rely on outside assessments of insurer solvency, and (iii) rating agencies are efficient at assessing financial strength.

*Unrated insurers:* In other industries, most firms with no debt have no ratings. But almost all insurers are rated, except for new firms. It is less expensive to pay for a rating than to demonstrate financial strength individually to others.\(^{10}\)

*Reliance by consumers and third parties:* Independent agents use ratings to select insurers, and insurers use ratings to select reinsurers. Agents might be sued for providing insurance from a financially weak insurer. Reinsurance officers at primary insurers must evaluate the ability of reinsurers to pay obligations years in the future. They rely on commercial ratings, and an unrated reinsurer might not even be considered.\(^{11}\)

*Efficiency:* Evaluating financial solidity requires expertise and extensive data. Most agents, underwriters, and even some regulators do not have the time, experience, or resources of the rating agencies to thoroughly research the financial condition of all insurers.\(^{12}\)
High ratings are important for certain lines of business.

Financial ratings are particularly important for reinsurance, surety, structured settlements, homeowners, and some specialty lines. Insurers with low ratings are not able to compete in certain markets. Rating agencies assess financial risk efficiently and reduce costs when safety is essential. Third parties who rely on insurance coverage often demand that the insurer obtain a rating, as the paragraphs below describe.

Reinsurance is a global market, and many reinsurers are not licensed in the United States. Excess-of-loss coverage is long-tailed, and reinsurers are exposed to catastrophe and other large claim risks that are hard to foresee. Primary insurers need to assess the financial strength of reinsurers to balance premium vs credit risk. Strongly capitalized reinsurers may charge higher prices; some reinsurers provide letters of credit or other collateral to secure their obligations, but the security is expensive; weakly capitalized reinsurers may charge low premiums. A primary insurer can use the reinsurer's rating as one tool to assess the financial strength of the reinsurer. Small reinsurers with A ratings can compete with larger peers. A large reinsurer that is downgraded below investment grade may not be able to renew its treaties.

Illustration: Scor Re was the ninth largest global reinsurer in 2001. After large losses in 2001-2002, its net worth declined 70%, and its rating dropped to BBB– by the end of 2003, below the A– level normally expected of large reinsurers. It could not renew treaties with primary insurers outside its home country, and it left several reinsurance markets.13

Some reinsurance treaties explicitly link ratings and security. A treaty with a downgrade clause may specify that if the reinsurer fails to maintain a certain rating, such as A- or better, it must deposit funds covering its obligations or provide letters of credit as security. The downgrade clause benefits both parties: the reinsurer avoids the costs of collateral as long as it maintains its rating, and the primary insurer gets collateral to cover reinsurance recoveries if the reinsurer cannot meet its obligations.

Insurance often provides security to a third party. For example, a surety ensures that a construction firm will complete a project. Many sureties are specialized firms, exposed to high surety losses in recessions. Principals may require construction firms to obtain surety contracts from A rated companies. The cost of examining the surety’s finances and risks are incurred by the rating agency, not by each principal. The rating also reduces the surety’s costs. Instead of reducing prices or advertising heavily to persuade principals of its financial stability, it provides its rating.

Banks require property insurance to issue mortgages, often requiring that they be listed in the policy as payees up to the amount of the mortgage. As a lien-holder, the bank receives the insurance payment if the property is destroyed. The banks can not independently verify the financial strength of the insurer, so they rely on commercial ratings.

Personal property is subject to natural catastrophes. An insurer with excessive risk (high concentration of exposures in coastal areas with inadequate reinsurance arrangements) may become insolvent after a hurricane and unable to pay claims to banks providing mortgages. It is too expensive for banks to assess the solvency of each insurer. Instead, banks may require Homeowners coverage on mortgaged properties from insurers with investment grade ratings, relying on rating agency’s risk evaluation.

Structured settlements indemnify accident victims by periodic payments, often funded by life annuities. These settlements are particularly important for young children or persons incapable of handling large sums of money. The casualty insurer paying the structured settlements may buy a life annuity from a life insurer to fund the payments. To ensure that claimants receive secure funding, some Canadian courts require structured settlements from A rated insurers, and plaintiff attorneys often make similar demands in the U.S. Courts and attorneys can not independently judge the financial strength of insurers, and they rely on commercial ratings.
SECTION 4: THE INTERACTIVE MEETING WITH THE INSURER’S SENIOR MANAGERS

The rating agency sets the agenda for the interactive meeting, with the insurer providing the substance. The rating agency expects to meet with senior managers for investments, underwriting, finance, actuarial, and reinsurance, as well as with the chief risk officer. Organizational, management, and capital structures, operating characteristics, business objectives, financial goals, reinsurance arrangements, and competitive strategy are major elements of interactive meetings. An insurer with much debt issued by a holding company can expect extensive analysis of its capital structure and associated risks, and a stand-alone monoline medical malpractice insurer can expect a focus on its reinsurance arrangements.

Interactive Meetings Focus on Qualitative Issues Not Available from Public Data.

Quantitative data, such as operating income, combined ratios, and investment yields, are not always ideal predictors. Underwriting cycles, asset volatility, and catastrophes affect past performance but may not affect an insurer’s future returns. Rating agencies stress qualitative aspects of insurers’ strengths and weaknesses, such as business strategy and management expertise.

Many qualitative attributes, such as exclusive sales forces, high name recognition, and reputations for honest claim settlement are expensive to develop and have uncertain benefits. Rating agencies judge the costs vs potential rewards of developing qualitative attributes. For example, acquisitions and mergers have uncertain benefits and high costs; they may lead to a ratings upgrade by one agency and a downgrade by another. In 2010, after multi-billion dollar investment losses and a government bail-out, AIG sold parts of its international operations to Prudential (a British life insurer) and Metropolitan Life (a New York life insurer) at prices favorable to the buyers. Most analysts viewed the acquisitions positively for Prudential and MetLife, who replaced AIG as global leaders. But Moody’s changed its outlook on MetLife to negative after the deal, issuing a press report that the acquisition may not produce the anticipated synergies.

Qualitative attributes must be objective and measurable.

Underwriting expertise is critical for insurance operations, but rating agencies can not easily judge underwriting expertise. Quality of claims service is subjective; rare is the insurer that does not say its quality is best. Brand names may lead to greater consumer persistency and high renewal rates. But brands are more important for industries with high profit differentiation. Many consumers view insurance as the same from all firms. Brand loyalty may lead to high renewal rates but not to better new business. Economies of scale may reduce costs from larger volume of business. Insurers serving small niche markets may have lower ratings, unless they show long-term higher profits from greater underwriting expertise. But large insurers must show measurable effects of size to improve their ratings.

Organizational structure: Does the insurer have subsidiaries or affiliates; is it owned by a holding company? Are subsidiaries and affiliates used for pricing (different rates by legal entity), are they intended for operations in specific states or countries, or were they formed to handle discontinued business (asbestos, pollution)? An outline of the insurer’s organizational structure can be gleaned from public documents, but the reasons for the different entities is not shown. Rating agencies are especially concerned about off-balance sheet liabilities for debts of affiliates. They first evaluate each legal entity, and then raise or lower the rating for benefits or liabilities of the corporate group. For example, a U.S. insurer that has a Japanese subsidiary and guarantees its liabilities to satisfy Japanese regulators faces risks that a domestic-only company does not have.

Capital structure: Many insurers are financed by equity only; others have complex capital structures. Topics discussed in rating meetings include: Is the insurer owned by a holding company that has issued debt? Is the debt guaranteed by the insurer’s assets? Has the insurer or holding company issued hybrid securities, with debt characteristics but treated as equity in statutory accounting? Has the insurer secured loans by affiliates or subsidiaries? Have subsidiaries gone bankrupt without being bailed out by parents? What is the coupon rate on the holding company debt? How much of statutory capital is intangible (goodwill, deferred tax assets)?
The relevant financial ratios depend on the capital structure. Agencies examine net income after taxes, debt, and lease charges. The debt may be issued by a holding company, an affiliate, or a subsidiary, and it may not be evident on the insurer's own financial statements. If the insurer has intangible capital, as is often true after an acquisition, the rating agency computes its ratio of debt to tangible capital to ascertain its financial leverage.

**Management structure:** How long have senior managers worked in the insurance industry? Are business lines and branch offices relatively independent, or do home office managers control major underwriting decisions? Are line operations separate from staff operations, or do business units operate as small insurers with internal staff support? For example, does personal auto have its own actuarial, finance, and claims staff?

No one structure is necessarily better than others. Rating agencies focus on how quickly senior managers learn of emerging risks. For example, accelerating medical inflation may cause persistent losses in several lines of business. Separate management for each line may help underwriting flexibility, but senior managers must be able to assess overall enterprise risks.

**Strategic objectives:** Insurers have different objectives and business strategies. Some insurers seek continued growth, even at the expense of short term losses; others seek stable profits even at the cost of lower market share. Rating agencies ask: Does the insurer follow market prices through hard and soft markets? Does the insurer seek niche markets? Does it have a strong brand name? Does it stress low cost for its products?

Size and efficiency are important, and rating agencies evaluate market share, competitors, and government licensing as an exclusive distributor. Efficiency may increase market share, which leads to further benefits. In the United States, low acquisition costs and independent pricing by personal lines direct writers led to their dominance of personal auto and homeowners, economies of scale, and further cost reductions.

Market share growth from lower prices is a two-edged sword. Rating agencies are wary of rapid growth that is not justified by other insurer attributes. Interactive meetings are essential for judging qualitative attributes, since the rating agency relies on the insurer to interpret the observed data. Rapid market share growth is good if it reflects superior products and bad if it reflects underpricing. The insurer must demonstrate that its growth rests on successful business strategies and validate them by actual performance. An apparent advantage with poor operating results means the insurer can not convert favorable attributes into market growth or profits.

Agencies focus on coherence of strategies and insurers' ability to attain them. Insurers with costly distribution system might focus on niche markets with alternative distribution systems for target consumers, not on price competition for generic products. Insurers accepting low returns to gain market share should be able to demonstrate the long-term rationale for this strategy and their ability to withstand short-term losses.

**Financial goals:** Insurers and rating agencies use a variety of performance measures. Financial statements show statutory and GAAP earnings, and many insurers compute some type of economic income. Rating agencies ask: Does the insurer target return on statutory surplus, GAAP equity, or invested capital? What financial measures are used for performance measurement and manager bonuses? How closely have actual returns matched target returns in past years? How do the target returns compare with industry averages? How does the insurer estimate economic income? Does it use economic value added (EVA) or risk adjusted return on capital measures (RAROC)?

**Acquisitions:** Profitable insurers have the money for good acquisitions, which lead to further profits. Some large insurers achieved their dominance by fleets of inter-related companies built from sensible acquisitions. But acquisitions can be as harmful as they are helpful. Fewer than a third of corporate acquisitions increase the market value of the combined entity. Acquisitions may cause downgrades if the agency doubts the insurer can absorb the new firm into its culture or if expected synergies offset costs. An acquisition may fail to produce the expected benefits, and rating agencies look closely at complex corporate transactions.
Insurers may discuss potential acquisitions with rating agencies to avoid actions that may spark a downgrade. After the acquisition, they provide data showing expense reductions, division of responsibilities, and smooth transition of the new managers into the parent firm.

Rating agencies closely examine acquisitions that strain the resources of the parent. They ask: How well have past acquisitions been integrated? Does the insurer contemplate further acquisitions? Even good acquisitions prompt rating reviews, since anticipated synergies often dissipate before they are realized.

Diversification may reduce insolvency risks, but it must be balanced against core competencies.

Diversification smooths income and reduces solvency risk, but may reflect a straying from core competencies. Geographic spread of risk is essential for catastrophe perils, such as hurricanes for homeowners or terrorist attacks of office buildings for workers’ compensation. If the insurer has underwriting expertise in each region, the geographic spread of risk reflects better agent placement. Single state insurers rarely receive the highest ratings, unless they are exceedingly well capitalized or are part of a larger insurance fleet.

Diversification by product is reasonable only if it is done for underwriting purposes. Insurers, like other firms, focus on core strengths where they have underwriting expertise and cost advantages. Expansion to new lines is risky: high costs of new business, lack of expertise, and costs of new distribution systems. Rating agencies examine insurers with much new business to judge if synergies with existing business justify the expansion.

Some rating agencies emphasize core competencies more than diversification. Insurers with well-structured exclusive agency or direct marketing systems need not use other distribution channels. Multiple distribution channels sometimes cannibalize each other, with growth in one channel coming from declines in others.

The ideal qualitative attributes are product innovations that are not easily copied.

Good qualitative attributes differentiate an insurer and are not easily copied. In other industries, successful firms may have patents and trade secrets. In food industries (soft drinks, chocolates), firms may even avoid patents to keep their formulas secret. Brand names and patents do not always reflect objective differences. For example, consumers of beer and cigarettes are loyal to particular brands even if they can not distinguish the brand in blind tests.

Insurance policies, class plans, and rates are public information that are easily copied and cannot be patented. For example, medical payments coverage in personal auto, homeowners, and general liability provide first aid treatment to accident victims and have high appeal. They cost little because of their low limits and may even reduce costs by preventing bodily injury claims. But the coverages are now offered by all insurers. Rating agencies may not view coverage innovations as a persisting qualitative attribute.

Class plans are best if they are not easily copied. Generalized linear models gave some insurers long-term advantages because their peer companies did not have the actuarial and statistical expertise to replicate the plans. More refined class variables, such as more age distinctions in personal auto, are easily copied and have less long-term value. The first insurer to use a new class variable, such as credit rating in personal auto, may build a profitable block of preferred business. High market share with strong policyholder loyalty (many renewals) may lead to long-term profits.

New product designs, such as package policies (homeowners and small businessowners), high deductible liability coverages, claims-made professional liability; and various specialty coverages, give the first insurers several years of high profits. Low cost generic products with high returns on capital, such as personal auto policies with discounts for good credit scores, and differentiated products with premium pricing, such as high deductible policies in states with large workers’ compensation residual markets, were ideal product innovations. Their success lead eventually to copying by others, but they provided strong competitive advantages for the insurers who first sold them. But policy forms are filed with states, publicly known, and not patented. Many new product designs have little effect on long-term profits.
Optimal operating (underwriting) characteristics depend on the insurer’s lines and business strategy

Rating agencies stress balance sheet strength (including loss reserve adequacy) and operating performance. They emphasize balance sheet strength for writers of short-tailed lines of business with high catastrophe risk. They emphasize stability of annual earnings for writers of long-tailed lines with high reserving risk.

Underwriting is the core of insurance operations. The pricing and underwriting standards that underlie an insurer’s strategy are not easily quantified. The insurer’s task is to persuade the rating agency that competitive strengths will persist and weaknesses will be corrected.

Rating agencies judge insurers against their peers and set objective criteria for consistent evaluations. All insurers say they underwrite carefully and provide excellent service; these assertions carry little weight. Rating agencies evaluate the coherence of the insurer’s strategy. Products geared to specific markets with profitable risk-adjusted returns on capital indicate a sustainable business strategy.

Rating agencies have financial ratios for each insurer: combined ratios, investment yields, and pre-tax net income. Interactive meetings allow rating analysts to evaluate the underwriting and pricing characteristics that provide competitive advantages to the insurer. The paragraphs below summarize the operating issues normally covered in the interactive meetings.

Lines of business: What competitive advantages does the insurer have in its major lines of business? How do niche markets (earthquake insurance, substandard auto, surety, excess layers) fit with the major lines? Does the insurer sell package policies to select policyholders?

Pricing: Rating agencies evaluate pricing strategy, not specific techniques: does the insurer target high or low quality insureds? Insurers targeting high quality insureds may reduce the price based on conservative underwriting and focus on high persistency for long-term profits. Insurers targeting low quality insureds may increase the price to cover higher than average losses and focus on underwriting standards that weed out bad risks. In many lines, high cost insureds have higher risk but higher margins. Low cost insureds have low risk but low margins.

Underwriting controls: In long-tailed lines of business, pricing and underwriting errors may compound over many years. Rating agencies want to know what feedback line underwriters get. For long-tailed lines, how quickly do they learn their policy year results? For lines with catastrophe exposure, do they know their contributions to tail value at risk before catastrophe events occur?

Insurance losses are often settled years after policies are written, and underwriting managers may not have good measures of profitability. Actuarial bulk reserves, excess-of-loss reinsurance costs, and costs of holding capital must be allocated to underwriting offices so that line managers can estimate ultimate results.

Illustration: An umbrella underwriting unit often has favorable policy year combined ratios on direct business, since losses emerge slowly and may not be recognized for years. Rating agencies judge whether bulk reserve estimates, reinsurance costs, and the costs of holding additional capital for umbrella policies are provided to the manager of the umbrella underwriting unit and used to assess the return on capital.

Long-term strategy: Rating agencies stress the strategic considerations affecting long-term profits. How does the insurer expect to outperform its peers? What are the insurer’s strengths and weaknesses? How well does the insurer know the strategy of its peers? Does the insurer target niche markets, or does it compete on cost for all insureds?

The rating agencies use a multi-stage analysis: industry, line, and insurer. They evaluate first the prospects for the property-casualty insurance industry based on expected investment yields and underwriting returns. Bursting of a housing bubble and widening credit spreads in 2007-2008 led agencies to downgrade insurers with exposure to mortgage-backed securities and corporate bonds (much of the industry).
Rating agencies evaluate prospects for each line of business based on its likely growth, current capitalization, and insurers' negotiating power with their consumers and suppliers. For example, workers' compensation for manufacturing firms faces declining revenue as workplace hazards decrease. Insurers that served traditional manufacturing firms face severe contraction unless they have feasible strategies for alternative markets. The third stage focuses on the individual insurer, evaluating its competitive advantages relative to its peers.

**Distribution systems:** Supplying products to consumers is expensive: insurance acquisition costs may be 20% or more of premium. Efficient systems reduce costs and improve marketing control, but they require high up-front investment, such as subsidies to exclusive agents in their early years, discounts for insurance coverage sold through banks, discounts for insurance sold through voluntary associations, advertising campaigns to establish brand names, direct response insurance sales to avoid agency costs, and participation in internet web sites. Initial expenses lower current profits but may improve the insurer’s future profits.

Rating agencies stress control, cost, and consumer access. Does the insurer control its distribution system (exclusive agents, direct marketing) or does it work through independent agents and brokers? Are its costs lower or higher than those of its peers? What are the conversion ratios (new policy sales over quotations) and renewal ratios by line? Does the distribution system reach the target market?

**Control:** Exclusive agents give insurers control over their consumers: they better select markets and classes and retain insureds. The agent is an employee of the insurer, and the insurer owns the rights to renewals. The insurer decides the marketing strategy and targets consumers. It can price higher without fear that agents will switch consumers to competitors; it can price lower to gain market share and retain the renewals.

In contrast, independent agents own their renewals and can switch policies to competing insurers. They avoid insurers in financial distress, lest they be responsible for policyholder losses. An unexpected loss from stock market declines, the effect of a hurricane on the insurer's capital, or adverse reserve development may result in a ratings downgrade, leading agents to switch policies to higher rated peers. The lower business volume and a perception of financial weakness may also encourage agents to avoid the insurer.

Rating agencies consider the control that **direct writers** have over their business. A direct writer can more easily change its mix of high vs low cost homes or urban vs rural autos to meet perceived risks. Quantitative data may not show poor performance in the current year, but lack of control over consumers may hurt future results. The following paragraphs describe how rating agencies balance attributes of distribution systems.

**Cost:** Independent agents have high costs. Exclusive agency forces are expensive at first, requiring multi-year subsidies for new agents to set up offices, but they have high retentions at low cost in subsequent years. Independent agency insurers rarely adopt exclusive agency systems, lest their current agents switch business to competitors. Exclusive agencies reduce costs for long-persisting lines (personal auto, homeowners, small commercial) by their low renewal commissions. Similarly, direct marketing has low variable costs and works well for insurers who dominate markets, but it may have high fixed costs (advertising) and low response rates.

**Consumer access:** Internet sales are low cost, but they may not provide access to preferred consumers. Visitors to insurance web sites are often high cost insureds unhappy with their current premiums. The insurer lacks screening by the sales agent. Direct marketing through voluntary associations gives access to preferred consumers, but the response rate is low, causing a risk of adverse selection. Some direct marketing systems allow little selection of insureds. Many insurers have been burned by TV sales that led to adverse selection.

Direct marketing distribution systems do not promote brand loyalty, since the insurer or agent has no personal contact with consumers. TV marketing stresses low prices, which may limit profits. Voluntary associations may switch an entire block of business to a competitor with lower rates.

**Growth:** Growth is a result of past profit and a harbinger of future profit. Successful insurers grow, and growing insurers achieve market power. But growth must be judged critically. Is the insurer growing faster or slower
than its peers? Does its growth vary with the underwriting cycle? Does growth stem from lower premiums or better underwriting? In what lines does the insurer expect to grow? Where does it expect to shrink?

Rating agencies are especially concerned about insurers who cannot easily shift away from low return blocks of business. An insurer with an exclusive agency force in a state that has suppressed rates below adequate levels may feel that it cannot reduce its premium volume because of commitments to its agents. Nimble insurers forecast expected profits for different states and lines and adjust their marketing accordingly.

Insurers speak of profitable growth; rating agencies judge if the growth is indeed profitable. Almost all insurers say they do not follow markets blindly, cutting rates as underwriting cycles turn down simply to retain market share. Rating agencies assess if business strategies seem likely to succeed. For example, a rating agency may question an insurer that says it writes only profitable business and reduces sales in soft markets but has a direct writing sales force that is compensated primarily as a percentage of new business.

**Technology:** Insurance is a technology driven industry. Insurance policies have changed little, but pricing and underwriting have changed over time as new technology has allowed better analysis of data. Rating agencies judge if an insurer’s technology is up-to-date. Does the insurer provide relational databases to pricing and accounting personnel? Does the insurer use current pricing, reserving, underwriting, and ERM tools?

Generalized linear models (pricing), stochastic reserving tools, credit scoring (underwriting), and economic capital models are current actuarial tools viewed favorably by rating agencies. These actuarial tools take several years to implement, and they have tremendous effects on selecting and valuing good business.

**Regulatory interaction:** Insurance is highly regulated. Quick approval of policy forms, premium rates, and class plans from regulators gives insurers competitive advantages over their peers. Rating agencies check if the insurer lobbies in state and federal arenas or relies on trade organizations. Does the insurer have rate filings and class plans approved by state insurance departments, or does it rely on bureau filings and class plans?

**Claims handling:** Insurers’ cash outflow depends on their claims handling. Some insurers settle claims quickly to avoid litigation expenses; others fight dubious claims to avoid future claims. Asbestos claims show the merits of both strategies. Settling a class-action suit quickly is less risky and usually costs less than allowing the suit to proceed to trial. But quick settlements prompt more claims.

Rating agencies ask: Does the insurer promote cost-saving claims handling programs: back-to-work programs in workers’ compensation, structured settlements in products liability, quicker claim payments in personal auto? What percentage of claims are litigated? How does the insurer’s claims settlement practices compare with those of its peers?

**Expense management:** Well-managed insurers keep expenses reasonable; left unchecked, expenses rise quickly. Rating agencies examine if the insurer’s expenses are higher or lower than average. Does the insurer monitor expenses in sufficient detail to identify and correct poor performance?

High expense ratios impair competitiveness and form a drag on earnings. Insurers with high expenses may lose business to more efficient competitors. By comparing the operating practices of peer companies, rating agencies try to identify inefficient insurers.

**Current reinsurance arrangements vs reinsurance recoverables on past exposures**

Rating agencies focus on the insurer’s reinsurance arrangements vs its catastrophe and large loss exposures. After Hurricane Andrew in 1992, several Florida Homeowners insurers became insolvent because their direct losses exceeded the limits of cat covers.

**Coverage:** Rating agencies examine the insurer’s current reinsurance program and recent changes in treaty limits, attachment points, and lines of business covered. They ask insurers for details of catastrophe covers
and corporate excess-of-loss treaties. Reinsurers are often excellent judges of a reinsured’s financial strength, and their underwriting and pricing actions may signal potential risks. Higher attachment points or a greater coreinsurance percentage may indicate a reinsurer’s concern that risk quality is poor. (It may also indicate the primary insurer’s belief that less coverage is needed or the reinsurance is too expensive, so this information must be examined carefully.) Changes in reinsurance pricing may reflect past results. Increasing reinsurance rates that do not match reinsurance underwriting cycles may indicate the reinsurer’s belief that the reinsured is financially distressed. Reinsurers have better knowledge of the primary insurer’s underwriting portfolio than the rating agencies has, so relying on reinsurers’ pricing decisions is often useful.

Catastrophe modeling: To evaluate insurers with high property exposure in catastrophe-prone areas, rating agencies may compare the insurer’s gross catastrophe modeling with its catastrophe covers. Catastrophe models generally provide the gross loss at various percentiles of the loss distribution, such as a 1 in 250 year event (the 99.6 percentile). An insurer may have a stated ERM goal of “no more than a 10% loss of surplus” except for a 1 in 250 year event. The rating agency would compare the attachment point and cover of the catastrophe treaty with the insurer’s surplus and its modeling of catastrophes.

Risk transfer: Not all reinsurance transfers risk. Financial reinsurance, funds withheld treaties, and treaties with offshore reinsurers are potential warning signs to rating agencies. Some arrangements circumvent the strictures of statutory accounting; others hide solvency problems.

SECTION 5: RATING AGENCY CAPITAL REQUIREMENTS

Since the late 1990’s, rating agencies have been publishing capital requirements for each rating. Insurers set policy prices, limit business expansion, avoid high-risk policies, sell blocks of business, or structure reinsurance to meet these capital requirements. Pricing actuaries once used premium to surplus or reserves to surplus leverage ratios for discounted cash flow (NPV and IRR) pricing models. Now they are more likely to use the required capital for their desired rating from Best’s, S&P, Moody’s, or Fitch.

Rating agency capital standards began as adaptations of the NAIC RBC requirements. The agencies modified the RBC formula to include other risks, such as interest rate risk, catastrophe risk, or asbestos and pollution loss reserves. They changed the RBC risk measure from the worst case year to value at risk, tail value at risk, or expected policyholder deficit. Moody’s and Fitch use stochastic economic capital models.

Capital standards are salient differences among the rating agencies. The agencies all use data from Annual Statements, SEC filings, analyst meetings, and earnings reports, and they discuss similar management issues in their interactive meetings with insurers. But their capital formulas differ greatly, and they stress the accuracy and flexibility of their models to attract clients. Each rating agency chose a different means of competing for clients by producing a better capital adequacy formula.

Rating agencies examine quantitative measures of balance sheet strength and operating performance and qualitative analyses of management quality, operating strategy, competitive advantages, and ERM practices. Agencies say that qualitative items are important: how ERM is used to mitigate risks and whether competitive advantages are sustainable. But judging qualitative items is not easy. Insurers provide idyllic pictures of ERM practices and competitive strategy at interactive meetings, and agency evaluations are subjective.

Rating agencies strive for consistency: clients of similar financial strength should be rated similarly. Standard insurance financial ratios (quantitative data) do not capture qualitative items that affect long-term profitability, but a stress on qualitative issues may cause inconsistencies: the analyst for one insurer may give credit for some qualities that another analyst does not. To ensure consistency, agencies relate ratings to economic capital measures and issue ratings by committees independent of the ratings analyst.
To be consistent, analysts’ ratings should have the same meaning. If two analysts each recommend 30 “A-” ratings one year, the number of defaults should be similar. But an A- rating has a negligible default probability, so differences among analysts are hard to validate. Rating agencies therefore use quantitative measures to ensure consistency. Analysts should have similar capital ratios among their A- clients. Rating agencies publish the expected capital ratios for each rating, though qualitative factors influence the final rating. Analysts begin with the capital adequacy measure and adjust for management quality, ERM, and competitive advantages.

To succeed, rating agencies must distinguish weak vs strong insurers: identify stable insurers who are underrated by other agencies (gaining clients who will pay for the rating) and identify weak insurers who are overrated by other agencies (strengthening a reputation for accurate ratings). All agencies have the same data (accounting statements and presentations by clients), use similar methods (quantitative ratios of balance sheet strength and operating performance), and produce the same product. Ratings are easily understood by investors, but they are perhaps less accurate than a perfectly competitive market might provide.

The capital models of the four major agencies differ. A more accurate model helps an agency attract insurers who might be mis-rated by generic models. Inaccurate capital models may damage an agency’s reputation or lower its market share. A rating agency with high capital standards and low ratings may lose clients. A rating agency with low standards and high ratings may lose investors’ trust in its objectivity or financial expertise.

Best’s adopted underwriting risk estimates, expected policyholder deficit risk measure, and interest rate risk from the American Academy of Actuaries task force on risk-based capital. By building on the work on casualty actuaries involved in RBC systems, it had the first sophisticated capital model among the rating agencies.

Moody’s and Fitch developed stochastic capital models, since fixed formulas could not accurately assess the risks of most insurers. They used actuarial studies of risk variances and dependencies, aligning their models with papers of the CAS. But persuading clients that proprietary models estimate required capital is difficult.

Many insurers have their own economic capital models. The European Union Solvency II directives advocate principles-based RBC solvency monitoring, and Standard and Poor’s proposes partial weight for internal company models. But assessing the quality of insurers’ internal models has proved difficult.

This section focuses on the distinctive attributes of rating agency models:

- A. M. Best’s use of the expected policyholder deficit to calibrate risk.
- Moody’s and Fitch’s use of stochastic cash flows to model economic capital.
- Standard and Poor’s emphasis on principles-based models and ERM practices.

**Best’s Capital Adequacy Ratio**

Best’s BCAR (Best’s Capital Adequacy Ratio) retains the RBC structure of independent risk categories with a covariance adjustment. RBC has six risk categories (fixed-income securities, equities, credit, reserves, written premium, and off-balance sheet risks). BCAR adds interest rate risk (which the NAIC did not include in its property-casualty formula) and risks not easily quantified from accounting statements: asbestos/pollution exposures and catastrophe risks.

The NAIC uses a worse case year measure to calibrate reserving and new business risks that is influenced by underwriting cycles in certain years: a different experience period gives different risk charges. The RBC charges are not consistent across risks. Asset risks reflect the pre-1990 MSVR (mandatory statutory valuation reserve) for life insurers, and credit risks are chosen subjectively. Instead of the worst case year and MSVR, BCAR uses an expected policyholder deficit (EPD) risk measure. BCAR uses a 1% EPD ratio for all sources of risk. In financial terms, the charge for each risk is the amount of capital such that the cost of a put option offsetting the risk is 1% of policyholder reserves. In conventional insurance terms:

- The EPD is the pure premium for unlimited aggregate excess-of-loss reinsurance.
- The **EPD ratio** is the EPD divided by the market value of held reserves.

*Illustration:* Insurer ABC’s general liability reserves have a market value of $V$, but they may develop adversely or favorably. ABC buys an aggregate excess-of-loss reinsurance treaty that pays the adverse development above $Z$. The pure premium for the treaty is $P$.

- The EPD ratio is $P / V$, and the required capital is $Z$.
- As $Z$ (the attachment point) increases, the EPD and the EPD ratio decrease.
- Best’s chooses $Z$ so that the EPD ratio is 1%.

The same 1% EPD ratio is used for all risks: capital losses on stocks, bond defaults, bond losses from interest rate movements, uncollectible reinsurance recoverables, reserve development, and new business losses. For each risk, the capital charge $Z$ is set so that aggregate excess-of-loss reinsurance covering losses above an attachment point $Z$ has a pure premium equal to 1% of reserves. The EPD depends on the volatility and size of the risk. For example, equities have more volatility than bonds, so they have a higher EPD and capital charge. But insurers hold less equities than bonds, so the marginal effect of equities on overall required capital may be less than that of bonds.

RBC looks at default risk on bonds and other fixed-income securities. Default risk on bonds held by P/C insurers (mostly Treasuries, investment grade corporate bonds, and municipal bonds) is slight. The major risk for insurers stems from interest rates rising above market expectations, leading to market value losses on fixed-income securities. Using average industry figures, Best’s finds that a 120 basis point rise in interest rates gives a 1% EPD ratio. It stresses each insurer’s asset portfolio with a 120 basis point interest rate rise.

RBC placed high weight on reserving risk, as befits a regulatory model. Regulators are most concerned that insurers pay their loss obligations to existing claimants. Distressed insurers often post deficient reserves. The NAIC viewed reserving risk as its highest priority.

BCAR uses an analysis of reserve volatility similar to one done by the American Academy of Actuaries in 1993-94 to estimate reserving risk and new business risk. Its analysis indicates that the RBC written premium risk charges should be raised relative to the reserving risk charges so that both have a 1% EPD.

Economic capital models can be bottom-up or top-down. A bottom-up approach determines capital charges for each risk and line of business and combines them with diversification factors. A top-down approach determines overall capital requirements from a multivariate distribution of all risks and allocates the required capital back to risk and line of business.

Best’s uses loss distributions for each risk and line of business, giving separate capital charges by risk and line. To most accurately determine the required capital for the insurer, one should use a multivariate loss distribution for all risks and lines. Multivariate distributions of this sort are extremely difficult to gauge, so BCAR uses the covariance adjustment and the loss and premium concentration factors in the RBC formula. The net required capital for all risk categories combined is

$$\sqrt{(B_1)^2 + (B_2)^2 + (B_3)^2 + (B_4)^2 + (B_5)^2 + (B_6)^2 + (B_7)^2}$$

B7 is off-balance sheet risks; B1-B6 are bond, equity, interest rate, credit, reserves, and new business risks.

The expected policyholder deficit procedure requires little capital for low volatility risks, and the square root rule further reduces the marginal capital of small risk categories. If equities and loss reserves are equally volatile, and equities are one tenth as large as loss reserves, the marginal effect of the equities capital charge is one tenth that of loss reserves.
Equities and loss reserves have the same absolute capital charge before the covariance adjustment, but loss reserves has ten times as great a marginal capital charge.

In the RBC formula, almost all marginal capital charges stem from reserving and written premium risks, with little capital stemming from fixed income and equities risks. Best’s partly corrects this problem with higher asset risk charges, but overall capital is still heavily weighted toward underwriting risks.

The financial crisis of 2008-09 has led the rating agencies, including Best’s, to reconsider the weighting of capital charges by risk. In particular, hurricanes, earthquakes, equities, and financial derivatives caused large losses for insurers since RBC was first implemented. Reserves for major lines have had little adverse development, but asbestos reserves have led to enormous losses. Reinsurance recoverables have not led to serious problems. The rating agencies re-estimate parameters of their capital models as new data emerge.

**STOCHASTIC CASH FLOW CAPITAL MODELS**

Moody’s and Fitch use stochastic cash flow models to assess capital requirements.

- The models form distributions of each risk and simulate repeatedly from them.
- Cash flows are projected until all current liabilities are settled.
- Required capital is set by a value at risk or tail value at risk measure.

The cash flow models provide full investment income offsets to full value loss reserves.

RBC, Best’s, and Standard and Poor’s use investment income offsets to reserving and written premium risks. The rating agencies use conservative discount rates and loss payment patterns to avoid over-stating the fair value of the insurer. RBC and Best’s use 5% discount rates; Standard and Poor’s uses a lower discount rate, based on current yields.

The fair value discount rates used by RBC, Best’s, and Standard and Poor’s range from 3% to 5%. They may be substantially less than the insurer’s investment yield when interest rates are high. The stochastic models use the insurer’s investment yield for the cash flow simulations.

Stochastic cash flow models examine the accumulated cash flows of assets vs insurance liabilities. Asset returns are based on interest rate generators and random walk simulations of equity returns. The interest rates and simulations are arbitrage free: that is, the mean return is the market forward rate, which is generally higher than current short term rates.

**Illustration:** The term structure of interest rates is 5% for one year, 6% for two years, and 7% for three years. These are risk-free spot rates: $1 invested now yields $1.05 in one year, $1 \times 1.06^2 = $1.12 in two years, and $1 \times 1.07^3 = $1.23 in three years. The implied interest rate from 2 to 3 years is $1.23 / $1.12 – 1 = 9%.

Cash flow simulation models are of two forms, depending on the treatment of negative cash balances at intermediate dates. The strict version requires the insurer to liquidate assets if no other cash is available. The more liberal version assumes the insurer borrows funds at short-term rates to satisfy sudden cash needs.

The rating agency stochastic models use either value at risk (VaR) or tail value at risk (TVaR) measures. A 99% VaR is the capital needed to remain solvent at the 99th percentile of the aggregate loss distribution. A 99% TVaR is the average capital needed to remain solvent in the 1% worst scenarios.

**Illustration:** A rating agency runs 50,000 simulations of an insurer’s aggregate losses from all risk sources. It sorts the results from worst to best outcome. In the 500th worst outcome, the insurer loses $250 million. The average of the 500 worst outcomes is a loss of $600 million. The 99% value at risk is $250 million, and the 99% tail value at risk is $600 million.
Fitch and Moody’s use interest rate generators to compute interest rate risk. Moody’s uses 60,000 simulations, each of which has a path of short duration and long duration interest rates. As the insurer sells bonds to pay loss obligations, scenarios with rising rates show market value losses.

The simulations provide the asset liability management analyses once done by matching durations of bonds and loss reserves. The simulations are more informative, since they encompass movements of both short- and long-term interest rates, sector spreads, credit spreads, and loss cost trends. But the simulations are harder to evaluate or replicate. The interest rate risk charge depends on the mean reversion and volatility parameters in the interest rate generator. The stochastic model often seems like a black box to insurers.

**PRINCIPLES-BASED SYSTEMS**

Standard and Poor’s chose not to form its own stochastic economic capital model. It has an accounting model based on the NAIC’s RBC formula, but with no financial risk measure or covariance adjustment. It does not use actuarial or financial models for underwriting and asset risks, and it has no diversification adjustment or actuarial risk measure. Instead, it focused on evaluating insurers’ enterprise risk management systems and internal capital models. It bases capital requirements on a weighted average of its own formula and the client’s economic capital model.

Standard and Poor’s reasons that well-managed insurers evaluate their capital needs more accurately than a rating agency can. Insurers examine distributions of reserve development using extensive data bases and sophisticated reserving methods. They can assess value at risk, tail value at risk, and expected policyholder deficit better than a rating agency can using public data.15

**APPENDIX A: FINANCIAL STRENGTH RATINGS VS BOND RATINGS**

Credit quality and financial strength are continuous variables. Markets rate on continuous scales. For example, the spread of a corporate bond above Treasuries may be anywhere from 100 basis points to 300 basis points. In theory, insurers might be rated on a scale of 0 to 100. But people can not make such fine distinctions. It would be hard to distinguish a rating of 82 vs a rating of 83.

Instead, the rating agencies use letter scales (introduced by Fitch). The highest rating is A++ (or AAA) and the lowest rating is F, meaning the insurer is in liquidation. The scales of the major agencies are similar, though not identical. This section shows the scale used by A. M. Best’s; the web sites of the other agencies show their letter grades.

Best’s divides insurers between secure (likely to meet their insurance obligations) and vulnerable (may not meet their obligations in adverse scenarios). Secure insurers are grouped into three categories (superior, excellent, and good) with two levels in each. Vulnerable insurers are grouped into seven categories ranging from fair to in liquidation with ten levels (in total). The last entry, a suspended rating, might occur after a major event, such as a hurricane or earthquake, whose effects on the insurer are great but still uncertain.

A. M. Best's issues also credit ratings: either investment grade or non-investment grade. A credit rating refers to the likelihood of payments on the debt securities. A short maturity bond backed by a mortgage on the insurer's property is likely to meet its coupon and principal payments, even if the insurer has a doubtful ability to pay long-term claims obligations.

A. M. Best's also rates short-term debt, such as commercial paper, with a simpler set of letter grades.

**APPENDIX B: HISTORY AND GROWTH OF THE RATING AGENCIES**

Credit ratings provide information to help investors determine whether issuers of debt will be able to meet their obligations. Rating agencies provide objective analyses and independent assessments of companies and countries that issue debt. Increasingly diverse debt securities and complex multi-national firms issuing them require investors to understand the risks of many countries and asset types. Most creditors do not have the requisite expertise, and the influence of the major rating agencies has burgeoned.

The three major U.S. rating agencies began in the late 19th century to aid investors in corporate securities. Poor's History of Railroads and Canals in the United States (1860) first analyzed company financial strength. Standard Statistics, formed in 1906, published corporate bond, sovereign debt and municipal bond ratings. It merged with Poor's in 1941 and was acquired by McGraw-Hill in 1966. Standard and Poor's also produces stock indices such as the S&P 500, which are used for derivatives trading and as stock market indicators.

John Moody began publishing manuals providing statistics and information about stocks and bonds of various industries in 1900. Moody's Investors Service, begun in 1914, rated government bonds. By the 1970's Moody's was rating all corporate and sovereign debt. Fitch began in 1913 with stock and bond manuals of financial statistics. Fitch introduced the letter ratings of bonds now used by all agencies: AAA for highest grade through D for default. It merged with several competitors (IBCA, Duff & Phelps, Algorithmics) to form a diversified advisor for enterprise risk management and data services.

A. M. Best's was founded in 1899, issuing reports and financial strength ratings about life and property-casualty insurers. A. M. Best's rates 95% of insurers by premium volume. It publishes voluminous reports each year assessing all life and property-casualty insurers. It has provided claims paying ratings since 1906 and credit ratings since 1999. Its monthly trade magazine, Best's Review, keeps it well known among insurance industry personnel. Its comprehensive surveys of insurers, monthly trade magazines with both articles and ratings, and low costs gave it a de facto monopoly on insurance ratings until the 1990's. Almost all insurers still take Best's ratings, though large insurers often have ratings from other agencies as well.

S&P, Moody's, and Fitch began as credit rating agencies; Best's began by rating insurers' overall financial strength (claims-paying ability). All rating agencies have since become full-service raters, though Best's still services only insurers and some other financial institutions, and the other agencies differ in their market shares by country and type of debt (corporate vs sovereign).
Before 1970, investors (not bond issuers) paid for publications of ratings agencies. But information spreads rapidly in efficient capital markets. Rating agencies realized that good ratings reduce the cost of debt and they could charge bond issuers for this value. Similarly, insurers pay for their own financial strength ratings.

In the 1970’s, the Securities and Exchange Commission (SEC) imposed capital and liquidity requirements on securities owned by banks and other financial institutions. The major rating agencies were designated nationally-recognized statistical ratings organizations (NRSRO) by the SEC, and financial institutions could satisfy their capital requirements by investing in securities with favorable ratings by an NRSRO.

The advent of non-investment grade bonds in the late 1970’s, the increase in sovereign debt since the early 1980’s, requirements for ratings, and SEC approvals of the major agencies led to extraordinary growth of the rating agencies. In 1940-1970, only 0.1% of corporate debt defaulted. The debt was all investment grade and the U.S. economy grew steadily. Creditors did not require ratings to provide capital. By 2010, much corporate debt is below investment grade and world sovereign debt is enormous. Some countries (Argentina, Russia) and large firms have defaulted on their debt, and ratings are now essential to secure new loans.

Despite calls for reform of the rating agency market, both investors and debt issuers generally support the current structure. Debt has become an important part of corporate and sovereign activity, and rating agencies assess its quality.

The rating agency market has grown enormously over the past 30 years, for several reasons: High yield bonds have enabled even weaker firms to issue debt; government borrowing has increased enormously with little concern for repayment ability, leading to vast debt by poorly rated entities; more complex indentures require expert evaluation of bond risks. Fifty years ago, most new corporate debt was investment grade, and ratings were not essential. Now bond issues range from triple A to B-, and without a rating, the bond can not be sold. Fifty years ago, ratings were sought by publicly traded U.S. firms; European firms used bank loans, and they were evaluated by the banks. Now firms throughout the world issue debt. Sovereign entities, including weak states with no histories of debt repayment, finance budget deficits by publicly held debt. Ratings are essential for estimating default probabilities, since fiscal statements of some countries are not well-supervised.

Ratings are paid by firms being rated, not by investors using the rating, leading to potential conflicts of interest. A rating agency that downgrades its clients may lose their business. The failure of rating agencies to identify risks leading to the insolvency or government bailout of several banks and insurers are cited as evidence that they do not properly assess risk and financial strength. About 93% of AAA-rated subprime-mortgage-backed securities issued in 2006 fell below investment grade by 2010 (New York Times, April 25, 2010). The rating agencies received millions of dollars for these ratings from the issuing firms.

Despite the market growth, the same rating agencies have dominated the industry for the past century. The leading U.S. agencies rate firms and sovereign entities worldwide. Some people say more competition would reduce rating agency costs and lead to better risk assessments. The lack of product diversification and the ease of rating are conducive to a competitive market. But rating agencies may be natural monopolies, similar to municipal utilities of the mid-20th century. It is not clear that small agencies could survive in this market. Large agencies have strong reputations, helping them attract clients and forming powerful barriers to entry.

Potential conflicts of interest by rating agencies and the failure to foresee some insolvencies raise questions about the efficiency of rating agencies. Standard and Poor’s, Moody’s, and Fitch rate firms, states, and sovereign entities throughout the world. Most large firms no longer operate in a single country, and non-insurance debt ratings entail analysis of global operations. The three U.S. agencies dominate the ratings market for multi-national firms.

Entry into the rating agency market is hard. Ratings have little value unless they are widely accepted. A group of financial analysts might produce excellent ratings, but no client would pay to be rated until the agency is
established, giving established agencies strong advantages. Agencies’ greatest asset are their reputations for accurate valuations and integrity. Firms already rated by Moody’s and S&P don’t want to pay for a third rating and don’t want to give up either of their current ratings. New agencies with no reputations can not persuade investors that their ratings are accurate. Market leaders have remained since inception.19

Most corporate debt receives similar ratings from the agencies. The agencies’ ratings are calibrated to the same levels: an A rating from S&P has similar meaning as an A rating from Moody’s.20 Rating agencies use the same data and provide similar services: public accounting statements and voluntary disclosures by their clients.21 Ratings conform to market information: a client with a rising stock price will get a favorable rating from any agency. By law, rating agencies must disclose their ratings methods, as they now do on web sites. Academic studies find few differences in ratings techniques among the agencies. Innovations by one agency are copied by the others.

National regulation affects the rating agency market. The Basel II agreement allows banks to use ratings from approved rating agencies to calculate reserve requirements. The U.S. Securities and Exchange Commission permits investment banks to use credit ratings from Nationally Recognized Statistical Rating Organizations (NRSRO’s) for creditworthiness regulations. Until 2007, Moody’s, S&P, and Fitch were NRSRO’s, along with three specialized agencies. Present law treats all rating agencies equally, but the three large agencies already dominate the market.

APPENDIX C: EFFICIENCY AND BENEFITS OF RATING AGENCIES

Until recently, rating agencies were seen as judges of credit worthiness whose analysis of bond issues or of firms’ financial strength move markets. Some recent insolvencies of well-rated firms and some ratings downgrades on sovereign debt have led to public debate about the efficiency and benefits of rating agencies.

The 2002 Enron insolvency and the government bail-out of AIG in 2009 illustrate the different perspectives. Credit rating agencies do not always downgrade companies promptly. Enron had investment grade ratings until four days before it went bankrupt, though agencies may have known already of the company’s problems.22 In 2007, AIG was the largest commercial insurer in the world, with operations in scores of countries and over $100 billion of assets. It had triple A ratings from all agencies until it suddenly went bankrupt from excessive financial risk in 2008 and was bailed out by the U.S. government. Some people question whether agencies knew about the risks and failed to inform the public or were oblivious to billion dollar risks that destroyed firms.

Empirical studies indicate that bond yields rise as credit quality falls before the rating agencies downgrade the bonds. Markets composed of investors with no access to private firm information may be more efficient than agency analysts meeting with corporate management and reviewing proprietary documents. The value of credit ratings to investors and bondholders is unclear.23

Losses on subprime mortgages in 2007-08 highlight the doubts about rating agencies. In an April 2010 column in the New York Times, Paul Krugman pointed out that 93% subprime mortgage-backed securities rated triple A in 2006 fell below investment grade by 2010.24

Agencies rank risk; they do not guarantee solvency.

Hindsight ratings are easy and infallible. Insolvent insurers reveal inadequate reserves, speculative investment strategies, poor reinsurance arrangements, or weak underwriting standards. After each insolvency, one hears: Why didn’t the rating agencies uncover the problems?

Insurers continually assume risks. They underwrite policyholders to screen out poor business and pool risks to quantify expected losses, but they do not eliminate the risks. Economic returns require firms to take risks: even well-managed insurers earning reasonable returns face significant risks.
Rating agencies base their evaluations on limited information. Insurers may not disclose proprietary data that might lower their ratings, unless they expect the data to become public. An A rating means that the probability of ruin is acceptably low, not that the insurer can not fail. A rating agency with no insolvencies among its A rated clients is performing well if it has the same likelihood of giving an A rating as other agencies. If it avoids A ratings for all but the most secure insurers, it is not providing useful information to users of the ratings.

Ratings corresponding to the relative risk of insurers. Rating agencies rank insurers by their probability of ruin; they do not vouch for an insurer’s solidity. An A rating may mean a 1% chance of insolvency over the next three years, not a guarantee of solvency.

Rating analysts seek recommendations that match ultimate committee actions. An analyst who is consistently above or below the committee actions learns to adjust the recommendations to the committee’s standards.

Rating agencies seek fair treatment of clients and strong reputations with investors.

Rating agencies have two objectives: impeccable reputations for assessing debt quality and financial strength, and equitable treatment of clients. When sovereign states are financially troubled, agencies are criticized in public forums whichever action they take. If they downgrade the country, they are criticized for contributing to its ills; if they don’t downgrade the country, they are criticized for misleading the public. Financial ratings of insurers present the same dilemma: no ratings philosophy satisfies all critics.

Both extremes – no high ratings unless default is impossible and no downgrades unless default is certain – are poor business strategy. Giving high ratings only if the client is immune from risk doesn’t serve investors, regulators, or the public.

Rating agencies hesitate to reduce ratings too quickly. An insurer may slip below its current rating because of serious operational problems, and the agency must re-assess the insurer before it slips further, or because of temporary problems, and the insurer may curtail its writings or reinsure parts of its portfolio. Sometimes the slippage reflects a new rating analyst or new members of the rating committee with different perspectives. A rating agency that downgrades insurers only to reverse the decisions later loses the goodwill of its clients, who may switch to competing agencies with more stable ratings. Slow ratings changes reflect business strategy, not poor assessments of risk.

Agencies use ratings outlooks and watch lists to avoid erroneous rating changes. A watch list means a rating change may soon occur, but the reasons are still vague. Agencies may place insurers on watch lists after large acquisitions; the rating may rise if greater market share leads to more profitable business and it may fall if the acquisition costs exceed the realized benefits. Outlooks reflect the agency’s expectations. Ostensibly, a negative outlook means that trends in the insurer’s operations or its environment may lead to a downgrade. In practice, a negative outlook may mean the insurer has fallen to a lower rating level, but the agency delays action for several months to verify the lower rating or to give the insurer time to correct the risks. An evaluation of ratings efficiency must consider outlooks, watches, and the potential harm of precipitous ratings changes.

Patterns of rating changes are examined by serial correlations. If agencies react promptly to new information, and downgrades occur as soon as the insurer falls below a given solvency threshold, then downgrades should be followed more often by upgrades than by a second downgrade. If rating agencies wait to issue downgrades until the insurer is well below a threshold, rating changes may be positively serially correlated.

Illustration: Agencies use sophisticated quantitative and qualitative scores that are weighted and mapped to letter ratings. For simplicity, suppose financial strength is ranked from 0 to 100, with 96-100 being AAA, 91-95 being AA, 86-90 being A, and so forth. Insurers move stochastically along the scale: an insurer rated 87 in 20X1 might be 85 or 89 in 20X2. If rating agencies downgraded insurers as soon as they crossed a threshold, then insurers downgraded from AA to A in 20X2 have ratings of 89 or 90. It is more likely that they rise above 90 in 20X3 than that they fall below 86. Letter rating changes should have negative serial correlations.
But if agencies do not downgrade insurers until they cross the mid-point of the rating level, an AA-rated insurer is not downgraded until it falls below 88. Insurers downgraded to A in 20X2 have average ratings of 86 or 87. It is more likely that they fall below 86 in 20X3 than that they rise above 90. Letter rating changes should have positive serial correlations. In some cases, the agency gives the insurer a negative outlook without changing the letter rating. An insurer that has dropped to 87 or 88 may retain its AA rating with a negative outlook. In contrast, capital markets (bonds for debt ratings; common stock for financial strength ratings) respond rapidly to new information.

Observed serial correlations are positive, indicating that the agencies change ratings only when the upgrade or downgrade is certain, long after bond markets change credit spreads. Good business practice explains the lag; agencies want to avoid excessive rating changes for firms on the boundary between rating categories.

Agencies’ lack of proprietary data is another reason for their slow response. Markets respond to hunches and gut feelings. If investors even suspect that a firm has problems, it stock price drops and its debt yield rises. Agencies cannot act without supporting evidence. The AIG case shows this clearly. Even senior managers did not know the magnitude of the risks. AIG is a highly secretive firm, and rating agencies knew no more than other outsiders. Agencies rely on the integrity of their clients: they are analysts assessing risks, not detectives.

**APPENDIX D: RATING AGENCIES EXERCISES**

The exercises below may help students understand the reading. However, these exercises are not necessarily representative of possible exam questions.

**Exercise 1.1:** Insurer XYZ writes Homeowners coverage. Insurer ABC writes life annuities funding structured settlements for accident victims, many of whom are minors. A judge has ruled that an insurer needs an A rating from a nationally recognized rating agency to fund structured settlements.

A. Why are ratings important for Homeowners insurers?
B. Why are ratings important for writers of life annuities funding structured settlements?
C. For which insurer is operating performance most important and for which is balance sheet strength most important?

**Part A:** Banks providing mortgages generally require Homeowners on the property. Sometimes the bank is the payee if the home is destroyed by a covered peril, up to the amount of the remaining mortgage. If the insurer is insolvent, the insurance protection does not safeguard the bank. A hurricane or other catastrophe may bankrupt a weakly capitalized insurer, so banks may require coverage by a well-rated insurer.

**Part B:** A minor receiving a structured settlement receives payments by the insurer for many years (perhaps a lifetime), but does not choose the insurer funding the structured settlement. A weakly capitalized insurer may become insolvent during the term of the structured settlement, which may extend for the life of the minor. A high rating safeguards the interests of the minor.

**Part C:** Balance sheet strength is more important for the Homeowners insurer. The bank is concerned that the insurer can indemnify the homeowner for the damage this year, not that the insurer will stay around for many further years. Operating performance is more important for the writer of life annuities funding structured settlements, since the insurer must stay around for many years.

**Exercise 1.2:** The ratings meeting is like a poker game at which neither side exposes its cards.

A. Why does the rating agency not disclose its impressions from publicly available data?
B. Why might the insurer’s failure to disclose adverse information lead to a downgrade?
C. How does the ratings process affect the insurer’s decision about what data to disclose?
Part A: The rating agency wants the insurer to believe it has better information than it actually has. Publicly available data are sparse; the rating agency often lacks information about critical parts of the insurer, such as its asbestos and environmental exposures. By not disclosing what data they already have, rating agencies force insurers to supply proprietary data for all parts of the company.

Part B: Management integrity is an important rating criterion. Rating agencies rely on proprietary data supplied by insurers. If the insurer is dishonest on one topic, the agency fears it is dishonest on others, and it may lower the rating.

Part C: The lead analyst gives a ratings proposal in a presentation to the ratings committee, supported by the data received from the insurer. The insurer has no opportunity to provide more data to the ratings committee, so it makes sure the lead analyst has all the data that might be requested by the committee.

Exercise 1.3: An insurer has a 2:1 premium to surplus ratio and 4:1 reserves to surplus ratio. How do each of the following affect a rating agency’s view of the leverage ratios? For each item, explain why a rating agency might look favorably or unfavorably on the asset or liability. Specifically, how does the asset or liability affect the insurer’s claims paying ability in adverse scenarios?

A. Goodwill from a recent acquisition.
B. Deferred tax assets.
C. Surplus relief from quota share reinsurance.
D. Holding company debt that appears as equity in the insurer’s Annual Statement.
E. Catastrophe bonds.

Part A: Goodwill is an asset on both statutory and GAAP balance sheets, reflecting the excess of the price paid for a subsidiary over its book value. Many acquisitions do not provide returns that justify their costs. (Half to two thirds of acquisitions turn out to have negative net present values.) Rating agencies view acquisitions critically: unless the promised benefits are likely to be realized, a large acquisition may lead to a negative outlook for the insurer. Goodwill may be excluded from surplus to evaluate the leverage ratios.

Part B: Deferred tax assets assume a going-concern with future taxable income that can be offset. Adverse scenarios leading to financial distress often eliminate taxable income, reducing the value of the deferred tax assets. Rating agencies may give little value to DTAs. The deferred tax asset may be excluded from surplus to evaluate the leverage ratios.

Part C: NAIC financial exams and IRIS tests may not give full value to surplus relief. Surplus relief offsets the surplus strain in statutory accounting. GAAP and fair value accounting do not penalize insurers for surplus strain. Rating agencies consider economic values of insurers, not just statutory values, so they have no reason to exclude surplus relief when computing leverage ratios.

Part D: Holding company debt appears as equity on the insurer’s books, but it is a fixed charge paid from the insurer’s income. Rating agencies evaluate the full debt of the insurer, whether it is issued through a holding company or an affiliate. Rating agencies may compute leverage ratios to equity only.

Part E: Catastrophe bonds can offset major losses. The potential value of the bond is an off-balance sheet asset. Rating agencies may add part of the bond payment to surplus when evaluating leverage ratios for catastrophes.

Exercise 1.4: Rating agency XYZ gives 40% of its client A- ratings or better, and their probability of ruin over the next five years is 4%. Rating agency ABC give A- ratings or better to 20% of its clients, who have a 2% probability of ruin over the next five years.

A. Is ABC better or worse at rating insurers than XYZ?
B. What is a possible effect of ABC’s rating philosophy on its market share?
Part A: Neither rating agency is better or worse at rating. The quality of a rating depends on its consistency. The ratings given by different analysts on the same agency should be the same, but different agencies often have different meanings for a rating.

Part B: ABC gives fewer high ratings. Insurers who would receive an A- rating from XYZ and a lower rating from ABC are likely to choose XYZ. As a result, agencies tend to have similar ratings. But the ratings are not identical; some agencies give consistently higher or lower ratings than others.

Exercise 1.5: Firms in other industries seek ratings if they issue debt or are publicly traded. Most insurers have no debt and are not publicly traded, yet almost all insurers are rated. Many insurers have ratings from two or more agencies, despite the high cost of ratings.

A. Why are ratings so prevalent in the insurance industry?
B. Which insurers most need ratings?

Part A: Other firms sell products or services. Consumer can evaluate the products in stores and read reviews by previous buyers on internet web sites or consumer magazines. Insurers sell promises, whose worth is not known for many years. Most consumers can not themselves evaluate insurers; even insurance agents and banks providing mortgages can not always identify high risk insurers.

Part B: Insurers providing coverage that benefit third parties, such as banks providing mortgages, sureties who guarantee completion of a construction project, or writers of life annuities supporting structured settlements, pay for ratings to assure others that they can fulfill their promises. Sophisticated consumers (large commercial policyholders and primary insurers for reinsurance) also seek insurers with good ratings.

Exercise 1.6: Tens of thousands of firms throughout the world need ratings each year. Most of these firms are rated by one of the three major U.S. rating agencies.

A. Why is the ratings industry dominated by three firms?
B. Why might three firms (instead of 30) create a more efficient ratings process?

Exercise 1.7: Whether ratings affect bond yields or bond yield changes precede rating changes is unclear.

A. Why might one presume that ratings affect bond yields?
B. Why might one presume that bond yield changes precede rating changes?

Exercise 1.8: The ratings process

A. What are the roles of the ratings analyst and the ratings committee?
B. What information does the rating agency seek to obtain from interactive meetings?

Exercise 1.9: ABC, an East Coast reinsurer, is preparing an offer to acquire XYZ, a West Coast reinsurer. It expects costs savings from the acquisition, and it offers a substantial premium over XYZ’s market price.

A. How might a rating agency view the acquisition?
B. What qualitative items might the rating agency be most concerned about?
C. Why might ABC discuss the acquisition with its rating agencies beforehand?

Exercise 1.10: Rating agencies seek performance measures that are consistent among insurers. You are choosing between pre-tax and after-tax earnings as the measure of operating performance.

A. Why might pre-tax earnings be more consistent among insurers?
B. Why might after-tax earnings be more consistent among insurers?
C. How might one adjust pre-tax earnings to make them more consistent?
D. How might one adjust after-tax earnings to make them more consistent?

Exercise 1.11: Quality of earnings

A. What is meant by quality of earnings?
B. What attributes affect quality of earnings?

Exercise 1.12: ABC writes personal auto in 20 U.S. states. XYZ writes property excess-of-loss treaties for catastrophe risks of windstorms and earth movement. Both insurers have a 6% return on sales.

A. Which insurer has the higher return on capital?
B. How might the quality of earnings differ for these two insurers?

Exercise 1.13: A personal auto insurer targets retirement communities in the U.S. sun-belt. Many of its insureds are wealthy, but they drive less after moving to these communities. It is well-capitalized, with a 60% loss ratio, a 90% persistency rate, and a return on surplus over 20% for the past five years. Rating agencies have kept the insurer at a B+ rating, citing risks of a single line of business subject to underwriting cycles and a small niche market that may be threatened by peers. The insurer is seeking to diversify. Explain the costs and benefits of each of the following.

A. Expand into Homeowners coverage, with a package policy for personal auto insureds.
B. Expand into standard and sub-standard auto risks, with discounts for children of current policyholders.
C. Expand into Medicare supplement policies for residents of the retirement communities.
D. Expand into medical malpractice coverage for physicians serving the retirement communities.

Corporate charters of some pension funds and similar institutional investors specify investments in bonds rated investment grade (BBB) or higher. Non-investment grade bonds (rated BB or lower) have higher default-adjusted yields (= the yield net of expected losses from defaults), indicating lower demand for these bonds.

Plaintiffs’ attorneys often demand an A- or higher rating for the insurer providing the annuity that funds the structured settlement.

The predictive accuracy of ratings is less relevant than their acceptance by investors. Even if an agency’s decision is contested by other analysts, the agency’s decision retains its effect on coupon rates if bondholders respect the decision.

Insurers’ indirect costs to secure high ratings include reinsurance to transfer risks, non-renewal of policies to reduce business volume, and internal ERM models to demonstrate a commitment to effective risk management. An insurer may cede a large portion of its property writings to reduce catastrophe risk in rating agency capital models, giving up expected profits for a higher rating. Some critics suggest that rating agencies hint of potential downgrades to induce insurers to pay for interactive ratings. For example, an insurer with A-ratings from two agencies may pay for interactive ratings from only one. The other agency informs the insurer that it may reduce its rating to B+, but that evidence of good corporate governance would keep the A- rating. The insurer may pay for an interactive rating to demonstrate its corporate governance and keep its A- rating.

See Koresh [2003], Kliger and Sarig [2000], Langohr and Langohr [2009], and Levich, Majnoni, and Reinhart [2002].

Critiques of rating agency activities are reviewed later in this reading.

Firms in other industries can keep their finances private; insurers provide extensive public information in statutory Annual Statements. Most insurers find it more efficient to pay for interactive ratings, with a chance to influence agency decisions, than to risk a public rating.

Insurers may choose initially not to be rated by a particular agency, but they rarely cease being rated by the agency for fear of a downgrade in a public rating.

Analysts for insurance company ratings may work entirely with insurers, so they have enough experience to assess their clients’ qualities.

State regressions examine the financial condition of all licensed insurers every three to five years. These financial examinations are more expensive and intrusive than rating agency valuations, and insurers seek to minimize the cost. Whereas a rating agency sees only data voluntarily provided by the client, state regulators often request records that the insurer might not wish to expose. Rating agencies spend two or three weeks analyzing the client; a state financial examination lasts months. State regulators do not require a commercial rating, but an unrated insurer may receive a more thorough exam.

The importance of commercial ratings is clear from advertisements in trade publications. Both insurers and reinsurer emphasize their ratings in ads geared to agents or primary insurers.
Actuaries once used models to evaluate the financial strength of reinsurers. But the effort and expertise needed to build the models, and the uncertainty in models based on public information alone, cause most primary insurers to rely on the commercial ratings.

Most insurers that did not renew Scor Re treaties probably based their decisions on the rating downgrade.

Agencies are sensitive to criticisms that ratings are influenced by the desire to retain profitable clients.

The impetus for principles-based solvency monitoring systems stems from the European Union’s Solvency II directives, which the NAIC is now also evaluating. Standard and Poor’s presumes that insurers will develop economic capital models to satisfy the new regulatory regimes, and they can assess an insurer’s financial strength from its ERM models.

The remaining 5% are mostly small or young insurers who do not meet Best’s size or age criteria.

S&P and Moody’s have 80% of the U.S. rating agency market; together with Fitch, they have about 90%.

Other rating agencies operate in foreign countries. Many foreign insurers operating in a single country are rated by country specific rating agencies.

Suppose an insurer is rated A- by S&P and Best’s. A new agency approaches the insurer offering a more sophisticated rating system. If the new agency gives more favorable ratings, it won’t affect investors and agents who rely on the rating agencies they are familiar with. If the new agency gives less favorable ratings, it won’t attract clients. The rating agency industry may already be saturated.

Insurance ratings by A. M. Best’s are somewhat higher (on average) than those from the other agencies, but the differences are slight.

Rating agencies do little proprietary financial research. It is less expensive to use published research by leading academics than to hire private researchers. The best analysts prefer work at universities where they publish freely than at private firms that own all their work.

Krugman infers that rating agencies are corrupt. He infers that the agencies began as market researchers, selling assessments of corporate debt to investors. Eventually they morphed into something quite different: companies that were hired by the people selling debt to give that debt a seal of approval. Few economists agree with this analysis; this reading presents the interpretations without supporting any of them.

Due to copyright restrictions, please use the following link to access the files:

What do the coverages mean?

**Accident Benefits**: Benefits that you or other insured persons may receive if injured or killed in an auto accident. The benefits may include: income replacement; medical, rehabilitation and attendant care; funeral and death expenses. Optional accident benefits are also available above the standard accident benefits in your auto policy.

**All Perils coverage**: This combines Collision or Upset and Comprehensive coverages. In addition, it covers loss or damage caused if a person who lives in your home steals the vehicle that is covered by your insurance policy. It also covers you if an employee who drives or uses, services or repairs your vehicle, steals it.

**Attendant Care Benefit**: Pays for expenses incurred for an aide or attendant to look after you if you have been seriously injured in an auto accident.

**Caregiver Benefit**: If you are providing full-time care to dependants and can no longer provide that care as the result of a catastrophic injury suffered in an auto accident, you may be eligible for caregiver benefits to reimburse you for your expenses to hire someone to care for your dependants.

**Catastrophic injury**: Is a serious and life-threatening injury, with the full definition set out in regulation. It may involve the loss of use of limbs or complete loss of eyesight as well as other injuries as defined in regulation. In Ontario there is a higher level of benefits available when the injury is catastrophic. If you suffer an injury in an accident, you can apply and be assessed for a determination of whether your injury qualifies as “catastrophic”.

**Collision or Upset coverage**: Pays for losses caused when your vehicle is involved in a collision with another object, including another vehicle, or rolls over.

**Comprehensive coverage**: Pays for losses for certain perils, such as falling or flying objects, and vandalism.

**Death and Funeral Benefit**: If you die as a result of an auto accident, the death benefit provides a lump sum payout to your spouse and your dependants; the funeral benefit provides a lump sum payout to cover the cost of your funeral expenses.

**Dependant Care Benefit**: Pays for additional expenses incurred to care for your dependants if you are employed and are injured in an auto accident and not receiving the Caregiver Benefit.

**Direct Compensation-Property Damage (DC-PD)**: Covers damage to your vehicle or its contents if another person was at fault for the accident. It is called direct compensation because even though someone else causes the damage, you collect directly from your own insurer. The accident must also occur in Ontario and both drivers must be insured by an insurance company licensed in the province.

**Family Protection Coverage (OPCF 44R)**: Covers you for the difference between the at-fault driver’s Third Party...
Liability limit and your own Third Party Liability limit if someone with less liability coverage than you injures you in an accident.

**Housekeeping and Home Maintenance expenses:** If you are unable to perform your usual duties due to a catastrophic injury, this benefit pays for reasonable and necessary additional expenses for someone to complete your usual duties.

**Income Replacement Benefit:** If you cannot work as the result of an auto accident, you may be eligible for basic weekly income replacement benefits of up to $400. This benefit commences after one week.

**Indexation Benefit:** The automatic adjustment of the income replacement benefit, non-earner benefit, attendant care benefit or medical and rehabilitation benefit according to the Consumer Price Index for Canada to compensate for inflation.

**Medical and Rehabilitation Benefit:** Covers the cost of reasonable and necessary medical and rehabilitation expenses (e.g., physiotherapy, prescriptions) that are not covered by OHIP or your disability insurance plan but which are listed in the Statutory Accident benefits schedule. Other expenses not listed might be covered if they are agreed by the insurer and are seen as essential to your recovery.

**Specified Perils coverage:** Covers damage to your vehicle caused by one of the following perils: fire; theft or attempted theft; lightning, windstorm, hail or rising water; earthquake; explosion; riot or civil disturbance; falling or forced landing of an aircraft or parts of an aircraft; or the standing, sinking, burning, derailment or collision of any kind of transport in, or upon which, an insured vehicle is being carried on land or water.

**Third Party Liability:** This section of your automobile insurance policy protects you if someone else is killed or injured, or their property is damaged. It will pay for claims as a result of lawsuits against you up to the limit of your coverage, and will pay the costs of settling the claims. By law you must carry a minimum of $200,000 in Third-Party Liability coverage but options exist to increase the minimum amount

**Tort Deductible:** The amount that is deducted from a settlement or court award for pain and suffering.

**Uninsured Automobile coverage:** Protects you and your family if you are injured or killed by a hit-and-run driver or by an uninsured motorist. It also covers damage to your vehicle caused by an identified uninsured driver.

### What do the terms mean?

**Coverage:** The scope of protection provided under an insurance policy.

**Deductible:** An insurance deductible is the amount you have to pay for losses and damages for which you are covered before your insurance payments kick in. Raising deductibles means you’ll contribute more toward the loss if you have an accident, but it can mean a lower insurance premium.

**Endorsement:** Any change made to your existing auto insurance policy that either expands or restricts coverage.
**Exclusions:** Items or conditions that are not covered by the general insurance contract.

**Minor Injury:** Minor injuries include sprains and strains, contusions and lacerations, or whiplash injuries. If you are deemed to have suffered a minor injury in an auto accident, your medical and rehabilitation benefits will be fixed at a maximum limit of $3,500, regardless of any optional increased benefits you have purchased.

**Premium:** The amount of money that you pay for your insurance policy.

**Risk Classification:** Is a grouping of risks or policyholders with similar risk characteristics to determine rates. Typical risk classifications are based on: type of vehicle, use of vehicle, driving record of drivers, age, gender and marital status of drivers and territory.

**Tort:** A wrong that is committed by one person on another that causes injury to that person. A tort can be either intentional or unintentional. Liability insurance is mainly purchased to cover unintentional torts.

**Underwriting:** The process of selecting or rejecting risks for insurance.
Common Pitfalls and Practical Considerations in Risk Transfer Analysis

Derek Freihaut, FCAS, MAAA, and Paul Vendetti, FCAS, MAAA

The current papers available on risk transfer have provided background and a general description of the tools available for analysis. Risk transfer analysis has many nuances that can trip up an actuary testing a contract. This paper discusses several of these pitfalls and provides direction on how to address them based on previously published materials from the accounting boards, the American Academy of Actuaries (AAA), and the Casualty Actuarial Society (CAS). This paper also addresses several outstanding risk transfer concerns that have no easy answers. While these issues do not have obvious solutions, the intent of the paper is to shed some light on these topics and open the door for further discussion.

To facilitate the discussion of these common pitfalls and practical considerations two example contracts are reviewed with an Expected Reinsurer Deficit (ERD) calculated for both.

Keywords: Risk transfer, Expected Reinsurer Deficit (ERD), FAS 113, Reinsurance Attestation Supplement (RAS), SSAP 62.

1. INTRODUCTION

Current papers available on risk transfer have provided background and a general description of the tools available for analysis. However, risk transfer analysis has many seemingly minor nuances that can trip up an actuary testing a contract. In this paper, we will discuss several of these pitfalls and provide direction on how to address them based on previously published materials from the accounting boards, the American Academy of Actuaries (AAA), and the Casualty Actuarial Society (CAS). We will also highlight a number of practical considerations that have not received as much attention in the available literature. While these practical considerations do not have obvious solutions, we hope to shed some light on the available options and open the door for further discussion on the topic.

1.1 Risk Transfer in Current Literature

This discussion is derived from a review of existing risk transfer literature, most notably “Reinsurance Attestation Supplement 20-1: Risk Transfer Testing Practice Note” from the AAA Committee on Property and Liability Financial Reporting and “Risk Transfer Testing of Reinsurance Contracts: Analysis and Recommendations” from the CAS Research Working Party on Risk Transfer Testing [1][2]. We also relied heavily on the accounting standards, Financial Accounting Standard No. 113, “Considerations in Risk Transfer Testing” (FAS 113) and SSAP 62, “Property and Casualty Reinsurance.” While some discussion of the CAS Working Party paper and the AAA Practice Note is necessary, this paper is an attempt to go beyond the framework provided in the
current literature and review the more routine issues faced by actuaries in reviewing reinsurance transactions for risk transfer.

1.2 Objective

In this paper, we will discuss several pitfalls and practical considerations with risk transfer analyses. We will provide direction on how to address the pitfalls based on previously published materials and we hope to shed some light on the available options concerning the practical considerations and open the door for further discussion on the topics.

1.3 Outline

In Section 2 of this paper we will present a brief history and background of risk transfer, including a discussion of the terms “substantially all” and “self-evident,” as well as discussion on measuring risk transfer and risk transfer thresholds.

Section 3 will contain a discussion on the pitfalls and practical considerations. We will start by showing two sample contracts that will be used as a basis for much of the discussion, and how to analyze risk transfer. Next we will cover various pitfalls, including discussion on the following topics:

- Profit Commissions
- Reinsurer Expenses
- Interest Rates and Discount Factors
- Premiums
- Evaluation Date
- Commutation and Timing of Payments

In the last part of Section 3, we will highlight some of the practical considerations in risk transfer testing, including discussion on:

- Parameter Selection
- Interest Rate
- Payment Pattern
- Loss Distribution
Common Pitfalls and Practical Considerations in Risk Transfer Analysis

- Parameter Risk
- Use of Pricing Assumptions
- Commutation Clauses

The fourth and final section of the paper will contain a short wrap up, conclusions and a reminder that risk transfer testing is a principle-based exercise and not just a “plug and chug” methodological exercise.

2. BRIEF HISTORY OF RISK TRANSFER

Since the reinsurance goals of ceding companies are as different as the risks reinsured, reinsurance contracts contain a variety of terms and conditions that can impact the economic structure of the reinsurance transaction. When a contract qualifies as reinsurance there are certain accounting benefits that a ceding company can realize.

The demonstration of risk transfer for reinsurance is required by FAS 113 in order for the contract to receive reinsurance accounting treatment under Generally Accepted Accounting Principles (GAAP). Statutory Accounting Principles (SAP) defined in SSAP 62 are similar in guidance to FAS 113. Generally, both standards for risk transfer require that:

1. The reinsurer assumes significant insurance risk under the reinsured portion of the underlying insurance agreement; and
2. It is reasonably possible that the reinsurer may realize a significant loss from the transaction.

Because the terms “significant insurance risk,” “reasonably possible,” and “significant loss” are not defined in either accounting standard, the challenge is to appropriately interpret and apply the accounting standards to each reinsurance transaction.

The abuses of the past several years in the use of finite reinsurance contracts have highlighted the need to document and quantify risk transfer. An increase in scrutiny of reinsurance contracts led to the introduction of the “Reinsurance Attestation Supplement,” in the 2005 NAIC Annual Statement.

The supplement requires the chief executive officer (CEO) and chief financial officer (CFO) to confirm that:

1. There are no separate written or oral agreements between the reporting entity and assuming
reinsurer.

2. There is documentation for every reinsurance contract for which risk transfer is not reasonably self-evident that details the transaction’s economic intent and that documentation evidencing risk transfer is available for review.

4. The appropriate controls are in place to monitor the use of reinsurance.

CEOs and CFOs have the responsibility to attest to risk transfer in reinsurance transactions. However, since actuaries are uniquely qualified to quantify and evaluate risk transfer, they are increasingly being called upon to quantify risk transfer and provide the necessary documentation.

As mentioned above, GAAP and SAP accounting standards contain similar wording about what is required for risk transfer to be present. Most notably, both require the presence of insurance risk. Insurance risk has two components, underwriting risk and timing risk. If both of these types of risk are not present, then insurance risk has not been transferred. While risk transfer is independently defined in each standard, we are unaware of any examples of a contract that would meet the requirements of one standard, but not the other. Contracts that qualify according to one standard are generally considered to meet the requirements of the other standard as well.

2.1 One Exemption from Risk Transfer Requirements – “Substantially All”

Both GAAP and SAP accounting standards specifically require that it be reasonably possible that the reinsurer may realize a significant loss from the transaction, except in cases where the reinsurer meets the “substantially all” requirement. This is meant to exempt a very narrow definition of contracts where the reinsurer assumes “substantially all of the insurance risk relating to the reinsured portions of the underlying insurance contracts.” The most common examples are straight quota share or individual risk contracts with no loss ratio caps or other risk limiting features. The reason for this exemption is that it allows companies to acquire qualifying reinsurance on inherently profitable books of business where it may not be reasonably possible that the reinsurer will realize a significant loss.

2.2 Required Risk Transfer Documentation and Reasonably Self-Evident

When the NAIC introduced the “Reinsurance Attestation Supplement” (RAS) in 2005 they also
introduced a new term to the risk transfer lexicon, “reasonably self-evident.” The RAS requires documentation “for every reinsurance contract for which risk transfer is not reasonably self-evident.” This classification of contracts is meant to reduce the need to rigorously test every reinsurance contract for risk transfer. Unfortunately, very little guidance was offered on what “reasonably-self evident” encompasses. The AAA Practice Note followed the introduction of the RAS and laid out some general guidelines for establishing when the presence of risk transfer is reasonably self-evident. The guidelines were general in nature and provided characteristics to look for in contracts to determine when risk transfer is reasonably self-evident and when it is not.

The CAS Working Party paper took these guidelines one step further and provided a list of specific contract categories where risk transfer is reasonably self-evident based on meeting a 1% Expected Reinsurer Deficit (ERD) threshold. They point out that this list is preliminary and expect it could be considerably expanded. They also point out that there are exceptions to the list, such as when a contract looks contrived. We feel that it can be dangerous to attempt to codify this terminology with explicit definitions. Every contract is different and must have its terms thoroughly reviewed.

Specifically, the CAS Working Party paper lists a couple of categories that we do not agree are always reasonably self-evident such as individual risk contracts and certain long tail excess of loss treaties. Individual risk treaties with no significant risk limiting features would likely be exempt from the accounting standards since the reinsurer assumes “substantially all” of the underlying risk. For individual risk contracts that do not qualify for this exemption, it is not hard to imagine special features that would restrict risk transfer.

For long tail excess of loss treaties, the CAS Working Party paper provides a few numerical qualifications to meet the reasonably self-evident standard. For excess of loss contracts that are not on short tail exposures, the CAS Working Party paper finds that any contract with aggregate limits no less than one per occurrence limit or twice the premium, meets the reasonably self-evident criteria if there are no ceding commissions and the rate on line is below 500%. It is not difficult to construct a contract around these parameters that clearly does not transfer risk. An extreme example would be a single doctor paying $1M for a $1M x $5M medical malpractice treaty with a $2M aggregate limit. This contract passes the established criteria for the risk transfer to be reasonably self-evident, but I think most would agree that not enough risk is transferred in this contract for it to qualify as reinsurance. This is obviously an unrealistic example, but it shows how applying specific parameters on the terminology can lead to unintended results.
The RAS requires documentation “for every reinsurance contract for which risk transfer is not reasonably self-evident.” It seems obvious that any contract requiring a more rigorous review would also require documentation for the model results. However, it is our recommendation that documentation be kept on all reinsurance contracts reviewed for risk transfer. We think it is valuable to have documentation for those contracts found to be exempt for any reason, although the most notable are those that meet the “substantially all” clause. We find it to be just as important to document any contract where the risk transfer is found to be reasonably self-evident. While the term reasonably self-evident might lead one to believe the conclusion is obvious and anyone who picks up the contract will reach the same conclusion, not all contracts that meet this standard are clear cut. This is of particular importance if you are using any reference, such as the previously discussed list from the CAS Working Party Paper, to make your determination. The AAA Practice Note also recommends keeping documentation for reasonably self-evident contracts. The practice note also includes several example checklists in the appendix from companies who have made this type of documentation standard.

2.3 Selected Risk Measuring Method – Expected Reinsurer Deficit (ERD)

Neither SSAP 62 nor FAS 113 provide a clear numeric trigger of when risk transfer fails. The “10-10” rule was developed as a benchmark to give meaning to the criteria in the two accounting standards. The “10-10” rule says that a reinsurance contract exhibits risk transfer if there is at least a 10% chance of a 10% or greater loss for the reinsurer.

Another method that has gained acceptance and overcomes some shortcomings of the “10-10” rule is the Expected Reinsurer Deficit (ERD). ERD can be viewed as the probability of a net present value (NPV) underwriting loss for the reinsurer multiplied by the NPV of the average severity of the underwriting loss. A treaty is typically considered to exhibit risk transfer if ERD is greater than 1%, which is consistent with the “10-10” rule (10% loss multiplied by 10% chance is a 1% ERD). Therefore, contracts that qualify for risk transfer under the “10-10” rule generally qualify under a 1% ERD. We will discuss thresholds more in the next section.

ERD has not been explicitly endorsed by any professional body. However, while the CAS Working Party paper stopped short of endorsing ERD, they did prefer its use as a de facto standard over the “10-10” rule. There are a handful of other methods, but none of them are as widely used as the two previously mentioned. Some methods, such as Value at Risk (VaR) and Tail Value at Risk (TVaR) are generalizations of methodologies we have already discussed. Others, such as the
Right Tail Deviation (RTD) method by Wang outlined in the CAS practice note, have not caught on due to the complexity of the model [4][5]. There are also methods, such as the Risk Coverage Ratio (RCR) by Ruhm, which have not caught on due to the exclusion of key variables [3]. RCR does an adequate job of evaluating risk in the losses that are transferred, but it does not make any comparison to premium.

In this paper we will test for risk transfer using a simple cash flow simulation and calculating the Expected Reinsurer Deficit (ERD). While some of these other measures could be used in our example analysis we will use only ERD in the interest of consistency.

2.4 Risk Transfer Thresholds

The CAS Working Party paper began some brief discussion about what the appropriate guideline threshold percentage should be and suggested that further research be done. Currently, because it is consistent with the “10-10” rule, the most commonly recognized threshold for ERD is 1%. Some have suggested that a 2% threshold would be more appropriate. Our recommendation is to continue using the 1% threshold until a more thorough analysis suggests otherwise. Using 2% would be a more stringent guideline, but the 2% threshold does not appear to be any less arbitrary than the current 1% threshold. While the 1% threshold is based on the somewhat arbitrary “10-10” rule, there is some reasoning behind it. The “10-10” rule was loosely derived from the accounting standard language that required that the reinsurer face a “reasonable chance of a significant loss.” For the purposes of risk transfer, it has been commonly accepted that a 10% chance is a “reasonable chance” and that a 10% loss is a “significant loss.” From these two accepted values, the ERD of 1% has been derived and this threshold continues to gain acceptance.

The CAS Working Party paper also mentions the possibility of including other requirements, such as a required maximum loss, in order to show risk transfer. We recommend not complicating the methodology with extra arbitrary requirements. While adding a maximum loss requirement may feel intuitive, it begins to complicate the process and makes explaining results to the decision-makers more difficult. Adding requirements can also lead to more engineering of contrived contracts. If a maximum loss is required, any contract can be rewritten to incorporate a rare maximum loss.
3. COMMON PITFALLS AND PRACTICAL CONSIDERATIONS

DISCUSSION

In order to illustrate the common pitfalls that can affect a risk transfer analysis it is first important to demonstrate how a basic risk transfer analysis is completed, highlighting many of the issues that can surface along the way. Many of the pitfalls referenced in this section are further emphasized later in the paper.

To demonstrate risk transfer analysis two reinsurance contracts are used. Contract #1 is a quota share contract while Contract #2 is an excess of loss contract.

The terms for Contract #1 are summarized in Table 1:

<table>
<thead>
<tr>
<th>Table 1 - Summary of Terms - Contract #1</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Inception Date</strong></td>
</tr>
<tr>

</tr>
</tbody>
</table>

The underlying exposure for Contract #1 is multi-state workers compensation. The company has written workers compensation for a number of years. The cession is a straightforward quota share with a loss ratio cap of 100%. This loss ratio cap has the potential to significantly affect risk transfer. The presence of the loss ratio cap does not always indicate a lack of risk transfer. Contracts, with loss ratio caps at 200% to 300% can clearly result in a significant loss to the reinsurer. Secondly, there is a profit commission provision whereby the ceding company will receive a profit commission if the underlying loss ratio is 66% or less with maximum profit provision of 5.0%. The profit provision swings on a one-to-one basis with the loss ratio. The impact of profit
provisions on risk transfer is discussed later in the paper.

The terms of the second contract are summarized in Table 2:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

This is an excess of loss contract covering workers compensation exposure that has a number of potential risk limiting features. The contract is swing rated with a provisional rate of 8.5% which can swing up or down by 2.5%. The swing is based on a ceded loss ratio of 75.0%. Secondly, there is a feature that states that the contract is automatically commuted after five years unless the ceding company pays an additional maintenance fee of $50,000.

For the two example contracts it is not reasonably “self-evident” that risk transfer exists due to the presence of such features as low loss ratio caps and swing-rated premiums.

3.1 Analyzing Risk Transfer

The first step in any risk transfer review is to understand the reinsurance contract’s terms and conditions, focusing especially on the terms that can affect the amount of risk being transferred. Care must be taken to understand not only the terms of the treaty but also when those terms will be triggered. In Contract #2 there is a commutation clause that requires a maintenance fee to avoid early commutation that is triggered after five years.

Next the reporting dates and premium due dates need to be determined. In both example
contracts the reinsurance premium is payable in quarterly installments due one month after quarter end, i.e., on April 30, July 31, October 31, and January 31 of the following year.

In both contracts there is not a pre-defined loss payment schedule and therefore losses are reimbursed as they occur. To determine the net present value of the losses, a loss payment pattern reflecting the underlying exposure being reinsured is applied. It is further assumed that losses in any given calendar year are paid at the midpoint of the year.

For Contract #2, it is assumed that the first swing rate adjustment is applied two years after the contract’s effective date. Most contracts will define the timing of the experience adjustments to the premium. It is also assumed in the model that the impact of the adjustment is correctly identified for the first adjustment with no further changes to the ceding commission necessary. This assumption implies that the ultimate loss ratio is known at the first adjustment.

The second assumption is that the commutation fee will be paid by the ceding company after five years. This is a reasonable assumption since the ceding company may not want to commute the contract and reassume the risk of changes in the unpaid claims estimates.

The risk transfer analysis was completed using Monte Carlo simulation, modeling first the direct loss payments and then projecting the treaty cessions from the direct loss payments. The ceded losses are then discounted to the effective date of the treaty. Next, the final premium amounts are determined based upon the nominal treaty results, not on the discounted premiums or losses. Any premium adjustments are determined from the modeled results. Care must be taken so that the premium payment dates are appropriately modeled. Like the losses, premium payments are discounted to the treaty effective date. The reinsurer profit/loss is then calculated for each iteration of the simulation as the net present value (NPV) of all payments made from the ceding company to the reinsurer minus the NPV of all the payments made from the reinsurer to the ceding company.

All cash flows between the ceding company and reinsurer need to be represented in the model whether they are called premiums, fees, or experience adjustments. Reinsurer expenses are not included in the model since this is not a cash flow between the ceding company and the reinsurer. For instance in Contract #2 the maintenance fee is included in the analysis and the reinsurer expenses are not. The reinsurer expenses are not part of the risk assumed by the reinsurer from the ceding company.

Finally, the Expected Reinsurer Deficit (ERD) is calculated. ERD can be viewed as the probability of a net present value (NPV) underwriting loss for the reinsurer multiplied by the NPV
of the average severity of the reinsurer underwriting losses. The resulting ERD values are 2.85% for Contract #1 and 2.09% for Contract #2. Details of the simulation and ERD calculation can be found in Appendices A and B. These results indicate that both of these contracts appear to exhibit risk transfer. This conclusion is based on the calculated ERD values and the commonly accepted threshold of 1.0%. As with any risk transfer decision, the ultimate determination must be made by the company CEO or CFO or both.

3.2 Common Pitfalls

This section will highlight easy-to-make mistakes or common pitfalls. Most of these come from our own experience in reviewing contracts for risk transfer and reviewing risk transfer analyses of other actuaries. It is our intent to provide concrete solutions citing previously published materials.

3.2.1 Profit Commissions

Profit commissions generally should not be considered in risk transfer analysis. When determining if risk transfer is present, the analysis focuses only on the scenarios resulting in a loss for the reinsurer. While profit commissions can affect the economic results of a treaty, they usually are not triggered during a reinsurer loss.

This exclusion of profit commissions and focus on reinsurer loss scenarios is not necessarily intuitive. However, the accounting standards clearly state that the presence of risk transfer requires a “reasonable chance of a significant loss” to the reinsurer. Therefore, the results of the ceding company should not be considered in a risk transfer analysis.

It is important to remember that contract features like profit commissions can still have an indirect impact on risk transfer. This impact on risk transfer stems from how these features may affect other aspects of the contract, most notably the premium. Reinsurance contracts are priced while considering any and all expected payments paid and received by the reinsurer. Any addition of a profit commission clearly increases the amount of future expected payments by the reinsurer to the ceding company and may result in a higher premium for the contract.

In the example analysis for Contract #1, the profit commissions were included in the simulation to demonstrate that they did not affect the reinsurer in any loss scenarios. However, if the contract failed to meet risk transfer requirements, the ceding company and the reinsurer may consider potential changes that would allow the contract to be accounted for as reinsurance. One potential change would be to eliminate or reduce the profit commissions with a corresponding decrease in
premium. This change in premium may result in the contract meeting risk transfer requirements.

Another way profit commissions can affect risk transfer is through carryforwards. Carryforwards may be used in multi-year contracts where the profits or losses from prior years may affect the results of the future years. A contract for periods of more than one year usually requires further testing for risk transfer and any carryforwards that may impact a loss position for the reinsurer would need to be incorporated into the model. Carryforwards can also be used in one-year contracts where the primary company and reinsurer agree to terms each year and at that time choose whether or not results will be carried forward. In this case each contract renewal may require a specific analysis. If there is a carryforward from a previous year that would affect results when there is a loss for the reinsurer, then it must be incorporated into the cash flow model. However, when considering one-year contracts with no impact from prior carryforwards there is no need to incorporate potential future carryforwards since they have no impact on the contract being reviewed.

3.2.2 Reinsurer Expenses

Only cash flows between the ceding company and the reinsurer should be considered in a risk transfer analysis. According to SSAP 62, “The evaluation is based on the present value of all cash flows between the ceding and assuming enterprises under reasonably possible outcomes.” This means that broker expenses, operating expenses, fees related to letters of credit, and taxes should bear no impact on the analysis. As can be seen in the Appendices, the analyses of the example contracts did not incorporate any of these expenses that did not result in a cash flow between the reinsurer and the ceding company.

3.2.3 Interest Rates and Discount Factors

SSAP 62 requires a constant interest rate to be used for discounting across all simulated scenarios. The interest rate should not vary by scenario because risk transfer analysis should only consider insurance risk. Non-insurance risks such as investment risk, currency risk, and credit risk should not be included. The AAA Practice Note interprets this to also mean that the same interest rate should be applied to all cash flows, including premiums and losses.

SSAP 62 only requires the selection of the interest rate to be reasonable and appropriate. The AAA Practice Note recommends the risk free rate as a reasonable choice. This is not necessarily a conservative selection. Because the risk free rate is commonly below a reinsurer’s expected
Common Pitfalls and Practical Considerations in Risk Transfer Analysis

investment returns, it will actually result in higher projected present valued losses. However, the investment abilities of the reinsurer should not affect the presence of risk transfer, so the risk-free rate is a consistent and reasonable selection for the analysis. The selection of other interest rates is considered later in the paper.

SSAP 62 states that a reasonable and appropriate interest rate “generally would reflect the expected timing of payments to the reinsurer and the duration over which those cash flows are expected to be invested by the reinsurer.” Therefore the duration used to select an interest rate should be based on the net cash flows to the reinsurer.

There has been a lot of guidance on interest rate selection and there is very little room for deviation from the use of a constant interest rate in all risk transfer analyses. However, in the selection of the interest rate the accounting standards do not prescribe a set framework and note that judgment is involved. While using a risk-free rate with duration equal to that of the reinsurers net cash flows is recommended, a selected rate could still be considered a “reasonable and appropriate rate”.

Page 4 of Appendix A provides an example of calculating a duration using loss and premium payments and then selecting a risk-free rate based on that duration. To get the duration of the net cash flows we performed two duration calculations. First we determined the duration of the premium payments. This was straightforward since the premium payment schedule is laid out in the contract. Next the loss duration is calculated using an industry payment pattern. The duration of the net cash flows is then the difference between the two. This calculation may not be exact, but it is a good approximation of the “duration over which those cash flows are expected to be invested by the reinsurer,” as the standard requires. The calculated duration of net cash flows was then used to select an interest rate based on the years of maturity and yield curve rates from the U.S. Treasury in Columns (7) and (8). This interest rate was used in the analysis for Contract #1.

For Contract #2 an interest rate was selected with consideration given to the current risk-free rates and longer expected payment pattern for an excess of loss contract.

3.2.4 Premiums

The premium paid by the ceding company is one of the most significant inputs when determining if risk transfer is present. When using the “10-10” rule or ERD all potential loss situations are going to be compared against the premium to calculate a percent of loss. While its importance is clear, what the premium should include is not nearly as straightforward.
First, the premiums used in risk transfer analysis should be gross premiums. This is specifically pointed out in SSAP 62. Gross premiums entail all premium paid to the reinsurer before the consideration of any payments back such as a ceding commission.

When making comparisons against premium to determine a reinsurer’s profit or loss, it is required that the present value of the premium be used. Reinsurance contracts often lay out specific payment plans for premium. The same interest rate used to discount losses should be applied to calculate the present value of the premium. While the risk transfer analysis is a present value calculation, it is important to model the actual functioning of the contract. This means that the application of the loss ratio caps and experience adjustments are based upon the nominal premium and loss amounts. As shown in Appendix A, the loss ratio cap in Contract #1 is applied to nominal losses and premiums in the simulation. The discounting of premium and losses happens after the contract losses and premiums are determined and any caps or experience based features are applied.

When the premium of a reinsurance contract is dependent upon future events, using the proper premium in a cash flow simulation is slightly more complicated.

There are a number of premiums that could be considered for this purpose. The initial deposit premium is an intuitive and simple choice, but it does not account for future payments from the ceding company to the reinsurer and could therefore be easily manipulated. The other options are to use an expected premium or the actual premium in each scenario.

The use of expected premiums may also seem intuitive, but can be troublesome as well. The most significant concern with using expected premiums is the potential over detection of risk transfer. When premium is dependent upon loss experience, the highest premium levels often occur when the loss experience is the poorest and the reinsurer’s losses are at their highest. If the reinsurer’s percent of loss is calculated using an average expected premium, it is likely that the resulting reinsurer loss percentage will be a larger negative value than what is actually possible. Because of this it is imperative that actual premiums are developed along with the losses for each scenario and that each scenario has a corresponding percent of reinsurer loss developed. From these simulated results, percentiles and values such as ERD can be calculated.

It is not uncommon for a reinsurance contract to include fees other than premium. When there are fees that depend upon future events, the impact of these events should be included in the model. If it is not possible to include certain events in the model, a general assumption about their impact on any future cash flows may be necessary. The conservative decision would be to include all fees.
that the ceding company may be required to pay to the reinsurer. There is an example of this in Contract #2, which requires a fee to delay mandatory commutation of the contract after five years. In the example it is assumed that the primary company will not want to commute the contract and reassume the risk after five years and therefore will be required to pay a fee of $50,000. When this type of fee is expected to occur, it should be considered as premium in any calculation of reinsurer loss. While the fee may be entirely administrative and related to the reinsurer’s claim handling costs, any cash flows from the ceding company to the reinsurer should be considered as premium. If this were not the case, the determination of risk transfer could be manipulated based upon the labeling of certain cash flows as premiums or fees.

3.2.5 Evaluation Date

The date used in risk transfer analysis will likely only be used in the selection of an interest rate or in determination of how much was known about potential losses when the contract was entered into. SSAP 62 states that “risk transfer assessment is made at the inception date based on facts and circumstances known at the time.” Therefore any parameters that may be affected by the date at which they were determined should be considered from the time of the contract’s inception. The contract inception date is the date the contract comes into force, or the original effective date. According to SSAP 62 it is not necessary to retest for risk transfer at every renewal unless there are any significant amendments made to the treaty. If a contract is tested at inception, the results of that test are unlikely to change. In the case of an amendment that makes a material change to the amount of risk being transferred, the amendment date should be treated as the inception date of the contract and the contract should be reviewed again for risk transfer.

3.2.6 Commutations and Timing of Payments

According to SSAP 62, any reinsurance contracts that have prescribed payment patterns do not meet the risk transfer requirements. In order to have risk transfer in a reinsurance contract, there must be timing risk as well as underwriting risk. Prescribed payment plans remove the timing risk necessary for risk transfer. In order for the contract to contain timing risk the reinsurer must make “timely reimbursement payments.”

Contracts with commutation clauses may still meet risk transfer requirements, but to the extent they affect the cash flows between the ceding company and reinsurer, they must be modeled. If a fee is required to avoid an early forced commutation, this fee should be considered as part of the expected premium paid. If the commutation decision is unilateral, it may be necessary to
incorporate the commutation decision into the model based on economically rational decision making. To the extent the commutation clause impacts the payment pattern, this too should be considered in the cash flow model.

### 3.3 Practical Considerations

This section is meant to highlight a number of practical considerations that commonly appear in risk transfer analyses and have not been thoroughly addressed in the current literature. While not all of these practical considerations have obvious solutions, we hope to shed some light on the available options and open the door for further discussion on the topics.

#### 3.3.1 Parameter Selection

One of the first and most important steps in performing a cash flow simulation for risk transfer analysis is choosing the parameters. Any parameters that are not given by the contract must be selected after some contemplation. This includes the interest rate, payment pattern, and any loss distributions used for projecting cash flows.

#### 3.3.2 Interest Rate

Making the appropriate interest rate selection was previously addressed in the Common Pitfalls section. Using a risk-free rate based upon a duration calculation and the expected premium and loss payments is recommended by the AAA Practice Note. It is also required by the accounting standards that the same rate be used throughout the analysis.

While the risk-free rate is recommended, there are other possibilities to consider. It is difficult to envision a scenario were it would be reasonable to use an interest rate that is lower than the risk-free rate. This may seem conservative, but using a lower interest rate would lead to higher losses at present value and could result in over-detecting risk transfer. It is also difficult to construct an argument for why a company would not have the risk-free rate available to them. Therefore, it seems reasonable to treat the risk-free rate as the lowest possible choice, or floor, when selecting an interest rate.

A better argument could be made for selecting an interest rate above the risk-free rate. The most logical argument is that the reinsurer in the contract has a higher expected return on investments and this expected return should be used when determining if they face a “reasonable chance of a significant loss.” While this argument is intuitive, it does have its flaws. First, this is not likely an
available parameter if the risk transfer analysis is being done on behalf of the ceding company. Next, if a reinsurer’s expected investment returns are used in the risk transfer analysis, it will create the situation where a contract may be found to exhibit risk transfer for a reinsurer with poor investment strategy, but be found not to transfer risk for a reinsurer with superior investment strategies. This type of counter-intuitive result is also why cash flows that are not between the ceding company and the reinsurer are not considered.

Based on these considerations it is difficult to construct an argument for using anything that is not at least loosely based upon the risk-free rate. For consistency and to provide support for the interest rate selected, it may be worthwhile to base the selection on the treasury yields available at the inception date of the contract and the expected duration of the cash flows, as was done in the example for Contract #1. This approach is consistent with the recommendation from the AAA Practice Note. However, depending on the situation and in an effort to keep an analysis simple, it may also be just as reasonable to select an appropriate approximation of the current risk-free rate, as was done in the example for Contract #2.

An alternative to selecting a duration-matched interest rate, which has been used by some practitioners, is the selection of a constant yield curve. Use of a yield curve is common in company planning and in making economic decisions on contracts. However, the use of yield curves in risk transfer analysis does not appear to be consistent with the accounting standards. The AAA Practice Note finds that SSAP 62 requires, “that a single interest rate be used to present-value the cash flows.”

A constant yield curve would generally result in a more stringent risk transfer analysis since interest rates tend to be higher at longer durations. The typical yield curve would lead to more discount being applied to losses in comparison to the premiums, which are often paid much quicker. While the use of a yield curve may seem like an improvement to the analysis, the language in the accounting standards clearly leads to a similar conclusion to the AAA Practice Note. Both standards refer to the use of “a constant interest rate,” through all cash flow scenarios. The intent of the standards appears to be that interest rate risk should not be incorporated in the model. Thus, an interest rate that varies by scenario is not allowed. Capturing interest rate risk is not the intent of incorporating a yield curve into the analysis. A constant yield curve across all scenarios would only result in a different interest rate when the timing of the cash flows differed, which reflects risk due to the timing of losses and premiums, not the interest rate. However, the use of a yield curve to discount cash flows would result in a different effective interest rate when no losses are paid
compared to a situation where significant losses are paid. This appears to violate the requirement in SSAP 62 that the “same interest rate shall be used to compute the present value of cash flows for each reasonable possible outcome tested.”

3.3.3 Payment Pattern

Payment patterns are often based on previous experience for the ceding company or industry benchmarks or both. While this can be a simple parameter to select, it is important to remember that there is uncertainty involved in the payment pattern. While this risk is more difficult to measure than the risk involved in a loss distribution, the timing of payments can play a significant role in the amount of risk transferred. For example, when a constant payment pattern is applied to a loss distribution, the results will not recognize the potential impact of quicker than expected payments. This will have the most significant impact on the tails of the distribution, which is often the portion we are the most interested in for determining risk transfer. While introducing variability into a payment pattern may be too complicated for the benefit it provides, it is important to at least consider this risk as you complete your analysis.

3.3.4 Loss Distribution

Loss distributions are often based on previous company experience, industry benchmarks, pricing information, or judgment, or all of these factors. For transactions covering large books of business with several years of historical experience available, selecting a loss distribution can be as easy as fitting a distribution to the available data. For books of business with low premium volume or immature loss experience, selecting the appropriate distribution can be much more difficult. Even for mid-size books of business it can be difficult to select a loss distribution because risk transfer testing focuses on the right tail of the distribution. This concern is compounded when working with high-level excess of loss contracts. However the loss distribution is determined, it is important to test the reasonableness of the tail results. Having an adequate comfort level with the tail results produced by the selected distribution is crucial.

When a company does not have enough historical loss experience to base a distribution upon, it is typical to turn to industry benchmarks or the information used to price the reinsurance contract. The use of pricing assumptions in risk transfer analyses is discussed later in the paper. Industry data can provide a starting point for overall expected loss ratios or frequencies and severities. However, it is difficult to select a distribution and develop a variance using only industry results. Individual companies can experience significantly higher variance in their loss than the industry as a whole. In
these instances it may be necessary to rely on some generally accepted distributions. Likewise a selected variance will be required. This selection will depend on a number of considerations, such as the size of the book of business, the type of coverage, the type of business being underwritten, and a variety of other factors.

3.3.5 Parameter Risk

A key consideration for any simulation model is parameter risk. Cash flow simulations for risk transfer are no different. As we previously discussed, selecting parameters to simulate future loss payments is a difficult process and it is important to account for the risk that the selected parameters or model are incorrect. Accounting for this increased variability in your simulation will increase the likelihood that your analysis will determine risk transfer is present. This is a reasonable result when you consider that the reinsurer is clearly accepting this same parameter risk when entering into the contract.

Parameter risk can be accounted for explicitly or implicitly. Implicitly it can be reflected in a slightly higher expected loss selection or in an increase to the expected volatility of losses. In the case of explicit recognition it is common to see a probability distribution assigned to key parameters and then to have them simulated also. This provides some variability to the selected parameters to help account for parameter risk. While this is a more concrete method than including it implicitly, it also depends on judgment and the selection of more distributions and parameters. There is not much information available about incorporating parameter risk into cash flow simulation models. Currently, there are no widely accepted methods and the costs of more complicated techniques may tend to outweigh the benefits.

Parameter risk is going to have the greatest impact on the losses simulated, but it can affect other facets of the analysis as well. When premium projections must be estimated based on the treaty terms, there is some additional parameter risk, but it will rarely affect the result of the analysis. There is also parameter risk in the discounting function used in the analysis. However, not all of that risk should be accounted for in a risk transfer analysis.

The majority of the parameter risk in discounting comes from two key inputs, the payment pattern and the interest rate. As we previously discussed, there is real risk in not incorporating an accurate payment pattern. This risk relates to timing risk, which is a part of insurance risk and should be considered in a risk transfer analysis. The second piece of the discount, the interest rate, however, should not contribute any risk, parameter or process, to the analysis. SSAP 62 clearly
states that “the possibility of investment income varying from expectations is not an element of insurance risk.”

Because there are no widely accepted methods and because the methods available either require some arbitrary selections or may add more cost than benefit to the analysis, we do not feel that parameter risk must be explicitly shown in a risk transfer analysis. We would strongly encourage practitioners to at least include it implicitly if not explicitly. Regardless, we recommend documenting the existence of parameter risk and, whether or not it is included in the analysis, documenting how it could affect the results. This documentation can be beneficial if another actuary needs to review the analysis. More importantly, parameter risk is too important to entirely exclude from both the analysis and the report when the analysis may be directly used to make the decision on risk transfer.

3.3.6 Use of Pricing Assumptions

One potential resource, if available, for selecting parameters for small or immature books of business is the reinsurance pricing assumptions. This concept is very attractive since a properly priced reinsurance agreement is likely to be based on an appropriate expected loss assumption with an appropriate risk load and payment pattern. While we are often more interested in a loss distribution than just the expected losses for testing risk transfer, these assumptions can help provide some of the necessary parameters for our simulation.

Pricing assumptions can also be helpful in parameter selection since they reflect how risky the market views a particular piece of business. The reinsurance market may provide a better indication of the amount of risk involved in a small new primary company searching for reinsurance than what you could find based on industry benchmarks. Of course, this market-driven view of a reinsurance contract is also one of the biggest drawbacks to using pricing assumptions. Simulation testing for risk transfer should be based on expected loss experience and should not be market-driven. Pricing assumptions should only be used in selecting parameters when reasonable. A hard insurance market with higher premiums does not mean that companies do not need to meet the same risk transfer standards. Because of this, when available, the underlying data that the pricing assumption was based upon can be even more beneficial than the parameters actually used in the pricing of the reinsurance.

To correctly apply the expected loss assumptions from a pricing model to a risk transfer analysis, it is important to properly account for the risk load in the pricing. In many reinsurance contracts,
risk load is a significant piece of the puzzle. It may be implicitly added into the expected loss ratio or explicitly stated in the development of the rate. If it is implicit in the expected losses, it is important not to blindly carry forward the expected losses without recognizing the extra loaded amount. If it is explicitly stated, intuitively there should be a relationship between this risk load amount and the level of risk inherent in the underlying coverage. While this risk load reflects the amount of variability the reinsurer anticipates in the contract, it is not easy to translate this load into a variance for your loss distribution. However, it is worthwhile to at least consider the size of this risk load when selecting the loss distribution and variance.

Another caveat to remember when using pricing information to select parameters for risk transfer testing is that while both practices are generally aimed at determining expected future losses, they both are doing so for very different reasons. The differences in intent can lead to different approaches and selections. Notably, when pricing a reinsurance contract, it might be considered prudent to make conservative selections. This might lead to slightly higher expected losses and risk load. These selections would not be considered conservative in a risk transfer analysis. Selecting higher expected losses and increasing the expected variability would lead to over-detecting risk transfer. For risk transfer testing the more conservative approach would be to use lower expected losses and variability. These differences in approach are important to remember anytime you are relying on assumptions from an analysis developed for a different purpose.

While pricing assumptions can clearly provide valuable input to any risk transfer analysis, it should also be clear that there are variety of reasons one may deviate from them. This is true even for reinsurance analysts who may be testing the same contracts they priced. These two exercises might require different assumptions about the modeled losses. Loss models used for pricing are often optimized based on their projections of all the potential results. Risk transfer, on the other hand, requires a model that is optimized on the right tail of the distribution. Due to this distinct difference in focus, the resulting selections for loss distribution and/or parameters may not be the same for pricing and risk transfer analysis.

### 3.3.7 Commutation Clauses

As previously discussed, any mandatory fees to delay a required commutation should be included when determining if risk transfer is present. Commutation clauses should be read carefully to determine their entire impact on risk transfer. While commutation clauses do not often prohibit a contract from exhibiting risk transfer, it is important to recognize that any commutation requirement
does restrict the amount of risk transferred. It is not uncommon for these clauses to set a predetermined date for commutation based on an actuarial determination of the unpaid claim estimates at that time. While this is a fair method for completing a commutation, it does require the ceding company to reassume the risk of any changes in the unpaid claims after the predetermined commutation date. This clearly returns some risk back to the ceding company, limiting the amount of risk transferred in the original transaction.

If a commutation clause states that the future commutation will be based on a mutually agreed upon value or on an actuarial determination, the payment pattern used to discount losses in the risk transfer analysis may not need to be adjusted. While the commutation may result in an earlier payment than anticipated by the reinsurer for any outstanding claims, the payment should reflect the present value of expected payments at that time and the impact on the original payment pattern assumption should be minimal. If there are explicit rules for the calculation of the value of outstanding claims at commutation, these rules may need to be included in the original analysis and may affect the selected payment pattern.

4. CONCLUSIONS

It is important to remember that none of the methods to test risk transfer provide a “bright line” indicator for its existence. While actuaries have the necessary skill set to evaluate the existence of risk transfer in any reinsurance contract, the final decision belongs to the CEO or CFO of the company. Risk transfer analysis, and more specifically ERD, is a tool to aid them in that decision. If a risk transfer analysis produces a borderline result, such as an ERD of 0.95% or 1.05%, it will likely require further consideration and documentation to show that risk transfer does or does not exist in the contract being reviewed. Risk transfer testing is a principle-based exercise and the existence of risk transfer is entirely based upon there being a “reasonable chance of a significant loss” to the reinsurer. ERD and other methodologies are just tools to help determine if a contract meets this standard.

INTRODUCTION

Nyce [1] provides an excellent introduction to government insurance including the five main reasons for government insurance, which are summarized in this study note.

Both the federal and state governments are involved in insurance as regulators of insurance companies and as insurers. As insurers, they participate in a number of insurance programs either as the sole insurer, in partnership with insurance companies or in competition with insurance companies. Several major programs that are discussed elsewhere in the syllabus include the National Flood Insurance Program, Social Security, Guaranty Funds, FAIR plans, TRIA, and various state Auto Plans. In this study note, we will discuss state and federal involvement in Workers Compensation Insurance, Crop Insurance, and Unemployment Insurance.

Is government participation in insurance necessary? According to Greene and Weining, there are several reasons for government participation in insurance:

- Filling insurance needs unmet by private insurance
- Compulsory purchase of insurance
- Convenience
- Greater efficiency
- Social purposes

Filling Insurance Needs Unmet by Private Insurance

According to Nyce [1] and Greene [2], one justification for government participation in insurance is the residual market philosophy, with governments offering insurance in markets unserved by private insurance; either because of unavailability or affordability. One implication of the residual market philosophy is that government requirements for insurability are different from private insurers’ requirements. A government may step into situations in which private insurers do not because the government has the financial capacity to subsidize losses, either by directly taxing taxpayers for the insurance program even those who do not benefit from the program, or indirectly by charging less than the actuarial cost of providing insurance coverage for the exposure and making up the difference through government-provided funds (crop / flood). There are strong
arguments, both pro and con, as to whether a government should provide this type of subsidy.

Begun in 1968, the Federal Crime Insurance Program was intended to provide coverage for homeowners and small businesses located in neighborhoods with high crime rates, primarily because private insurance for burglary or robbery was not available at affordable rates for these risks. With proper loss prevention methods, this insurance was available from the private market at rates less than the government rates and the Federal Crime Insurance Program expired in 1995.

Crop insurance and Flood insurance are available and affordable only because of subsidies from the federal government.

**Compulsory Purchase of Insurance**

Government may require individuals or businesses to obtain insurance to meet social responsibilities. A driver who causes an automobile accident is responsible for repairing the damage or injury caused by the accident. Many people would not have the financial resources to meet this obligation without insurance protection. An employer is deemed responsible for injury to an employee regardless of fault. Again, without insurance protection an employer may not be able to meet this obligation. Without a compulsory insurance requirement, some persons who have suffered injury or loss may not have the costs of repairing the damage to their property or their medical costs covered by the person responsible for these costs.

Since purchase of insurance such as workers compensation or automobile insurance may be compulsory, some state legislatures felt obliged to offer the insurance to individuals who could not find a private market [2]. The workers compensation state funds established in several states and the Maryland Automobile Insurance Fund are examples of this philosophy. Another reason why some federal and state legislators believe that government should provide compulsory insurance is that private companies should make only limited profits, given the government guaranteed market. A government program would operate as a not-for-profit entity and the cost of the compulsory insurance would be lower than if offered by a for-profit insurer. In other non-insurance government mandated programs such as highway construction contracts, private organizations often service the program. Within a purely competitive market excessive profits cannot persist in the long run. Private insurance seems to work for most states in supplying the vast majority of the public with compulsory insurance such as workers compensation and auto insurance.

While workers compensation insurance is administered by a monopolistic state fund in a few states, most states have private companies that offer workers compensation insurance, sometimes in competition with state-run funds that will provide coverage to anyone who applies for coverage to the fund, sometimes referred to as “take all comers.” For those states without a state fund, and some with a state fund, there is usually some
other form of residual market that provides coverage to those who are unable to find the required coverage with a private insurer.

For compulsory auto insurance, government insurance is normally not the answer; so provisions are in place to make auto insurance available for those unable to buy insurance on the open market. Sometimes these alternate sources also provide the coverage at costs below the actuarial cost of providing the coverage. In these situations, insurers, other insureds or taxpayers subsidize part of the cost of the coverage for high risk drivers. Hamilton and Ferguson [3] discuss these provisions, which include assigned risk plans, reinsurance facilities, and joint underwriting associations depending on the state. Maryland has the only state-owned auto insurance company.

Convenience

Some government insurance programs are established because it appears to be easier for the government to set up a program quickly as a legislature can appropriate funding for the new program, whereas the private market may take longer to find the necessary funding [3]. A government program may also be already set up to provide certain types of services needed by the insurance program. These services include loss mitigation development and funding, as the Florida legislature did when establishing the Florida Hurricane Catastrophe Fund.

Using government insurance programs only for convenience may not be justified if the private market is willing and able to provide a reasonable market.

Greater Efficiency

One argument in favor of government insurance is that there is greater efficiency than in the private market [2]. Some government insurance programs may be established because of the belief that government can provide the service at a lower cost than the private market. However, the costs of providing insurance, including the costs of keeping records, providing consumer education, issuing policies and paying claims, exist even in government insurance programs. Services such as explaining coverages, keeping records, and handling claims questions are still provided by customer service representatives (who must be compensated). The cost savings claimed for government insurance programs might be overstated because other government departments may perform services on behalf of the government insurance entity that are usually performed by insurance companies, including appraising property, administering claims, or making investments.

Social Purposes

The use of government insurance to achieve social purposes may be the main reason for government insurance programs [3]. Some feel that these social purposes can only be fully achieved within government-owned insurance programs. For example, rehabilitation and vocational training of injured workers are important goals of a workers compensation
system and requirements for loss mitigation in catastrophe insurance plans may be more easily accomplished under government insurance programs. Can private insurance programs accomplish the same goals? If Social Security benefits were made available through a welfare program for the truly needy elderly and disabled while pension plans, 401(k)s, life insurance and disability insurance were to be used to fill the needs of others, would adequate protection for retirement and the disabled be available? If building codes and zoning requirements could be altered to prevent construction in flood-prone areas would private insurers be willing to provide flood coverage? In this scenario, government flood insurance would still be needed for existing buildings in the flood zones, but the need for government flood insurance on new construction would be reduced.

**Level of Government**

The government (either state or federal) can be involved in three levels as either exclusive insurer, partner with private insurers or as a competitor to private insurers. As an exclusive insurer the government functions as a primary insurer by collecting premiums, providing coverage and paying all claims and expenses. An example of this at the federal level is Social Security and at the state level with some state government-run workers compensation programs.

In partnership with private insurers the government offers reinsurance coverage on specific loss exposures for which the private insurer may retain only a portion of the loss. Examples of this at the federal level are National Flood insurance program, Terrorism Risk Insurance Program and Federal Crop insurance. On the state level this includes several programs to address residual markets where the insured cannot find coverage on the open market. Examples of this are Fair Access to Insurance Requirements (FAIR) plan, Workers Compensation, Windstorm plans and Residual Auto Plans.

In some cases the states operate in direct competition to private insurers such as in the Workers Compensation market in some states.

Detail of the various government insurance plans are provided in this document or in other readings on the Syllabus.

**Evaluation of Government Insurance Programs**

How well have the federal and state governments performed in providing insurance? According to Greene [2] the questions to be asked are:

- Is the provision of the insurance by the government necessary or does it achieve a social purpose that cannot be provided by private insurance?
- Is it insurance or a social welfare program? Social welfare is designed to provide benefits to qualified people based on demonstrable need for assistance without any payment or contribution by those receiving assistance. These benefits are usually
financed by general tax resources. The public welfare programs are an example of social welfare.

- Is the program efficient, is it accepted by the public?

Based on experience in 2004, 2005 and 2012 how is the Federal Flood Insurance Program performing? The rates don’t seem to be actuarially sound; insurance is usually only purchased if required by law or mortgage companies; people who do not buy flood insurance seem to be getting federal disaster assistance. With appropriate rates, enforceable building codes, up-to-date flood maps, and available reinsurance could private insurance companies provide flood insurance?

In the following sections, we will discuss several government insurance programs, how they work, their origin and purpose, and their effectiveness.

CROP INSURANCE

To help farmers recover from the Great Depression and the Dust Bowl, in 1938 the federal government created the Federal Crop Insurance Corporation (FCIC), a wholly owned corporation of the U.S. Department of Agriculture (USDA), to oversee the newly created federal crop insurance program. The initial program, intended to provide farmers protection against low yields, was limited to a few major crops (wheat and corn) in the main producing areas [4] and was not successful due to high costs and low participation by farmers [5]. In 1980, Congress passed legislation that expanded the types of crops covered and the regions of the country in which the federal crop insurance was available. To encourage participation the 1980 Federal Crop Insurance Act also authorized a subsidy of the crop insurance premium. According to the Congressional Research Service, in 2014 farmers paid about 38 percent of the policy premium [6].

In the late 1980's and early 1990's, droughts, and wet and cool growing seasons resulted in Congress passing several disaster bills to assist farmers in recovering from these disasters. These disaster bills were still costly and competed with the insurance program, so in 1994, Congress made participation in the crop insurance program mandatory for farmers to be eligible for payments under price support programs, certain loans and other benefits. In addition, catastrophic coverage became available and the premium for this coverage was completely subsidized.

In 1994, the mandatory participation requirement was repealed, but farmers who accepted other types of benefits were required to purchase crop insurance. Participation in the crop insurance program increased significantly.

Multiple Peril Crop Insurance policies are a public-private partnership. Private insurers market and write crop insurance policies, which generally indemnify farmers if yields fall below a given baseline due to natural causes (drought, heat, cold, fire, wind, or flood). Some policies also provide protection if prices fall below a given level. The RMA sets
the rates for these policies and determines which crops can be insured in different parts of the country. The private insurer services the policies including adjusting and settling any claims resulting from the policies. The RMA acts as a reinsurer, reimbursing the participating insurers for losses in return for a portion of the premium. In addition, the federal government reimburses the private insurance companies for their operating and administrative costs. The premiums paid by farmers are subsidized by the federal government to reduce the cost to farmers and encourage farmers to participate in the program.

A farmer must elect to purchase multi-peril coverage prior to planting. The crop insurance subsidies may encourage farmers to purchase more coverage than they might if they paid the full price. A higher participation in the program provides better protection to farmers and may reduce requests for disaster assistance, but it also increases costs to taxpayers.

The Federal crop insurance program differs from most private insurance programs in that an insurer who participates in the Federal program must sell the coverage to any farmer at the rate set by the Federal government. Because the insurer cannot impose its own underwriting standards, judgment or desired rate level regardless of the risk, the risk sharing agreement between the federal government and insurance companies allows an insurer to transfer some liability associated with riskier policies to the government and retain profits or losses on less risky policies.

Some private insurers offer crop-hail insurance which is not part of the federal program. Unlike the multi-peril coverage, a crop-hail policy may be purchased at any time during the growing season. Many farmers purchase this coverage because hail can totally destroy a planted field.

Crop insurance is not mandatory. Farmers may choose whether to buy it, and for which crops. However, the RMA requires that if a farmer chooses to insure a particular field, he or she must insure all of his or her fields growing the same crop in the same county. This alleviates problems of adverse selection, since otherwise farmers would insure only their most loss-prone locations and the program would bear a higher loss ratio. In addition, farmers who choose to forego crop insurance are not eligible for payments for crop loss from federal disaster relief programs.

Supporters of federally backed crop insurance argue that it is necessary to bring stability to a very volatile but important sector of the American economy. Private crop insurance would definitely be more expensive (if the subsidy were removed), and might be substantially more expensive or even unavailable due to the risk of catastrophic losses over a large geographic region. Opponents have charged that crop insurance subsidies encourage agricultural over-production and encourage farming in marginal and disaster-prone areas, which harms the environment and increases general disaster relief costs.
WORKERS COMPENSATION INSURANCE

With the advent of the industrial revolution, new technology and machinery resulted in more industrial accidents. The only recourse an injured worker had was to sue their employer - a long, expensive process with an uncertain outcome. Workers compensation benefits evolved as a means by which employees injured on the job would be certain to have their injuries adequately taken care of by their employer without having to sue. Employers, as well as employees, benefited from the new system as the employer also exchanged an uncertain, potentially large payment, for a certain guaranteed benefit system.

Governments, both state and federal, participate in workers compensation insurance programs in a variety of ways. In some states, workers compensation insurance is only available through private insurance companies, while in other states it is only available from a state fund (an entity established by law to provide workers compensation insurance.) In some states, a state fund may compete with private insurers. In all states, government and private insurers cooperate in providing workers compensation insurance as the benefits are defined by law, either state or federal, and unless there is an exclusive state fund, private insurers provide the insurance coverage.

Workers compensation programs covering most employees are enacted and administered at the state level in all fifty states, the District of Columbia and the five U.S. territories. Federal government employees and certain categories of workers, such as longshoremen or railroad workers, are covered by federal workers compensation programs.

A) Federal Workers Compensation Programs

Various federal programs compensate certain categories of workers for disabilities caused on the job and provide benefits to dependents of workers who die of work-related causes. The federal government works to ensure these programs perform well under the U.S. Office of Management and Budget and Federal Agencies. The following are some major federal programs:

1) The Federal Employee Compensation Act (FECA) provides compensation benefits to non-military, federal employees for disability due to personal injury sustained while in the performance of duty and for employment-related disease. It is administered by the Office of Workers’ Compensation Programs (OWCP) in the U.S. Department of Labor.

The Act is the exclusive remedy for federal civilian employees who suffer occupational injury or illness. There is some claimant overlap with other federal programs; however, regulations generally bar the receipt of dual benefits for the same injury/illness and mandate the reduction in benefits to offset other sources of compensation.

The program’s purpose is to return individuals to work while containing the costs of the system. Designed as a non-adversarial system (i.e., no judicial review and limited
employer ability to contest claims) the program limits administrative and litigation costs, which may account for a substantial share of payout in some systems.

2) The **Longshore and Harbor Workers’ Compensation Act of 1927** requires employers to provide workers compensation protection for longshore, harbor, and other maritime workers who are injured or suffer occupational diseases while working on or near navigable water in the United States. These benefits are provided by employers by either procuring insurance coverage from private insurers or by qualifying to self-insure. In some special circumstances, such as second injuries or default in payment of claims by insurers or employers, benefits are paid by a special fund administered by the Department of Labor Employment Standards Administration, Division of Longshore and Harbor Workers’ Compensation (DLHWC). The DLHWC is responsible for adjudicating disputed claims and ensuring that employers and carriers pay benefits.

The Act was created to provide workers’ compensation coverage for categories of workers who were not seamen and were injured while working on or near navigable water in the United States and for which no state act coverage applied. Since the enactment of the Act, there have been questions regarding when coverage under the Act ends and state act coverage begins, particularly when the injury occurs “near” navigable water. In 1984 the scope of the program was amended in an attempt to clarify the extent to which shoreside coverage applied. However, about 40 states allow concurrent receipt of state and longshore benefits. The Act provides for the offset of compensation paid to individuals under any other workers compensation law for the same disability or death. The possibility of an injured worker pursuing either longshore benefits or state act benefits is an issue that employers need to be aware of so that they have adequate insurance protection for their exposure.

3) The **Black Lung Benefits Act** (BLBA) provides wage-replacement and medical benefits to coal miners who are totally disabled due to pneumoconiosis (black lung disease) and to eligible survivors.

The program was established in 1969 out of concern that black lung victims were not receiving adequate recompense from state workers compensation systems. States have sometimes been slow to recognize chronic occupational diseases such as black lung as compensable injuries. Coal miners frequently change employment, which made it difficult to assign responsibility for a chronic disease to a particular employer. In addition, the BLBA acts as a form of disability insurance, providing compensation to survivors and dependents over and above medical care and loss of earnings. Black lung victims do remain eligible for ordinary workers compensation benefits, but if an individual receives both state and federal benefits, the federal benefit is reduced by the full amount of the state benefit.

Federal benefits are paid by the Black Lung Trust Fund which is financed by coal mine operators through a federal excise tax. In years when payouts exceed revenues, the fund borrows from general government revenue. These deficits are intended to eventually be
paid back with interest. In 2008, however, the Trust Fund deficit had grown so large that Congress made a one-time appropriation to reduce the deficit out of general funds. The hope as of 2016 is that the deficit will eventually be paid down without further excise tax increases or appropriations from general revenue.

B) State Workers Compensation Programs

The state government can act as a partner with private insurers, a competitor of private insurers, or an exclusive insurer.

Partnership with Private Insurers

State programs vary concerning who is allowed to provide insurance, which injuries or illnesses are compensable, and the level of benefits. State laws prescribe workers compensation benefits, but these laws assign to employers the responsibility for providing benefits. Employers can obtain workers compensation coverage to provide benefits to their employees by purchasing insurance from a private carrier or a state workers compensation fund, depending upon the options available in their state. They can also use self-insurance in almost every state if they demonstrate the financial capacity to do so by meeting certain requirements.

Private insurers are allowed to sell workers compensation insurance in all but a few states and territories that have exclusive state funds. Where private insurers may sell workers compensation, a public-private partnership exists since the benefits are established by state law, but insuring those benefits is the role of private insurers.

State Funds

With enactment of state workers compensation laws, the need for workers compensation insurance created its own set of problems, while solving others. Employers feared they would be forced out of business if refused coverage by insurance companies. They were also fearful that insurance carriers might impose excessive premium rates that would be a financial burden. High premium rates could negatively affect a state’s economy and ultimately limit opportunities for employment. Another fear was that because the mandatory nature of the coverage reduces elasticity of demand, insurance rates might soar, enabling insurers to reap unfair profits. Some state legislators addressed these concerns by establishing state workers compensation insurance funds to provide a stable source of affordable insurance coverage.

Washington was the first state to adopt the state fund approach in 1911 and by the end of 1916, thirteen states had established state funds. As of 2016, a total of twenty-three states have state funds that provide workers compensation insurance [7].
In general, state funds are established by an act of the state legislature, have at least part of their board appointed by the governor, are usually exempt from federal taxes, and typically serve as the insurer of last resort – that is, they do not deny insurance coverage to employers who have difficulty purchasing it privately.

Among the twenty-three states that have state workers compensation funds, four have exclusive state funds and nineteen have competitive state funds. The four states with exclusive funds are North Dakota, Ohio, Washington and Wyoming. The South Carolina state fund is a hybrid; it is an exclusive insurer for state employees and is available to cities and counties to insure their employees, but it does not insure private employers.

**Competitive State Funds**

In states with competitive state funds [8], state funds sell workers compensation insurance, at least theoretically, in competition with private insurers in insuring and administering the workers compensation laws. In some states, Oklahoma is one example, the state fund is not permitted to refuse coverage to an employer, no matter how undesirable the risk, so long as past and current premiums are paid. In this regard they are referred to as “insurers of last resort”. In other states such as Oregon, the state fund does not operate as the insurer of last resort. The mission of the state fund is set out in the Oregon statute that authorizes the existence of the state fund. This mission is to “make insurance available to as many Oregon employers as inexpensively as may be consistent” with protecting the integrity of the Industrial Accident Fund and sound principle of insurance [9].

**Exclusive State Funds**

In states with exclusive state funds, private insurers are not permitted to provide workers compensation insurance and state funds enjoy the exclusive right to sell workers compensation insurance. All employers are required to procure their workers compensation insurance from the state fund, or, in some jurisdictions, an employer may also self-insure.

**Residual Markets**

In states without a state fund, or with a state fund that does not serve as an “insurer of last resort”, it will sometimes happen that an applicant for workers compensation insurance is unable to obtain coverage. Private carriers are limited by regulation in the rates that they can charge. If they believe that the maximum rate will be inadequate for a particular insured, they simply decline to write the policy. This may be because the prospective insured has an inherently hazardous business model, or poor safety practices, or a poor or inadequate loss record.
If states took no action on behalf of such applicants, the applicants would have little choice but to go out of business. This would increase unemployment and impair tax revenues. As a result states without state funds have set up residual market mechanisms to act as insurers of last resort.

The details of this mechanism vary from state to state. Applicants generally enter the residual market after being declined by at least two private carriers. In some states such applicants are assigned to carriers based on their workers compensation market share, with the carriers writing policies and collecting premium and paying claims just as if they were serving the applicants voluntarily.

In other states, carriers reinsure undesirable applicants via a reinsurance pool, and profits or losses from the pool are shared among carriers in proportion to market share. In still other states, the state authorizes a Joint Underwriting Association to serve the residual market, and with carriers sharing on a pro-rata basis profit or loss. Note that these residual market mechanisms closely parallel the automobile liability residual market mechanisms described by Cook [10].

The market share within the residual market varies from state to state and year to year, depending on filed rate adequacy and the risk appetites of insurers. In 2014 the aggregate residual market share was about 8% within the states for which the National Council on Compensation Insurance (NCCI) collects data. The combined ratio for residual market business, over the last several years, has been running between 105% and 115% [11]. As one would expect, residual market business is generally written at a loss despite generally higher rate levels for residual market risks. This results in a higher combined ratio for workers compensation insurers, either directly as residual risks are assigned to carriers, or indirectly as reinsurance or JUA losses are pro-rated. The voluntary market effectively subsidizes the higher-risk residual market, despite higher rate levels for residual market risks.

C) Evaluation of Workers Compensation Insurance

Private carriers remain the largest source of workers compensation benefits. In 2013, they accounted for 56% of benefits paid in the nation, with state funds at 15%, self-insurers at 23%, and the federal government at 6% [12]. The trend in the share of benefits paid by state funds has decreased in recent years, down from 20% in 2004.

Nevertheless, the state funds have created significant competition in the workers compensation insurance business in the states where they operate. State funds have a significant market share in virtually every state where they are located. In 2013, state fund market share (as measured by benefits paid) in competitive state ranged from 7% in Pennsylvania to 59% in Idaho [12].

Proponents of state funds argue that because the state funds are specialists in workers compensation they can be expected to offer more intensive levels of rehabilitation and
other services than some private insurers whose workers compensation plan is only one of several types of coverage offered. However, there are private insurers who also specialize in providing only workers compensation coverage and may offer the same level of service and expertise as the state funds.

State funds are, by law, designed to be self-supporting from their premium and investment revenue. Overhead expense ratios of both exclusive and competitive funds may be lower than expense factors for private carriers in part because of absence of some administrative costs such as agency commissions and other marketing costs. As nonprofit departments of the state, or as independent nonprofit companies, they are able to return dividends or safety refunds to their policyholders, just as some private insurers do. This further reduces the overall cost of workers compensation insurance both for the state fund as well as the private insurer that offers these types of programs [2] [3]. While lower administrative costs for state funds may reduce the cost of providing workers compensation coverage, the fact that more states have not created state funds, and some state funds have been privatized recently, suggests that private insurers are also able to provide this coverage in an efficient manner.

The evidence suggests that both state funds and private insurers are able to provide workers compensation coverage in an efficient manner.

D) Interaction of Workers Compensation Insurance with Medicare

**Background**

In 1965, Congress created the Medicare program to provide health insurance for elderly Americans. The authors of the law creating Medicare recognized that it might overlap with other private or government insurance programs—especially workers compensation insurance.

For example, a 67-year-old worker might be injured in a job accident. That worker would be entitled to have his or her medical costs reimbursed by his or her employer’s workers compensation insurer. However, that worker, being more than 65 years of age, might also be eligible for Medicare. To save Medicare costs, Congress therefore stipulated that workers compensation insurance would be primary in such a case. Medicare would be secondary and would begin to pay only if and when workers compensation benefits were exhausted.

In 1980, Congress passed the Medicare Secondary Payer Act, which stipulated that Medicare was also secondary to liability insurance. For example, if an elderly American were injured by another driver in an auto accident, the responsible driver’s insurance would be primary and Medicare secondary.

The 1980 act also introduced the notion of a “conditional payment”. In many cases persons begin incurring medical costs before eligibility to collect insurance has been
determined. In such cases Medicare will make “conditional payments” to medical providers, subject to later reimbursement by an insurer subsequently determined to be primary.

In some cases workers compensation claims are closed via a settlement which provides compensation to the injured worker for anticipated future medical payments. These payments can also overlap with Medicare. For example, a 63-year-old worker may be injured on the job. That worker is not eligible for Medicare. However, the worker’s claim may be closed with a settlement that allows for medical treatment anticipated to last five years. By the end of that time the worker will be Medicare-eligible.

Federal regulators therefore introduced (1989) the Medicare Set-Aside Allocation (MSA), in which all parties to a settlement would agree to “set aside” a portion of the workers' compensation or liability settlement to be used to pay for future medical costs related to the workers' compensation or liability injury. The MSA funds are primary over Medicare and are limited to services that are related to the injury that would be covered by Medicare after the injured party becomes Medicare eligible.

Despite these laws and regulations, the status of Medicare as secondary insurer remained mostly notional through the Twentieth Century. Medicare administrators simply did not know when Medicare eligible (or soon to be eligible) parties were collecting workers compensation or liability payments. In the absence of aggressive collection, parties had little incentive to agree to MSA’s.

**Medicare Set-Aside Allocations since 2001**

This became increasingly untenable as Medicare costs rose due to medical cost inflation and longer life expectancy. In 2001 the Center for Medicare and Medicaid Services (CMS), which administers Medicare, established its first guidelines for the review and approval of MSA’s. The implied threat was that, where MSA’s were not submitted, or not approved, Medicare would refuse payment for future care, and be more aggressive in seeking reimbursement for past conditional payments.

Since 2001, the submission and approval process for MSAs has changed several times. The changes have generally been in the direction of making MSA approval more difficult. A new sub-industry of MSA consultants has emerged to assist Third Party Administrators and insurers to evaluate settlements for MSA requirements and gain the approval of CMS.

As of 2012, CMS will review all workers compensation MSA’s where:
- The claimant is either a Medicare beneficiary and the settlement is greater than $25,000 or
- The claimant is expected to be Medicare eligible within 30 months of the settlement and the settlement or expected future medical costs and lost wages of the injury exceeds $250,000.
The CMS thresholds do not create a safe-harbor, so even smaller medical settlements should consider Medicare’s interests.

In 2016, the CMS announced that it will also begin reviewing liability and no-fault insurance MSA's.

After an MSA is approved, the injured worker must comply with reporting requirements and use the MSA appropriately. Claimants must agree to pay their workers compensation-related medical bills, using an interest-bearing account, and to complete reporting of their payments before Medicare will make any payments for claim-related conditions.

CMS can reject or revise MSA proposals, increasing the estimated lifetime medical need, to assure that Medicare rarely becomes liable for claim-related expenses throughout the claimant's life. Two specific issues – pharmacy costs and life expectancy – are often cited as areas of concern. With Medicare Part D, pharmacy costs were added to Medicare. In 2009, CMS issued pharmacy guidelines for MSAs, which essentially priced drugs at the retail cost level without regard to negotiated price arrangements that the insurer may have. However, many drugs commonly used for pain management are not included in Medicare Part D.

Due to industry concerns [13], in May 2010 Medicare issued clarifying language that drugs which were not included in Medicare Part D did not need to be considered in a MSA. This reduced the prescription costs in MSAs and was hailed as a significant victory in the insurance industry.

Another issue which can raise the costs of a MSA is use of a “rated age” or impaired life expectancy versus the claimant’s actual age. If a rated age is used, that means the injured person's life expectancy is less than normal which allows the settlement amount to be less than would be needed for an individual with a normal life expectancy. If CMS protocols for rated ages are not followed, CMS will recalculate the MSA using the claimant’s actual age rather than the impaired life expectancy. Due to the nuances of CMS approval, many insurers use specialists to review their MSA proposals prior to submission to CMS and to shepherd the claim through the process. Use of specialists increases the administrative costs of settling such claims.

New Reporting Requirements since 2007

On December 29, 2007, President George W. Bush signed the “Medicare, Medicaid and SCHIP Extension Act of 2007” (MMSEA). This law sought to address the problem of CMS being unaware of primary payer responsibilities, whether or not a claim involved an MSA. The law requires claim payers, known as Responsible Reporting Entities (RREs), to report claim data to the CMS. Specifically, Section 111 of the act requires the providers of liability insurance (including self-insurers), no fault insurance and workers’ compensation insurance (hereinafter “insurers”) to determine the Medicare-enrollment
status of all claimants and report certain information about those claims to the Secretary of Health and Human Services, through the CMS.

The implementation of the reporting requirement was delayed, as regulations and technology issues were ironed out, but reporting became mandatory on January 1, 2011 for insurers with workers’ compensation claims. Reporting of liability claims was phased in (with the largest claims first) beginning on January 1, 2012.

CMS uses the Section 111 data to assist Medicare in coordinating benefits and in uncovering potentially reimbursable claims. There are substantial penalties for non-compliance with the required reporting of claims - $1,000 per day per beneficiary for each day the insurer is out of compliance. This penalty is in addition to a “Double Damages Plus Interest” penalty that defendants (as primary payers) can be fined if Medicare’s right to reimbursement is ignored in any settlement. This rule applies to settlements on or after October 1, 2010.

**Property/Casualty Actuarial Implications of the Recent Changes**

From 2008 through 2010 there may have been an increase in claim closings, lump-sum payments or settlement in advance of the Section 111 reporting deadline. Some RREs may have taken the opportunity to decrease the volume of relatively minor claims that would otherwise need to have the Medicare eligibility status of the claimant determined and reports made to CMS. For actuaries reviewing both insurers’ and self-insurers’ loss data, such claim activity can distort both paid and reported losses.

Slowdowns in claim settlement rates are sometimes attributed by Workers Compensation claims professionals to the CMS changes in procedures and increased emphasis on MSAs. CMS approval of MSAs generally takes 60 to 90 days, which can contribute to a slowdown in settlements. It is possible that some portion of increasing WC medical trends is due to MSAs. In the past, claim settlements may not have specifically identified medical vs. indemnity components and the settlement costs may have been entirely attributed to indemnity. With MSAs, a clear portion of the settlement is identified as medical cost, and the CMS procedures may also have increased the average size of the settlements due to future medical considerations. However, to date there are no publicly available studies to quantify the impact on overall costs or severity trends.

In addition, for some entities, a significant risk factor could be that some injured workers currently receiving Medicare payments should be classified as workers compensation claims. The Section 111 reporting could uncover Medicare payments that should shift to workers compensation claims, causing actuarial estimates to increase as CMS files liens to recover payments. Over the last three years before claim reporting was required, the number of recovery demands from CMS increased significantly to 74,000 in 2010 from 43,000 in 2007 [14]. The number may continue increasing after 2011, or it may spike and then settle down as CMS catches up. Note that recovery can affect claims that were open in prior years, even if they are closed now.
Successful recoveries naturally increase claim severity to an insurer. The General Accounting Office (GAO) estimates total saving due to Medicare claim denials and recovery of payments of $737 million in 2008, rising to $861 million in 2011. These are costs that are borne by insurers instead of Medicare. Furthermore the GAO notes that “(A)n accurate estimate of savings could take years to determine because of the time lag between initial notification of Medicare Secondary Payer situations and recovery, the fact that not all situations result in recoveries, and the fact that mandatory reporting is still being phased in.” [15]

In 2012, new legislation affecting the interaction of Medicare and private property-casualty insurance was passed. A key provision of the Strengthening Medicare and Repaying Taxpayers Act, or SMART Act, was the implementation of a 3-year statute of limitations on Medicare conditional payment recovery. This provision became effective on July 10, 2013 and provides that an action by the federal government for recovery must be filed no later than 3 years after the date of the receipt of notice of a settlement, judgment, award, or other payment.

While the statute does not define how notice of the settlement, judgment, award or other payment is to be made to Medicare, the provision was put in place with the understanding that notice would be through Section 111 Mandatory Insurer Reporting. It is unclear then whether other types of “non-Section 111 Mandatory insurer Reporting” to Medicare will trigger the limitations period, or whether the statute of limitations will be effective in curtailing increased workers compensation claims should Medicare not cover certain claims.

Changes in the Future?

Section 111 reporting is in its infancy. It is uncertain how CMS will use the huge volume of data that it is collecting, whether this will lead to a significant further increase in set-asides or recovery demands, and whether the statute of limitations will temper claim volume. It may take years for changes to be fully apparent, especially for liability lines for which mandatory reporting didn’t begin until 2012 and will be phased in.
Notes:

Tort Reform Tension

Some countries, such as the U.S. and Australia, have made headway on reforming tort systems that many perceive to be unfair, costly and inefficient. Joint and several liability, compensatory damages, collateral sources and vicarious liability have specifically been targeted for change. Has the time come for amendments to Canada's legal rules?

August 1, 2005  by Craig Harris

The wave of tort reform experiments that have washed over the legal systems of other
countries has barely caused a ripple in Canada. Despite the 2002 Attorney General Geoffrey Plant’s civil liability review project in British Columbia, few provinces have gone fishing for serious changes to the way courts assess and rule damages. But insurers say the recent hard market revealed that reforms to key legal principles are necessary to reach the goals of stability and predictability.

“The primary reason behind the increase in claims (in the commercial liability market) is the cost of settling court cases and potential court cases, which has increased significantly over the past few years,” according to the Insurance Bureau of Canada (IBC).

Australia enacted a sweeping series of changes to damage awards in 2003 and have addressed limits to liability but, currently no province is actively looking into tort reforms. Several groups, ranging from the IBC to the Risk and Insurance Management Society’s Canada Council to the Voluntary Sector Forum to the Ontario Federation of Snowmobile Clubs, have targeted unreasonable liability lawsuits as a primary source of increasing claims costs and exposures.

“RIMS and Canadian risk managers have long supported meaningful tort reform to eliminate economic unpredictability and inefficiency,” Lance Kayfish, chair of the RIMS Canada Council Sub-Committee on Communications and External Affairs and a risk manager for the City of Kelowna, B.C., says. “It has been on our radar screen for some time.”

According to the IBC, court awards and legal expenses cost approximately $7.3 billion in 1998. By 2003, tort costs rose to an estimated $10 billion. These numbers pale in comparison to the sharp increase in tort costs experienced in the U.S. A Tillinghast study released in January shows that tort costs reached a record $246 billion in 2003. In Australia, court awards increased at a rate of 10% per year from 1992 to 2002, which contributed to an “insurance liability crisis in 2002,” according to the Australian government treasury.

ATTENTION TO THE AUSSIE WAY

In 2003, the Australian government undertook a “program of unprecedented law reform and achieved a raft of changes unmatched in the common law world for their breadth and scope,” the treasury department noted in a report. Specifically, the changes involved three main areas – establishing liability, clarifying damages and undertaking procedural reforms. In particular, the amendments changed the way courts decide issues such as duty of care, foreseeability, causation and remoteness of damage and the standards to which professionals should be held.

The U.S. has been equally aggressive in its push for tort reform, spearheaded in many cases by the insurance industry. The Insurance Information Institute, AIG and the U.S. Chamber of Commerce released a paper early in 2005 entitled “Tort Excess: The Necessity for Reform from a Policy, Legal and Risk Management Perspective.”

“The American legal system remains the most expensive civil justice system in the world, costing more than double that of other industrialized nations,” the study argues. “Civil justice reform legislation aims to return integrity to the U.S. legal system, abolish incentives for abuse now endemic in the system and redirect the system on an efficient, timely, predictable and fair course.”

Noting that the “future insurability of some types of liability risks is in doubt,” the report cites several key reforms that either have taken or should be taking place across states, including capping non-economic damages, modifying the joint and several liability rule, restricting punitive damage awards and revising the collateral source rule.

REFLECTING ON REFORM

An IBC document stated that “(tort reform) is an area garnering increased attention internationally, as reflected in the tort reforms that several US states have passed and the state legislative reforms to limit the escalation of liability costs in 2003.” But the big question now is – what could tort reform look like in Canada and what are the chances of any changes being
enacted here?

The IBC has put some thoughts together on what it would like to see changed in specific areas of tort and general damages. Acknowledging differences between the U.S., Australian and Canadian environments, IBC vice president and general counsel Randy Bundus says there are some clear areas ripe for reform – joint and several liability, the collateral sources rule, establishing net income as the basis for determining damages and vicarious liability. “Our goal is to strike a balance in terms of fairness between the plaintiff and the defendant,” Bundus says.

Some legal groups agree with this approach. Jamie Chipman, a partner with Stewart McKelvey Stirling Scales and president of the Canadian Defence Lawyers Association, says there is a “need for clarity. It’s necessary to finally become proactive in tort reform because I am looking at what the Supreme Court of Canada has been doing of late with respect to any cases involving insurers and statutory language. The Supreme Court is saying if you don’t do anything with this antiquated language, we are going to continue to find a way to come out with decisions that are ‘plaintiff-friendly’.”

Not surprisingly, trial lawyers in Canada tend to disagree with the thrust of any tort reform measures. “The insurance industry likes to look at numbers, but as lawyers we are in the justice business,” Russ Howe, president of the Ontario Trial Lawyers Association and a partner with Boland Howe Barristers, says. “And the number one rule of law is that the innocent party gets full compensation. And that is what rules like joint and several liability are all about.”

WHAT CURRENTLY COUNTS IN COURT

Under the current joint and several legal doctrine, courts allow the plaintiff to recover all of the damages from one of multiple wrongdoers, even if that party is only partially at-fault for the loss. It is one of the primary areas that IBC and other parties would like to see changed. “We don’t think it is fair for a defendant who is found to be only one per cent at fault to potentially have to pay 100% of the loss,” Bundus says.

“RIMS supports the elimination of joint and several liability for all non-economic damages, such as pain and suffering and punitive damages,” Kayfish says. “We believe this would discourage plaintiffs and their counsel from approaching defendants on the ‘deep pocket’ syndrome.”

Eric Gunnell, director of claims and litigation for the Ontario Municipal Insurance Exchange (OMEX), says joint and several liability is a “big issue for us. Because we represent municipalities, we are often the deep pocket they come to. And all they have to do is find that 1% (liability).”

The tendency towards “plaintiff-friendly” rulings makes some insurance groups reluctant to go to court. “We don’t like to go to trial, because there is no rhyme or reason to the settlement,” Gunnell says. “So we go to mediation and sit down and say if we don’t throw something in today, we could lose it all tomorrow.”

But Howe says trial lawyers must demonstrate that there is some liability for a party in the case of a loss. “To get them in the game, we have to prove they did something wrong,” he notes. “And realistically, lawyers don’t go to trial on cases where they think they are going to get one point on liability. That is way too risky.”

Howe also argues that joint and several liability has the salutary effect of increasing efficiency in the legal system. “It promotes settlement in many cases. If parties were only going to end up paying on some percentage basis, we would have way more trials. That would be very expensive and slow the whole system down.”

Jim Sami, general manager and attorney in fact for the Ontario School Board Insurance Exchange (OSBIE), says “trial lawyers play the (joint and several) card to the extreme, not only at the trial but also in negotiations at mediation. They know if they have a deep pocket there they can use it to the maximum.”
Sami acknowledges that “there is a fairness issue in that maybe the guilty party does not have the ability or coverage to indemnify the injured party. Having said that, there are different ways to look at how joint and several could be changed. One way is to have a fund to pay for these kinds of lawsuits, similar to PACICC.”

Gunnell says if joint and several liability is not scrapped, it should at least be amended so that it is proportionate. “If you are going to keep it then let’s change it around, so that if you are in for 1%, just pay your 1%; not in for a penny and pay the pound,” he argues.

THE BIGGER PICTURE

There are other areas beyond joint and several liability that insurers and other groups are interested in amending. Currently, damages for loss of income are determined on the basis of gross earnings, which do not take into account taxation and other employment deductions. In other words “plaintiffs can collect more than they would have received if they were working,” Bundus says. In addition, the collateral source rule means that plaintiffs have the potential for “double recovery” – once from the wrongdoer and secondly from insurance, sick pay and disability plans carried by employers or employees.

Gunnell argues that when it comes to loss of income “it is too easy to ramp up what this person could be worth. You start getting some astronomical numbers, and that ends up scaring you off going to trial, because your policy is going to be tagged. It is amazing what people could end up making when they ramp it all up.”

Howe counters that the government has granted the victim’s right to full compensation by not taxing future income. “This is a tax break that the government has decided to give to injured people and the insurance industry wants to steal it,” he says. “The question of taxes is between the individual and the state. The insurance industry is sticking its nose where it doesn’t belong.”

VESTING VICARIOUSLY

In terms of vicarious liability, Gunnell says last years introduction of Bill C-45 into Ontario, which introduced criminal liability for employees and organizations for negligent conduct, has raised awareness of the issue. “We are starting to see it come out more now,” he says. “Some of our members are saying `we have to look at our procedures, we don’t want to be held responsible for what one of our employees did,’ I think we are getting back to some of the reasons why auto went to no-fault in 1990, and that was to try to get it away from liability. Now, we seem to be falling right back into it.”

Vicarious liability is a broad, complex area of the law, Kayfish says, “but risk managers share the view that the standards and test for establishing vicarious liability are not high enough in many cases.”

The two main issues in vicarious liability today are sexual abuse claims and car leasing or renting (see Canadian Underwriter, March 2005 “The Politics of Leasing” and May 2005 “Staying on the Road.”). Howe says “vicarious liability is vital, you can’t dump it. For the leasing companies, it would be the biggest joke of all. Because it would mean the companies that are making money off this would be held to a lower standard than me if I lend my car to my brother.”

Other topics on IBC’s laundry list of legal reforms include disallowing gross-up for income tax and requiring that the courts order structured settlements in all cases where the plaintiff has future care or future income losses. Additional changes could see the elimination of prejudgment interest on general damages and the calculation of prejudgment interest on pecuniary losses from the date the claimant notifies the defendant they will be suing.

One area not mentioned in IBC documents, but still of concern to large insurance organizations is class action lawsuits, according to Sami. “These lawsuits are the one area that could create major havoc,” he says. “The cost of defence is a major concern and you can spend a lot of time and money in just fighting a certification case. I believe class action reform would be a valuable
area to consider."

Another issue that risk managers think should be reviewed is severe sanctions on frivolous lawsuits, according to Kayfish. "We think this will go a long way toward improving efficiency in the tort system." He notes that in provinces like Alberta, there are available remedies, such as the awarding of “double costs’ against plaintiffs for frivolous lawsuits.

For Gunnell, the entire process of tort reform is long overdue here. "I think there is an appetite for tort reform in Canada," he says. "I used to think we were years behind the U.S. in terms of settlements. Now, I think we are right up there. We have to start moving from talking about it to doing something about it."

Howe argues that litigation in the U.S. is a “whole different world." The so-called reforms, like caps on non-economic damages, already exist in Canada. The same goes for punitive damages, which are minimal here compared to the U.S. The bottom line is that if the innocent victim doesn’t get full compensation, we have just abandoned Magna Carta and hundreds of years of jurisprudence," he explains.

Bundus says the current tort reform proposals are just that – proposals – which could form part of an organized lobby to legislators. At this stage, however, it is not clear which group, or whether a coalition of groups, will lead the charge on tort reform. In Canada, the common law, including the law of negligence, falls within the jurisdiction of the provinces (Quebec operates on the civil code). That means lobbying for tort reform, if and when it comes, will need to be coordinated with various attorney generals.

“Tort reform will have to be done on a province by province basis,” Bundus says. “Hopefully, there will be some receptive provinces and this will allow the industry to show that the experiment can work. This is an issue that affects all of society and requires some necessary changes.”
Insurance Act

R.R.O. 1990, REGULATION 664
AUTOMOBILE INSURANCE

Consolidation Period: From July 1, 2020 to the e-Laws currency date.

Last amendment: 180/19.

Legislative History: 780/93, 823/93, 553/94, 399/96, 464/96, 530/96, 301/98, 113/00, 483/01, 399/06, 464/96, 530/96, 301/98, 113/00, 483/01, 391/02, 275/03, 459/03, 210/04, 46/05, 316/05, 548/05, 62/08, 36/10, 291/10, 222/15, 250/15, 43/16, 252/16, 180/19.

This is the English version of a bilingual regulation.

CONTENTS

DEFINITIONS
1. In this Regulation,
   “commercial vehicle” means an automobile used primarily to transport materials, goods, tools or equipment in connection with the insured’s occupation, and includes a police department vehicle, a fire department vehicle, a driver training vehicle, a vehicle designed specifically for construction or maintenance purposes, a vehicle rented for thirty days or less, or a trailer intended for use with a commercial; (“véhicule utilitaire”)
   “fleet” means a group of not fewer than five automobiles that meets the following requirements:
   1. At least five of the automobiles in the group are commercial vehicles, public vehicles or vehicles used for business purposes.
   2. The automobiles in the group are,
      i. under common ownership or management, and any automobiles in the group that are subject to a lease agreement for a period in excess of 30 days are leased to the same insured person, or
      ii. available for hire through a common online-enabled application or system for the pre-arrangement of transportation, and insured under a contract of automobile insurance in which the automobile owner or lessee, as the case may be, has coverage as an insured named in the contract; (“parc automobile”)
   “public vehicle” means an automobile used primarily to provide transportation services to the public, and includes an ambulance, bus, funeral vehicle, limousine or taxi. (“véhicule public”) O. Reg. 780/93, s. 2; O. Reg. 275/03, s. 1; O. Reg. 43/16, s. 1; O. Reg. 252/16, s. 1.
2. REVOKED: O. Reg. 391/02, s. 1.
MONTHLY PREMIUM PAYMENTS (SECTION 234 OF THE ACT)

3. (1) This section applies with respect to statutory condition 3 as set out in the Schedule to Ontario Regulation 777/93. O. Reg. 780/93, s. 3 (1).

(2) An insurer is not required to permit an insured to pay the premium in instalments unless all of the following conditions are met:

1. The insurer, together with its affiliates, insured at least 10,000 private passenger automobiles in Ontario during the previous year.
2. The contract is written on Ontario Automobile Policy 1 or Ontario Policy Form 2.
3. The contract does not insure a commercial vehicle or public vehicle.
4. The contract does not insure five or more vehicles that are under common ownership or management.
5. The total annual premium payable under the contract exceeds $300.
6. The insured has not had more than one automobile insurance policy terminated by an insurer for non-payment of the premium during the thirty-six months before the contract takes effect. O. Reg. 780/93, s. 3 (1); O. Reg. 464/96, s. 2.

(3) REVOKED: O. Reg. 780/93, s. 3 (1).

(4) As a precondition for permitting an insured to pay the premium in instalments, an insurer may require that the insured,
   (a) make an initial payment equal to two monthly instalments of the premium; and
   (b) agree to make all payments under the contract by pre-authorized payment from the insured’s account at a financial institution. R.R.O. 1990, Reg. 664, s. 3 (4).

(5) REVOKED: O. Reg. 250/15, s. 1 (1).

(5.1) The maximum interest rate that an insurer may charge for instalment payments in respect of a contract entered into or renewed before June 1, 2016 is,
   (a) 3 per cent of the total premium payable under the contract, if the term of the contract is twelve months or more;
   (b) 1.5 per cent of the total premium payable under the contract, if the term of the contract is six months or more but less than twelve months; and
   (c) 0.5 per cent of the total premium payable under the contract, if the term of the contract is less than six months. O. Reg. 780/93, s. 3 (3); O. Reg. 250/15, s. 1 (2).

(5.2) The maximum interest rate that an insurer may charge for instalment payments in respect of a contract entered into or renewed on or after June 1, 2016 is,
   (a) 1.3 per cent of the total premium payable under the contract, if the term of the contract is twelve months or more;
   (b) 0.65 per cent of the total premium payable under the contract, if the term of the contract is six months or more but less than twelve months; and
   (c) 0.22 per cent of the total premium payable under the contract, if the term of the contract is less than six months. O. Reg. 250/15, s. 1 (3).

(6) The amount of each instalment payment shall be calculated as blended principal and interest.

(7) An insurer who is not required to permit its insureds to pay their premiums in instalments but who chooses to do so is subject to the same requirements as those insurers who are required to permit their insureds to pay their premiums in instalments. R.R.O. 1990, Reg. 664, s. 3 (6, 7).

EXEMPTION FROM NOTICE (SECTION 236 OF THE ACT)

4. Insurers are exempt from the requirements of section 236 of the Act with respect to every contract of automobile insurance that insures a fleet. O. Reg. 275/03, s. 2.

REFUSAL TO ISSUE CONTRACTS (SECTION 237 OF THE ACT)

5. (1) No insurer shall decline to issue, refuse to renew or terminate any contract of automobile insurance or refuse to provide or continue any coverage or endorsement solely because,
   (a) the applicant or another person who would be an insured person under the contract is or was insured by the Facility Association; or
   (b) another insurer declined to issue or renew another contract of automobile insurance for the applicant or another person who would be an insured person under the contract. R.R.O. 1990, Reg. 664, s. 5 (1).

(2) In deciding whether to issue, renew or terminate any contract of automobile insurance or to provide or continue any coverage or endorsement, the insurer shall not consider,
(a) the existence of a physical or mental disability affecting a person who would be an insured person under the contract;
(b) the number of persons who would become insured persons under the contract or their state of health or life expectancy;
(c) the occupation, profession or employment circumstances of any person who would be an insured person under the contract;
(d) the level of income of any person who would be an insured person under the contract;
(d.1) the employment history of a person who would be an insured person under the contract;
(d.2) the fact whether a person who would be an insured person under the contract has a credit card;
(d.3) the credit history of a person who would be an insured person under the contract;
(d.4) the credit rating of a person who would be an insured person under the contract;
(d.5) the fact whether a person who would be an insured person under the contract is bankrupt or has a history of bankruptcy;
(d.6) the residence history of a person who would be an insured person under the contract;
(d.7) the fact whether a person who would be an insured person under the contract owns a home;
(d.8) the gross or net worth of a person who would be an insured person under the contract;
(d.9) the indebtedness of a person who would be an insured person under the contract;
(d.10) the fact whether a person who would be an insured person under the contract has made premium payments that were late or dishonoured in respect of a contract of automobile insurance that was not terminated by reason of the late or dishonoured payments;
(e) the existence or non-existence of a medical, surgical, dental or hospitalization plan or any other arrangement or plan providing coverage to a person who would be an insured person under the contract for services and treatment that the insurer would otherwise be required to pay for under the Statutory Accident Benefits Schedule;
(f) the existence or non-existence of an income continuation benefit plan, a sick leave plan or any other arrangement or plan providing coverage to a person who would be an insured person under the contract for benefits that the insurer would otherwise be required to pay for under the Statutory Accident Benefits Schedule;
(g) a request by the applicant to purchase any optional benefit established under paragraph 10 of subsection 121 (1) of the Act;
(h) any past claim under Schedule C of the Act or under the Statutory Accident Benefits Schedule arising out of an incident for which a person who would be an insured person under the contract was not at fault; or
(i) any past claim under section 263 of the Act for loss or damage, arising directly or indirectly from the use or operation of an automobile, for which a person who would be an insured person under the contract was not at fault. R.R.O. 1990, Reg. 664, s. 5 (2); O. Reg. 780/93, ss. 1, 4; O. Reg. 46/05, s. 1.

(2.1) Subject to subsection (2.2), for the Personal Vehicles — Private Passenger Automobiles category of automobile insurance, in deciding whether to issue, renew or terminate any contract of automobile insurance or to provide or continue any coverage or endorsement, the insurer shall not consider a minor accident that occurred on or after June 1, 2016. O. Reg. 250/15, s. 2 (1).

(2.2) An insurer may consider a minor accident that occurred on or after June 1, 2016 if, within the previous three years, any automobiles that were or would be covered by the contract of automobile insurance were involved in a total of more than one minor accident and, in any of those accidents, the driver of that automobile was at fault. O. Reg. 250/15, s. 2 (1).

(2.3) For the purposes of subsections (2.1) and (2.2), an accident is a minor accident if all of the following circumstances exist:
1. The cost of damage to each automobile, including any associated property damage, did not exceed $2,000 and the cost of all such damages was paid by or on behalf of the driver who was at fault.
2. No personal injuries were sustained as a result of the accident.
3. No payment was made by any insurer with respect to damage to any automobile or property resulting from the accident. O. Reg. 250/15, s. 2 (1).

(3) In deciding whether to issue, renew or terminate a contract providing only third party liability coverage in any amount and the benefits and coverages described in subsection 265 (1) (uninsured automobile coverage) and section 268 (statutory accident benefits) of the Act, the insurer shall not consider whether a person who would be an insured person under the contract has made any past claim for loss or damage to an automobile, including its equipment, caused by any peril other than collision or upset. R.R.O. 1990, Reg. 664, s. 5 (3); O. Reg. 780/93, s. 1.

(4) An insurer shall not terminate a contract of automobile insurance because,
(a) a group marketing plan within the meaning of section 17 terminates; or
(b) the insured ceases to be a member of a group referred to in clause 16 (5) (a) or (b). O. Reg. 553/94, s. 1.

**ADDED COVERAGE TO OFFSET TORT DEDUCTIBLES ENDORSEMENT**

5.1 (1) If requested by an insured in respect of a contract of automobile insurance, the insurer shall offer the “Added Coverage to Offset Tort Deductibles” endorsement, as approved by the Chief Executive Officer under section 227 of the Act. O. Reg. 36/10, s. 1; O. Reg. 180/19, s. 7.

(2) Benefits provided by the endorsement referred to in subsection (1) are deemed not to be statutory accident benefits for the purpose of Part VI of the Act. O. Reg. 36/10, s. 1.

**DIRECT COMPENSATION — PROPERTY DAMAGE (CLAUSE 263 (5) (B) OF THE ACT)**

6. (1) For the purpose of clause 263 (5) (b) of the Act, the insurer of an automobile that is in the care, custody or control of a person who is engaged in the business of selling, repairing, maintaining, servicing, storing or parking automobiles is entitled to indemnification from the person.

(2) The amount of the indemnity is limited to that proportion of the loss that is attributable to the fault, as determined under the fault determination rules, of the person or of an employee or agent of the person. R.R.O. 1990, Reg. 664, s. 6.

7. (1) For the purpose of clause 263 (5) (b) of the Act, the insurer of an automobile that is being towed by another automobile is entitled to indemnification from the lessee or, if there is no lessee, from the owner of the automobile towing it,

(a) if the lessee or owner, as the case may be, is engaged in the business of towing automobiles; or
(b) if the automobile towing the insured automobile has a gross vehicle weight greater than 4,500 kilograms.

(2) The amount of the indemnity is limited to that proportion of the loss that is attributable to the fault, as determined under the fault determination rules, of the driver of the automobile that is towing the insured automobile. R.R.O. 1990, Reg. 664, s. 7.

8. (1) For the purpose of clause 263 (5) (b) of the Act, the insurer of an automobile the contents of which suffer damage in an amount greater than $20,000 is entitled to indemnification from the insurer of the other automobile involved in the incident.

(2) The amount of the indemnity is limited to that proportion of the loss over $20,000 that is attributable to the fault, as determined under the fault determination rules, of the driver of the other automobile. R.R.O. 1990, Reg. 664, s. 8.

8.1 The following classes of contracts are prescribed for the purpose of subsection 263 (5.1) of the Act:

2. Contracts written on Ontario Policy Form 4. O. Reg. 399/96, s. 1.

**INDEMNIFICATION FOR STATUTORY ACCIDENT BENEFITS (SECTION 275 OF THE ACT)**

9. (1) In this section,

“first party insurer” means the insurer responsible under subsection 268 (2) of the Act for the payment of statutory accident benefits; (“assureur de première part”)

“heavy commercial vehicle” means a commercial vehicle with a gross vehicle weight greater than 4,500 kilograms; (“véhicule utilitaire lourd”)

“motorcycle” means a self-propelled vehicle with a seat or saddle for the use of the driver, steered by handlebars and designed to travel on not more than three wheels in contact with the ground, and includes a motor scooter and a motor assisted bicycle as defined in the Highway Traffic Act; (“motocyclette”)

“motorized snow vehicle” means a motorized snow vehicle as defined in the Motorized Snow Vehicles Act; (“motoneige”)

“off-road vehicle” means an off-road vehicle as defined in the Off-Road Vehicles Act; (“véhicule tout terrain”)

“second party insurer” means an insurer required under section 275 of the Act to indemnify the first party insurer. (“assureur de deuxième part”) R.R.O. 1990, Reg. 664, s. 9 (1); O. Reg. 780/93, ss. 1, 6.

(2) A second party insurer under a policy insuring any class of automobile other than motorcycles, off-road vehicles and motorized snow vehicles is obligated under section 275 of the Act to indemnify a first party insurer,

(a) if the person receiving statutory accident benefits from the first party insurer is claiming them under a policy insuring a motorcycle and,

(i) if the motorcycle was involved in the incident out of which the responsibility to pay statutory accident benefits arises, or

(ii) if motorcycles and motorized snow vehicles are the only types of vehicle insured under the policy; or
(b) if the person receiving statutory accident benefits from the first party insurer is claiming them under a policy insuring a motorized snow vehicle and,

(i) if the motorized snow vehicle was involved in the incident out of which the responsibility to pay statutory accident benefits arises, or

(ii) if motorcycles and motorized snow vehicles are the only types of vehicle insured under the policy. R.R.O. 1990, Reg. 664, s. 9 (2); O. Reg. 780/93, s. 1.

(3) A second party insurer under a policy insuring a heavy commercial vehicle is obligated under section 275 of the Act to indemnify a first party insurer unless the person receiving statutory accident benefits from the first party insurer is claiming them under a policy insuring a heavy commercial vehicle. R.R.O. 1990, Reg. 664, s. 9 (3); O. Reg. 780/93, s. 1.

SETTLEMENTS — STATUTORY ACCIDENT BENEFITS

9.1 (1) In this section, “settlement” means an agreement between an insurer and an insured person that finally disposes of a claim or dispute in respect of the insured person’s entitlement to one or more benefits under the Statutory Accident Benefits Schedule. O. Reg. 780/93, s. 7.

(2) The insurer shall give the insured person a written disclosure notice, signed by the insurer, with respect to the settlement. O. Reg. 483/01, s. 1.

(3) The disclosure notice shall be in a form approved by the Chief Executive Officer and shall contain the following information:

1. The insurer’s offer with respect to the settlement.

2. A description of the benefits that may be available to the insured person under the Statutory Accident Benefits Schedule.

3. A statement that the insured person may, within two business days after the later of the day the insured person signs the disclosure notice and the day the insured person signs the release, rescind the settlement by delivering a written notice to the office of the insurer or its representative and returning any money received by the insured person as consideration for the settlement.

4. A description of the consequences of the settlement on the benefits described under paragraph 2 including,

   i. a statement of the restrictions contained in the settlement on the insured person’s right to apply to the Licence Appeal Tribunal under subsection 280 (2) of the Act or appeal from a decision of the Licence Appeal Tribunal,

   ii. a statement that the tax implications of the settlement may be different from the tax implications of the benefits described under paragraph 2 and

   iii. a statement that the insured person may not apply to the Licence Appeal Tribunal under subsection 280 (2) of the Act with respect to benefits that were the subject of a settlement or a purported settlement unless the insured person has returned the money received as consideration for the settlement.

5. A statement advising the insured person to consider seeking independent legal, financial and medical advice before entering into the settlement.

6. A statement for signature by the insured person acknowledging that he or she has read the disclosure notice and considered seeking independent legal, financial and medical advice before entering into the settlement. O. Reg. 483/01, s. 1; O. Reg. 43/16, s. 2 (1, 2); O. Reg. 180/19, s. 7.

(4) The insured person may rescind the settlement within two business days after the later of the day the insured person signs the disclosure notice and the day the insured person signs the release. O. Reg. 483/01, s. 1.

(5) The insured person may rescind the settlement after the period referred to in subsection (4) if the insurer has not complied with subsections (2) and (3). O. Reg. 483/01, s. 1.

(6) Subsections (4) and (5) do not apply with respect to a settlement that has been approved by a court under Rule 7 of the Rules of Civil Procedure (Parties under Disability). O. Reg. 483/01, s. 1.

(7) The insured person shall rescind a settlement under subsection (4) or (5) by delivering a written notice to the office of the insurer or its representative and returning any money received by the insured person as consideration for the settlement. O. Reg. 483/01, s. 1.

(8) No person may apply to the Licence Appeal Tribunal under subsection 280 (2) of the Act with respect to benefits that were the subject of a settlement or a purported settlement unless the person has returned the money received as consideration for the settlement. O. Reg. 483/01, s. 1; O. Reg. 43/16, s. 2 (3).

(9) If the insured person returns money to the insurer under subsection (7) or (8) and a dispute arises between the insurer and the insured person with respect to the validity of the purported settlement or the right of the insured person to rescind

5
settlement, the insurer shall hold the money in trust until the matter is determined, at which time the amount and any income on the amount,

(a) shall be paid to the insured, if it is determined or agreed that there was a valid settlement that was not rescinded; and
(b) shall be returned to the insurer, if it is determined or agreed that there was no settlement, or that the settlement was invalid or was rescinded. O. Reg. 483/01, s. 1.

(10) A restriction in a settlement on an insured person’s right to apply to the Licence Appeal Tribunal under subsection 280 (2) of the Act or appeal from a decision of the Licence Appeal Tribunal is void unless the insurer complied with subsections (2) and (3) and one of the following conditions is satisfied:

1. The settlement is entered into on or after the first anniversary of the day of the accident that gave rise to the claim.
2. Before entering into the settlement,
   i. the insured applied to the Licence Appeal Tribunal under subsection 280 (2) of the Act, and
   ii. if there were applicable rules or procedures of the Licence Appeal Tribunal in respect of case conferences at the time of the settlement, a case conference was held in accordance with the rules or procedures. O. Reg. 43/16, s. 2 (4).

(11), (12) REVOKED : O. Reg. 43/16, s. 2 (5).

9.2 (1) Section 9.1 applies only with respect to settlements made on or after the transition date. O. Reg. 43/16, s. 3.

(2) Subsection 9.1 (3), as it read immediately before the transition date, applies with respect to settlements for which written notice under subsection 9.1 (2) was given before the transition date but which were made on or after the transition date. O. Reg. 43/16, s. 3.

(3) Section 9.1, as it read immediately before the transition date, applies with respect to settlements made before the transition date, with necessary modifications, and the following modifications:

1. Subsections 9.1 (2) to (5), as they read on February 28, 2002, continue to apply with respect to settlements for which written notice under subsection 9.1 (2) was given before March 1, 2002.
2. In addition to a mediation proceeding, subsection 9.1 (8) applies in respect of an application to the Licence Appeal Tribunal under subsection 280 (2) of the Act.
3. In addition to the right to mediate, litigate, appeal or apply to vary an order, subsection 9.1 (10) applies to the right to apply to the Licence Appeal Tribunal under subsection 280 (2) of the Act or appeal from a decision of the Licence Appeal Tribunal. O. Reg. 43/16, s. 3.

(4) In this section, “transition date” has the same meaning as in subsection 283 (5) of the Act. O. Reg. 43/16, s. 3.

DISPUTE RESOLUTION (SECTION 280 OF THE ACT)

10. If the Licence Appeal Tribunal finds that an insurer has unreasonably withheld or delayed payments, the Licence Appeal Tribunal, in addition to awarding the benefits and interest to which an insured person is entitled under the Statutory Accident Benefits Schedule, may award a lump sum of up to 50 per cent of the amount to which the person was entitled at the time of the award together with interest on all amounts then owing to the insured (including unpaid interest) at the rate of 2 per cent per month, compounded monthly, from the time the benefits first became payable under the Schedule. O. Reg. 43/16, s. 4.

11. REVOKED: O. Reg. 301/98, s. 2.

12., 13. REVOKED : O. Reg. 43/16, s. 4.

14. REVOKED: O. Reg. 301/98, s. 2.

PRESCRIBED ELEMENTS OF RISK CLASSIFICATION SYSTEM (SECTIONS 410 TO 417 OF THE ACT)

14.1 (1) For the purposes of section 260 of the Act, insurers shall use the following elements of a risk classification system in classifying risks for loss or damage to an automobile or loss of its use:

1. REVOKED: O. Reg. 250/15, s. 3 (1).
2. For collision or upset coverage, as referred to in the standard policy forms approved by the Chief Executive Officer under subsection 227 (5) of the Act, a deductible of $500 for contracts issued or renewed on or after April 15, 2004, unless the contract provides for a different amount.
3. For comprehensive coverage, as referred to in the standard policy forms approved by the Chief Executive Officer under subsection 227 (5) of the Act,
   i. a deductible of $300 for contracts issued or renewed on or after April 15, 2004 and before June 1, 2016, unless the contract provides for a different amount, and
ii. a deductible of $500 for contracts issued or renewed on or after June 1, 2016, unless the contract provides for a different amount. O. Reg. 459/03, s. 1; O. Reg. 250/15, s. 3; O. Reg. 180/19, s. 7.

(2) Insurers shall use the following elements in their risk classification systems in classifying risks for damage to an automobile or its contents or loss of its use:

1. For contracts issued or renewed on or after April 15, 2004 and before September 1, 2010, $300 as the amount of the reduction referred to in clause 263 (5.1) (b) of the Act, unless the contract provides for a different amount.

2. For contracts issued or renewed on or after September 1, 2010, $500 as the amount of the reduction referred to in clause 263 (5.1) (b) of the Act, unless the contract provides for a different amount. O. Reg. 36/10, s. 3.

(3) Insurers shall use the following element in their risk classification systems in classifying risks for the Personal Vehicles — Private Passenger Automobiles category of automobile insurance:

1. For contracts issued or renewed on or after January 1, 2016, a discount in the rate of insurance in respect of an automobile that is equipped with winter tires. O. Reg. 222/15, s. 1.

APPLICATION OF SECTIONS 410 TO 417 OF THE ACT

15. (1) Sections 410 to 417 of the Act apply in respect of contracts of automobile insurance written on Ontario Automobile Policy 1 or Ontario Policy Form 2. O. Reg. 464/96, s. 5 (2).

(2) Sections 410 to 417 of the Act apply in respect of all types of endorsements to contracts of automobile insurance written on Ontario Automobile Policy 1 or Ontario Policy Form 2. O. Reg. 464/96, s. 5 (2).

(3) Despite subsections (1) and (2), sections 410 to 417 of the Act do not apply to any contract of automobile insurance that insures a fleet. O. Reg. 275/03, s. 6.

EXPEDITED RISK CLASSIFICATION AND RATE APPROVAL (SECTION 411 OF THE ACT)

15.1 (1) The percentage prescribed for the purpose of paragraph 1 of subsection 411 (1) of the Act is, for each coverage and category of automobile insurance, the percentage difference between the average of the insurer’s existing rates for that coverage and category and the average of the insurer’s proposed rates. O. Reg. 464/96, s. 6.

(2) For the purpose of paragraph 1 of subsection 411 (1) of the Act, the proposed rates must meet the following additional criteria:

1. The proposed rates relate only to the Personal Vehicles — Private Passenger Automobiles category of automobile insurance.

2. The effective date of the proposed rates for the insurer’s renewal business is on or after January 1, 1997.

3. The average cumulative rate change for all coverages, calculated in accordance with the Section 411/412 Filing Guidelines published by the Financial Services Commission of Ontario, as they may be amended from time to time, is less than or equal to zero.

4. The percentage difference, for each territory used by the insurer, between the average of the existing rates for each coverage and the average of the proposed rates for that coverage is not more than 5 per cent higher or lower than the percentage difference, for all of Ontario, between the average of the existing rates for that coverage and the average of the proposed rates for that coverage.

5. No changes are proposed to the rating algorithm, differentials, discounts or surcharges used to determine the proposed rates. O. Reg. 464/96, s. 6; O. Reg. 301/98, s. 1; O. Reg. 222/15, s. 2.

(3) For the purpose of paragraph 2 of subsection 411 (1) of the Act, the proposed risk classification system may not contain,

(a) any new element; or

(b) any existing element that uses a different definition or different rating rules. O. Reg. 464/96, s. 6.

PROHIBITED RISK CLASSIFICATION ELEMENTS (SECTIONS 410 TO 417 OF THE ACT)

16. (1) Insurers are prohibited from using elements of a risk classification system described in this section in classifying risks for any coverage or category of automobile insurance. O. Reg. 780/93, s. 8 (1).

(2) No element of a risk classification system shall use past claims arising out of accidents occurring on or after September 1, 2010 for which an insured person was 25 per cent or less at fault. O. Reg. 36/10, s. 4.

(3) No element of a risk classification system shall use the existence or non-existence of a medical, surgical, dental or hospitalization plan or any other arrangement or plan providing coverage to a person who would be an insured person under the contract for services and treatment that the insurer would otherwise be required to pay for under the Statutory Accident Benefits Schedule. R.R.O. 1990, Reg. 664, s. 16 (3); O. Reg. 780/93, ss. 1, 8 (3).

(4) No element of a risk classification system shall use the existence or non-existence of an income continuation plan, a sick leave plan or any other arrangement or plan providing coverage to a person who would be an insured person under the
contract for benefits that the insurer would otherwise be required to pay for under the Statutory Accident Benefits Schedule. R.R.O. 1990, Reg. 664, s. 16 (4); O. Reg. 780/93, ss. 1, 8 (4).

(4.1) No element of a risk classification system shall use a lapse in automobile insurance coverage unless,

(a) the insured person contravened section 2 of the Compulsory Automobile Insurance Act during the lapse in coverage; or

(b) the lapse of coverage resulted directly or indirectly from,

(i) the termination of a policy of automobile insurance as a result of the insured person’s failure to pay the premiums due under the policy,

(ii) the suspension of the insured person’s driver’s licence as a result of a conviction for an offence related to the use or operation of an automobile, or

(iii) an accident or a conviction for an offence related to the use or operation of an automobile, if the insured person did not inform the insurer of the accident or conviction and the accident or conviction would likely have led to the insured person being charged a higher premium. O. Reg. 464/96, s. 7 (2).

(4.2) Except as permitted under subsection (4.3) or (5), no element of a risk classification system shall use any of the following factors:

1. The level of income of a person who would be an insured person under the contract.

2. The employment history of a person who would be an insured person under the contract.

3. The occupation, profession or employment circumstances of a person who would be an insured person under the contract, unless the contract is in respect of a commercial vehicle or a public vehicle or a vehicle used in the course of carrying on a business, trade or profession.

4. The fact whether a person who would be an insured person under the contract has a credit card.

5. The credit history of a person who would be an insured person under the contract.

6. The credit rating of a person who would be an insured person under the contract.

7. The fact whether a person who would be an insured person under the contract is bankrupt or has a history of bankruptcy.

8. The residence history of a person who would be an insured person under the contract.

9. The fact whether a person who would be an insured person under the contract owns a home.

10. The gross or net worth of a person who would be an insured person under the contract.

11. The indebtedness of a person who would be an insured person under the contract.

12. The fact whether a person who would be an insured person under the contract has made premium payments that were late or dishonoured in respect of a contract of automobile insurance that was not terminated by reason of the late or dishonoured payments.

13. A minor accident that occurred on or after June 1, 2016. O. Reg. 46/05, s. 2; O. Reg. 250/15, s. 4 (1, 2).

(4.3) The factor described in paragraph 13 of subsection (4.2) may be used in an element of a risk classification system if, within the previous three years, any automobiles that were or would be covered by the contract of automobile insurance were involved in a total of more than one minor accident and, in any of those accidents, the driver of that automobile was at fault. O. Reg. 250/15, s. 4 (3).

(4.4) For the purposes of subsections (4.2) and (4.3), an accident is a minor accident if all of the following circumstances exist:

1. The cost of damage to each automobile, including any associated property damage, did not exceed $2,000 and the cost of all such damages was paid by or on behalf of the driver who was at fault.

2. No personal injuries were sustained as a result of the accident.

3. No payment was made by any insurer with respect to damage to any automobile or property resulting from the accident. O. Reg. 250/15, s. 4 (3).

(5) Membership in an organized group shall not be used as an element of a risk classification system unless the group consists of no fewer than 100 members other than associate members of the group, a group marketing plan has been entered into that meets the requirements of section 17 and the group is,

(a) a trade union, a professional or occupational association or an alumni association;

(b) a non-profit entity that has been in existence for at least 24 months;

(c) a group of employees of the same employer; or
(d) a group of members of a credit union that satisfies the requirements of subsection (7). O. Reg. 275/03, s. 7.

(6) An organization formed primarily for the purpose of purchasing or providing goods or services does not constitute a non-profit entity for the purposes of clause (5) (b). O. Reg. 275/03, s. 7.

(7) A group of members of a credit union constitute an organized group for the purposes of clause (5) (d) if the following rules are satisfied:

1. The bond of association in respect of the credit union for the purposes of subsection 30 (1) of the Credit Unions and Caisses Populaires Act, 1994 is a common bond of occupation or association referred to in clause 30 (2) (a) of that Act.

2. The members of the credit union who belong to the group are,
   i. employees of the same employer,
   ii. members of the same trade union, or
   iii. members of the same professional or occupational association.

3. The group of members does not include any person admitted to the credit union who does not come within the common bond of association described in paragraph 1, unless the person is an associate member of the group under subsection (8), (9) or (10). O. Reg. 275/03, s. 7.

(8) Despite paragraph 2 of subsection (7), the following persons may be included in an organized group described in clause (5) (d) in respect of a particular credit union, but only as associate members of the group:

1. Employees of the credit union.
2. Retired employees of the credit union who receive or are entitled to receive retirement benefits from the credit union. O. Reg. 275/03, s. 7.

(9) Retired employees of the same employer who receive or are entitled to receive retirement benefits from the employer may be included in a group referred to in clause (5) (c) or subparagraph 2i of subsection (7), but only as associate members of the group. O. Reg. 275/03, s. 7.

(10) Each of the following persons may be included in a group referred to in clause (5) (a), (b), (c) or (d), but only as an associate member of the group:

1. The spouse of a member or associate member of the group.
2. A person under 25 years of age who is a child of a member or associate member of the group or of the spouse of a member or associate member of the group and,
   i. resides in the same dwelling as the member or associate member, or the spouse of the member or associate member, as the case may be, or
   ii. attends an educational institution on a full-time basis.
3. The spouse of a child described in paragraph 2. O. Reg. 275/03, s. 7; O. Reg. 316/05, s. 1 (1-4).

(11) A risk classification system shall not include an element that results in the exclusion of a member or associate member of an organized group referred to in subsection (5) for the purposes of risk classification if,

(a) the insurance is sold under a group marketing plan within the meaning of section 17; and

(b) coverage is for a private passenger vehicle within the meaning of the Plan of Operation established by the Facility Association under subsection 7 (3) of the Compulsory Automobile Insurance Act. O. Reg. 275/03, s. 7.

(12) No element of a risk classification system shall result in a change in the classification of an insured before the next renewal date of the insured’s policy because,

(a) a group marketing plan within the meaning of section 17 terminates; or

(b) the insured ceases to be a member or associate member of an organized group referred to in subsection (5). O. Reg. 275/03, s. 7.

(13) Subject to subsection (12), no element of a risk classification system that uses membership in an organized group referred to in subsection (5) shall apply to an insured who ceases to be a member or associate member of the group. O. Reg. 275/03, s. 7.

(14) An organized group that met the requirements of this section and section 17 as they read on September 30, 2003 shall be deemed to meet the requirements of this section and section 17 after that day if,

(a) membership in the group was an element of a risk classification system before October 1, 2003; and

(b) a group marketing plan has been entered into that meets the requirements of section 17. O. Reg. 275/03, s. 7.

(15) In this section,
“credit union” means a credit union as defined in section 1 of the *Credit Unions and Caisses Populaires Act, 1994*; (“caisse populaire”)

“spouse” has the same meaning as in Part VI of the Act. (“conjoint”)  O. Reg. 275/03, s. 7; O. Reg. 316/05, s. 1 (5).

**GROUP MARKETING PLANS**

17.  (1) In this section,
“group marketing plan” means an arrangement made in writing between an insurer and a sponsor to market automobile insurance to members of an organized group referred to in subsection 16 (5); (“plan de commercialisation de groupe”)

“sponsor” means a person who is authorized to enter into a group marketing plan on behalf of an organized group referred to in subsection 16 (5). (“parrain”)  O. Reg. 275/03, s. 8 (1).

(1.1) A group marketing plan shall include the details of the arrangement, including,
(a) the name of the insurer and the name of the sponsor or sponsors and their respective responsibilities;
(b) the name of the broker or agent;
(c) the effective date of the group marketing plan;
(d) information with respect to fees;
(e) whether or not the group marketing plan is made to the exclusion of another group marketing plan with respect to the group; and
(f) the procedure for terminating the group marketing plan.  O. Reg. 275/03, s. 8 (1).

(2) An insurer shall not sell automobile insurance under a group marketing plan if any person is required to purchase insurance under the plan or is subject to a penalty for failing to purchase insurance under the plan.  O. Reg. 553/94, s. 3.

(3) An insurer, agent or broker who sells automobile insurance under a group marketing plan shall not accept an application from a person for insurance coverage unless, not later than 30 days after accepting the application, the insurer, agent or broker makes full and fair disclosure in writing to the person of all features of the group marketing plan and the insurance coverage, including,
(a) the group marketing plan’s provisions relating to group discounts, policyholder services, termination of the plan and termination of eligibility; and
(b) the financial interests of the sponsor in the group marketing plan.  O. Reg. 553/94, s. 3; O. Reg. 275/03, s. 8 (2, 3).

(3.1) For the purposes of clause (3) (b), the financial interests of the sponsor include any lump sum payment, percentage of premium or other payment received by the sponsor from the insurer as a result of a person purchasing automobile insurance coverage through the plan.  O. Reg. 275/03, s. 8 (4).

(4) A person who collects premiums under a group marketing plan, other than an agent or broker, shall provide adequate administrative facilities for the collection of premiums and shall be deemed to be the agent of the insurer for the purpose of collecting premiums.  O. Reg. 553/94, s. 3.

(5) All premium funds received or receivable by a person under a group marketing plan, other than by an agent or broker, shall be deemed to be trust funds held for the benefit of the insurer.  O. Reg. 553/94, s. 3.

(6) A person who receives or is entitled to receive premium funds under a group marketing plan shall not assign, pledge, mortgage or in any way charge the funds.  O. Reg. 553/94, s. 3.

(7) An assignment, pledge, mortgage or other charge of premium funds contrary to subsection (6) is void.  O. Reg. 553/94, s. 3.

**PUBLIC ADJUSTERS — STATUTORY ACCIDENT BENEFITS (SECTION 398 OF THE ACT)**

18. A person who is authorized to provide legal services in Ontario pursuant to the *Law Society Act* is exempt from subsection 398 (1) of the *Insurance Act* in respect of a claim for benefits under the Statutory Accident Benefits Schedule.  O. Reg. 62/08, s. 1.

**TRANSITION**

19. In this section and in sections 20 and 21,
“arbitrator” means an arbitrator appointed under section 8 of the pre-transition date Act; (“arbitre”)

“Director” means the director of arbitrations appointed under subsection 6 (1) of the pre-transition date Act; (“directeur”)

“Licence Appeal Tribunal” means the Licence Appeal Tribunal established under the *Licence Appeal Tribunal Act, 1999*; (“Tribunal d’appel en matière de permis”)
“pre-transition date Act” means the Act as it read immediately before the transition date; (“loi antérieure à la date de transition”)

“transition date” has the same meaning as in subsection 283 (5) of the Act. (“date de transition”) O. Reg. 180/19, s. 1.

20. (1) On July 1, 2020, any of the following proceedings that were continued by subsection 21 (1) or section 22.1 of this Regulation, as either provision read immediately before July 1, 2020, and that have not been finally determined by July 1, 2020 are extinguished:

1. A mediation under section 280 of the pre-transition date Act.
2. An arbitration under section 282 of the pre-transition date Act.
3. An appeal under section 283 of the pre-transition date Act.
4. An application for a variation or revocation of an order under subsection 284 of the pre-transition date Act. O. Reg. 180/19, s. 1.

(2) For greater certainty, no party may commence a new proceeding described in subsection (1). O. Reg. 180/19, s. 1.

(3) Despite subsection (1), if a motion or application to a judge for approval of a settlement in respect of a person under disability has been made in accordance with the Rules of Civil Procedure on or before July 1, 2020 in respect of a proceeding described in paragraph 2, 3 or 4 of subsection (1), the proceeding is continued until the settlement is approved or not approved by the judge. O. Reg. 180/19, s. 1.

(4) A proceeding described in subsection (3) is extinguished on the day the settlement is not approved by a judge, and,

(a) in the case of a proceeding described in paragraph 2 of subsection (1), either party may make a new application to the Licence Appeal Tribunal within 90 days after the day the judge refused to approve the settlement to resolve the dispute in accordance with section 280 of the Act; or

(b) in the case of a proceeding described in paragraph 3 of subsection (1), the former appellant may make an appeal of the arbitration order to the Divisional Court in accordance with section 11 of the Licence Appeal Tribunal Act, 1999, within 30 days after the day the judge refused to approve the settlement, as if,

(i) it were an appeal of a decision of the Licence Appeal Tribunal, and

(ii) the arbitration order were made on the day the judge refused to approve the settlement. O. Reg. 180/19, s. 1.

(5) If, on July 1, 2020, an order has not yet been issued in an arbitration described in paragraph 2 of subsection (1), either party may make a new application to the Licence Appeal Tribunal on or before December 1, 2020 to resolve the dispute in accordance with section 280 of the Act. O. Reg. 180/19, s. 1.

(6) If, on July 1, 2020, an order has previously been issued in an arbitration described in paragraph 2 of subsection (1) but the issue of a special award under subsection 282 (10) of the pre-transition date Act or of costs has not been finally determined, either party may apply to the Licence Appeal Tribunal under section 280 of the Act on or before December 1, 2020 to decide that outstanding issue. O. Reg. 180/19, s. 1.

(7) Section 56 of Ontario Regulation 34/10 (Statutory Accident Benefits Schedule - Effective September 1, 2010), made under the Act, does not apply to an application described in clause (4) (a) or subsection (5) or (6). O. Reg. 180/19, s. 1.

(8) If an order has been issued in an arbitration described in paragraph 2 of subsection (1) before July 1, 2020, the order has not been appealed and the time to serve a notice of motion for leave to appeal, as set out in subsection 283 (2) of the pre-transition date Act, has not expired, either party may appeal the arbitration order to the Divisional Court in accordance with section 11 of the Licence Appeal Tribunal Act, 1999 as if it were an appeal of a decision of the Licence Appeal Tribunal. O. Reg. 180/19, s. 1.

(9) If an appeal of an arbitration order has been extinguished by subsection (1), the former appellant may make an appeal of the arbitration order to the Divisional Court, in accordance with section 11 of the Licence Appeal Tribunal Act, 1999, before December 1, 2020 as if,

(a) it were an appeal of a decision of the Licence Appeal Tribunal; and

(b) the arbitration order were made on July 1, 2020. O. Reg. 180/19, s. 1.

21. (1) A court that conducts a judicial review of a proceeding described in subsection 20 (1) may refer the proceeding to the Licence Appeal Tribunal if it determines that such a referral is appropriate. O. Reg. 180/19, s. 2 (2).

(2) If the Director ordered that a dispute be heard again by an arbitrator, and if the dispute was not finally determined by July 1, 2020, either party may make a new application to the Licence Appeal Tribunal on or before December 1, 2020 to resolve the dispute in accordance with section 280 of the Act. O. Reg. 180/19, s. 2 (2).

(3) If a court refers a dispute to be decided by the Director or by an arbitrator on or after July 1, 2020, either party may make a new application to the Licence Appeal Tribunal within 90 days after the day the matter was referred to the Director or arbitrator to resolve the dispute in accordance with section 280 of the Act. O. Reg. 180/19, s. 2 (2).
(4) Section 56 of Ontario Regulation 34/10 (Statutory Accident Benefits Schedule - Effective September 1, 2010), made under the Act, does not apply to an application described in subsection (2) or (3). O. Reg. 180/19, s. 2 (2).

22. (1) For greater certainty, nothing in section 20 or 21 prevents a party from seeking judicial review. O. Reg. 180/19, s. 3 (2).

(2) For greater certainty, if an application is made to the Licence Appeal Tribunal under subsection 280 (2) of the Act, the dispute shall be resolved in accordance with the rules of the Licence Appeal Tribunal. O. Reg. 180/19, s. 3 (2).

22.1-25. **REVOKED**: O. Reg. 180/19, s. 5.

26. References in this Regulation to a form approved by the Chief Executive Officer are deemed to include the last form approved by the Superintendent for the purposes of the relevant provision prior to the day section 22 of Schedule 13 to the *Plan for Care and Opportunity Act (Budget Measures), 2018* came into force until the Chief Executive Officer approves a subsequent form for the purposes of the relevant provision. O. Reg. 180/19, s. 6.

**TABLE 1 REVOKED**: O. Reg. 36/10, s. 5.

**SCHEDULE REVOKED**: O. Reg. 43/16, s. 6.

**FORM 1 REVOKED**: O. Reg. 780/93, s. 9.

PURPOSE

The purpose of this Code of Conduct is to provide insurers who use credit information in their underwriting and rating activities for personal insurance with guidelines on the use of credit information in accordance with principles of consumer protection and applicable federal and provincial laws.

SCOPE

This Code applies to personal insurance only and does not apply to commercial insurance. In this context, “personal insurance” means private passenger automobile, homeowners, motorcycle, mobile-homeowners and non-commercial dwelling fire insurance policies [including boat, personal watercraft, snowmobile and recreational vehicle policies]. Such policies are individually underwritten for personal, family or household use. “Credit information”, is defined in this Code to include credit scores, credit history, credit reports and other credit related information as defined under the provincial Consumer Reporting Acts.

These guidelines are for the use of credit information obtained from a consumer reporting agency in the context of quoting, underwriting and rating.

1. Comply with provincial laws

The insurer must be aware of and fully comply with any federal and provincial laws and regulations (including but not limited to Privacy Legislation and Consumer Reporting Acts) affecting their use and/or management of credit information.
2. Ensure credit information used is current and accurate

a) The insurer must use up to date credit information:
   - The insurer shall not use credit information that is not current;
   - The insurer shall update any customer credit information used, at the customer’s request.

b) Ensure accurate credit information is used:
   - When informed by a consumer reporting agency of a correction, supplement or deletion to an individual’s credit file, the insurer must immediately make the necessary adjustments to the file and shall re-underwrite and re-rate the consumer as soon as practical;
   - After re-underwriting or re-rating the insured, the insurer shall make any further adjustments that are consistent with its underwriting and rating practices;
   - If an insurer determines that the insured has overpaid premium it shall comply with pertinent regulations relating to refunding of overpayments;
   - At the request of the consumer, the insurer shall inform the consumer of the source/supplier of the credit information used (i.e. identifying the specific consumer reporting agency that supplied the credit information);
   - The customer/applicant for insurance is responsible for contacting the consumer reporting agency to verify his/her file and, if applicable, request that it be corrected.

3. Gathering prior consent to collect and use credit information (written or verbal)

The insurer must secure prior consent to collect and use credit information from the consumer in accordance with the following principles and procedures:

a) Consent must be informed.
   - Customers must not feel obliged to give consent;
   - Customers must understand the nature and scope of the request. The request for consent must be clear and understandable to ensure that customers know specifically what they are consenting to and how that consent will be used;
   - Consent must be specific and the insurer must not presume consent will be given. Consent may be given verbally, in writing or via an e-medium. E-medium consent should be a field that the policyholder can click on directly in order to give consent.

Prior to an agent or broker collecting credit information, the customer consent field (agent’s or broker’s screen) must be clear and explicit for the user. The field must not default to yes.

b) No one can give consent for another person. Consent must be obtained directly from each individual in the household if their credit information is to be used. Any applicant or co-applicant about whom credit information will be collected and used must either provide a signed consent form or provide verbal consent directly to the agent or broker.
c) **Consent retention:** The insurer must maintain the trail or proof of consent in the customer file (paper, e-medium or other). The retention period for the customer file is the minimum period required by law.

d) **Duration of consent:** The consent is valid for the duration that the policy is in effect. Unless withdrawn by the policyholder, consent is valid for as long as the policyholder has a continuous business relationship with the insurer, i.e., the policy is in force until cancelled. Under these circumstances, the insurer can request the insured’s credit record or credit information from the consumer reporting agency, by relying on the initial consent.

### Word of consent question (Verbal or written)

<table>
<thead>
<tr>
<th>Key elements to be included in the consent request:</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Authorization to collect information from consumer reporting agencies;</td>
</tr>
<tr>
<td>ii. Nature of the information sought (e.g. credit information);</td>
</tr>
<tr>
<td>iii. Use made by the insurer of the credit information (what will it be used for);</td>
</tr>
<tr>
<td>iv. Consent use period (validity);</td>
</tr>
<tr>
<td>v. Right to withdraw and consequences (an insured may withdraw consent at any time in writing; however, he or she might not benefit from the insurer’s best quote).</td>
</tr>
</tbody>
</table>

### 4. Keeping customers’ credit information confidential and private

The insurer must respect the confidential nature of personal credit information. The only persons who should have access to the information are those who require it to do their job.

Relevant Canadian consumer and privacy protection laws are to be fully complied with. Among these is PIPEDA (Personal Information Protection and Electronic Documents Act), the federal privacy law that sets out rules around how private sector organizations may collect, use or disclose personal information. For example:

Consent is required for the collection of personal information and the subsequent use or disclosure of this information. Privacy legislation applies at the time that personal information is collected or in cases where the information has already been collected, prior to it being used for a purpose not previously identified. (PIPEDA, Principle 4.3.1)

Personal information is not to be used or disclosed for purposes other than those for which it was collected, except with the consent of the individual or as required by law. Personal information is to be retained only as long as necessary for the fulfillment of those purposes. (PIPEDA, Principle 4.5)
5. **Use of credit as a sole variable**

The insurer must not refuse to quote or base an insured’s renewal rates, or deny, cancel or non-renew a policy of personal insurance solely on the basis of credit information without consideration of other non-credit underwriting or rating variables.

6. **Legitimate uses of credit information – pricing, underwriting or financing of premiums - modeling**

An individual’s credit information must not be double counted in rating an individual’s premium, consistent with established actuarial practice.

The insurer must seek assurance from suppliers of credit information that the following are not used as a negative factor in any credit scoring models:

   i. Inquiries by the consumer for his or her own credit information;
   
   ii. Inquiries relating to insurance;
   
   iii. Income, gender, address, ethnic group, religion, marital status, or nationality of the consumer;
   
   iv. Multiple lender inquiries, if coded by the consumer reporting agency on the consumer’s credit information as being from the home mortgage industry and made within 30 days of one another, unless only one inquiry is considered;
   
   v. Multiple lender inquiries, if coded by the consumer reporting agency on the consumer’s credit information as being from the automobile lending industry and made within 30 days of one another, unless only one inquiry is considered.
   
   vi. Factors used in establishing an individual’s credit information must not include factors expressly prohibited in provincial insurance regulations or bulletins, which may vary by province.

7. **Handling of Consumer Disputes**

Consumer complaints about the insurer’s use of a customer’s credit information are to be addressed by the insurer in accordance with the complaint procedure provisions as required under federal (i.e. Financial Consumer Agency of Canada) and provincial law.
8. Taking adverse action as a result of credit information

a) The insurer must treat consumers fairly when they have no record of credit information or they are unable to create a credit score. In particular, this means:
   - Customers with an absence of credit information shall not be denied coverage, cancelled or non-renewed a policy of personal insurance without consideration of any other applicable underwriting factors;
   - In the absence of credit information, underwriting and rating decisions will be based upon the relevant information which is available to the insurer.

b) The insurer must disclose to the consumer adverse action taken only as a result of credit information.
   - Notification should be provided to the consumer explaining the reason for the adverse action and in accordance with applicable Consumer Reporting Legislation laws.

9. Refusal of consent

The insurer shall not refuse to provide an insurance quote to the customer, nor refuse to insure a customer, nor terminate or refuse to renew a policy because the customer refuses to give consent to use their credit information. In this situation the customer will be offered a competitive rate but may not qualify for related discounts or the insurers’ best quote.

An insurer shall not refuse to provide an insurance quote to a customer, nor terminate or refuse to renew a policy solely because of unfavourable credit information.

10. Extraordinary life circumstances

If a customer believes that his or her credit information resulted in an adverse action by their insurer and that their credit has been adversely impacted by an extraordinary life event, the customer could elect to provide a written request detailing the extraordinary event to their insurer. The insurer would then review the decision to use credit information as a rating and underwriting tool for this customer. The request must provide appropriate supporting documentation verifying how and why their credit history was adversely influenced and why it should be reconsidered. If an exception is approved by the insurer, the customer would be re-rated accordingly.

Provided that there is sufficient evidence, extraordinary events may be considered by the insurer for the granting of reasonable exemptions. An “extraordinary life event” could be, for example, an identity theft or a catastrophic event as declared by provincial authorities.

If deemed necessary at the discretion of the insurer, consumers shall be provided a notice that reasonable exceptions are available and information about how the consumer may inquire further.

Executive Summary

Every year, thousands of Canadians experience financial losses due to severe weather. The losses to insurers and their policyholders and losses to governments and, by extension, taxpayers are escalating. Wildfires, floods, hailstorms and windstorms are occurring with greater frequency and intensity. Scientific evidence published by the Intergovernmental Panel on Climate Change and in the U.S. National Climate Assessment is now showing that the escalation in severe weather around the globe is attributable to climate change and that these loss trends will only worsen in the future. In Canada, as is the case in many nations, flooding is the threat where we are facing the greatest cumulative losses and the threat for which we are least prepared.

Recognizing this emerging trend, the Honourable Ralph Goodale, Minister of Public Safety Canada, the Honourable Larry Doke, Saskatchewan Minister of Government Relations (being responsible for Emergency Management) and Heather Bear, Vice-Chief of the Assembly of First Nations convened a National Roundtable on Flood Risk in Regina in November 2017. As recommended by that National Roundtable, an Advisory Council on Flooding was created in early 2018 with the purpose of advancing the national agenda on flood risk management. An early deliverable of the Advisory Council was the creation of a public-private sector Working Group on the Financial Management of Flood Risk, co-chaired by Public Safety Canada1 and the Insurance Bureau of Canada (IBC). In May 2018, Federal/Provincial/Territorial Ministers of Emergency Management asked this Working Group to refine options for managing the financial costs of high-risk residential properties while drawing upon international models, such as Flood Re in the United Kingdom. IBC has been asked to report on these options, developed through Working Group consultations, to Public Safety Canada, through the Advisory Council on Flooding. This paper is the resulting product, and was authored by IBC with input from members of the Working Group.

This paper considers the views of both the private and the public spheres of society, and focusses primarily on measures to transfer residential property risk from public sector disaster financial assistance programs, which are funded by the taxpayer, to private sector insurance solutions, which are primarily funded by the property owner. The paper’s goal is to present some of the existing options to address the financial management of flood in high-risk zones based on a suite of commonly agreed principles. These principles were first identified at the National Roundtable and have evolved through consultations with various stakeholders. Taken together, the principles are designed to incent community and individual resiliency while decreasing pressure on public finances.

---

1 Public Safety primarily worked to facilitate the participation of various stakeholders, and to provide strategic linkages to the other Working Group under the Advisory Council on Flooding (the working Group on Flood Data and Mapping). The views expressed in this paper do not necessarily reflect the view of the federal government.
These principles are:

**AFFORDABILITY:**
An optimal approach should provide affordable protection for high-risk properties to ensure maximum participation (Appendix II).

**INCLUSIVITY:**
An optimal approach should provide an insurance solution to all primary-residence property owners irrespective of the level and type of flood risk they face, e.g., pluvial, fluvial or coastal (Appendix III). Indigenous residences, which are often covered by commercial insurance, and other vulnerable communities require particular attention and possibly a concurrent program.

**EFFICIENCY:**
The price of insurance should reflect as much of the risk as possible, thereby incenting appropriate flood risk reductions among all stakeholders.

**OPTIMAL COMPENSATION:**
Insurance solutions should provide predictable and wholesome compensation to residential property owners and therefore diminish residential pressure on publicly funded disaster assistance programs.

**SHIELD THE TAXPAYER:**
An optimal approach should reduce reliance on ongoing taxpayer-funded subsidies by creating the conditions necessary for expansion of private market insurance coverage.

**FINANCIALLY SUSTAINABLE:**
An optimal approach should be financially self-sufficient where systemic losses are reduced over time.
Application of these principles involves trade-offs. For instance, the principles of efficiency and affordability can be in opposition. To receive the price signals required to incent prevention and mitigation actions, the homeowner should pay for the full risk that they bear. However, many homeowners, particularly those with low incomes, simply cannot afford the premiums that would be required to cover that full risk.

Consequently, premiums need to be capped, and the resultant residual risk needs to be subsidized from other sources. In any scenario, government investments in flood mitigation are essential to lower the homeowner’s risk to an affordable level. Design of the three options listed in this paper involves addressing such trade-offs in varying ways.

Canada must increase its resiliency to residential flood risk to keep people safe and financially viable. The solutions presented below are intended to provide better outcomes for individual Canadians and are less about reducing pressure on public accounts. Currently, flooding is Canada’s most costly natural peril and accounts for roughly three quarters of federal Disaster Financial Assistance (DFAA) payments. However residential losses account for only 5-15% of that total - a greater portion by far, perhaps as much as 70%, is spent on recovery of public infrastructure. Therefore, any risk-transferring solution for residential infrastructure will present modest cost-savings for public treasuries. (This paper focuses exclusively on residential property and not on larger public/critical infrastructure, which may require a different approach and should be the subject of further study.)

Regardless, considering the amplifying effects of climate change on future precipitation patterns and sea levels, governments must be concerned about Disaster Risk Reduction – lowering the public safety and personal financial risk of those Canadians living in high risk areas.

The desired end state for flood disaster risk reduction is a future where every Canadian is both physically and financially safe from flooding and where each individual is empowered to manage their own risk. This end state reflects an overall reduction in flood risk and will result from a whole-of-society approach to building resilience (Appendix VII).

A flood disaster risk reduction approach for Canada should fit within the broader Emergency Management Strategy and should take a ‘whole of society’ perspective. Such an approach should leverage significant stakeholder partnerships in infrastructure to reduce climate risk in the most exposed communities AND elevate risk awareness and incent de-risking efforts amongst all stakeholders. Within this context of lowered risk, insurers can introduce new products and employ premium structures that will further incent responsible behaviour.
To elaborate, this approach should have three prongs:

a. **ELEVATE RISK AWARENESS/ENGAGEMENT:**
   Elevate consumer and government awareness to incent active flood-risk reduction to ensure price signals are properly received and understood. This should include conveying risk-assessment information to all participants throughout all stages of the property development, transaction, financing and insurance processes.

b. **IMPROVE RISK IDENTIFICATION:**
   Improve and align public-facing risk maps that allow insurers as well as property owners and governments to collaborate on identifying, updating and managing risk. These maps must be evergreen in that they reflect continuous improvement of the underlying flood hazard modelling to reflect investments in flood defences.

c. **AGGRESSIVELY MITIGATE RISK:**
   Aggressively invest in reducing the number of Canadians who live in areas at high risk of flooding, through flood mitigation and strategic retreat from these high-risk areas (Appendix V). This will require bold political leadership that resists allowing people to rebuild in harm’s way. Investments in flood mitigation should incorporate natural infrastructure wherever possible, given lower maintenance and increased auxiliary benefits of such approaches.

The options presented below will only be successful at addressing financial risk of flood if undertaken in context with the measures outlined above. Taken together they can provide a roadmap to the desired end state (Appendix VII) that reflects a nationally cohesive, yet regionally flexible approach to addressing flood risk. Given a ‘whole of society approach’, responsibility for delivering these measures lie with a range of actors from banks, mortgage insurers and realtors, to property and casualty insurers to municipal, provincial and federal government agencies to non-government organizations.

It was recognized by stakeholders that any of the options discussed below need to be considered as decades long, transitory measure to achieve the desired end state. The structure of any option should, as much as possible, incent all actors including governments, insurers and consumers, to reduce flood risk throughout the transition and reward behaviour for doing so.
A number of stakeholders collaborated to conduct significant international analyses (Appendix IV) and chose to focus on three potential options for Canada. A global survey of flood programs shows that approaches vary widely and that no country has a perfect solution to address high risk residential flooding. In Australia, flood insurance is risk based. Insurance premiums are based on the level of flood risk that a property will face, as well as the cost of rebuilding or repairing the property. In the United States, efforts to move the National Flood Insurance Program toward a risk-based funding model, while initially successful, were largely reversed by subsequent legislation. The program continues to have a significant debt, and is also hampered by the government’s recent practice of providing only short-term funding for the program. In the Netherlands, the contingent liability for overland flood is endemic and, as a consequence, private insurance is basically unavailable (a large portion of the Dutch population is at high-risk of flooding). When residents get flooded, the government intervenes through a combination of different resilience-building measures that include physical assets retrofits (whenever possible), strategic retreats and property buyouts. In U.K., a high risk insurance solution, called Flood Re, provides insurance for all high risk properties in the country (Appendix VI).

After reviewing international experience, stakeholders focused on three main options to address the financial cost of managing high risk properties. These options can be considered along a spectrum of intervention/effort from a pure market option (low intervention) where high risk homeowners bear all their own risk to a government-backed option where these homeowners are partially subsidized by taxpayers to an structured insurance pool option (High intervention) where these homeowners can be fully protected. The differences along the spectrum relate to the level of programming effort available to assist homeowners.
Option I – Pure Market Solution: Risk borne by homeowners

In this option, the flooding of private residences is no longer covered by government DFA programs and homeowners can self-insure, purchase insurance from the private insurance market or relocate. There are no subsidies in place to provide perverse incentives and premiums are risk-based, which would mean that a significant portion of homeowners will be excluded from the insurance market. As governments invest in flood defence infrastructure and targeted buyouts of properties at high risk of repeated flooding, insurance becomes more available and affordable. To increase take-up rates, the government could consider introducing means-tested subsidies through taxation-based voucher programs or other mechanisms to ensure that vulnerable populations are not left behind.

Option I strongly meets the Working Group’s key principles in two key areas, namely in efficiency and financial sustainability. Insurance premiums are fully transparent in that they reflect the true risk that a homeowner faces. As a result, accurate price signals should incent market behaviour – from pressure on community leaders to mitigate risk, to individual behaviour to enact property-level mitigation. In terms of optimal compensation, this scheme has the potential to provide superior indemnification for the insured, though it falls short for the uninsured and most vulnerable. Another possible strength of this program is its ability to encourage the development of the insurance market, provided that governments refrain from offering broad disaster assistance after an event, thus creating expectations of continuous bailouts in the future. (In some cases, some kinds of government-disaster assistance may still be appropriate post-event, though their frequency and eligibility should be restricted.)

Option I fares poorly in terms of affordability (Appendix II) and inclusivity for the zones most at risk, as insurance may be very expensive to obtain, if available at all, and because the risk falls entirely on the shoulders of homeowners.

International experience has shown that this option may leave significant numbers of Canadians financially exposed. In Australia, few high-risk individuals buy risk-based insurance because it is too expensive. Furthermore, governments may be subject to immense pressure to intervene in the aftermath of a disaster, regardless of their initial stance – Germany’s reneging on its anti-interventionist position after two major floods is a case in point.
Option II – Evolved Status Quo: Risk borne by blend of homeowners and governments

In this option the private sector takes on as much contingent liability for flooding as its risk appetite allows, while leaving the highest-risk properties, where premiums would be unaffordable, to be covered ex post by government DFA programs.

This second option comes out strong from a household affordability standpoint given that no additional contribution is expected from residents at high risk. Once disaster strikes, however, provincial variations in eligibility criteria and payments render affordability inconsistent. Presently, there is significant confusion as to what homeowners can expect from DFA compensation and how such DFA programming relates to insurance payouts (Appendix VIII).

This option maintains pressure on all orders of government to invest in flood mitigation because they continue to hold the contingent liability for properties at highest risk. Expenditures on mitigation may de-risk properties to the point where insurance becomes available and affordable.

This option scores low on optimal compensation, since high-risk homeowners are subject to the limits of what DFA programs would cover. Financial sustainability could become problematic due to the ever-rising pressure of flooding costs for the government. From the point of view of the other principles – inclusivity, efficiency and promoting private market development – Option II falls short, mostly due to provincial DFA variability, its inability to promote mitigating behaviours and the lack of market mechanisms at the individual homeowner’s level.

To somewhat reduce the government’s exposure, this option could be augmented by transferring some of the government’s risk to the insurance and global reinsurance market, similar to what the United States and Mexico are doing with portions of their DFA programs. Although the government would continue to bear some of the risk, the insurance/reinsurance option could provide a buffer, making DFA-type disbursements more predictable from a budgeting and accounting perspective. (Reinsurance can absorb large losses, and commissions are certain and can be easily budgeted. By contrast, DFA outlays are not as easily predictable due to the uncertainty of catastrophic events and the variability of loss amounts. Reinsurance thus provides a government with a better budgeting tool.) Reinsurance premium reductions may also be used to reward desired government behaviour, such as making public investments in infrastructure to de-risk regions at high-risk of flood damage.
Option III – Create a High-Risk Flood Insurance Pool

This solution involves building a high-risk flood pool of properties that would not otherwise be offered affordable insurance (or any flood insurance). Property owners would pay premiums that are as risk-based as possible. However, to ensure affordability and, therefore, take-up, these premiums could be capped and subsidized through a range of possible mechanisms.

High-risk property owners could be offered overland flood insurance through their existing insurer who would then make the determination on whether to relegate a particular policy to the pool. Premiums are collected by the insurer and then remitted to the pool, providing one source of pool capital. Other sources of capital could include contributions by governments, levies applied to homeowners and levies applied to municipal property tax. The pool could be run in a shared public-private partnership – administered by the insurance industry but governed and guaranteed by the government/global reinsurance market.

Two stages of capitalization would be required. Initially, the pool would require an influx of capital over a transition period to become self-sufficient. Government contributions and levies on homeowners or municipal ratepayers could be applied on a time-limited basis to ensure the pool becomes fully capitalized. To limit drawdowns on pool capital during this period, governments could pay all incoming claims. Once the pool is fully capitalized, these contributions/levies could cease and governments could stop most of their financial assistance for flood-related damage to residential properties.

At this point, a low-maintenance form of capitalization would be required to cover the subsidy necessitated by capping premiums. This ongoing capitalization could come from a range of government contributions or levies. Alternatively, the ongoing subsidy could be limited by offering high-risk consumers several choices of fully risk-priced coverage with varying levels of compensation. The consumer could choose the coverage they can afford.

As a high-risk property is de-risked through individual or community-based mitigation measures, the insurer may choose, upon an annual review, to cover the property as a normal customer thereby providing a means to exit the pool. Capitalization approaches should be structured to ensure that governments, insurers and consumers are properly incented to shrink the pool over time.

Option III scores high points in terms of affordability, inclusivity and optimal compensation, as it offers an insurance product at affordable rates to all high-risk homeowners in Canada. Depending on the measure used to make insurance affordable (different coverage limits, deductibles or subsidies), premiums may be more or less efficient in reflecting risk and eliciting the desired behaviours.
Similarly, the peace of mind conveyed by the fact that affordable insurance is within reach, no matter the risk profile, may relay a false sense of security that could delay policyholders from taking important mitigation action, especially if repeat claims are allowed to be part of the program. For these reasons, Option III gets only passing grades in terms of its efficiency. Although designed to withstand losses and remain financially sustainable, the pool would require an ongoing focus on mitigation and, from time to time, it may require a capital infusion. This is the reason for a neutral-to-strong mark in terms of its financial sustainability.

**Measuring the three options against the six principles**

A summary of how these options have been scored is provided below in Table 1. These scores are qualitative and inherently subjective. They result from lengthy stakeholder discussions and can change based upon policy choices made when executing each option. This summary is, therefore, not definitive.

The multi-stakeholder Working Group believes the three options presented in this note offer viable courses of action to reduce the number of properties at high risk of flooding. All of them have distinct strengths and weaknesses in the way they meet the guiding principles.

For any of these plans to be successful, all levels of government must commit to long-term investment in complementary measures such as mitigation, better flood mapping and consumer awareness initiatives. It is also necessary to create a system where mitigation investments are reflected in the models insurers use to price risk, which should then lead to improvements in availability and affordability of insurance. Each of these plans has the potential to take Canada through a period of transition to the desired end state.
Options for Managing Flood Costs of Canada’s Highest Risk Residential Properties

Mandate

The Canadian Minister of Public Safety and the Saskatchewan Minister of Government Relations (being responsible for Emergency Management) convened a National Roundtable on Flood Risk in Regina in November 2017. As recommended by that National Roundtable, the Advisory Council on Flooding was created in early 2018 with the purpose of advancing the national agenda on flood risk management. An early deliverable of the Advisory Council was the creation of a public-private sector Working Group on the Financial Management of Flood Risk, co-chaired by Public Safety Canada and the Insurance Bureau of Canada (IBC). In May 2018, Federal/Provincial/Territorial Ministers of Emergency Management asked this Working Group to further refine options for managing the financial costs of high-risk residential properties while drawing upon international models such as Flood Re (Appendix VI) in the United Kingdom. IBC has been asked to report on these options, developed through Working Group consultations, to Public Safety Canada, through the Advisory Council on Flooding. This paper is the resulting product, and was authored by IBC with input from members of the Working Group.

Issue

Given a progressively warming atmosphere and rising sea levels, current climate forecasts project that the escalation in flood events, as witnessed over the past decade, will continue into the future. Canada must increase its resiliency to residential flood risk to keep people safe and financially viable. The solutions presented below are intended more to provide better outcomes for individual Canadians and less about reducing pressure on public accounts. Currently, flooding is Canada’s most costly natural peril and accounts for roughly three quarters of federal Disaster Financial Assistance (DFAA) payments (Appendix VIII). However residential losses account for only 5-15% of that total - a greater portion by far, perhaps as much as 70%, is spent on recovery of public infrastructure – an issue not covered by this paper. Considering the amplifying effects of climate change on future precipitation patterns and sea levels, governments are concerned about Disaster Risk Reduction – lowering the public safety and personal financial risk of those Canadians living in high risk areas.

2 Public Safety primarily worked to facilitate the participation of various stakeholders, and to provide strategic linkages to the other Working Group under the Advisory Council on Flooding (the Working Group on Flood Data and Mapping). The views expressed in this paper do not necessarily reflect the view of the federal government.
Flood Disaster Risk Reduction and a Desired End State

The desired end state for flood disaster risk reduction is envisioned as a future where every Canadian is both physically and financially safe from flooding and where each is enabled to manage their own risk. This end state reflects an overall reduction in flood risk and will result from a whole-of-society approach to building resilience (Appendix V). Targeted investment in climate action and disaster mitigation that includes flood risk reduction will result in fewer Canadians living in high-risk zones with better access to affordable flood insurance.

A Flood Disaster Risk Reduction approach for Canada should fit within the broader Emergency Management Strategy and should take a ‘whole of society’ perspective. Such an approach should leverage significant government partnerships in infrastructure to reduce climate risk in the most exposed communities AND elevate risk awareness and incent de-risking efforts amongst Canadians. Within this context of lowered risk, insurers can introduce new products and employ premium structures that will further incent responsible behaviour.

To elaborate, this approach should have three prongs:

a) **ELEVATE RISK AWARENESS/ENGAGEMENT:**
   Elevate awareness of governments and Canadians to incentivize active risk reduction and engagement on flood risk to ensure price signals are properly received. This should include risk assessment being conveyed throughout all stages of the property development, transaction, financing and insurance process;

b) **IMPROVE RISK IDENTIFICATION:**
   Improve and align public facing risk maps that allow insurers as well as property owners and governments to collaborate on identifying, updating and managing risk. These maps must be evergreen in that they reflect continuous improvement of the underlying flood hazard modelling to reflect investments in flood defenses;

c) **AGGRESSIVELY MITIGATE RISK:**
   Aggressively invest in reducing the number of Canadians living in areas of prioritized high flood risk through flood mitigation and relocation from high-risk areas (strategic retreat-Appendix V). This will require bold political leadership and resistance to rebuilding in harm’s way. Investments in flood mitigation should incorporate natural infrastructure wherever possible given lower maintenance and increased auxiliary benefits of such approaches.
The options presented below will only be successful at addressing financial risk of flood if undertaken in context with the measures outlined above. Taken together they can provide a roadmap to the desired end state that reflects a nationally cohesive, yet regionally flexible approach to addressing flood risk. Given a ‘whole of society approach’, responsibility for delivering these measures lie with a range of actors from banks, mortgage insurers and realtors, to property and casualty insurers to municipal, provincial and federal government agencies to non-government organizations.

Furthermore, stakeholders have emphasized that we are decades away from reaching that desired end state and that implementation of any of the options below should occur over a transition period. The structure of any option should, as much as possible, incent all actors including governments, insurers and Canadians, to reduce flood risk throughout the transition and reward behaviour for doing so.

**Canadian Considerations**

There are 10.9 million residential properties across Canada. Most are at risk of water damage of some sort (e.g., sewer backup, rain damage, burst pipes). However, based on flood modelling conducted by IBC, 2.2 million homes are at risk of overland flood, including fluvial (riverine), pluvial (rainfall) and coastal floods\(^3\). The number of homes at high risk would vary from 800 thousand at a 1 in 20 year risk categorization to 1 million using a 1 in 100 year risk categorization.

The limited insurability of overland flood risk has meant that taxpayers are bearing a significant burden for overland flood damage across the country, as is evident by examining spending on the federal Disaster Financial Assistance (DFAA) program. Since the 1970s, federal transfer payments for flood assistance have totaled $4.9 billion— or roughly two/thirds of total DFAA spending. These costs have more than quadrupled in 40 years, swelling from a cumulative $300 million in the 1970s, to $1.2 billion in the 2000s, to a staggering $3.7 billion in the first four years of this decade. Only 5-15% of these DFA costs are for residential losses – the rest is dominated by restoration of public infrastructure. An IBC assessment of provincial DFA programs shows a similar cost breakdown. While the recent restructuring of the DFAA has devolved more of these costs to provincial tiers of government, and although residential losses vary from province to province, taxpayers remain the ultimate funding source for flood loss compensation.

---

\(^3\) IBC Flood analysis, JBA and Associates Risk Mapping, January 2016
Despite the exclusion of overland flooding, insurers have paid for sewer back up losses related to flood on residential policies, as well as for automotive and commercial losses as well as ex gratis payments such as those made following the 2013 southern Alberta floods. Extreme weather payouts including flood have more than doubled every five to 10 years since the 1980s. For each of the past six years, these industry payouts have been close to or above $1 billion in Canada. By comparison, insured losses averaged $400 million a year over the 25-year period from 1983 to 2008. As of 2005, water claims have become the number one cause of property insurance losses across the country. The impacts of extreme weather, driven by climate change, are escalating.

However even in the current context the situation is changing. In 2015, consistent flood models became available for all of Canada south of sixty degrees latitude. These models enabled some insurers to begin underwriting overland flood risk. As of spring 2019, 16 insurers now offer overland flood products to about 77% of Canadian property owners. IBC estimates that about 34% of Canadians are now insured for overland flood risk. This number will increase as these flood models improve and as the nascent private insurance market develops. As society transitions towards a future where most low and medium risk is borne by the private sector it will create a challenge that must be considered in the context of the ‘high risk’ solution.

The challenge facing insurers is how to predict risk in an era of climate change. Flooding is complex and we expect that the return periods used to gauge flood risk are not static. In other words, severe flooding is becoming more common. Overland flooding is comprised of three types of peril. First, fluvial or floodplain flooding is water that overflows the banks of a river or lake to inundate nearby properties. This is flooding which is easiest to model and predict because it follows known topography.

Alternatively, pluvial or urban flooding results when intense rainfall overwhelms urban drainage systems and water flows into nearby homes. Pluvial flooding is much more difficult to predict and for insurers to model and yet with climate change, the frequency and intensity of such severe storms is rising. These storms can happen anywhere and even low risk communities may get overwhelmed.

Finally, coastal flooding from storm surge is also difficult to model given tidal influences and will be compounded by rising sea levels projected over the next few decades.
As a result, observers sometimes believe that insurers will only assume low and medium risk where they are guaranteed to profit, leaving high risk properties alone. However, in actuality, insurers are pressured by consumer demand and competition to take on increasing amounts of unpredictable risk and are seeking to manage this by diversifying their exposure across geographies and by using deductibles and compensation limits or caps to control uncertainty. As we have seen in other countries, insurers will avoid known areas of high risk but will eventually cover most other scenarios and offer more generous compensation as the market matures.

Addressing the financial risk of high-risk residential properties alone does little to address the overall risk profile of the nation. There has been a growing recognition by insurers and other stakeholders that flooding is a significant risk for Canadians that demands a whole-of-society response. This approach would leverage significant government partnerships in infrastructure to reduce climate risk in the most exposed communities. As well, it elevates risk awareness and incents de-risking efforts among consumers and businesses. In this framework of lowered risk, insurers can introduce new products and use premium structures that will further encourage responsible behaviours.

The University of Waterloo and the Geneva Association provided international insights to the Working Group and their examination of the flood management programs in G7 countries offers insights into solutions that may be applicable in Canada. Every country with a flood management program has had to wrestle with the same issues. The approaches developed by other nations span along a continuum that ranges from insurance-based to government relief solutions, including approaches that are fully private, fully public or in between.

To make residential flood insurance commercially viable in Canada, the international experience clearly points to four preconditions that are essential to establishing a strong flood risk management culture.

1. There must be accurate and up-to-date flood hazard mapping to allow all tiers of government – as well as insurers, developers and other key private sector stakeholders – to make smart decisions about asset management, urban planning and flood risk management;

2. There must be ongoing and adequate investment in public and private flood defences, and sewer and storm water infrastructure;

3. There must be widespread awareness of flood risk and a sound understanding by all stakeholders – including governments, communities and individuals – of the physical and financial consequences of flood risk and the tools available to ensure Canadians are prepared; and

4. Access to post disaster assistance for residential flooding should be limited/structured in a manner that encourages investments in mitigation and strong disaster reduction behaviours.
International experience also shows that there should be careful consideration given to a budget line approach where a clear cost-benefit relationship can be established between the capital needed to fund rebuilding and the investments made to reduce risk.

Whichever solution is adopted, it should be expected that a period of transition will occur. Key advice provided by stakeholders during the development of the options highlighted the need for both a transition period and acknowledged the evolving and increasing impact climate change will have on the financial risk facing high risk properties. The need for a transition period stems chiefly from the lack of authoritative and reliable risk mapping coupled with a lack of flood risk awareness by Canadians. Courageous decisions to systematically relocate Canadians out of harm’s way, a process called strategic retreat (Appendix V), should be an element of any overall strategy.

As climate change will continue to impact the risk profile of Canadian communities, the number of Canadian properties at high risk to overland flood damages is expected to grow in the absence of significant action taken to reduce risk.

It is important to understand that no solution we have found can sustain itself financially if the number of properties at high risk grows. To ensure the financial stability of, whichever program is put in place, there must be a supporting effort to reduce the number of properties deemed ‘high risk’. Increasing attention on flood mitigation will be required in the coming years and links must be made to flood models to reflect when ‘derisking’ has occurred to ensure that insurance offerings reflect the change in terms of availability and affordability (Appendix II).
Disaster Financial Assistance in Canada

PROVINCIAL AND TERRITORIAL GOVERNMENTS

Every provincial and territorial government has a responsibility for disaster management, including the financial management of disasters. Each government has established financial relief programs for homeowners and residential tenants affected by a disaster. It is up to each province and territory to determine eligibility, but most disaster relief programs mirror the eligibility requirements of the federal DFAA to ensure the province or territory qualify for maximum cost sharing of disasters with Canada.

If the damage to the residential property was the result of an event that could not be insured, the homeowner is eligible for payments under their provincial/territorial disaster relief program if the provincial or territorial government chooses to provide financial assistance. (Note: In Ontario the disaster assistance may be made available for uninsured essential losses. Ontario is unique in covering uninsured losses vs. those that are uninsurable). However, all of these programs limit the level of relief they provide both in caps and in eligibility requirements. Only primary residences are covered. They are not insurance programs.

If insurance is “readily and reasonably available,” disaster assistance programs do not cover the damage regardless of whether the property owner purchased the insurance or knew it existed, with the exception of Ontario.4

FEDERAL GOVERNMENT

Disaster Financial Assistance Arrangements (DFAA) is a federal program that reimburses provinces and territories for some of their disaster response and recovery costs related to catastrophic events. One of the eligible costs provinces and territories can make claims for under DFAA is assistance paid to owners of residential properties. One of the aims of the program is to help provinces and territories support disaster recovery through financial assistance to property owners repair damage to basic and essential property only to its pre-disaster condition. The program is not intended to compensate for all damages that result from a disaster. The DFAA guidelines clearly indicate that damage or losses that are insurable (readily and reasonable available) are not eligible under the program.

Principles

This document explores a range of financial solutions to manage costs for properties that are considered at high risk of flooding. These solutions are necessary to reduce homeowners’ financial vulnerability in the short-term and to provide them with enough time to lower their contingent liability of flooding over the longer run. These options will be measured according to the following principles which have evolved through consultations with stakeholders. Taken together, the principles are designed to incent community and individual resiliency while decreasing pressure on public finances.

These principles are:

- **AFFORDABILITY:**
  An optimal approach should provide affordable protection for high-risk properties to ensure maximum participation.

- **INCLUSIVITY:**
  An optimal approach should provide an insurance solution to all primary residence property owners irrespective of the level and type of flood risk they face (e.g. pluvial, fluvial, coastal – Appendix III). Indigenous residences, which are often covered by commercial insurance, and other vulnerable communities require particular attention and possibly a concurring program.

- **EFFICIENCY:**
  The price of insurance should reflect as much of the risk as possible, thereby incentivizing appropriate flood risk reductions amongst all stakeholders.

- **OPTIMAL COMPENSATION:**
  Insurance solutions should provide predictable and fulsome compensation to residential property owners and therefore diminish residential pressure on publicly funded disaster assistance programs.

- **SHIELD THE TAXPAYER:**
  An optimal approach should reduce reliance on ongoing taxpayer-funded subsidies by creating the conditions necessary for expansion of private market insurance coverage.

- **FINANCIALLY SUSTAINABLE:**
  An optimal approach should be financially self-sufficient where systemic losses are reduced over time.
Application of these principles involves trade-offs. For instance, the principles of efficiency and affordability can be in opposition. To send the price signals required to fully incent consumer behavior, the homeowner should pay for the full risk that they bear. However, many homeowners, particularly those with low-incomes, simply cannot afford the premiums they would pay if truly risk-priced.

As a result, premiums need to be capped and the resultant residual risk needs to be subsidized from other sources. In any scenario, investments in flood mitigation need to be made which lower the homeowner’s risk to an affordable level. Design of the three options listed below involves addressing such tradeoffs in varying ways.

There can also be a trade-off between affordability and financial sustainability and a solution should aim to optimize the compromise between the two as transparently as possible. For instance, it is important that the connection between price and risk be clear and obvious, even in circumstances where affordability is a priority. Premium caps, a means-based voucher system and/or tax rebates could be considered to maintain the plan’s affordability. To contain the scheme’s size and ongoing costs to government, it will be important to consider measures such as admission restrictions (to existing homes rather than new buildings, or to only primary residences, for example), the establishment of better building codes, climate-savvy land use planning and limited assistance payouts. Furthermore, financial efficiencies could be achieved through improvements to program administration and delivery.

**International Review**

The University of Waterloo and the Geneva Association conducted an extensive international review. Through their efforts, it was demonstrated to stakeholders that the approach to handling the high risk of flood varies from country to country.

Australia’s flood insurance is risk based private market where the system calculates premiums that reflect the level of flood risk a property will face, as well as the cost of rebuilding or repairing the property. The role of the government is limited to mitigation investment, flood mapping and basic event aid that is income-tested; including to property owners to offset costs to make homes safe and habitable where insurance does not respond. Information on flooding and data is available through the National Flood Information Database which insurers can use to calculate premiums for an individual address as opposed to a postal code. Many high risk homeowners simply do not purchase expensive insurance and face financial ruin if a severe flood occurs.
In the United States, efforts to move the National Flood Insurance Program toward a risk-based funding model, while initially successful, were largely reversed by subsequent legislation. All home owners with a 1% risk or higher annual chance of flood with a mortgage from federally regulated or insured lenders are required to have flood insurance. The program continues to have a significant debt, and is also hampered by the government’s recent practice of providing only short-term funding for the program. To contain costs, government offers loans or grants to homeowners in order to undertake mitigation efforts, on a means-tested sliding-scale. Local governments have to restrict development in 1/100yr flood zones or have the flood zones elevated if not protected by a levee.

In the Netherlands, the contingent liability for overland flood is endemic and, as a consequence, private insurance is basically unavailable (a large portion of the Dutch population is at high-risk of flooding). When residents get flooded, the government intervenes through a combination of different resilience-building measures that include physical assets retrofits (whenever possible), strategic retreats and property buyouts. By focusing on mitigation, the Dutch government is investing in improvements in communities’ flood resilience, which ought to result in much less flooding in the future. Despite high up-front costs, heavy public intervention and implementation complexities due to federal-provincial layers of government – the Dutch approach to flood remains the fastest way to transition residual risk communities to insurable levels.

The U.K.’s solution for managing the financial risks for properties at high risk of flooding (known as Flood Re (Appendix VII) came into effect in April 2016. It is a temporary plan to ease high risk regions into a risk-based pricing regime. It was designed to be in place until 2039 to provide enough time for government to adequately de-risk private properties to levels granting affordable insurance. After the transition period is complete, the expectation is for consumers to be able to purchase insurance directly from insurers at a risk-based price. However, this system has already undergone changes and remains largely untested. For example, properties in the highest tax bracket were originally going to be excluded from the system, but due to political pressure, they are now being included.

The central government is responsible for both releasing building permits and providing disaster assistance, so incentives have long been aligned for responsible land plan use – quite the opposite on this side of the ocean, where federal and provincial governments responsible have little control over issuing building permits. One takeaway from the British experience that merits some consideration is that the scheme will take quite some time to get up and running. Furthermore, UK insurers are skeptical that governments will make the mitigation investments necessary for Flood Re to wind down by 2039.
Options

Leveraging this international review, the Working Group has developed three possible options for the financial management of properties at high risk of flood. These options can be considered along a spectrum of intervention/effort from a pure market option (low intervention) where high risk homeowners bear all their own risk to a government-backed option where these homeowners are partially subsidized by taxpayers to an structured insurance pool option (High intervention) where these homeowners can be fully protected. The differences along the spectrum relate to the level of programming effort available to assist homeowners.

The underlying assumption for the three options is continuous investment in protective infrastructure and in targeted buyouts to shrink the size of the group at high risk. Each one of these options has strengths and weaknesses and the selection of any one involves tradeoffs based on government priorities.

OPTION I – PURE MARKET SOLUTION - RISK BORNE BY HOMEOWNERS:
Private residences would no longer be covered by DFA programs and homeowners either self-insure, move, or transfer their flood contingent liability to the private insurance market. There are no subsidies in place to create perverse incentives and premiums are risk-based, which may mean that a portion of high-risk homeowners will opt out of the insurance market. As the government invests in adaptive infrastructure and targeted buyouts of immitigable properties, insurance becomes more available and affordable. To increase take-up rates, the government could consider introducing means-tested subsidies through taxation-based voucher programs or other mechanisms to ensure that vulnerable populations are not 'left behind'.

OPTION II – EVOLVED STATUS QUO - RISK BORNE BY BLEND OF HOMEOWNERS AND GOVERNMENTS:
In this option the private sector takes on as much contingent liability for flood as its risk appetite allows, while leaving the highest risk properties, where premiums would be unaffordable, to be covered ex post by government DFA programs. To somewhat reduce the government's exposure, this option could be augmented by transferring some of the government's risk to the global re-insurance market, similar to what the United States and Mexico are doing with portions of their own DFA programs. To do so, the government would need to define its risk appetite and leave re-insurers to take on the excess loss up to a pre-defined maximum liability, with anything in excess being borne by taxpayers. Although the government would continue to bear some of the risk, the re-insurance option would provide a buffer, making DFA-type disbursements more predictable from budgeting/accounting perspective. Note that the greater the number of jurisdictions participating, the lower the relative premium due to risk diversification. Reinsurance premium reductions may also be used to reward desired government behavior, such as making public investment in infrastructure investments to de-risk priority areas. This option is the one that received the least amount of attention amongst Working Group members as it is the closest we have with the status quo.
OPTION III – CREATE A HIGH RISK FLOOD INSURANCE POOL:
This solution involves creating a high risk flood pool of properties that is managed separately from what is considered normally insurable risk. The pool is run in a shared public-private partnership – administered by the insurance industry but governed and guaranteed by the government/global reinsurance market. The pool would need sources of both pre-capitalization to get the pool up and running and ongoing capitalization to subsidize the difference between true risk pricing and premium caps needed to assure affordability. The pool could be pre-capitalized either through a fund contributed to by governments, similar to how the Caribbean Catastrophe Risk Insurance Facility (CCRIF) was set-up, and then be supported by premiums paid into the pool and levies assessed on all homeowners or, if feasible, municipal ratepayers. In the meantime, claims could be paid out through federal and provincial disaster assistance programs. Ongoing capitalization could be paid by levies and/or through government contributions. Ongoing capitalization must be structured to ensure that all actors are incented to reduce the size of the pool over time.

This was the option that was the most discussed during meetings with stakeholders. Working group members debated the design of proper incentives (both positive and negative) to stimulate appropriate de-risking behaviour on the part of homeowners. Concerns were raised on how to ensure proper incentives were designed to ensure that government mitigation investments would continue. Other concerns focused on ensuring that the private market took on as much risk as possible and did not use the pool to enhance profitability.

Options assessment

In this section, each option will be examined with respect to how well it meets the key principles (see above) and the expected impacts for key constituencies such as federal and provincial/territorial governments, private industry and individual homeowners. Wherever applicable, we will tease out lessons from international jurisdictions that use similar schemes.

OPTION I – PURE MARKET SOLUTION - RISK BORNE BY HOMEOWNERS:
In Option I, government focuses solely on mitigation efforts and strategic retreats and does not provide financial relief to individual homeowners, no matter how large and devastating the flood event. To manage their contingent liability for flood, residents have the option to either self-insure or to obtain private coverage. Very rapidly, competitive market forces and rising demand will accelerate the expansion of private insurance supply to provide the option of coverage for nearly all residential properties in Canada, bar the immitigable ones or those for whom effective mitigation would be too costly (in which case, the government could provide buyout options and means-tested premium subsidies). Even with widespread availability, some Canadians may find the cost of coverage to be prohibitive and these homeowners may decide to self-insure more by necessity than by choice.
Clear communication about government’s intention to stop providing disaster relief, and, as importantly, the resolve to follow up on those intentions post-event is paramount for the success of Option I and for the expansion of the private market. Also, equally important is active communication about flood risk and mitigating measures that homeowners can undertake to lower their risk as well as the establishment of a national program for climate-smart retrofits and a shared federal/provincial program for larger infrastructure investment in municipalities.

In order to facilitate the move towards Option I, the government could set a short transition timetable for DFAA/DFA reform in which it develops national flood risk maps, conducts active communication campaigns and provides enough time for homeowners to prepare, while continuing to offer relief assistance.

To contain costs, government could offer loans or grants to homeowners in order to undertake mitigation efforts, on a means-tested sliding-scale. At the end of the transition period, to incentivize insurance uptake and responsible mitigation while providing some form of financial buffer, the government could consider assisting flood victims mostly through loans rather than grants, very much like FEMA currently does.

The closest example to this scheme is the Australian model. The Australian model is based on a private-market solution, where flood cover is not subsidized and largely risk-priced, and where government’s role is limited to mitigation investment, flood mapping and basic post event aid that is income-tested; including to property owners to offset costs to make homes safe and habitable where insurance does not respond. The Australian insurance industry developed an industry-wide flood mapping tool, which most insurers use to determine risk zones and for pricing (though insurers can use additional information as they see fit).

This helps create consistency in coverage across the industry – with insurers sharing a similar view of risk. Insurers can choose whether or not to offer flood cover but when they do, legislation requires that it be bundled with basic home insurance. Over 90% of insured homeowners have flood cover. If flood is not covered, legislation also requires that insurers clearly inform policyholders.

The definition of “flood” is also set by federal legislation, so that there is little confusion as to whether or not an event is covered and applicability of coverage does not depend on each insurer’s interpretation. The coverage offered is very comprehensive and only ocean surge is excluded.

The insurance industry is now covering a substantial level of flood risk exposure, and, as a result, premiums have increased dramatically since the legislation was introduced. Flood insurance for high-risk properties is available, but is very expensive – and as a consequence virtually all high-risk zones remain uninsured. (Premiums for flood insurance alone in these areas can average over $10,000 while the average premium for all other perils together in these areas is in the order of $1,000). Option II would be based on a similar model to Australia’s, covering most of the flood risk, with perhaps some targeted premium subsidies for vulnerable populations.
STRENGTHS:
Option I’s biggest strength is perhaps its efficiency in leveraging market incentives to encourage de-risking behaviours. These include investing in adaptive measures for existing private infrastructure, and encouraging strategic retreat in areas where risks cannot be mitigated, but also demanding better standards for new communities with respect to land use planning, building codes and materials. The ultimate result should be less residential flooding and lower treasury outlays in the future. Another advantage is that this scheme allows government to focus almost exclusively on mitigation instead of having to devote resources to disaster management. Last but not least, private insurance is more efficient than disaster assistance in emergency response situations as qualifying criteria are much less ambiguous and claim payments tend to be delivered much quicker, allowing flood victims to recover sooner.

WEAKNESSES:
Option I’s key weakness is its potential to lead to avoidance. Experience in Australia and Germany however show that this model is problematic. In Australia, many high risk homeowners simply do not purchase expensive insurance. They roll the dice and face financial ruin if a severe flood occurs. In Germany, governments have stepped in and bailed homeowners out despite having discontinued formal government assistance programming. The political pressure has proven to be just too great. At this time, it is likely similar problems would emerge in Canada.

FIT WITH GUIDING PRINCIPLES (TABLE 2):
Option I strongly meets the key principles in several areas, namely in efficiency, and financial sustainability, all thanks to full price transparency and its ability to leverage market mechanisms to incentivize the right behaviour. In terms of optimal compensation, this scheme has the potential to provide superior indemnification for the insured, though it falls short for the uninsured. Another possible strength of this program is its ability to encourage the development of the insurance market, provided that governments refrain from offering disaster assistance post-event, thus creating expectations of continuous bailouts in the future.

This is a simple principle, but not an easy one. Government may be subject to immense pressure to intervene in the aftermath of a disaster, regardless of its initial stance – Germany’s reneging on its anti-interventionist position after two major floods is a case in point. Meanwhile, Option I fares poorly in terms of affordability, and inclusivity for the zones most at-risk as insurance may be very expensive to obtain, if available at all, and because the risk befalls entirely on the shoulder of homeowners.

<td>Financially Sustainable</td>
<td>Parallel mitigation may be accelerated</td>
</tr>
</tbody>
</table>

**OPTION II – EVOLVED STATUS QUO - RISK BORNE BY BLEND OF HOMEOWNERS AND GOVERNMENTS:**

This option is very similar to the status-quo, as provincial/federal governments (taxpayers) are in charge of managing residual risk properties through the DFA/DFAA and they have the option (though so far unexercised) of using the insurance and reinsurance market to off-load a portion of that risk.

For the uninsured portion, the Dutch model may offer some insights on how to manage residual risk properties. In the Netherlands, the contingent liability for overland flood is endemic and, as a consequence, private insurance is basically unavailable (a large portion of the Dutch population is at high-risk of flooding). When residents get flooded, the government intervenes through a combination of different resilience-building measures that include physical assets retrofits (whenever possible), strategic retreats and property buyouts.

By focusing on mitigation, the Dutch government is investing in improvements in communities’ flood resilience, which ought to result in much less flooding in the future. Despite high up-front costs, heavy public intervention and implementation complexities due to federal-provincial layers of government – the Dutch approach to flood remains the fastest way to transition residual risk communities to insurable levels.

One barrier to implementing Dutch style interventions is that municipalities stand to lose tax revenue/population, though this may be what is required to achieve the federal government’s objective of reducing the overall risk in the system and ultimately DFAA costs. These issues may be amplified in communities where there are geographical or socio-economic limitations which restrict options for relocating residents.
STRENGTHS:
Option II is the simplest to implement as it does not require any major change to the current system. Furthermore, the use of the insurance and reinsurance market conceivably allows for the partial risk transfer to the private sector, which could reduce the volatility of disaster assistance payments, making flood risk more predictable and sustainable. This option can be evaluated as affordable, at least pre-event, as it doesn’t require any targeted outlays on the part of high-risk residents to manage their flood contingent liability.

Last but not least, insurance and reinsurance premiums may be structured to incent de-risking by local governments, including through investments in mitigation infrastructure and by limiting building permits in flood zones.

WEAKNESSES:
This policy option falls short in several areas:

1. It is expensive for governments, and may not be fiscally sustainable in an ever-warmer and flood-prone climate.

2. It does not eliminate moral hazard at the individual resident level. There is no price mechanism to fully reflect the inherent flood liability risk and thus no market-based incentives to encourage mitigation (this is a big reason why the burden on the government is growing);

3. It creates uncertainty with respect to eligibility and compensation amounts;

4. It reinforces expectations for ongoing government bailouts, thereby hindering demand for private insurance;

5. It lacks clarity concerning how private sector insurance and disaster assistance programs ought to work together. For instance, in some provinces, sewer back-up is excluded from disaster assistance, but overland flood is eligible. Concurrent causation events, capped coverage and variable flood definitions all have the potential to create administrative difficulties and leave communities inadequately protected;

6. It lacks efficiency from an administrative point of view – provinces may have to wait up to ten years before receiving DFAA transfers;

7. The high cost of insurance and reinsurance may not offer much savings to governments;

8. The government’s tendering process for selecting an insurer or reinsurer adds complexity to the process.
FIT WITH GUIDING PRINCIPLES (TABLE 3):

Option II comes out strong in terms of household affordability given that no additional contribution is expected from residents at high risk.

Once disaster strikes, however, provincial variations in eligibility criteria and payments render affordability inconsistent. Financial sustainability is problematic due to the ever-rising pressure of flooding costs for the government, though this could be somewhat offset if some of the risk is transferred to the private market.

From the point of view of the other principles – inclusivity, compensation, efficiency and promoting private market development – Option II falls short, mostly due to provincial DFA variability, lack of de-risking behaviour by the individual and the lack of market mechanisms at the individual homeowner’s level.

<tr>
<td>Shield the Taxpayer</td>
<td>Taxpayers subsidize flood losses albeit at different levels across the country</td>
</tr>
<tr>
<td>Financially Sustainable</td>
<td>Parallel mitigation and the use of re-insurance market are needed to contain growing public costs</td>
</tr>
</tbody>
</table>

OPTION III – CREATE A HIGH-RISK FLOOD INSURANCE POOL:

This solution involves building a high risk pool of properties that is managed separately from what the private market is willing to insure. The pool can be structured in many different ways and because of its complexity, several possible measures are considered regarding its operating principles, capitalization and governing rules.

GOVERNANCE:

The pool could be run as a shared public-private partnership – administered and operated by the insurance industry but guaranteed by the government (federal/provincial/municipal) and the global reinsurance market. Its Board could be comprised of representatives from different orders of government, the insurance industry and consumer groups.
The pool could be centrally administered but could operate regional sub-pools to limit cross-subsidization between jurisdictions and to account for the varying levels of risk and land-use policy across the country. This would also sharpen incentives around mitigation and land-use planning.

The scheme should be a temporary solution to replace government assistance to private residents. Its transitory nature would be contingent on continuous mitigation efforts from all levels of government, private residents and infrastructure owners.

Due to the centrality of mitigation, de-risking incentives should be embedded in the scheme’s operations. For example, individual homeowners could be required to show proof of spending in retrofitting measures to obtain premium discounts and/or to continue to qualify for a subsidy. All levels of government should be required to invest in protective infrastructure and commit to a plan that identifies at-risk regions and sets yearly targets to mitigate flood risk in these areas. Failure to do so could result in financial penalties, for instance, in the form of pool re-capitalization requirements.

Municipalities and provincial governments could together commit to providing needed infrastructure investment – first by identifying the properties at risk and costing out the required projects, second by setting yearly investment targets to de-risk and committing to reaching those goals and finally by tracking progress on their own roadmaps to flood resilience.

**OPERATING MECHANICS:**
The pool is meant to be a transitional mechanism to a future state where risk mitigation and market competition has resulted in private market overland flood products being available to all Canadians. For this transition to take place, the pool must be structured to:

- Continuously incent governments to invest in targeted flood mitigation
- Continuously incent insurers to expand their coverage outside the pool
- Continuously incent homeowners to undertake property level mitigation measures

The insurance industry would serve as the distribution channel, while providing underwriting, claims handling, administrative and operational functions for the pool.

The pool would guarantee automatic admission to residents that are willing but unable to access private flood insurance – either because it is not yet available in their geographic area or because the premiums would be prohibitively expensive. Although flood insurance take-up should remain voluntary, the offer of flood coverage would become mandatory – private insurers would have to decide whether to underwrite that risk themselves or cede a portion or the entirety of it to the pool.
As a property is de-risked through individual or community-based mitigation measures, the insurer may choose, following an annual review, to cover them as a regular property. This provides a means to exit the pool. Capitalization approaches should be structured to ensure that governments, insurers and consumers are properly incentivized to shrink the pool over time.

Capital and operating revenues for the pool could come principally from premiums on insurance policies, homeowner levies, government contributions, incomes from portfolio investment and re-insurance payouts. Operating expenses could come from losses and other underwriting expenses, re-insurance premiums, and operating costs. The pool could operate as a not-for-profit entity, and would thus not be subject to either provincial or federal tax. Any profit should be retained within the pool structure to increase the pool’s capital base.

When a property gets flooded, the homeowner would submit the claim to the insurance company, which then would provide indemnification. At the same time, the insurer would make a cash call on the high-risk pool for its corresponding share of the claim (see Chart 1).

While premiums could be capped to ensure affordability, as much as possible they should reflect the underlying risk to reduce individual risk hazard. One solution to reach the optimum balance between price signaling and affordability could be to use declining premium subsidies funded by a levy on homeowners for a pre-determined –and well communicated- duration of time. Such a measure would make up for any financial shortfall to the scheme caused by premium limits, yet still introduce the urgency to mitigate at the individual level.

Alternatively, another solution to preserve affordability could be to maintain risk-based premiums, but offer different levels of coverage and/or deductibles, so that high-risk Canadians have access to coverage at a level of their choosing and based on what they can afford. For this solution, different products can be offered, ranging from stripped-down insurance limits to full replacement value coverage.

Chart 1: High risk pool operational management
**CAPITALIZATION:**

During the launch phase, the pool will need some form of financial support as collected premiums alone won't be sufficient to pay for incurring claims and operating costs. The scheme will need to have enough capital reserves to achieve financial viability.

Some capitalization options include:

1. Pre-capitalization could be achieved through a combination of one-time grants and long-term preferential loans from governments, as well as levies on property taxes and on the insurance industry. A budgetary line-item may be required in this case.

2. The accumulation of premiums and retained earnings could go towards capitalization, while government funding could be re-directed to pay for recurring liabilities (i.e. losses and operating expenses). No line-item would be necessary, but some form of disaster relief program may need to continue for some time after the scheme's inception.

Once full capitalization would be achieved, all governments should exit residential DFA programming. However, backstopping of the pool may still be required if ever its capital base were to erode following many cumulative flooding events and/or a lack of progress in mitigation efforts.

**EXIT STRATEGY:**

The high risk pool would ramp up over a period of years until it is fully capitalized and, ideally, self-sustaining. But the pool itself should be a transitional strategy and should not be a permanent mechanism. All consumers would be able to purchase insurance at a mostly risk-based price through the pool. As risk is decreased through mitigation or as insurers’ risk appetite grows through competition and risk diversification, more and more consumers should exit the pool. At some point, the pool would ideally be collapsed and a pure market system should prevail.

***

The closest example to this scheme is the United Kingdom Flood Re program, which became operational in April 2016. It is a temporary plan to ease high risk regions into a risk-based pricing regime. It was designed to be in place until 2039 to provide enough time for government to adequately de-risk private properties to levels granting affordable insurance. After the transition period is complete, the expectation is for consumers to be able to purchase insurance directly from insurers at a risk-based price.
Despite the similarities between our Option III and Flood Re, there are significant differences between the Canadian and the UK context that make it difficult to simply adopting the British model wholesale. For example, in the UK, the flood insurance market is mature, having been around since the 1950s. Insurers have a lot of experience in this space and a good understanding of the underlying risk in different geographies, thanks to decades of claims history and up-to-date government-sponsored flood maps. Furthermore, the central government is responsible for both releasing building permits and providing disaster assistance, so incentives have long been aligned for responsible land plan use – quite the opposite on this side of the ocean, where federal and provincial governments responsible have little control over issuing building permits.

In terms of lessons learned, it is still early to tell whether the UK scheme is worth emulating since it has not been put to test yet. It has been in place for less than two years and no major flood has occurred since then. One takeaway from the British experience that merits some consideration is that the scheme will take quite some time to get up and running. This is potentially a drawback for its application to Canada, considering our relatively more complex government structure, federal-provincial power dynamics, and the nascent state of the flood insurance market. Furthermore, UK insurers are skeptical that governments will make the mitigation investments necessary for Flood Re to wind down by 2039.

**STRENGTHS:**

Option III's main strength is that it allows for a transition to building more climate resilient communities, while promoting risk-sharing among property owners, private insurers and all levels of government. A major caveat, though, is that its success depends entirely on a whole-of-society continuous public and private investment in mitigation, maintenance, reducing exposure, and strategic retreat disaster mitigation, including significant and sustained investments by government. It is also necessary to create a system to connect implemented adaptive measures to re-calculated risk. Without these, the pool is likely to get larger and run into solvency problems.

Another strong point of this program is that it delivers insurance payments rather than public assistance. This is an enhancement to the homeowner’s experience as coverage is more comprehensive, there is less ambiguity in terms of qualifying criteria, and generally, claim payments are much quicker than under DFA programs.

A fourth point is the universality of this scheme – under Option III all Canadians, coast to coast, can be covered for flood risk, either through the private market or the high-risk pool. And finally, the scheme is compatible with embedded mechanisms to limit perverse incentives while keeping premiums affordable.
WEAKNESSES:

There are numerous disadvantages with this option, and they are all mostly relating to its administration:

1. *Lengthy negotiation-to-implementation phase* - The setting up and operating of this scheme may take many years, as it will require an agreement between the federal government and all 10 provinces and three territories – a tall order considering that insurance is a provincially regulated industry. (Flood Re took decades between initial discussions and inception and the California Earthquake Authority took several years of heated negotiations before it was created. Considering Canada’s more complex governing structure, it is safe to say that the design of the pool will not be a short-lived experience.)

2. *Administrative costs:* The administrative costs of setting up the pool and establishing a governance system scheme will be higher than running the current federal DFA program for residential flooding.

3. *Protection gap for certain citizen classes* - Questions remain unanswered regarding the treatment of some homeowner groups, such as repeat flood victims and low-income Canadians who would normally qualify for regular insurance but can’t afford it. Under Flood Re there are limits on who can belong to the pool (only homes built before a cut-off date qualify) and repeat victims won’t be considered. Affordability may still be an issue for vulnerable Canadians, despite the premium subsidy. An alternative solution may be needed for lower income cohorts, such as further support determined through means testing.

4. *Possible needs for recurring government assistance:* Even after full capitalization is achieved, the pool may periodically require swift government backstops in case of very large losses or a multitude of cumulative losses. While re-insurance would be used to provide additional capacity, only a portion of the pool’s risk should be ceded as it remains an expensive option. A strong focus on mitigation remains the most cost-effective and the best long-term solution to address this issue.

FIT WITH GUIDING PRINCIPLES (TABLE 4):

Option III scores high points in terms of affordability, inclusivity, and optimal compensation as it basically offers an insurance product at affordable rates to virtually all high-risk homeowners in Canada. Depending on the measure used to make insurance affordable (different coverage limits, deductibles or subsidies), premiums may be more or less efficient in reflecting risk and eliciting the right behaviours.
Similarly, because premiums do not fully reflect risk levels and coverage is easily available, policyholders may delay necessary mitigation action, especially if repeat claims are allowed to be part of the program. For these reasons, Option III gets only passing grades in terms of its efficiency.

Although designed to withstand losses and remain financially sustainability, the pool may require government to provide a capital infusion from time to time (see above), on top of on-going focus on mitigation. This is the reason for a neutral to strong mark in terms of its financial sustainability.

Table 4: Reviewing Option 3 against Principles

</tbody>
</table>
Conclusion

This study explored a range of financial solutions for residual risk properties. Clearly, stakeholders should collaborate to reduce communities’ financial vulnerability in the immediate term and to provide them with enough time to lower their risk profile over the longer run so that market solutions become accessible. Any of the financial management mechanisms presented needs to be paired with necessary spending in physical risk treatment measures (e.g. mitigation, maintenance, exposure reduction, and strategic retreat) to contain, if not decrease, the number of dwellings that falls in the high-risk category in order to achieve the desired end state.

The desired end-state will reflect an overall reduction in flood risk and will foster a whole-of-society approach to building resilience. Targeted investment in climate action and disaster mitigation that includes flood risk reduction will result in fewer Canadians living in high-risk zones with better access to affordable insurance.

Therefore, the options should be considered a transitory step towards a desired end-state and should be considered within the context of a three-prong approach to climate risk:

I. Elevate consumer and local government awareness and engagement on flood risk to ensure price signals are properly received;

II. Improve and align public facing risk maps that allow insurers as well as property owners and governments to collaborate on identifying, updating and managing risk; and

III. Continue to invest in reducing the number of Canadians living in high risk to flood damage.
Appendix I: Financial Risk of Flood Working Group Participants

Input on this report was provided by members of a Financial Risk of Flood Working Group consisting of:

Public Safety Canada (co-chair)\(^5\)
Craig Stewart (co-chair), Insurance Bureau of Canada
Agis Kitsikis, Swiss Re
Alain Lessard, Intact Financial Corporation
Alana Lavoie, Federation of Canadian Municipalities
Alex Kaplan, Swiss Re
Andrea Minano, University of Waterloo
Barbara Turley-McIntyre, The Co-operators Group Limited
Blair Feltmate, Intact Centre on Climate Adaptation, University of Waterloo
Catherine McLennon, Province of Ontario
Christine Stevens, Province of Ontario
Helen Collins, Province of Ontario
Daniel Hains-Cote, Province du Québec
Daniel Henstra, University of Waterloo
Dina McNeil, Canadian Real Estate Association
Erin Robbins, Province of Manitoba
Hiran Sandanayake, Canadian Water and Wastewater Association
Isabelle Girard, Intact Financial Corporation
Jason Thistlethwaite, University of Waterloo
Jeff Joaquin, Province of Manitoba
Johanna Morrow, Province of British Columbia
Kevin Smart, Aviva
Maryam Golnaraghi, Geneva Association
Moira Gill, TD Insurance
Natalia Moudrak, Intact Centre on Climate Adaptation, University of Waterloo
Paul Cutbush, Aon Benfield
Pascal Chan, Canadian Real Estate Association
Philipp Wassenberg, Munich Re
Sara Jane O’Neill, Federation of Canadian Municipalities

\(^5\) Public Safety primarily worked to facilitate the participation of various stakeholders, and to provide strategic linkages to the other Working Group under the Advisory Council on Flooding (the working Group on Flood Data and Mapping). The views expressed in this paper do not necessarily reflect the view of the federal government.
Insurance advice was provided on this report through an internal Insurance Bureau of Canada Flood Working Group comprised of:

Agis Kitsikis, Swiss Re
Alain Lessard, Intact
Amy Graham, RSA
Carolina Yang, Travelers
David MacInnis, Allstate
Derek Stewart, Wawanesa
Diane Sullivan, TD
Francois Langevin, TD
Isabelle Girard, Intact
Jean-Raymond Kingsley, OdysseyRe
Kevin Smart, Aviva
Kirstie Horrocks-Cutler, CAA
Matthieu Jasmin, Desjardins
Patrice Raby, La Capitale

The report was drafted by the policy team at the Insurance Bureau of Canada:

Claudia Verno
Chris Rol
Javeria Niazi
Kristen Wansbrough
Lee Spencer
Craig Stewart
David McGown
Pierre Babinsky
Bernard Marchand
Appendix II: Addressing Affordability

To address the transition point between those who can afford anything and those that can afford nothing, IBC proposes that we could apply the approach, based on the principle of residual income, used by Hudson et al. (2016) in which objective (un)affordability is determined by the difference between the residual income above the poverty line (the “threshold level of income”) and the expected deductible.

Because Statistics Canada does not produce a figure or has a definition of “poverty line,” IBC proposes to use the federal agency’s “Low-Income Cut-Offs” (LICO) concept, which defines income thresholds below which “a family will likely devote a larger share of its income on necessities of food, shelter and clothing than the average family.” The approach essentially estimates an income threshold at which families are expected to spend 20 percentage points more than the average family on food, shelter and clothing. The cut-offs use Statistics Canada’s Survey of Consumer Finances to produce low-income rates. They vary depending on family size (from 1 to 7 people) and area of residence (rural, small, medium, large, very large urban setting). This variability is intended to capture differences in the cost of living amongst community sizes. Depending on provincial governments’ definitions and prerogatives, less stringent income thresholds than LICO could be applied.

The expected deductibles range is quite large and could vary between $500 to up to $50,000 or more.

$$\text{Affordable}_{i,j,q} = \begin{cases} 0 & \text{if } \pi_{i,j,t} \geq \text{Income}_{j,q} - \text{LICO} - \text{E}(D_{i,j,t}) \\ 1 & \text{if } \pi_{i,j,t} < \text{Income}_{j,q} - \text{LICO} - \text{E}(D_{i,j,t}) \end{cases}$$

Where:  
$$\pi_{i,j,t} = \text{Premiums for household } i, \text{ in region } j, \text{ in time } t$$  
$$\text{E}(D_{i,j,t}) = \text{the expected deductible}$$  
$$\text{Income}_{j,q} = \text{disposable income in the qth percentile in region } j$$  
$$\text{LICO} = \text{Low-Income Cut-Offs}$$

Insurance is objectively unaffordable if $\text{Affordable}_{i,j,q} = 0$ as insurance costs would cause a household to join the ranks of low-income households. Conversely, as long as households are able to stay above the LICO threshold, affordability becomes subjective.

Appendix III: Key Definitions

The following section provides definitions for some key concepts that will be used in the discussion of the different schemes.

Full indemnification vs. financial relief:

Indemnification is the compensation insurance offers to the insured for a loss, in whole or in part, by payment, repair or replacement. Financial relief is a transfer payment by the government to an individual for a loss. In Canada, financial relief through provincial DFA programs varies widely. Provinces have different eligibility criteria for activating their programs and do not activate assistance programs for all events, leaving the inundated with minimal to no assistance in some cases; some provincial DFA programs are more comprehensive in what they cover, but most offer only limited protection with restrictive caps and a focus on essential property.

Furthermore, once residents are deemed entitled to financial relief, there is quite a lot of variability in terms of its amount, as assistance caps vary from a maximum of $80,000 in Nova Scotia, up to $300,000 in British Columbia, while other provinces still have no limits (Alberta, Newfoundland). These different assistance levels leave some Canadians in a better financial position post-event than others, given the strong provincial differentials in home values and rebuilding costs. For instance, Nova Scotia residents can hope to get up to a maximum of 36 cents to the dollar of what it costs to rebuild a home, while Alberta and Newfoundland & Labrador residents may be made whole post-event.

Insurance affordability vs. affordable insurance:

Insurance ought to be affordable to be a viable option. Yet affordability is not a characteristic of insurance, rather it is a relationship between the cost of acquiring insurance (premiums, deductibles, caps) and a person’s revenue. For some people any type of insurance coverage is affordable, no matter how expensive it is; for others, no insurance is affordable unless it is free.

“AFFORDABLE” INSURANCE HAS MEANING ONLY IN THE CONTEXT OF:

1. Individual revenue
2. Level of coverage, deductibles, caps
3. Personal choice
If the cost of obtaining satisfactory insurance coverage exceeds what a household can afford, then the issue of affordability is real. Lower-income households have little discretionary spending power on how to allocate their resources to cover essential needs (food, shelter) relative to other items. For them, insurance affordability is not subjective. By contrast, higher-income households possess a discretionary budget that they can choose to allocate according to personal choice, risk appetite and awareness, and hence, for them insurance affordability may be subjective. The problem of low insurance take-up with this cohort is not tied to their inability to afford the premium, but rather to product value perceptions.

There is a threshold in the income continuum that separates households into two groups – those for whom affordability is objective and those for whom it is not. A methodology based on the principle of residual income is one amongst many that can be used to determine such threshold (see Affordability in Appendix II). Government support, if any, can focus on targeting those households for whom the issue of affordability is objective. As for the group for which insurance is subjectively “unaffordable”, any kind of support would be a matter of public policy decision, though efforts should be directed to change product perceptions.

**Flood risk and who should be covered by the plan:**

Flood risk can be attributed to three primary sources: Fluvial, pluvial and coastal flooding.

**Fluvial Flood** can be a result of water levels rising in lakes and rivers due to rain or extensive volumes of melted snow, or overflow of dams and channel. Fluvial risk is often predictable and can be modelled and mapped based upon flood return intervals across discrete geographies (e.g. floodplains) – this is the primary peril affecting the target population and the focus of this paper. Insurance for homeowners in these risky areas is either unaffordable or not available and is likely to remain so in absence of mitigating measures that can bring it to insurable levels (this may involve their physical removal to a safer setting).

**Pluvial, or Surface Water Flood**, is caused when heavy rainfall creates a flood event independent of an overflowing water body. There are two common types of pluvial flooding: 1) Intense rain saturates and overwheels an urban drainage system so that the water flows out into streets and nearby structures (often through the sewage system causing sewer back-up); 2) Run-off or flowing water from rain falling on hillsides that are unable to absorb the water. Hillsides with recent forest fires are common sources of pluvial floods, as are suburban communities on hillsides. Pluvial flooding can happen in any urban area — even higher elevation areas that lie above coastal and river floodplains. As a consequence, pluvial risk is less predictable and can affect anyone. Insurance for sewer back-up is widely available and typically offered as an optional endorsement to homeowner insurance. Flood coverage available in many areas for this type of flooding.
COASTAL, OR SURGE FLOOD is produced when high winds from hurricanes and other storms push water onshore — is the leading cause of coastal flooding and often the greatest threat associated with a tropical storm. In this type of flood, water overwhelms low-lying land and often causes devastating loss of life and property. Coastal risk can be modelled and predicted. Because insurance for this peril is in its infancy and thus still very limited, Canadians living along coastal areas may be considered in the plan.

Policy limits (caps) and deductibles:

Insurance limits are the maximum amount of money an insurance company will pay for a covered loss. Generally, the higher the coverage limit, the higher the premium. If limits are in place, one may still be eligible to acquire disaster financial assistance. For example, in some provinces, flood insurance policies may have a cap of $30,000. Insurance evaluators will come and assess the DFA eligible losses and their associated compensation. The DFA payment will be total DFA-eligible losses less the amount payable by insurance.

The deductible portion of an insurance claim is an amount that a policyholder agrees to pay, per claim, toward the total amount of an insured loss. The damage associated with the deductible is still considered insurable damage and therefore not eligible for DFA.

High-risk pool:

A high-risk pool takes the risk facing individuals and transfers it to a larger group. It is a vehicle that can be used to effectively transfer individual risks to the entire group. Each member of the group pays a relatively small insurance premium, which corresponds to a small but certain loss of income, but in so doing the risk of incurring a larger loss is avoided. While the risk facing one specific person is largely unknowable, the risk for a larger group can be calculated with a great deal of certainty.
Reinsurance:

In lay terms, a reinsurer is the insurer of a primary insurer. By covering the insurer against accumulated individual commitments, reinsurance gives the insurer more security for its equity and solvency and more stable results when catastrophic floods occur. Insurers may underwrite policies covering a larger quantity or volume of risks without excessively raising administrative costs to cover their solvency margins. In addition, reinsurance makes substantial liquid assets available to insurers in case of exceptional losses.

The main advantage offered by insurance and reinsurance is that they allow for the partial or full risk transfer to the private sector, while reducing the volatility of disaster assistance payments. Taking care of flood risk in an increasingly wetter climate becomes more predictable and sustainable.

The risk of under- or over-protection from flood contingent liability is inherent in any of these options. Good planning and forecasting may be required prior to considering any of them. Given the evolving nature of the risk, the solutions should be continually reevaluated. Future scenario modelling is fundamental to any mid-range risk assessment.

The government’s tendering process of selecting an insurer or reinsurer may be adding complexity to choosing risk transferring to the private sector. Premiums may be structured to incent de-risking by local governments, including investments in mitigation infrastructure and limiting building permits in flood zones.

Mitigation:

The purpose of mitigation is to lower the contingent liability profile of residual risk properties to acceptable levels so that insurance becomes affordable and available. Mitigation can be implemented both at the level of the individual homeowner (e.g. sump pumps, terrain grading, etc.) and local government (larger infrastructure investment, i.e. water reservoirs, dykes, berths, and natural infrastructure, such as wetlands, reforestation, ponds, etc.).

In severe cases, collaborative mitigation may not be sufficient and strategic retreats may be the only option to reduce risk.
Since the 1980s, the frequency of climate-related disasters, such as floods and storms, has increased significantly around the globe. According to Impacts, Adaptation and Vulnerability by the Intergovernmental Panel on Climate Change Working Group II, enhancing resilience is equivalent to reducing the risk of climate change impacts on society.

Resilience can be strengthened by decreasing the probability of a hazard occurring through managed retreat, avoiding or reducing its potential effects, and facilitating recovery from damages when impacts occur. Managed retreats and property buyouts, which are popular types of strategic retreat, have gained prominence in the last two decades as part of mitigation policies in some countries (the Netherlands and the United States, for example). By making strategic retreat part of the entire gamut of strategies it can lead to improvements in communities’ flood resilience.

Though rarely used, this policy option has been considered in Canada in some cases. The following is a list of examples of strategic retreat seen in Canada:

**Breezy Point, Manitoba**

Due to repetitive flooding in the northern part of Breezy Point, Manitoba, in 2009, the provincial government decided to terminate the leases on the Crown land and remove residences from the flood-prone properties. The Manitoba government declared that frequent flooding of the settlement posed a risk to the lives of the residents as well as any rescuers required to come to the aid of people in the area. The government gave residents time to voluntarily terminate their leases and move out before facing forced eviction. It offered buyouts to permanent residents but not to the cottage holders in the area.

**Perth-Andover, New Brunswick**

In 2012, the New Brunswick government announced that it would spend $8 million to move or flood-proof homes destroyed or damaged by flooding in Perth-Andover, a village at high risk of repeat flooding. The residents were given the choice of relocating to higher ground or staying and having their homes flood-proofed. Notably, although homes were moved, businesses were not and this was controversial locally.
High River, Alberta

The Town of High River, Alberta, is located at the critical choke point of the Highwood River, and the Wallaceville neighbourhood was at very high risk of flooding. In 2013, the town offered mandatory buyouts to Wallaceville residents, based on its 2013 property assessments. The houses and deep infrastructure were cleared and the area is currently being naturalized to make room for the river. This naturalization has also reduced the risk for other High River communities’ downstream in future high flow events.

Conclusion

When considering strategic retreat options, governments need to decide whether the program should be mandatory or voluntary. When governments make the program mandatory, there is often a push-back by property owners wishing to stay. Municipal governments are particularly susceptible to pressure from homeowners who want to remain in their homes. When developing a strategic retreat policy, governments need to take into account the emotional attachment that individuals have to their homes and properties.

Strategic retreats in the form of buyouts have been successfully used as part of mitigation strategies in other countries and, despite early implementation challenges in Canada, they are a viable option; and should be part of the mitigation policy. Buyouts are especially suitable for properties facing repeat losses. One noteworthy feature of a Canadian voluntary buyout program is that homeowners who choose to stay in the high-risk areas are not eligible to make future claims from government disaster assistance programs.
Appendix V: A Whole-of-Society Response to Climate Change and Increasing Flood Risk

In order for any plan for the financial management of flood risk to succeed there needs to be a broader commitment to reducing the impacts of our changing climate on Canadian communities. Because the paper is focused on the financial management of flood risk, there has not been any real examination of the other factors necessary for the long-term success of any financial management plan. The importance of climate adaptation was borne out in the Vancouver Declaration on Clean Growth and Climate Change and through the subsequent development of the Pan-Canadian Framework.

Adaptation and the mitigation of risk must accompany any of the financial management options being considered. Climate change will change the flood risk profile in many parts of the country, and without an ongoing commitment to address that risk flood related damages will be more common and more severe in communities across Canada. Some of that risk can and should be borne by property owners, but federal and provincial governments have a sizable role to play in improving education, flood risk assessment, funding for mitigation, and setting standards for future development.

According to IBC, these priorities should be undertaken alongside the development of that solution to ensure that Canada develops a strong flood risk management culture alongside a mechanism for the financial management of flood risk:

Prioritize and invest in resilient infrastructure to help communities adapt to emerging climate realities. Infrastructure decisions should be made through a climate adaptation lens that includes recognizing the important role of natural infrastructure in reducing climate change impacts.

- Ongoing mitigation investments by all levels of government will be needed to address current vulnerabilities and to offset future climate related impacts. The federal government has allocated $2 billion for a Disaster Mitigation and Adaptation Fund* and made another $5 billion eligible over the next five years for green infrastructure projects. This cannot be a one-time funding envelope and ongoing funding will be required as a prerequisite for a successful financial management of risk solution.

- Flood risk can also be reduced by assessing the value of and incorporating innovative infrastructure options (i.e. natural infrastructure) into community infrastructure planning and decision-making.

---

* Canada Federal Budget 2017, p.122

† Ibid, p.115
b Update and Improve Canadian Risk Maps.
   - A key outcome of the 2017 National Roundtable on Flood Risk was identifying the need to explore mechanisms for sharing up-to-date flood data and flood maps to better understand the risks and to predict future risks. Although each community will be impacted in different ways by climate change, water is a hazard most will need to address. Many communities and property owners still lack the ability to assess their risk – much less mitigate it. Developing strong tools and better data can enhance our capacity for preparedness, response and recovery.

c Educate, engage and incent home and business owners to mitigate their risks at the property level.
   - The National Roundtable on Flood Risk also identified the need to better engage with Canadians to communicate the changing nature of flood risk. Although there is a clear role for government here, there are many other actors that are committed to similar goals. There are extensive opportunities for all stakeholders to collaborate to advance the public’s understanding of flood risk.

d Update building codes and standards to improve climate and disaster resilience objectives, and improve land use planning.
   - Canada’s population will continue to grow in coming years and we will see growth both in existing communities and the emergence of new communities. On a practical level this means that we will have the opportunity to do better going forward and ensure that new homes and new communities are more resilient. The National Research Council is leading an effort to update codes and standards to improve resiliency. When these new standards are developed, fast-tracking them into building codes will help protect Canadians against flood and other climate related impacts. A significant part of flood risk can also be avoided by making smart land-use planning decisions, and there is a clear role for governments in setting smart development rules.

The options being considered for the financial management of flood risk deal with only one component of the problem, and that is the risk that we have not mitigated. These options address existing risk in places where, in hindsight, we ought not to have built residential communities. The options do not address new risks or worsening of existing risk. Unless that risk is addressed through ongoing investments, more properties will find themselves at risk and these financial management options will not provide a sustainable solution. It is imperative that governments recognize the ongoing responsibility they have to invest in ongoing mitigation and making communities more resilient if they want a sustainable financial management solution for flood.

Appendix VII: Flood Re as an option for Financial Management of Flood for High Risk Properties in Canada

Introduction

Flood Re is an agreement between insurers and the government in the U.K. that updates previous agreements. Flood Re, which became operational in April 2016 after the previous agreement expired, addresses the financial management of flood risk for high-risk properties and could serve as a potential model for a Canadian program. However, to implement a similar program in Canada, the model would have to be changed significantly because of the many differences between the two countries.

How Flood Re works

STRUCTURE

Flood Re is a reinsurance pool in the U.K. for flood insurance for residential and small commercial properties at the highest level of risk. The pool is used to pay insurers for claims they pay out. The reinsurance pool was established to ease the transition to full risk-based pricing of insurance over the course of 20 to 25 years. Gradual increases in premiums and improved risk mitigation will make it possible for private insurers to offer risk-based coverage by the end of that time period.

Below are some internal aspects of Flood Re.

- Of the properties in the U.K. that are insured against flooding, it is estimated that 350,000 properties will benefit from Flood Re coverage. It will take a few years of Flood Re being operational before an accurate number is available.
- Consumers purchase insurance from their insurers and submit claims directly to them.
- Insurers choose whether the flood risk portion of a policy is ceded into the Flood Re pool.
- If claims following a flood event exceed Flood Re’s reserves, Flood Re can impose “Levy 2” which calls on insurers for additional funding.
- There is no formal public backup mechanism.
• The government has no role in the scheme’s day-to-day management.

• The government has provided insurers with a non-binding “letter of comfort,” acknowledging that the government will provide flood risk mitigation investments and developing policies to help manage flood risk.

• Insurance is sold in a competitive marketplace in the U.K. This means that insurers have the discretion to price policies (not Flood Re) as they choose and customers have the freedom to do business with whatever company they choose.

ADMINISTRATION COSTS
Costs of running the Flood Re system include underwriting, administration, ongoing mitigation and levy collection expenses. Specific costs include:

• Underwriting the separate pool liability for Flood Re: £16 million–£49 million per year ($27,590,720–$84,496,580 CAD)
• Setting up the pool: £8 million–£12 million ($13,799,480–$20,693,040 CAD)
• Running the pool: £6 million–£10 million per year ($10,346,520–$17,244,650 CAD)
• Collecting levies: £1 million per year ($1,724,812 CAD)

FUNDING STRUCTURE
Funding to cover Flood Re’s costs comes from three sources:

1. A levy paid by insurers, which is based on their market share (known as Levy 1)
2. Ad hoc payments by insurers (known as Levy 2), used under extraordinary circumstances
3. Premiums for the properties ceded to the Flood Re pool.

Flood Re’s Levy 1 maintains the cross-subsidization that existed under the previous insurance schemes in the U.K. For properties at low to no risk of flooding, the cross-subsidy is not anticipated to increase costs to consumers. The annual market-share levy amounts to £10.50 ($18.11 CAD) per policy. Levy 1 is paid by all insurers that underwrite policies for household buildings and contents, which totals £180 million ($302,691,212 CAD) per year. Insurers will pay the levy each year for the first five years of the scheme. If the pool needs to be topped up due to Flood Re’s reserves being exceeded due to post-flood claims, this can be done through the ad hoc, or Levy 2, payment system. All insurers that pay the market-share levy must also make any required ad hoc payments to the Flood Re administrator.
The third source of income for Flood Re is the premiums (a fixed amount per ceded policy) that Flood Re charges insurers. These premiums are calculated based on Council Tax bands. Insurers choose whether to recover the cost of these premiums from consumers. However, Flood Re was designed on the principle that properties located in bands in which people pay lower taxes should be assessed lower premiums to promote affordability.

**PREMIUMS PAID BY INSURERS**

Flood Re assesses premiums for the ceded flood risk portions of policies for high-risk properties using a tier system in which insurers ceding expensive homes pay a higher premium than insurers who cede less expensive homes. According to the 2016 Financial Management of Flood Risk report published by the Organisation for Economic Co-operation and Development, Flood Re premiums for the lower-income households are indirectly subsidized through the pricing of reinsurance for the flood portion of bundled household policies. Flood Re then provides standard prices for reinsurance coverage for properties in Council Tax bands in which the level of flood risk is irrelevant. While insurers are free to set the premiums for bundled coverage, the set price of the flood risk portion that insurers transfer to Flood Re provides a notional ceiling on the premiums for high-risk properties.

Every five years, Flood Re will review the premiums and Levy 1. Flood Re's scheme is designed to increase premium thresholds to align them with the Consumer Price Index at the start of every financial year, but any changes to the premiums require the approval of the Secretary of State. The fixed premium scale currently ranges from £210 to £540 ($362–$931 CAD), depending on the Council Tax band classification in which the property is located.

**Disadvantages of the Flood Re system**

Flood Re is a temporary plan to ease the transition to a risk-based pricing regime. It was designed to be in place until 2039. After the transition is complete, consumers will purchase insurance directly from insurers at a risk-based price. If the government, through mitigation efforts, does not reduce the overall level of risk over the course of the time that Flood Re is operational, the government and insurers will once again have to tackle affordability in the context of a mandatory insurance regime. If the risk is not addressed and lowered, then the Flood Re system that is used to transition to a risk-based system will have failed. If the transition toward risk-based pricing is successful, flood insurance will still be unaffordable for a small number of homeowners. Some form of support will need to continue beyond 2039.
As flood-related financial losses rise globally, and climate change continues to represent additional risk, it is important that the underlying flood risk be addressed through mitigation measures by both governments and individuals. If this risk isn’t addressed, the Flood Re system may not work according to plan. The pool may increase in size, the windup of the pool could be delayed or the risk-based price of insurance for high-risk properties could be prohibitively expensive when the pool winds up. There is no guarantee that future governments will invest in flood mitigation, and there is concern that the current government’s commitment to appropriate mitigation measures is waning. The government has already proposed cuts to the budget for additional flood defences.

While Flood Re remains in place, governments and individuals may forgo the necessary mitigation simply because there is a financial management scheme in place. Moral hazard is a risk any time the true cost of risk is hidden. Flood Re measures affordability strictly on the basis of property value and does not include metrics such as those that assess exposure, vulnerability and risk, which can better reflect vulnerability to flood damage.

### Comparing flood insurance in Canada and the U.K.

</thead>
<tbody>
<tr>
<td>Home insurance is mandatory, but flood insurance is voluntary and often bundled with home insurance.</td>
<td>Home insurance is voluntary, and flood coverage is optional.</td>
</tr>
<tr>
<td>Cross-subsidization, and the attendant moral hazard, is a feature of the insurance market.</td>
<td>Private insurance market is risk based.</td>
</tr>
<tr>
<td>The premiums that insurers pay to Flood Re are assessed through a Council Tax band system.</td>
<td>Canada would need to group properties using property assessment data or another mechanism to assess risk and flood vulnerability.</td>
</tr>
<tr>
<td>Flood insurance being offered since the 1950s, and Flood Re is only the most recent financial management scheme for flood risk.</td>
<td>Insurers started to offer residential overland flood insurance in 2015.</td>
</tr>
<tr>
<td>The federal government in the U.K. has more control over flood mitigation decision-making.</td>
<td>Canadian provinces and territories (and municipalities) are responsible for land-use planning decisions and flood mitigation spending.</td>
</tr>
<tr>
<td>Government gives a letter of comfort regarding ongoing mitigation and flood risk management, there is no guarantee that this mitigation will take place.</td>
<td>It would be difficult to bind future governments to this type of agreement.</td>
</tr>
</tbody>
</table>

### Conclusion

While insurers and the government in the U.K. have come to an agreement in establishing the Flood Re pool, it is a tailored arrangement that works for circumstances specific to the U.K. While a reinsurance pool may be an attractive option for managing the financial risks associated with flooding in Canada, there are sufficient differences between the U.K. and Canada to make the adoption of the Flood Re model in Canada difficult.

The financial management of flood risk

An international review: Lessons learned from flood management programs in G8 countries
Established in 1964, Insurance Bureau of Canada (IBC) is the national industry
association representing the Canadian private property and casualty (P&C)
insurance industry. Our members account for more than 90% by premium
volume of private auto, home and commercial insurance sold in Canada.

The P&C insurance industry employs more than 118,000 Canadians, pays $6.7
billion in taxes and levies to the federal, provincial and municipal governments,
and has a total premium base of $48 billion, approximately half of which is
derived from automobile insurance.

IBC’s role is to be active on behalf of its members. IBC does this by:

» Leading on issues of national importance to its members and all Canadians;
» Forecasting and responding to issues that arise in the industry;
» Anticipating opportunities to identify, shape and influence change in
   support of members’ business needs; and
» Lobbying the federal and provincial governments to secure changes in
   public policy and in the business-operating environment that will benefit
   insurance companies and their customers.

IBC works on a number of fronts to increase public understanding of home,
auto and business insurance. It also fosters public understanding through its five
regional consumer centres, where trained personnel with many years of industry
and government relations experience answer tens of thousands of consumer
inquiries each year.

The purpose of this paper is to examine best practices and available models for managing the financial impact of floods. The paper (i) identifies key issues specific to flood risk management, (ii) evaluates international experience with public and private flood insurance programs, and (iii) draws out lessons for Canada’s approach to the financial management of flood risk and the role of insurance.

Although the market is now starting to change, residential coverage for overland flooding has historically not been available in Canada. There are three key reasons explaining this fact.

First, flood risk does not lend itself to the economics of insurance. It inherently leads to adverse selection, which, in turn, hinders the basic insurance principle of diversification through risk pooling. As a result, flood insurance is hard to offer and, when available, it is naturally expensive.

Second, flood-related losses are often directly attributable to under-investment in public infrastructure, poor asset management, obsolete building codes and ineffective land-use planning. Unless governments fulfil their obligations to improve risk planning and mitigation, the widespread availability of residential flood insurance may remain commercially unviable.

Third, Canada lacks effective flood hazard maps, which are an essential risk-assessment tool. Insofar as the risk of flood cannot be adequately assessed, the financial management of this risk remains a challenge. Recent large-scale flooding has provided insurers with helpful flood risk information, but mapping allows for the assessment of risk prior to flooding occurring.

The limited insurability of flood risk, in turn, means that taxpayers are bearing a significant burden for flood damage across the country, as is evident by examining spending on the Disaster Financial Assistance Arrangements (DFAA) program. Since the 1970s, federal payments for flood assistance have totalled $6.2 billion – or 70% to 80% of total DFAA spending. These costs have more than quadrupled in 40 years, swelling from a cumulative $300 million in the 1970s, to $1.2 billion in the 2000s, to a staggering $3.7 billion in the first four years of this decade. While the recent restructuring of the DFAA has devolved more of these costs to provincial tiers of government, taxpayers still remain the ultimate funding source for flood loss compensation.

Despite the long-standing exclusion of overland flooding, insurers have often ended up paying for flood-related damage in the event of a major flood. Payouts from extreme weather have more than doubled every five to 10 years since the 1980s. For each of the past six years, these payouts have been close to or above $1 billion in Canada. In 2012, losses hit $1.2 billion. In 2013, losses were a historic $3.4 billion, due to floods in Alberta and Toronto. In 2014, losses again approached $1 billion. By comparison, insured losses averaged $400 million a year over the 25-year period from 1983 to 2008. Water claims have become the number 1 cause of home insurance losses across the country.
IBC's examination of the flood management programs in G8 countries offers insights into solutions that may be applicable in Canada.

Every country has had to wrestle with the same issues. The approaches that have been developed span along a continuum that ranges from insurance-based to government relief solutions, including approaches that are fully private, fully public or in between.

Although none of these countries offer a template readily transferable to Canada, IBC has identified several best practices and lessons learned that can guide the financial management of flood risk here at home.

Whether residential flood insurance will ever become commercially viable in Canada, the international experience clearly points to four preconditions that are essential to establishing a strong flood risk management culture.

1. There must be accurate and up-to-date flood hazard mapping to allow all tiers of government – as well as insurers, developers and other key private-sector stakeholders – to make smart decisions about asset management, urban planning and flood risk management;

2. There must be ongoing and adequate investment in flood defences, and sewer and stormwater infrastructure;

3. There must be widespread awareness of flood risk and a sound understanding by all stakeholders – including governments, communities and individuals – of the physical and financial consequences of flood risk and the tools available to ensure Canadians are prepared; and

4. There must be limited recourse to government revenue to finance post-disaster compensation so that individuals face effective risk-mitigation incentives, and the financial burden on taxpayers is minimized.

In the recent past, individual insurers have started taking steps to address this coverage gap, but it remains clear that, as an industry and as a country, a more comprehensive and institutionalized solution is needed to tackle the pressing challenges faced by high-risk properties.

Consequently, IBC welcomes the federal government’s commitment to work with the industry to develop a national approach to flood insurance. The approach, from the industry’s perspective, will need to address the preconditions listed above, and identify clear roles and responsibilities for all of the stakeholders.
It is now widely established that the weather around the globe is changing, and Canada is feeling the effects of this trend first-hand.

Over the past 60 years, average temperatures in Canada have increased by more than 1.3°C – about twice the global average. During the same time period, the weather has also become wetter, with an average 12% increase in rainfall across the country. As a result, Canadians now cope with an additional 20 days of rain per year, compared to the 1950s. It is projected that for some regions in Canada, storms that used to strike every 40 years will occur every six years by 2050.1

The wetter, warmer environment has led to more violent, extreme weather patterns, including storms and floods. Over the past two decades, storms and floods have increased in frequency by a factor of 20, making overland flooding the most frequently occurring natural disaster that affects the most people worldwide. Between 1900 and 2012, there were 289 significant floods in Canada – the equivalent of more than two major floods every year – representing almost 40% of all natural disasters ever recorded in Canada. This means floods occur more than twice as often as the next most-common disaster.2

The changing weather, in turn, generates growing economic losses for Canadian families and governments. While the availability of insurance for water damage in Canada is limited, insurers are already shouldering much of the associated losses.

For six years in a row, Canadian P&C insurers have suffered losses of close to or at $1 billion every year. In 2013, that figure reached $3.4 billion.3 Water-related damage caused the majority of these insured catastrophic losses, and was compounded by aging sewer and stormwater infrastructure that is increasingly unable to handle today’s increased volume of precipitation. As a result, water damage has now surpassed fire as the number 1 cause of home insurance loss across the country.

The purpose of this paper is to examine best practices and available models for managing the financial impact of floods. The paper (i) identifies key issues specific to flood risk management, (ii) evaluates international experience with public and private flood-insurance programs, and (iii) draws out lessons for Canada’s approach to the financial management of flood risk and the role of insurance.

**Editorial Note**

At the time of publishing, the G8 group of countries has effectively become the G7+1 due to the suspension of Russia from its membership.

Because most of the literature that IBC reviewed to prepare this report and the cited references refer to the G8, and solely for the purpose of maintaining clarity and consistency in our literature review, we continue to refer to this group as the G8 group of countries.
Issues with the Financial Management of Flood Risk
Of all natural disasters, floods are the most frequent, affect the most people worldwide and cause the largest number of fatalities and the largest economic losses. Moreover, because of the challenge in insuring flood risk and the low rate of flood insurance take-up (even in countries where a national flood program does exist), most of these economic losses remain uninsured and, hence, are absorbed by governments and taxpayers.

The financial management of flood risk is increasingly problematic due to the combination of several trends: the growth in population and asset values, the concentration of urban and industrial development in flood-prone areas, the onset of more violent weather patterns, and the increase in the vulnerability of private structures and public infrastructure due to obsolete building codes and under-investment in risk mitigation measures. Taken together, these trends make adaptation to flood risk a priority.

What Insurers Mean by “Flood”

In Canada, there is no unequivocal definition of overland “flood,” and the term is often used somewhat liberally. In principle, floods are best categorized based on their (a) causes and (b) locations.

There are five main underlying hazards that can generate overland floods:

- **Spring snow-melt runoff** – the melting of the accumulated winter snowpack
- **Storm rainfall** – localized, extreme rainfall that can generate, especially when combined with impervious soil and/or inadequate draining infrastructure, extreme stormwater runoff
- **Tidal flooding** – a combination of low-pressure weather systems and peak high tides can raise water levels in rivers, lakes and oceans to the point where water defences are breached
- **Natural dam failure** – the sudden release of water flow resulting from the failure of temporary natural dams caused by ice buildup (i.e., ice jams), landslides, moraines and glaciers
- **Structural failure** – the sudden release of water flow resulting from the failure of man-made engineered flood defences and water control infrastructure (e.g., dams, levees, dikes)

There are three main types of floods based on location:

- **Fluvial (i.e., riverine) flooding** – occurring when, in the flood plains of a river, a combination of the causes noted above result in the capacity of watercourses being exceeded, with consequential river overflow
- **Urban (i.e., pluvial) flooding** – occurring when, in an urban centre, surface and underground infrastructure is unable to drain excess water flow generated by a combination of spring snow-melt runoff and stormwater runoff
- **Coastal flooding (i.e., storm surge)** – generated by the combined action of wind, waves and high tides – including the effect of tsunamis – along the coast of large lakes and oceans
In Canada, while there is insurance to cover water-related damage, comprehensive residential coverage for overland flooding is not yet available across the country and for all water-related risks. Insurers provide residential coverage by endorsement for damages caused by sewer backup (in Quebec, the endorsement coverage also includes seepage and rising of the water table). Moreover, overland flooding is covered through automobile insurance as well as through commercial property policies.

As a result, although flood is typically not covered under residential insurance, insurers often end up paying for a significant portion of associated losses. The reason for this is twofold. First, often two different perils – one covered by the policy (e.g., sewer backup) and one excluded from coverage (e.g., overland flooding) – can act together to cause damage or loss. In these cases, it has been difficult to ascertain to what extent the resulting losses were caused by the (un)insured peril, leading insurers to compensate damages that would not have otherwise been covered under the policy.

Second, in the event of a major flood or other natural disaster, it is not uncommon for insurers to lift certain policy exclusions and offer policyholders ex-gratia compensation, above what would be required by the insurance contract, to avoid reputational damage and potential political pressures.

The flood events of 2013 have made these challenges apparent, and insurers have since taken steps to further clarify the distinction between the types of water damage that are and aren’t covered by a homeowner’s policy.

Despite this, losses suffered by homeowners from overland flooding are not, technically, deemed insurable for several reasons.

The key issue is that, unlike most other perils, flooding does not lend itself to the economics of insurance. Insurance, by its very nature, works well for random, uncertain risks that are not correlated. Flood risk is the opposite: it is easily predictable because the same properties on the same floodplain tend to flood at periodic, recurrent intervals. And when it happens, flooding affects a large pool of properties at the same time.

This, in turn, has three negative consequences.

First, predictability leads to adverse selection, meaning that only high-risk individuals, knowing that they are likely to suffer flood losses, will seek out insurance. As a result, the basic insurance principle of diversification through risk pooling no longer applies. Moreover, frequent repeat claims affecting a large portion of the pool would occur, which would necessarily lead to high – often unaffordable or non-commercially-viable – premiums.

In other words, flood insurance is hard to offer and, when it is available, it is naturally expensive and only purchased by a few individuals. Under these circumstances, insurers can only choose between charging actuarially sound but unaffordable premiums, or not offering flood coverage at all.

Second, a significant portion of flood-related losses is directly attributable to under-investment in public infrastructure, poor asset management plans, obsolete building codes and ineffective land use planning. Unless governments address these basic issues, the current environment in Canada is not conducive to widespread availability of overland flood insurance coverage.
Fortunately, one of the main obstacles to the insurability of flood risk – namely, the predictability of flooding – is also key to the success of public infrastructure investment and land use planning. That is, the fact that floods reoccur periodically in the same places means that targeting these locations with risk mitigation investment is effective in reducing the frequency of flooding and its associated financial cost.

Third, the current state of flood mapping in Canada is inadequate. Governments and insurers need to have an advanced understanding of flood risk, albeit for different purposes and to different degrees of accuracy. They need to identify risk zones for zoning and urban planning purposes, evaluate the vulnerability of critical infrastructure, and be able to quantify and price the flood risk that individual policyholders are exposed to.

Flood hazard maps represent the minimum requirement for establishing a sound risk management culture. In Canada, mapping data is available across the country from conservation authorities; municipal, provincial and federal governments; and a selection of commercial vendors. However, available maps are often not up to date and not of sufficient resolution and quality. These maps haven’t been developed to a common and consistent standard across the country, typically exclude urban (i.e., pluvial) flood risk and often assess only a single return period. For all of these reasons, the current state of flood mapping in Canada is inadequate for the assessment of flood risk except at anything more than an aggregate level. Accurate flood maps need to be developed as the first step in any serious government strategy for the management of flood risk.

The Arithmetic of Flood Insurance Premiums

Individual insurers have their own approach to pricing flood risk based on different methodologies, risk assessment tools and commercial strategies. However, the basic arithmetic of insurance still holds. Here is a stylized example of the constraints within which flood risk typically needs to be assessed.

Imagine a property that is worth $500,000 and located within a 1-in-50 year floodplain. Assume that a typical flood – given the characteristics of the floodplain and the vulnerability of the property being insured – would cause damage worth approximately 25% of the property value. The expected loss from this policy, when the flooding event occurs, is therefore $125,000, which translates into an annualized best estimate of loss of $2,500 (given that each year there is a 1/50 probability of a $125,000 loss).

As a result, even if the insurer set premiums equal to the best estimate of loss (i.e., without incorporating any margin for administrative/operating expenses or profit) the homeowner would have to be charged a premium of at least $2,500 a year just for flood coverage, in addition to the “base” home insurance premium charged for standard coverage.

For other perils, the insurer is typically able to pool together several properties within the same portfolio, under the assumption that not all properties would suffer a loss at the same time, which allows for risk diversification and hence for a reduction in the required average premium. However, when a floodplain floods, all properties are affected at the same time, reducing the diversification benefit. This explains why risk-based premiums for properties in floodplains are, by nature, expensive.
The limited insurability of flood risk in Canada places the burden for post-disaster reconstruction and recovery on homeowners and taxpayers who are funding disaster relief spending from federal, provincial and municipal governments.

The role of taxpayers becomes clear when examining spending on the Disaster Financial Assistance Arrangements (DFAA) program. Between 1970 and 2013, there were 208 disasters that triggered federal financial assistance under DFAA. Of these, 116 were due to overland flooding (generally, fluvial/riverine flooding) and an additional 60 to 70 (depending on definitions) events were due to storms that are likely to have caused water-related damage associated with flooding.7

During these 43 years, the average number of DFAA events has increased threefold – from three disasters per year in the 1970s, to nine disasters per year in the first four years of this decade. And the cost of flood disasters to the federal government has increased by an even greater magnitude. Since the 1970s, federal payments on flood assistance total $6.2 billion – or 70 to 80% of total DFAA spending. These costs have more than quadrupled in 40 years, swelling from a cumulative $300 million in the 1970s, to $1.2 billion in the 2000s, and a staggering $3.7 billion in the first four years of this decade. Annual DFAA spending on flood recovery has also followed a similar trend, jumping from an average of $30 million a year in the 1970s, to $124 million in the 2000s, and almost $1 billion a year during the past four years.8

The recent restructuring of the DFAA program has partially redistributed the responsibility for disaster financial assistance by devolving more of these costs to provincial tiers of government. However, taxpayers still remain the primary source of finance for these costs, and the very same trends that are increasing insured losses will also increase economic, uninsured losses borne by governments and taxpayers. That's why federal and provincial governments across Canada have recognized that there needs to be a change in the way Canadians prepare for flooding events and other disasters, and that a partnership with the insurance industry is critical to implement a national solution to the flood problem.
Every country around the world has had to wrestle with the issues discussed above that make providing flood insurance problematic. The approaches developed by Canada’s international counterparts involve various combinations of insurance and government relief. There are approaches that are fully private, fully public or in between; that make flood insurance voluntary or mandatory; and that offer flood insurance on its own or as part of a bundle of several types of coverage.

This section focuses on other G8 countries’ provisions for flood insurance to gain insights into ways flood coverage could be offered in Canada. Many different financial management models have been developed – with varying degrees of success. Each model provides important lessons for how Canada can adapt its response to flood management.

In general, the approach to the financial management of flood risk can be categorized based on six variables:

1. Private vs. publicly administered programs
2. Voluntary vs. mandatory insurance take-up
3. Optional vs. bundled coverage
4. Risk-based vs. government-mandated pricing
5. Policyholder-funded vs. taxpayer-funded subsidization of high-risk properties (or neither)
6. Government as insurer vs. enabler of insurance

These variables, in turn, have direct implications for insurance take-up rates and will affect which stakeholders will ultimately bear the lion’s share of flood-related financial losses.

Private models are market-based, with government intervention typically being limited to investment in risk assessment and risk mitigation initiatives and with insurance pricing typically being risk-based. Public models are characterized by a strong government involvement in the provision, funding and design of flood insurance. In these cases, governments typically set prices and terms of coverage, making these systems more akin to a social assistance program than to insurance.

In some cases, flood coverage is optional and available as an additional endorsement on a standard (i.e., fire and theft) homeowner’s policy on payment of a separate premium. In other cases, coverage is bundled as part of a package inclusive of other perils. There are also instances in which coverage can be both optional and bundled. Indeed, it may be automatically included in a standard homeowner’s policy (making it virtually mandatory), or it may be bundled with other optional perils (e.g., earthquake and other natural disasters).

Notes: Take-up based on residential coverage. Figures for commercial property are typically higher. No additional information for Russia was available.
Germany

In Germany, flood insurance is privately offered as a bundle that includes other natural disasters, and is available to policyholders as an optional endorsement to standard homeowner’s policies. Flood is the major peril insured under this optional natural catastrophe coverage, which includes both fluvial and pluvial flooding but excludes storm surges.

The German flood insurance scheme is a private market-based system, largely deregulated, with no backing from government and with private insurers purchasing reinsurance in the international market.

Insurers set policy terms, prices and deductibles independently and based on risk. As a consequence of risk-based pricing, the vast majority of properties are insurable although some may not be. The take-up rate of natural disaster coverage (including flood coverage) is estimated at 30%.

Adequate risk pricing was made possible by government action to forbid floodplain development in risk zones and by an upfront investment to create a nationwide flood mapping tool (known as ZÜRS), which the German Insurance Association (GDV) developed to help insurers assess risk. ZÜRS provides insurers with a zoning system for flood, backwater and heavy rain risks. The system is based on the following four risk zones.

Source: Adapted from (Swiss Re and ICLR 2010) and (Consorcio de Compensacion de Seguros 2008)

Italy

In Italy, flood insurance is available through the private market and can be purchased as an add-on to residential fire policies. This optional product is bundled with earthquake coverage. The flood coverage includes both fluvial flooding and torrential rainfall damages. Additional protection is also provided for landslides that result from rising river waters.

Residential take-up levels are low, at less than 10% of countrywide property values. This is not surprising given that overall property insurance take-up is also low, at approximately 35%.

This low insurance take-up is primarily explained by cultural and institutional reasons. In particular, there is a widespread belief that it is the government’s responsibility to compensate losses due to natural disasters. Following natural catastrophes, the Italian government historically intervenes with financial support or ad-hoc legislation.

Russia

In Russia, insurance for flooding is provided by the private market as an optional coverage.

Qualitative, anecdotal evidence suggests that the insurance product is rather expensive. Cost pressures, combined with a widespread cultural reluctance to purchase non-mandatory insurance products, generally leads to low take-up rates (only 5% of households have basic property insurance).

Japan

In Japan, private flood insurance coverage was introduced in the mid-1980s. This was part of a government-sponsored flood risk management initiative built on the understanding that for private flood insurance to flourish, flood risk had to be mitigated first.

From the 1960s to the 1980s, Japan saw significant public investment in risk mitigation measures, with a large share of the national budget – ranging from 8% in 1961 (equivalent to 1.5% of the GDP) to 4.5% in the late 1980s (equivalent to 0.5% of the GDP) – invested in disaster risk reduction activities.

These investments were able to bring flood risk under control. At that point, residential flood insurance coverage was introduced by extending standard homeowner’s policies to cover damage from typhoons. As such, flood coverage is not available as a stand-alone product but can be obtained as part of a standard homeowner’s policy.
Through this approach, flood losses are now compensated, albeit with a significant degree of co-insurance (i.e., insurers compensate for up to 70% of flood damage, with the remaining 30% resting on individuals) to maintain incentives for investment in risk reduction measures.

Although coverage has been incorporated as part of comprehensive homeowner’s policies, take-up rates for flood coverage remain relatively low.

The United Kingdom

In the U.K., flood insurance is privately offered and automatically included in standard homeowner’s policies. As such, coverage is virtually mandatory and the vast majority of households are covered for flood damage. However, the current system is unsustainable and is being reformed.

Since 1961, flood insurance has been governed by a series of informal arrangements between the insurance industry and government, beginning with a “gentlemen’s agreement” whereby insurers agreed to offer coverage to all properties regardless of risk while government committed to risk mitigation and infrastructure investment.

The initial setup proved unsustainable, largely due to a worsening of weather trends combined with insufficient investment in water infrastructure. The agreement was amended by a series of Statements of Principles. The latest amendment limited insurers’ liability by establishing that coverage in areas with a flood probability greater than 1-in-75 years will be maintained only in the presence of new investment in mitigation infrastructure.

Although this is a private market system, both government and individuals have clear roles to play. Government is an enabler of insurance, by providing basic flood mapping, adequate flood control infrastructure and stringent land use planning. Consumers play their part by paying risk-based premiums and, in some cases, by investing in risk mitigation measures to maintain insurability.

Despite the recent amendments, it had been known for some time that the arrangement was unsustainable and would not be renewed. The reason is twofold. First, existing insurers were required to retain high-risk properties, while this didn’t apply to new market entrants. Second, the agreement called for government to invest in mitigation, and this investment has not been at the level insurers had expected.

Insurers and government reached a new agreement (known as Flood Re) on June 27, 2013, and the broad legislative structure is in now place. The regulations governing the operations of Flood Re are expected to be tabled following the 2015 U.K. general elections.

In essence, Flood Re is a risk sharing pool, supported by a government commitment to backstop excess losses, which will be operated and financed by insurers as a not-for-profit fund to subsidize flood coverage for high-risk properties. Flood Re was created to ensure availability and affordability to high-risk properties, and to enable a sustainable transition to a risk-based pricing environment over the planned 25-year existence of the Flood Re pool.

Continued real estate development in flood-prone areas, combined with severe under-investment in flood defence and water infrastructure, meant that risk-based premiums for coverage to high-risk properties were becoming unsustainably costly. Addressing the affordability issue required artificially capping premiums for high-risk properties and subsidizing the difference (between risk-based and artificially capped premiums).

Flood Re is a way to explicitly provide such subsidization, by ceding high-risk properties to a risk sharing pool and supplementing this pool with additional revenue from a levy charged to all other policyholders. Flood Re targets only high-risk properties. Flood insurance for other, non-high-risk properties will remain privately offered. Eligible high-risk properties have been identified through risk mapping (there are between 300,000 and 500,000 properties nationwide, equivalent to approximately 2% of the total properties in the U.K.) and are tracked in a national registry. Homes built after 2009 have been excluded from the scheme to avoid encouraging unwise building in high-risk areas.
Flood insurance coverage will continue to be bundled with home insurance coverage. Insurers will be required to offer coverage to high-risk properties (under their own policy terms), and they can choose to do so independently or by ceding the policy to the Flood Re pool.

» If the risk-based premium the insurer would ordinarily charge for a given policy exceeds the applicable price ceiling, the consumer is charged only the capped price. The insurer then cedes that policy (100% of its capped premium and associated risk) to Flood Re.

» If the premium the insurer is willing to charge is less than the applicable price ceiling, the insurer may choose to retain that policy.

To ensure affordability, the scheme sets out price ceilings for eligible (high-risk) flood insurance policies. The ceilings are adjusted using Council Tax bands (i.e., property tax). This transparent process will allow consumers to know up front the maximum premium they may have to pay if they choose to buy flood coverage.

Because the pool is a concentration of bad risks that are charged less-than-actuarially-sound premium rates, it will always operate at a loss. To mitigate this, the Flood Re fund is topped up through additional income from a levy charged to policyholders, amounting to £180 million per year (equivalent to a £10.50 levy on each policy). This amount is said to be equivalent to what policyholders already implicitly pay to cross-subsidize high-risk properties.

To implement the system, the insurance industry is paying £10 million in start-up costs. Flood Re will also purchase reinsurance to cover losses up to a 1-in-200-year flood event level – and participating insurers will not be liable for losses beyond this level. According to the latest Memorandum of Understanding between government and the ABI, should an event generate industry losses in excess of this level, the government will work with Flood Re and the industry to determine how available resources should be distributed to policyholders.

The role of government will remain limited to:

» Setting the price ceilings for flood coverage, which are anticipated to increase over time;

» Providing financial support in the event of extraordinary catastrophic losses exceeding the capacity of the pool; and

» Investing in new and improved flood defences by spending £2.3 billion over the next four years and committing additional investments over the following six years. The government anticipates that flood risk will be reduced by 5% and that over 300,000 properties will be protected by 2021. However, stakeholders – including the Committee on Climate Change, the National Audit Office and the ABI – have pointed to an estimated £500 million shortfall in the required spending on flood defences.

The United States

In the U.S., flood insurance is available through a federal program – the National Flood Insurance Program (NFIP). The program was established in 1968 as a joint initiative by private insurers and all tiers of government. The federal government – through the Federal Emergency Management Agency (FEMA) – is responsible for administering the program.

Homeowners can purchase NFIP coverage only if they live in NFIP-approved communities located within 1-in-100 year floodplains, referred to as Special Flood Hazard Areas (SFHAs). For a community to be approved, it must commit to specific floodplain management requirements set by FEMA, which include floodplain development and zoning. Coverage is optional, although it is mandatory for mortgage holders located in SFHAs.

FEMA sets the premiums based on Flood Insurance Rate Maps (FIRMs). Properties that were developed in SFHAs before being identified as high-risk in this mapping system are provided insurance at subsidized premium rates, at a discount as high as 40% of the risk-based rate. Those that were developed after the creation of flood maps pay actuarially sound rates (as determined by FEMA).
In exchange for an expense allowance, private insurers write and service NFIP policies under their own brand. This enables NFIP to leverage insurers’ expertise in marketing, underwriting and claims handling, without insurers having to retain any of the associated risk.

Because the NFIP pool is based on selecting only bad risks and heavily subsidizing coverage, the system, by design, cannot be financially self-sustainable. It continues to operate thanks to a backstop guarantee by the federal government. This reliance on public funds to meet unfunded liabilities, instead of leveraging risk transfer through international reinsurance markets, has resulted in compounding public debt. This is further magnified by the fact that flood maps are out of date and floodplain management programs are often not enforced, meaning that the premium rates set by FEMA are likely below their actuarially sound level. Recent moves to try and move prices closer to risk-based levels have faltered due to political pressure. Currently, FEMA/NFIP has debt of approximately $23 billion USD and is unlikely to be able to repay it.14

**France**

In France, flood insurance is offered as a mandatory bundle that includes other natural disasters, through a government program (Cat Nat) established in 1982. The program combines private insurance with public reinsurance provided by the Caisse Centrale de Reassurance (CCR), a state-owned reinsurer supported by a government backstop.

The government sets Cat Nat premiums at a uniform rate across France, without any differentiation based on risk exposure. Cat Nat premiums are charged to consumers as an additional percentage on their standard property insurance premiums, which is currently set at 12%. All policyholders with standard homeowner’s insurance are required to participate.

For a claim to be eligible under the Cat Nat scheme, both national and local governments must declare a state of emergency. Once this happens, government-guaranteed reinsurance funds from CCR become available.

Reinsurance with CCR is not compulsory, and primary insurers can choose to rely on international reinsurance markets instead. There are, however, strong incentives to reinsure with CCR, because the reinsurance premiums charged are artificially low and because it can offer unlimited coverage with low solvency and liquidity risk owing to the government’s backstop guarantee.

The main drawbacks of the French model are related to the public nature of rate setting and risk transfer. Public rate setting means that premium rates are set by government rather than based on risk. Not only does this remove any incentive for risk mitigation investment (both by individuals and by local authorities), it is also rather unfair as it effectively forces low-risk consumers across the country to subsidize those at higher risk of disaster (although the offering of a multi-peril, all-catastrophe bundle ameliorates fairness concerns). As such, the system is more akin to a welfare or risk redistribution program than insurance.

Public risk transfer results in reinsurance rates (through CCR) being artificially low and reinsurance payouts being state-guaranteed, both of which create a strong incentive for primary insurers to reduce their retention rate (i.e., to increase the share of risk ceded to CCR), especially for high-risk portfolios.15 This, in turn, places considerable stress on CCR and, hence, on taxpayers.
Best Practices and Lessons Learned
In many developed economies, there is a role for insurance in the financial management of flood risk. This has several advantages over relying on government disaster relief programs. There are two reasons for this. First, while the objective of government relief programs is to reduce hardship by providing basic financial support, insurance seeks to fully compensate consumers by restoring them to their pre-disaster position. Second, while government relief programs typically encourage risky behaviour, insurance premiums are a function of the underlying risk, therefore creating a strong incentive for consumers to undertake risk reduction measures.

However, unlike standard homeowner's insurance, which is rather common, the take-up of flood insurance is typically very limited even in countries where an established flood insurance market exists. As IBC’s analysis indicates, take-up rates fluctuate considerably with each country’s experience, but are frequently within the 10% to 20% range unless the product is mandatory or bundled with other perils. Adverse selection – when flood coverage is demanded only by high-risk consumers – is the main reason for the failure or fallibility of many of the international models. Because of adverse selection and the predictability (or non-randomness) of flood risk, risk-based premiums tend to be unaffordable. This leads to low take-up rates, which, in turn, reinforce the adverse selection problem.

This is particularly true of insurance schemes based on optional coverage. By contrast, where flood insurance is provided as part of a wider bundle, adverse selection and the resulting high premiums are greatly reduced. In fact, evidence from international experience suggests that flood insurance works best when bundled with other perils.

One of the main downsides with bundled coverage is that it forces low-risk consumers to subsidize high-risk ones (which is what allows for lower premiums). However, to the extent that most of the bundled product is priced based on risk, the outcome can still be equitable as low-risk consumers will be charged lower premiums overall. Moreover, the erratic severe weather patterns experienced in recent years – where locations previously deemed low-risk have suffered large flood losses – suggest that more properties than previously thought are likely to experience flood damage in the future, further reducing any unfairness inherent in the bundled approach.16

That said, the experience of countries such as Germany indicates that a relatively high rate of take-up can be achieved even in the absence of mandatory or bundled coverage, as long as there is a well-designed system of incentives supported by a sound risk management culture. Importantly, this includes an environment where private insurers have freedom to charge actuarially sound rates17 and where government relief programs do not discourage the uptake of private insurance coverage.
As a comprehensive Organization for Economic Co-operation and Development (OECD) study determined, "if the private insurance industry remains the main provider of flood coverage, it is essential for [government] to provide the appropriate conditions for managing flood risk." This implies that government action should focus on:

- Promoting risk mitigation measures by means of direct investment in infrastructure and through implementation of early warning systems and strict enforcement of zoning, land use planning and floodplain development regulation;
- Increasing public education and awareness to ensure homeowners understand the risk they face and what they can do to mitigate it, and are financially prepared; and
- Addressing the issue of high-risk properties by either providing subsidies to households for whom insurance is unaffordable, or through financial relief programs that specifically target high-risk properties that may be commercially uninsurable.

In addition to these three key roles, developing a sound risk assessment platform through up-to-date flood maps is paramount. Because of increasingly severe and volatile weather trends, the immediate and long-term management of flood risk must hinge on a reliable analysis of associated losses. Throughout history, flood insurance has typically been introduced only in countries that have developed a sound flood risk management culture – including techniques for an advanced assessment of the risk and ongoing investment in risk mitigation infrastructure.

For example, official flood risk zones that are developed based on a common understanding of risk – such as those used in Germany – are important to ensure equitable treatment of consumers. Such strategies establish a shared understanding of what is or isn’t commercially insurable, setting appropriate expectations for consumers and governments alike.

While this strategy doesn’t necessarily imply that governments should develop flood maps for use by insurers (as the underlying requirements are often different), governments should at least develop flood maps that can be relied on for land use planning purposes. Governments should also make the data available to the private market to ensure widespread understanding of risk.

Finally, even when an insurance scheme is designed to address the affordability issue of high-risk properties (for example, by bundling coverage), insurance for properties where there is a very high likelihood of frequently recurring losses may not be commercially viable. In these cases, alternative government-sponsored risk management approaches – ranging from targeted investment in risk mitigation, to relocation of the property outside the high-risk area and the use of government relief funds – may make more economic sense.
A frequent question that arises is: Why is Canada alone among G8 countries in not offering flood insurance coverage?

First, while residential flood coverage is not available across the country and for all water-related risks, Canadian P&C insurers already cover water-related damage, including sewer backup, through both residential and commercial policies, and overland flooding, through automobile and commercial property policies. As a result, Canadian insurers have suffered losses at or near $1 billion for five years in a row – and in 2013 that figure was a staggering $3 billion or more – making water claims the number 1 cause of home insurance losses across the country.

Second, simply having a flood insurance program is not enough. It needs to be a program that works, and many of the international schemes that we have examined simply don’t work. None of them offer an effective “off-the-shelf” solution that could be implemented in Canada.

IBC’s review has highlighted two important distinctions between alternative flood insurance models. First, many of the schemes are not financially sustainable. Countries such as the United States implemented a program that, by design, is financially unsustainable leading to ballooning public debt in recent decades.

Second, many of the international schemes reviewed enable compensation but at a cost that may be unaffordable to some. The key to designing a financially sound flood program is to price coverage based on actual risk. That, however, means that high-risk consumers will pay high premiums.

Affordability for all consumers, including those at highest risk, comes at a cost. If coverage for high-risk individuals is available at premiums below the level that would be necessary based on actual risk, that difference will have to be made up through one of two approaches. It must either be spread among all policyholders by bundling the product – in which case low-risk policyholders subsidize high-risk ones – or it must be paid through government subsidies – in which case taxpayers subsidize high-risk policyholders.

Whether residential flood insurance will ever become commercially viable in Canada, the international experience clearly points to four preconditions that are essential to establish a strong flood risk management culture:

1. There must be accurate, up-to-date flood hazard mapping to allow all tiers of government – as well as insurers, developers and other key private sector stakeholders – to make smart decisions about mitigation investment, urban development and flood risk management.

2. There must be ongoing, targeted investment to build and maintain resilient flood defences and sewer and stormwater infrastructure.

3. There must be widespread risk awareness and a sound understanding by all stakeholders – including governments, communities and individuals – of the physical and financial consequences of flood risk and of the tools that are available to ensure Canadians are prepared.

4. There must be limited recourse to government revenue to finance post-disaster compensation to ensure that individuals face effective risk-mitigation incentives, and the financial burden on taxpayers is minimized.
Although these basic preconditions are not in place today, there are growing signs that Canada is moving in the right direction.

The 2014 Economic Action Plan announced a proposal to develop a National Disaster Mitigation Program (NDMP). The objective of the NDMP is to take a proactive approach to disaster risk management and to reduce the impact of natural catastrophes on Canadians.

In addition to generating new investment for disaster protection and mitigation initiatives, the NDMP aims at prioritizing measures to identify and mitigate the impacts of floods, including the strain on government finances and the Disaster Financial Assistance Arrangement (DFAA) program.

These initiatives are consistent with Public Safety Canada’s all-hazards approach to emergency management, which sees prevention and mitigation activities as one of its four pillars. These activities are aimed at eliminating or reducing the risks of disasters in order to protect lives, property and the environment, and reduce economic disruption. Mitigation includes structural measures, such as construction of floodways and dikes, and non-structural measures, such as building codes, land-use planning and insurance incentives.

The Economic Action Plan also announced the government’s plans to consult with the industry to explore options for a national approach to residential flood insurance and insurance issues arising from natural disasters more generally, noting that Canada is the only G8 country without residential flood insurance coverage.

Recently, individual insurers have started taking steps to address this coverage gap by introducing, or exploring the introduction of, some type of residential overland flood insurance product.

Nevertheless, it remains clear that Canada and its P&C insurance industry need a more comprehensive and institutionalized solution to tackle the pressing challenges faced by high-risk properties. For this reason, IBC welcomes the federal government’s recent commitment to work with the industry to develop a national approach to flood insurance – an approach that, from the industry’s perspective, will need to address the preconditions identified above and identify clear roles and responsibilities for all stakeholders.

Introduction

OBJECTIVES AND SCOPE OF THE STUDY

In February 2016, I was appointed by Order in Council as a Special Adviser to the Minister of Finance to review and make recommendations as to improvements in the system of auto insurance in the Province of Ontario.

Auto insurance is compulsory for drivers in Ontario. The Financial Services Commission of Ontario (FSCO), is an agency of the Ministry of Finance that regulates insurers and approves most insurers’ auto insurance rates.

Auto insurance impacts all consumers in Ontario as the cost and the coverage it provides impacts not only the over 9.7 million private passenger drivers and other road users, but also is a component cost of transportation for all goods and services in the province. There are approximately 60,000 injuries in motor vehicle collisions each year in Ontario. As a result, the price of auto insurance is of significant policy interest to the government.

Ontario is frequently criticized as having the most expensive auto insurance rates in the country. The government has been taking a range of actions to meet its commitment to rate reduction, including the passage of Bill 15, Fighting Fraud and Reducing Automobile Insurance Rates Act, 2014 and a number of regulation changes.

I was asked to provide advice to the Minister of Finance on the development of further initiatives to reduce claims costs and uncertainty in Ontario’s auto insurance system. In developing advice, I was asked to focus on improving the efficiency and effectiveness of claims management in the system based on best practices in Ontario and other jurisdictions. In particular, I was asked to focus on:

- **Coverage options.** The option to give consumers more flexibility to buy coverage options that reflect individual needs, and the possibility of a lower cost auto insurance product focused on essential coverages as a means of providing additional insurance options for Ontario drivers.

- **Comparable systems.** Structures of comparable auto insurance systems in Canada.

- **Common traffic injuries.** The development and implementation of a successor to the current Minor Injury Guideline (MIG) based on the most recent medical evidence presented in “Enabling Recovery from Common Traffic Injuries: A Focus on the Injured Person,” a report developed for FSCO by a team of medical experts led by Dr. Pierre Côté.
• **Medical examinations and assessments.** Measures to improve efficiency and reduce duplication in the provision of the overall management and delivery of health care on behalf of auto insurance claimants and insurers in Ontario’s auto insurance system.

• **Legal costs.** The nature and extent of legal fees currently incurred by individuals pursuing claims in Ontario’s auto insurance system, the effectiveness of current rules in place to protect consumers from unreasonable fees and possible measures to improve transparency, competition and consumer protection in this area.

• **Dispute prevention.** Approaches to preventing disputes, particularly over accident benefits claims, in Ontario’s auto insurance system. This could include further examination of the Honourable J. Douglas Cunningham’s recommendations in the 2014 Ontario Automobile Dispute Resolution System Review Final Report (Cunningham Final Report) for further restrictions on lump-sum settlements of certain accident benefits claims and the need for individual insurance companies to establish internal review processes.

• **Engagement and education.** Strategies to engage consumers and health care practitioners regarding changes in the auto insurance system, including strategies to inform consumers regarding new coverage options, promote adoption of new evidence-based treatment protocols and minimize the development of disputes between claimants and insurers.

• **Evidence-based treatment protocols.** Adopting new protocols and minimizing the development of disputes between claimants and insurers.
CONDUCT OF WORK

In conducting my work, I examined extensive records and conducted research and interviews, including interviews and discussions with officials within FSCO, the Ministry of Finance and representatives of Insurance Companies and Associations within Ontario and other provinces (see Appendix I for full list). As well, I inquired into the auto insurance system of Alberta which has a similar private sector distribution system as Ontario and the systems in Saskatchewan, British Columbia and Quebec, which have various forms of public/private distribution systems.

I received significant support from the leadership and staff of FSCO without which I could not have completed my review. I would also like to acknowledge the value of the Superintendent’s Report on the Three-Year Review of Automobile Insurance, completed in December 2014. In many instances, the Report was prescient in that it suggested lines of inquiry and possible improvements that anticipated my own findings and recommendations.
Executive Summary

Auto insurance in Ontario is mandatory. It comes in two parts. A no-fault part, (also called the accident benefits part) where benefits are provided whether or not a driver is at fault; and recourse to sue an at-fault driver for damages through a court action (also called the tort or bodily injury part). The insurance premium reflects the total cost of both parts.

Ontario delivers its program through private sector insurance companies. Alberta and Nova Scotia do the same. Other provinces (like Manitoba, Saskatchewan and British Columbia) run their insurance either exclusively or mostly through government agencies, while Quebec provides all the medical and rehab benefits through the province and allows private sector companies to sell insurance for damage to the car or other property.

Since it is mandatory for drivers to purchase automobile insurance, there is a corresponding responsibility on government to create a marketplace where fair benefits are fairly delivered, at a reasonable cost. This report examines Ontario’s auto insurance marketplace and provides recommendations for improvement.

Overall, Ontario has one of the lowest levels of auto accidents and fatalities in Canada and the most expensive auto insurance premiums. Historically, periods of cost reduction have inevitably been followed by cost increases. What is more disappointing is that while the number of automobile accidents in Ontario – especially very serious ones – have consistently come down, the cost of claims has consistently gone up. Ontario also has one of the least effective insurance systems in Canada. It is filled with disputes and inefficiencies, and a very high percentage of premiums are being used to pay experts and lawyers and not going directly to injured persons.

The opportunity gap: Ontario’s average auto insurance premium for 2015 at $1,458 per vehicle, represents a significant expenditure for the average Ontarian. That premium is 24 per cent higher than Alberta’s, double the premium in Quebec and almost 55 per cent higher than the Canadian average, excluding Ontario. Ontario drivers pay about $10 billion in insurance premiums a year. If Ontario could achieve a premium level approaching the Canadian average of about $930 it would save Ontario drivers almost 40 per cent off its current level - about $4 billion a year or some $20 billion over a five-year period – that’s the opportunity gap.

The value gap: No one in the system is actively managing medical care for accident accident victims. There are clear indications that accident victims are not receiving appropriate care, they are taking longer to recover and many report that they have developed permanent impairments from simple soft tissue injuries – that’s the value gap.
The structure is flawed: Current trends do not indicate that the system will self-correct. Claim costs continue to rise while automobile accidents continue to fall. The main cause is not inefficiency or excess profits by insurance companies or the behaviour of claimants, providers or lawyers. It is the way the system is structured.

The goal of the government is to provide a guaranteed safety net for those injured in auto accidents. Guaranteed safety nets work best when they are administered by a government agency, which is an administrative tribunal, with authority to interpret the governing legislation and set policy and practices. Private sector insurance companies work best when they can write policies with defined conditions and benefits. Ontario has devised a guaranteed safety net for victims of auto accidents and outsourced it to insurance companies without giving them the authority to decide how to deliver it.

The legislation is at once very broad and open to a wide latitude of interpretation and at the same time regulations are very prescriptive as to how insurance companies can deliver the product. This creates an opening for disputes as to interpretation on the one hand and restrictions on efficiency on the other. It is a structural flaw in the system.

The results are not good: There is little agreement as to what constitutes fair diagnosis and care for injuries. Consequently, many applications for benefits are rejected based on medical opinions obtained by insurance companies while claimants hire lawyers and generate countervailing medical opinions. Simple minor injury sprains and strains (80 per cent of claims) often take over a year to settle and incur high medical costs. Instead of a system that helps accident victims recover from their injuries, a significant portion of the system has been diverted into a cash settlement system in lieu of care. Each year about one third of benefit costs, some $1.4 billion – about $7 billion over five years – is being paid for competing expert opinions, lawyers’ fees and insurer costs to defend claims – instead of going to treatment of injured parties.

The solution does not lie in reducing benefits. Fair benefits must be taken as the starting point in any recovery, and they must be delivered fairly. If these two conditions do not exist, the system will always fail to meet expectations. Nor does the solution, purely from a cost point of view, lie in changing from a private sector delivery to a public sector delivery system. Run properly, the premium cost for drivers under either system can be roughly the same.
While Ontario’s benefits, taking into account both the no-fault and tort portions are, on the whole, fair, they are not being fairly delivered. The main cause is that the system does not promote a timely, conflict-free means of deciding what care is needed and providing it to accident victims. The system allows participants to work at cross purposes to its original goals:

- Insurers do not aim to provide care to their customers rather they focus on controlling costs.
- Accident victims may seek to maximize their entitlement rather than address their need.
- Lawyers working on contingency fees work to boost the value of claims.
- Providers are paid on volume of treatments, not results.

The system has strayed far from its goals. Justice Cunningham in his review of the Ontario dispute resolution system put it this way: “the whole notion of getting benefits to deserving claimants quickly and inexpensively has been lost.”

Broadly speaking, this report outlines a five-part action plan.

First, the government should fix the structural flaw in the system by setting up an arms-length regulator with a skills-based board. Thankfully this is already underway through the creation of the new Financial Services Regulatory Authority in Ontario. The legislation should set broad policy goals for auto insurance in the province and give the regulator powers to enact policies and procedures. The regulator must substantially overhaul existing Regulations to make them simpler to understand and easier to apply. The regulator will need to be very much more involved and proactive in the functioning of the auto insurance marketplace than it is today.

Second, the system of compensation for catastrophically injured persons needs to be substantially changed. Cash settlements are being drained by having to pay legal fees and, in any case, cash settlements often do not adequately meet the needs of catastrophically injured persons. They need lifetime care as their needs and available treatments will change over time. This must be actively explored with the Ministry of Health and Long-Term Care.

Third, the system needs to adopt a care not cash approach. The solution lies in focusing on timely, appropriate medical care, not cash settlements. All the other expenses such as wage replacement, attendant care, pain, and suffering build from the basis of the extent of recovery from an accident. The regulator must create programs of care – evidence-based treatment protocols, used extensively in several Canadian jurisdictions – that cover most common injuries. The programs of care need to be kept up to date and new ones introduced where necessary. Investment needs to be made on research into the diagnosis and treatment of mental stress and other neurological injuries.
This serves to avoid disputes as to what care is appropriate and delivers care to the majority of injured parties immediately. Where the programs of care don’t apply, or don’t work, a roster of hospital-based independent examination centres should be established by the regulator to provide diagnoses and future treatment plans. Insurers must provide the treatments prescribed in the programs of care or those that are stipulated by the independent examination centre without dispute. The advice given by the independent examination centres should be taken as mandatory in accident benefits and tort disputes and courts should afford these opinions a zone of deference in tort cases.

Where the legislation provides for care, care should be provided and not cash. This shifts the focus to the needs of the patient rather than the amount of the settlement.

Fourth, contingency fees for lawyers should be made much more transparent. The need for accident victims to hire lawyers to access benefits needs to be greatly reduced by simplifying the benefits and making them more readily available. And lawyers need to be held accountable for much more transparency in how they advertise and how they charge their fees.

Fifth, the auto insurance industry is likely to undergo major changes over the next ten years as innovation and competition from non-traditional sources come into the picture. The current regime of heavy regulation and price controls is poorly suited to adapt to the future. More open systems should be explored including changes to allow insurers to introduce new consumer products and to compete more freely on price and service in the marketplace.

There are several other supporting and useful recommendations that, for example, address more efficiency in the dispute resolution system; suggestions to improve the fairness of the tort system; ways to provide better education to consumers and improve innovation in the marketplace.

Ontario must strive to close the opportunity gap and achieve a premium rate for insurance that is close to if not at the Canadian average of about $900 a year. Ontario must also close the value gap in its service and obligations to accident victims. There is absolutely no reason this cannot be achieved.

No one government bears the responsibility for the current state of automobile insurance in Ontario. Successive governments from all political parties over the past 30 years have tried to improve the cost and value that auto insurance delivers to the citizens of Ontario. No-fault benefits have been increased and decreased, access to tort has been increased and decreased, private vs. public delivery has been analyzed, cost control measures have been tried, anti-fraud measures have been introduced and freezing of insurance premiums has been tried. None of these measures has succeeded in improving service or reducing costs for a sustained period.
There is no magic bullet. To achieve lasting value for its citizens, the government must push beyond the old methods of tinkering with aspects of the system and make some of the structural changes to the delivery system as recommended in this report.

There is no need to make any reductions in benefits; indeed, catastrophically injured accident victims can be better served. There should be new investments in health care particularly for brain and mental injuries, such as chronic pain. Access to early, appropriate, health care should be made readily available. Accident victims will recover faster and fewer will develop permanent impairments from their injuries.

Disputes will be significantly reduced. Billions of dollars currently being spent on disputes can be diverted and made available to provide benefits for accident victims and those who pay premiums. The focus of the system will change from managing costs to helping injured paries recover and return to their former functioning lives. Insurers can compete on service and price. There will be robust and independent regulatory oversight.

None of the measures proposed in this report is revolutionary. There is no need to make a disruptive change from a private to a public system of delivery. The government has already put in place legislation to create an independent regulator and evidence-based programs of care are already being used to benefit thousands of injured persons in other jurisdictions across Canada. In Ontario, hospital-based teams are already engaged in providing independent opinions of future care where needed, and catastrophically injured persons are already receiving lifetime care rather than cash settlements in some auto insurance jurisdictions in Canada and in all of the provincial worker compensation systems.

The biggest challenges will be in implementation. The independent regulator will be a new function and will have to evolve into its mature role in regulating the auto insurance industry in ways that help it deliver good value. Insurance companies will have to change from managing cash to managing care. There are plenty of examples of how this is being done today from which they can learn. Structural change does take time to deliver results. In the case of automobile insurance, the results are likely to be felt in eighteen months to two years from when action is taken. This is likely sooner than one would expect from such a transformational change in such a large system, but not as soon as some might like, namely an immediate reduction in costs.

The rewards are great for all parties concerned; and best of all they are sustainable. Ontario has an opportunity to lead the way in auto insurance.
Auto Insurance In Ontario

BACKGROUND/CONTEXT

The law obliges citizens who own automobiles to carry a certain level of insurance to protect against injury to themselves and others who may be injured as a result of an auto accident. It also requires a certain amount of insurance to be carried
to help with the cost of repairs to the automobile if the driver is not at fault. The benefits that are available to consumers to help them recover from an accident are sometimes referred to as the accident benefits, ABs or no-fault benefits.

If the driver of an automobile is not at fault, the law permits him or her to recover additional damages, after meeting certain thresholds, from the at-fault driver through the courts under tort law. This is referred to as the bodily injury (or BI) or tort portion of the system. Ontario drivers are obliged to carry insurance to deal with this “third-party liability.” Optional coverage is available to drivers over and above the mandatory coverages.

Automobile insurance in Ontario is not taxpayer funded. Owners of vehicles predominantly carry the cost of accidents and injuries through insurance premiums. In that sense, it is not a social welfare system. Nor is it a full tort system. Rather it occupies an intermediate zone between the two systems. The no-fault (accident benefits) part of the insurance system acts like a safety net collectively funded by the owners of motor vehicles, and the bodily injury part acts like a tort system where injured parties who are not at fault can sue the at-fault parties for additional compensation.

Because carrying automobile insurance is mandatory, the government has an obligation to create a marketplace where insurance is available and affordable. The government is also obliged to see that the system is fair and reasonably efficient in providing the intended benefits.

Governments across the country have had to decide how to balance the no-fault collective liability portion of the system with the right to sue at-fault drivers in the tort system.

The tort system is confrontational, time-consuming, involves the cost of legal counsel and experts, and ties up negotiating time if settled out of court or court time if cases go to trial. Moreover, using the court system to get injured parties what they deserve results in a significant leakage in the benefit they actually receive since the award they get is reduced by the need to pay expert witnesses and large fees to lawyers.
The no-fault portion of the system is intended by many governments to provide most, if not all, essential needs of injured parties through a system that is more efficient, less costly and delivers more of the end benefit to the consumer than the tort system. Where the no-fault portion of the system is outsourced to the private sector as in Ontario, the goals are challenging to meet. If not structured properly, this part of the system can start to mirror the tort system with its inevitable confrontation, costs and delays, which is what is happening in Ontario today.

It is important to remember that in the end, the citizen who owns a vehicle pays, through their insurance premiums, for the full cost of the combined no-fault and tort systems, whichever way the system is structured. There is no free lunch. It is also important to remember that not all injured persons have access to sue – only those who are not at fault. About 30 per cent of drivers who are involved in accidents are at fault which leaves this substantial proportion of injured persons out of the tort system and with access only to the basic no-fault coverage.

**HISTORY OF AUTO INSURANCE REFORMS**

Ever since mandatory auto insurance came into force in Ontario in 1980, successive governments have been continuously striving to balance the essential goals of the system: adequacy of benefits, cost, efficiency and fairness. It is not as though these issues have been ignored.

Before 1990, Ontario auto insurance operated with minimal accident benefits on the no-fault side and largely as a tort system. Lawyers represented the majority of accident victims.

However, costs rose rapidly, and the government tried to put a lid on costs by freezing insurance premiums. In 1986 the government appointed Justice Coulter Osborne to look into the matter. In Justice Osborne’s report, Report of Inquiry into Motor Vehicle Accident Compensation in Ontario (Osborne Report), he stated that rising costs due to the costs of litigation and court awards and restricted premium increases were the main cause of an insurance marketplace “crisis.”

In 1990, the government shifted the balance of compensation needs from the tort system to the no-fault accident benefits system. Henceforth, to save time and money most of the requirements for compensation were to be met through the accident benefits system with restrictions on what could be obtained through the tort system. The government also introduced other recommendations of the Osborne Report namely a process of rate approvals and a system for dispute resolution outside of the courts.
Since then, a succession of governments in Ontario has grappled with the problem of the degree of protection from the effects of automobile accidents which citizens should maintain vs. affordability and efficiency.

In 1994, the then government considerably expanded the benefits under the accident benefits system, extended the right to sue under tort for pain and suffering, but eliminated the right to sue under tort for economic damages.

In 1996, the government reintroduced the right to sue for economic damages but reduced the amount of coverage for medical and rehabilitation benefits under the accident benefits system. The government also introduced additional cost control measures, such as setting maximum fee schedules for providers of health care and the requirement to submit treatment plans for approval by insurance companies. Initially, these fee schedules were based on a negotiated agreement between providers and the insurance industry. The same government introduced further refinements to these reforms in 2003.

Later, in 2003, a new government introduced legislation to temporarily freeze auto insurance rates and set an objective to reduce rates by 10 per cent.

In 2006, the government eliminated the Designated Assessment Centres (DAC) system and moved back to addressing accident benefits disputes through insurer examination assessor.

In 2010, the government introduced further substantial changes, changing benefits under the standard accident benefits coverage and presenting a series of reforms to try to control costs, exploring the use of evidence-based treatment plans, capping the cost of medical assessments, capping the maximum benefit for a minor injury and other measures. Later the government introduced many of the recommendations of the Ontario Auto Insurance Anti-Fraud Task Force.

In June 2013, the government passed the Prosperous and Fair Ontario Act, which set out a target to reduce insurance premiums by 15 per cent over the next two years.

Finally, in 2015, the government introduced legislation impacting no-fault benefits, and in April 2016 a new dispute resolution system was introduced based on recommendations in Cunningham’s Final Report.

The government is presently engaged in implementing the recommendations in the report of an expert advisory panel that undertook a review of the mandates of the Financial Services Commission of Ontario, the Financial Services Tribunal and the Deposit Insurance Corporation of Ontario (FSCO Mandate Review). If adopted, these changes have the potential to substantially improve the regulatory oversight of financial services in Ontario, giving the regulator more powers to enact policies and respond to the needs of the financial services marketplace.
What this long list of interventions and initiatives by successive Ontario governments from all three political parties shows is that there has been no lack of effort to try to improve the system of auto insurance. No-fault benefits have been increased and decreased, access to tort has been increased and decreased, cost control measures have been tried, anti-fraud measures have been introduced, freezing of insurance premiums has been tried and now a complete restructuring of the regulatory body is underway.

Chart 1 shows that following each of the reform measures over the past years, costs and premiums come down for a few years and then begin to rise sharply to establish new highs. This has been a challenge for governments for a long time.

---

**Chart 1: Auto Insurance Premiums and Costs Reacting to Major Cost Control Measures**

![Chart showing auto insurance premiums and costs reacting to major cost control measures from 1990 to 2015.](image)
Further changes in benefits were implemented in 2015 to curb costs, but trends indicate that costs will once again rise despite these changes.

What is even more disappointing is that while the number automobile accidents – especially very serious ones – have consistently come down, the cost of claims has consistently gone up (see Chart 2).

The long, winding road we have taken over 50 years to tinker with and adjust the system of auto insurance has fallen short in one crucial respect – there has been scant innovation in the system. Aside from a few new features, such as premiums based on driving behaviour (usage-based insurance) which are not widely available or purchased, the system is still delivering the same product in the same way it has for over half a century. Part of the responsibility must lie with how the industry has been structured.
and regulated. Everywhere around us industries that have failed to change are being disrupted. There is clearly a need to structure the system so that it can be encouraged to innovate and change.
Where We Are Now – The Opportunity Gap and The Value Gap

THE SYSTEM IS EXPENSIVE

Ontario today remains in an unenviable position. Ontario’s roads continue to be among the safest in North America. In 2013, Ontario’s fatality rate of 0.54 per 10,000 licensed drivers was the second lowest ever recorded. It was the second lowest in all of North America, behind only the District of Columbia. In 2013, Ontario’s injury rate of 62.1 per 10,000 licensed drivers is the lowest injury rate ever recorded and among the lowest in Canada.3

Nonetheless, in 2015, at an average premium per vehicle of $1,458, Ontario’s is the highest in Canada. Auto insurance premiums represent a significant expenditure for the average Ontarian. That premium is 24 per cent higher than Alberta’s at $1,179, a province with a similar distribution structure, double the premium of Quebec at $724 and more than 55 per cent higher than the Canadian average, excluding Ontario, of about $930 (see Table 3 below). Collectively, Ontario drivers pay about $10 billion a year in automobile insurance.

To put it another way, if Ontario’s auto premiums per vehicle could approach the Canadian average premium, it would represent a premium reduction of almost 40 per cent over the current level, or nearly $4 billion a year, to Ontario’s consumers. That’s a lot of money. This represents the opportunity gap we must try to close.

IS IT DELIVERING VALUE?

Ontario also has other serious challenges. First, the amount of leakage of funds in the system – expenditure not going directly to the benefit of claimants at about $1.4 billion a year (see Table 6 below) is extraordinarily high. Second, in the course of my discussions, insurers shared with me that it is taking them over a year to close even the simplest claims on a full and final basis. Third, accident victims are having a difficult time getting what they perceive to be fair benefits. One out of three accident benefits claims goes into a dispute resolution system (see Figure 1, Disputes and Tort and Appendix VI).
And finally, despite expending large amounts on health care, a very high percentage – some 25 per cent of claims – present themselves as having developed serious and permanent impairments from what began as mostly simple soft tissue injuries. These challenges represent a value gap we must try to close.

THE STRUCTURAL PROBLEM

The system of regulation and delivery of auto insurance in Ontario is poorly structured. It induces participants to act against each other rather than to ensure a common goal. Over time, governments have enacted legislation and increasingly complex and detailed regulations in attempts to solve this problem. Private sector insurance companies sell and implement this program on a cost recovery plus profit margin basis.

This hybrid structure; a government-mandated service delivered by private industry, brings with it inherent challenges that have not been well understood and have contributed to undermining the intent of the government.

Insurance companies work best when they write policies with well-defined parameters and outcomes, which allows them to estimate risk and set the premiums accordingly. We see this in typical supplementary medical coverage benefit plans or short-term and long-term disability plans. The conditions under which benefits will be available are well defined and the amount of the benefit is defined. For example, the coverages for drugs and dental care are described as being eligible for payment as long as they represent usual and habitual costs and they invariably have a maximum per person and per year or a lifetime maximum. Both parties, the insurer and the insured, understand the contract. Very few disputes arise, benefits are paid promptly and they are rarely taken to court for a decision.

AUTO INSURANCE AS A GUARANTEED SAFETY NET FOR ACCIDENT VICTIMS

Programs like auto insurance, which have overarching goals and apply to a broad segment of society (such as worker’s compensation, social assistance and others) are usually given to government agencies to administer. These agencies are given the powers and authority of an administrative tribunal. Basically, the agency is given the authority to enact policies and procedures that interpret the governing legislation and further refine their application.
Quebec, for example, has elected to provide no-fault auto insurance through an empowered government agency. This is not the case in Ontario. The government has designed a guaranteed safety net and then assigned it to private sector agents (about 100 insurance companies) to deliver without giving those agents the ability to decide how to deliver the program.

To complicate matters greatly, the current automobile insurance regulations are vague and broad in many important ways and at the same time extremely detailed and restrictive.

For example, in dealing with an injured person’s entitlement to rehabilitation benefits, the Statutory Accident Benefits Schedule (SABS) enumerates a list of benefits and then concludes with:

“Rehabilitation benefits shall pay for necessary expenses ... for the purpose of reducing or eliminating the effects of any disability resulting from the impairment, or to facilitate the person’s reintegration into his or her family, the rest of society and the labour market.”

The interpretation of this provision is wide open to dispute and disagreement. Since there is no person or agency empowered to make rules or regulations other than the Cabinet itself, the eligibility of any particular form of benefit for a given claimant is left to be contested as between claimants and their lawyers; and insurers and their lawyers either before mediators, arbitrators or before the courts.

At the same time regulations attached to the Insurance Act are extremely detailed and restrictive; insurers must follow 50 pages of prescribed forms and actions (the much-contested SABS) in virtually every interaction with their clients and providers of services. These regulations are designed to provide protections to consumers and also consistency of service across multiple insurers. These are laudable goals but there is no doubt that they also restrict innovation, efficiency and competition since every insurer must do the same things in the same way.

To access benefits a person must first fill out an eight-page form that can be difficult to understand, even though they may have already registered their claim with the insurance company by telephone. In all cases where the injury is more than “minor,” a service provider must ensure the insurer approves the treatment plan to confirm that the treatment will be paid. An insurer is restricted from having a sensible discussion about the treatment. Instead, the only option is to accept the treatment plan or reject it. Plans are often rejected, but generally only after obtaining an expensive “independent” medical exam (also called an insurer examination). The injured person’s only recourse, if the plan is rejected, is to seek help, usually from a lawyer, and likely to generate expensive, opposing medical exams, the cost of which get deducted from the maximum benefit available.
A large number of accident victims have some alternative health or income replacement insurance through their workplaces. The SABS stipulates that the auto insurer is the “second payer.” In these cases, the auto insurance company will not pay the health care provider until after they have recovered any eligible amounts from the claimants’ workplace or other insurer. Claimants are often surprised and annoyed to learn that they must first exhaust their workplace medical and sick day insurance before they can benefit from their auto insurance.

Insurance companies are not required to, and therefore many do not see their role as providing health care for their clients. They treat every claim as a cash expense and act to minimize their cash outlays. Insurance company front line staff are not “case managers,” they are “adjusters.” As a consequence, they are often viewed by their clients not as someone there to help them recover from their injury but as someone having a conflict of interest – since they might try to limit the amount of benefits. In my consultations with insurance companies it became clear that they are not happy with this role. They recognize that their policyholders are their clients, and they wish to provide good service. However, they feel hamstrung by the legislative and regulatory framework within which they have to work. Unfortunately, despite restrictive regulations, insurance companies could do more for their clients in the area of helping them manage health care. But the roles and positions taken up by claimants, their legal representatives and the government are such that insurance companies have found it comfortable to remain in their expected role of managing the cost of claims rather than the care. This is the outcome of decades of “expectations.” All of the participants in the system have come to accept the status quo and have learned to live with it.

Most injured parties seek to receive the help they need and move on with their lives. However, a small but significant number have a propensity to maximize their entitlements rather than address their needs. They approach the insurance company with expectations that their injuries are serious and expect to encounter a reluctant payer – and in many instances their expectations are fulfilled. On the other hand, insurance companies often suspect that claimants may be exaggerating their needs in order to get a larger settlement. At present, there is no efficient, professional and unbiased way to diagnose the true needs of an injured person and to provide appropriate treatment.

Personal injury lawyers, representing clients on a contingency-fee basis, have a financial stake in the outcome and are incented to maximize the presentation of their client’s disability. They enlist the services of multiple medical experts in this effort who also have to be paid for their services.
Health care providers (of which there are myriad) are incented to over-treat the client as they are being paid for treatments rather than the outcomes.

In Ontario, there are more than 30,000 providers belonging to 26 different professional bodies to treat some 60,000 injured claimants a year (see Figure 1 above).

The goals of all the principal stakeholders are not well aligned. As a result, the government’s goal, to provide affordable and efficient care for those injured in automobile accidents, is being undermined by the way the structure of the system is exploited. This puts the government on the defensive when the system exhibits dysfunctional symptoms.
The Results

CROSS-JURISDICTIONAL COMPARISONS

Cross-jurisdictional cost comparisons are difficult to make because the level of benefits in the no-fault system and access to tort vary. Simply put, a province may provide fewer no-fault benefits but allow more access for plaintiffs to sue at-fault drivers for additional benefits. The “no-fault” insurance premium may be low but the premium to defend policyholders against claims in the event they are at fault will be higher. The resulting overall auto insurance premium thus reflects the total cost of the two benefit access systems combined. There is no free lunch.

In terms of benefits provided, Ontario has a higher level of no-fault benefits compared to Alberta and Nova Scotia, which have a similar private sector delivery structure, as well as B.C., which has a predominantly government-run, no-fault system. But Ontario has more restrictions on what can be obtained through the tort system than these other provinces. On the other hand, Quebec and Manitoba, which deliver their health care and rehabilitation program through a government agency, have much more generous benefits in their no-fault systems than Ontario. In Quebec and Manitoba, there are no limits to medical care either in dollar value or time frame, catastrophically injured persons get all the medical care they need for as long as they live and generous wage replacement till age 65. Saskatchewan’s government-run, no-fault system has a maximum lifetime benefit of $6.7 million. But, in these cases, there is no access to the courts for tort recovery.

One could make a general assumption that the combined access systems provide fair benefits overall – generous no-fault benefits are accompanied with restrictions to access in tort and vice versa. There is, however, one major exception and that is that the tort system excludes at-fault drivers (about 30 per cent of injured parties,) who cannot sue under tort. Hence it is likely true to say that the more generous no-fault systems treat all accident victims more fairly than those that require access to tort. As well, when benefits are obtained through the tort system, accident victims lose a significant portion of their benefits because they have to pay lawyers and other experts to prosecute their case.
TOTAL PREMIUMS

The combined premium costs of the two benefit access systems no-fault and tort for provinces across Canada for 2015 are shown in Table 3. We can see from this table that Ontario has the highest average premium costs across all provinces. The average premium amongst the provinces and territories excluding Ontario is approximately $930 vs. Ontario’s at $1,458. Table 3 compares overall provincial auto insurance premiums. The provinces which have a private sector delivery system similar to Ontario’s (Alberta and the Atlantic provinces) are shown in blue. The average premium of this group of provinces for 2015 is $914 and Ontario’s premium at $1458.

With the exception of Ontario, the average premium level of provinces with private delivery systems ($914) is lower than the average premium of provinces with government-run delivery systems ($937), indicating that the method of delivery – government vs. private sector – is not necessarily a major determinant of cost.

**Claims are per accident year in Ontario, Alberta, the Atlantic provinces, N.W.T., Yukon and Nunavut**
PREMIUM MIX ACCIDENT BENEFITS VS. THIRD PARTY LIABILITY

The relative emphasis as between no-fault and tort premiums for those provinces with a private sector distribution system similar to Ontario’s is shown in Table 4. What this shows is that Ontario’s higher accident benefits system is reflected in significantly higher premium costs for no-fault coverage among provinces with a similar private sector distribution system. To recognize a more generous accident benefits system Ontario has the highest barriers for access to tort. However, despite this, Ontario still has by far the highest third party liability premium among provinces with a similar distribution system. Ontario is more expensive on both the no-fault and tort side of the equation which signals that there is something wrong with the way the system is being managed.

PUBLIC VS. PRIVATE DISTRIBUTION SYSTEMS

Alberta, Ontario and the Atlantic Provinces have a private sector distribution system for auto insurance while Quebec and all the western provinces except Alberta, have predominantly government-run systems for auto insurance. Table 3 shows that both systems achieve premiums that are well below Ontario’s. There are provinces with privately-run auto insurance systems that achieve a lower premium than some with government-run systems and vice versa.

Ontario’s auto insurance premium is too high by a wide margin, whether it is compared to provinces with government-run or privately-run auto insurance systems. The system of distribution, whether public or private and the mix as between more or less generous no-fault systems with more or less access to tort do not seem to impact overall premium costs as much as how the systems are managed. Ontario can do well by taking the best from the other systems and improving its own.

Claims are per accident year in Ontario, Alberta and the Atlantic Provinces

Medical care drives all the other costs in the system. The longer an injury takes to resolve, the more likely it is to become chronic, the more medical care is needed and all the other costs – replacement of lost wages, attendant care, compensation for pain and suffering also go up. Worst of all, the injured person is not well served by extending their disability.
The majority of injury claimants report that they have “minimal” or “minor” injuries at time of the accident. While symptoms may manifest themselves long after an accident, the fact is that most people are not seriously injured. Some 83 per cent of motor vehicle injuries involve whiplash or other soft tissue injuries such as a sprained back, which, most of the time, can be treated by relatively simple, short-term and inexpensive procedures that are well understood by health care providers.6

In the course of my inquiries, insurers indicated to me that on average, claims that fall under the minor injury definition – mostly soft tissue sprains and strains – take just over one year to close if they are not disputed and incur an average medical cost of $2,000 to $3,000. If the claims are disputed the average time to resolve minor injuries increases to roughly 900 days and involves medical costs averaging $10,000 to $15,000. These costs, not covered by OHIP, which are for generally minor soft tissue injuries, would indicate that either there is a fairly intensive set of treatments taking place or providers are being overpaid.

Individual insurance companies do not keep track of when claimants reach medical recovery, nor does the regulator. Records are only kept on how long it takes to close a claim file. There is no record kept of outcomes or the effectiveness of medical treatments. In the absence of understanding how effectively medical care is being delivered, the system is open to inefficiency, excessive cost and over treatment. Moreover, there is no opportunity to improve outcomes for patients. Considering that support for medical recovery is one of the cornerstones of the legislation, the system is not currently meeting this standard.

The longer a claim takes to settle the longer the claimant must continue to fight with the insurance company and to assert that they continue to suffer consequences of the accident or might suffer such consequences sometime in the future.

Dr. Côté, in his study on the outcome of insurance claims for whiplash injury, points out that “there was a strong and consistent association between the time to the closure of claims and recovery from the injury. A lower level of pain and a higher level of physical functioning and the absence of depression were strongly associated with shorter time to closure under both tort and no-fault systems.”7

The Association of Worker’s Compensation Benefit Systems in Canada reports on its website that the average duration of injury claims for 2015 (the length of time taken to get a worker back to health and to close the file) is just 76 days, about two and a half months.8 This compares with the one year to two years or more it takes to resolve minor injury claims in the auto insurance system.
The Ontario auto insurance system could achieve better health care outcomes for accident victims and save considerable money by creating programs of care and aligning the payment schedule to those of other payers.

The study Initial Patterns of Clinical Care and Recovery from Whiplash Injuries: A Population-Based Cohort Study put it this way:

“We found that increasing the intensity of care beyond two visits to (family doctors), beyond six visits to chiropractors, or adding chiropractic to medical care was associated with slower recovery from whiplash injuries even after controlling for initial injury severity. Clinicians who promote frequent visits may inadvertently encourage patients to cope passively with their pain…patients who cope passively with their pain may demand more clinical care. Relying on repetitive clinical care likely reinforces some patients’ belief that whiplash is a serious disorder with a long, disabling course. As with low-back pain aggressively treating patients with acute whiplash injuries likely promotes illness behaviours and disability rather than return to normal activities.”

Other studies have pointed to long recovery times and over-treatment of injured persons. The Automobile Insurance Third Party Liability Bodily Injury Closed Claim Study in Ontario conducted by Pinnacle Actuarial Resources, Inc (Pinnacle Study) found that soft tissue injuries (neck and back sprains) were associated with claimants who accounted for 67 per cent of the total claim payments in the study. The study also reported that roughly 70 per cent of the claimants were classified as having no injuries or having minimal or minor injuries in the police report. Nonetheless, the majority of these claimants developed serious and permanent impairments and the median time lost from work for these claimants was seven months.

Each year an average of about 25 per cent of injured persons make bodily injury tort claims. In order to make a bodily injury claim, the individuals must produce medical evidence that they have suffered a permanent serious impairment of an important physical, mental or psychological function (necessary to pass the verbal threshold). This is a very high level of impairment from what are mostly soft tissue injuries. The provincial worker’s compensation systems in Canada find that the proportion of claims awarded permanent impairment benefits across Canada is about 13.5 per cent or almost half that found in the auto insurance system in Ontario.

Soft tissue injuries should not normally develop into permanent impairments if they are treated properly to begin with. The rate of impairment in the auto insurance system is a warning sign that medical care is not being properly handled. Appropriate medical treatment has been shown to reduce or prevent the development of permanent impairments from soft tissue injuries by as much as 80 per cent.
THERE ARE TOO MANY CLAIMS GOING INTO DISPUTE – EVEN MEDIATION ATTEMPTS FAIL AT LEAST 40 PER CENT OF THE TIME

Each year approximately 23,000 or about 30 per cent of all accident benefits claims – go into the dispute resolution system (see Figure 1 above). This level of breakage is a signal that there is something seriously wrong with how claims are being handled. In Ontario’s auto insurance system, claims that go into dispute are represented by legal counsel nearly all the time. Over the five-year period 2011-2015, an average of 9,000 claims (40 per cent) that went into dispute resolution failed to reach full and final agreement at the mediation stage and went on to an arbitration process, adding further time and cost to the system (see Appendix VI).

ACCIDENT VICTIMS ARE SUFFERING LARGE LOSSES

In order to understand where the costs and benefits in the auto insurance system are going, I undertook an examination for the 2013 fiscal year. What I found is that there is tremendous leakage of costs in the system. Out of the $3.87 billion in costs for 2013 (combined accident benefits and bodily injury), only $2.5 billion is going to claimants. The rest, approximately $1.4 billion, is going to other parties. Over five years this amounts to almost $7 billion going to other parties – a staggering sum which is threatening the very foundation of the system.

</table>

Based on 2013 expenses, in the no-fault accident benefits system, out of about $1.9 billion in benefit payments by insurance companies, about $440 million, more than one dollar out of every four is not received by the accident victim in benefits; that is, $340 million is going to pay for competing medical opinions because insurers and claimants – or their lawyers – disagree on what is appropriate medical care, and another $100 million is going to lawyers’ contingency fees. And this is in a no-fault system which is intended to eliminate disputes over fault.
In the tort or bodily injury part of the system the diversion of costs is proportionally higher. Out of about $1.5 billion in benefit settlement payments made by insurance companies, $430 million or almost one dollar out of every three is not going to accident victims; that is, $373 million dollars is going to pay lawyers contingency fees to fight with insurance companies and a further $57 million is going to pay for more medical and other experts to support accident victims claims against the insurance companies.

When you add in the costs incurred by the insurance companies to manage and defend claims in the dispute resolution and the tort systems, a further cost of almost $500 million is added to the overall costs which contribute to higher premiums but do not reach the accident victim.

Overall, out of total claim costs of about $4 billion in benefits, about $1.4 billion or some 35 per cent of the benefits costs are not going to accident victims. In my opinion, this is undermining the integrity of the system.

Commenting on his review of the dispute resolution system, Justice Cunningham said “The whole notion of getting benefits to deserving claimants quickly and inexpensively had been lost.”

**MEDICAL EXAMS AND ASSESSMENTS**

In the no-fault system, despite the fact that the majority of injuries are relatively routine and common, a major element of delay and extra cost is caused by the inability of parties to agree on an appropriate diagnosis and treatment of the injury. As a result, many thousands of expensive medical examinations are ordered by insurers and claimants in an effort to resolve this matter. Claimants frequently have to attend more than one insurer examination. The average total cost of examinations for each of the 30,000 to 35,000 claimants is approximately $9,000 for the life of the claim. The aggregate cost of these insurer medical exams is huge. In the no-fault accident benefits system, the table in Appendix III shows that they grew from $248 million in 2004 to $847 million in 2010; then in response to a cap on the cost per medical opinion and other changes, they came down to $282 million in 2012 and has grown again to $347 million in 2013. The equivalent average annual cost of medical opinions in the whole of the Ontario Workplace Safety and Insurance Board system was just $30 million in treating 170,000 injured workers.
These medical opinion expenses in the Ontario auto system which in 2013 amounted to over 20 per cent of money spent on actual medical treatment costs do not go to medical care for the individual. What is perhaps even worse is that the usefulness of the medical opinions is questionable. In his final report, Justice Cunningham puts it this way:

“Today’s insurer examination (IE) reports appear to have little credibility with claimants and only service to trigger disputes. ... IE assessors are not accountable to FSCO, have no standard assessment protocols, report formats or timelines and are not insulated from outside influence.”17

**SYSTEM IS FOCUSED ON CASH NOT CARE**

As indicated earlier, the main reason is that the system of regulation and delivery is poorly structured. The government has enacted overarching legislation and then enacted regulations which are extremely prescriptive and handed the system to private sector insurance companies to deliver. These insurers do not have the powers of the administrative tribunal to govern their actions. Until there is a direct intervention by government to alter the system, the result will continue to experience very high level of disputes that can only be dealt with through a battle of experts and the added cost of legal fees.

From the insurer perspective, many argue that the current structure effectively blocks them from managing the health care and recovery for their clients. As a result, claimants are left on their own to navigate the health care system with the frequent help of lawyers who themselves are not medical professionals. Overall recovery from injury is not the primary goal of anyone in the system – nor is it being measured or managed. This leads to suboptimal care, lengthy recovery times, overtreatment and escalation of simple soft tissue injuries into permanent impairments.

Faced with the structure of the legislation, insurers view claims through the lens of what they cost to settle – not what is the best medical outcome for the patient. Some claimants approach the process from the point of view of the maximum benefit they can get from the system, usually this is expressed as the dollar value of a cash settlement from the insurance company. Some health care providers in part are interested in maximizing their fees and there are lawyers, likewise, who are incented to obtain the largest cash settlement they can get for their clients since their fees are entirely contingent on the size of the settlement.
How health care goes, so goes the rest of the system. If medical recovery takes an extended time, wage replacement costs go up, attendant care costs go up, pain and suffering awards go up and all the other costs that derive from the extent of the time it takes to recover and get back to normal function go up, including legal costs.

The system has been diverted from its original goal: a medical safety net with ancillary financial compensation as a bridge. Instead it has become a system that is largely focused on cash rather than care. Paradoxically, the outcomes are not only more expensive but worse for injured parties.
What Is Needed – A Sound Regulatory Regime with Fair Benefits Fairly Delivered

Fair benefits must be taken as the starting point in restoring the system to its original intent, and they must be delivered fairly. If these two conditions do not exist, the system will always fail to meet expectations and incur unnecessary cost. Benefits in the current Ontario auto system are fair, the system does not always deliver fairness – such as in cases of catastrophic impairment where lifetime care is essential. But benefits are not being fairly delivered, too many claims for treatment are being rejected and these are going into dispute.

This is mainly because of the legal and regulatory structure which does not allow for proper assessment of accident victims’ needs.

Ontario doesn’t have to have a poor system of auto insurance. There are good and sound ways to improve the process. The key to improvement must begin with clear goals for the system.

Implementation of the goals must be practical, simple and efficient. The system must deliver the best for the most people in each tier of injury severity. It cannot attempt to deal with all exceptions. The no-fault system should:

• **Provide an adequate safety net for individuals injured in an auto accident**

  The majority of auto related injuries are relatively minor. The system should provide appropriate scope for medical treatment and care. The focus of the system should be on the serious or catastrophically injured, as those cases are often unique to each individual and cannot be addressed by common treatments, such as in the case of minor injuries. That is where the most need lies. To the extent possible the no-fault system should satisfy the needs of the majority of injured parties without the need to resort to an expensive tort system.

• **Benefits should be simply described and easily understood**

  There is general agreement among stakeholders that the current description and entitlement provisions are overly complex. Very few people outside those who are professionals in the system are able to understand them. This needs to change.
• **Benefits should be easy to access without the need for legal counsel**

   The insurance system should be able to quickly respond to the legitimate needs of accident victims. Not only is it clear that accident victims are worse off if medical care is difficult to obtain and extended over a long period, but it is also evident that insurers can limit costs by supporting appropriate care on a timely basis. Currently, the design of the system allows for, and actually encourages, far too many delays and disputes.

• **Premiums should be affordable**

   It goes without saying that Ontario drivers do not have unlimited resources. Since they are required to purchase insurance for automobile accidents, the government has a special responsibility to create a marketplace that is efficient and affordable. At the present time insurance premiums in Ontario need to be made more affordable.

• **The system should be able to adapt and innovate**

   No matter what changes are adopted today, they are going to be obsolete in the near future just because of the nature of the rapid change that is a constant of our time. Because the current system is so firmly tied to legislation and regulation only the Legislature or the Cabinet can make any meaningful adjustments to the system. The system is not able to adapt and improve in a rational way as circumstances change. Hence you have major upheavals every three to four years. Nor is the system able to encourage innovation in product design and delivery. In a world where rapid changes are occurring in both the financial and automotive worlds these are serious shortcomings. It needs to change.
A Better Future – Should Ontario Move to a Government-Run Auto Insurance System?

This is a question that has come up more than once over the years. On the surface, it would seem that provinces with government-run auto insurance systems like Quebec and most of the Western provinces are able to achieve satisfactory auto insurance benefit systems at a much lower cost than Ontario has been able to achieve with its privatized model. The choice of delivery model – public or private – is not a simple one, nor is it a silver bullet. For example, provinces with government-run systems like Quebec, Manitoba and Saskatchewan have chosen to greatly enhance their no-fault insurance benefits and effectively restrict access to tort. B.C. has gone somewhat the other way with a relatively skinny no-fault benefit scheme with maximum access to tort with its attendant burden on the justice system. There are provinces with privately-run auto insurance systems that are less expensive than those of provinces with government-run auto systems. The B.C. system which is predominantly government-run, as well as subsidized, is the second most expensive in Canada, second only to Ontario’s.¹⁸

The key to achieving lower cost and better value does not lie simply in the type of delivery model that is used. The key is to ensure that appropriate management and regulatory tools must be used which are appropriate for the model chosen. **Whichever model is chosen there needs to be certainty and speed of decision-making, simple benefit structures, efficient access to benefits without the need for intervention by third parties; incentives that are client-centric rather than provider-centric and continuous measurement and improvement processes.**

There are several good reasons why Ontario should avoid a major shift in its delivery model for auto insurance at this time.

First, a seismic change in Ontario’s business model brings with it significant disruption to customer service; significant job losses in the private sector; major investments in time and money as new computer systems and administrative processes are put in place; high risk of failure and no guarantee that the outcome will be any better than the model you began with unless changes in benefits and process are also introduced at the same time. It is far superior and less risky to carefully analyze what is lacking in the current model and incrementally correct it than to take a giant leap into a new system.

Second, in privatizing the delivery of a financial product, the government is presumably hoping to capture the efficiency of the private sector arising from competition. But to reap this benefit the regulatory control governing the service must be such as to encourage rather than discourage competition and innovation.
Third, and likely most important, the insurance industry like almost every major sector of the economy is undergoing major disruption and change resulting from technology and customer demand. Driver-assisted and fully-automated cars will develop new opportunities to understand customer behaviour and tailor-made insurance and financial products will emerge. As well, non-traditional competitors are likely to try to enter the auto insurance field, including technology companies and the car manufacturers themselves as they chase the value chain. All the financial industry players including auto insurance providers are either in the middle of or about to commence major technology and systems investments to capture and analyze customer data. This would be the wrong time to ring fence and bring the auto insurance system in-house. It would be a solution to yesterday’s problem while the ground is shifting in unpredictable ways. In times of rapid change, private companies are best poised to innovate and provide competitive services to customers, providing they are freed up to do so.

**Recommendation**

1. **The government should not move to a government-run auto insurance system at this time. There is an opportunity to learn from past experience and fix the problems in the current auto insurance delivery system in Ontario as described in this report.**
A Better Future – Fair Benefits

BENEFITS TODAY

It is possible to achieve a much better system. The key is to cut waste, which can come in a variety of forms, such as, overtreatment, failures in coordinating proper care and administrative complexities, not benefits.

Ontario has chosen to retain its relatively rich, no-fault, first-party system with the intent that most of the needs of an injured person could be met without having to go to the courts under tort, as the vast majority of injuries are minor in nature. The richness of Ontario’s no-fault benefits is often referred to as an explanation for why it’s auto insurance premiums are so much higher than in other provinces. But analysis shows that a more generous no-fault system is fairer to accident victims than one which requires access to tort and does not require more cost. Quebec, Manitoba and Saskatchewan – all public or hybrid systems – all have more generous no-fault systems than Ontario’s yet their costs are not only lower than Ontario’s, but also lower overall than the provinces with a mix of no-fault and access to tort. So the answer to Ontario’s cost problem does not point to lower accident benefits costs.

Recommendation

2. Ontario’s current no-fault benefits should not be reduced.

CATASTROPHICALLY INJURED PERSONS

While there is no need to cut Ontario’s current accident benefits levels, there is a need for a different approach to the needs of the approximately one per cent of claimants who are catastrophically injured each year.

Table adapted from the FSCO Three Year Review

The definition for being catastrophically injured is contained in the SABS. It is extremely complex – see Appendix II – and requires several specialists to come to a determination of whether or not an accident victim fits the catastrophic injury definition. This determination is extremely important since the benefits payable to an accident victim judged to be catastrophic are many times higher ($1 million vs. $65,000) than for an injury not judged to be catastrophic. As a result, tens of thousands of dollars – in the range of $15,000 to $20,000 are spent by the claimant and the insurer on medical reports to arrive at or challenge a determination.

As well, the process of arriving at a decision often goes through the dispute resolution system and takes more than a year to resolve (it has yet to be seen how quickly these issues will be resolved at the new License Appeal Tribunal – LAT).
There are several problems with how catastrophically injured claims are handled. In the first place, we have a claimant who is put through multiple tests administered by competing sets of doctors. Secondly, the claimant may wait a year or more to receive confirmation of the medical and financial help to which they are entitled during an extremely stressful and life changing time in their lives. The accident victims are, of course, using up their lower tier of accident benefits and accessing the regular OHIP and social support systems as best they can in the meantime. And in many cases, the insurer will advance funds for treatment if the person is obviously catastrophically impaired for life. However, more problematically, the accident victim may resort to financing from one of the settlement loan companies at very high interest rates. Finally, because the process to access benefits is so complex, the accident victim often hires a lawyer in order to properly access them. What can happen then, is the accident victim may ultimately find themselves with significantly less than the $1-million benefit to which they were entitled, since this amount would be partially reduced by the cost of medical exams and legal fees.

In any event, the payment of a cash settlement for needs that can run many years in the future is not well suited to catastrophically injured persons. Injured persons who receive a lump-sum payment during a period of crisis in their lives, should not be forced to figure out how to make the settlement work for their needs, not only now, but also in the future, where they could very well change significantly. As well, lump-sum settlements could very well run out during the lifetime of the injured person.

Alternatives to monetary compensation, how it is delivered and the method of support should be explored. The goal should be to increase the support given to this group of claimants. Specifically, catastrophically injured victims should receive lifetime care. Of the benefits available under the no-fault policy, the benefit for catastrophically injured persons is arguably the most important of all because there isn’t the simplicity of treatment that is found in minor injuries.

If the accident benefits system does not fairly address catastrophic injuries, injured parties will go to the tort system if they can. Those who are at fault (30 per cent) will not be able to do so; those who can will pay a heavy price — in time as they fight through the dispute system — and in lawyer’s contingency fees and expert fees to obtain any additional benefit.
In Australia and New Zealand lifetime care and support is provided to seriously or catastrophically injured persons. Here in Canada, the Saskatchewan no-fault system offers up to $6.7 million for seriously injured persons in their no-fault system, whereas in Quebec, lifetime care is provided in their no-fault system. Both have lower premiums than Ontario. All workers’ compensation boards in Canada also provide lifetime care and support with no upper limits on costs. At the present time, the Ontario Workplace Safety and Insurance Board is looking after some 7,000 seriously injured persons for their lifetime. So, there are several examples of lifetime care being made available to catastrophically injured persons.

A further complication is that the definition of catastrophic impairment in the accident benefits system is causing many challenges both in how to qualify for the benefit and in the details as to how the benefit is to be calculated (see Appendix II). This results in long and expensive negotiations with claimants. Further, where the claimant is also seeking redress under tort, the offset of any accident benefits catastrophic payment is unclear, opening the possibility of duplicate or double recovery, which I address in depth in another section of this report.

The current definition of catastrophic injury and process for qualification of benefits is highly complex and is likely causing more problems than necessary in the system To reduce the complexity, evaluation of catastrophic impairment should be done using an objective guide such as the most current American Medical Association guide and supplemented, where appropriate, by specialized and well established guidelines. The evaluation should be done by a competent, hospital-based independent examination centre (IEC), which is discussed below.

Until lifetime care is made available, these claimants should continue to be awarded lump-sum payments. However, the lump-sum payment should be calculated based on the IEC assessment, using the degree of impairment and an adjustment for age and be made immediately and without delay by the insurance company upon receiving the report of the IEC. There should not be a need for a catastrophically injured person to retain legal counsel. The decision from the IEC should not be subject to dispute or further medical examination. Furthermore, the payment must be made fully deductible from the total settlement received under tort, another issue addressed later in this report.
Recommendations

3. The regulator should undertake serious discussions with the Ministry of Health and Long-Term Care to develop a service for lifetime management of care for seriously injured accident victims. Eventually, as the province develops this expertise, the expertise and even services could expand to address other injuries outside of the auto insurance system. This would allow for continuing improvements in care to develop and recommendations for preventative measures to be generated while ensuring that patients are being treated by a reliable and sustainable system.

4. There should be a minimum of disputes and delays in accessing single lump-sum awards for those who are catastrophically injured. Such awards, should be efficiently and quickly determined by an independent examination centre and based on objective measures, such as the American Medical Association guide, supplemented, where appropriate, by specialized and well-established guidelines.

5. Insurers should make sure that seriously injured persons are given top priority and do not need to hire lawyers or other professionals to get their entitlement.
A Better Future – Benefits Fairly Delivered

PROGRAMS OF CARE

As stated earlier, the central failing of Ontario’s auto insurance system – and the largest contributor to its cost – is the singular inability of participants to agree on what constitutes an appropriate medical diagnosis and treatment for injuries. Again, improved health outcomes must be the central goal of the system.

The SABS provides for a $3,500 financial limit within which the majority of injuries – sprains strains and minor whiplash injuries – ought to be satisfactorily treated. The $3,500 limit for treatment automatically starts the process of debate over cost rather than care. It invites claimants and lawyers to find ways to show that their injuries do not fall within the definition of a “minor injury” and hence need to breach the financial limit and access the greater benefits in the $65,000 limit applicable to more serious injuries. On the other side, insurance companies may also fight to keep claimants to the minor injury limit if at all possible.

In the course of this dynamic, claimants, lawyers and insurers spend large amounts of money – up to $2,000 on each medical evaluation – and insurers end up rejecting between 25 and 30 per cent of the amounts proposed for treatment each year. The efficacy of this process can be judged by the fact that 25 to 30 per cent of claims go into a dispute resolution system where they take longer and cost much more to settle (see Appendix VI). Cunningham’s Interim Report states that 61 per cent of disputes concerned medical benefits and related assessment and examination expenses.19

Since there is no monitoring of medical outcomes, it is highly uncertain whether accident victims are indeed getting the right kind of care in the right facilities. Drs. Côté and Soklaridis observed in an article in Spine Journal:

“It is an unsettling fact that most interventions used in clinical practice are not supported by scientific evidence. ... It is likely that a high proportion of patients are treated every day with ineffective or unproven clinical interventions. These findings emphasize that clinicians need to be educated on the use of evidence based interventions.”20
It is necessary and essential to find a better way to resolve the issue of how to efficiently diagnose and treat injuries under the no-fault system.

**Programs of care**
The solution is to adopt programs of care, based on the principles of evidence-based medicine, for the most common (70 to 80 per cent) of injuries. Programs of care are patient- and outcome-focused for the best results in treatment. They are designed around what the patient needs, not the processes of the providers. They are also focused on health outcomes for the patient not the number of treatments provided.

Michael Porter and Thomas H. Lee, in their Harvard Business Review article, put it this way:

“In health care, the days of business as usual are over. Around the world every health care system is struggling with rising costs and uneven quality despite the hard work of well-intentioned, well-trained clinicians. Health care leaders and policy makers have tried countless incremental fixes – attacking fraud, reducing errors, enforcing practice guide-lines...but none have had much impact. Its time for a fundamentally new strategy. At its core is maximizing value for patients...We must move away from supply-driven health care systems organized around what physicians do and toward a patient-centered system organized around what patients need. We must shift the focus from the volume of...physician visits...procedures and tests – to the patient outcomes achieved.”

Programs of care minimize uncertainty and disputes about what treatment is needed on a case by case basis. The vast majority of accident victims get proven care strategies and insurers do not dispute them. This provides quality care on a consistent basis, reduces delays and saves enormous cost and aggravation, while creating a fair system where accident victims are no longer forced to navigate a complex system, or find themselves caught between lawyers and insurers.
Programs of care are developed for specific types of injuries, the most common and high-volume ones. For example, there will be a program which treats musculoskeletal injuries such as whiplash, others that treat low back injuries, shoulder injuries, mild traumatic brain injuries and so forth. The programs set out clear expectations to providers and insurers: the treatment goals are defined, the duration of the care is defined and the total fee for the treatment is set.

Importantly, providers should be required to examine the patient and record their medical condition – level of pain, functionality of injured body part – prior to commencing the program and then to measure and report on the outcomes of the treatment.

Porter and Lee put it this way:

“Rapid improvement in any field requires measuring results – a familiar principle in management. Teams improve and excel by tracking progress over time and comparing their performance to that of peers inside and outside their organization. Indeed, rigorous measurement of value (outcomes and costs) is perhaps the single most important step in improving health care.”22

Where they are used, programs of care have been developed in consultation with the relevant professional bodies and are well understood by all providers. For example, the musculoskeletal program of care used for injured workers in Ontario was developed with the participation and contribution of regulated health professional associations, namely the Ontario Chiropractic Association, the Ontario Physiotherapy Association, the Ontario Society of Occupational Therapists and the Registered Massage Therapists’ Association of Ontario.

Variations of programs of care are in use in many jurisdictions including in auto insurance delivery systems in Alberta, Nova Scotia and some states in the United States, as well as in workplace injury systems throughout Canada.

The Ontario Auto Insurance Anti-Fraud Task Force Final Report expressed the view that (well-defined) evidence-based treatment protocols could make fraudulent behaviour more difficult and made the following recommendation:

“The government should reduce uncertainty and delay for those who have legitimate auto insurance claims by moving aggressively to introduce treatment protocols for minor injuries that are based on scientific evidence.”23

In Alberta and Nova Scotia, diagnostic treatment protocols (protocols), which are similar to programs of care, provide a structured model for the treatment of strains, sprains and whiplash injuries. The focus of the protocols is patient recovery.
The patient is entitled to the number of treatments under the protocols, subject to the health professional’s opinion. The treatments may not be disputed by an insurer and are considered pre-approved. Reasonable and predictable costs have been negotiated with providers, patients are treated quickly and appropriately, and treatment providers understand the parameters within which they are working and treat their patients accordingly. Disputes around the protocols themselves are infrequent because they have been established in consultation with the relevant medical practitioners and organizations.

Under the guidance of FSCO, Ontario has already made a start along this path through the development of a Common Traffic Injury Guideline, which lays out very detailed, evidence-based treatment paths for common injuries and was designed after consultations. This work would be a good starting point from which to develop appropriate programs of care for the auto insurance industry in Ontario.

The issue of quality control of health care providers was raised more than once during my study. Professional groups of providers suggested that while most practitioners were honest and competent there exist some who are not providing appropriate care.

No doubt there will be some providers who are not meeting acceptable standards. The Ontario Auto Insurance Anti-Fraud Task Force had several suggestions to address this issue. There is a practical means of promoting good providers and dis-incenting poor providers and that is to monitor the effectiveness of treatment and the outcomes achieved. This is an essential part of the process of improving both the design and the execution of programs of care. Monitoring of provider performance also helps detect and manage fraud to the extent that it exists.

While several useful and necessary programs of care have already been developed in other systems, there is always more to be done. There are more needs that must be urgently addressed. For example, chronic pain, stress related impairment and post-traumatic stress. These medical conditions have been recognized by the courts as legitimate injuries but they are often extremely difficult to diagnose and treat. They are also a significant factor in the rising cost of benefits in the auto insurance industry. Rather than passively waiting for solutions to emerge, the insurance industry should be conducting research to develop evidence based standards for the diagnosis and treatment of mental injuries.
Both the Alberta and the Ontario Workplace Safety and Insurance Board (WSIB) systems have a process by which an injured person is referred to an independent expert where a program of care has not resulted in the full recovery of the injured person. In the WSIB system, where a program of care is not working or there is uncertainty around the appropriateness of different care programs, the patient is referred to a regional evaluation centre (not dissimilar to the independent examination centres, or IECs, defined in this report). The purpose of the referral is to provide and expert diagnosis of the present condition of the patient and to recommend future care needs.

In Ontario, the IEC would be a hospital-based service that brings multidisciplinary skills to the assessment and treatment plan for a patient. Being hospital based, physicians from multiple disciplines can be brought in to the assessment, as required. The IEC is also required to contact and have a conversation with the patient’s family doctor who can provide a whole person context to the situation at hand. The role of the IEC is to examine the patient to establish a diagnosis and to provide recommendations on the best treatment options to facilitate recovery. The role of the IEC is forward looking and helpful to both the patient and the insurer in terms of the best options for future care. It is not concerned in any way with approving or denying a claim.

At WSIB, typical costs for a multi-discipline examination and treatment plan is much less expensive than the cost of medical examinations in the Ontario auto insurance system in two ways. It costs less than the $2,000 per opinion that is currently paid by the Ontario auto insurance system and the injured party does not have to submit to multiple separate examinations. As a point of reference the total cost of medical examinations paid by the WSIB in a year is about $26 million for a system handling 170,000 injury claims a year, compared with the approximately $350 million currently paid in the Ontario auto system for handling just 60,000 injury claims.24

To be adopted in the Ontario auto insurance system, the auto insurance regulator must keep a roster of reputable, competent, hospital-based IECs to which insurers can refer patients for assessment. The regulator would need to monitor the quality and timeliness of the advice given. Further, it is essential that the opinion of the IEC be taken as final and not subject to competing opinions from either the insurer or the patient. For this reason, it is also essential for the IEC to be a hospital-based team that can bring multidisciplinary skills to the evaluation and recommendation for treatment. Hospital-based teams already meet high medical and ethical standards. The WSIB, for example, has thirteen hospital-based centres on its roster, including Sunnybrook Health Sciences Centre and the University Health Network in Toronto, Health Sciences North in Sudbury and others located across the province. This model could be explored, as it provides an example of how the roster of IECs could be developed throughout the province.
The Ontario auto insurance system did try to institute something similar to the IEC concept with the introduction of Designated Assessment Centres (DAC) in 1994. These were discontinued in 2006 for several reasons. In the first place, DAC evaluations were used late in the claims process – that is as means of accepting or denying a claimant medical care as precursor to a mediation or arbitration hearing or litigation. Furthermore, DAC assessments were not unique. A claimant would have gone through assessments by the insurer before being assessed by a DAC, and either party could dispute the DAC assessment during the dispute resolution process. DAC assessments were often long, drawn out and expensive, as several experts, frequently from different organizations, were asked for separate opinions based on their area of competency. Furthermore, arbitrators and courts failed to give a DAC opinion any degree of deference over any other medical opinion produced by either the claimant or the insurer. If this wasn’t bad enough, the independence of the DAC opinion became compromised as DAC assessors also frequently acted on behalf of insurers or claimants in providing medical assessments to them separately. Ultimately, with a lack of respect for the DAC process, the cost and time involved and the independence brought into question, the DAC system failed and was discontinued.

In contrast, the IEC process is quite different in its purpose, its conduct and its process. An IEC evaluation takes place much earlier in the treatment cycle. It is not designed to accept or deny a claim. It is designed to provide guidance as to the best options for future care in cases where a program of care has not resulted in satisfactory recovery of the injured party. The IEC is hospital based and has access to a wide variety of medical and rehabilitation experts. In this role, the IEC is an extraordinary resource of first class expertise to aid in the treatment of the patient. IECs are also completely independent of either the insurer or the patient and they come with the quality control of a major hospital organization – their orientation and high level of competency is to provide the best possible medical advice.

In terms of the volume and intrusiveness of insurer medical exams, one of the issues with the current system is the frequency with which medical exams are sought by the insurers and claimants. As reported above, some 30,000 to 35,000 claimants per year, more than half of all claimants, are subjected to medical examinations at a cost of $9,000 for the life of the claim. Because the proposed system will be based on programs of care, there will be greater certainty around treatment and the need to dispute will be greatly reduced. Only those patients who are not responding to the programs of care will be referred to an IEC. Those referrals will not be in order to deny a claim. The IEC, in consultation with the patient’s family physician, conducts an examination and makes a recommendation for additional care, where appropriate, in order to help the patient make a sound recovery.
Recommendations

6. The regulator should move as quickly as possible to create programs of care for the most common types of automobile injuries. The programs should be based on the evidence-based findings of the Common Traffic Injury Guidelines.

7. The regulator should be provided with a sufficient budget to monitor and continuously improve the outcomes of existing programs of care and partner with the government on research into the development of new programs of care as the need arises – for example for neurological injuries, injuries from concussions, spinal cord injuries, chronic pain and post-traumatic stress disorder. Consideration should be given to leveraging existing programs of care that have been developed by other jurisdictions.

8. The government should empower the regulator with the authority and direction to establish a roster of independent examination centres (IEC) which should be hospital-based and must be able to provide a multidisciplinary team to provide appropriate diagnoses of injured patients and recommended treatment plans. Insurers must follow, without dispute, the recommendations of the IEC for future treatment within the financial limits of the insurance policy as provided by law. The dispute resolution process must respect the evaluation of the IEC without resorting to competing opinions from either party to a dispute.

9. The regulator should conduct regular quality control studies of the outcomes of future care recommended by IECs to monitor the quality of such recommendations and ensure their effectiveness. As part of this process the regulator should consider instituting a system of professional peer review of roster assessors to ensure quality is maintained.

10. The regulator should undertake a complete overhaul of the pricing schedules for treatment by providers and evaluators to bring them more in line with prices being paid by other similar bodies, such as workers’ compensation boards, and to emphasize outcomes rather than the number of treatments.
PROVIDE CARE NOT CASH

The intention of the legislation is clearly to provide accident victims the medical care they need to recover their health with some income replacement support as a bridge during the recovery period. The legislation never intended the auto insurance system to be a cash jackpot. Many insurance companies, however, are incented not to see their role as providing medical care to their clients. Rather, they are incented to close their liability with as little cash cost as possible and hence they introduce the practice of negotiating cash settlements with claimants in lieu of medical treatment, future wage loss and other future benefits under the SABS. In Cunningham’s Interim Report he put it this way:

“Although I sympathize with the insurance industry’s desire to close files on a full and final basis, I find the practice in some circumstances counter-productive. It only encourages the type of behaviour insurers have raised with me during this review. Other insurance systems such as worker’s compensation or supplementary health plans will never or only in exceptional cases pay a lump sum for future health care benefits. I would support extending the one-year prohibition on settlements if it would have an impact on the ‘cash for treatment’ approach to care that is widely practiced. Disputes and settlements need to be focused on getting claimants timely access to necessary treatment and assessments.”

— Justice Cunningham

Justice Cunningham is referring to the practice of insurers to want to get a full and final release of the claims against them so that they can finalize their cost and release any capital that is tied up to support future amounts that might be owing on the claim. Hence insurers often drive towards getting a release on settlement of all future claims via a lump-sum payment.

This practice is counterproductive and goes against the main goal of the system which is to provide the necessary medical care and related support – not to provide a cash lump sum in lieu of care. Trying to estimate the care and other benefits needed in the future leads to lengthy negotiations over amounts which may or may not ever be put to the uses estimated.
It also introduces professional negotiating via lawyers, which can result in a large dose of exaggeration and gamesmanship on both sides in an attempt to figure out what the other party is likely to settle for, not necessarily what the claimant actually needs. As long as there is a prospect of a lump-sum payment at the end of a process, injured parties may be advised to boost a claim in order to maximize the size of the payment. This does not serve either the injured person well (boosting a claim requires spending money on expert opinions and lengthening the time of disability) nor does it serve the system as a whole since added costs which are not necessary increases the cost of insurance for all participants.

To avoid this situation a major cultural shift needs to occur. As a start, insurers must stop pushing to reach full and final releases from their clients. A claim should be handled on its merits. If health care is needed it should be provided either through the programs of care mentioned above or through the diagnosis and treatment recommended by the independent examiner – within the dollar and time limits of the policy.

Once the claimant reaches medical recovery the claim is closed, but the claimant can return for more treatment – up to five years after their injury or other time limit in the legislation – if they can show that their condition has resurfaced and that it can be related to the original accident. This process has two big advantages: there is an incentive for the insurance company to stay in touch with their client to ensure they get the proper medical care so that they can return to normal function as quickly as possible; and there is no pressure to keep the claim open for long periods of time while negotiations for a release go on. The patient can come back for more treatment if that is what is fair and right.

With respect to the impact of removing a cash incentive, the study by Dr. David Cassidy et al. reported that when the Province of Saskatchewan changed its auto insurance system from a tort system where all compensation was given in cash vs. treatment to a no-fault system where treatment was provided instead of cash, the Saskatchewan system experienced a 28 per cent reduction in whiplash claims. Median time to closure of whiplash claims came down from 433 days to about 200 days. The study goes on to say that a decision to make a whiplash claim could involve factors beyond actual medical need and include a prospect of financial gain. As pointed out by the Ontario Auto Insurance Anti-Fraud Task Force, the adoption of programs of care combined with the elimination of cash for care will have the effect of substantially reducing the opportunity for fraud in the system.
In terms of the need to tie up capital against future claims, experience within the worker’s compensation system shows that the majority of claimants, once they have recovered from their injury do not need further care and do not come back for more treatment. Those that do, account for a fairly small proportion. The actuaries will quickly adapt to the rate of recurrence and are able to advise management as to how much capital to set aside for this eventuality. This is also the process followed by the Quebec auto insurance system which has demonstrated that their costs are the lowest in Canada.

**Recommendation**

**11.** There should be no cash settlements in the accident benefits portion of the Ontario auto insurance system for those benefits specified in the legislation as being for medical and rehabilitation care. Where the legislation provides for cash payments, for example for lost wages and lump-sum payments for catastrophically injured persons, these would, of course, continue to be paid.

**LEGAL REPRESENTATION, ADVERTISING AND CONTINGENCY FEES**

Insurance companies reported to me that about 25 to 35 per cent of claimants – some 15,000 to 20,000 a year – come to them at the time of making a claim or shortly thereafter with a lawyer already hired. From this point on, the insurance company must deal with their client only through their lawyer.

The incidence of legal representation quickly rises through the handling of the claim as difficulties arise. Going into the dispute resolution system at FSCO, there was virtually 100 per cent legal representation of clients and there is little reason to believe this situation has changed with the move of the dispute resolution system to the Licence Appeal Tribunal.

“Money out of the pockets of claimants.”  
— Justice Cunningham
Legal fees are not cheap. In the no-fault system alone the cost of contingency fees annually is approximately $100 million, and in the tort system the contingency fees are about $400 million. And this doesn’t count the legal costs incurred by insurers. (see Table 6 above). Clearly, a better way to deliver fair benefits to accident victims needs to be found.

Justice Cunningham’s Interim Report states:

“Ontario’s auto insurance system is extremely complicated…. Not only are the SABS complicated but so are the forms required to be completed by claimants to apply for benefits or for mediation and arbitration. ... In its early days, many clients accessed the DRS without a representative. This is no longer the case. ... Legal representation is not free and not necessarily inexpensive. Legal representatives are charging SABS claimants contingency fees which I am told can be as high as 30 or 35 per cent. This is money out of the pockets of claimants who need these funds to replace lost income and pay for treatment.”

In many ways, the need to have lawyers involved to negotiate settlements in what should be a straightforward, no-fault, accident benefits system signals a failure in the system. The system should not be as complex as it has come to be, there should not be so much uncertainty that neither accident victims nor insurers are confident as to what constitutes fair benefits.

Many of the recommendations in this report are directed at improving this situation. The simplification of the regulations referred to in a section below; the introduction of evidence-based programs of care, delivered promptly and without dispute, an independent examination centre to guide future care if needed and strong oversight by the regulator are all measures which should greatly improve speed of access to benefits, reduce the time to recovery and reduce disputes. In the section under improvements to the tort system, the recommendation that the independent examination centre opinion on the medical condition of the accident victim and the indication of future care be given deference by the court will further improve the quality and independence of evidence provided to a court.

Contingency fees permit enhanced access to legal representation, nevertheless, it is clear that there are concerns with how the contingency fee regime is operating in Ontario auto insurance cases today. The Law Society of Upper Canada’s Professional Regulation Committee (LSUC Committee) looked into the issue of advertising, contingency fees, referral fees and related matters in the practice of personal injury law. The LSUC Committee recently issued its final report which did not provide specific recommendations on contingency fees. However, in its June 23, 2016, Interim Report to Convocation, the Committee addressed Advertising and Fee Arrangements and had this to say:

"Ontario’s auto insurance system is extremely complicated.... Not only are the SABS complicated but so are the forms required to be completed by claimants to apply for benefits or for mediation and arbitration. ... In its early days, many clients accessed the DRS without a representative. This is no longer the case. ... Legal representation is not free and not necessarily inexpensive. Legal representatives are charging SABS claimants contingency fees which I am told can be as high as 30 or 35 per cent. This is money out of the pockets of claimants who need these funds to replace lost income and pay for treatment."
• In Ontario, lawyer advertising appears to have rapidly become “big business.”

• Referral fees – the practice of obtaining clients through advertising then passing them onto other lawyers for a fee – in personal injury law have become unreasonable and disproportionate and in many cases clients are not sufficiently aware that they are being referred to another lawyer.

• Due to the high cost of acquiring cases, counsel might not be able to afford to spend adequate time with the client or be prepared to take the case to trial if necessary.

• The Working Group is concerned that contingency fee pricing is not currently sufficiently transparent at the outset to consumers. In the personal injury market, the fee that a prospective client can expect to ultimately be charged often remains opaque, and it is difficult to determine whether a competitive fee structure is being proposed.

One area of particular concern is the reported practice by some lawyers of double dipping, which is, keeping part of the legal costs awarded to clients or charging their contingency fee on top of the legal costs. Keeping the disbursements and other practices not fully explained to the client up front are either in violation of the Solicitors Act or potentially questionable.

One of the more serious and unfortunate results of the delay in finalizing claims in the Ontario auto insurance system is the burden it places on claimants when they do not receive timely assistance. Consequently, clients often suffer financial hardship. To meet this need, specialized firms called settlement loan companies step into the picture. The settlement loan companies state that the loan is on a contingency basis, promising that no credit check is necessary and no principle or interest is payable unless the client wins a settlement from the insurance company. These companies provide bridge loans to auto insurance claimants ranging from an estimated $500 to $50,000 at high interest rates. There is very little transparency on who owns these settlement loan companies, how they obtain their financing and who refers clients to them.

Handling of an accident benefits claim in a no-fault system ought to be straightforward. There should be very little, if any reason to have to hire a lawyer or resort to a finance company to provide a bridge loan, especially in cases where there are minor injuries. In the future, when the core entitlement decisions are readily determined by programs of care and neutral independent examiners, there should be little structural need for conventional litigation and a consequent improvement in both health outcomes, and the efficiency and cost of the system.
Recommendations

12. There is clear urgency to make the accident benefits system simple and accessible without the need for legal representation. Since accident victims are in a vulnerable position and contingency-fee arrangements are not very transparent, the government should consider:

- Banning or restricting advertising and referral fees, and restricting contingency fees in personal injury cases, as the law society reports is being done in some jurisdictions such as in England, Wales and Australia.
- Requiring contingency-fee arrangements to be filed with the regulator, who should inquire into their fairness on a spot-check basis and work with the relevant authorities to curtail abuses if they arise.
- Settlement cheques should be made payable jointly to the accident victim and the lawyer. This will allow the accident victim to clearly understand the relationship between the total settlement and what he or she eventually receives.
- Claimants should be informed in writing, possibly on a final settlement schedule, of their right to appeal the fees charged by their lawyer and where to apply to do so.

13. The regulator should monitor the overall use of legal representation in the accident benefits system to analyze why claimants are needing to resort to legal advice. Also, the regulator should examine if the system should be further simplified, barriers should be removed or other practices changed to reduce the need for the time and expense of legal involvement.

14. The regulator should monitor, on a continuous basis, the length of time insurance companies are taking to provide benefits to claimants and determine if undue delays are causing financial harm to accident victims.
Dispute Resolution

In his final report, Justice Cunningham observed:

“One of the things I quickly realized...was how polarized the system has become. I am certain that when the first no-fault auto insurance system was introduced in 1990, policy makers did not contemplate that the claims process and the [dispute resolution system] would become so adversarial. This was very much reflected in the feedback received from stakeholders. The insurance industry points to the plaintiff bar as the source of the system’s problems, while the legal community blames the practices of the insurance industry. Neither is an accurate portrayal of the current system.”

In the Ontario auto insurance system, in one out of every three cases, the insurer and the claimant cannot agree on what is a fair compensation for the injury involved. Until the Licence Appeal Tribunal began in April 2016, accident benefits disagreements were first sent to mediation and evidence shows that almost 40 per cent of the time the disagreements were not resolved at mediation and cases proceeded to arbitration (see Appendix VI). Justice Cunningham made proposals to streamline the process of mediation/arbitration and his proposals have for the most part been accepted and implemented this past year. And, while on the right path, there is more work to be done to improve the system.

The recommendations noted in earlier sections regarding introduction of programs of care, continuous care, absence of cash settlements and an independent examination centre should go a long way towards reducing disputes in the no-fault system. There should be a goal to achieve a dispute level of no more than 10 per cent compared to the current average of over 30 per cent. Later, even more challenging goals can be set.

Following Cunningham’s Final Report, the dispute resolution system moved from FSCO to the Licence Appeal Tribunal of the Safety, Licensing Appeals and Standards Tribunals Ontario and many reforms were put in place.

INTERNAL APPEAL PROCESS

Justice Cunningham recommended that insurance companies set up an internal appeal process. The system of dispute resolution can be greatly helped if it becomes mandatory for insurers to have an internal appeal process. It should be staffed with case managers who have the experience and judgment to review decisions made by front line staff. The appeal team should be required to issue written decisions with explanations and support for their opinion.
Experience in the Quebec auto insurance and worker’s compensation systems has shown that an internal appeal function can usually resolve half or more of disputes without the need to go any further. The internal appeal function adds further value by acting as a feedback and training loop for front line staff who learn about mistakes they may have made and are able to improve their decisions going forward. It also gives management an opportunity to adjust and change procedures based on results from the appeal team.

The auto insurance regulator should monitor the functioning of the automobile insurance dispute resolution system. For example, if a particular insurance company is generating an unusual number of appeals at the Licence Appeal Tribunal or an unusual level of reversal of their adjudicative decisions on claims, the regulator should be given the right to audit and examine the internal management and training practices of those insurers with a view to improving decision making and lowering the number of disputes going to the dispute resolution system.

**GATEKEEPER FUNCTION**

There is great value in establishing a gatekeeper function at the Licence Appeal Tribunal, as recommended by Justice Cunningham. More recently, a gatekeeper function has been established at the Licence Appeal Tribunal. Experience in other systems shows that this function can significantly improve the efficiency of a dispute resolution system by ensuring that claims have all the necessary documents and qualifications to proceed to examination. The gatekeeper should perform two important services.

First they must make sure that an appeal is ready to proceed, that is, all the required documents are present and all processes have been followed, which is now in place. The gatekeeper function should also insist that the claimant provide evidence of having gone through the insurer’s internal appeal function before allowing the claim to proceed further.

Second, the gatekeeper must determine if new information is being introduced that has not previously been shared by either party with the other. The dispute resolution process should not become an exercise in gamesmanship or ambushing an opposing party. If there is new information that is relevant to the case it should be presented back to the original decision-maker at the insurance company or to the claimant. This might well change the decision and avoid the need to proceed any further. Only after the new information has been thoroughly considered and a new decision rendered should the appeal be allowed to proceed through the formal appeal process if necessary.
EXPERT WITNESSES

Overwhelmingly, disputes centre around or are related to the medical condition and necessary treatment of claimants. Trying to resolve this type of dispute through the process of sifting through competing expert opinions is not the most efficient or even the best way to arrive at fair conclusions. Both insurer and claimant will seek experts whose opinion is likely to support their position.

Justice Cunningham put it this way in his final report:

“Part of the culture shift that I see being needed within the Dispute Resolution System (DRS) is that medical experts appearing before adjudicators should have a duty to the DRS and not to the party that has retained them. Experts should be required to certify their duty to the tribunal and to provide fair, objective and non-partisan evidence. Arbitrators should ignore evidence that is not fair, objective or non-partisan.”

In order to meet the standard of objectivity and professional competence, adjudicators should be required to rely on the opinion of the independent examination centre (IEC) referred to above. IECs will be selected by the regulator who will create a roster of such centres. In the first place this serves the injured person extremely well since he or she will be getting advice from a highly qualified and independent team. Secondly, the opinion of the IEC can be relied upon, in the great majority of cases, to reflect some of the best medical thinking and techniques available.

As described earlier, the opinion of the IEC, in consultation with the family physician, must be relied upon during the management of care in the first instance that it becomes apparent that the current approach to treatment is not working. It should also be taken as final in the case of a claim going into dispute resolution. The case manager at dispute resolution may ask for a second evaluation from the roster of IECs if it appears necessary for whatever reason, but there must be no submission of competing evaluations by either the insurer or the claimant. This process would best satisfy the essential requirement that an expert witness be competent and objective and not beholden to either party in a dispute. It would also allow disputes to be handled efficiently, with less cost and with the least damage to trust in the system.

Dispute resolution in New Jersey’s auto insurance system has an analogous provision. There, the arbitrator of a dispute must use a certified medical review organization as designated by the New Jersey Department of Banking and Insurance to perform a medical review of the claimant’s case. The determination of the medical review organization is presumed to be correct unless the arbitrator finds the opinion to be clearly wrong, in which case he or she must provide written explanation of the reason.
Recommendations

15. Insurers should be required to establish an internal appeal process to provide an early resolution to claims and reduce the number that have to proceed to the external dispute resolution system. The regulator should monitor the effectiveness of the internal appeal process and be empowered to order corrective action if a particular insurer is generating an unusual number of claims to the dispute resolution process.

16. The gatekeeper function at the Licence Appeal Tribunal should insist that a claim has gone through the insurer’s internal appeal process before allowing it to proceed further. The gatekeeper should also determine that if new information is being introduced in the claim, it should go back to the original decision-maker to see if it changes the decision before the appeal proceeds.

17. In relation to medical condition and treatment, the opinion of the independent examination centre should be taken as definitive by arbitrators. If, in exceptional circumstances, the arbitrator has reason to be concerned about the independent examination centre opinion under consideration, the arbitrator can ask for a second opinion from a second independent examination centre from the regulator’s roster. Competing examination opinions from experts hired by either the claimant or the insurer should not be permitted.
Bringing Simplicity and Responsiveness to the System

Generally, all parties who participate in the system agree that is that the current legislation and SABS is complex and very difficult to interpret. This is surely a major contributing factor to disputes and disagreements.

The Ontario Trial Lawyers Association’s (OTLA) letter to me observes:

“Those who work daily within this system have a difficult time interpreting the complex legal maze that is now Ontario auto insurance. ... The ability of the average policyholder to competently manage his or her own insurance claims and related disputes is essentially non-existent. ... Both the tort and accident benefits legislation and regulations involve multiple, often incomprehensible tests for benefit and compensation entitlement that have led to decades of litigation, at an enormous cost. As much as possible, we must eliminate those tests that lead to uncertainty and litigation.”

Justice Cunningham put it this way:

“The SABS has become a complex and difficult document to interpret; many stakeholders noted that it is very difficult to work with it. Insurance companies need to make a considerable investment in training and developing adjusters, as does FSCO in respect to its mediators and arbitrators. Claimants need to find representatives well versed in the regulations. The learning curve associated with the SABS adds cost to the system. Other no-fault schedules are far less complex and not so procedure-oriented [emphasis added]. Everyone would benefit from a wholesale review of the SABS in an effort to simplify the regulation.”

— Ontario Trial Lawyers Association (OTLA)

See Appendix IV for the sections from the SABS that describe income replacement benefits, one of the main types of benefits available under the auto insurance policy. There are various procedural and definition provisions that would be relevant to a claim, but these are the main sections that set out the terms and amount of entitlement. It would take many close readings of this section to understand what the entitlement to benefits amounts to, if indeed a lay person were able to understand it at all.
There is an urgent need to address the complexity of the auto insurance regulations.

There should be well defined schedules of benefits with limited or no need for complex adjudication. The Société de l’assurance automobile du Québec (SAAQ) website offers a good example of simple, clearly understood benefits and how to access them.

The new rules should encourage the direct contact of insurers with their clients so that insurers and health care providers can work collaboratively for the health care needs of their client.

Having the regulator responsible for formulating the rules (as opposed to government amending regulations) will allow this function to respond to the need to change and evolve much more efficiently than the current structure that has to be deployed before any change can be made.

Moreover, the rules should focus on outcomes rather than process. Instead of particular forms to be used there should be a requirement to meet certain standards; for example, standards of care, standards of fair treatment, benefit of the doubt to claimants and other key components of a well-functioning system.

---

**Recommendations**

**18.** There is an urgent need to revise and simplify the legislation and current set of regulations and focus on desired outcomes and less on the details of process.

**19.** The new regulator should be given authority to make regulations (already underway). Rules should support insurers to be in direct contact with their clients so that they can manage care and recovery for their clients.
CONSUMER CHOICE – LEAVE IT TO THE MARKETPLACE...

The question of consumer choice is a difficult one to address since the auto insurance system at its heart is a safety net designed to provide needed coverage and not a suite of options based on the personal opinion of the policy holder. Consumer choice in this context usually means allowing drivers to pick a less costly coverage if they are willing to take the risk of a lower safety net. This may result in a compromise of people’s safety or a lack of access to necessary treatment. On the other hand, the option to buy more coverage brings with it the need to ensure there is transparency across insurers and some confusion and lack of understanding of what is being purchased may result.

Having said that, there is a legitimate question as to how far the safety net should extend. Should the mandatory safety net cover just the most serious injuries? After all, coverage costs money. Should the government insist on coverage for catastrophic injuries and allow consumers to buy coverage for less serious injuries if they want to?

These questions lie at the heart of consumer choice. If current trends like ridesharing are any indication, increasingly in the future, consumers will push to be allowed to tailor their purchases to their needs rather than be forced into a one size fits all product. How the government addresses this movement is of great importance. This is not the purview of this study, but it is true to say that it is an issue that is not going to go away and that the government needs to equip itself with sufficient structures and research to understand what society is likely to need in the near- and medium-term future. All of these issues should be taken into consideration as the new regulator is established.

Having said that, there are some particular cases where consumer choice can make sense. For example, according to the Canadian Life and Health Association close to 70 per cent of drivers have access to some form of medical or income replacement insurance, mostly through their workplaces, in addition to carrying auto insurance. At the same time auto insurance is a second payer – after other insurance coverages of the claimant have been used – which means that for those drivers who already have workplace insurance, they are caught between two competing insurance companies with potentially different claims processes and criteria for accepting claims. As well they must first use up their workplace insurance entitlements before they can access their auto insurance. This is a source not only of administrative complexity but also a source of surprise and frustration to claimants.
As well, there are several drivers who, due to their youth or other circumstances, would like to carry less insurance than the standard policy. After protecting others through a minimum liability insurance, a sensible system of consumer choice whereby a person may consciously take less auto insurance and save money should be explored.

At the other end of the scale, insurers should be empowered to offer additional coverages and new products if consumers are willing to pay and insurers should be encouraged to innovate and introduce new products.

Consumer choice is a powerful force that is going to change the nature of auto insurance in the not too distant future. An independent regulator held accountable for the functioning and responsiveness of the system, less prescriptive regulation, more outcome-based regulation and more flexibility on setting price should all be part of an overall regime to encourage and adopt innovation.

PROVIDING ENHANCED EDUCATION TO CONSUMERS

One of the frequent observations of stakeholders familiar with the system, is that consumers are generally ignorant of their insurance coverage and hence become annoyed and feel taken advantage of when it comes time to access benefits. Simplifying the regulations concerning entitlements will go a long way to increasing transparency and trust.

Two actions might further improve this situation:

One consideration could be to institute an “Office of the Driver Adviser” or something similar to the proposed “Office of the Consumer” to the Financial Services Regulatory Authority. Such an office would be available to explain how auto insurance works, how to access benefits efficiently and the rights and obligations of drivers. Second, it may be useful to consider making some basic insurance concepts part of the driver education program and requirement to pass a driving test.

The Ontario Auto Insurance Anti-Fraud Task Force also had a number of good suggestions to help create an informed consumer as a protection against illegal or fraudulent practices. The task force’s final report suggested, among other things:

“With respect to prevention, our key recommendations include:

• “The government should join with insurers to form an Anti-Fraud Awareness Implementation Group to implement a consumer engagement and education strategy. This group should oversee the creation of:
“educational material in different media that could instruct consumers at critical moments such as when they learn to drive, select an insurer, choose optional coverage, collide with another vehicle or make an insurance claim; and

“a dedicated, multilingual website that would explain how to make an auto insurance claim, what to expect by way of treatment and recovery after an injury, and how to avoid, detect and report improper activity.”31

---

**Recommendation**

**20.** Consumer education in the field of auto insurance is a key component of a well-functioning system. In conjunction with making the rules and regulations governing the system simpler, the government should seriously address the need for enhanced consumer education. The recommendations of the Ontario Auto Insurance Anti-Fraud Task Force and the creation of an “Office of Driver Adviser” should be considered.

---

**ENSURING GOOD FAITH**

At present there are no specific rules about the consequences of false statements in the context of tort liability claims for damages. This needs to change to send a clear signal that the tort system will not be used to fuel fraudulent claims.

Claims under insurance policies, including claims for accident benefits are subject to provisions that apply consequences if a person makes a false statement. The logic for this is strong. Benefits administrators largely depend on the claimant’s own recitation of facts, portrayal of symptoms and assertions of impairment in order to evaluate entitlement. Assessors and adjudicators also must make decisions based on the veracity of the claimant’s own description of condition and circumstance. Much hinges on that foundation of personal credibility.
If a testimony is not reliable, then the system is deprived of the best evidence necessary to determine entitlement.

The Insurance Act recognizes the public policy of negating entitlement for dishonest claimants. Section 233 of the Insurance Act states:

**Misrepresentation or violation of conditions renders claim invalid**

233. (1) Where,

(a) an applicant for a contract,

(i) gives false particulars of the described automobile to be insured to the prejudice of the insurer, or

(ii) knowingly misrepresents or fails to disclose in the application any fact required to be stated therein;

(b) the insured contravenes a term of the contract or commits a fraud; or

(c) the insured wilfully makes a false statement in respect of a claim under the contract,

a claim by the insured is invalid and the right of the insured to recover indemnity is forfeited. R.S.O. 1990, c. I.8, s. 233 (1).

**Statutory accident benefits protected**

(2) Subsection (1) does not invalidate such statutory accident benefits as are set out in the Statutory Accident Benefits Schedule. R.S.O. 1990, c. I.8, s. 233 (2); 1993, c. 10, s. 1.

Section 233 broadly applies the false statement rule, but subsection 233(2), above, paradoxically exempts accident benefits claimants from the general rule.
Within the SABS regulation a modified version of the false statement rule is applied. Section 53 of the SABS 2010 states that an insurer may terminate the payment of benefits to or on behalf of an insured person if the insured person has wilfully misrepresented material facts with respect to the application for the benefit but not to any other aspects of evidence provided.

---

**Recommendation**

21. Repeal subsection 233 (2) and amend 233 (1) so that SABS claims and tort claims are subject to exactly the same rule that applies to other auto insurance claims.

---

**IMPROVEMENTS TO THE TORT SYSTEM**

Applications for compensation under tort in Ontario accounts for a significant part of the premiums of the system – equal to or greater than the first-party, no-fault system (see Table 4 above).

The FSCO Three Year Review states that:

“Between the 2004 to the 2013 accident years, [bodily injury] claims costs for private passenger vehicles increased from approximately $1.32 billion to $2.48 billion, an increase of approximately 88 [per cent]. This is mainly due to a significant increase in the frequency of these claims.”32 While at the same time the number injuries, especially major injuries, from motor vehicle collisions was falling rapidly (see Chart 2 above). The Pinnacle Study of bodily injury claims found that the majority (67 per cent) of claimants for serious and permanent impairment had suffered soft tissue injuries – sprains and strains – at the time of the accident.

Clearly something is happening in the bodily injury portion of the system that is not being driven by changes in the number or severity of injuries. As well, it seems that the generous benefits in the no-fault portion of the system are not having the effect of reducing the amounts awarded under tort claims, while the no-fault system has itself become fraught with legal disputes and delays.

---

The inefficiency and cost of tort claims has a large impact on the cost of the system as a whole.
The improvements to medical care described above should significantly improve the incidence of permanent impairments, particularly from soft tissue injuries. As well, timely and objective recommendations of care from independent examination centres should reduce disputes and improve care for accident victims. Nonetheless, a number of administrative inefficiencies and some unfairness to one party or the other has crept into the system. This has led to drawn-out negotiations and in the relatively few instances where the cases go to trial, there are long delays – up to two or three years, and considerable costs before a claimant gets to receive any benefits due to them.

The current process for tort claims follows procedures in the court system developed over many years for all kinds of claims, some of which are highly complex. Auto insurance tort claims, while numerous (about 15,000 to 17,000 a year) are relatively straightforward. The issues in dispute recur frequently and seldom involve complex issues of law.

Under the current system, the basic issue of parties exchanging relevant documents and information is highly inefficient. There is no prescribed set of documents that must be produced by each party. If one party refuses to offer certain documents, the other must make a motion to the court, often a lengthy process, to compel the party to produce the documents. There is no provision for an early examination of the plaintiff or expert witnesses, which might help resolve the case before it has to go to court. As a point of comparison, the dispute resolution system at the Licence Appeal Tribunal provides for an early “case conference” to resolve issues before the case proceeds.

In the tort system, examination for discovery under oath comes much later in the litigation process and does not permit the examination under oath of expert witnesses for either side. And there is no process to encourage parties to move the case along and avoid delay.

In terms of compensation under tort, measurement of the amount and nature of future care is an area that is particularly complex and hotly contested. The opinion of an objective independent examination centre should go a long way to helping the parties to a claim come to a fair resolution of this matter. As well, amounts awarded under the no-fault system are difficult to relate to the awards made under the tort system leading to the potential for double dipping by the claimant.

As it stands today, policyholders are paying for a tort system with very little transparency as to its costs and relative benefits. And accident victims – who pay a high price for legal representation – are walking away with a lot less compensation than they ought to get. Furthermore, the tort system excludes access to drivers who are at fault, (approximately 30 per cent of accident victims). The challenge is to find the right balance between the freedom and right to sue for damages and the time and cost involved. After all it is fundamentally this reason why the no fault accident benefit system was created in the first place.
Recommendations

22. The government should consider implementing ways to make the system for automobile accident tort claims more streamlined, particularly:
   - Creating a prescribed list of documents that must be produced.
   - Allowing for earlier examination under oath for both claimants and expert witnesses.
   - Providing for some form of case management that encourages cases to proceed with a minimum of delay.

23. The regulator should monitor the awards and costs of the tort system to determine if changes need to be made to the no-fault system to avoid having to sue under tort and to recommend changes to the tort system if costs appear to outweigh benefits from a public policy point of view.

24. The independent examination centre’s opinion as to the claimant’s medical diagnosis and future care needs, should be given a zone of deference by the courts in tort cases. This means that the opinion of the independent examination centre should be taken as definitive unless there is compelling reason to doubt it.

25. There should be full deductibility of accident benefits awards from tort awards.

26. Contingency fees in tort cases should be made fully transparent to the client, including notification that fees can be appealed.

27. Claimants should be informed in writing, possibly on a final settlement schedule, of their right to appeal the fees charged by their lawyer.

28. Settlement cheques should be made payable jointly to the claimant and his or her lawyer to allow the claimant to fully understand and accept the disposition of the funds.
INNOVATION AND PRICE REGULATION

It is safe to say that in just a few years – perhaps as few as ten years - automobile insurance in Ontario will not be the same as it is today. In every part of the economy change and innovation is taking place. Traditional providers are being displaced and whole sectors of the economy are being disrupted by technology. The financial industry is no exception. Automobile insurance in Ontario, a multibillion dollar industry, is ripe for disruption.

In order to adapt to consumer demands, it is more than likely that auto insurers will need to merge or cooperate with players in other industries such as car manufactures, technology companies or providers of home security systems who are attempting to gain primary control over the relationship with home owners through knowledge-based monitoring of their behaviour.

It is critical that the legal and regulatory framework for the industry be so organized as to allow rapid evolution to take place in at least a rational and secure way, while continuing to protect consumers. The current framework is singularly unsuited for this role because it is not structured to be flexible and able to adapt to change.

Let us imagine one plausible disruptive scenario. A major automobile manufacturer decides to sell their cars with insurance bundled in at $400 for three years or 30,000 kilometres, whichever comes sooner. The coverage is simple, $x for medical care geared to the loss of a limb or bodily function or damage to the brain or nervous system; repair of the automobile. Part of this scenario, lifetime insurance coverage for damage and repair to the car, has already been announced by Tesla for the Asian market and by Volkswagen in Europe. It is not a stretch to find that the coverage could be extended to health care and income loss for accident victims as car manufacturers seek to find new sources of income. How will the government react? Will it try to protect the existing industry by making such an offer illegal? How will they deal with consumers who demand they be allowed to purchase such a product? How will the SABS apply? This is not a dissimilar scenario than what is being faced by the hospitality industry and the taxi industry today. To react to consumer demand, governments will have to rethink the meaning of the health care safety net incorporated into the current auto insurance product and flexibility around how it might be delivered, as large parts of the existing regulations would likely become obsolete. The long and cumbersome premium rate setting regime will be outdated or even useless. There will be far fewer disputes and costs.
While all of these are important questions that address how the system might evolve, the point is that the system needs to be geared to adapting to rapid change demanded by consumers. For example, to what extent do consumers really want or need the level of coverage the government has deemed necessary? Are there better ways of delivering value? At the present time, several of the key players are simply carrying on as if change will come gradually. That’s a recipe for unwelcome disruption.

The system of pricing approvals today is becoming quickly outdated, time consuming and expensive. It needs to be addressed. Basically, it is a cost plus margin-for-profit system. Insurance companies present their costs and are given a margin, until recently five per cent, above their costs to set their premium. Critics have pointed to this system as being unfair to consumers since it protects insurance company profits and subsidizes inefficient providers. There are some 100 insurance companies providing auto insurance in Ontario with about 20 companies accounting for the majority of market share. Because of the built-in inertia and complexity of the rate approval process, insurers’ ability to respond to market changes and take advantage of opportunities for innovation and competitiveness is reduced.

Commenting on the current rate regulation regime in Ontario, the FSCO Mandate Review expert advisory panel made the following observation:

“[There is] an international trend away from regulation of the pricing of automobile insurance while consumers seek more personalized coverage options. Many jurisdictions, particularly throughout the United States and Europe, have moved away from the prior approval system that is used to regulate auto insurance rates in Ontario. We heard from one U.S. jurisdiction that it experienced auto insurance rate reductions for nearly 80 per cent of drivers following the introduction of a more flexible system.”

— FSCO Mandate Review
Recommendations

29. To the extent possible, the regulatory regime should be overhauled to encourage insurers to innovate and introduce new products even on a trial or experimental basis.

30. The government should undertake a comprehensive review of auto insurance pricing alternatives with a view to providing more competition in the marketplace.
Role of the Regulator

If Ontario’s system of government legislation with private sector delivery has any chance of operating well, a new role for the insurance regulator must be constructed. As discussed earlier, individual insurance companies, much less 100 of them, are in no position to, nor should they devise rules governing the delivery of insurance and the general operation of the insurance marketplace. Further, the government of the day should not be tasked with directly addressing these issues because there are more pressing big-picture issues to be addressed. In the absence of a strong central guiding force to conduct these functions, disagreement, confrontation and dysfunction are bound to prevail.

The insurance regulator in this case must take on the rule-making authority normally granted to an administrative tribunal. That is, the regulator must be an independent office and must have the authority to make policies and regulations which are binding in the field of automobile insurance. The Regulator should be responsible for the efficient and effective functioning of the auto insurance marketplace. As long as the policies and regulations set by the regulator are in keeping with the letter and spirit of the legislation, the regulator’s actions should not be challenged in court.

Fortunately, the FSCO Mandate Review also recommended independent regulatory powers for the new Financial Services Regulatory Authority (FSRA). The government has accepted this advice and the FSRA Act was passed in December which, in summary:

- Establishes FSRA as a Crown agency which brings with it specific accountability requirements such as annual reports, agency business plans, and risk assessments.
- Sets out the object of FSRA to regulate the regulated sectors and requires FSRA to work with the Minister to prepare to carry out that regulatory function.
- Establishes the foundation of the governance structure for the agency by enabling the government to appoint a Board, composed of at least three and no more than 11 directors, and to designate one director as Chair.
- Specifies that the Board will govern FSRA’s affairs, including appointing a CEO and making bylaws.
• Helps facilitate the start-up of the organization by providing for potential loans from the Minister of Finance if required and for assessments from the regulated sectors to finance the new regulator.

The key next step is the appointment of the initial Board to work with the Ministry of Finance on an implementation plan.

Of particular importance in the context of automobile insurance is that the regulator, in addition to its role of consumer protection, must have its responsibilities expanded to include or enhance the following:

• Establishment of programs of care for common injuries and establishment of a roster of qualified independent examination centres. This must be a central role of the regulator. The office will need to acquire staff with medical, health care and rehabilitation expertise to ensure that medical and market practices are constantly monitored and the effectiveness of programs of care and the quality of independent examinations are monitored and adjusted as needed. If this is not done on an ongoing basis the system risks deterioration and a return to the dysfunction it is currently experiencing.

• Establishment of a roster of independent examination centres and overseeing the operation of the centres to ensure that the advice given is objective, medically sound and reasonable in the circumstances.

• Proactive analysis and monitoring of the auto insurance marketplace with changes to policies and practices being proactively promulgated. This will require statistical, analytical, medical and policy expertise to reside with the regulator.

• Conduction of research, working alongside the government, into new and emerging health care challenges such as concussions, chronic pain and post-traumatic stress.

• Monitoring the business practices of insurance companies and providers. If a particular insurance company is exhibiting an unusual number of disputes going into the Dispute Resolution process, the regulator should have the power to audit that insurer with a view to determining if claim handling or management practices are contributing to an unusual level of consumer disagreement with decisions being rendered.

• Monitoring the accident benefit, tort and dispute resolution processes to ensure that they are operating efficiently and that lessons learned are continuously translated into policy changes and improvements to benefit consumers.

The regulator should be required to set objective targets for the insurance marketplace and to report at least annually, or as regularly as seen fit by Cabinet, to the Legislature on
performance versus the targets. The targets should be set in a Memorandum of Agreement between the regulator and the Minister of Finance and should, as an illustration, include targets and improvement plans in areas such as:

- Average number of days to restore accident victims to health.
- Level and trend of accident victims acquiring permanent impairments.
- Average number and percentage of claims going to dispute resolution.
- Trend and number of benefit claims compared with automobile accidents in the province.
- Comparison of premium rates vs. other provinces.
- Average settlement costs in the no-fault and tort portions of the system, and the amount of funds going directly to medical and other needs of claimant’s vs. examination, legal and other overhead costs.

Recommendations

31. A new, independent regulator with its own board of directors for automobile insurance be established either as part of the new Financial Services Regulatory Authority or a new separate office specifically for auto insurance.

32. The Insurance Act and regulations should be amended to include only broad principles and entitlements for benefits. The regulator should be responsible for interpreting the legislation and, following appropriate consultation with stakeholders, creating policies, guidelines and rules that are enforceable and not subject to challenge in the courts as long as they are in keeping with the letter and spirit of the legislation.

33. The new regulator needs to be equipped with the staff and expertise to act as a central governor over the automobile insurance marketplace including the conduct of all the players and providers within that marketplace.

34. The new regulator should be required to set standards of performance for the marketplace and to be accountable to the government for meeting those targets.
Role of Insurance Companies

Insurers do carry a share of the blame for their reputation as being difficult to deal with. In a new system the role of insurance companies will also have to change. They must move from an approach of “closing a claim” to actually providing appropriate medical care and income support to injured parties. This after all is the fundamental intent of the legislation. During my inquiries I was surprised by how little effort, overall, the insurance companies were making to manage health care for their clients instead of managing costs. The argument they presented was that they were effectively precluded from directly helping their clients due to the presence of lawyers who acted as gatekeepers. However, a large part of their clients, more than half, did not come to the insurers with a lawyer in the first instance. I believe that insurers will need to change their mind set and approach to their clients.

Insurance companies must stop seeking to close claims via a cash settlement, something that changes the focus from health care to cash. Injured persons should be able to return for additional care as needed in accordance with the terms of the insurance policy.

Insurance companies will have to equip themselves with staff who have an appropriate level of medical and rehabilitation expertise. Their front line staff must become “case managers” rather than “claims adjusters.” They need to monitor the effectiveness of health care providers and give feedback to both providers and the regulator on issues or conditions which can improve care for injured persons or remove barriers to early and efficient care.

They will need to establish an internal appeals function and they will need to monitor the reasons and outcomes of appeals and improve their management of claims accordingly.

Following a goal that is aligned directly with the intent of the legislation and focusing on the client’s needs rather than on costs will yield significant results both in the value delivered to customers as well as reducing costs.

They will also need to innovate and compete on service and cost which is a role that would ensure their continued relevance and value and which most of them would welcome. The leading insurers of auto insurance, collectively represent a deep and formidable pool of talent. In a marketplace structured to take advantage of this resource, and with the right attitude, both the insurers and consumers can derive tremendous value.
Recommendation

35. Insurance companies must change their role from managing costs to delivering care to their customers. They will need to change their claims management and related practices in the process. They will also need to innovate and compete on service and cost.

CATASTROPHIC IMPAIRMENT – ONTARIO REGULATION 34/10: STATUTORY ACCIDENT BENEFITS SCHEDULE – EFFECTIVE SEPTEMBER 1, 2010

Catastrophic Impairment

3.1 (1) For the purposes of this Regulation, an impairment is a catastrophic impairment if an insured person sustains the impairment in an accident that occurs on or after June 1, 2016 and the impairment results in any of the following:

1. Paraplegia or tetraplegia that meets the following criteria:
   i. The insured person’s neurological recovery is such that the person’s permanent grade on the ASIA Impairment Scale, as published in Marino, R.J. et al., *International Standards for Neurological Classification of Spinal Cord Injury*, Journal of Spinal Cord Medicine, Volume 26, Supplement 1, Spring 2003, can be determined.
   ii. The insured person’s permanent grade on the ASIA Impairment Scale is or will be,
      A. A, B or C, or
      B. D, and
   2. the insured person requires urological surgical diversion, an implanted device, or intermittent or constant catheterization in order to manage a residual neuro-urological impairment, or
   3. the insured person has impaired voluntary control over anorectal function that requires a bowel routine, a surgical diversion or an implanted device.
2. Severe impairment of ambulatory mobility or use of an arm, or amputation that meets one of the following criteria:

i. Trans-tibial or higher amputation of a leg.

ii. Amputation of an arm or another impairment causing the total and permanent loss of use of an arm.

iii. Severe and permanent alteration of prior structure and function involving one or both legs as a result of which the insured person’s score on the Spinal Cord Independence Measure, Version III, item 12 (Mobility Indoors), as published in Catz, A., Itzkovich, M., Tesio L. et al, A multicentre international study on the Spinal Cord Independence Measure, version III: Rasch psychometric validation, Spinal Cord (2007) 45, 275-291 and applied over a distance of up to 10 metres on an even indoor surface is 0 to 5.

3. Loss of vision of both eyes that meets the following criteria:

i. Even with the use of corrective lenses or medication,

   A. visual acuity in both eyes is 20/200 (6/60) or less as measured by the Snellen Chart or an equivalent chart, or

   B. the greatest diameter of the field of vision in both eyes is 20 degrees or less.

ii. The loss of vision is not attributable to non-organic causes.

4. If the insured person was 18 years of age or older at the time of the accident, a traumatic brain injury that meets the following criteria:

i. The injury shows positive findings on a computerized axial tomography scan, a magnetic resonance imaging or any other medically recognized brain diagnostic technology indicating intracranial pathology that is a result of the accident, including, but not limited to, intracranial contusions or haemorrhages, diffuse axonal injury, cerebral edema, midline shift or pneumocephaly.

ii. When assessed in accordance with Wilson, J., Pettigrew, L. and Teasdale, G., Structured Interviews for the Glasgow Outcome Scale and the Extended Glasgow Outcome Scale: Guidelines for Their Use, Journal of Neurotrauma, Volume 15, Number 8, 1998, the injury results in a rating of,

   A. Vegetative State (VS or VS*), one month or more after the accident,

   B. Upper Severe Disability (Upper SD or Upper SD*) or Lower Severe Disability (Lower SD or Lower SD*), six months or more after the accident, or
C. Lower Moderate Disability (Lower MD or Lower MD*), one year or more after the accident.

5. If the insured person was under 18 years of age at the time of the accident, a traumatic brain injury that meets one of the following criteria:

i. The insured person is accepted for admission, on an in-patient basis, to a public hospital named in a Guideline with positive findings on a computerized axial tomography scan, a magnetic resonance imaging or any other medically recognized brain diagnostic technology indicating intracranial pathology that is a result of the accident, including, but not limited to, intracranial contusions or haemorrhages, diffuse axonal injury, cerebral edema, midline shift or pneumocephaly.

ii. The insured person is accepted for admission, on an in-patient basis, to a program of neurological rehabilitation in a paediatric rehabilitation facility that is a member of the Ontario Association of Children’s Rehabilitation Services.

iii. One month or more after the accident, the insured person’s level of neurological function does not exceed category 2 (Vegetative) on the King’s Outcome Scale for Childhood Head Injury as published in Crouchman, M. et al, A practical outcome scale for paediatric head injury, Archives of Disease in Childhood, 2001: 84: 120-124.

iv. Six months or more after the accident, the insured person’s level of neurological function does not exceed category 3 (Severe disability) on the King’s Outcome Scale for Childhood Head Injury as published in Crouchman, M. et al, A practical outcome scale for paediatric head injury, Archives of Disease in Childhood, 2001: 84: 120-124.

v. Nine months or more after the accident, the insured person’s level of function remains seriously impaired such that the insured person is not age-appropriately independent and requires in-person supervision or assistance for physical, cognitive or behavioural impairments for the majority of the insured person’s waking day.

6. Subject to subsections (2) and (5), a physical impairment or combination of physical impairments that, in accordance with the American Medical Association’s Guides to the Evaluation of Permanent Impairment, 4th edition, 1993, results in 55 per cent or more physical impairment of the whole person.
7. Subject to subsections (2) and (5) a mental or behavioural impairment, excluding traumatic brain injury, determined in accordance with the rating methodology in Chapter 14, Section 14.6 of the American Medical Association’s Guides to the Evaluation of Permanent Impairment, 6th edition, 2008, that, when the impairment score is combined with a physical impairment described in paragraph 6 in accordance with the combining requirements set out in the Combined Values Table of the American Medical Association’s Guides to the Evaluation of Permanent Impairment, 4th edition, 1993, results in 55 percent or more impairment of the whole person.

8. Subject to subsections (3) and (5), an impairment that, in accordance with the American Medical Association’s Guides to the Evaluation of Permanent Impairment, 4th edition, 1993 results in a class 4 impairment (marked impairment) in three or more areas of function that precludes useful functioning or a class 5 impairment (extreme impairment) in one or more areas of function that precludes useful functioning, due to mental or behavioural disorder. O. Reg. 251/15, s. 3; O. Reg. 116/16, s. 1.

(2) Paragraphs 6 and 7 of subsection (1) do not apply in respect of an insured person who sustains an impairment as a result of an accident unless,

(a) two years have elapsed since the accident; or

(b) an assessment conducted by a physician three months or more after the accident determines that,

(i) the insured person has a physical impairment or combination of physical impairments determined in accordance with paragraph 6 of subsection (1), or a combination of a mental or behavioural impairment and a physical impairment determined in accordance with paragraph 7 of subsection (1) that results in 55 per cent or more impairment of the whole person, and

(ii) the insured person’s condition is unlikely to improve to less than 55 per cent impairment of the whole person. O. Reg. 251/15, s. 3.

(3) Paragraph 8 of subsection (1) does not apply in respect of an insured person who sustains an impairment as a result of the accident unless,

(a) two years have elapsed since the accident; or

(b) a physician states in writing that the insured person’s impairment is unlikely to improve to less than a class 4 impairment (marked impairment) in three or more areas of function that precludes useful functioning, due to mental or behavioural disorder. O. Reg. 251/15, s. 3.
(4) Subsection (5) applies to an insured person who was under the age of 18 at the time of the accident and whose impairment is not a catastrophic impairment within the meaning of subsection (1). O. Reg. 251/15, s. 3.

(5) If the insured person’s impairment can reasonably be believed to be a catastrophic impairment for the purposes of paragraph 6, 7 or 8 of subsection (1), the impairment shall be deemed to be the impairment referred to in paragraph 6, 7 or 8 of subsection (1) that is most analogous to the impairment, after taking into consideration the developmental implications of the impairment. O. Reg. 251/15, s. 3.

Appendix IV

INCOME REPLACEMENT BENEFITS – ONTARIO REGULATION 34/10:
STATUTORY ACCIDENT BENEFITS SCHEDULE – EFFECTIVE
SEPTEMBER 1, 2010

Income Replacement Benefits
Interpretation

4. (1) In this Part,

“gross employment income” means salary, wages and other remuneration from employment, including fees and other remuneration for holding office, and any benefits received under the Employment Insurance Act (Canada), but excludes any retiring allowance within the meaning of the Income Tax Act (Canada) and severance pay that may be received; (“revenu brut d’emploi”)

“gross weekly employment income” means, in respect of an insured person, the amount of the person’s gross annual employment income, as determined under subsection (2), divided by 52; (“revenu brut hebdomadaire d’emploi”)

“other income replacement assistance” means, in respect of an insured person who sustains an impairment as a result of an accident,

(a) the amount of any gross weekly payment for loss of income that is received by or available to the person as a result of the accident under the laws of any jurisdiction or under any income continuation benefit plan, other than,

(i) a benefit under the Employment Insurance Act (Canada),

(ii) a payment under a sick leave plan that is available to the person but is not being received, and

(iii) a payment under a workers’ compensation law or plan that is not being received by the person because the person has elected under the workers’ compensation law or plan to bring an action and is not entitled to the payment, and
(b) the amount of any gross weekly payment for loss of income, other than a benefit or payment described in subclauses (a) (i) to (iii) that may be available to the person as a result of the accident under the laws of any jurisdiction or under any income continuation benefit plan but is not being received by the person and for which the person has not made an application. ("autre assistance au titre du remplacement du revenu") O. Reg. 34/10, s. 4 (1).

(2) The gross annual employment income of an insured person is determined as follows:

1. In the case of a person referred to in subparagraph 1 i of subsection 5 (1) who was not a self-employed person at any time during the four weeks before the accident, the person’s gross annual employment income is whichever of the following amounts the person designates:
   
   i. The person’s gross employment income for the four weeks before the accident, multiplied by 13.
   
   ii. The person’s gross employment income for the 52 weeks before the accident.

2. Subject to paragraph 3, the person’s gross annual employment income is his or her gross employment income for the 52 weeks before the accident if,

   i. the person qualifies for a benefit under subparagraph 1 i of subsection 5 (1) and was a self-employed person at any time during the four weeks before the accident, or

   ii. the person qualifies for a benefit under subparagraph 1 ii of subsection 5 (1).

3. If the person described in subparagraph 2 i was self-employed for at least one year before the accident, the person may designate as his or her gross annual employment income the amount of his or her gross employment income during the last fiscal year of the business that ended on or before the day of the accident. O. Reg. 34/10, s. 4 (2); O. Reg. 370/10, s. 1.

(3) A self-employed person’s weekly income or loss from self-employment at the time of the accident is the amount that would be 1/52 of the amount of the person’s income or loss from the business for the last completed taxation year as determined in accordance with Part I of the Income Tax Act (Canada). O. Reg. 34/10, s. 4 (3).

(4) A self-employed person’s loss from self-employment after an accident is determined in the same manner as losses from the business in which the person was self-employed would be determined under subsection 9 (2) of the Income Tax Act (Canada) without making any deductions for,

   (a) any expenses that were not reasonable or necessary to prevent a loss of revenue;
(b) any salary expenses paid to replace the self-employed person’s active participation in the business, except to the extent that the expenses are reasonable in the circumstances; and

(c) any non-salary expenses that are different in nature or greater than the non-salary expenses incurred before the accident, except to the extent that those expenses are reasonable in the circumstances and necessary to prevent or reduce any losses resulting from the accident. O. Reg. 34/10, s. 4 (4).

(5) If, under the Income Tax Act (Canada) or legislation of another jurisdiction that imposes a tax calculated by reference to income, a person is required to report the amount of his or her income, the person’s income before an accident shall be determined for the purposes of this Part without reference to any income the person has failed to report contrary to that Act or legislation. O. Reg. 34/10, s. 4 (5).

(6) The amount of a person’s gross annual employment income and the amount of the person’s income or loss from self-employment may be adjusted for the purposes of this Part to reflect any subsequent change in the amount determined by the Canada Revenue Agency under the Income Tax Act (Canada) or by the relevant government or agency under the legislation of another jurisdiction that imposes a tax calculated by reference to income. O. Reg. 34/10, s. 4 (6).

Eligibility criteria

5. (1) The insurer shall pay an income replacement benefit to an insured person who sustains an impairment as a result of an accident if the insured person satisfies one or both of the following conditions:

   1. The insured person,
      i. was employed at the time of the accident and, as a result of and within 104 weeks after the accident, suffers a substantial inability to perform the essential tasks of that employment, or
      ii. was not employed at the time of the accident but,
         A. was employed for at least 26 weeks during the 52 weeks before the accident or was receiving benefits under the Employment Insurance Act (Canada) at the time of the accident,
         B. was at least 16 years old or was excused from attending school under the Education Act at the time of the accident, and
         C. as a result of and within 104 weeks after the accident, suffers a substantial inability to perform the essential tasks of the employment in which the insured person spent the most time during the 52 weeks before the accident.
2. The insured person,
   i. was a self-employed person at the time of the accident, and
   ii. suffers, as a result of and within 104 weeks after the accident, a substantial inability to perform the essential tasks of his or her self-employment. O. Reg. 34/10, s. 5 (1).

(2) Despite subsection (1), an insured person is not eligible to receive income replacement benefits if he or she is eligible to receive and has elected under section 35 to receive either a non-earner benefit or a caregiver benefit under this Part. O. Reg. 34/10, s. 5 (2).

**Period of benefit**

6. (1) Subject to subsection (2), an income replacement benefit is payable for the period in which the insured person suffers a substantial inability to perform the essential tasks of his or her employment or self-employment. O. Reg. 34/10, s. 6 (1).

(2) The insurer is not required to pay an income replacement benefit,

   (a) for the first week of the disability; or
   
   (b) after the first 104 weeks of disability, unless, as a result of the accident, the insured person is suffering a complete inability to engage in any employment or self-employment for which he or she is reasonably suited by education, training or experience. O. Reg. 34/10, s. 6 (2).

**Amount of weekly income replacement benefit**

7. (1) The weekly amount of an income replacement benefit payable to an insured person who becomes entitled to the benefit before his or her 65th birthday is the lesser of “A” and “B” where,

   “A” is the weekly base amount determined under subsection (2) less the total of all other income replacement assistance, if any, for the particular week the benefit is payable, and

   “B” is $400 or, if an optional income replacement benefit referred to in section 28 has been purchased and applies to the person, the amount fixed by the optional benefit. O. Reg. 34/10, s. 7 (1).

(2) For the purposes of subsection (1), the weekly base amount in respect of an insured person is determined as follows:

   1. Determine whichever of the following amounts is applicable:
i. 70 per cent of the amount, if any, by which the sum of the insured person’s gross weekly employment income and weekly income from self-employment exceeds the amount of the insured person’s weekly loss from self-employment, if the weekly income replacement benefit is for one of the first 104 weeks of disability, or

ii. the greater of the amount determined for the purposes of subparagraph i and $185, if the weekly income replacement benefit is for a week for which the person is entitled to receive an income replacement benefit after the first 104 weeks of disability.

2. To the amount determined under paragraph 1, add 70 per cent of the amount of the insured person’s weekly loss from self-employment that he or she incurs as a result of the accident. O. Reg. 34/10, s. 7 (2).

(3) The insurer may deduct from the amount of an income replacement benefit payable to an insured person,

(a) 70 per cent of any gross employment income received by the insured person as a result of being employed after the accident and during the period in which he or she is eligible to receive an income replacement benefit; and

(b) 70 per cent of any income from self-employment earned by the insured person after the accident and during the period in which he or she is eligible to receive an income replacement benefit. O. Reg. 34/10, s. 7 (3).

(4) The insurer shall pay an expense incurred by or on behalf of an insured person for the preparation of a report for the purpose of calculating the person’s income from employment or self-employment if all of the following conditions are satisfied:

1. The insured person is applying for an income replacement benefit under this Part that is based on the employment or self-employment considered in the report.

2. The report is prepared by a member of a designated body within the meaning of the Public Accounting Act, 2004.

3. The expense is reasonable and necessary for the purpose of determining the insured person’s entitlement to an income replacement benefit. O. Reg. 34/10, s. 7 (4); O. Reg. 289/10, s. 2.

(5) The insurer is not required to pay more than a total of $2,500 for the preparation of one or more reports under subsection (4) in respect of an insured person. O. Reg. 34/10, s. 7 (5).
Adjustment after age 65

8. (1) If a person is receiving an income replacement benefit immediately before his or her 65th birthday, the weekly amount of the benefit is adjusted, on the later of the day of the person’s 65th birthday and the second anniversary of the day the person began receiving the benefit, to the amount determined in accordance with the following formula:

\[ C \times 0.02 \times D \]

in which,

“C” is the weekly amount of the income replacement benefit that the person was entitled to receive immediately before the adjustment, before any deductions permitted by subsection 7 (3),

“D” is the lesser of,

(a) 35, and

(b) the number of years during which the person qualified for the income replacement benefit before the adjustment is made.

O. Reg. 34/10, s. 8 (1).

(2) Despite section 6, an income replacement benefit that has been adjusted under subsection (1) is payable, without any deductions under clause 7 (3) (a) or (b), until the person dies. O. Reg. 34/10, s. 8 (2).

If entitlement first arises on or after 65th birthday

9. (1) If an insured person becomes entitled to receive an income replacement benefit on or after his or her 65th birthday,

(a) subject to clause 6 (2) (a) and despite clause 6 (2) (b), the insured person is entitled to an income replacement benefit for not more than 208 weeks after becoming entitled to the benefit; and

(b) the weekly amount of the benefit is the weekly amount of the income replacement benefit otherwise determined under section 7 before any deductions permitted by subsection 7 (3), multiplied by the factor set out in Column 2 of the Table to this subsection opposite the number of weeks that have elapsed since the person became entitled to receive the benefit.

**Total Med/Rehab Expenditure** $1,781,608,366

*Replacement of clothing, hearing aids, glasses and other devices*

**Percentage are over total med/rehab amount**

### Notes:

- This segregation of amounts is based on the definitions of the accident benefits coverages.
- When settlements are paid, insurers allocate the amounts to one of the coverages above.
• To determine how much of any of these payments go to the actual purpose it is meant for is not possible given the information available.
• The allocation of an expenditure category to "Other" does not necessarily imply that the expenditure does not contribute to the well being of the individual in medical terms. For example visitation costs for relatives to visit the injured are not direct medical expenditures, however may contribute to their emotional well being.
Appendix VI

INFORMATION SUPPLIED BY THE FINANCIAL SERVICES COMMISSION OF ONTARIO

Dispute resolution services – mediation and arbitration from 2011/12 to 2015/16

| A. Total applications less admin closures | Mediation: 115,908 |
| B. Full and partial Settlements | Arbitration: 54,790 |
| Total value of full and partial settlements | $777,400,000 |
| Annual average | $17,143 |
| C. Settlements with zero value | (9,523) |
| D. Move to arbitration | 44,599 |
| E. Offline | 25,701 |
| F. Failed Settlements | 61,118 |
| G. Total | 115,908 |

Conclusions

A. Average number of claims going to mediation | 23,200 |
B. Average annual settled at mediation with value >$0 | ((B-C)/A); 39% |
  a. Average annual value | $155,500,000 |
  b. Annual average value of settlement | $17,143 |
C. Settlements with zero value (annual average / %) | 2,000; (C/A) 8.2% |
D. Moved to arbitration (annual average / %) | 9,000; (D/A) 38% |
E. Moved off line (annual average / %) | 5,140; (E/A) 22% |

Over a five-year period (2011-2015), the average number of applications going into mediation at FSCO annually was 23,200 (or about 35 per cent of total claims).

• Drugs prescribed by a regulated health professional
• Goods with a cost of $250 or less per item
• Dental goods or services
FOREWORD

EY was originally retained by the Casualty Actuarial Society (CAS) to write a text on financial reporting and taxation as it affects reserving and statutory reporting for use in the CAS basic education process. The CAS had two key objectives for this text:

1. Replace a number of readings that existed on the CAS Syllabus of Basic Education as of 2011 with a single educational publication.
2. Refine the content of the syllabus material to focus on financial accounting and taxation topics that are of particular relevance to the property/casualty actuary.

The CAS specified that the text would focus on the learning objectives contained within the syllabus as of 2011.

This publication has been prepared from an actuary’s lens, highlighting those areas of financial reporting and taxation deemed to be relevant by the CAS Syllabus Committee and the authors of this text. The learning objectives contained within the 2011 syllabus provided the underlying direction of the content contained herein. Further, the core content was originally developed based on the NAIC Annual Statement Instructions in 2011.

Subsequently, EY was requested to update the original textbook to:

- Add specific examples to illustrate differences between SAP and GAAP
- Include tax implications of investment strategies
- Reflect the new tax law enacted in the U.S. in December 2017
- Bring IFRS and Solvency II current (to 2018) and include discussion of the NAIC’s Own Risk and Solvency Assessment (ORSA)
- Bring Schedule F current (to 2018)
- Provide discussion as to why companies use intercompany pooling arrangements and their impact on surplus
- Reflect any resolution of discrepancies between the NAIC’s written and electronic instructions for risk-based capital (RBC) regarding Asset Risk associated with insurance company subsidiaries
- Bring the Canadian chapter current (to 2018)
- Reflect comments and questions received by the CAS from candidates and others, as well as errata previously submitted

This version of the text reflects the above specified changes. In doing so, we have updated the Annual Statement for Fictitious Insurance Company to 2018. No other changes have been incorporated, other than minor typographical edits. Further, we have not accounted for any changes to the Exam 6 Syllabus, other than those resulting in the above requested updates from the CAS. The Exam 6 learning objectives and examination material may have changed.
and may continue to change in the future. Therefore, the content of this publication may need to be updated in the future.

This text does not represent the position of EY or the authors with respect to interpretations of accounting or tax guidance. Nor is this text intended to be a substitute for authoritative accounting or insurance regulatory and related guidance issued by the National Association of Insurance Commissioners (NAIC), American Institute of Certified Public Accountants (AICPA), Financial Accounting Standards Board (FASB), Governmental Accounting Standards Board (GASB), Securities and Exchange Commission (SEC), Internal Revenue Service (IRS), Chartered Professional Accountants Canada (CPA Canada)\(^1\), International Federation of Accountants (IFAC), Global Accounting Alliance (GAA), International Financial Reporting Standards Foundation (IFRS)/International Accounting Standards Board (IASB), or any other regulatory body. Authoritative guidance from regulatory bodies trumps the writings contained herein. Furthermore, accounting standards are continuously evolving. As a result, readers of this text should be aware that the accounting standards referenced in this publication may have changed since the time of writing. The CAS may request that this publication be updated to reflect such changes.

While the authors of this publication have taken reasonable measures to verify references, content and calculations, it is possible that we may have inadvertently missed something. We would appreciate being informed of any inaccuracies so that an errata sheet(s) may be issued, and/or future editions of this publication may be corrected.

This publication has been prepared for general informational purposes only, and is not intended to be relied upon as accounting, tax or other professional advice. It is not intended to be a substitute for detailed research or the exercise of professional judgement. Neither Ernst & Young LLP nor any other member of the global Ernst & Young organization can accept any responsibility for loss occasioned to any person acting or refraining from action as a result of any material in this publication. Please refer to your advisors for specific advice.

---

\(^1\) In October 2014, the Certified General Accountants Association of Canada (CGA-Canada) joined Chartered Professional Accountants of Canada (CPA Canada) to complete the integration of the country’s national accounting bodies. CPA Canada was established the previous year by the Canadian Institute of Chartered Accountants (CICA) and The Society of Management Accountants of Canada (CMA Canada).
ACKNOWLEDGEMENTS

The authors of this publication would like to thank the CAS Syllabus Committee for its review of this publication and feedback provided. Special thanks goes to Sarah McNair-Grove, Laura Cali, George Levine, Michel Trudeau, Miriam Fisk, Brandon Basken, Stephane McGee, Sarah Chevalier and Mei-Hsuan Chao who reviewed the various drafts. We would also like to thank Wendy Germani who spent countless hours creating and editing the 2011 Annual Statement excerpts for Fictitious Insurance Company. The amount of personal time spent by these individuals demonstrates their tremendous dedication to the actuarial profession.

The authors would also like to acknowledge those individuals within EY who assisted us by creating certain content, tables and exhibits and performing editorial reviews. These individuals include Dave Osborn, Kishen Patel, and Yan Ren. Particular credit goes to David Payne, who rewrote Chapter 19, Risk-Based Capital, Ian Sterling and Mike McComis, who contributed to Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S., and Liam McFarlane and Shams Munir, who contributed to Part VII. Canadian-Specific Reporting.

Finally, the authors of this text would like to express their deep gratitude to the actuarial professionals who have invested their time writing publications for the CAS examination process. Although this publication will serve as a consolidation of many of the papers formerly on the Exam 6 Syllabus, we acknowledge the significant contributions that those papers have made in advancing the actuarial profession, as well as the knowledge of the authors of the text.

In preparing Financial Reporting through the Lens of a Property/Casualty Actuary, we relied extensively on the following publications and resources:

PART I. INTRODUCTION

CHAPTER 1. FINANCIAL REPORTING IN THE PROPERTY/CASUALTY INSURANCE INDUSTRY

IMPORTANCE AND OBJECTIVES OF FINANCIAL REPORTING

Financial reporting serves as a means to communicate a company’s financial results and health. Financial reporting is accomplished through a series of financial statements that consolidate a company’s transactions and events into a summarized form under specified accounting rules. The purpose of these rules is to provide companies with a framework for measuring and recording transactions and the related revenue, expenses, assets and liabilities on a consistent basis.

Financial reports enable stakeholders and regulators to track financial performance, compare a company’s performance to others and make informed financial decisions under a set of common rules. The stakeholders of an insurance company include policyholders, claimants, investors, directors of the board and company management. The regulators primarily include state governmental authorities, as we shall see below.

OVERVIEW OF THE BASES OF FINANCIAL REPORTING (STATUTORY, GAAP, IFRS, TAX, CANADIAN) AND DIFFERENCES IN TERMS OF USE

The accounting standards that govern financial reporting for insurance companies are numerous and complex. As we write this publication these standards are evolving, and this evolution is resulting in much debate among industry participants. Regardless, the intent of accounting standards is to promote a consistent framework for reporting insurance company transactions such that comparisons of financial performance and health of insurance companies can be made within the industry.

In the U.S., insurance companies are regulated by the individual state governments within which they are licensed to transact business. Within each state government there is an insurance division led by an insurance commissioner, director, superintendent or administrator (commissioner). The National Association of Insurance Commissioners (NAIC) serves as an organization of state regulators that facilitates and coordinates governance across the U.S. The NAIC itself is not a regulator; regulatory authority remains with the individual states. Therefore, model laws and regulations established by the NAIC are not law; individual states have the authority to decide whether to adopt NAIC model laws and regulations.
Statutory Accounting Principles (SAP) is a framework of “accounting principles or practices prescribed or permitted by an insurer’s domiciliary state.” Most insurance companies are licensed to transact business in more than one state. Having to follow the accounting rules and regulations of each state in which the company is licensed can be cumbersome and result in inconsistent reporting practices. To minimize the varying complexities of different rules and facilitate commonality in reporting practices, the NAIC adopted Codification of SAP effective January 1, 2001. Codification does not prevent individual state regulation but rather provides a common set of principles that individual states can follow to ease the regulatory burden on companies and promote consistency.

Statements of Statutory Accounting Principles (SSAPs) are published by the NAIC in its Accounting Practices and Procedures Manual. The manual includes more than 100 SSAPs and references related statutory interpretations, NAIC model laws and actuarial guidelines which collectively serve as the basis for preparing and issuing statutory financial statements for insurance companies in the U.S. in accordance with, or in the absence of, specific statutes or regulations promulgated by individual states.

From a financial reporting perspective, regulatory oversight by state governments focuses on insurance company solvency to ensure that policyholders receive the protection they are entitled to and claimants receive the applicable compensation for damages incurred. SAP and associated monitoring tools are intended to provide regulators with early warning of deterioration in an insurance company’s financial condition. SAP tends to be conservative in order to provide that early warning. For example, certain illiquid assets are not admitted (excluded from the balance sheet) under SAP, despite having economic value.

Generally Accepted Accounting Principles (GAAP) provides another set of common rules under which publicly traded insurance companies and privately held companies report their financial transactions and operating results. GAAP does have certain specialized rules for insurance companies, but unlike SAP, this framework is not built on the principle of conservatism. Rather, the primary focus of GAAP is the presentation of a company’s financial results in a manner that more closely aligns with the company’s financial performance during the period. Historically, this has been accomplished by matching revenues and expenses. For example, under GAAP, expenses incurred by an insurance company in conjunction with successful acquisition of business are deferred to match the earning of associated premium. In contrast, under SAP, all costs associated with policy acquisition are expensed at the time they are incurred by the insurance company.

The Securities and Exchange Commission (SEC) is the authoritative body for establishing accounting and reporting standards for publicly traded companies in the U.S., including publicly traded insurance or insurance holding companies. As highlighted on the SEC’s website, “The mission of the U.S. Securities and Exchange Commission is to protect investors,
maintain fair, orderly and efficient markets, and facilitate capital formation.”³ The SEC has designated the Financial Accounting Standards Board (FASB) with the responsibility of developing and establishing GAAP, with the SEC operating in an overall monitoring role. The FASB is the private organization providing authoritative accounting guidance for nongovernmental entities.

The Governmental Accounting Standards Board (GASB) is the private organization providing authoritative accounting guidance for the public sector. According to the GASB’s website, the GASB “is the independent organization that establishes and improves standards of accounting and financial reporting for U.S. state and local governments ... the official source of generally accepted accounting principles (GAAP) for state and local governments.”⁴ Although this publication does not discuss accounting for governmental entities, we note that the accounting for such entities differs from the accounting for insurance companies. Knowledge of the GASB as it relates to insurance-related activities of governmental entities is important for the property/casualty actuary who performs actuarial services for the public sector.

The Internal Revenue Service (IRS) is the U.S. government agency responsible for enforcing tax laws and collecting taxes. Every business paying taxes in the U.S. must compute taxable income based on the tax laws passed by Congress and the related regulations issued by the IRS. For insurance companies, the starting point for taxable income is income determined under SAP. SAP income is adjusted based on the provisions of the various tax laws and regulations. While SAP is generally conservative, tax-basis accounting may be more or less conservative depending on how political and other factors affect tax legislation. While some adjustments result in a decrease to taxable income (e.g., tax-exempt income), adjustments specific to the insurance industry tend to focus on the acceleration of income for tax purposes (e.g., the discounting of loss reserves and the reduction of unearned premiums).

The Canadian Institute of Chartered Accountants is the body in Canada that defines Canadian Generally Accepted Accounting Principles (CGAAP). At one time, SAP applied to the preparation of the Annual Return for Canadian-domiciled insurers. However, this is no longer the case, and the financial statements included in the Annual Return are prepared in accordance with CGAAP.

Under CGAAP, policy liabilities can be recorded in accordance with accepted actuarial practice in Canada, which means that the recorded liabilities are discounted to reflect the time value of money and include a provision for adverse deviation.

International Financial Reporting Standards (IFRS) provide an accounting framework used by many countries outside the U.S. IFRS are established by the International Accounting Standards Board (IASB).

IFRS already affects companies in the U.S. that currently have international subsidiaries or are subsidiaries of IFRS filers. At the time of the writing of this publication, IFRS 4, which pertains to the recognition and measurement of insurance contracts, permits insurance companies to report under the current accounting rules of their local country with slight modifications. An example of one such modification is requiring companies to establish premium deficiency reserves, as needed, regardless of local requirements. Given the current lack of a detailed measurement model under IFRS for insurance contracts, one of the key initiatives of the IASB is the development of a new accounting standard for insurance contracts. We will discuss the standard developed by the IASB (and the FASB developments in this area) and how it differs from the measurement of insurance liabilities today.
CHAPTER 2. RELEVANCE OF FINANCIAL REPORTING TO THE ACTUARY

IMPORTANCE AND OBJECTIVES OF FINANCIAL REPORTING

Actuaries estimate the financial impact of insurable events. As such, actuaries need to understand the accounting rules under which the financial impact is being reported. Consider the actuary providing an estimate of an insurance company’s unpaid claims for purposes of comparison to recorded loss reserves on the company’s balance sheet. If the balance sheet is prepared under Statutory Accounting Principles (SAP), then the loss reserves are recorded on a net of reinsurance basis. If the company’s financial statements are prepared under Generally Accepted Accounting Principles (GAAP), then the loss reserves are recorded gross of reinsurance. For comparison purposes, the actuarial estimate of unpaid claims would need to be prepared on a net basis for SAP and gross basis for GAAP. The actuary might also provide an estimate of unpaid claims ceded to the company’s reinsurers, for comparison to the reinsurance recoverable amount recorded as an asset on a GAAP basis.

Actuaries providing estimates of unpaid claims on a SAP basis must also be aware of state regulations under which the company is recording its loss reserves. For example, while the National Association of Insurance Commissioners Accounting Practices and Procedures Manual permits companies to discount workers’ compensation reserves on a tabular basis, certain states have varying requirements with respect to whether and how the tabular discount is applied. For instance, as of December 31, 2018, the state of Montana permitted discounting of both workers’ compensation indemnity and medical tabular reserves (excluding LAE) but required use of a specific interest rate in the calculation (4%).

To take this one step further, actuaries issuing Statements of Actuarial Opinion should include a statement within the opinion stating that the company’s recorded loss and loss adjustment expense reserves “meet the requirements of the insurance laws of (state of domicile).” The opining actuary is therefore required to read the state regulations and confirm that the recorded reserves meet the state laws.

The accounting convention is not only important to the reserving actuary for an insurance company, but also to actuaries who perform other jobs, including but not limited to the following:

- Working with regulators to monitor the financial health of insurance companies

---

5 According to page C-3 of the American Academy of Actuaries, 2018 Property/Casualty Loss Reserve Law Manual, tabular reserves are defined as “indemnity reserves that are calculated using discounts determined with reference to actuarial tables that incorporate interest and contingencies such as mortality, remarriage, inflation, or recovery from disability applied to a reasonably determinable payment stream. This definition shall not include medical loss reserves or any loss adjustment expense reserves.”

7 NAIC, Annual Statement Instructions Property/Casualty, 2018, page 12.
Part I. Introduction

- Pricing and designing insurance products, including development of profit margins
- Determining capital requirements to support the various risks of an insurer
- Evaluating risk transfer of reinsurance contracts
- Assessing reserve adequacy for non-insurance entities, such as organizations that self-insure or retain a portion of their property/casualty insurance exposures
- Preparing tax returns
- Appraising and valuing insurance companies in merger and acquisitions

For each of the above, the result of the work performed will differ depending on the accounting framework used, illustrating the need for actuaries in different disciplines to be knowledgeable about the various accounting and financial reporting frameworks.
Part I. Introduction

CHAPTER 3. OVERVIEW OF THIS PUBLICATION

ROADMAP

This publication begins with an overview of basic accounting concepts (Part II. Overview of Basic Accounting Concepts) and then delves into the fundamental aspects of the statutory Annual Statement and certain supplemental filings, that provide the means for financial reporting in the U.S. under Statutory Accounting Principles (SAP) (Part III. SAP in the U.S.: Fundamental Aspects of the Annual Statement and Part IV. Statutory Filings to Accompany the Annual Statement). Measurement tools used to evaluate the financial health of a property/casualty insurance company are discussed in Part V. Financial Health of Property/Casualty Insurance Companies in the U.S. These tools are particularly important to regulators in monitoring solvency for the purpose of protecting the stakeholders of an insurance company. We then investigate differences between statutory reporting and other financial reporting frameworks in the U.S., namely Generally Accepted Accounting Principles, International Financial Reporting Standards and tax accounting in Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S. We move on to Canada to provide a discussion of Canadian accounting principles (Part VII. Canadian-Specific Reporting). The publication closes with a discussion of the future of SAP and evolution of new accounting frameworks, differentiating between what is “real” and what is only in the discussion phase at the time of publication of this text (Part VIII. The Future of SAP).

ANNUAL STATEMENTS REFERENCED THROUGHOUT THE PUBLICATION

The Casualty Actuarial Society (CAS) Syllabus Committee and authors of this publication agreed that it would be helpful for students studying for the CAS exams to be able to rely as much as possible on one insurance company throughout the publication to illustrate the major concepts. For the U.S. examples, the CAS Syllabus Committee has assisted us in creating excerpts of a 2011 Annual Statement for a fictional insurance company named Fictitious Insurance Company (Fictitious). The excerpts of this statement are contained in Appendix I of this publication.

We have relied on the Annual Statement excerpts for Fictitious for the more detailed examples and calculations. We also referenced the National Association of Insurance Commissioners 2011 Property and Casualty Annual Statement Blank, which was also included on the CAS Exam 6 U.S. Syllabus at the time this publication was originally written. We have updated the dates in the Fictitious Annual Statement to year-end 2018, as well as specific schedules noted in the Foreword of this edition. We recommend that the current version of the Annual Statements (Blank and those for specific companies referenced on the current Exam 6 U.S. Syllabus) be viewed side by side with this publication when reading and working through examples and following the flow of exhibits, notes, interrogatories, and schedules within the Annual Statement.
For Canada, we have used the 2018 aggregate experience of Canadian insurers as published on the website of the Office of the Superintendent of Financial Institutions (OSFI). As with the U.S. chapters, we recommend that the student have this information by his or her side when reading the Canadian chapters of this publication.

We also acknowledge that there may be differences between exhibits within an Annual Statement; such differences are due to rounding.

BACKGROUND ON FICTIONAL INSURANCE COMPANY

The authors of this publication felt it important to provide some background information on Fictional and describe the landscape in which Fictional was operating during the time period covered when the Annual Statement was originally compiled (December 31, 2011). This will provide additional context for students when reading and interpreting the figures contained therein.

Fictional is a publicly held property/casualty insurance company in the U.S. As displayed in Table 1, approximately one-third of the company’s writings in 2018 were in personal lines markets, with the remainder in commercial markets. Homeowners multiple peril (homeowners) was the largest single line written in 2018 on a net of reinsurance basis (17% of net written premium), followed by workers’ compensation (15% of net written premium) and other liability — occurrence (13% of net written premium). The company wrote business in all 50 states in the U.S. and was therefore exposed to natural catastrophes and weather-related events in 2018.

Insurers were hit hard by record levels of catastrophe losses in 2017 and 2018, following a sustained period of benign activity from 2012 through 2016. Headline events included hurricane activity in North America (Harvey, Irma and Maria in 2017; Florence and Michael in 2018) and Japan (Jebi, Trami and Mangkhut in 2018). California saw its most costly wildfire season for the second year running, with the Camp Fire alone leading to approximately $10 billion of insured losses.

2017 events in the U.S. are estimated to have cost the (re)insurance industry approximately $106 billion, with a further $50 billion in 2018, significantly exceeding the prior 10-year average of just under $20 billion.\(^8\)

As we shall see through examination of the company’s 2018 Annual Statement, Fictitious did not escape the financial impact of the natural catastrophes in the U.S., but surprisingly was relatively unscathed by the events in 2017. During 2018, Fictitious experienced a net loss from underwriting of $2 million, largely due to events including Hurricanes Florence and Michael and the California wildfires. The company’s net loss and loss adjustment expense (LAE) ratio for accident year 2018 was about 10 percentage points higher than that for accident year 2017.

\(^8\) [https://www.iii.org/article/spotlight-on-catastrophes-insurance-issues](https://www.iii.org/article/spotlight-on-catastrophes-insurance-issues), December 20, 2019
When reading this publication and reviewing the 2018 Annual Statement for Fictitious Insurance Company, note that Fictitious tightened its underwriting standards in reaction to the soft insurance market in commercial lines. Despite the company’s efforts, soft market conditions also contributed to the increasing loss and LAE ratio in 2018.

9 A soft market is one where insurance prices are low and therefore insurance is cheaper for the consumer. The insurance industry tends to observe increasing loss ratios in a soft market because the consumer is paying less in premiums for the same level of insurance protection.
PART II. OVERVIEW OF BASIC ACCOUNTING CONCEPTS

INTRODUCTION TO PART II

Part II of this publication will provide a detailed discussion on the construction, use and interpretation of an insurance company’s financial statements and other financial information. Before beginning that detailed discussion, we will introduce two important accounting topics: primary financial statements and key accounting concepts. Both are recurring topics throughout this publication, and a basic understanding will be helpful to students.
Although there are numerous accounting frameworks, they generally rely on a few primary financial statements. Of these, the two most commonly referenced are the balance sheet and the income statement. Other primary financial statements include the statement of capital and surplus (or equity) and the statement of cash flow. The financial statements are accompanied by subsequent pages of notes, which provide additional information that helps explain balances within the financial statements.

**BALANCE SHEET**

The balance sheet presents all of a company's assets and liabilities as of a specific point in time. Assets are defined as resources obtained or controlled by a company as a result of past events that have a probable future economic benefit to the company. Liabilities are probable sacrifices of economic benefits arising from present obligations of a company to transfer assets or provide services to other entities in the future as a result of past events. The relationship between the assets and the liabilities of a company is important, because it is a measure of the company's ability to use its assets to fully satisfy its liabilities. The difference between assets and liabilities is generally referred to as net worth (or equity); in the case of an insurance company reporting under Statutory Accounting Principles (SAP), this difference is referred to as statutory surplus (or policyholders’ surplus).

One unique aspect of insurance companies' balance sheets is the inherent uncertainty associated with the estimation of the liability for unpaid claims and claim adjustment expenses (loss reserves). While a certain amount of estimation is involved in other industries' accounting, the more significant estimates are generally with respect to asset valuation and collectability and pale in comparison to the uncertainties involved in estimating loss reserves. Actuaries typically have an important role in valuing insurance company liabilities and are therefore critical to the accurate preparation of the balance sheet.

**INCOME STATEMENT**

While the balance sheet presents the financial balances of a company at a point in time, the income statement reveals a company's financial results during a specific time period. The general types of accounts that are used as a means to measure these results are revenue and expenses. Revenues are inflows or enhancements of assets or settlement of liabilities (or a combination of both) from delivering goods or services during the specific time period. Expenses are outflows or other use of assets or incurrence of liabilities (or a combination of

---

10 Note that the assets reflected in this relationship only include "admitted" assets because Statutory Accounting Principles (SAP) do not allow insurers to take credit for nonadmitted assets in surplus. Admitted versus nonadmitted assets are discussed later in this text.
Part II. Overview of Basic Accounting Concepts

both) from delivering or producing the goods and services that were provided during the specific time period. The difference between the amount of the revenues and expenses during the period is referred to as net income if it is positive or net loss if it is negative.

The nature of the service provided by insurance companies, which is a promise to pay claims in the future if some specific criteria are met, creates unique accounting challenges. Insurance accounting standards address how to earn the premiums insurance companies are paid and how to measure and when to record claim costs resulting from the insurance coverage. Again, actuaries usually play a significant role in the estimation of the amount and timing of these future payments and therefore are critical to the accurate preparation of the income statement. Another important source of revenue for insurance companies is investment income, which will be discussed in Chapter 8, The Statutory Income Statement: Income and Changes to Surplus.

CAPITAL AND SURPLUS

The statement of capital and surplus reflects certain changes in surplus that are not recorded in the income statement and reconciles the beginning surplus to the ending surplus for the reporting period. This statement is similar for insurance companies and for other types of companies; however, there are several items within the statement of capital and surplus, such as those related to nonadmitted assets and the provision for reinsurance, that are unique to insurers. These items and others will be discussed in Chapter 7, Statutory Balance Sheet: A Measure of Solvency and Chapter 8, The Statutory Income Statement: Income and Changes to Surplus.

CASH FLOW

The cash flow statement receives less attention but is also important. This financial statement is necessary because the timing of the receipt or payment of cash for a revenue or expense does not necessarily coincide with the recognition of that revenue or expense from an income statement perspective. In other words, even if the cash payment is received sometime before or sometime after the good or service is provided, the associated revenue is generally recognized at the time the good or service is provided. The cash flow statement presents all operations strictly from a cash perspective.

In other industries, companies face liquidity issues when they cannot collect revenue in cash on a timely basis, and this type of liquidity issue would be made evident by the statement of cash flows. An example of this would be a manufacturing company that sold products on credit but was not able to collect the cash on a timely basis to pay their expenses. For insurance companies, this specific type of liquidity issue is less likely to occur due to the collection of premiums at the onset of the policy and the subsequent payment of losses. This difference in the order of cash receipts and disbursements somewhat diminishes the importance of cash flow statements for insurance companies. Further, actuaries are not
Part II. Overview of Basic Accounting Concepts

generally involved in or necessary for the preparation of the cash flow statement, so this financial statement is not covered in detail in this publication.

NOTES TO FINANCIAL STATEMENTS

In addition to the four primary financial statements already discussed, another important element is the notes to financial statements. The notes include quantitative and qualitative disclosures regarding the significant accounts presented in the financial statements. This includes matters that are relevant or may be relevant to the users of the financial statements. For instance, the notes will typically describe the basis of accounting used in the preparation of the financial statements, as well as any important details on specific aspects of the financial statements that are based on estimates or subject to uncertainty. We will discuss several of the footnotes to the financial statements that are of specific importance to actuaries in Chapter 10. Notes to Financial Statements.
CHAPTER 5. KEY ACCOUNTING CONCEPTS

Throughout each major accounting framework, there are several common key concepts. Understanding these key concepts will be beneficial to anyone who is involved in using or preparing financial statements because it will allow them to appreciate the purposes of and the differences between each framework. A few of the most important and relevant concepts are below.

- **Liquidation vs. going concern**: When preparing financial statements, it is possible to view the company as either an ongoing business (going concern) or as a run-off of the current assets and liabilities (liquidation). Either perspective may be appropriate depending on the user and purpose of the financial statements. For instance, investors would generally be most interested in the value of a business as a going concern, whereas regulators may think in terms of a liquidation perspective, given that they are primarily interested in the ability of the company to satisfy its policyholder obligations.

- **Fair value vs. historical cost**: There are often multiple possible approaches to valuing a given asset or liability. The choice of approach is of particular importance when the value of that asset or liability is uncertain. Recording an asset or liability at fair value means recording it at a value that it would be bought or sold for in the open market, while recording at historical cost means valuing it at the original purchase price less depreciation. In cases where the value of an asset or liability is uncertain, there is a trade-off between the reliability of the historical cost method (in that it is objectively verifiable) and accuracy of the fair value approach (in that it is more consistent with the actual market value).

- **Principle-based vs. rule-based**: Each aspect of any accounting framework is generally guided by either a principle or a rule. A principle describes a general accounting approach that must be interpreted and applied, while a rule provides specific accounting guidance on how something should be done. There is a trade-off because the rules-based guidance may be easier to understand and to audit, but a principles-based approach is generally more adaptable to changes in the business environment.
INTRODUCTION TO PART III

In the U.S., property/casualty insurance companies report their financial results to state insurance regulators in what is called the Annual Statement. For those who have never used or seen an Annual Statement, it is an 8.5” x 14” book. The Property/Casualty Annual Statement is identified by its yellow cover, while the Life Annual Statement’s cover is blue (known as the yellow book and blue book, respectively). Both types of Annual Statements are publicly available documents.

The Annual Statement is developed and maintained by the National Association of Insurance Commissioners and is often referred to as “the Blank.” The Blank is the template that insurance companies use to report under Statutory Accounting Principles (SAP), and is uniformly adopted by all states. This allows insurance companies licensed in multiple states to prepare one Annual Statement for filing with all states. The Annual Statement is accompanied by NAIC instructions that are generally adopted by all states, though there are instances of specific differences and exceptions.

The first page in the Annual Statement is the Jurat page, which provides basic information about the reporting entity, such as name, NAIC code, address, name of preparer and title, and officers of the reporting entity. The notarized signatures of officers of the reporting entity are included on this page, attesting to the accuracy of the information contained therein.

Following the Jurat page are the statutory financial statements. The statutory Annual Statement contains other exhibits and schedules that provide further insight into the insurance company's statutory financial statements and historical experience. These include General Interrogatories; Five-Year Historical Data; and Schedules A, B, BA, D, DA, F, P, T and Y.

In Part III. SAP in the U.S.: Fundamental Aspects of the Annual Statement, we will walk through the Property/Casualty Annual Statement, beginning with the financial statements, and discuss the related accounting requirements. We provide examples to illustrate the uses of the Annual Statement and how certain amounts are calculated and compiled.
CHAPTER 6. INTRODUCTION TO STATUTORY FINANCIAL STATEMENTS

INTRODUCTION

This chapter focuses on Statutory Accounting Principles (SAP) and specifically discusses the fundamental aspects of the Annual Statement, including the financial statements themselves (the balance sheet and income statement, for example), as well as the other exhibits and filings that accompany the Annual Statement (such as various schedules, the Insurance Expense Exhibit and the Risk-Based Capital calculation). Part V. Financial Health of Property/Casualty Insurance Companies in the U.S. will discuss how this information can be used to assess the financial health of an insurance company and Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S. will focus on differences between SAP and the other financial and relevant regulatory reporting regimes.

SAP AND THE NAIC

The National Association of Insurance Commissioners (NAIC) operates through various committees that comprise state insurance commissioners and their staff. Through these committees, the NAIC regularly updates SAP and creates model insurance laws and regulations that individual states may elect (or be required) to adopt. While this generally leads to a good deal of uniformity in insurance regulation, there are still instances of differences between states. For example, individual states have the ability to permit accounting practices that differ from NAIC SAP (“permitted practices”) and model laws and regulations are not always enacted by all states exactly as adopted by the NAIC.

It is worth noting that the NAIC may revise the Annual Statement each year, and these changes are described on the NAIC website. The basis of the examples and exhibits provided in this section of the publication are based in part on the structure and information provided in the 2011 industry Annual Statement, with specified updates based on the 2018 Annual Statement as noted in Foreword of this publication.11

---

11 Accessed via a sector-specific information and research firm in the financial information marketplace.
CHAPTER 7. STATUTORY BALANCE SHEET: A MEASURE OF SOLVENCY

As previously noted, the primary focus of statutory accounting is to highlight potential solvency issues (an insurance company’s capability to meet its obligations to its policyholders and creditors when due). Consequently, the most important aspect of an insurance company’s financial statements to an insurance regulator is the strength of its balance sheet (i.e., the extent to which its admitted assets are sufficient to meet all liabilities).

RELEVANCE TO ACTUARIES

Solvency and the balance sheet are relevant to the actuary for two primary reasons.

First, actuaries traditionally have some responsibility for the loss and loss adjustment expense (LAE) reserves, which represent the majority of the liabilities for property/casualty insurance companies. Actuaries may either participate directly in the reserve-setting process, or they may assess the reasonableness of the reserves established by company management. Actuaries involved in either of these functions are focused on the liabilities for losses and LAE on the Liabilities, Surplus and Other Funds page of the Annual Statement (page 3).

Second, actuaries often have a role in determining or assessing the amount of capital that an insurance company requires to support the risks that it has taken through its business operations. In the context of statutory accounting, this would be based on an actuary’s understanding of the Risk-Based Capital (RBC) framework to calculate the required capital at a given point in time (see Chapter 19, Risk-Based Capital). More broadly speaking, actuaries may evaluate the surplus needs on other bases, including on an economic basis, which is guided by the insurer meeting some economically defined criteria for solvency. In both of these cases, an actuary who is evaluating an insurance company’s capital will need to be familiar with the admitted assets and the liabilities on the balance sheet (pages 2 and 3), as well as the risk characteristics of each of those items.

This chapter will provide an overview of the composition of the two main categories in the statutory balance sheet:

- Assets (page 2)
- Liabilities, Surplus and Other Funds (page 3)

ASSETS\[^{12}\]

Assets can be broadly defined as a property, right or claim arising from past events that has future value. From an individual perspective, we are all accustomed to the concept of owning

\[^{12}\] In general, this section aligns with Chapter 2 (Assets) of Property Casualty Insurance Accounting by the Insurance Accounting and Systems Association (IASA). References to other sections in IASA that were previously on the CAS Syllabus will be included throughout. Readers seeking additional detail may consult with IASA on these topics or other topics.
financial assets, such as stocks and bonds, and owning real assets, such as a home or vehicle. Insurance companies own various assets in the same way that an individual does, and those assets are summarized on page 2 of the Annual Statement Blank (the balance sheet). Some of these assets are consistent with assets of non-insurance entities, and some are specific to insurance companies.

Table 2 summarizes the major assets held by the U.S. property/casualty insurance industry as of December 31, 2018. The first column indicates the numerical label for each item, as presented on page 2 of the Annual Statement. Only the material line items are shown in this summary.

---

13 Accessed via a sector-specific information and research firm in the financial information marketplace.
As shown in Table 2, the U.S. property/casualty industry held $2.1 trillion dollars of assets as of December 31, 2018. The statutory balance sheet makes two broad distinctions regarding assets held by insurers:

- **Cash and invested assets vs. non-invested assets:** Assets are categorized by this criterion to identify the proportion of an insurer’s asset that is readily convertible to cash. The “cash and invested assets” are assets that could be readily sold in near term to meet the insurer’s liabilities, while the “non-invested assets” are less liquid. This distinction is in line with the emphasis that statutory accounting places on solvency. Rows 1 through 12 on the Assets page include cash and invested assets, while rows 13 through 25 include non-invested assets.

- **Admitted vs. nonadmitted assets:** As shown in Table 2, there are separate columns that depict the amount of assets that are nonadmitted. These nonadmitted assets, which represent about 3% of total assets, are not recognized by state insurance departments in evaluating the solvency of an insurance company for statutory
accounting purposes. The rationale for this exclusion is that those nonadmitted assets are not readily convertible for use to meet an insurer’s liabilities now or in the future and thus would not be reasonable to consider in evaluating a company’s solvency. In many cases nonadmitted assets are determined by formulae established by the National Association of Insurance Commissioners (NAIC). As shown in Table 2, there are nonadmitted assets in the cash and invested assets categories and the non-invested assets categories, though the proportion of nonadmitted assets is much lower for cash and invested assets. Several common examples of nonadmitted assets will be discussed in the description of the specific asset classes below (such as certain uncollected and deferred premiums and agents’ balances and net deferred tax assets), which will help to demonstrate this point.
