Report on **Fundamental Reform of the ALBERTA AUTOMOBILE INSURANCE COMPENSATION SYSTEM**

September 2020

by the Automobile Insurance Advisory Committee for the Minister of Finance of the Government of Alberta
Honourable Sir:

With this letter, the Automobile Insurance Advisory Committee transmits its report on Fundamental Reform of the Alberta Automobile Insurance Compensation System.

Chris Daniel, Chair

Shelley L. Miller, Q.C.

Dr. Larry Ohlhauser, M.D.
I. Executive Summary

II. Summary of Conclusions and Recommendations

A. Conclusions

Automobile Insurance Reform 23
   A. Analysis of Alternative Legislative Models 23
   B. Analysis of Alberta Auto Insurance Reforms 24

Proposed Reform of the Alberta Automobile Insurance Compensation System 24

Review of Health Outcomes Evidence 26

Actuarial Evidence from Tort Accident Injury Compensation Systems 28

Public Consultations 29
   A. Evidence of Public Consultations 2003 29
   B. Results of 2020 Public Surveys 29
   C. Submissions from Insurance Industry Service Providers 30
      Property Damage Product Reform 30
      Reforms to Address Risky Driving Behavior 30
      Reform of the Regulatory Process 30
      Reform of the *Judgment Interest Act* 31
      Optional Insurance Products (UBI) 31
      Legislation to mandate use of winter tires 31
      Section B Benefits 31
      The Tort/No-Fault Issue 32
      Evidence-Informed Health Treatment for Traffic Injured 32
      Reforms to the Assessment of Injury and Pecuniary Loss Process 33

Proposed Reform of Health Care Model 33

Proposed Reform of Auto Insurance Regulatory Regime 34

Actuarial Forecast of Impact of Proposed Reforms 35

Legal Considerations 35

B. Recommendations 36

Evidence-Informed Health Treatment for Traffic Injured 36
   Reforms to the Assessment of Injury and Pecuniary Loss Process 37
   Section B Benefits 37

Establishment of an Independent Administrative Structure of Traffic Accident Regulation 38

Health Outcomes Evidence 39
Program for Long-Term Care for Catastrophically Injured
Implementation of reforms requires collaboration of insurance and health service providers

Property Damage Product Reform

Reforms to Address Risky Driving Behavior

Reform of the Regulatory Process

Judgment Interest Act

Optional Property Insurance Products

User Based Insurance

Legislation to mandate use of winter tires

III. Introduction

IV. Automobile Insurance Reform

A. Chronological Review of Auto Insurance Reform and Analysis

Societal response to automobile accidents

Chronological review of auto insurance reform models between 1946 and 2015

The Columbia Plan (1932)

The Saskatchewan Plan (1946)

Royal Commission on Automobile Insurance, Report of the Commissioner, (July 30, 1968) (British Columbia)

Ontario Task Force on Insurance 1986

Alberta Automobile Insurance Board, Study of Premium Stability in Compulsory Automobile Insurance (September 12, 1991)

Government of British Columbia consultant study (1996)

Saskatchewan (1988-1995)

Ernst & Young review of the New South Wales motor accident scheme for the board of Motor Accident Authority (November 1998)

New South Wales motor accident reform created and enacted in 1999

Elective/Choice model – Saskatchewan 2003

Auto insurance reform in Alberta 2003

Nova Scotia – 2003

Newfoundland and Labrador, New Brunswick and Prince Edward Island

Ontario – implemented periodic reforms to the threshold/no-fault model

British Columbia – 1983-2020

B. Analysis of Auto Insurance Reform Studies and Legislative Alternative Models

1946-1978
1946 Introduction of no-fault benefits: Saskatchewan
1978 Introduction of pure no-fault model: Québec
1978 expansion of tort remedies: The Supreme Court of Canada Trilogy

1986-1996
1986-1990 Introduction of threshold/no-fault model: Ontario
1991 Recommendation for gradual tort reform: Alberta
1990-1996 Continuous modifications to threshold/no-fault: Ontario

1996-2003
1996 KPMG Report Recommending No-Fault model: British Columbia
1999 New South Wales, Australia
Summary of Results
2003 Saskatchewan Introduction of Choice Model
2003 Introduced caps to non-pecuniary damages for minor injuries: Alberta
2003 Investigation of auto insurance reform: Atlantic Canada
2003 Introduced caps to non-pecuniary damages for minor injuries: Nova Scotia
2003 Implementation of periodic reforms to the threshold/no-fault model: Ontario

2013-2017
2013 Auto insurance reform model revealing deterioration: NSW
2013-2017 Auto insurance reform model revealing deterioration: Ontario

Conclusions

C. Chronology of Alberta Auto Insurance Reform

Alberta Automobile Insurance Board, A Study of Premium Stability in Compulsory Insurance (September 12, 1991)

Pure no-fault
Threshold no-fault
Elective/Choice
Tort with modest reforms 86
Option 1 86
Option 2 86
Public consultation 87
Increase in no-fault benefits 87
The 2003-2004 Reforms 87
Testimony in Morrow v. Zhang – The political process behind the reform and the expert opinions related to it 89
The political process 89
Testimony of Medical Experts 103
Evidence on Comparative Accident Compensation Models 104
Evidence on Canadian Insurance Industry Study 109
Actuarial Evidence 110

D. Analysis Of Alberta Auto Insurance Reforms 112

Caps on insurance rates
Making automobile insurance more affordable
Conclusions

C. Submissions of Insurance Industry Service Providers

Property Damage Product Reform
Reforms to address risky driving behavior
Reform of the Regulatory process
  Rate Regulation
  All comers’ rule and the Grid
  Territories
Reform of the Judgment Interest Act
Optional Insurance Products
Legislation to mandate use of winter tires
Section B Benefits
The tort/no-fault issue
Reported weaknesses and abuses of the current tort/no-fault model
  Discourages full compliance with treatment and encourages sickness behavior
  Negotiated lump sum settlements leave some traffic injured untreated and encourage claims where no treatment is required
  Exaggeration or dishonesty in claims behavior for monetary gain
  Diminution of the intended Effect of the Minor Injury Regulation and increased claims
  Substantial percentage increases in Section B Claims
  Uncertainty caused by Court decisions redefining the wording of regulations
  Expert fees in tort cases reported to be excessive
  Concerning examples of undesirable practices to secure optimal tort awards
  Ever increasing amounts for various heads of damages
  Cost of legal service providers
  Fringe lenders
Evidence-informed health treatment for traffic injured
### Evaluating the value of the tort component of the compensation system against the burdens
- Delays and increased costs due to tort system 192
- Benefits of retaining Tort 193
- Case for fundamental reform 193
- Increase scope of anti-fraud conduct 197
- Time to implement reforms 197

### D. Conclusions
- Property damage product reform 198
- Reforms to address risky driving behavior 198
- Reform of the Regulatory Process 198
- Reform of the *Judgment Interest Act* 200
- Optional Property Insurance Products 200
- Legislation to mandate use of winter tires 200
- Section B benefits 200
- The tort/no-fault issue 200
- Evidence-informed health treatment for traffic injured 201
- Reforms to the assessment of injury and pecuniary loss process 201

### E. Recommendations
- Property damage product reform 203
- Reforms to address risky driving behavior 203
- Reform of the Regulatory Process 204
  - *Judgment Interest Act* 204
- Optional property insurance products 205
- Legislation to mandate use of winter tires 205
- Section B benefits 205
- Evidence-informed health treatment for traffic injured 205
- Reforms to the assessment of injury and pecuniary loss process 207

### IX. Proposed Reform of the Alberta Auto Insurance Compensation System

#### A. Additional Studies from Consulting Actuary
- Alberta private passenger third party liability written premium per vehicle 210
- Transaction Costs of Injury Litigation 211

#### B. Health Outcomes for traffic injured Sub-optimal under the Current Model

#### C. Compensation of All Traffic Injured Sub-Optimal under Current Model
D. Failure of Auto Insurance Reform by Piecemeal Increments to Deliver Long-term Stability

E. The Tort Principle of Deterrence Does not Deliver Intended Goal

F. The Tort Principle of Quantifying Damages on an Individual Basis Subject to Increasing Costs and Delays

G. Lump Sum Payments for Pain and Suffering subject to misuse and abuse

H. Need to extend and expand principles of DTPR to all non-catastrophic traffic injured

I. The Tort model requires replacement by a Pure No-fault Model

J. Need for No-Fault Care and Compensation Model for All Catastrophically Injured

K. Delivery of goals listed in Mandate by Pure No-Fault Compensation Model

L. Administrative Traffic Accident Regulatory Structure to replace the Court Assessment of Extent of Injuries and Pecuniary Losses

M. Individual Assessment of Injuries and Treatment by review panel of medical and health experts within 2-3 years from the accident date

N. Defined Rehabilitation, Care or Impairment Benefits for most seriously injured Improved Health Outcomes Improved Environment for Health Service Providers

O. Individual Assessment of Economic Losses and Future Care Entitlements by review panel of financial, vocational and rehabilitation experts within 2-3 years from the accident date Elimination and Reduction of Costs

P. Legal Challenges to Fundamental Auto Insurance Reform

Q. Reform will promote long term stability and sustainability

R. Further cost savings and improved competition will result from regulatory and property insurance reform processes

S. Reforms to benefit the traffic injured require trade-offs to also ensure affordability, accessibility and sustainability of fair premiums

T. Preservation of tort action outside insurance compensation model against motorists found guilty of criminal driving conduct causing bodily injury

U. Establishment of an Ombudsperson Office for Consideration of Additional Compensation in Exceptional or Extraordinary Cases

V. Conclusions

W. Recommendations
X. Proposed Reform of Health Care Model
   A. Pre-2004
   B. DPTR Model
      Goals and Principles
      Erosion of Model
   C. Reform
      Continuum of Care Model
      Proposed Enhanced COC
      Creation of new classifications of injuries
         Typical Symptomology and Treatment of Type I Classification
         Diagnosis, treatment and rehabilitation
         Typical Symptomology and Treatment of Type II Classification
         Diagnosis, treatment and rehabilitation
         Typical Symptomology and Treatment of Type III Classification
      Continuum of care model to enhance optimum recovery for all traffic injured
   D. Conclusions
   E. Recommendations

XI. Proposed Reform of Auto Insurance Regulatory Regime
   A. Making the Changes Necessary for Fundamental Alberta Auto Insurance Reform
      Needs of the new model
      Changes in Culture
   B. The New Model and Processes
   C. The Transitional Period

D. Appendix 4 – Cheng Transaction Cost Report April 20, 2020 506
On December 18, 2019 the Honourable Travis Toews, President of Treasury Board and Minister of Finance, announced the appointment of an expert advisory committee to explore options to reform Alberta’s automobile insurance system. The Automobile Insurance Advisory Committee (Committee) was comprised of consumer and insurance industry expert Chris Daniel, as Chair, legal expert Shelley Miller, Q.C., and medical expert Dr. Larry Ohlhauser.

The Committee’s mandate is set out below:

- Develop and provide recommendations for Alberta’s automobile insurance systems that are based on the following guiding principles:
  
  i. a private sector delivery model for automobile insurance;
  
  ii. fair accessible and affordable insurance for Albertans;
  
  iii. timely and appropriate outcomes when claims are made; and
  
  iv. a viable and sustainable automobile insurance system.

- The goals a fundamental reform would need to achieve include:
  
  i. a private sector delivery model;
  
  ii. appropriate medical benefits for Albertans injured in automobile collisions;
  
  iii. easier access to income replacement benefits;
  
  iv. requiring insurers to be responsive to the treatment, care and compensation needs of their customers, and accountable for their claims related decisions and practices;
  
  v. to significantly reduce or eliminate costs from the system;
  
  vi. to stabilize and potentially decrease automobile insurance rates; making them more affordable for Albertans in the long term; and
  
  vii. to return the automobile insurance industry to long-term competitive sustainability.

At the outset of its investigation, the Committee delineated two categories of persons who will be affected. The first consists of the traffic injured, and the Alberta motorists who collectively pay for the losses of the traffic injured, as well as the fees, expenses and costs of various service providers.

The second consists of service providers who perform roles in the existing system, including insurance, health care and legal professionals, insurance brokers and agents, auto insurance regulators, suppliers and the legislators. However, as worthy as their interests and perspectives may be, the Committee recognized that these participants are not a genuine part of the motor accident compensation stake holding arrangement.

The only true fundamental stakeholders in this arrangement, the traffic injured and motoring public, are not in it by complete freedom of choice. Any Alberta motorist who wishes or needs to operate a motor vehicle in the province must purchase and maintain valid automobile insurance because the law has declared it mandatory to do so. The traffic injured are also not in the stakeholder arrangement by choice since no reasonable Albertan would seek to be injured in a motor vehicle accident.

It was important to reflect on the requirements and interests of these true stakeholders, separate and apart from the service providers who represent them. The Committee recognized it was also important to weigh and balance all the views presented, including those
of the service providers in the context of what reforms are required for the benefit of the two true stakeholders.

The Committee’s paramount goal was to identify improvements so that Alberta traffic injured can more quickly get their lives back on track and so that Alberta motorists better understand where their premium dollars are applied in the compensation system, what factors affect the cost of automobile insurance and what factors will best achieve long-term premium stability so that they can expect in future to secure auto insurance that is more affordable, more available and less volatile in pricing increases.

The Committee found convincing evidence that:

a. since 1988 the cause of high automobile insurance premiums was ever increasing bodily injury loss costs, more specifically, the component of non-pecuniary general damage awards for pain and suffering and loss of amenities of life that resulted from the tort system litigation process;

b. since there was nothing in the system to control those increases, premiums would continue to rise over the long term and create an even more serious pricing problem;

c. some traffic injured were overcompensated while others were undercompensated;

d. between 2000 and 2019 additional scientific evidence continued to emerge in various jurisdictions in Canada and elsewhere to show that traffic accident health outcomes were improved where tort systems, with their characteristic features of delay, conflict, and the retention of dueling experts, were eliminated from auto insurance compensation systems and replaced with no-fault alternative models; and

e. the scientific evidence further showed that under tort systems, or hybrid tort systems, there was often found health services provided to traffic injured that were either incorrect, duplicative or ineffective, with the result that the health outcomes of traffic injured were further hindered.

In the face of these two consequences, undesirable from the perspectives of traffic injured and insured motorists alike, the Committee conducted extensive study of the history of auto insurance reform from 1946 to the present, from across Canada and elsewhere, and in Alberta from 1988 to the present to determine why this paradox has endured. The Committee found that in Alberta while there had been clear evidence of the first consequence since 1990, the developing scientific evidence of the second consequence over the last two decades has not received widespread recognition.

The Government of Alberta has undertaken auto insurance compensation reform on one occasion between 1990 and the present. In 2003 it elected to proceed with a modest tort reform to restrict recovery of non-pecuniary general damage awards for soft tissue injuries (the Minor Injury Regulation). It also enacted a health treatment reform (the Diagnostic and Treatment Protocol Regulation). These regulations impacted the traffic injured. It also enacted a regulation establishing a Grid to correct a problem of unaffordability of auto insurance premiums for young and new drivers.

The Diagnostic and Treatment Protocol Regulation (DTPR) was devised with the recognition that early access, appropriate diagnosis and effective treatment and early recognition of individuals who had alerting prognostic factors likely to give rise to chronic problems would improve treatment solutions and traffic accident health outcomes.
The Committee found that the scope of the *Minor Injury Regulation* was restricted from its original intent during the design process with the result that it would have a lesser effect in reducing non-pecuniary general damage awards and in turn the extent of savings it would deliver to the cost of automobile insurance.

The Committee found the DTPR also did not achieve its full potential between 2004 and the present due in part to the incomplete compliance with its requirements by health practitioners, incomplete supervision and oversight and the effects of the tort litigation processes that resulted in delay, duplication of health treatments and assessments and disincentive to recovery.

While additional amendments were made by government between 2004 and 2019 to mitigate the effect of court decisions impacting bodily injury loss costs, premium increases were the consequence. In short, the reforms to the auto insurance compensation system in Alberta from 2004 to the present did not produce long-term sustainability, affordability or accessibility in respect of auto insurance premiums.

The Committee reviewed the history of automobile insurance reform across the Canadian provinces and in the Australian state of New South Wales. One common thread found was that the cause of high automobile insurance premiums was ever increasing bodily injury loss costs, more specifically, the component of non-pecuniary general damage awards for pain and suffering and loss of amenities of life that resulted from the tort system litigation process.

Some Canadian provinces responded to loss cost inflation by eliminating the tort component of the automobile insurance system altogether and replacing the rights of recovery with a comprehensive care and income replacement system. This system is commonly referred to as no-fault benefits because the benefits are provided without the requirement to prove fault or otherwise have the economic and non-economic losses measured by the litigation process. Those jurisdictions then experienced stability in automobile insurance premium levels and consistency in delivery of health care benefits to traffic injured.

The jurisdictions that endeavored to preserve the tort component by rebalancing with differing degrees of no-fault benefits experienced only temporary periods of stability. The history of automobile insurance reform in Alberta reflected this same trend. The Committee found convincing evidence that the lack of long-term success in stabilizing premiums was due to uncontrolled increases in non-pecuniary general damage awards as well as the growing costs of legal or health service providers.

The Committee next examined judicial decisions in terms of constitutional authority of the province and legal commentary on the implications of automobile insurance reform in light of the *Canadian Charter of Rights and Freedoms*, ss. 1, 7, 15. The Committee took guidance from a decision of the Alberta Court of Appeal which pronounced that where full costs of care are awarded, damages for pain and suffering can be moderated by policy considerations, for example, workers’ compensation regimes which limit or replace non-pecuniary damages.

The Committee next examined relevant scientific health studies which evaluated health outcomes when traffic injury models converted to no-fault compensation systems. These studies produced consistent, compelling evidence that restricting or eliminating the tort component in auto insurance compensation
models, together with a greater emphasis on evidence informed diagnosis and treatment, produces statistically better health outcomes.

The Committee considered actuarial evidence including various closed claims studies undertaken in Alberta between 1988 and 2019, which demonstrated statistically that automobile insurance rates have consistently increased over nearly two decades, as predicted by the AAIB in 1991. These increases have been consistently well in excess of Consumer Price Index increases.

The Committee received input from the public, including service providers and members of the Alberta motoring public by way of public surveys, written submissions and consultations with service providers.

The Committee also took into consideration its individual members’ decades of experience with various aspects of the automobile insurance compensation system including experience with its rating boards, with personal injury litigation, with accident injury compensation, with medical and health treatment and diagnostic and treatment protocols, with tort reforms, with insurers and insurance intermediaries and academics.

The Committee concluded on the evidence it evaluated that the Alberta tort system has lost the ability to best serve the traffic injured and motoring public. The Committee concluded the optimal and only solution to produce long-term stability to auto insurance pricing is replacement of the existing hybrid tort/no-fault model with a pure no-fault traffic accident care and compensation model.

The parallel solution to produce the best outcomes for traffic injured is a comprehensive evidence informed care model that builds on the DTPR implemented in 2003.

A pure no-fault model can rebalance the goals of traffic compensation resulting in fair, accessible and affordable insurance, timely and appropriate outcomes when claims are made, and a viable and sustainable automobile insurance system with modernized assessment and treatment protocols for all traffic injured.

A pure no-fault system will produce greater opportunities to deliver improved health and benefits.

Improved health benefits delivered to all traffic injured will benefit families and dependants of the traffic injured as well as the motoring public and Alberta taxpayers. Better health outcomes would likely reduce the duration of recovery times, which in turn would result in earlier return to work and life activities and lower the nature and amounts of claims for pecuniary losses.

A redesigned pure no-fault accident compensation model will enable and incentivize health providers to develop consistent assessment and treatment protocols and collect patient feedback and objective treatment data to continue to inform those protocols. In the result the redesign will produce opportunities to deliver superior health outcomes for traffic injured and without the delays, duplications in services, adversarial processes and costs that exist under the current model.

The design of a health care model that provides appropriate medical evaluation, assessment and treatment modalities for those traffic injured who may have permanent incapacity and long term care needs is a complex task. It is better addressed by transforming the health care model so that medical, health and vocational expertise currently utilized in the tort system can be redirected to an administrative model that eliminates the features of adversity, conflict and dispute for better care, efficiency and cost.
A pure no-fault auto insurance compensation model will promote innovation and encouragement of optimal health treatment for Alberta traffic injured in an environment devoid of legislated adversarial conduct. Traffic injured, like all persons who suffer ill health, are better served if all their service providers are pulling in the same direction. This collaborative approach induces the injured to also take an active participatory role in their own recovery.

The Committee recommends a redesigned continuum of care model that establishes a new paradigm that will encourage collaboration, innovation and continuing improvement among service providers based on evaluation of performance, health outcomes and research. It combines the most useful features of existing health care treatment regimes with views of subject matter experts as to expansion to apply to all Alberta traffic injured.

The proposed continuum of care model will address the deficiencies identified in the current system, namely delay, conflict, inappropriate and ineffective treatment and duplications in service. It will reallocate resources to produce better health outcomes for all, not merely a portion of all traffic injured in Alberta.

The continuum of care model will provide more rational individualized diagnosis and treatment of Alberta traffic injured. In turn it will encourage the collaborative pursuit of optimal health outcomes among the health service providers, insurers, traffic accident regulators and the traffic injured themselves.

The continuum of care model contemplates a specialized pure no-fault long-term care program for catastrophically injured that will ensure individually designed treatment, rehabilitation and care over the life of the individual on the basis of best evidence informed protocols. To function in a private enterprise system, the Committee proposes the creation of a pool of funds contributed by a specified portion of every auto insurance policy premium, managed by an entity similar to the Facility Association. Where efficiencies can be achieved with improved protocols and provided it is always fully funded according to prudent actuarial calculations, premiums may be reduced or rebated.

In order to provide reasonable care to all traffic injured, the pure no-fault compensation model recasts the concept of compensation for pain and suffering and loss of enjoyment of life. For traffic injured who suffer a temporary non-permanent injury, in addition to the treatment to be provided under the care protocols, our proposed Model I provides a fund of money referred to as a rehabilitation maintenance account.

For the most serious injury cases that involve the most pronounced consequences of pain and suffering and loss of enjoyment of life, there is provision for an impairment benefit that will be specifically tailored to the circumstances of the individual case and will stand in place of the former court award for pain and suffering and loss of enjoyment of life.

In the case of the catastrophically injured person, the intent of the model is to provide proper compensation that will approximately replicate the amount of the lump sum award pronounced in the SCC Trilogy of cases, but in a different form and application.

The new model will extend to all traffic injured including those at fault. The Committee’s expectation is that upon elimination of current costs that did not improve health outcomes, the reduction and elimination of certain lump sum payments for pain and suffering, the implementation, management and oversight of superior evidence informed protocols and
health provider practices, the model will deliver first, much improved health outcomes. In the medium and long term, where the pure no-fault model achieves maximum performance, it will deliver reductions in the cost of medical treatment and the amounts of income compensation required. Reduced stabilized costs will result in sustainable, predictable and stabilized premium levels over the long term.

This trend will be achieved through the maximum effort of all participants to deliver optimal performance which will be verified by collecting and examining all the relevant data and the use of modern technology including artificial intelligence and applying medical innovations.

Transferring the Alberta traffic injury compensation mechanism to an administrative body that oversees individual assessment of all traffic injured and provides well informed treatment individually will also provide a healthy environment for its health services providers.

The Government of Alberta retains the ultimate statutory and regulatory authority over the reformed auto insurance compensation model. A reformed traffic accident administrative regulatory structure would continue to owe a reporting obligation to government including responding to government requests and keeping it apprised of changing circumstances that required input and direction.

The Committee recommends the creation of a Traffic Injury Regulator, including a Board and Tribunal to oversee four arms of accident care and compensation: one of which will provide accident claims administration and support to help claimants advance claims for health treatment, benefits and economic losses. A second arm will be composed of certified and qualified medical experts to provide conclusive determinations of injured persons’ extent of recovery and impairments. The medical panel process under the Alberta workers’ compensation system is a useful example. A third arm will consist of claims assessment panels comprised of financial and vocational experts to provide conclusive determinations of income replacement for traffic injured.

The Committee recommends the current Automobile Insurance Rate Board (AIRB) be reconstituted to form a fourth arm to the Traffic Accident Board. There should be commensurate changes to the authority of the AIRB and some communication procedures by which the outcomes of the Traffic Injury panels and Tribunal can be periodically transmitted to the AIRB to inform its rate-approval responsibilities.

Each arm will have resort to the Traffic Accident Board for advice and direction and the claimants will have recourse to the Traffic Injury Tribunal for review or appeal in respect of the conclusive certificates issued.

The Committee concluded that these regulatory arms should be independent of both government and the auto insurance industry, however should be funded by the auto insurers who write business in Alberta, according to their proportionate share of the market, with some financial contribution also from the Government of Alberta, to take into account the savings it will incur due to elimination of administrative costs pertaining to court, health and rating process.

The Committee recommends that more expanded collaborative dialogue be undertaken among the auto insurance industry, health providers, claims providers, proposed injury navigators and government officials prior to and in the implementation phase before a final design is adopted. Collaborations among these providers could have long-term advantages in providing reliable information for insurers
to improve their array of optional programs and in turn those could inform improvements to the services delivered as regards the mandatory product.

With proportionate joint financial support the public can be assured of independence in the conversion to a regulatory process and optimal selection of subject matter experts who will oversee the claims processes, make the medical and financial determinations and rating and other market practices on the basis of objective and transparent predetermined qualification for the roles and appetite to participate.

The report of the consulting actuary demonstrated that under the Committee’s proposed Model I, the pure-no fault compensation system would be expected to produce a 9.4% reduction in auto insurance premiums for the majority of consumers who purchase the full package of insurance which would include third party liability, accident benefits, uninsured and underinsured motorist, collision and comprehensive coverages. The Committee observes that if the auto insurers were able to deliver on the expected reduction in cost of overhead, by reason of the creation of the Traffic Accident Regulator, the 9.4% reduction might well deliver as much as 10%.

For those consumers who desire and require more extensive coverage for their potential medical health and financial losses after a traffic injury, the optional products the insurance industry has committed to make available should allow for a wide array of choice for consumers to tailor to their individual needs.

The Committee expects that once the operation of the model delivers the maximum expected improved health outcomes the premium reduction will remain stable in the medium term, i.e. three years, and should thereafter rise no faster than the Consumer Price Index increase in the long term.

The Automobile Insurance Advisory Committee submits its conclusions and recommendations in line with the guiding principles and desired goals outlined in its Mandate for achievement through a fundamental reform of automobile insurance compensation in Alberta.

The discussion, analysis and conclusions which follow are offered on the basis of a detailed review of the relevant judicial authorities. No members of the Committee are active members of the Law Society of Alberta, nor were any consulted in connection with this section. The Minister of Finance is cautioned to consult his own legal advisors for professional legal advice, if required.
II Summary of Conclusions and Recommendations
Automobile Insurance Reform

A. Analysis of Alternative Legislative Models

1. The historical review and evaluation of numerous commissioned reports over decades and across many Canadian provinces provided compelling evidence that reformed traffic accident compensation models which retain tort features result in continuing premium instability in the medium and long term.

2. It was evident to the Committee that in a reformed auto insurance model tort finds opportunities to grow and thrive. Two recent examples illustrate this phenomenon. The New South Wales model, redesigned in 1999 to minimize tort components, fell prey to pricing problems and bodily injury cost increases within 14 years. In short, the tort components found areas for regrowth. The Ontario experience was the same or similar, despite its intent to minimize tort with a high litigation threshold and enhanced accident benefits. Over time, tort components replicated with increasing litigation on the accident benefit side combined with duplication and increased service provider costs generated by legal and health professionals.

3. More importantly, since the conversion of some systems to full no-fault compensation, emerging scientific data has produced equally compelling evidence that tort models impede health outcomes and recovery of traffic injured.

4. The Committee was satisfied on the evidence of its detailed historical analysis of auto insurance reform experience that preserving any component of tort in a reformed automobile insurance system is inconsistent with the needs of traffic injured. Further, since it adds unnecessary expense to policy holders, it also adversely affects the motorists who pay for automobile insurance.

5. The Committee concluded from its analysis that there should be a transformation from the current model and its primary tort principle of money compensation for non-pecuniary damages to a pure no-fault model based on better, more timely rehabilitation and health outcomes and the replacement of court determination of the measure of traffic accident pecuniary losses through a collaborative administrative panel-based process. The current model of accident compensation should be reformed to expedite health outcomes and recovery to all traffic injured, including those who cannot prove fault of another driver.
6. The Committee concluded that to attain both optimal health treatment for all of its traffic injured and predictable, stable insurance premiums for road users, the Alberta motoring public would be best served in the medium and long term by the implementation of a pure no-fault system of automobile insurance designed with evidence-informed medical diagnostic and treatment protocols, and non-adversarial claims processes and assessments.

B. Analysis of Alberta Auto Insurance Reforms

7. From the analysis of the history of Alberta automobile insurance reform when compared to other similar hybrid tort models, the Committee drew the following lessons for Alberta:

a. the various experiments undertaken by hybrid tort/no-fault auto insurance models from 1990 to 2017 in Canadian provinces and elsewhere when compared to pure no-fault models clearly show that the pure no-fault models have performed more effectively in terms of premium stability;

b. those jurisdictions that endeavored to balance both tort and no-fault accident benefit components in one traffic accident compensation model were unsuccessful in delivering affordability, accessibility, and stability in premiums in the medium and long term;

c. auto insurance reform models that preserve a tort component or tort components have been criticized for the adverse effects upon the health outcomes of traffic injured;

d. pure no-fault models reduce recovery times, enhance health outcomes, expedite claims resolution for the benefit of the traffic injured and reduce premium costs for the benefit of insured motorists;

e. a legislature contemplating a fundamental reform of its automobile insurance system should recognize that a broad consensus among all constituents, including both the traffic injured and the policy holders and service providers, is unlikely to be achieved; and

f. a legislature which undertakes a fundamental reform of its automobile insurance system should expect to receive some initial opposition from various sectors of the public because such a transformation will be disruptive to certain service providers whose roles will be transformed, diminished or eliminated altogether.

Proposed Reform of the Alberta Automobile Insurance Compensation System

8. Increases to auto insurance premiums for insured Alberta motorists have continuously exceeded the Consumer Price Index increases for the past 3 decades, and have been sharply escalating since 2014. The current Alberta auto insurance compensation model does not deliver stability of premiums or long-term sustainability.

9. There are serious systemic problems in the current Alberta model. These are exacerbated by entrenched practices and processes that have not kept pace with the health needs of the traffic injured but have in fact prevented or delayed the introduction of modern innovations to improve health outcomes for the traffic injured and to prevent worsening of traffic injuries due to delays in claims resolution.
10. All Albertans, including those who do not form part of the insured motoring public, will be better
served if the automobile insurance system provides at least a modicum of evidence-informed
medical and health treatment to help all traffic injured receive proper care, participate optimally
in their own recovery and see an expedited return to normal life activities including employment
and leisure.

11. The Committee concluded that growing divergence between the intent and the result of the 2004
reforms is detrimental to the traffic injured and the motoring public, as is ongoing uncertainty
flowing therefrom.

12. The Committee concluded that an alternative administrative health delivery model outside the
tort system can provide individual evaluation of each injured person’s injuries and losses, and can
do so more effectively, more swiftly and with superior health outcomes for traffic injured than the
current model.

13. The principle of deterrence is no longer a convincing justification for maintaining the tort system in
auto insurance. Deterrence of risky driving is more effectively achieved with increased enforcement
of traffic laws, increased penalties for traffic infractions, more extensive education about the
consequences of risky driving and the pricing mechanism that requires reckless drivers to pay
higher premiums for insurance, if they are not precluded altogether from driving due to traffic
enforcement laws.

14. The long delays endemic in tort litigation could be avoided by substitution of medical review panels
established under an administrative model. These would have the authority to make conclusive
determination at appropriate milestones after an accident as to issues of medical impairment and
future treatment requirements.

15. The requirement for duelling doctors to be engaged by both sides in litigation, to expend large
amounts of time, resources and expense to craft written reports and prepare for possible cross-
examination on their credentials and credibility is counterproductive. Instead doctors should be
enabled to lead the inquiry, collaborate in a non-controversial, non-adversarial environment, and
take factors into consideration that in a legal environment may have been excluded for procedural
reasons. This will produce a more comprehensible and speedier resolution to the benefit of all
participants and will permit final conclusions about the health condition of traffic injured much earlier
than typically occurs in the litigation process.

16. The original design of the DTPR remains sound and should be further developed, enhanced in its
design and extended to deal with all other injuries. The development and extension of the existing
DTPR under a properly designed regulatory process will address the problems of some traffic
injured in Alberta receiving inadequate, wrong or duplicative treatment that does not benefit their
recovery. Such additional treatment protocols when reviewed, refined, and enforced in line with
current evidence-informed practices will establish greater uniformity of treatment, will allow for
greater relevant data collection and feedback to inform and track recovery methods that are safe
and effective.
17. The Alberta tort system has lost the ability to best serve the traffic injured and motoring public. A pure no-fault model can rebalance the goals of traffic compensation resulting in fair, accessible and affordable insurance, timely and appropriate outcomes when claims are made, and viable and sustainable automobile insurance systems with modernized assessment and treatment protocols for all traffic injured. A pure no-fault system will produce greater opportunities to deliver improved health and benefits.

18. Improved health benefits delivered to all traffic injured will benefit families and dependants of the traffic injured as well as the motoring public and Alberta taxpayers. Better health outcomes would likely reduce the duration of recovery times, which in turn would result in earlier return to work and life activities and lower the nature and amounts of claims for pecuniary losses.

19. A redesigned pure no-fault accident compensation model will enable and incentivize health providers to develop consistent assessment and treatment protocols and collect patient feedback and objective treatment data to continue to inform those protocols. In the result the redesign will produce opportunities to deliver superior health outcomes for traffic injured and without the delays, duplications in services, adversarial processes and costs that exist under the current model.

20. The design of a health care model that provides appropriate medical evaluation, assessment and treatment modalities for all of those traffic injured who may have permanent incapacity and long-term care needs is a complex task. It is better addressed by transforming the health care model so that medical, health and vocational expertise currently utilized in the tort system can be redirected to an administrative model that eliminates the features of adversity, conflict and dispute for better efficiency and cost.

21. A pure no-fault auto insurance compensation model will promote innovation and encouragement of optimal health treatment for Alberta traffic injured in an environment devoid of legislated adversarial conduct. Traffic injured, like all persons who suffer ill health, are better served if all their service providers are pulling in the same direction. This collaborative approach induces the injured to also take an active participatory role in their own recovery.

22. Transferring the Alberta traffic injury compensation to an administrative body that oversees individual assessment of all traffic injured and provides well informed treatment individually will also provide a healthy environment for its health services providers.

**Review of Health Outcomes Evidence**

23. The peer-reviewed scientific evidence the Committee examined from evaluations of traffic injured recovery under no-fault compensation models since 2000 prove that health outcomes of traffic injured are improved after elimination of money compensation for pain and suffering.

24. The scientific evidence the Committee examined supports the contention that under a tort system claims are filed in a potentially adversarial environment that can promote the persistence of symptoms in claimants. In the course of proving that their pain is real, claimants may encounter conflicting medical opinions, unsuccessful therapies, and legal advice to focus their suffering or disability by continuous documentation.
25. The evidence the Committee examined suggests a tort system may influence patients’ perception of their medical needs and how insurers/tort require them to legitimize their injury and then influence the patients to pressure clinicians for referrals.

26. A study under the tort system the Committee examined confirmed that too much health care too early after a soft tissue injury negatively influences the prognosis of whiplash patients. Early minimal care that promotes activation improves prognosis.

27. The study showed that fewer persons file claims for whiplash injury under the no-fault system, and those who did recovered faster than similar claimants under the tort system. Similar results have been produced in Alberta in respect of recovery periods for mild traumatic brain injury.

28. Scientific data studying long-term outcomes after orthopaedic trauma the Committee examined led to the conclusion that compensation schemes may impede recovery from injury by producing worse outcomes for compensable orthopaedic trauma patients, compared with non-compensable patients.

29. Under both the tort and the no-fault systems, the involvement of a lawyer was associated with delayed claims closure.

30. All of the foregoing medical evidence supports the finding of the trial judge in *Hartling v. Nova Scotia (Attorney General)*, 2009 NSCA 130, that:

> Unfortunately, the nature of the tort recovery system which is adversarial requires patients to focus on their pain and disability which is counter to the best methods of treatment which focusses patients on their abilities.

31. Under a no-fault system, there is no financial incentive to delay recovery since claimants have immediate access to medical care and other benefits without being required to substantiate their injuries.

32. The consistently developing medical evidence the Committee examined from 2000 to the present demonstrates that health outcomes of traffic injured are not well served by the tort system and preservation of any of its components in the Alberta automobile insurance compensation system is not justified. This is supported by testimony of health practitioners in the recent court challenges in Alberta and Nova Scotia.

33. Experience from other jurisdictions the Committee examined consistently suggests extended treatment and some investigative procedures, such as imaging and invasive treatment, are not recommended for most soft tissue injuries and can be linked with dependence and poor health outcomes.

34. New South Wales’ and Ontario’s experience provides further caution that fee for service payment models for treatment of traffic injured tend to support quantity over quality. Overtreatment occurs in compensation systems because sometimes the practitioner is not aware of or committed to best practice guidelines for soft tissue injuries and others are influenced to recommend treatment or extend treatment in response to pressure from patients or their families.
35. A study of patterns of early clinical care involving visits to general practitioners, chiropractors, or specialists did not show that early, aggressive care promotes faster recovery. Whiplash injury is less of a problem in jurisdictions where the involvement of healthcare providers is minimal.

36. In addition to establishing objective evidence that no-fault models are superior to tort models from a health outcome perspective, pure no-fault models have demonstrated the greater opportunity to collect reliable treatment data to inform, innovate and improve treatment modalities to traffic injured.

37. The implementation of the pure no-fault model in Québec enabled the Québec Task Force to utilize the data to establish a classification system for whiplash associated disorders as WAD I, II and III, and this system is now being used worldwide. This experience is strong evidence that a pure no-fault model for accident compensation can not only provide ongoing data to inform consistent, appropriate treatment for various categories of traffic injuries but is also better suited to utilize the data collected to implement innovative techniques to improve treatment more effectively and expeditiously.

38. The New South Wales’ experience also supports the importance of collecting and analyzing data on patterns of rehabilitation and recovery to validate approaches that produce optimal health and functional outcomes for soft tissue injured persons. It provides supporting evidence that any reformed medical assessment model must ensure that treatment paths are consistent with established and current evidence-informed practice guidelines to facilitate optimal recovery and containment of treatment costs.

39. The New South Wales’ experience also reinforced support for an independent panel of medical specialists who are the sole decision makers about assessment and treatment issues, noting that accessibility to skilled and qualified experts eliminates adversarial elements, such as duelling experts that can result in delay, increased cost and potential impaired recovery.

40. The evidence and experience pertaining to the development and implementation of the Alberta DTPR protocols the Committee examined since 2004 provides reliable validation of the benefits of that innovation and should be used as a foundation in the transformation of treatment of traffic injured in Alberta.

41. The Committee was satisfied that the peer-reviewed health evidence it examined further bolstered its conclusion that a pure no-fault model would be the optimal choice for treatment of Alberta traffic injured.

**Actuarial Evidence from Tort Accident Injury Compensation Systems**

42. From the actuarial evidence reviewed, the Committee concluded that since non-pecuniary awards for catastrophic injuries and minor injuries have been capped, whereas the four categories of injuries isolated in the 2019 Cheng Claims and Cost Study (see Sources) were not, claimants in those four categories have been overcompensated relative to the minor and catastrophically injured.
43. The primary cause of high and continuing increases in auto insurance premiums in Alberta and in other tort jurisdictions is that uncapped bodily injury loss costs continually increase and at a rate well in excess of Consumer Price Index increases for other market commodities.

44. Efforts in other tort jurisdictions to provide a solution to the excessive effect of tort on the cost of bodily injury claims have failed despite well considered experiments to preserve and balance both tort and no-fault components, as for example, in Ontario and New South Wales. The actuarial evidence supports the conclusion that the only effective and sure means to secure premium stability and sustainability in the long term is to remove the tort components altogether and to replace them with the best and proven innovations resulting from the pure no-fault models implemented in other jurisdictions.

Public Consultations

A. Evidence of Public Consultations 2003

45. The Committee concluded that automobile insurance reform is not a topic on which legislators can expect to secure broad support for the reasons that the subject is examined by so many different persons and groups from different angles, as well as from short, medium and long term perspectives. Previous attempts in Alberta to negotiate auto insurance reform for consensus among groups with vested interests showed that the original goal was diluted through disagreement among constituents, which resulted in half measures and undermined the long-term solutions the reform originally intended.

B. Results of 2020 Public Surveys

46. The responses to the 2020 public surveys could not be viewed as definitive in informing the Committee’s final recommendations, however, it carefully considered the findings of Leger and noted the following most salient features of the responses as follows:

a. 63% of respondents indicated that they do not feel their premiums are fair and reasonable;

b. 56% and 64% respectively indicated they would prefer access to affordable insurance rates, as well as immediate to medical/rehabilitation and income replacement over the right to sue for a cash settlement;

c. 77% of respondents indicated that at-fault drivers should be subject to penalties which could include fines, convictions along with higher insurance rates; and

d. 42% of respondents indicated their desire to retain their right to sue in the event of a serious permanent injury.

47. Respondents clearly indicated that they considered auto insurance premiums are too high, and greater emphasis should be placed on rewarding good drivers and lowering repair costs.
C. Submissions from Insurance Industry Service Providers

Property Damage Product Reform

48. A no-fault model known as Direct Compensation Property Damage (DCPD) would deliver a simpler, faster claims process, improve the communication and service to the insured motorist, enable the insurer to predict future loss costs more accurately and likely result in some reduction in premium costs.

Reforms to Address Risky Driving Behavior

49. The Government of Alberta (GOA) should increase enforcement and penalties for high-risk driving offences, collect, maintain and disseminate results and data to help further educate consumers about the dangers and consequences of risky driving behavior.

50. The GOA should reform the graduated licencing and other driver training programs, including possible inclusion of retesting of penalized drivers, to build public confidence that such programs can effectively promote safe driving practices.

Reform of the Regulatory Process

51. As to concerns about the operation of the prior approval process, operation of the Grid, all-comers Rule, Territories, and use of rating factors, resulting in delay and confusion, the Committee concluded that the legislative reforms to the regulatory process in 2004 either are no longer meeting their intended goals or have created new problems, or both.

52. The Committee concluded that one of the reasons for the industry concerns is the overlapping jurisdiction of the AIRB and the Office of the Alberta Superintendent over rating conduct which results in conflicting and reportedly confusing rulings to insurers as well as delays over approvals, which weakens market relevance of the rate applications during the lapse of time.

53. The Committee concluded that the AIRB should take exclusive jurisdiction over all rating issues while the Superintendent should govern insurance solvency, financial reporting and other areas its supervised before the 2004 reforms.

54. AIRB, either as it presently exists or as reconstituted to enlarge its mandate, should re-examine:
   a. the prior approval model and a file and use model with a designed set of principles;
   b. whether to publish guidelines to apprise insurers of what information is appropriate to include in rating applications relative to risk assessment;
   c. the “all comers rule” and the Grid;
   d. previous Facility Association ceding arrangements and oversight of its premiums to ensure adherence to social policy considerations and actuarial evidence;
   e. the current Territories designation;
   f. establishing and publishing a list of prohibited rating factors;
g. remedies for non-compliance with guidelines; and
h. the benefit of retaining a delegate of the Superintendent of Insurance in the rate approval process.

55. The Committee concluded that:
   a. reforms in these areas are likely to:
      i. minimize or eliminate the need for sudden legislative corrective actions such as rate freezes;
      ii. reduce cross subsidization of bad drivers by good drivers;
      iii. reflect the driving risk across geographic areas of Alberta; and
      iv. assist more drivers to qualify for mandatory insurance.
   
   b. greater transparency, education and timely disclosure to consumers of amounts of the premium which are allocated for premium tax, medical treatment, the Alberta health care levy, cost of physical damage claims and bodily injury claims are likely to enhance the consumers’ understanding of the components of the mandatory premium.

Reform of the Judgment Interest Act

56. The Judgment Interest Act should be amended to make the rate for non-pecuniary damages the same as the rate for pecuniary claims and to suspend claims for judgment interest on non-pecuniary damages for a period of two years from the date of accident loss as both would reduce the cost of insurance to motorists in a transition period.

Optional Insurance Products (UBI)

57. Permission to utilize and expand use of user based optional insurance products is a question that should be examined and determined by the AIRB, either as it presently exists or as reconstituted.

Legislation to mandate use of winter tires

58. The Committee concluded use of winter tires for the winter months in Alberta will reduce the occurrence and frequency of auto accidents and injuries.

Section B Benefits

59. The Section B Benefits system under the current model had demonstrated many flaws and was not delivering the original goals intended. A fundamental transformation of the current system for compensation for no-fault benefits was required.
The Tort/No-Fault Issue

60. The list of concerns about the tort features of the current model was extensive. The Committee concluded that since implementing modest and piecemeal reforms which have been demonstrated in other jurisdictions to be ineffective, undertaking one fundamental comprehensive reform on one occasion to all aspects of the current model will best achieve the goals of optimal health outcomes to traffic injured, together with affordability, accessibility and long-term sustainability of auto insurance premiums. Moreover, given that any auto insurance reform is likely to result in dislocation and disruption to many service provider businesses and operations, the Committee concluded that the extent of such adverse consequences will be contained if reform occurs at once, rather than in piecemeal increments over varying time periods.

61. Insurers’ preparedness to now design competitive and well-structured optional income replacement coverages can address concerns about incomplete coverage for some traffic injuries. It will allow consumers at the time of renewal of issuance of their auto insurance policy to elect to purchase additional amounts of coverage to ensure compensation for the entirety of their provable income losses.

62. Those optional products should be subject to reasonable oversight by an independent traffic accident regulatory body to ensure fairness to consumers from pricing and coverage perspectives.

63. Under a reformed pure no-fault model, insurers should continue to be subject to oversight delivered by independent regulators with necessary subject matter expertise as regards all aspects of mandatory automobile insurance in Alberta.

Evidence-Informed Health Treatment for Traffic Injured

64. Other than legal service providers, most participants supported the view that removing or reducing the tort component would lessen the strain of litigation demands on medical and health professionals whose main professional purpose was treating traffic injured.

65. The Committee concluded that under a pure no-fault model there were many opportunities to optimize health treatment for traffic injured. These many opportunities are specifically listed below in our Recommendations.

66. Competent health service providers working collaboratively with the private insurers will have the relevant insight to respond to the requirements of fundamental reform. This is so even weighing facts that the reform will require transformative changes to health services delivery to traffic injured and more comprehensible and responsive oversight and regulation of insurers’ conduct regarding their claims, compensation and rating practices.
67. There will be a sufficient appetite among competent health providers and insurers to collaborate in the design and delivery of a fundamental reform of the accident compensation model to eliminate adversarial conduct and unnecessary commercial operations currently existing between the traffic injured and the administrative health delivery and compensation services they require.

**Reforms to the Assessment of Injury and Pecuniary Loss Process**

68. Almost all service providers agreed that to be an effective alternative to the current model, the alternative regulatory injury evaluation and compensation regime must exclude conflict, disputation and adversarial features that increase cost, delay and added stresses to the injured claimant and include the service providers who desire to expedite optimal recovery and rehabilitation outcomes for traffic injured.

69. The Committee concluded that the market preparedness to offer a complete suite of optional products to provide first party coverage of those losses previously addressed under the tort model would probably satisfactorily fill any gaps for any traffic injured not fully made whole by the benefits provided in a reformed pure no-fault compensation model.

70. The Committee concluded that a composition of a series of mandatory benefits made available to all traffic injured under a mandatory policy supplemented by a series of optional enriched benefit that a consumer may choose or decline is the superior version of a choice model for motorists and traffic injured.

71. There should be a fully redesigned traffic injury regulatory body populated by independent subject matter experts to establish and maintain optimal health treatment and delivery of services for all traffic injured, for early and appropriate claims assessment.

72. In the transition period, the GOA may wish to establish regulations to limit fees for services for all such litigation support providers, including lawyers, court experts, and mediators to appropriate and transparent levels for so long as any tort component is retained in the accident compensation system.

**Proposed Reform of Health Care Model**

73. The Committee concluded that the redesigned continuum of care model outlined in Section X of this Report combines the most useful features of existing health care treatment regimes with views of subject matter experts. It establishes a new paradigm that will encourage collaboration, innovation and continuing improvement among service providers based on evaluation of performance, health outcomes and research.

74. The proposed continuum of care model will address the deficiencies identified in the current system, namely delay, conflict, inappropriate and ineffective treatment and duplications in service. It will reallocate resources to produce better health outcomes for all, not merely a portion of all traffic injured in Alberta.
75. The continuum of care model will provide more rational individualized diagnosis and treatment of Alberta traffic injured. In turn it will encourage the collaborative pursuit of optimal health outcomes among the health service providers, insurers, traffic regulators and the traffic injured themselves.

76. Because the proposed continuum of care model will extend to all traffic injured the Committee expects the elimination of current costs that did not improve health outcomes, the reduction and elimination of certain lump sum payments for pain and suffering, the implementation, management and oversight of superior evidence-informed protocols and health provider practices, will deliver much improved health outcomes. It further expects that over time, this redesign will reduce the cost of medical treatment and income compensation due to improved health outcomes. Reduced stabilized costs will result in sustainable, predictable and stabilized premium levels over the long term.

77. The Committee concluded that the proposed pure no-fault private enterprise model should trend toward expediting recovery of Type I and Type II injuries, and optimizing treatment and long-term care for Type III injuries, all of which, in turn, should result in reduced medical costs and income claims over time. This trend will be achieved through the maximum effort of all participants to deliver optimal performance which will be verified by collecting and examining all the relevant data and the use of modern technology including artificial intelligence and applying medical innovations.

Proposed Reform of Auto Insurance Regulatory Regime

78. The Committee has included in its Recommendations extension of the jurisdiction of the AIRB or, alternatively, expanding its mandate under a new reform model. It offers a few additional words of guidance with respect to AIRB’s role in future.

79. The Committee observes that the predecessor Alberta Auto Insurance Board was first constituted in approximately 1970 as a statutory body established independent from the GOA. From that date until about 2003, it functioned efficiently in delivery of rate and rate related decisions as a prior approval board.

80. In about 2003, the Alberta Auto Insurance Board was reconstituted as the Alberta Insurance Rate Board and since then reported directly to the Minister of Finance, as a part of the GOA although it has been funded by the automobile insurance industry. While the jurisdiction of the Alberta Insurance Rate Board is similar to that of its predecessor, as reported under Section XI C of this Report, some overlapping jurisdiction has emerged with that of the Alberta Superintendent of Insurance which has resulted in concerns about the efficiency of the operation of both regulators.

81. The Committee concluded that while the current Alberta Insurance Rate Board has worked well under the existing model, the motoring public would be better served if it reverted to its former status, so that it could provide independent expert advice to the GOA from time to time as circumstances dictate, and on a regular basis interact more nimbly and informally with auto insurers, new traffic regulators and other affected parties as regards rate and rate regulating issues.
82. With its existing expert knowledge about the specific operation of prior approval, the Grid, Territories, rating factors that should be permitted and prohibited and new optional products such as UBI, the current board members and staff are in a unique and valuable position to offer advice and guidance in an implementation phase.

**Actuarial Forecast of Impact of Proposed Reforms**

83. The report of the consulting actuary demonstrated that under the Committee’s proposed Model I, the pure-no fault compensation system would be expected to produce a 9.4% reduction in auto insurance premiums for the majority of consumers who purchase the full package of insurance.

84. For those consumers who desire and require more extensive coverage for their potential medical health and financial losses after a traffic injury, the optional products the insurance industry has committed to make available, should allow for a wide array of choice for consumers to tailor to their individual needs.

85. The Committee observes that if the auto insurers were able to deliver on the expected reduction in cost of overhead, by reason of the creation of the Traffic Accident Regulator, the 9.4% reduction might well deliver as much as 10%.

86. The Committee expects that once the operation of the model delivers the maximum expected improved health outcomes, the premium reduction will remain stable in the medium term, i.e. three years, and should thereafter rise no faster than the Consumer Price Index increase in the long term.

**Legal Considerations**

87. Although no one can ever predict whether a legal challenge will be made following an auto insurance law reform, the prevailing judicial authority has clearly established that pure no-fault auto insurance regimes, like those that have been in force in Manitoba and Québec, are within the scope of provincial legislative authority and since they treat every member of the driving public equally, a challenge under the Charter would be without merit.

88. The decision of the Alberta Court of Appeal in *Morrow v Zhang* has satisfied the Committee that a Charter challenge to a future auto insurance reform would be untenable provided that, like the 2003 reform, it is developed and implemented as a package, balanced, interrelated and interdependent.

89. In summary, the Committee concludes Alberta’s existing auto insurance system should be replaced with a pure no-fault accident compensation model with features described below.
B. Recommendations

Evidence-Informed Health Treatment for Traffic Injured

1. The Committee recommends removing the tort component to lessen the strain of litigation demands on medical and health professionals whose main professional purpose was treating traffic injured and replacement with a pure no-fault model under which enhanced care programs should be developed for all categories of injuries including psychological, chronic pain, and combinations and clusters of accident injuries.

2. The Committee recommends a fundamental reform to the delivery of health care to all traffic injured under a pure no-fault model to include as far as possible the following features:
   a. supporting early, active, and appropriate evidence-informed treatment aligned with and for traffic injuries;
   b. pre-approved treatment frameworks for common injuries based on evidence-informed care with associated schedules and policy limits;
   c. expedited access to care from prescribed providers;
   d. reducing transactional administrative burdens in the system;
   e. reducing duplication of services and overutilization;
   f. optimizing appropriate treatment modalities with consistent quality improvement to achieve recovery timeframe of 2 to 3 years for most injuries;
   g. codifying causation so that there can be reasonable finality of injury claims and proper evaluation of the injuries caused or contributed to by the traffic accident as distinct from other causes; and
   h. establishing:
      i. definitions of serious and catastrophic injuries;
      ii. definitions of chronic pain and psychological injuries;
      iii. expert medical panels to make conclusive determinations as to which claimants fall into which categories;
      iv. treatment regimes that will include an intended resolution date for the claimant and the service providers;
      v. an independent oversight body to supervise treatment providers to ensure that health providers are following evidence-informed guidelines in regimens to ensure optimal recoveries for traffic injured;
vi. a structured review process for traffic injured not recovering within the normal treatment guidelines or whose recovery has plateaued so that they can be referred for alternative treatment;

vii. clear return to work guidelines for claimants seeking disability payments to encourage gradual return to work programs, modified duties or retraining for different occupations;

viii. regulation of fees for health and dental health providers;

ix. means of collecting and aggregating health treatment data to ensure ongoing monitoring and evaluation of care programs, outcomes and continuous improvement of first party compensation based on reliable data; and

x. implementation of an electronic system for auto insurers in conjunction with a traffic injury regulator, health care and ancillary service providers to expedite transmission and processing of claim forms.

3. The Committee recommends the continuum of care model described in this Report be adopted as part of its proposed pure no-fault accident compensation model, with the intention that its service providers be subject to oversight of a new Traffic Injury Regulator as described in this Report.

4. The Committee recommends that the GOA engage a team of competent health providers to collaborate with the regulators and insurers in the design and delivery of a fundamental reform of the accident compensation model to eliminate adversarial conduct and unnecessary commercial operations currently existing between the traffic injured and the administrative health delivery and compensation services they require.

Reforms to the Assessment of Injury and Pecuniary Loss Process

5. The Committee recommends replacement of the current model with a pure no-fault care model to compensate all traffic injured without the requirement to prove fault of a negligent driver to be overseen and regulated by alternate traffic accident administrative structure, similar to Alberta workers compensation and other workers compensation models, which provide individualized assessments by a panel of medical experts and claims assessments by panels of experts. However, in the case of an Alberta traffic accident compensation model, the Committee recommends a model that takes the most effective features of those successful models and designs additional features that address the needs of the array of traffic injured that vary greatly from injured workers.

Section B Benefits

6. The Committee recommends that the current component of no-fault Section B Benefits be replaced by a pure no-fault model to provide appropriate insurance coverage to all traffic injured regardless of fault. The Committee recommends that the AIRB, either as it presently exists or reconstituted to enlarge its mandate, should have co-extensive authority to monitor and oversee the array of optional insurance products offered by insurers to supplement the health benefits provided to Alberta motorists under the reform from a pricing and consumer fairness perspective.
Establishment of an Independent Administrative Structure of Traffic Accident Regulation

7. The Committee recommends the establishment of a board and tribunal, described in this Report as the Traffic Accident Regulator, to oversee all operations and act as authority of last appeal which:
   a. serves as regulatory accident compensation tribunal for oversight of claims processes to ensure fair determination and provision of claimants’ health and financial entitlement to benefits;
   b. serves as regulatory accident compensation tribunal for oversight of health and medical treatment, assessment and evaluation of permanent injury to ensure fair determination and provision of claimants’ entitlement to health benefits;
   c. serves as regulatory accident compensation tribunal for oversight of claims assessment panels to ensure fair determination and provision of claimants’ financial entitlement to benefits and compensation; and
   d. structured in a manner similar to the current Alberta WCB model although led by a statute appointed leader to ensure independence.

8. The Committee recommends that the Traffic Accident Regulator establish four administrative arms to oversee specific aspects of the pure no-fault accident compensation system.

9. The Committee recommends the Traffic Accident Regulatory model establish groups of subject matter experts that will serve on panels to provide conclusive and final medical evaluations, conclusive income loss assessments, oversight of health service providers to ensure ongoing education and professional development, and evidence-informed results.

10. The Committee recommends such alternative model select the most highly qualified medical and health experts, and the most highly qualified financial and vocational experts, the most highly qualified educators, all of whom will provide expert advice and will work collaboratively to determine medical impairment and future treatment issues, income calculations, and future care needs. Such collaborations will eliminate the need to prepare written reports for litigation proceedings, promote evidence-informed practices and protocols and hasten incorporating new innovations that can speed up treatment and recovery of traffic injured.

11. The Committee recommends the Traffic Injury Regulator establish maximum recovery standards to encourage and enable all participants, including traffic injured, health providers and claims navigators to move collaboratively toward closure of claims at the appropriate recovery milestones. These goals would be optimally delivered by removal or diminution of monetary gain incentives. Where insurers have developed an array of optional pecuniary and non-pecuniary insurance products, those can provide suitable supplements to consumers who desire to purchase the same for additional protection and security.

12. The Committee recommends that where a medical expert panel concludes injury recovery has been attained as far as possible, benefit and income claims are referred to a claims assessor panel for final resolution. If optional products are offered by the industry, those coverages may, subject to the traffic regulators, establish contractual terms for provision of the benefits.
Health Outcomes Evidence

13. Medical and health treatment for all traffic injured in Alberta should be reformed to incorporate and conform to consistent evidence-informed practices.

14. All reforms that can align with improved health outcomes for traffic injured should be incorporated into a reformed care and compensation traffic insurance model.

15. In light of compelling evidence that being involved in litigation can adversely affect a person’s health, any services provided under the current model that directly or indirectly promote or sustain litigation, adversarial conditions, points of dispute, duplication of examinations and assessments or that otherwise do not promote prompt and optimal recovery of traffic injured should be eliminated.

16. Specifically, roles of service providers of treatments, follow-up visits, and referrals when patient health benefit or medical need is not informed by reliable evidence, or consultations in respect securing benefits, or income replacement, which may as a consequence prolong recovery by legitimizing patients’ fears and creating unnecessary anxiety, should be eliminated.

17. Reform legislation should promote early acceptance of genuineness of reported symptoms of traffic injured and delivering prompt and appropriate pathways for ensuring appropriate treatment.

18. New protocols for treatment of all traffic injured must be introduced and regularly reviewed and refined with data developed and analyzed to minimize or eliminate overtreatment, undertreatment or ineffective and incorrect treatment of traffic injuries.

19. A reformed care model for Alberta should build on the existing DTPR model and expand it to be available to all traffic injured under a pure no-fault care model.

Program for Long-Term Care for Catastrophically Injured

20. The long-term care medical professionals should be engaged to assist in implementation of a long-term care model that would best serve the needs of those severely injured in traffic accidents.

21. The no-fault long-term care model established in New South Wales in 2007 should be considered as an example for persons severely injured in traffic accidents. The property and casualty insurers who distribute automobile insurance policies in Alberta should be engaged in dialogue to determine the viability of establishing a funding pool model to support a long-term care program.

22. A pure no-fault care model for Alberta should optimize development and application of data technology including innovations such as artificial intelligence to further identify and add evidence-based improvements to diagnosis and treatment to provide continued renewal of treatment modalities.
23. The Committee recommends that the GOA give consideration establishment of an ombudsperson or ombudsperson office for which to make application for additional compensation in exceptional or extraordinary cases. Such an office may serve to identify any cases that do not appropriately fall within one of the categories of injuries or due to extenuating circumstances warrant additional consideration.

24. The Committee recommends that the Auto Insurance Rate Board should be reformulated to comprise an essential part of a larger Traffic Injury Regulator. Those features that work well under the current private enterprise model should be retained and blended with those features that work well under the current Alberta Workers Compensation Model and which could be appropriately adapted to a comprehensive Traffic Injury Regulator in a private enterprise environment.

25. The Committee recommends that the most successful and applicable features of the current Alberta Workers Compensation model in terms of administrative regulatory structure be utilized as a guide in the design and then modified for the traffic accident injury context.

**Implementation of reforms requires collaboration of insurance and health service providers**

26. The Committee recommends that the ultimate details of a reformed pure no-fault auto insurance compensation model be developed in consultation with selected health and medical experts and thereafter ancillary health service providers.

27. The Committee recommends that there be consultation with insurance industry experts to determine what modifications are optimally delivered without compromising the reasonable needs of motorists.

28. The Committee recommends that more expanded collaborative dialogue be undertaken among the auto insurance industry, health providers, claims providers, proposed injury navigators and GOA officials prior to and in the implementation phase before a final design is adopted.

**Property Damage Product Reform**

29. The Committee recommends that the property damage component of the auto insurance compensation system be converted to a no-fault model known as Direct Compensation Property Damage (DCPD) under which the insured motorists’ insurers will process the costs of repair directly in any event of fault. A driver who caused the collision will continue to be found responsible for the purpose of assessing appropriate rate adjustment.

30. The Committee recommends oversight of this program should be reposed under the AIRB, or as it may be reconstituted under a reform model. Implementation of this reform should be subject to transitional legislative change provisions to allow for orderly resolution of existing claims, including those under the *Motor Vehicle Accident Claims Act*. 
Reforms to Address Risky Driving Behavior

31. The Committee recommends the GOA legislate increased penalties to punish and deter all types of risky driving behaviour.

32. The GOA should help enhance data collection of accident statistics to inform an education program to promote traffic safety. As well, all service providers should assist the GOA in:
   a. collecting relevant collision data about traffic collisions including by use of technological and other innovations;
   b. participating in providing more and consistent education about the dangers of and penal consequences for risky driving behavior;
   c. modifying the graduated licencing program to be principle-based and more affordable for new drivers; and
   d. developing consistent and informative education programs for consumers to foster a greater understanding of automobile insurance issues.

Reform of the Regulatory Process

33. The Committee recommends that the AIRB, or as it may be reconstituted to enlarge its mandate, determine and advise GOA whether the goals of auto insurance regulation would be better served by:
   a. retaining the prior approval model or converting to a file and use model with a designed set of principles;
   b. establishing a practice of publishing guidelines to apprise insurers of what information is appropriate to include in rating applications relative to risk assessment;
   c. evaluating, eliminating or replacing the “all comers rule” and the Grid;
   d. exploring whether to revert to previous Facility Association ceding arrangements and overseeing its premiums to ensure adherence to social policy considerations and actuarial evidence;
   e. revising, expanding or eliminating the current Territories designation;
   f. publishing and disallowing use of only those rating factors that are prohibited;
   g. establishing and enforcing remedies for non-compliance with those guidelines;
   h. preserving a voice for a delegate of the Superintendent of Insurance in the rate approval process; and
   i. consultation with its counterparts in other provinces, the Facility Association and auto insurers who carry on business in Alberta, to investigate whether to replace or maintain the all comers’ rule and the Grid or devise an alternate mechanism that will be optimally responsive to market conditions as they evolve from time to time, and has regard to the following guiding principles:
      i. The premium charged to all motorists, including new entrants, fairly represents their risks;
      ii. The alternative solution must be transparent, easy to understand, administratively viable and sustainable;
iii. The alternative solution must strive to minimize cross-subsidization within the reasonable limits of an insurance system;

iv. the mechanism must ensure that no consumers are subject to unfair market practices;

v. the alternative solution must be flexible and adaptable to technological advances; and

vi. the alternative solution must be reviewed periodically to ensure it continually responds to needs of consumers.

34. Either the AIRB or a newly established Traffic Regulator should investigate provision for coverage for claims by pedestrians and cyclists not otherwise covered by auto insurance.

**Judgment Interest Act**

35. The Committee recommends the GOA amend the *Judgment Interest Act* to make the rate for non-pecuniary damages the same as the rate for pecuniary claims and to suspend claims for judgment interest on non-pecuniary damages for the two year period from the date of loss.

**Optional Property Insurance Products**

**User Based Insurance**

36. The Committee recommends that the AIRB, either as it presently exists or reconstituted to enlarge its mandate, should have exclusive authority:

a. to collect more data about the potential costs and benefits of UBI;

b. to determine whether expanding the areas of its current use would be fair to consumers and insurers;

c. to determine what restrictions or guidelines should be implemented;

d. to determine what information and education should be distributed and provided to motorists; and

e. to determine what recommendations should be made to GOA to reform regulations pertaining to the same.

**Legislation to mandate use of winter tires**

37. The Committee recommends the GOA enact legislation to make mandatory use of winter tires for motor vehicles for some specified period between October and March of each winter season.
III Introduction
The Minister of Finance for the Government of Alberta tasked this Committee to lead reform of the Alberta automobile insurance system so that it is viable, sustainable, provides fair, accessible and affordable automobile insurance for Albertans and timely and appropriate outcomes when claims are made.

The terms of reference for this Committee are clear that the supplier of a reformed product will remain the private property and casualty industry licensed to write automobile insurance in the province.

An automobile accident compensation system is complex and involves a wide range of dynamics, behaviors, customs and processes that would require change to attain effective long-term reform. Delivering these outcomes will require a significant recalibration of the existing injury compensation components which may necessitate reduction or re-engineering of the roles of certain service providers, other than the supplier of the insurance product. With planned redistribution of resources, dislocation and disruption should be expected during the transitional period. Some existing service providers may prefer or be required to exit a reformed compensation model whereas opportunities may emerge for new service providers.

As reform is investigated, it is important to delineate the two categories of persons who will be affected. One category consists of service providers who perform roles in the existing system, including insurance, health care and legal professionals, insurance brokers and agents, auto insurance regulators, suppliers and the legislators. However, as worthy as their interests and perspectives may be, it must be understood that those participants are not a genuine part of the motor accident compensation stake holding arrangement.

The only true fundamental stakeholders are the traffic injured, and the Alberta motorists who collectively pay for the losses of the traffic injured, as well as the fees, expenses and costs of various service providers. It is important to reflect on the requirements and interests of these true stakeholders, separate and apart from the service providers who represent them.

The true stakeholders in this arrangement are not in it by complete freedom of choice. Any Albertan who wishes to operate a motor vehicle in the province must purchase and maintain valid automobile insurance because the law has declared it mandatory to do so. Because the private industry suppliers are numerous, there is some variation as to the cost of mandatory insurance, but the fact remains that Alberta motorists must purchase the product.

Purchasing auto insurance is often considered a necessity, rather than a choice, for those Albertans who drive for a living, or who must use a vehicle to travel distances to meet their living requirements.

The traffic injured are also not in the stakeholder arrangement by choice. No reasonable Albertan would seek to be injured in a motor vehicle accident, although some of the reasons for increased insurance costs include the existence of fraudulent or exaggerated claims.

Sometimes, but not always, the traffic injured also belong to the other stakeholder group, namely motorists, if they own an auto policy and pay into the pool of premiums to pay for their losses.
Automobile insurance differs from all other forms of insurance, because it deals with a private driving activity on public roads where people are placed at risk. Operating a motor vehicle is both a high-risk activity and one which most people engage in without expecting to cause or sustain injuries. In particular, most motorists do not expect a minor driving error could cause catastrophic injuries. This likely explains why automobile insurance was first made mandatory by law in Alberta in 1975.

Alberta policyholders who have never been injured in a motor vehicle accident are not likely to have a detailed understanding of the processes provided and required by traffic injured to obtain medical and health treatment to attain recovery or what specific financial benefits may be claimed for under the current system.

Albertans who have not sustained a traffic injury may not be aware that if they choose to retain legal counsel to pursue full monetary compensation in the court system, it may necessitate delay in receiving payment for desired and recommended medical and health care treatment, in receiving payment for loss of income or payment for various expenses needed to approve the claim, and the requirement to attend upon extra numbers of health experts to evaluate the state of their injuries.

The delay is often extended because the lawyers for the opposing parties each engage their own sets of experts on several categories of claims such as loss of past earnings, future earnings, earning capacity, rehabilitation, pain and suffering and loss of amenities of life.

Because the Alberta law has made auto insurance mandatory, the government has also established an independent auto insurance rate board (AIRB) to oversee the rates of automobile insurance in Alberta to ensure that the suppliers are charging a fair price for the product they provide. The AIRB independently evaluates complex actuarially based rating data to predict future loss costs for property damage and bodily injury to ensure motorists pay appropriate premiums that relate to the risk. However, it is not designed to, nor does it have any input or power to modify the impact on the measurement of injury awards produced by the legal system in lawsuits advanced by traffic injured.

The legal profession in Alberta provides its services to traffic injured even though it is recognized that money cannot adequately compensate for pain and suffering. It proceeds on the rationale that nevertheless money remains the best that can be provided by way of recompense for pain and suffering and the loss of enjoyment of life that results from traffic injuries.

A third aspect that factors into the quest to balance the requirements of traffic injured and auto insurance policy holders is the impact of judicial decisions that establish legal precedent as to the proper measure of money damages for individual traffic injured losses. A court case which awards higher amounts than previous decided injury cases usually results in a ripple effect of elevation of global damage awards for non-economic losses for pain and suffering and loss of enjoyment of life and for certain future economic losses in subsequent settled or tried cases.

The court process for assessing tort awards and the roles of legal service providers are not designed to, nor do they normally present, weigh or take into account evidence about the impact of those awards on the affordability of prices of auto insurance to policyholders.
Increased awards year over year make the actuaries’ task of predicting future loss costs more and more uncertain, although it is certain that the premium levels must increase in response to the inflation of injury awards and settlements. In the end, it must be remembered that it is ultimately the individual policyholders who pay for the continuing annual increases in auto insurance premiums.

The path to recovery from traffic injuries is also not a static one. Medical science and research continually identify improved remedies, but such innovations are not always transmitted quickly, consistently and comprehensively throughout the accident injury health care system to the traffic injured.

With this overview, this Committee began its task to identify reforms to the current model that will provide major improvements for traffic injured. This may be expected to include more transparent, comprehensible and uniform service from the responding insurers, claim management that is better timed, is based on interdisciplinary evaluation of rehabilitation treatment, biopsychosocial and economic needs and has a view to restoring the traffic injured as far as possible to pre-accident health and life activities.

At the same time, the Committee would have to evaluate reforms that will ensure as far as possible that auto insurance is accessible, affordable and sustainable in the long term for the average Alberta motorist.

This Committee would carefully consider the views the service providers in this auto insurance system as regards the questions about how to better serve the true stakeholders. It recognizes that these service providers have legitimately conducted business and performed their roles in the existing system with obligations to do what they do within the regulations to maximize the benefits to their clients.

However, the Committee would have to weigh and balance these views in the context of what reforms are required for the benefit of the two true stakeholders. The Committee’s task is to recommend improvements so that traffic injured can more quickly get their lives back on track and so that motorists better understand where their premium dollars are applied in the compensation system, what factors affect the cost of automobile insurance and what factors will best achieve long-term premium stability so that they can expect in future to secure auto insurance that is more affordable, more available and less volatile in pricing increases.
IV Automobile Insurance Reform
A. Chronological Review of Auto Insurance Reform and Analysis

The idea that the tort based system of compensation for automobile accident injuries in North America suffers from some fundamental unfairness is not a new one. Studies as early as 1932 have observed that many traffic injured are undercompensated or not compensated at all under tort based systems, while others, often those with less serious injuries, are overcompensated at the cost of the premium pool. These studies have spawned public debate over alternative compensation models followed by incremental legislative reform. A review of the studies and reforms followed by a deeper analysis of the reforms will help to explain why, in Alberta and elsewhere, the fundamental unfairness and premium instability continues to exist.

Societal response to automobile accidents

Legal commentators have identified the rationale for the traditional tort action as the primary societal response to accidents injuries on roadways in North America. As noted by Professor Ison in *The Forensic Lottery*, p 31-32 (1967):

“... [UK...] Parliament went no further than to require the owners of motor vehicles to carry third-party liability insurance. At the same time, a thorough interdisciplinary research project on compensation for the victims of road accidents... was undertaken at Columbia University in New York. The committee engaged in the study reported in 1932 recommending a scheme analogous to workmens’ compensation.... This proposal has been the subject of political controversy in several of the United States, but has not so far been enacted. The adoption of such a plan, however, continues to be advocated in several countries, including Britain.”

Professors Keaton and O’Connell in their textbook *Basic Protection* 1-3 identified deficiencies in the negligence claim as a model for fair and timely compensation of traffic injured:

[M]easured as a way of compensating for personal injuries suffered on the roadways, the system [in the United States] falls grievously short. Some injured persons receive no compensation. Others receive far less than their economic losses. Partly this gap is due to the role of fault in the system...

Second, the present system is cumbersome and slow. Prompt payments for compensation for personal injuries are extraordinary indeed. And delays of several years before final payment – or determination that no payment is due – are common, especially in metropolitan areas. The backlog of automobile personal injury cases presents a serious community problem of delay in the courts, affecting other cases as well.
Third, the present system is loaded with unfairness. Some get too much – even many times their losses – especially for minor injuries. To avoid the expense and risks of litigation insurance companies tend to make generous settlements of small claims. This largesse comes out of the pockets of all who are paying premiums as insured motorists. Others among the injured... get nothing or too little, and most often it is the neediest (those most seriously injured) who get the lowest percentage of compensation for their losses. Their larger claims are more vigorously resisted, and their pressing needs induce them to give up more in return for prompt settlement.

Fourth, operation of the present system is excessively expensive. It is burden enough to meet the total of losses that are inescapable when injuries occur. It is intolerable to have to meet the additional burden of administrative waste built into our methods of shouldering inescapable costs... In the cases of relatively modest injury, the expense of the contest often exceeds the amount claimed as compensation. All this expense, of course, is added to automobile insurance costs and... is reflected in the premium of every insured.

Fifth, the present system is marred by temptations to dishonesty that lures into their snares a stunning percentage of drivers and victims. To the toll of physical injury is added all of psychological and moral injury resulting from pressures of exaggeration to improve one’s case or defence...

Chronological review of auto insurance reform models between 1946 and 2015

The Columbia Plan (1932)
The Columbia University Council for Research in the Social Sciences issued a report in 1932 entitled Report by the Committee to Study Compensation for Automobile Accidents (Columbia Report). The Committee relied on information indicating that attorneys’ fees ranged from ¼ to ½ half of sums recovered in negligence actions. The plan it proposed had the following features:

a. every registered motor vehicle was compelled to be covered by compensation insurance;

b. there was a compensation fund pooled by insurance premiums to compensate persons killed or injured by the operation of a registered vehicle without regard to fault;

c. there was no compensation for a vehicle operator involved in a single vehicle accident or to anyone for pain and suffering;

d. payments were made for wage loss with deductible and maximum amounts in place and made on a periodic as opposed to a lump sum basis;

e. medical care was covered;

f. property damage was outside the plan for the reason that private insurance coverage could fill this gap;

g. a person in receipt of benefits under the Columbia Plan could not sue in tort. (in court);

h. the plan would be board administered; and
the framers of the Columbia Plan believed most claimants would not retain lawyers which prompted the conclusion that “a larger portion of the money paid in premiums would find its way to injured persons”. (p 150)

**The Saskatchewan Plan (1946)**

In 1946 a committee to study accident insurance compensation produced a report entitled *A Report on the Study of the Problem of Compensation for Victims of Automobile Accidents*. The report recommended compensation for injury or death regardless of fault.

Despite the recommendation, the Saskatchewan government enacted legislation which continued with tort but provided limited compensation on a no-fault basis to persons suffering bodily injury or death due to a motor vehicle accident. It was the first limited no-fault auto insurance plan in North America. It provided basic universal insurance to Saskatchewan owners and drivers on a break even basis. It did not include property damage or third-party liability. Premiums were to pay benefits and expenses. Any deficit was made up through increased premiums.

The Saskatchewan government enacted further legislation in 1948 which included collision, public liability and property damage insurance coverage. In 1953 it extended coverage for increased limits. High claims led to the first deficit which resulted in a rate increase.

The introduction of no-fault benefits legislation did not occur in any other Canadian provinces for approximately 25 years from this time.

The nature of the no-fault benefits when introduced in other provinces, i.e. Ontario in 1969, British Columbia in 1970, and Alberta in 1975, varied from jurisdiction to jurisdiction, but typically provided for some measure of income replacement, medical and rehabilitation expenses and death benefits. The intent was to provide some protection to the accident victims for the pecuniary losses and initially, these benefits were paid promptly.

For those who had an action in tort, the no-fault benefits provided interim support until the action could be set for trial. Those who could not maintain a tort action received only some indemnification for financial losses.

On January 25, 1966 the British Columbia government appointed a *Royal Commission on Automobile Insurance* led by Justice R.A.B. Wooton to address the public discontent over the rapidly increasing cost of automobile insurance, specifically, to determine whether a no-fault scheme or the current tort process would be better in dealing with claims of persons injured in automobile accidents.

Following an exhaustive investigation, including a review of models in other jurisdictions, the Royal Commission (*Wooten Report*) in the words of Professor Craig Brown “delivered a condemnation of the tort system as it applied to automobile accidents. It recommended a pure no-fault scheme completely replacing tort law for automobile insurance.”

The *Wooten Report* found there was dissatisfaction with the tort system, the cost of automobile insurance, litigation delays and lack of compensation for the at-fault driver who suffered serious injuries. It concluded that “the fault system cannot adequately protect the general public insofar as the automobile accident is concerned. [The Commissioners]
are firmly convinced that by a system of no-fault cover aided by other factors, the motorist and the general public would be better served.” *Wooten Report*, 84 (1968).

Professor Brown noted that the Commission “stated a preference for competition as the means of encouraging innovation and serving the interest of consumers, and... came down firmly against the government monopoly for automobile insurance.” (*No-Fault Automobile Insurance in Canada*, Craig Brown, Carswell 1988, pp 26-27)

In May 1971, the Government of Québec appointed a Committee lead by M. Jean-Louis Gauvin to report and make recommendations on the measures that should be adopted to reduce the cost of automobile accident losses and provide adequate compensation to victims in as equitable manner as possible, as well as on the findings made during its study.

In 1974 the *Auto Insurance Study Committee Report (Gauvin Report)* concluded that the fault concept must be completely abolished. The Committee had considered partial tort reforms but concluded they were compromises and half measures which were not acceptable because the compensation was inadequate for those in the greatest need such as insureds suffering from long-term disability, their dependents, dependents of those killed, and dependents of those drivers who were judged at fault and to whom compensation was refused. It said adequate compensation in all cases has a price, but if desirable to reduce the cost of automobile insurance, it would be wrong to do so by reducing the compensation to those who are the most disadvantaged.

In an historical account published in 1999 by one of the Committee members, (Claude Belleau) it was reported that every service provider directly affected rejected the notion of no-fault insurance (and a government monopoly delivery system). However, consumer groups and trade unions endorsed a no-fault insurance model.

Due to continuing public controversy, a subcommittee led by Québec Court Justice Desjardins was struck to examine the Gauvin proposals. It examined four options and its report of July 1975 adopted the Gauvin recommendations (except on the government supply aspect instead, suggesting entrusting administration of the basic compensation plan to existing government organizations).

A newly elected Québec government would not then endorse the Gauvin Report proposed no-fault model mainly due to the expected costs of transitioning to a government monopoly model that would increase premiums. It instead proposed a compulsory auto product with a modified no-fault plan, a proposal which was not favourably received.

In August 1976, the then elected Parti Québécois formed a Task Force which resulted in a report made public on April 15, 1977. That Task Force endorsed the concept of a full no-fault plan for bodily injuries but not full government ownership of all automobile insurance.

Instead, the Task Force proposed to entrust management of the basic plan for bodily injuries to a public insurer and let private insurers offer supplementary optional no-fault insurance plus compensation for property damage. It stated its preference to separate that part of automobile insurance that is of social importance to that part which is not. It hinted at a return on
premiums in the form of indemnities reaching 75 to 80% but did not promise a significant reduction in auto insurance premiums.

The Task Force received criticism from insurers, lawyers, trade unions and the news media mainly for the lack of commitment to reducing premiums. It was claimed that such a dual system would increase management process costs. Lawyers, brokers and claims adjusters all objected to their roles being reduced or locked out altogether. The Minister undertook a consultation tour which answered many public questions.

A Parliamentary Committee then studied the new bill for four months and received briefs opposing the plan from all vested interests.

On March 1, 1978, the government of Québec instituted a government monopoly compensation plan over the bodily injury portion while the property damage coverages remained in the hands of private insurers. The government also introduced the pure no-fault scheme which entirely eliminated the right to sue. It substituted a schedule of no-fault benefits to include awards for pain and suffering, as well as economic losses provided through mandatory first party insurance, to all individuals injured in automobile accidents.

The government also established the “Régie de l’assurance automobile du Québec” (Régie) as a Crown corporation to be responsible for providing public auto insurance for all drivers, passengers, pedestrians, bicyclists and motorcyclists involved in road collisions, whether or not they were at fault.

Belleau reported that the Québec system was very successful with respect to the issue of return on premium. An assessment in 1995 (Fluet-Lefebvre) estimated that the return for bodily injury claimants was 61% of the premium for the period 1978 to 1987. Between 1988 and 1992, it reportedly rose to 96%.

The Régie’s successor, the Société de l’assurance automobile du Québec (SAAQ), continues to operate the compensation fund for property damage due to uninsured or unidentified drivers. It paid $87 million from 1978 to 91 comprised of $5 million for administrative expenses and received $35 million from at-fault drivers. Between 1992 and 1994, it paid $0.9 million for administrative expenses.

**Ontario Task Force on Insurance 1986**

A Task Force led by the Ontario Minister of Financial Institutions appointed January 1986 and reporting May 1986 concluded that the tort system was not defensible, in theory or in practice, and that personally injured traffic victims would be better served under a pure no tort system. The reasons included:

a. the tort system in the personal injury area has reached the limits of its capacity; continuing it as a compensation mechanism using notions of negligence or fault will only deepen the incoherence, instability and continuing unpredictability;

b. proposals for tort reform that continue to obscure the fundamental tension between insurance and deterrence should be rigorously resisted;

c. deterrence can be answered outside of tort;

d. the compensation rationale fails, in theory and in practice;

f. fault will remain relevant in the premium pricing mechanism;
g. no tort accident compensation should remain in the hands of private industry so long as it can demonstrate its financial capacity to deliver at affordable premium levels;

h. the auto policy should provide unlimited medical and rehabilitation benefits, including cost of care and income replacement benefits at levels that should be reasonably adequate for the majority of citizens; and

i. additional coverage for income replacement in excess of basic insurance should be made available on the first party basis through voluntary purchase of additional layers.

Mr. Justice C. Osborne (Osborne) was appointed by the government of Ontario in May 1986 to consider the appropriate design of a no-fault system. He examined all aspects of Ontario’s automobile insurance compensation scheme in his *Report of Inquiry into Motor Vehicle Accident Compensation in Ontario* delivered in February 1988.

Despite recognizing the favorable features of a pure no-fault model, Osborne concluded that the public did not seem to want it. He also expressed limited enthusiasm for threshold no-fault plans. He recommended that should the Government desire to introduce a no-fault compensation plan, consideration should be given to a modified threshold plan capping pecuniary damages for less serious injuries. *(1 Osborne report 53).* A more detailed examination of the analysis of alternate models by Osborne and others is found in Section IV B of this Report.

In exploring the question why no-fault compensation for workplace accidents is nearly universally recognized now, but not in the field of motor vehicle accidents, Osborne opined that one explanation for the difference might lie in the fact that both the legal profession and the insurance industry had a great deal at stake in the maintenance of the existing system and were able to exert a considerable influence against the widespread adoption of a no-fault system of compensation. He then noted that the insurance industry had, since 1970, altered its position by supporting a threshold no-fault model.

The Kopstein Report stated that the provision of a reasonable living standard for the catastrophically injured must be the highest priority of an automobile compensation scheme. *(Kopstein Report 102).* The Commission recognised this priority might require reducing compensation for those suffering minor injuries:

“Minor injuries are disruptive and uncomfortable, but not tragic. It is, in my opinion, the potential to be injured critically and disabled permanently that motorists should most fear. It is for that eventuality that insurance make uncontested access to an acceptable level of compensation available. If it is necessary to compensate minor injuries less generously than at present in order to assist in the financing of adequate compensation for those severely and permanently disabled, it is appropriate, in my opinion, to do so. The largest portion
of insurance premiums pay for vehicle repairs and for minor injuries. To the extent that it may be necessary to limit those benefits within an affordable insurance plan design to restore, to a reasonably comfortable standard, individuals with suffered catastrophic personal injuries, they should be limited."

The Commissioners were firmly of the opinion that tort concepts provided inequitable results for injured person and recommended a pure no-fault compensation similar to that of Québec (Kopstein Report 105).

On March 1, 1994, the Manitoba government acted to contain large increases in bodily injury claims costs with the introduction of the Personal Injury Protection Plan. Modest no-fault benefits replaced the old tort-based model.

Alberta Automobile Insurance Board, Study of Premium Stability in Compulsory Automobile Insurance (September 12, 1991)

In 1990 the Alberta Automobile Insurance Board (AAIB) in response to public concerns about rapidly rising automobile insurance premiums and at the request of the Government of Alberta Minister of Consumer and Corporate Affairs, undertook a study of the Alberta automobile insurance system to determine whether there was a problem with premium stability, and if so, whether the cure was to modify its tort and no-fault features. (AAIB study)

The AAIB study showed that loss costs had increased dramatically since 1985 due to the increase in bodily injury loss costs, mostly resulting from non-pecuniary general damages claims. The AAIB said it expected loss costs would continue to increase because of continuing increases in frequency and severity of injury claims.

The AAIB also made the following findings:

a. claimants with minor injuries are overcompensated in the tort side of the system relative to all the traffic accident claimants with catastrophic injuries or undercompensated in the tort side of the system relative to all other traffic accident claimants. (AAIB Study 2);

b. at-fault claimants were inadequately compensated for the economic losses relative to tort claimants and there were structural deficiencies in the delivery of benefits in the current system. (AAIB Study 2);

c. all payments required under the system are subject to delays;

d. between 1988 and 1990, bodily injury loss costs increased 12.9%, more than twice that of the Consumer Price Index. (AAIB Study 3);

e. there was a pricing problem in the system because premium levels were not sufficient to meet current loss costs;

f. one of the reasons for that deficiency was that loss costs had increased at unusually high rates;

g. as there was no specific feature operating in the current system to control increases in claims costs, the AAIB expected loss costs to continue to increase in the long term unless bodily injury loss costs were curtailed in some fashion. (AAIB Study 3);

h. the more prices increase, more and more motorists would have difficulty affording automobile insurance. The resulting dissatisfaction would have to be addressed either by the participants in the system or the government, or both;
i. there was no uniform viewpoint among participants in the system about whether the costs or premium levels should be curtailed to preserve the balance in the system;

j. one of the methods examined to control premium increases was to reduce the amount paid to traffic injured;

k. AAIB recommended that to obtain the goal of premium stability and to maintain the cost of automobile insurance at an acceptable level, there must be a reduction or limitation of the amount of monetary compensation provided to accident injury victims. (AAIB Study 6);

l. AAIB observed that no one system is superior overall in obtaining the objectives of the automobile insurance system. It nevertheless commissioned an analysis of the current system and five alternative models;

m. AAIB did not recommend a pure no-fault model similar to that in place in Québec;

n. AAIB recommended three options. Option 1 was limitation of the right of recovery for all non-pecuniary damages in the form of a deductible of $10,000;

o. Option 2 was the implementation of enhanced no-fault benefits scheme with full tort rights subject to a deductible of $10,000 for all non-pecuniary damages and other tort reforms; and

p. Option 3 was the implementation of a threshold no-fault system similar to that in place in Ontario in 1991 under which tort rights would be restricted to only the most serious injury claims with enhanced no-fault benefits for other traffic injured.

**Government of British Columbia consultant study (1996)**

British Columbia motorists in about 1995 were reporting premiums were too costly. The British Columbia government froze rates for 1996 and 1997 and requested Insurance Corporation of British Columbia (ICBC) find ways to cut costs and control rising premium levels.

ICBC commissioned a study by three consultants, including KPMG, Eckler Partners and Exactor Services Inc. (the *KPMG report*) which delivered the following findings:

a. motor vehicle insurance costs increased higher than the rate of inflation from 1986 to 1996;

b. the average premium increased by 135% over the same period;

c. claims costs represent about 79% of total expenditures and increased at more than 6.5% per year, after inflation;

d. claims operating cost expenses and commissions grew 5% per year faster than inflation over 1985 to 1995;

e. the introduction of premium tax in 1987 added to the increase in product costs;

f. bodily injury claims represent $0.50 of every dollar of claims, including legal and other tort claims costs;

g. the real bodily injury claims cost per insured vehicle nearly doubled over the ten-year period;

h. the trend was due to increased claims frequency and increase in average cost per claim;

i. bodily injury claims grew at 7% per year, far faster than rate of property damage claims;

j. bodily injury claims increased 50% over the past 10 years;

k. the propensity to file personal injury claims increased by 40% over the 10 years;
1. the average bodily injury claim was four times
the average property damage claim; and

2. rising claims costs and numbers appeared to
due to

   i. increasing propensity and ability to
      maximize awards especially due to
      non-economic losses;

   ii. growing sense of entitlement to receiving
       motor vehicle insurance payments;

   iii. growing inclination to focus on pain
       and suffering;

   iv. increased advertising by lawyers and
       tendency to seek legal representation;

   v. willingness of courts to increase types and
      amounts of compensation awards; and

   vi. increased incidence of fraud.

The study provided a cost breakdown of ICBC
dollars from 1995 data which showed:

3. 87% of the costs related to payments to
   claimants and claims related expenses;

4. 8% of costs were paid for distribution of
   the product;

5. 9% of total expenses or $223 million
   represented total legal costs;

6. $670 million were paid to external suppliers,
   including defence counsel, glass repair
   shops, car rental agencies, medical
   payments and the like; and

7. brokers were paid $151 million.

In total, only 2/3 of claims costs and expenses
were put in the hands of claimants for their
claims or damage repairs. For personal injury
claims, claimants received only 72% return with
17% paid to legal services.

The KPMG report provided a further explication
of legal costs for 1995 as follows:

8. ICBC in-house legal department – about
   $7 million;

9. ICBC external defence counsel hired to
   defend tort claims – about $53 million;

10. cost for expert reports, independent
    adjusters, and private investigators required
    for litigated claims – about $17 million; and

11. estimated Plaintiffs’ costs, including
    contingency fees and disbursements – about
    $146 million.

The KPMG report concluded that only by
changing the volume and nature of claims
shaped by the design of the insurance product
could sufficient savings be achieved to bring
loss costs in auto insurance under control.
It stated that tinkering with or fine-tuning the
product would not be sufficient and all service
providers must make an equitable contribution
to the solution.

The KPMG report said that the main benefit
of the existing system is the preservation of
the right of access to an independent process
favoring fair compensation to an innocent person
injured by bad driving conduct. However,
when this principle was measured against the
deficiencies in the system, such as long delays
and uncertainty about adequacy of compensation
and rehabilitation, potential for exaggeration of
claims and the high legal investigative cost to
establish claims, it concluded such deficiencies
work against the recovery of the traffic injured,
erode the economics of the system and create
an intolerable financial burden on policyholders.
The *KPMG report* recommended the system reform should:

a. embrace a comprehensive solution to realign the priority in favour of the seriously permanently and grievously injured;

b. accept that much of driving behaviour that causes accidents is due to inadvertent, momentary inattention or unexpected climate conditions that can happen to normally safe drivers; and

c. reframe the goals from acquiring as much monetary recovery as possible to achieving more effective health outcomes and wellness.

The *KPMG report* cautioned:

a. underlying problems must be addressed in the medium and long-term or the increasing cost trends will resurface;

b. there must be a reduction of legal processes and shift to more efficient expeditious and less costly dispute resolution;

c. there should be elimination of dispute through the system replaced by assured injury benefits; and

d. there needs to be re-focus on better health outcomes, simplified fair processes and improved driving behavior.

The *KPMG report* predicted that the era of tort in automobile insurance was nearing its end because the price of maintaining the current adversarial system is substantial premium increases, which takes a growing share of personal and collective social wealth, combined with unpredictable and unfair awards. Solicitor/client costs on a contingency basis up to 33 1/3 percent make this a major cost component in the current process. No-fault models can replace the costly and lengthy tort benefits with well-defined and controlled compensation through a tightly managed administrative process, protection and in shifting the focus to better health outcomes provided it preserves justice, fairness and equity.

The *KPMG report* also mentioned lessons learned from other jurisdictions including:

a. government-imposed rate freezes focus public attention on the issues of rising costs and the suffering manifested in those costs but are not a solution;

b. maintaining the status quo for compensation models like BC are not feasible;

c. failures of threshold no-fault systems are usually due to a tort threshold that does not adequately restrict the right to sue or lack of balance between the tort threshold and no-fault benefits for wage loss or medical care; and

d. no-fault models must have strong administrative controls on personal injury benefits and emphasize early, effective rehabilitation.

### Saskatchewan (1988-1995)

Between 1988 and 1993 the Saskatchewan Government Insurance Company observed almost 40% of the claims dollar was allocated to bodily injury claims. It set up an Injury Study Advisory Board with the objectives of:

a. improving and updating benefits and coverage; and

b. realigning priorities to place medical and vocational rehabilitation first, loss of income next, then pain and suffering and addressing the injury crisis.

It was seen that bodily injury claims costs were continuing to increase above the rate of inflation. There was pressure to increase premium rates and the Rate Stabilization Fund...
was depleted. In the year ending December 31, 1994, the Auto Fund had a loss of nearly $94 million and accumulated deficit of $105 million.

To address escalating cost of tort awards to traffic injured in 1995, Saskatchewan abolished fault-based indemnification subject to one exception whereby the right to take legal action for economic loss was maintained for traffic injured whose gross earnings exceed $50,000 per year. The Saskatchewan Auto Fund provided a Personal Injury Protection Plan similar to that of Manitoba. The benefits were indexed to the Consumer Price Index.

After implementation of the Personal Injury Protection Plan, the number of personal injury claims declined by 30%. Personal injury claims costs declined by 48% or $108 million. The tort remedy was further restricted by a 90% of net income limit. It is thought that the change to this compensation model was the major factor to explain the savings.

The E&Y report concluded that the compensation benefits were not fairly distributed among automobile accident victims. Persons with severe injuries did not receive adequate sums to fund future care and those with non-severe injuries received more than they needed. Approximately 50% of the schemes resources were diverted to service providers involved in the determination of benefits eligibility. Future changes had to address the scheme’s cost structure and a more equitable distribution of benefits.

New South Wales motor accident reform created and enacted in 1999

In December 1988 the MAA decided to investigate consensus for change which resulted in the creation of a working party whose recommendations led to the enactment of the Motor Accident Compensation Act 1999. (1999 NSW model)

The working party consisted of 16 persons, including two physicians, two rehabilitation health professionals, four insurance industry experts, four senior legal practitioners, two actuaries, the Attorney General’s Director, and the General Manager of MAA. It conducted its work without any external involvement or input, except the facilitation by seconded Canadian legal counsel to the AAIB.

The group began its work in March 1999 and by early April presented by unanimous agreement an initial blueprint of reforms to the government Minister responsible for auto insurance reform, indicating the group could endorse the reform to its various constituents if the provisions were not altered by legislative process.

The original Motor Accidents bill was introduced into the Upper House of Parliament at the beginning of June and the legislation, with some
amendments, was passed by both Houses by July 1, 1999. On October 5, 1999 the new scheme was operative.

The reform occurred over the objection of the NSW Law Society and Bar Association whose members opposed the restriction of the rights of traffic injured victims to have the monetary value of their pain and suffering judicially determined. It occurred further without extensive evidence that the awards for pain and suffering were too high for NSW traffic victims or that the awards did not effectively console injured persons or that the price of the average automobile insurance premium was too high. An account of this working group/negotiated reform process may be found at (2000) Insurance Law Journal 1. (NSW)

The reforms under the 1999 NSW model are summarized as follows:

a. The focus was away from simply paying compensation for injuries and toward providing better, earlier health treatment. The new law streamlined the medical treatment process by introducing standardized medical treatment and a medical review panel to provide final determination of medical impairments and binding assessments of permanent impairment.

b. A dispute resolution panel was introduced to determine all remaining issues relating to work capacity and economic losses which decisions would be binding on the insurer. This was a major transformation in introducing an objective assessment of impairment as a gateway for economic loss.

c. While the model preserved the right of the claimant to appeal the dispute panel decision to the court, the intention was to deter further disputation by providing the disincentive of a legal costs penalty if the appeal was unsuccessful.

d. To produce the necessary reduction in costs, the model prohibited amounts payable for non-pecuniary general damages unless the injured person had a greater than 10% permanent impairment as defined by the American Medical Association guidelines.

e. Further refinements were added including maximum tariffs for legal and medical fees and advertising restrictions.

Once implemented, the reform was accepted by the public and most service providers, particularly health professionals. It also reduced and flattened premium levels. One study of health outcomes indicated traffic injured recovered more quickly after the reform was implemented and concluded the legislative reform was responsible. More detailed discussion appears in the Review of Health Outcomes Evidence in Section VI of this Report.

Elective/Choice model – Saskatchewan 2003

In Saskatchewan, an elective/choice model was implemented effective January 2003.

The theory of the elective/choice model (choice model) is that it permits the prospective insured motorist a choice between receiving speedy compensation for economic and medical costs on a no-fault basis and waiving the right to tort claims, or waiving the no-fault benefits and pursuing possible tort claims for the full measure of damages.

The operation of the choice model intends that where two people with no-fault insurance collide with each other, each seeks recovery for the losses from their own insurer. If two people with third-party coverage collide, they would proceed just as they do under a tort system. If a person with no-fault insurance collides with someone with third-party insurance, the first person claims losses from their insurer and is
not liable for the other person’s losses, even if the first person was negligent. The second person has a tort claim against her own insurer if negligence on the part of the first driver could be proven. This claim would be much like tort claims against an uninsured motorist.

Some commentators have opined the choice by consumers under this model might be influenced by cost, such that low income and elderly consumers might choose the no-fault option because they are insuring lower than average perspective income losses. For example, when the state of Kentucky introduced the choice model in the 1970s, it became a de facto no-fault state. Commentators also opined that high-risk drivers and drivers and heavy vehicles might strategically select the no-fault option to insulate themselves from liability and coverage cost to negligently injured third parties.

The American states of New Jersey and Pennsylvania implemented very similar choice models in 1989 and 1990. Prior to the reform, New Jersey had a no-fault model whereas Pennsylvania had a tort model. A subsequent study of these choice models on outcomes such as less attorney usage, speedier time to payment and more consistent (equity) payments found higher insurance costs in both New Jersey and Pennsylvania.

A later study however showed that between 1990 and 1998 auto insurance premiums in Pennsylvania declined after about 44% of the insured population had chosen the no-fault option. It appeared that the factors that led choosing the no-fault option included price savings, household income, traffic density and political party preference. It found that males and households with increasing income were more likely to choose the no-fault option whereas increases in traffic density and attorney influence led to more full tort choice.

The KPMG report expressed the opinion that choice models are fraught with administrative difficulties of questions, in cases for example where the traffic injured never have the chance to make a choice, such as pedestrians, occupants of vehicles or dependents of non-automobile owners. It pointed to another difficulty in the method by which to appropriately allocate costs when an accident occurs between a tort policyholder and a no-fault policyholder. It said on balance, the systems have not been effective in health treatment or cost control.

In Saskatchewan at present, an injured claimant may have access to over $7 million in medical benefits for the claimant’s lifetime, if necessary. Reportedly, no claimant has yet ever reached the maximum benefits available. SGI is said to be considering removing the upper limit on available for treatment, as actuarially it would have no impact on current automobile insurance rates. However, it has also been recently reported that only 0.05% of Saskatchewan motorist have opted for the tort option. It is unclear whether this is a rejection of tort or a rejection of the elective/choice model.

Auto insurance reform in Alberta 2003

In 2000, the Government of Alberta again became concerned that mandatory auto premiums were becoming unaffordable or unavailable. This led to a review of auto insurance and other interrelated issues such as fairness of risk classifications, claims cost pressures, adequacy of Section B benefits, ability of traffic injured, especially soft tissue injured, to access effective treatments and traffic safety initiatives to reduce injuries. The review resulted in the enactment of the Insurance Amendment Act No.2, S.A. 2003, c 40 (and Regulations). A detailed review of the reform process and the subsequent court
The challenge is discussed in the Chronology of Alberta Auto Insurance Reform at Section IV (C) of this Report.

The Regulations established:

a. capped damage awards for certain injuries;
b. diagnostic and treatment protocols to improve recovery times for certain injuries.
c. increased Section B benefit limits to $50,000;
d. improved access to Section B benefits;
e. an insurance premium Grid to base premiums and driving records rather than age, gender and marital status;
f. an all comers’ rule, with some exceptions;
g. a strengthened role of the Automobile Insurance Rate Board; and
h. a mechanism for premium rate dispute resolution.

The diagnostic and treatment protocols apply to sprains, strains and WAD (Whiplash-Associated Disorder) I and II injuries. The protocols authorize payment for injuries by their healthcare providers. The reforms were multifaceted, and were carefully balanced. It was explained that subsequently altering one component could render the entire program unfeasible.

The maximum premium Grid caps premiums. Insurers must compare their market premium to the Grid premium in charging a consumer, and if it is lower than the Grid, it must charge its market rate. About 80% of drivers are charged premiums lower than the Grid. About 20%, poor risks, drivers with poor driving records, or inexperienced drivers are charged premiums capped by the Grid.

There is no traditional risk sharing pool for private passenger risks. Insurers can cede policies into a Grid or a non-grid pool. The new Automobile Insurance Rate Board can now adjust premiums annually by comparing total premiums to industry wide loss costs, administrative and other relevant expenses. This ensures that industrywide costs are accounted for in premiums and industry wide savings are accounted to the consumer.

*Report of the Atlantic Canada Insurance Harmonization Task Force (2003)*

In 2003 the Council of Atlantic Premiers appointed a Task Force to undertake a comprehensive study of the full cost/benefit and legal implications of establishing an Atlantic Canada public automobile insurance system. The September 30, 2003 *Report of the Atlantic Canada Insurance Harmonization Task Force* (the *Atlantic Report*) included a report on alternative automobile insurance systems ranging in design from the pure tort model to the pure no-fault model, with various alternative models in between.

The Task Force interpreted its mandate to identify the most reasonable package of basic compulsory automobile insurance that best balanced the needs of both motorists and the traffic injured of Atlantic Canada. Those needs were interpreted to include the features of affordability and availability of basic compulsory insurance and reasonable compensation of those injured in automobile accidents.

The Task Force reviewed the findings of the 1968 *Wooten Report* in British Columbia, the 1988 *Kopstein Report* in Manitoba, the 1974 *Gauvin Report* of Québec, the 1988 *Osborne Report* in Ontario, the 1991 *AAIB Report* and the 1996 *KPMG report* in British Columbia. It also examined the auto insurance models in the Australian states of New South Wales, Queensland and Victoria.
The Task Force concluded that the evidence overwhelmingly supported the conclusion that the primary long-term and core solution to the problem of rising automobile insurance rates requires reform of the characteristics of the product and its design features.

The Task Force found that the core problem of increases in premiums has been consistently identified as the increase in bodily injury loss costs resulting from the tort elements of the auto compensation system.

The Atlantic Report identified two real issues: how the majority of traffic injured can come to terms with reasonable reduction of their compensation so that Atlantic Canadians can afford the cost of basic mandatory automobile insurance and how motorists can come to accept realistic and reasonable cost of insurance to pay for the injuries caused by the insured motorists. (Atlantic Report 5)

The Atlantic Report proposed that the resolution required recognition of the need to reduce the tort components as far as possible while maintaining the appropriate balance between the cost of premiums and the necessity of reasonable compensation.

**Nova Scotia – 2003**

As reported in the court challenge in the Hartling decision (discussed more fully in Section V (C) of this Report), in 2003 Nova Scotia motorists found themselves paying more and more for mandatory insurance coverage, and the Nova Scotia regulator concluded that:

a. premium increases are to be expected as long as the existing automobile insurance system in Nova Scotia remains;

b. the major reason is the increasing cost of claims;

c. the primary cause is claims for compensation for bodily injuries;

d. third party liability claim costs have been increasing much faster than collision and comprehensive claim costs;

e. the increase in the average cost of a bodily injury claim over the last five years had been dramatic; and

f. automobile insurers have been taking drastic rate action to restore profitability.

The Nova Scotia legislature proposed a reform that would implement a limit or “cap” upon all non-pecuniary general damage claims, except for the most serious permanent injuries. Through a legislative compromise that initial proposal was narrowed down to impact only a small group of traffic injured.

With a legislative compromise established, the government amended the Insurance Act to include a definition of “minor injury”, together the term “serious impairment”. The operative provisions set by regulation confirmed that the cap would be $2,500 and that certain listed injuries, including chronic pain, would be excluded from its application.

Although that legislation was later subjected to a legislative Charter challenge in Hartling, it was upheld at the trial and appellate levels of the Nova Scotia courts.

**Newfoundland and Labrador, New Brunswick and Prince Edward Island**

In 2004 these provinces legislated a deductible of $2,500 for pain and suffering tort awards for minor injuries.
Ontario – implemented periodic reforms to the threshold/no-fault model

In 2003, the Ontario government introduced further refinements to the maximum fee schedules for providers of health care and the requirement to submit treatment plans for approval by insurers which had been initially based on a negotiated agreement between providers and the insurance industry.

Later in 2003, a new government introduced legislation to temporarily freeze auto insurance rates and set an objective to reduce auto insurance rates by 10 per cent.

In 2006, the government eliminated the Designated Assessment Centres (DAC) system and reverted to resolving accident benefits disputes through insurer examination assessors.

In 2010, the government introduced further substantial reforms including changing benefits under the standard accident benefits coverage, a series of reforms to try to control costs, exploring the use of evidence-based treatment plans, capping the cost of medical assessments, capping the maximum benefit for a minor injury and other measures. Later the government introduced many of the recommendations of the Ontario Auto Insurance Anti-Fraud Task Force.

The 2017 Marshall Report concluded that all these previous periodic attempts at reform to alleviate the problems amounted to only ineffective tinkering.

Territories

North West Territories and the Yukon impose no constraints on claims for pain and suffering damages.

In 2005 the New South Wales government determined that the 1999 auto insurance reform had led to a stable and affordable scheme which made it possible to expand coverage to all catastrophically injured persons whether they could prove fault or not.

The New South Wales government identified that about 125 people were catastrophically injured annually in New South Wales. They had significant daily needs including care, personal assistance, domestic support and an ongoing equipment and medical needs. It proposed a scheme Long Term Care and Support (LTCS) that would provide:

a. medical treatment;

b. acute inpatient care;

c. rehabilitation;

d. specialist and expert medical care; and

e. pharmaceutical expenses for life.

The long term care program would appoint a lifetime care coordinator to work with the person in the person’s family. The coordinator would focus on helping the person adjust to the disability and help them regain as much daily function and independence as possible. It would also identify options for accommodation, transport, education, employment, social and recreational activity. In the acute care and rehabilitation phase, they would be working with the injured person to help develop rehabilitation and community participation plans that identify short and long-term goals consistent with desire.
The coordinator would also help the injured person and their family develop a community participation plan to enable the person to access all available activities and opportunities. The long-term planning process would include:

a. specific goals of the injured person including educational social and employment;

b. services and support required including identifying any specific skills;

c. time frames;

d. specific service entry exit and transitional strategies;

e. roles and responsibilities of those involved and support;

f. agreed review date to assess the adequacy of the plan; and

g. support for carers.

Following the rehabilitation towards discharge, the life care coordinator would help the person and family focus on living with their disability and identify their ongoing support needs. Following discharge the scheme would typically provide daily services as required, such as:

a. aids and appliances;

b. home and transport;

c. personal care;

d. domestic services;

e. childcare services;

f. nursing care;

g. assistance with community access;

h. educational and vocational services; and

i. respite care.

The program would provide lifetime care and support through a fully funded statutory trust. The government would also provide support, including medical costs, for the scheme.

An actuarial analysis estimated approximately 124 persons would be eligible to enter the scheme annually. This would include about 37 with spinal cord injury, 84 with traumatic brain injury, and three with other injuries, such as bilateral amputee, major internal injuries and severe burns.

Guidelines would establish the extent of the injury.

Standards would be developed for service providers covering a range of skills, training and experience. Care providers would be approved by the LTCS authority to ensure quality of service. The model of service delivery would as far as practicable give control of the selection of service providers and coordination of services to the injured person and or their family.

The government proposed to establish a board of the long term care program with authority that would:

a. oversee the fund, including its investment;

b. approve the guidelines for eligibility and care need assessment;

c. approve the assessor fee schedule; and

d. approve the care provider fee schedule.

An Advisory Council would be established including two practicing health professionals with relevant experience in treating persons with catastrophic injuries, consumer representatives from relevant disability organizations and care provider representatives. The Council would advise the minister and the government on the operation of the scheme.

The scheme would be fully funded through a levy on motorists collected in conjunction with motor accident insurance.
Funds paid into the scheme would be the full cost of providing lifetime care and medical treatment services to injured people. The pooling of the funds would protect against the possibility of poor estimation of an individual claimant.

For those eligible to enter the LTCS scheme, lump sums would no longer reflect compensation for future treatment lifetime care and domestic assistance performed on an unpaid basis, but would be provided through the scheme. Payments for damages for pain and suffering and economic loss would remain unchanged. In determining the levy, the LTCS Authority would rely on independent actuarial advice to ensure that the fully funded principle was maintained.

The NSW government obtained an actuarial no-fault long-term care costing study which gave a cost estimate based on the number of people injured in the 2005/2006 accident year.

The NSW government ultimately introduced on 1 October 2006 for children under 16 and on 1 October 2007 for adults the lifetime care and support scheme (icare) to improve the quality-of-life of the injured person and their family.

**NSW MAA Report Why the NSW Green Slip Scheme needs to change – 2013**

A summary of the findings of the NSW MAA in 2013 is as follows:

- **a.** The need to establish fault means the NSW CTP Scheme is essentially adversarial. By comparison, the Victorian CTP Scheme is no-fault and premiums are considerably less expensive.

- **b.** Every year there are about 7,000 people who cannot access more than the first $5,000 of benefits because they cannot prove the fault of another party. Their care and recovery may be compromised, including drivers in single vehicle accidents.

- **c.** To claim benefits, the injured person must lodge a claim with the insurer of the vehicle most at fault and provide the insurer with details of the accident, their injuries and losses.

- **d.** Once all the details of the injury have been established, the insurer is required to make offer of settlement. There may be disputes over liability, the extent and cause of injury and the settlement amount.

- **e.** The negotiation and dispute processes are often costly and protracted. In NSW, very little is paid to injured people in the first year after an accident. Only medical expenses are paid on the way. Generally, the majority of the compensation is paid out between three and five years after the accident. … funds are not received by injured people when they need it most and would be most effective in assisting with a quicker recovery. Many disputes will end up in a formal assessment process or in court, which is frequently very stressful for injured people, contributing to secondary injuries.

- **f.** The continuing need to prove disability or incapacity perversely discourages quick recovery as this tends to equate to reduced payments, creating a lump-sum compensation mind-set.

- **g.** Compensation can also be reduced if it is determined that the injured person was partially at fault in the accident. Many people take a long time to reach an agreement as to their future needs and entitlements, only to have this amount reduced because they were considered partly at fault. For many such people, their ongoing needs arising from injury are not met despite a protracted claiming process.
h. Many of the payments made by insurers, including medical assessments and legal costs, are not benefits to claimants.

i. Because of the complexity and adversarial nature of the scheme, ..., many engage a lawyer to help them with their claim. The system deters unrepresented claimants.

j. Since 1999, more has been spent on lawyers in the NSW Scheme than on medical and related treatment costs (excluding care) for injured people. The complex system also dissuades many people from making a claim in the first place, with only around half the people who could make a claim actually doing so, while others may simply give up or give in during the process, perhaps receiving sub-optimal benefits.

k. Fault-based schemes can be said to help uphold the principles of justice and fairness, by providing compensation for the wrongdoings of others and withholding benefits from those at fault. Some believe that this provides an incentive for people to drive safely, however because risk is effectively contracted out to the insurance company, there is little evidence that the price of a Green Slip influences driver behaviour.

l. Instead, as case studies show, the complex technicalities of the current scheme lead to disputes and unnecessary costs and delays, which do not help the injured person but increase Green Slip premiums.

---

**Fair Benefits Fairly Delivered: A Review of the Auto Insurance System in Ontario April 11, 2017 by David Marshall**

Mr. David Marshall (Marshall) was appointed in February 2016 to review and make recommendations as to improvements in the system of auto insurance in Ontario, noting that it was frequently criticized as having the most expensive auto insurance rates in the country.

Marshall was to advise on the development of further initiatives to reduce claims costs and uncertainty in Ontario’s auto insurance system to focus on improving the efficiency and effectiveness of claims management in the system based on best practices in Ontario and other jurisdictions, coverage options, comparable systems, common traffic injuries, medical examinations and assessments, legal costs, dispute prevention, engagement and education and evidence-based treatment protocols.

Marshall analyzed the Ontario history of auto insurance reforms since 1990 as follows:

a. Before 1990, Ontario auto insurance operated largely as a tort system with minimal accident benefits on the no-fault side. The majority of accident victims were represented by lawyers.

b. In 1990, the government tried to shift the balance of compensation needs from the tort system to the no-fault accident benefits system. To save time and money, most compensation requirements were to be met through the accident benefits system with restrictions on what could be obtained through the tort system. The government also introduced a process of rate approvals and a system for dispute resolution outside the court process.
c. In 1994, the then government considerably expanded the accident benefits, extended the right to sue in tort for pain and suffering, but eliminated the right to sue in tort for economic damages.

d. In 1996, the government reintroduced the right to sue for economic damages but reduced the amount of coverage for medical and rehabilitation benefits under the accident benefits system. The government also introduced additional cost control measures, such as setting maximum fee schedules for providers of health care and the requirement to submit treatment plans for approval by insurers.

e. Later, in 2003, a new government introduced legislation to temporarily freeze auto insurance rates and set an objective to reduce rates by 10 per cent.

f. In 2006, the government eliminated the Designated Assessment Centres (DAC) system and reverted to insurer examination assessors to resolve disputes over accident benefits.

g. In 2010, the government introduced further changes, including:
   i. changing the standard accident benefits coverage;
   ii. presenting reforms to try to control costs;
   iii. exploring the use of evidence-based treatment plans;
   iv. capping the cost of medical assessments;
   v. capping the maximum benefit for a minor injury; and
   vi. other measures.

h. In June 2013, the government passed the *Prosperous and Fair Ontario Act*, which set out a target to reduce insurance premiums by 15 per cent over the next two years.

i. In 2015, the government introduced legislation impacting no-fault benefits, and in April 2016 a new dispute resolution system was introduced.

The government then acted upon recommendations of an expert advisory panel that undertook a review of the mandates of the Financial Services Commission of Ontario, the Financial Services Tribunal and the Deposit Insurance Corporation of Ontario (FSCO Mandate Review).

*Marshall* came to damning conclusions about the effects of this extensive history of auto insurance reform in Ontario as follows:

a. no-fault benefits had been increased and decreased;

b. access to tort has been increased and decreased;

c. cost control measures have been tried;

d. anti-fraud measures have been introduced;

e. freezing of insurance premiums has occurred;

f. a complete restructuring of the regulatory body has been undertaken;

g. following the past reform measures, costs and premiums have dropped for a few years and then begin to rise sharply to establish new highs;

h. although further changes in benefits were implemented in 2015 to curb costs, trends indicate that despite these changes’ costs will once again rise;

i. while accident frequency has dropped, the cost of claims has consistently increased;

j. the road taken over 50 years to tinker with and adjust the system of auto insurance has fallen short in system innovation; and

k. there is clearly a need to structure the system so that it can be encouraged to innovate and change.
According to the Marshall:

a. The tort system is confrontational, time consuming, involves the cost of legal counsel and experts, and ties up negotiating time if settled out of court or court time if cases go to trial. Moreover, using the court system to get injured parties what they deserve results in a significant leakage in the benefit they actually receive since the award they get is reduced by the need to pay expert witnesses and large fees to lawyers.

b. The no-fault portion of the system is intended by many governments to provide most, if not all, essential needs of injured parties through a system that is more efficient, less costly and delivers more of the end benefit to the consumer than the tort system. Where the no-fault portion of the system is outsourced to the private sector, as in Ontario, the goals are challenging to meet. If not structured properly, this part of the system can start to mirror the tort system with its inevitable confrontation, costs and delays, which is what is happening in Ontario today.

c. It is important to remember that in the end, citizens who own vehicles pay, through their insurance premiums, for the full cost of the combined no-fault and tort systems, whichever way the system is structured.

d. It is also important to remember that not all injured persons have access to sue – only those who are not at fault. About 30 per cent of drivers who are involved in accidents are at fault which leaves this substantial proportion of injured persons out of the tort system and with access only to the basic no-fault coverage.

e. When the core entitlement decisions are readily determined by programs of care and neutral independent examiners, there should be little structural need for conventional litigation and a consequent improvement in both health outcomes, and the efficiency and cost of the system.

Of other specific concerns identified, Marshall noted that based on 2013 expenses, more than one dollar out of every four is not received by the accident victim in benefits; that is, $340 million is going to pay for competing medical opinions because insurers and claimants – or their lawyers – disagree on what is appropriate medical care, and another $100 million is going to lawyers’ so that $4 billion in benefits, about $1.4 billion or some 35 per cent of the benefits costs are not going to accident victims which is undermining the integrity of the system and “the whole notion of getting benefits to deserving claimants quickly and inexpensively has been lost.”

Marshall also observed as follows:

a. lawyer advertising having rapidly become “big business.”;

b. the practice of obtaining clients through advertising then passing them onto other lawyers for a fee – in personal injury law have become unreasonable and disproportionate and, in many cases, clients are not sufficiently aware that they are being referred to another lawyer;

c. due to the high cost of acquiring cases, counsel might not be able to afford to spend adequate time with the client or be prepared to take the case to trial if necessary;

d. contingency fee pricing is not currently sufficiently transparent at the outset to consumers. In the personal injury market, the fee that a prospective client can expect to ultimately be charged often remains opaque, and it is difficult to determine whether a competitive fee structure is being proposed;
e. one area of particular concern is the reported practice by some lawyers of double dipping, which is, keeping part of the legal costs awarded to clients or charging their contingency fee on top of the legal costs. Keeping the disbursements and other practices not fully explained to the client up front are ... potentially questionable; and

f. clients often suffer financial hardship. To meet this need, specialized firms called settlement loan companies step into the picture and provide bridge loans to auto insurance claimants ranging from an estimated $500 to $50,000 at high interest rates. There is very little transparency on who owns these settlement loan companies, how they obtain their financing and who refers clients to them.

Marshall concluded there should be very little, if any reason to have to hire a lawyer or resort to a finance company to provide a bridge loan, especially in cases where there are minor injuries.

Marshall noted that trying to estimate the care and other benefits needed in the future leads to lengthy negotiations over amounts which may or may not ever be put to the uses estimated. It also introduces professional negotiating via lawyers, which can result in a large dose of exaggeration and gamesmanship on both sides in an attempt to figure out what the other party is likely to settle for, not necessarily what the claimant actually needs. As long as there is a prospect of a lump-sum payment at the end of a process, injured parties may be advised to boost a claim in order to maximize the size of the payment. This does not serve either the injured person well (boosting a claim requires spending money on expert opinions and lengthening the time of disability) nor does it serve the system as a whole since added costs which are not necessary increases the cost of insurance for all participants.

To avoid this situation a major cultural shift needs to occur. ... A claim should be handled on its merits. If health care is needed it should be provided either through the programs of care mentioned above or through the diagnosis and treatment recommended by the independent examiner –within the dollar and time limits of the policy.

With respect to the impact of removing a cash incentive, the study by Dr. David Cassidy et al. reported that when the Province of Saskatchewan changed its auto insurance system from a tort system where all compensation was given in cash vs. treatment to a no-fault system where treatment was provided instead of cash, the Saskatchewan system experienced a 28 per cent reduction in whiplash claims. Median time to closure of whiplash claims came down from 433 days to about 200 days. ...a decision to make a whiplash claim could involve factors beyond actual medical need and include a prospect of financial gain.

Experience within the worker’s compensation system shows that the majority of claimants, once they have recovered from their injury do not need further care and do not come back for more treatment. Those that do, account for a fairly small proportion. The actuaries will quickly adapt to the rate of recurrence and are able to advise management as to how much capital to set aside for this eventuality. This is also the process followed by the Québec auto insurance system which has demonstrated that their costs are the lowest in Canada.

A summary of Marshall’s key findings are as follows:

a. the goals of all the principal stakeholders are not well aligned. As a result, the government’s goal ... is being undermined;
b. claims appear to be unusually expensive, are taking too long to resolve, and too many accident victims are suffering a permanent serious impairment from what began as soft tissue injuries;

c. the system is open to inefficiency, excessive cost and over treatment;

d. expenditures are not going directly to the benefit of claimants (which) is threatening the very foundation of the system;

e. a major element of delay and extra cost is caused by the inability of parties to agree on an appropriate diagnosis and treatment of the injury. It has become a system that is largely focused on cash rather than care. ... The outcomes are not only more expensive but worse for injured parties;

f. legal representatives are charging claimants contingency fees as high as 30 or 35 per cent which is money out of the pockets of claimants who need these funds to replace lost income and pay for treatment;

g. disputes and settlements need to be focused on getting claimants timely access to necessary treatment and assessments;

h. catastrophically injured persons’ needs change as they age; and

i. it is necessary and essential to find a better way to resolve the issue of how to efficiently diagnose and treat injuries under the no-fault system.

British Columbia – 1983-2020

Accident benefits were first introduced in 1969. Following recommendations of an Automobile Accident Compensation Committee in British Columbia in 1983, Part 7 of the Insurance (Vehicle) Regulation, BC Reg 447/83 was enacted. Since 1983 some sections have been amended several times over the years, other sections have been repealed and in certain years no amendments were made.

Amendments were made yearly between 1984 and 1995, with respect to coverage, medical or rehabilitation benefits, medical examinations, provisions to terminate benefits, for refusal to undergo treatment or training, employment during disability, medical examinations and medical certificates. Further amendments were made in 1997 and 1998. No amendments were made between 1999 and 2005. Amendments were made again in 2006, 2008, and 2010. No amendments were made between 2011 and 2017. In 2018 and 2019 numerous amendments were made.

In early 2020, the Government of British Columbia announced an intention to convert the automobile compensation system to a pure no-fault model. No legislation has been presented to the date of writing of this Report.
B. Analysis of Auto Insurance Reform Studies and Legislative Alternative Models

1946-1978

The Committee found significant the consistency in conclusions drawn by the studies of auto insurance reform in five Canadian provinces between 1946 and 1988 which uniformly recommended elimination of tort and replacement with a no-fault insurance model to provide compensation for all traffic injured. These findings are listed below with our emphasis noting the bold verdicts against the tort model:

a. Saskatchewan 1946 Report on the Problem of Compensation for Victims of Automobile Accidents recommended compensation for injury or accident regardless of fault;

b. British Columbia Wooten Report 1968, “the fault system cannot adequately protect the general public insofar as the automobile accident is concerned…and by a system of no-fault cover aided by other factors the motorist and the general public would be better served.”;

c. Québec Gauvin Report 1974, “partial tort reforms were compromises and half measures which were not acceptable because the compensation was inadequate for those in the greatest need and so the fault concept must be completely abolished.”;

d. Ontario Slater Report 1986, “tort system was not defensible in theory or in practice and will only deepen the incoherence, instability and continuing unpredictability and instead personally injured traffic victims would be better served under a pure no (fault) system.”; and

e. Manitoba Kopstein Report 1988, “tort concepts provided inequitable results for injured persons.” It recommended a pure no-fault compensation similar to that of Québec.

The Committee also found significant the fact that despite the consistent conclusion found after extensive study on each occasion between 1946 and 1988, most provinces resisted acting on those findings and recommendations.

1946 Introduction of no-fault benefits: Saskatchewan

Although the province of Saskatchewan was the first province to take the then revolutionary step in 1946 of introducing no-fault accident benefits for traffic injured that could not secure monetary recovery in tort, no-fault benefits were not adopted in any other Canadian province for more than 20 years.

The gradual introduction in around 1970 of a no-fault benefits component alongside a tort component in Ontario and Alberta was likely recognized by private enterprise auto insurance models as necessary to mitigate the harshness of the tort requirement of proof of causation by a negligent driver which deprive many traffic injured of any recovery for losses resulting from accidents. It also presented the attractive prospect of brokering a blended compromise that would take into account all competing interests.
1978 Introduction of pure no-fault model: Québec

As noted, Québec was the first province to respond to the problem of escalating auto premiums by eventually adopting the initial recommendations of a commissioned report issued in 1974 by eliminating tort altogether. When it enacted legislation in 1978 in line with the recommendations, it became the first pure no-fault accident compensation model of its kind in North America.

Although there was significant resistance to the original reform proposal from many sectors of the public which delayed the enactment of the legislation by several years, auto insurance premiums remained stable in Québec since that time, are reportedly the lowest in Canada and since 1978, there have been no public calls for a restoration of tort remedies.

Despite its discernable success in attaining affordability and long term premium stability, no other provincial government adopted a pure no-fault accident compensation model for a further 14 years.

1978 expansion of tort remedies: The Supreme Court of Canada Trilogy

As may be well-known, in 1978 the Supreme Court of Canada (the Court) decided three personal injury cases which have become known as the Trilogy to set out clear and consistent principles to govern awards of damages in severe personal injury cases. The Court formulated guidelines for compensation for future care costs and loss of earnings capacity as well as to explain the purpose of awards for non-pecuniary damages which involved consideration of such factors as pain and suffering, loss of amenities and loss of expectation of life.

The Court held that if an injured person is properly provided for in terms of future care, large amounts should not be awarded for non-pecuniary damages, which should serve the function of making life more enjoyable for the disabled person above and beyond awards directly related to the injuries involved. One reason given by the Court for “capping” the non-pecuniary damage awards for catastrophically injured was recognition that insurance could not respond to unlimited general damage awards.

However, one consequence of the Trilogy became a more intensified focus on the pursuit of pecuniary loss claims of traffic injured in the tort system. Over the next decade, other statutory and common-law developments increased the number of people entitled to compensation, new rights of compensation have been created and higher awards have resulted which, in turn, have led to increased automobile insurance premium levels.
1986-1996

1986-1990 Introduction of threshold/no-fault model: Ontario

The consequences of the Trilogy in impacting tort awards between 1978 and 1990 may have contributed to the decision of the Ontario government to transform its then existing maximum tort/minimum no-fault hybrid model to a model that strictly restricted tort rights but substituted enhanced no-fault benefits.

The transformation of the accident compensation model in Ontario had a fraught four year journey, as was the case in Québec, although the opposition was manifested in different forms with different consequences. In Ontario there were two comprehensive auto insurance reform inquiries undertaken in rapid succession both of which reflected extensive consultations with many affected parties.

First, the desire of the Ontario government to implement a pure no-fault model in line with the Slater Report of 1986 was unmet. Equally, the Osborne Report’s proposal to implement a modified threshold plan capping pecuniary damages for minor injuries was unmet.

The eventual solution, known as the Ontario Motorist Protection Plan (OMPP), dramatically restricted the right to sue for most traffic injured, allowing such right only to those permanently and severely injured. However, in exchange it enacted substantially enhanced no-fault benefits. OMPP was enacted into law without first achieving a broad majority consensus of the Ontario motoring public and soon after became the subject of a legal challenge.

In a 1992 ruling a Judge of the Ontario Superior court upheld the OMPP, explaining that this legislation did not deprive individuals of tort rights, because it exchanged their rights of action with a right to comprehensive no-fault benefits. Of interest, no appeal was taken from that decision, which has been since cited in later similar cases at higher court levels.

OMPP, after surviving a legal challenge, likely produced an extended expectation in Ontario and in other provinces which maintained private enterprise delivery systems, that reasonable balances between tort and no-fault components could be carefully calibrated to solve the problems of unavailability, unaffordability and instability in auto insurance premium levels.

However, against the Ontario trend premium increase problems in Manitoba and Saskatchewan were producing different developments in response to increased bodily injury loss costs.

1991 Recommendation for gradual tort reform: Alberta

In 1991 the AAIB report, after identifying causes for increasing premiums as increased bodily injury loss costs, particularly for non-pecuniary damages, recommended for premium stability modest tort reform in the short term and a threshold/no-fault model in the long term.

At the time the rate board (AAIB) conducted consultations with Osborne which likely informed the AAIB’s decision to reject the pure no-fault model, despite its proven advantages, and to prefer the belief that reasonable balances
between tort and no-fault could solve the problems of unavailability, affordability and long-term instability in the auto insurance premium levels.

The AAIB recommendations produced strong opposition from the Alberta section of the Canadian Bar Association. In the event, no government action was taken to implement any of the AAIB recommendations.

While Ontario was undergoing a lengthy reform process, a commission led by a Manitoba jurist produced a report recommending abolishing the tort model in place of a pure no-fault model similar to that of Québec.

The tort-based model was replaced entirely with modest no-fault benefits in order to head off large increases in bodily injury claims costs by way of legislation enacted in 1994 (Personal Injury Protection Plan). This change occurred in Manitoba without evident protracted controversy or opposition. The KPMG report said the Personal Injury Protection Plan reduced the number of injury claims and produced a net reduction in premium of 34% in the first two years. From all reports, auto insurance premiums remained stable over the long term, and there have been no public calls from Manitobans from 1994 onward for a restoration of tort remedies.

After observing from 1988 to 1993 that almost 40% of the claims dollar was allocated to bodily injury claims in 1995 the Saskatchewan government took action to implement a no-fault plan similar to that of Manitoba but preserving a right to sue where a not at-fault claimant had economic damages exceeding the benefits provided under the plan. The tort remedy was further restricted by a 90% of net income limit.

1990-1996 Continuous modifications to threshold/no-fault: Ontario

In the mid 1990s problems began to emerge with the Ontario threshold/no-fault model (as described by Marshall in 2017), resulting in a series of modifications.

In 1994, the government considerably expanded the benefits under the accident benefits side of the system, extended the right to sue under tort for pain and suffering, but eliminated the right to sue under tort for economic damages.

In 1996, the government reintroduced the right to sue for economic damages but reduced the amount of coverage for medical and rehabilitation benefits under the accident benefits side of the system. It also introduced additional cost control measures, such as setting maximum fee schedules for providers of health care and the requirement to submit treatment plans for approval by insurance companies.

These various attempts to save costs by calibrating and recalibrating the balance of tort and no-fault components in the system were judged by Marshall to be unsuccessful in the long term.
1996-2003

1996 KPMG Report Recommending No-Fault model: British Columbia

In about 1995 British Columbia motorists were reporting premiums were too costly. The 1996 KPMG Report provided a deep insight into the British Columbia trends of premium cost increases from 1986 to 1996 which mirrored the rising premium trends in other provinces in the same interval.

The KPMG Report was blunt in its conclusions and recommendations in condemning the tort component of the traffic accident compensation system. Most revealing in its cost breakdown of ICBC dollars from 1995 data was the breakdown of actual legal costs due to the tort component totalling $223 million in 1995. The ability to identify precise legal costs in a government monopoly system is a clear advantage over private enterprise insurance models.

The KPMG Report concluded that only by changing the design of the insurance product could costs in auto insurance be brought under control and that tinkering with or fine-tuning the product would not be sufficient.

The KPMG Report also concluded that preserving a right of action in tort eroded the economics of the system and created an intolerable financial burden on policyholders. This was particularly so when measured against the deficiencies in the system such as long delays and certainty about adequacy of compensation and rehabilitation, potential for exaggeration of claims and the high legal investigative costs to establish claims worked against the recovery of the traffic injured.

The KPMG report predicted that the era of tort in automobile insurance is nearing its end whereas no-fault models can replace the costly and lengthy tort benefits with well-defined and controlled compensation through a tightly managed administrative process, protection and in shifting the focus to better health outcomes provided it preserves justice, fairness and equity.

These conclusions were compelling because they came from detailed study and analysis by actuaries and accountants who did not have the same type of vested interest in the auto insurance compensation system as other tort service providers. They also bore a strong resemblance to the criticisms levelled in other jurisdictions in other time intervals, such as in reports of Ernst & Young in Australia in 1999 and Marshall in Ontario in 2017.

1999 New South Wales, Australia

The 1999 motor accident reform in New South Wales was a response to public dissatisfaction with record high premiums. Its model introduced a shift away from money compensation for injuries and to standardized medical treatment. The model included a threshold for nonpecuniary general damages defined as more than 10% permanent impairment based on American Medical Association guidelines. This was intended to target premium cost reductions.

Another transformation in the 1999 reform was to legislate the determination of key issues such as medical impairment, work capacity and economic losses by expert panels rather than litigation. While the model preserved the right to appeal dispute panel decisions to court it intended to deter the frequency of appeals through a cost penalty for unsuccessful
appeals. As was proven in subsequent years, the concession to the adversarial process would eventually prove to have been counterproductive.

Summary of Results

What was clear from the history of all the various jurisdictions examined was that automobile insurance premium levels were increasing continuously at a rate motorists from the mid 1980s to the mid 1990s were reporting as unaffordable and unacceptable, and not only in Canadian provinces but elsewhere. All indications were that the main cause in all jurisdictions was bodily injury loss costs escalating and exceeding high rates of inflation and the Consumer Price Index.

The studies continuously recommended elimination or severe restriction of the tort component, and in Manitoba and Saskatchewan where the recommendations were accepted, public dissatisfaction has been quelled. In jurisdictions where the tort component was maintained, the pricing problems continued and the remedies implemented, if effective at all, were only so in the short term.

The enduring problems for the Ontario government since the 1990 reform have been vividly recounted in the Marshall report. In the same interval, the premium instability problems in Alberta and British Columbia, where no auto insurance reform was undertaken, other than increases to accident benefits, continued through the next two decades.

2003 Saskatchewan Introduction of Choice Model

In Saskatchewan a choice model was implemented effective January 2003. The Committee was unable to locate the history behind the decision to transition from the nearly pure no-fault model which had functioned from 1995 to 2003 without apparent reported systemic problems.

It is the Committee’s understanding that motorists who have previously elected the no-fault option continue to have the no-fault product as their election, unless they take active steps to opt out of their previously selected option. Since the operation of the choice model from 2003 to the present, there has apparently been very little take up of the tort option by Saskatchewan motorists over the period from 2003-2019 (reportedly currently to be around 0.5%).

The choice model may seem at first blush as a unique and desirable model as it places the decision as to the type of compensation coverage to purchase in the hands of motorists. However, since in the Committee’s view the Saskatchewan experience since 2003 has in effect been a de facto nearly pure no-fault model, it does not provide reliable evidence as to whether and how it would perform in a private enterprise insurance delivery system.

Some commentators consider the choice by consumers might be influenced by cost, such that low income and elderly consumers might choose the no-fault option because they are insuring lower than average prospective income losses. The KPMG report concluded that on balance this model was not effective in health treatment or cost control.
The AAIB recommended that a choice model be considered after an enhanced benefits model and before a threshold model had been tried out. However, as will be discussed in Section IV (C) of this Report, the choice model was considered and rejected in 2003. In the Morrow decision, the then current tort/no-fault system in Alberta was categorized as a threshold no-fault model, which was unsuccessful in controlling escalating bodily injury loss costs in the long term. It would then follow according to the AAIB recommendations, that the next model to be considered would be that of pure no-fault.

The Committee concluded that the Saskatchewan choice model is anomalous in relation to all the other automobile insurance reform experiences in Canadian provinces. That is not of itself sufficient reason to reject it. However, if as the Committee concludes, retaining a tort component cannot be defended on its own merits, then retaining it under a choice model would be equally indefensible.

In addition, the Committee is concerned that the choice models create a significant risk that many motorists, especially young and new drivers, will select the option that costs the least instead of making informed choices at the time of purchasing auto insurance. The Committee is concerned that many motorists under such a model would regret their choice if they were injured in a traffic accident and unable to recover the benefits and compensation that would have been available if they had made the opposite election. In the result, the Committee rejects the choice model because it would perpetuate the same deficiencies currently found in the tort system, with the same adverse consequences to traffic injured and the motoring public.

2003 Introduced caps to non-pecuniary damages for minor injuries: Alberta

In 2000 concerns that mandatory auto premiums were becoming unaffordable or unavailable led the GOA to review auto insurance issues including fairness of risk classifications, claims cost pressures, adequacy of Section B benefits, ability of traffic injured, especially soft tissue injured to access effective treatments and traffic safety initiatives to reduce injuries.

In the initial stage of reform, the proposed cap was to apply to claims for non-pecuniary damages for all except the permanent and catastrophically injured. Through the course of the legislative process, including consultations and responses to public concerns, the scope of traffic injured to be included under the cap was substantially reduced.

A detailed review of the reform process and the subsequent court challenge concluded in 2009 is discussed in the review of the history of Alberta auto insurance reform under Section IV (C) of this Report. In that discussion it will be seen that the reform package did not produce long-term stability in auto insurance premium levels in Alberta.
2003 Investigation of auto insurance reform: Atlantic Canada

The Atlantic Canada Insurance Harmonization Task Force (Task Force) found that the core problem of increases in premiums has been consistently identified as the increase in bodily injury loss costs. The Task Force Report proposed that product reforms in those jurisdictions must reduce the tort components as far as possible while maintaining the appropriate balance between the cost of premiums and the necessity of reasonable compensation.

2003 Introduced caps to non-pecuniary damages for minor injuries: Nova Scotia

After complaints from Nova Scotia motorists about increased premiums for mandatory insurance coverage, the Nova Scotia regulator drew conclusions similar to all other auto insurance compensation studies, i.e. that:

a. premium increases are to be expected as long as the existing automobile insurance system remains;

b. the major reason is the increasing cost of claims;

c. the primary cause is claims for compensation for bodily injuries;

d. third party liability claim costs have been increasing much faster than collision and comprehensive claim costs;

e. the increase in the average cost of a bodily injury claim over the last five years had been dramatic; and

f. automobile insurers have been taking drastic rate action to restore profitability.

The Government amended the Insurance Act to include a definition of “minor injury”, together the term “serious impairment” which by regulation confirmed that non-pecuniary general damages for such minor injuries would be subject to a cap of $2,500 and that certain listed injuries, including chronic pain, would be excluded.

The evidence presented in the Hartling decision indicated the initial plan was to cap non-pecuniary general damage claims for all but the severely and permanently injured. However, through a political compromise in the legislative process, the group of traffic injured to be included under the cap was substantially reduced.

2003 Implementation of periodic reforms to the threshold/no-fault model: Ontario

The Marshall Report detailed the ongoing reforms undertaken by the Ontario government in 2003, 2006, and 2010 in an effort to control costs which continued to plague the auto insurance system. His conclusion that all the measures taken over that period amounted to only ineffective tinkering of the system serves as a warning to governments that piecemeal changes which do not solve the underlying cost issues will not be effective in the long term.
2013-2017

2013 Auto insurance reform model revealing deterioration: NSW

As noted, the MAA found deficiencies as of 2013 in the 1999 model mainly because proof of fault and the dispute processes in the scheme became highly adversarial which resulted in systemic benefit delays and unnecessary costs. This New South Wales experience demonstrates how tort can find opportunities to survive in an insurance model even where the right to sue has been restricted for the benefit of the traffic injured and motorists.

2013-2017 Auto insurance reform model revealing deterioration: Ontario

Marshall documented the Ontario history continuing auto insurance reforms between 2013 and 2015 and then decisively pronounced on their ineffectiveness, explaining that following each of the reform measures, costs and premiums decreased for a short period but then rose sharply to establish new highs. Despite further changes to curb costs, trends indicate claims costs will again rise, and cost of claims has consistently increased even though accident frequency has decreased.

Marshall’s criticism of the impact of tort in Ontario was unflinching. First, he described it as confrontational, time consuming, and costly, then identified processes he considered particularly detrimental, such as the cost of legal counsel and experts which ties up negotiating time and the significant leakage in the benefit traffic injured receive by using the court system to secure their deserved compensation since their awards are reduced by the need to pay … large fees to lawyers.

Marshall was also critical of the additional costs to traffic injured by health as well as legal professionals’ growing involvement in the no-fault accident benefits side of the system. He said governments intend the no-fault portion of the system to provide most, if not all, essential needs of injured parties through a system that is more efficient, less costly and delivers more of the end benefit to the consumer than the tort system. However where the no-fault portion of the system is outsourced to the private sector, and not structured properly, as he found to be the case in Ontario, this part of the system is beginning mirror the tort system with its inevitable confrontation, costs and delays.

Marshall was clearly concerned that it was the insured motorists who ultimately had to pay the full cost of the combined no-fault and tort systems, whichever way the system is structured. He was also concerned that the Ontario model excludes about 30 per cent of drivers (because they cannot prove the losses were due to a negligent driver) which leaves them with access only to the basic no-fault coverage.

Marshall also identified the solutions for the profound problems he exposed. First, he said where the core entitlement decisions are readily determined by programs of care and neutral independent examiners, there should be little structural need for conventional litigation and a consequent improvement in both health outcomes, and the efficiency and cost of the system.

Marshall then pointed the health outcome benefits shown in Saskatchewan system resulting from the removal of a cash incentive, namely a 28% reduction in whiplash claims and reduction of median time to closure of whiplash claims from 433 days to about 200 days.
Marshall also reported the positive outcomes found within the worker’s compensation system which demonstrated that the majority of claimants, once they have recovered from their injury do not need further care or return for additional treatment. Those that do account for a fairly small proportion. He noted that actuaries in those models will quickly adapt to the rate of recurrence and are able to advise management how much capital to set aside for this eventuality. He noted with approval that the Québec auto insurance system follows this process, and their costs are the lowest in Canada.

Finally, the Committee noted that Marshall advocated a major cultural shift to promote claims processing on their merits so needed health care is provided through diagnosis and treatment as recommended by independent examiners and recognized that it should keep front of mind Marshall’s trenchant analysis of the deficiencies in the Ontario system and the solutions he identified.

The thread running through Marshall’s key findings is that the Ontario accident compensation system became too focussed on cash rather than care resulting in the loss of the goal of delivering benefits to deserving claimants quickly and inexpensively.
Conclusions

1. The historical review and evaluation of numerous commissioned reports over decades and across many Canadian provinces provided compelling evidence that reformed traffic accident compensation models which retain tort features result in continuing premium instability in the medium and long term.

2. It was evident to the Committee that in a reformed auto insurance model tort finds opportunities to grow and thrive. Two recent examples illustrate this phenomenon. The New South Wales model, redesigned in 1999 to minimize tort components fell prey to pricing problems and bodily injury cost increases within 14 years. In short, the tort components found areas for regrowth. The Ontario experience was the same or similar, despite its intent to minimize tort with a high litigation threshold and enhanced accident benefits. Over time, tort components replicated with increasing litigation on the accident benefit side combined with duplication and increased service provider costs generated by legal and some health professionals.

3. More importantly, since the conversion of some systems to full no-fault compensation, emerging scientific data has produced equally compelling evidence that tort models impede health outcomes and recovery of traffic injured.

4. The Committee was satisfied on the evidence of its detailed historical analysis of auto insurance reform experience that preserving any component of tort in a reformed automobile insurance system is inconsistent with the needs of traffic injured. Further, since it adds unnecessary expense to policy holders, it also adversely affects the motorists who pay for automobile insurance.

5. The Committee concluded from its analysis that there should be a transformation from the current model and its primary tort principle of money compensation for non-pecuniary damages to a model based on better, more timely rehabilitation and health outcomes and the replacement of court determination of the measure of traffic accident pecuniary losses through a collaborative administrative panel-based process. The current mode of accident compensation should be reformed to expedite health outcomes and recovery to all traffic injured, including those who cannot prove fault of another driver.

6. The Committee concluded that to attain both optimal health treatment for all of its traffic injured and predictable, stable insurance premiums for road users, the Alberta motoring public would be best served in the medium and long term by the implementation of a pure no-fault system of automobile insurance designed with innovative evidence-informed medical diagnostic and treatment protocols and non-adversarial claims processes and assessments.
C. Chronology of Alberta Auto Insurance Reform

Automobile insurance reform in Alberta has been marked by four significant events:

a. A study of premium stability in compulsory auto insurance by the Alberta Automobile Insurance Board (AAIB) in September 1991. The study generated a report which recommended three options for reform but no reform resulted.

b. An increase in the limits to Section B (no-fault) benefits in May 1995 from $5,000 to 10,000.

c. A major legislative reform in 2003 followed by supporting regulations in 2004. The reform included a cap on non-pecuniary damages for defined minor injuries and diagnostic and treatment protocols.

d. A constitutional challenge in 2004 to the reform legislation (*Morrow*) which is significant here for two reasons:
   i. testimony given at the trial by politicians and public servants about the process leading up to the legislation and regulations and by experts in accident compensation law, actuarial science and medicine; and
   ii. the outcome of the challenge which was a decision of the Alberta Court of Appeal in 2009 upholding the legislation.

These events will be considered in turn.

*Alberta Automobile Insurance Board, A Study of Premium Stability in Compulsory Insurance (September 12, 1991)*

In the late 1980s concerns had been raised by Albertans about the pricing of compulsory automobile insurance.

The Government of Alberta (GOA) wished to investigate whether there were means to establish greater stability of pricing in the short term and long term for the benefit of Alberta motorists.

It was also found desirable to examine:

a. the current cost of compulsory automobile insurance;

b. the merits of the existing tort system for personal injury and property damage by automobile accidents;

c. certain proposals for improvement to the tort system; and

d. the question of whether certain features of no-fault automobile insurance systems may better serve Alberta motorists.

In September 1991 the AAIB reported to the Alberta Minister of Consumer and Corporate Affairs on the following issues:

a. the cost effectiveness of the current automobile insurance system for claims arising out of automobile accidents;

b. the desirability of implementing modest reforms to the current automobile insurance system to enhance its cost effectiveness;
c. the cost savings and effectiveness of a no-fault system for compensation for claims arising out of automobile accidents; and  
d. whether there were reasonable grounds to support the proposition that modifications to the current system that enlarge no-fault features would produce greater price stability in the short and long term.

The AAIB commissioned a claims costing study from Mr. Joe Cheng (*Cheng Study* 1990) and an economic analysis of alternate compensation models from Professors Michael Trebilcock and Bruce Chapman (*Trebilcock Report*). (Volume 2 of AAIB Report)

The AAIB examined previous research, including the 1988 *Osborne Report*, held discussions with administrators of alternate insurance systems in other jurisdictions, including SAAQ, the Department of Licensing and Regulation of the Insurance Bureau of Michigan, and the Ontario Insurance Commission.

The AAIB received advice from scholars who had studied auto insurance models in and outside of Canada including Professor Marc Gaudry of the University of Montreal, Professors Claude Fluet and Peter LeFebvre at University of Quebec, and Professor Jean Bigot at the University of Paris.

The AAIB also considered its own information and knowledge of the operating automobile insurance system in Alberta.

The AAIB’s findings included the following:

a. after examining the history of automobile insurance premiums and loss costs from 1972 to 1989, it found loss costs had increased dramatically since 1985 mainly due to the increase in bodily injury loss costs;  
b. the increases in loss costs, i.e. 12.9% between 1988 and 1990, were more than twice that of the Consumer Price Index, and were caused mainly by the rate of increase of bodily injury loss costs;  
c. the third-party liability premium increases in 1989 and 1990 were not yet sufficient to bring premiums into balance with the current expected costs;  
d. claimants with minor injuries were overcompensated in the tort side of the system relative to all other traffic injured. Claimants with catastrophic injuries were undercompensated in the tort side relative to all other traffic injuries;  
e. at-fault claimants were inadequately compensated for their economic losses relative to tort claimants;  
f. there were structural deficiencies in the delivery of benefits in the current system;  
g. all payments required under the current system were subject to delays;  
h. the then current data proved that there was a pricing problem in the system which would persist in the future without some measures to counteract it; and  
i. loss costs would continue to increase because of continuing increases in frequency and severity of claims unless bodily injury costs were curtailed and effective cost saving measures were not undertaken.

The *Trebilcock Report* provided an evaluation of the current and alternate models but noted inherent problems in such an undertaking because of the basic disagreement about what goals the systems are designed to serve and uncertainty in proving how well a current system, or any alternatives, achieve those goals.
Taking into account the economic analysis of alternative models set out in the Trebilcock Report, the AAIB examined four alternative compensation models including: (a) a current system with tort reform, (b) tort with enhanced no-fault (the model proposed in the Osborne Report), (c) elective no-fault (choice) and (d) pure no-fault.

The AAIB also considered the Osborne Report, in particular, the comments at chapter 12.

Osborne concluded that the workable compensation options were pure no-fault, threshold no-fault and an add-on plan with coexisting no-fault benefits and tort system access. He also commented on the awareness and input of the public and interested groups and the cost and impact of shortcomings in the existing system.

As to public consultation, Osborne observed:

a. due to the lack of public awareness of the no-fault/tort components of the system, the tort/no-fault debate has not been a large concern to consumers;
b. academic opinion clearly favoured no-fault compensation;
c. although insurers recommended a threshold no-fault model, implicitly, their preference was for a pure no-fault model;
d. lawyers’ groups and others urge resistance to anything that will erode the values of individual responsibility, deterrence, fairness, and individualized compensation;
e. both insurers and lawyers’ groups have vested interests in the final disposition of what the auto insurance system is to be, which should affect the weight of their insights; and
f. all agreed first party no-fault accident benefits should be increased.

Regarding the existing systems problems, Osborne said:

a. most compensation problems including cost, uncertainty, delay and the undercompensated are reflected in criticism of the tort system; and
b. based on history, if premiums are not to be increased, funding for increased first party benefits can only be secured by systematically reducing or eliminating existing non-economic loss compensation rights.

Osborne did not accept that the increase in bodily injury claims costs was a trend that would necessarily press against the limits of affordable, accessible premiums in the future. In this, he would ultimately be proven wrong.

As to the pure no-fault option, Osborne made these comments:

a. A pure no-fault system ensures compensation to all injured in traffic accidents on the same basis. The emphasis is on economic loss, although some plans provide modest non-economic compensation (including Québec and New Zealand).
b. From a compensation standpoint, pure no-fault is superior to the tort system.
c. From a rehabilitation perspective, it is in the public interest that all injured be rehabilitated.
d. In a pure no-fault model legal costs will be dramatically reduced because of the elimination of third-party claims.

Osborne rejected pure no-fault on fairness and deterrence grounds, and because it seemed to him that few seemed to want it. However, earlier in his report he observed that academics and insurers did. Moreover, the preamble to his terms of reference stated that no-fault automobile insurance system was recommended by the Ontario Law Reform
Commission 1973, the 1986 Task Force, and the Select Committee of the Legislature on Company Law.)

As to the threshold no-fault option, Osborne observed that it was superior to the tort system but that it would produce smaller savings in legal costs than pure no-fault. He rejected this option as inefficient and arbitrary.

Osborne favoured an add-on plan with substantially expanded no-fault benefits and some tort system access. In his opinion these “could coexist in a soundly structured plan delivered by the auto insurance system at reasonable cost.”

Taking all the foregoing into consideration, the AAIB concluded that to deliver all auto insurance models’ objectives, no alternative was superior overall. Its own conclusions on the alternative models are as follows:

**Pure no-fault**

AAIB did not seek cost estimates of a pure no-fault model but was satisfied that cost savings would be higher under a pure no-fault model, similar to that in place in Québec, than would be attainable under any other model. Thus, this model is superior in producing lowest premium costs. Further, a pure no-fault model would provide the highest degree of operational efficiency of all models.

AAIB concluded that pure no-fault and threshold no-fault systems function effectively in practice and noted that administrators in Québec and Michigan respectively reported a high degree of consumer satisfaction, although initially trade-offs were necessary that did not meet with approval of all groups of consumers.

**Threshold no-fault**

The threshold no-fault model implemented in Ontario resembled the model in place at the time in the state of Michigan. It was expected to eliminate the right to sue for about 88% of traffic injured and contemplated no recovery for moderate claims for non-economic losses or for psychological injuries. Claimants with high incomes would not receive full compensation for income loss, although they might choose to buy additional coverage.

AAIB noted that the cost savings would be higher under the threshold no-fault model and that it had greater potential for premium savings and price stability in the long term than tort and a tort model with modest reform.

The AAIB reported that if Albertans require their automobile insurance compensation system to provide traffic injured restoration as far as possible to preaccident condition, by calculating full tort compensation for pain and suffering and loss of enjoyment of life, then premium levels must be higher than those achieved by pure and threshold no-fault models.

**Elective/Choice**

The AAIB examined the proposed elective or choice model that was proposed in 1989 to the Ontario Automobile Insurance Board. It noted commentators’ concerns that the choice model would be subject to serious adverse selection and that the more drivers choose no-fault; the higher will be the premiums for those who elect tort. As well, those who choose tort will have to sue their own insurers and pay premiums reflecting the cost of those claims.
The effect will be increasing divergence of average premiums between the two options which will cause all drivers to choose no-fault and, in effect, convert the system to a pure no-fault model.

**Tort with modest reforms**

As compared to the pure no-fault system which ranked first in the attainment of low premium costs and in operational efficiency, the tort model scored last on compensation coverage and operational efficiency, and also scored very poorly on the attainment of low premium costs.

There was overcompensation in cases of minor injuries and undercompensation in cases of catastrophic injuries. Some tort claimants were probably overcompensated for their wage loss as claimants represented by lawyers usually received higher recovery than those that did not. There was an unusually high inflation rate in bodily injury claims and some delays in receipt of compensation on the tort side.

The AAIB concluded that greater cost savings and effectiveness can be achieved by conversion to a primarily no-fault model with the sacrifice of certain tort benefits.

Despite the foregoing, AAIB concluded that there were not irreparable problems with the tort component of the system and that the pricing problem would be adequately met in the short term by implementing Option 1 or Option 2.

The AAIB warned that transformation of an auto insurance system is a significant undertaking and that in the automobile insurance market system changes can cause market dislocation and instability that will affect consumers and suppliers. The overhaul an auto insurance system can be costly and may have to be borne ultimately by consumers.

The AAIB recommended modifying the insurance system to reduce the amount paid to traffic victims. It proposed two modest tort reform options to attain premium stability in the short term, to reduce litigation and curtail the inflationary effect of claims costs over time.

**Option 1**

The AAIB concluded that greater price stability could be attained in the short term (five years) if modifications were made to the current system to enlarge the no-fault features and non-pecuniary tort benefit for catastrophically injured but to also restrict tort rights to correct overcompensation in some instances and to contain claims costs.

The AAIB suggested that cost savings could be achieved by imposing a deductible of $10,000 for all non-pecuniary damage claims and to implement other tort reforms such as mandatory structured settlements, adjustment of prejudgment interest rates for non-pecuniary general damage claims and elimination of the collateral benefits rule.

**Option 2**

The AAIB suggested an alternative Option 2 which was implementation of a threshold no-fault system with an enhanced no-fault benefit package. Under this option, the right to sue would be restricted to only the most serious claims and it would have to be considered whether such a threshold system should have a verbal or a monetary limit.

The AAIB noted that the cost savings under this option were lower than Option 1 but the benefits were more in line with those offered to the traffic injured in Ontario and Québec and the needs of Albertans in 1991-2. It expected that Option 2 might solve the problem of premium
stability in the long term. It recommended further study for the solution for premium and stability in the long term.

Because it could not determine if modest tort reform would ensure premium stability in the long term, it recommended the government consider alternative models in the order set out in the Trebilcock report until it achieved the combination of compensation features most suitable for Alberta motorists.

Public consultation
The Minister sought public input and received a written submission from the Canadian Bar Association Alberta Section (CBA) disagreeing with the recommendations.

Neither the CBA nor any other organization representing lawyers provided information as to:

a. the amount of fees charged and recovered by lawyers acting for traffic injured in conducting minor, severe and catastrophic personal injury cases;
b. the net amount of settlements or awards that were ultimately remitted to traffic injury clients compared to the amount paid by defendant;
c. the cost of litigation and the time taken to complete a personal injury case in minor, severe and catastrophic personal injury cases;
d. post litigation analysis of disposition of awards recovered; or
e. cost and number of expert witnesses required for injury cases.

Increase in no-fault benefits
In May 1995, the GOA increased Section B benefits from $5,000-$10,000 for medical rehabilitation and made some improvements within Section B to disability payments. (Automobile Accident Insurance Benefits Regulation, AR 114/95.) Otherwise no automobile insurance reforms were undertaken from September 1991 until 2003.

The 2003-2004 Reforms
Between 1986 and 2004 automobile insurance premiums in Alberta increased steadily to the point that there were concerns about affordability and accessibility of mandatory coverage. Auto insurers were required to submit applications for premium increases to the AAIB which required, among other things, that they be supported by sound actuarial data and opinions. Several actuaries who later gave evidence in the Morrow case came to conclusions about the causes of premium increases. These are outlined below.

Mr. Ted Zubulake’s testimony included the following points:

a. bodily injury coverage financial results contributed to the insurer action between 1986 and 2004;
b. the greatest increase in costs through those periods was third-party liability coverage and escalation of bodily injury loss costs driven by minor soft tissue injury claims costs;
c. the average pain and suffering cost for minor injuries in 1990 was almost $3,000 whereas in 2003, the average pain and suffering cost for minor injuries was almost $17,000 in 2005 dollars;
d. this increase in excess of the compounded rate of growth amounted to an excess of 10% per year;
e. thus, minor injury accident related injuries such as soft tissue strains and sprains represented a high proportion of bodily injury liability claims costs;

f. between 2000 and 2003 auto insurance premiums sharply increased and became less available in the regular insurance market, mostly due to escalating bodily injury claims costs, likely driven by minor soft tissue injury claims costs; and

g. at the time the GOA was considering automobile insurance reforms, auto claims costs were increasing primarily due to higher minor soft tissue injury awards.

Dr. Ron Miller gave the following evidence regarding the causes of premium increases:

a. from 1984 to 1999 the average cost of third-party liability bodily injury coverage was increasing at a steep rate compared to the all Canada Consumer Price Index (CPI);

b. in Alberta and Canada, typically inflation inherent in third-party liability bodily injury costs exceeds the CPI inflation. Costs continued to increase because the inflation includes CPI inflation, but there is a load in addition;

c. from 1994 to 1998 claims frequency increased on average by about 2 to 3% per year while claims severity increased by 7.3% per year resulting in an increase in claims cost per auto on average of 9.8 %, while CPI inflation averaged only 1.6% per annum. Those results imposed large stress on the system which was likely the cause of the increase in rates, consumer dissatisfaction and resulting reform measures;

d. from 1999 to 2001 claims cost reduced and then spiked to the highest point in 2004; and

e. in 2000 the loss ratio at 100 and 110 was unprofitable (for insurers), reflective of the increase in bodily injury claims costs not being offset by sufficient premium increases.

Mr. Joe Cheng also testified about the causes of the premium increases:

a. between 1986 and 2002 bodily injury claims were rising faster than the Consumer Price Index by 28%;

b. between 1986 and 2002 bodily injury claims per 1000 vehicles had increased 72%, which is a significant factor contributing to premium increases;

c. compounding the increase in claims by 72% and the inflation over the Consumer Price Index at 28% presents 120% rising faster than the Consumer Price Index;

d. premium increases in 2001 to 2003 were mainly due to higher bodily injury claims costs and the need to redress the accumulated premium deficiency;

e. auto insurance premiums in 2002 and 2003 increased mainly because of the high cost of bodily injury costs which were rising at about 120% more than the Consumer Price Index. In hindsight, if insurers had realized that was occurring at that time consumers would have had to pay 45% more than the Consumer Price Index in that period;

f. the major issue in Alberta was the accumulated premium deficiency in 2001 and the insurers’ need to catch up to the proper level. This is why premiums increased while claims may not have done so; and

g. if that trend continued, Albertans would find their own insurance premiums less affordable.
Testimony in *Morrow v. Zhang* – The political process behind the reform and the expert opinions related to it

**The political process**

Concerned about the continuing deterioration of the auto insurance market, the GOA undertook an investigation into possible reform. This led to Caucus of the GOA approving a policy option to revise the existing tort system with a deductible or cap on pain and suffering awards for minor soft tissue injuries. The reform produced some reductions in premiums.

Regulations that became part of the reform produced diagnostic and treatment protocols for the no-fault benefits provided by the standard auto policy and these have significantly improved the timeliness and effectiveness of treatment and helped Albertans with minor injuries recover.

The chronology of this process is instructive and so is set out in detail below.

In 2002, Alberta Finance (AF) and the Government of Alberta (GOA) became concerned about problems with the auto insurance system, including:

a. affordability;

b. long-term rising claims costs;

c. deteriorating returns and solvency of insurers;

d. unavailability of insurance in the regular market;

e. inadequate Section B benefits; and

f. barriers to effective treatment of minor injuries.

Premium increases, on average, were 11% in 2002 and 13% in 2003. Even larger increases were found for high-risk drivers. The Facility Association, a non-profit organization whereby high-risk drivers who were refused insurance could access insurance through a pool underwritten by the auto insurers and distributed rateably among them) (FA), reported premiums increased 60% in 2002 and 9% in 2003.

Newly licensed and young drivers were assigned the same driving record as a driver with a claim. Drivers under age 25 were assigned higher premiums.

AF received many letters expressing concerns and commenting about a proposed cap on non-pecuniary claims.

Comparisons with other provinces showed that Alberta has much higher premiums than public systems for inexperienced young drivers and risks such as drivers with lapses in coverage. Rates approaching $7,000 were unaffordable to many drivers.

The Insurance Brokers Association of Alberta estimated the number of uninsured drivers was in the range of 10,000. The Motor Vehicle Accident Claims Fund data showed increases of about 11% in uninsured driving convictions (5300-5900) and 14% in claims from 2000 to 2002.

In 2002 Alberta auto insurers underwriting results, profit and return on equity fell. Thus, less capital was retained causing deterioration of solvency and capital tests. The Cooperators General Insurance Company had ceased writing new business in Alberta.
A reduction in capital translated into declining coverage and accessibility problems for consumers. The Insurance Bureau of Canada (IBC) reported the return on equity for the property casualty industry in Canada in 2002 was the worst on record in the previous 25 years.

Insurers pay a premium tax and also an annual health levy set by the Minister. Before the reforms, insurers could refuse any application for insurance but in such a case a driver was entitled to insurance from FA.

The financial pressures on insurers resulted in stricter underwriting guidelines, coverage being declined for more Albertans and more drivers being unable to obtain insurance other than through the FA. The FA noticed growth in the number of persons insured in 2002 which continued in 2003 (and 2004). Prior to the reforms it was five times higher than in February 2001.

The Superintendent of Insurance, Dennis Gartner, (Gartner) concluded the increases were not explained by a sudden increase in drivers with poor driving records.

FA would attempt to assign drivers without bad driving records the best possible rate. FA rates were very high for many classes but still subject to approval of the AAIB.

Gartner noted in his testimony that the 1991 AAIB report showed that the GOA should consider whether to continually increase premiums or modify the structure of system to control loss costs.

In 1995 damages awarded for most soft tissue injuries ranged from $6,000-$10,000. By 2000 they were at $24,000 and at 2002 they were at $29,000.

AF also identified a problem dating back to the 1991 AAIB report with inadequacy of Section B benefits. There was also difficulty in accessing treatment in part because benefits were being unfairly restricted or treatment terminated by insurers and victims had to pay for a treatment themselves and then wait for later insurer reimbursement. Some traffic injured were also having problems accessing effective treatment.

A report of the AAIB in 2002 noted a 100% increase in injury loss costs over the previous 10 years. It confirmed its earlier conclusion that there was nothing in the system to control bodily injury loss cost increases. It warned that premium increases could result in public backlash. It noted that between 1986 and 2002, bodily injury claims costs per vehicle had tripled while property damage claims grew only 23%.

Gartner noted in his testimony that Professors Neilson and Kleffner from the University of Calgary Haskayne School of Business recommended reduced access to compensation for non-economic losses.

The Office of the Superintendent of Financial Institutions reported that the financial position of the property casualty industry has been deteriorating for several years due to rising claims costs, especially in auto insurance, not matched by increases in premium revenue.

The GOA’s investigation of possible auto insurance reform began in April 2003.

In April 2003 the Minister of Finance (MF) asked Robert Renner, MLA (Renner) to assist in developing reforms in response to concerns about rising insurance premiums and prepare options for discussion in July. It was recognized that auto insurance issues would be complex and controversial. There was media attention in Alberta and across Canada.
Although Renner had no insurance expertise and since 1993 no interest in auto insurance other than as a consumer, he had been chosen for his experience in dealing with complex issues and carrying forward government initiatives.

Renner and MLA colleagues had calls from many constituents regarding increased premiums and the problem of affordability of insurance. They heard insurers would move high-risk clients into the FA which resulted in higher premiums and coverage problems with having to hire a lawyer to pursue Section B benefits from their own insurer.

Renner was asked to report to Caucus on options for a ‘made in Alberta’ solution.

Renner and Gartner had several meetings to discuss options with the MF, the Deputy Minister and other government employees. They also engaged Mr. Jack Donahue, Q.C. (Donahue) to help explore with the Minister a range of options including no-fault insurance, caps on claims, public delivery, increased accident benefits, caps on premiums, or maintaining the status quo.

Gartner had examined portions of a survey indicating 39 out of 1000 agreed that putting a limit on settlements was an issue for Albertans.

Donahue, a practising lawyer in Calgary with 39 years of experience, although none in auto insurance or personal injury law, was engaged because of his long experience in providing policy, strategy and legal advice to government departments on troublesome files that involve policy and strategy. Donahue was to provide an external look at issues, frame the issues and prepare a strategy to address the issues to present to Caucus.

Renner and Gartner discussed with provincial officials the alternate models in different provinces and their experience with claim costs and premium stability. The universal message was that it would be impossible to control insurance costs or premiums unless soft tissue general damages were controlled.

Renner testified that the purpose of the reform was to make the cost of insurance more affordable and to pass the savings onto the consumer.

A strategy group (SG) was formed including the Deputy Minister of Finance, an official with the department and an economics professor to contribute to the work.

Donahue was informed that escalating premiums were troubling Albertans and were an issue in New Brunswick, Nova Scotia, Prince Edward Island, Newfoundland and Ontario. The perception was that premiums were higher in Alberta than Manitoba and Saskatchewan. He could not recall if the SG had information in May 2003 that insurance premiums for auto policies were lower in no-fault jurisdictions than full tort jurisdictions.

The Deputy Minister gave guidelines to the SG as to what options were to be considered and recommended to Caucus. SG would look at presentations and discuss issues being directed by the Deputy Minister or the Superintendent.

The SG was largely looking to reform to solve the problem of young drivers finding insurance unaffordable and to reduce premiums that were unacceptably high for some drivers without making other drivers pay those costs. In assessing how to do so, the SG considered the models in Saskatchewan, British Columbia, Québec and the existing Alberta model.
Renner and Gartner conducted a cross country tour. They met with the Saskatchewan Minister responsible for insurance and SGI officials. In Manitoba Renner met with MPI and Gregg Hansen, president of Wawanesa Mutual Insurance Company (Hansen). In Toronto Renner met with an MLA responsible for government review. In Nova Scotia he met an insurance advocate appointed by the government. In Ontario he was told that deductibles have not been a solution because after implementation they had to increase the amount shortly thereafter. His impression was that the judiciary reacted to deductibles by increasing the general damage awards.

Manitoba and Saskatchewan advised that their provinces implemented no-fault regimes primarily to solve the cost problem presented by soft tissue injury damage awards. Québec also had a no-fault system. The Maritime provinces were considering alternatives. British Columbia indicated it controlled claims more effectively because ICBC was a sole provider and defended all claims aggressively. None had implemented general damage injury claims caps to that date.

In the cross-country tour to Gartner’s recollection no public concerns about traffic injured not getting proper treatments by health professionals were raised.

The SG did not consider a government subsidized insurance scheme due to:

- the significant costs to establish;
- the increased economic risk;
- the possible dislocation of jobs;
- the fact that GOA was not in the business of being in business;
- the transition issues to a public sector environment; and
- its view that the private sector with appropriate regulations was the more appropriate provider.

The SG identified there was a cost to eliminating the legal rights and creating a no-fault system but it would have the advantage of treating all traffic injured equally.

Despite awareness that it would provide consistent and thus equitable predetermined benefits, would simplify and speed up administration of claims and reduce administration and litigation costs, Renner did not endorse the no-fault model and noted (in Québec) consumers had to purchase insurance from the government for bodily injury claims and property insurance from private insurers.

Despite the advantages of predetermined benefits, ease of administration and reduced litigation and investigative costs, the SG rejected the no-fault model because it would entirely eliminate existing legal rights.

The SG did not consider the no-fault option or perform a formal cost benefit analysis as it felt Albertans would not be comfortable to give up the right to sue a wrongdoer. Donahue could not recall what comparisons were made as to the nature of coverage respecting costs and benefits.

The SG considered and rejected hybrid models which involves a choice between no-fault and tort, or combined the two. Saskatchewan could be considered a hybrid system with a tort option. The SG noted the first offered consumer choice but would be costly to administer or run concurrently and would risk cross subsidization.

Renner rejected the Saskatchewan model, concluding it would be costly to implement a no-fault model and then administer two systems concurrently. It also seemed to require
government intervention to ensure no cross subsidization among policyholders within the different systems.

The second hybrid model would require purchase from two different providers. It was presented as one option but was not preferred. Renner did not recall any formal cost benefit analysis of this model.

Renner favoured reforms that would produce reasonable entry-level premiums incentives for safe drivers, penalties for drivers with accidents and violations and regulation of awards for certain injuries.

The GOA asked the Alberta Civil Trial Lawyers Association (ACTLA) and Insurance Bureau of Canada (IBC) to recommend a joint solution for automobile insurance reforms which the GOA would seriously consider. However, ACTLA and IBC could not agree on several major issues and thus issued separate responses.

The SG prepared a presentation to Caucus including the no-fault option.

With advice of the SG, Renner and the MF returned to Caucus with three options for consideration:

a. a revised tort system with a deductible or cap on pain and suffering awards for minor soft tissue injuries and a benchmark premium for basic coverage varied only for driving record, class of vehicle and geographic territory;

b. a no-fault system that set predetermined limits for benefits for economic losses, limited payments for non-economic losses and prohibited or severely restricted the right to sue an at-fault party. (like Manitoba); and

c. a combined tort and no-fault system which the government regulated or possibly delivered no-fault injury benefits with the right to sue for property damage maintained under a tort system. (like Québec)

On July 7, 2003 Caucus accepted Option (a) and directed formation of an implementation team (team) to develop plans for the policy option. Caucus gave permission to cap non-economic soft tissue injuries although advised Renner was not certain it would be necessary. Renner and Donahue were appointed to co-chair the team.

The GOA never surveyed the public on whether there was support for a cap on general damages or other restrictions on recovery.

Donahue was advised to proceed with an implementation plan and present it in the fall. A team was established on July 11, 2003.

The team consisted of Donahue, Renner, Brian Kapusianyk, Hansen, Nick Geer, Shelley Miller and Alain Thibault. Messrs. Hansen and Thibault were insurance company executives. Mr. Geer was the then CEO of ICBC. Kapusianyk and Miller were lawyers from Calgary and Edmonton respectively.

Gartner’s office created the auto insurance reform policy framework terms of reference as it interpreted Caucus’ direction.

The team was given a draft auto insurance reform implementation plan dated July 16, 2003 along with briefing and background material pertaining to the Alberta insurance system, the process for rate setting, the FA, the Motor Vehicle Accident Claims Fund, a summary of other Canadian auto insurance systems, complaints received by the GOA, an analysis of media coverage, submissions from ACTLA, and IBC, information about reviews from Nova
Scotia, New Brunswick and Ontario, numerous independent studies and a summary of Alberta whiplash award decisions rendered between 1992 and 2002.

The issues to be addressed were those that related to minor soft tissue injuries and the cause of rising premium costs.

The consistent message was that the problem of long-term insurance premiums would not be solved unless the issue of minor soft tissue injuries was resolved. The team was to examine reforms either by way of a cap or a deductible imposed by regulation.

The team was also given other material Renner and Gartner collected from their cross Canada tour, the 1991 AAIB report, and the Supreme Court of Canada Trilogy of cases, to assess the question of whether court awards for minor injuries were equitable considering catastrophic injuries, though indexed for inflation, were capped.

The team also received a memorandum indicating other provinces were proposing to regulate non-pecuniary damages, and a memorandum from Miller comparing the merits of a cap against a deductible considering the experiences in Australia and Ontario, which led to the conclusion that a deductible would not be pursued.

After review of the materials it was clear that reform to all aspects of auto insurance would be required, premiums would have to be balanced against claims costs and reforms would have to consider the long-term viability of the auto insurance industry.

The team began work in August 2003 to identify and cost options for Section B benefit levels and for limitations on pain and suffering awards. It retained KPMG and Mercers to provide actuarial services.

KPMG was retained to advise what average premium would be required in Alberta to align it with other provinces and then calculate the reduction required to achieve the Caucus policy directive. The number was between $200 and $250 million.

KPMG analyzed closed claim surveys in 2001 in Nova Scotia and New Brunswick and concluded claims for minor injuries constituted 78% of the total amounts paid for all bodily injury claims. It applied then existing definitions from the Maritime provinces and Ontario. The team concluded that information would be reliable, very similar to an Alberta study, and so performing an Alberta closed claims study was unnecessary.

KPMG found significant savings could be obtained from caps and deductibles.

Renner knew from the actuarial calculations the amount of savings desired, i.e. between $200 and $250 million, and had a general idea of how to achieve it.

One of the main reasons for the reform was to reduce premiums especially for young drivers, seniors and FA candidates. The team considered whether it would be acceptable to take money saved by capping and use it to reduce premiums for young drivers. Raising premiums for all Albertans would not have been acceptable.

The team considered whether it was reasonable to treat minor injury claimants differently. As a trade-off, it favoured medical benefits to help expedite the recovery and evolved
treatment protocols so they would not have to fight for insurance payments. They had entitlements such as increased Section B benefits that others did not have to enhance their ability to recover and reduce the number of injured overall.

The team consulted with various service providers and interest groups. The potential for a cap was the subject of much public discussion. Gartner considered the main aspect of the debate was the insurance industry demanding a cap and trial lawyers rejecting any cap being imposed.

The team vigorously debated the issues. Not all agreed on the contents of the reforms or the policy direction of Caucus, but concluded a cap was the more appropriate option.

Donahue thought the $4,000 cap figure was a starting point provided by AF. He could not recall if the team had any input into that starting point or whether it was appropriate but said it did turn out to be the endpoint.

In 2002 AF had prepared draft legislation which included several of the reforms suggested in the 1991 AAIB report. The draft became known as Bill 33, although it was not proceeded with.

The team was directed to cost various items of the Bill 33 reforms but not to present a formula and create a cap. It was asked to determine the amount that would be saved by imposing a $4,000 cap and how much would be saved by imposing the Bill 33 tort reforms.

KPMG was asked to estimate the net savings with the cap of $4000 for minor personal injuries, increased accident benefits from $10,000 to $50,000 and implementation of the Bill 33 tort reforms.

KPMG applied definitions from the Maritime provinces and Ontario which were not ultimately the definition used in Alberta.

Gartner said the lion’s share of the savings was intended to be generated by the cap.

Approximately 10,000 claims would fall below the cap. Those 10,000 would generate roughly $200,000,000 in savings. This process would produce an average of $20,000 for each minor injury victim. On average 50% of Albertans would save an average of $150 on their auto premium. Capping minor injuries would treat those 10,000 Albertans differently but also by enlargement of the Section B benefits had made those benefits more accessible to those Albertans.

On August 13, 2003 a memo to the Agendas and Priorities Committee (APC) said that general damage awards for less serious injuries would likely need to be regulated. No mention of soft tissue injuries was made. The team proposed to define “major injuries” by specifically listing certain injuries as “major”. Any injuries not included in that list would be designated as “minor injuries” and would be subject to the legislative cap.

Dr. Larry Ohlhauser (Ohlhauser) helped create a list of major injuries.

SPC disagreed with the August 13, 2003 approach to APC and directed a specific definition of what was a minor injury. SPC wanted more dollars involved in the decision and information as to who would be affected. The SPC sought to secure cost savings from other than major injuries and did not want the cap to unintentionally affect certain injured persons.
In September 2003 Ohlhauser was asked to find certain medical terms to develop regulations dealing with motor accident soft tissue injuries. He advised that most (80% to 90%) minor injuries such as strains and sprains, if properly treated, would heal in three months.

Ohlhauser reported that the assessment and diagnosis of treatment of some minor injuries have been inconsistent and there was no effective patient-focussed process for reassessing injuries for those who did not recover in the expected timeframe. He suggested that guidelines for consistent diagnoses and treatment of these injuries would help improve injured persons’ recovery.

Ohlhauser was retained to assist to develop a process to help Alberta traffic injured to recover more quickly and effectively. However, Ohlhauser’s work surrounding the treatment for different category of injuries was contentious among the health professionals.

After consultation with victims, lawyers and other stakeholders, the team developed proposals to present to SPC on October 15, 2003.

Renner recalled one of the difficulties with soft tissue injuries was determining when they had resolved and a discussion as to whether minor injury should be determined according to the time it takes to heal. That is why they designed treatment and diagnostic protocols.

Ohlhauser’s proposal had a significant impact on the policy.

On October 15, 2003 the Minister’s Report to SPC referenced a cap on claims. The intention was to cap less serious injuries.

Renner presented reforms designed to reduce premiums and increase accident benefits funded by the savings from the proposed cap and the Bill 33 tort reforms. Renner also proposed guidelines for health practitioners in assessing injuries and treatment protocols that would not require prior approval of the insurer.

To that point Renner had proposed listing designated injuries so that anything not designated would be a minor injury.

Ohlhauser provided input to Renner’s presentation to SPC on October 15, 2003.

At the SPC meeting, discussion with 25 to 30 Legislative members as to what should comprise minor injuries resulted in a consensus that they should consist of sprains and strains.

SPC did not agree to implement the proposed plan. It wanted a clear definition of minor injury. It wanted to address a process for defining minor strains and sprains, options to answer concerns about territory risk rating, a communication plan to the public and stakeholders for feedback and determining optional insurance to cover lower awards for minor injuries.

SPC asked Renner to specifically define what injuries would be considered minor and subject to the cap.

Ohlhauser was asked to organize a group of healthcare professionals to develop guidelines for diagnosing and treating minor injuries. Gartner was asked to look at other initiatives to reduce the incidence of injuries, particularly in relation to traffic safety.

The initial proposed minor injury definition was a sprain, strain or flexion extension injury to the spine that resulted in a functional limitation of not more than 18 months.
Ohlhauser’s working group did not support the 18 month limitation on the proposed minor injury definition. He recommended WAD I, II, and III (whiplash associated disorder) be included in the definition. 

At meetings on October 15 and 27th 2003, participants agreed that a minor injury should be something the average person would understand as a minor injury but with the legal definition.

On October 27, 2003 Ohlhauser attended a further meeting with SPC. 

SPC decided as follows:

a. the priority was to take care of traffic injured as the primary goal irrespective of any changes made to save money on the premium side;

b. Renner was directed to prepare a definition of minor injuries;

c. there should be recommended a process to define what would be minor injuries;

d. a protocol should not be developed until minor strains and sprains were defined; and

e. The Minister was to establish a process to define minor strains and sprains, address concerns regarding territory risk rating, establish communication process and determine if optional insurance could be provided to cover low awards for minor injuries.

The team began to look at the soft tissue injury definition but then a scare campaign was initiated that the GOA was going to cap all claims in the province. It then had to define for Caucus what was its original intent.

Donahue was not sure how it was arrived at but a draft definition was drawn based on something taken from the first SPC meeting, along with the definition of major serious injuries, because Caucus was responding to media reports that caps were to be applied to permanent injuries.

The definition became very important to SPC and evolved several times due, in large measure, to feedback from SPC, stakeholders, insurers, legal industries, consumers and victim groups.

SPC directed the team to stop advising what was not included in the definition but to include what was.

On October 30, 2003 Cabinet approved regulations to freeze premiums retroactively in order to stabilize premiums until the implementation plan was completed.

There was still a huge media campaign about minor injuries and increasing premium costs. Insurers were still applying to the AAIB for premium increases.

Gartner asked the AIRB to analyze the financial effect of the premium freeze.

The rate freeze took more funds out of the premium side and impacted some of the numbers examined but not the recommendations. Some of the recommendations were not contentious and were implemented sooner which resulted in some additional savings but mainly the insurers were required to absorb the cost of the freeze and were unhappy about it.

The AIRB responded that the effect of the rate freeze was to produce $25 million in premium reductions for the last two months of 2003 and $100 million for 2004. As a result of the rate freeze, Gartner said he had to come up with at least $125 million worth of savings to offset
the cost of the freeze. It was harder to show at the end of the process what all of the savings would be.

The GOA discussed how to compensate insurers for the loss of revenues resulting from the freeze. The freeze was a short-term item funded in part by the early proclamation of Bill 53 with collateral benefits and tax rules plus freezing of the health levy which paid for it in part.

The net cost after mitigating measures would be funded by the insurance industry. The intent, after the mitigating factors were applied, was to leave to the industry to finance the rest of the freeze. It was not a consideration that insurers impacted by the freeze order would recoup their losses through the cap.

The Cabinet briefing on November 3, 2003 indicated that minor strains and sprains that heal quickly will be the only injury subject to the cap and the definition will be developed in consultation with organizations representing injured persons, consumers, insurers, lawyers and healthcare professionals. Cabinet directed outstanding issues return to SPC for final recommendations to Cabinet.

The actuaries could not confirm the purported savings of each of the latter proposals.

On November 3, 2003 SPC decided to include under the cap minor sprains and strains that heal relatively quickly. Reference to serious injury not expected to improve and the term “permanent” was specifically excluded.

SPC did not want to prohibit a bona fide case of an apparent minor injury that did not recover as expected from clearing the cap. It did not want the definition to include a time period for complete recovery. SPC realized there would be grey areas and wanted to leave it to the courts to determine what were ‘normal activities’. A broken bone healing within a year would not be subject to the cap. A WAD injury with symptoms after 18 months would not be within the cap and would depend on court interpretation.

The team continued to meet with stakeholders.

The ultimate definition was continually restricted by Caucus and so the cost saving was continually reducing. The cost saving reductions reduced the number of persons affected by the cap because the object was if an Albertan had a minor accident the impact should be as minor as possible.

Gartner requested Ohlhauser provide advice as to the definition of “minor injury” and to develop protocols and guidelines for diagnosis and treatment to improve their prognosis.

Ohlhauser met with the team on November 7, 2003 and discussed the definition of minor injury.

Ohlhauser conducted a literature review, engaged professionals and representatives of healthcare groups, proposed a model for consideration and enlisted a core working group to provide input as to the diagnosis and treatment of all soft tissue injuries. He interviewed clinicians experienced in treating soft tissue injuries and interviewed others. He prepared a presentation for meetings with consumer and injury groups including insurance and legal.

After receiving feedback from IBC and WCB Ohlhauser determined that an evidence-based approach to diagnosing and treating whiplash injuries was consistently advocated. There was a wide variation in recovery times for WAD injuries in different circumstances and countries.
It was important to identify those less likely to recover quickly and uneventfully by referring to certain alerting factors. Once identified, those persons would more likely require multidisciplinary assessment and treatment by an inter-disciplinary rehabilitation team.

The object was to reduce the numbers of persons complaining of chronic whiplash symptoms. Improved recovery time could occur if care was managed properly which included making an accurate diagnosis, an appropriate injury treatment plan and identifying early the poor prognostic factors.

Around November 17 2003 a Ministerial Report referenced the definition with functional limitations lasting no more than 18 months. Renner, although involved in discussions, did not draft the report but agreed that a time element was part of the consideration at that time.

On November 17, 2003 the SPC considered a more specific definition for minor injury sprains and strains. Ohlhauser discussed the definition, said it was a work in progress and the development of diagnostic criteria would be finalized later.

The SPC accepted the suggested reforms and approved the recommendations for a more specific definition of minor injuries that became restricted to strains, sprains and flexion extension injuries to the spine.

The SPC accepted a revised report on November 17, 2003.

On November 18, 2003 Cabinet agreed to implement the auto insurance policy framework except optional insurance for pain and suffering coverage.

On November 19, 2003 a press release indicated the minor injury compensation limit of $4,000 would be restricted to minor strains and sprains and the reform package would save $250 million.

On November 24, 2003 Bill 53 was introduced to the Legislature.

On November 27, 2003 Hansen resigned from the team stating he did not want his name to be associated with Bill 53. Many insurer executives expressed displeasure with the reforms.

On November 27, 2003 Ohlhauser met with Dr. Ferrari and reviewed other compilations including the Québec Task Force Report which had a useful classification system for grading whiplash associated disorders and enhancing communication between practitioners and insurance regarding the patient condition.

On November 28, 2003, Gartner, the Deputy Minister and Donahue met with insurance industry members.

The team was the disbanded in November 2003 and a new transition team was established.

Bill 53 was passed on December 3, and received Royal assent on December 4, 2003. (the Insurance Amendment Act, No. 2. S.A. 2003, c.40.)

On December 11, 2003 Gartner met with insurer chief executive officers to discuss their concerns with the benchmark premium system. They proposed an alternative to the benchmark system which was approved by the transition team and SPC.
The team continued to meet with stakeholders and discuss reforms and development of the definition which contained an 18 month time limit for recovery of sprain, strain and flexion and extension spine injuries.

Health professional groups Ohlhauser consulted said an 18 month time limit was not supported from a medical standpoint and the type of injuries contemplated by the cap would usually resolve far sooner. They wanted a diagnostic approach rather than an approach based on artificial time barriers.

The transition team concluded the result would undermine the goal of early and effective recovery through protocols and preapproval of Section B benefits.

Ohlhauser met with the core working group which originally included members of the Colleges of Physicians and Surgeons, Physical Therapists, and Chiropractors of Alberta, the Alberta Association of Occupational Therapists, Alberta Medical Association, Massage Therapists and Psychologists Associations. Their object was to understand the context of developing the “minor injury” definition, agree to a process to develop diagnostic criteria and treatment protocols, finalize the definition of minor injury and improve the Section B benefit processes.

On December 15, 2003 Ohlhauser advised that the 18 month timeframe was not consistent with the natural healing process or medically supportable and the subject injuries generally resolved prior to that time period. He recommended removal of the temporal limit and replacement with a reference to functional limitation.

Ohlhauser said the priority of healthcare providers should be to focus on assisting quick and effective recovery and any dispute resolution process dealing with entitlement to damages should be set out in a separate regulation to involve practitioners other than those providing the care to the injured person.

On December 15, 2003 the proposed definition of minor injury was examined in a meeting with the transition team. The definition was discussed between January, February and March 2004. Sprains, strains and WADS were singled out because KPMG warned that if they were not dealt with, premiums would not be stabilized.

Originally “minor injury” included contusions, minor concussions and fractures but those were eliminated after meetings with full Caucus. The SPC continued to limit the definition further than those in New Brunswick and Nova Scotia. When Caucus was informed the savings would not result, Caucus moved the focus from savings to the proper definition to reduce the impact as far as possible and not relate it back to savings.

On December 17, 2003 Gartner advised all licensed insurers in Alberta of a new Fair Practices Regulation put in place to prevent unfair market practices such as the requirement of a lawyer to notify an insurer of a retainer in respect of a claimant and the requirement of the insurer to disclose to the lawyer the policy limits of the insured’s policy.

The transition team of Renner, Donahue, Kapasianyk, Gartner and AF and Department of Justice officials continued to develop the Premium Regulation and Minor Injury and Treatment Protocols Regulations and to implement the reform plan and oversee the transition up to June 2004.

Ohlhauser met with the core working group, and received feedback and responses from stakeholders to a draft of the continuing
care model. He met with representatives of Peace Hills Insurance Company which suggested the injured person have access to physicians for diagnosis within 2 to 3 days of the loss, treatment to be in accordance with internationally accepted practices and over treatment by clinics must be avoided. He provided the traffic injury recovery chart which identified three levels of claimants grouped according to recovery time.

On February 18, 2004 Ohlhauser presented to the transition team the most recent version of the injury management system he developed and a process for development of the diagnostic and treatment protocols.

After drafting the Minor Injury Regulation (MIR), relying on advice from Ohlhauser, the transition team sought comments from the insurance industry and ACTLA. The team consulted with interest groups, disseminated regulations to various organizations and received numerous responses. The insurance industry objected to various aspects of the reform.

On March 3, 2004 Ohlhauser met with his core working group which agreed in principle with the process for diagnosing of injuries in categories of WAD injuries. They and other consulted experts supported the notion of early access to practitioners to receive an appropriate diagnosis and effective treatment and advocated early recognition of individuals who had alerting prognostic factors that would likely give rise to chronic problems.

Since Ohlhauser knew some practitioners may not have the interest or skills to effectively manage the injured person, he introduced the concept of an injury management consultant to provide early consultation where diagnosis was in question or the person was not progressing as expected. He concluded if those persons could be early identified, they could be moved out of the protocols into a multidisciplinary assessment process using the biopsychosocial model to address factors.

In April 2004 Ohlhauser provided a draft of the minor injury regulation for comment. He received feedback from IBC, CBA and ACTLA.

On April 20, 2004 Renner presented to the SPC an explanation of the draft minor injury regulation, diagnostic and treatment protocols (DTPR), accident benefits and insurance grid regulation. Ohlhauser presented the injury management system.

Ohlhauser advised the SPC of the steps to be taken if the patient has not fully recovered by 12 weeks. The injury management consultant could provide early consultation before that and after assessment recommend multidisciplinary assessment or interdisciplinary rehabilitation.

The target outcome for sprain, strain and WAD I and II injuries was expected to be 90% by 12 weeks, if properly managed treatment and care following the DTPR. Potential barriers would include the patient not participating in the recovery, the practitioner not following protocols, and lack of further support by insurers in a timely manner for the multidisciplinary assessments in rehabilitation when requested by the practitioner.

The SPC approved the Grid regulation on April 28, 2004.

At a meeting on May 4, 2004 the remaining regulations were deferred. Between this date and the next meeting certain service providers wrote to object to the proposed regulations.
On May 27, 2004 the SPC agreed to recommend Cabinet approve the following four regulations:

a. **Minor Injury Regulation**;

b. **Diagnostic and Treatment Protocols Regulation**;

c. **Accident Insurance Benefits Regulation**; and

d. **Insurance Grid Regulation**;

subject to some wording variation to allow public insurers into the marketplace, to establish a review committee to monitor the implementation of regulations and to include traffic enforcement and safety initiatives as part of the package.

Renner said the original purpose of the reform package was to benefit individual Albertans who were paying too much for their premiums and not being treated properly for their injuries. He left the file in May 2004.

On June 21, 2004 Cabinet approved the regulations which became effective October 1, 2004.

During 2004, AF prepared to implement the reforms and an interpretive guide for calculation of the grid premium. Two insurers were asked to assist in drafting the premium regulation which turned out to be a controversial process.

After the regulations were passed on June 21, 2004, Ohlhauser worked with staff of AF to address implementation issues as to the time to educate practitioners, develop and distribute interpretive materials and prescribe forms and develop qualification standards for injury management consultants and certified examiners in clarifying final procedures.

The **Diagnostic and Treatment Protocols Regulation** stipulated that it would be reviewed at least every two years. Three working committees met regularly from October 2004 to April 18, 2006. Ohlhauser was the main architect of the protocols that finally appeared in the regulations.

After claimants have exhausted the initial set of treatments, they are entitled to continue to receive medical benefits under Section B unless the insurer asks for an independent medical assessment and that assessment determines the treatments are no longer required. The initial set of treatments are paid directly by the insurer with no requirement of insurer approval.

The Alberta Insurance Rate Board (AIRB) (successor to AAIB), sets the Grid premium on an annual basis which operates as a maximum to be charged for insurance in a particular category.

Population of FA fell and AF expected FA’s market share to continue to decline. Convictions for uninsured driving had grown by 18% from 2000 to 2003 but had fallen by 10% from 2003-2005.

There have been no Alberta closed claims studies between that in 1991 and report of Ms. Barb Addie in 2006.

The elements of the reforms were balanced as to cost and policy. The policy balance was conducted at the level of the transition team and, ultimately, the elected officials.

The government considered but did not proceed with the DTPR for injuries other than those covered by current reforms.

During the development of the minor injury definition and protocols there were consultations from certain insurers, IBC and ACTLA for feedback. Gartner admitted that the insurance industry, the trial lawyers, IBC and the brokers considered the consultation was
inadequate. At the date of his testimony he concluded there was much consultation, his view was the consultation was adequate and more would not have resulted in consensus.

The GOA imposed an “all comers rule” which, except for a small portion of the market, requires all insurers to sell market insurance to any applicant.

The effect of the Grid regulation and the “all comers rule” is that all drivers are entitled to a capped rate which is either the insurer’s rate or the Grid rate set by the premium regulation. If the insurer does not want to provide insurance to an applicant, it refers the applicant to the risk sharing pool which was operated by the FA. The small portion of the market which is the exception is referred to as the “residual market” which is clearly defined in the regulations and provides that drivers with convictions or at-fault accidents pay the higher Grid rate. The FA continued to pay claims beyond 2004.

A review of the protocols was completed by October 2006 and provided to the Minister. At the trial date the GOA had no information as to whether there had been an improved cure period for minor injury victims from the reforms.

Since the cap was implemented, the health levy had gone up, premiums have gone down and no other funds have been injected into the system to fund increases in the health levy other than premiums.

GOA had not performed any calculations as to the amount of savings attributable to the application of the cap from April 1, 2005 to March 31, 2006.

Since implementation of the reforms, Albertans have seen reduction of premiums through the effect of the premium freeze, mandated reductions and the impact of the Grid system. The insurance rate deductions decreased compulsory auto insurance premiums by 15%. AF had received few complaints from customers about unaffordable premiums, inaccessible coverage and unfair treatment by insurers.

AF was never able to determine whether auto insurers have been profitable as a result of their Alberta operations. No actuaries analyzed whether the protocol treatments added any costs to the system.

The GOA never performed an analysis as to the cost of benefits added back into the system for minor injury claims or the extent to which enlargement of Section B benefits would benefit the minor injury victims who would heal within 10 weeks of their accidents.

Testimony of Medical Experts

The medical experts identified a number of ways that the existing tort system fails to promote healthy outcomes for the traffic injured:

a. adversarial dealings with insurers could aggravate stress and trigger unwanted negative psychological reaction;

b. patients would benefit from removal of that adversarial relationship for a period of time;

c. traditional compensation procedures are prolonged and highly frustrating for victims and do not promote good early treatment but often delay specialist care;

d. innocent victims considered the compensation system did not seem sympathetic. They found it unpleasant to go through a court experience. Their encounters with the legal system did not give them the apologies, concern or sympathy they felt entitled to;

e. their frustration related to the slow and arduous process, conducted in a way that conveyed no sympathy, even if liability was
admitted. They were frustrated with the long time it took to settle and settlement was generally seen as a relief;

f. it was not the money that it was important because it did not get them back to their pre-accident state but concerns were pecuniary losses which caused the difficulties and delays in obtaining recompense for them;

g. traffic injured want to get back to normal and are upset by obstructions and delays. It is the injury and disability that caused the distress, often exacerbated by legal procedures;

h. outcomes for chronic whiplash patients may be adversely affected by getting involved in the legal process;

i. likely the entire litigation process, often drawn out for years, may be an adverse factor and removing an interest or a convenience for pursuing of litigation process may actually reduce (numbers of) chronic care patient;

j. a change in the compensation system that makes compensation an automatically brief process would be helpful;

k. traffic injured are blameless in respect of the conscious choices they make following a collision in ways that lawyers, therapists the media, and others encourage illness behaviour that is, at best, maladaptive and at worst, grief driven;

l. studies showed that being in litigation can affect a person’s health; and

m. many subjects said money was not the most important issue but rather they wish those responsible showed awareness of their suffering.

The medical evidence emphasized the importance of early treatment under well-designed protocols to optimize recovery from whiplash injuries:

a. the type and intensity of clinical care initiated in the first month after the injury is associated with the rate of recovery from whiplash injuries;

b. whiplash patients are one of the highest users of the healthcare system and such open ended and infinite possibilities feed the current state of excess expenditure;

c. these injuries were very expensive and warranted research and investigation into the protocols;

d. evidence supported early immobilization, early return to normal activity, early exercise and multi model treatment for acute whiplash. Data also showed multidisciplinary biopsychosocial rehabilitation with a functional restoration approach improves pain and function;

e. well-designed early interventions to provide information and psychologically and behaviourally informed advice can be valuable in improving satisfaction and outcomes; and

f. routine clinical care of WAD disorders is generally in line with the recommendations of the Québec Task Force.

Evidence on Comparative Accident Compensation Models

Dr. Michael Trebilcock (Trebilcock) was qualified as an expert on and gave evidence about current comparative Canadian/American accident compensation law.

Trebilcock explained there are three theoretical classes of substantive values in discussing tort law and its alternatives, namely, individual responsibility, distributive justice, and affordability. He defined these values in the following terms:
a. Individual responsibility stresses deterrence and corrective justice and evaluates reforms in terms of whether it provides incentives to reduce accident injury. It also emphasizes imposing responsibility on drivers’ morally culpable behaviour for violating individual autonomy and to restore the injured person as far as possible to pre-injury condition.

b. The distributive justice perspective views accidents as an inevitable by-product of urban society and does not expect tort economic incentives to impact accident causing behaviour or expect corrective justice components will affect behaviour because of the very existence of automobile insurance. This perspective argues that accident costs should be broadly spread to a general class of activities and horizontal equity requires that all persons similarly financially impacted should be similarly treated.

c. This means that alternatives to tort should be evaluated against the capacity to spread risks and provide meaningful compensation or low-cost insurance expeditiously to traffic injured to minimize the financial impact on their lives and to facilitate rapid and effective rehabilitation.

d. In tort compensation models, first and third-party automobile accident insurance is compulsory up to some minimum coverage floor and insurance costs are an unavoidable cost of driving. Cost will be of significant social importance given its potential regressive impact on low income drivers and its impact on physical mobility which is important in economic and social relationships. For those to place a high value on this objective, auto compensation models that minimize private and social transaction costs, and as a result the premium costs, are most attractive.

e. Auto insurance compensation systems must balance these three classes of values which means trade-offs are necessary.

_Trebilcock_ outlined the comparative compensation systems with these comments:

a. In the United States nearly half of the states adopted compulsory no-fault models while the others retained a traditional third-party tort model. For those that adopted compulsory no-fault models, most were threshold systems that precluded a tort suits below a defined threshold, either monetary or verbal.

b. Those threshold models which are verbal relate to the severity of the injury. These models are vulnerable to medical expense padding to surmount the threshold and the effects of inflation. Some no-fault models have add-on regimes that provide first party no-fault benefits in addition to tort entitlements. The no-fault benefits vary widely between the various threshold and add-on regimes. In all U.S. threshold models claims for non-pecuniary damages below the verbal or monetary threshold are prohibited. This pattern is replicated in Canada.

c. Alternatives to the traditional tort model in automobile insurance context entail either a supplement or a replacement of tort. Elective choices schemes are more complex and adopted only in a small number of jurisdictions. Each option has many variations in theory and practice.

d. As to the trade-offs necessary to balance the three classes of values, the need to contain administrative costs and premium increases to acceptable bounds may elevate affordability to a higher priority over the abstract notions of distribution of justice or deterrence.
As to the achievement of the goal of individual responsibility/deterrence Trebilcock noted that:

a. Early studies of the Québec pure no-fault system indicated an increase in accidents which was attributed to the flat rate premium structure initially adopted which permitted certain high-risk drivers previously priced off the highway to continue to drive. Thus on this evidence, the tort model would achieve the deterrence goal better than a pure no-fault model.

b. The goal of corrective justice is well achieved under tort in that most auto victims with valid claims actually bring claims and achieve compensation, however, it did not well serve the other feature of corrective justice goal because there was overcompensation of many small claims and undercompensation of many large claims. Threshold, add-on and elective models insulate negligent drivers from costly consequences of their actions.

c. A 1991 Rand study reported that under traditional tort, traffic injured with economic losses less than $5,000 received compensation from all sources that averaged 2 to 3 times their economic losses while injured persons with much higher economic losses such as $10,000-$25,000 received compensation equal to just half of their economic losses.

d. The same pattern appeared from a 2001 study which found that 61% of claimants claim for only soft tissue strains and sprains and receive 39% of the total settlement amounts and 61% of total settlement amounts were for pain and suffering.

e. A 2005 Newfoundland Public Utility Board (NFLD PUB) study found that of total claim payments, 60.4% were for pain and suffering and 74% had at least one injury described as a sprain or strain of the neck, back or other area or a knee or shoulder injury and these claimants received 56% of total settlements. The NFLD PUB concluded that while most options did not lower insurance premiums, a higher deductible limit resulted in the greatest estimated savings for consumers.

f. A Nova Scotia closed claim study of 2002 found that 67% of total settlement amounts were for pain and suffering and 70% of claimants claimed only for soft tissue strains and sprains of the neck, back or other body parts and received 56% of total settlement amounts.

g. An American authority stated that automobile claims mostly constitute claims for soft tissue injury such as sprains and whiplash. These injuries are the most difficult to diagnose and at the same time there has been a drop in objectively diagnosable hard injuries such as broken bones. In tort, claimants seek to maximize their litigation recovery and the magnetic pull of potential tort awards is seen in the ratio of soft tissue injuries to hard
injuries in states with tort systems. California traffic showed about 250 soft tissue injuries for every 100 hard injuries. In Michigan the ratio is 70 to 100 because claimants have less incentive to run up medical bills.

With respect to affordability, Trebilcock said pure no-fault schemes entail the most modest premium level increases. Add-on schemes are quite costly. Threshold schemes moderate premium increases. Other no-fault schemes reflect lower administrative costs compared to tort states. Where the tort system plays a large role, administrative costs are highest because it is an adversarial system with lawyers, claims adjusters, courts and experts.

Trebilcock explained that much auto insurance/tort reform is driven by public concern over escalating auto insurance premiums. No one scheme achieves all three goals better than other models and thus trade-offs are required across all three values. He elaborated with the following points:

a. Almost all models that have adopted some form of no-fault compensation reveal that the more generous the no-fault benefits regarding medical and rehabilitation costs and economic losses, the tighter are the constraints on recovery of non-pecuniary loss, including absolute prohibitions. Trebilcock explained that this is most evidenced in worker’s compensation schemes and auto insurance no-fault systems.

b. Trebilcock then gave explanations for the need for a trade-off. One reason is the need to contain administrative costs and premium increases to acceptable bounds. Another is conventional wisdom that consumers display a lower willingness to pay for non-pecuniary damages mainly because money is less likely to replace non-pecuniary losses.

c. This trade-off is often found in no-fault jurisdictions, whether workplace or auto accidents. He noted even under tort models in Canada, caps on non-pecuniary general damages were established by the Trilogy in 1978 to the limit of $100,000 Canadian indexed to the Consumer Price Index. In this respect the Supreme Court of Canada adopted a distributive justice perspective stating that there must be some limit on non-pecuniary damages.

d. Non-pecuniary losses cannot be made good with money and money is not a good substitute for the loss. Hence, few parents buy insurance against the loss of their child’s life because even a large sum of money would not bring the child back. That is why when consumers have a choice, they do not purchase insurance for the kinds of losses that money cannot make good.

e. To keep insurance coverage reasonably affordable it must be recognized that citizens will not pay as much for insurance to cover non-pecuniary losses as they will for pecuniary losses.

f. There is a long-standing view among policymakers, including judges and academic commentators, that non-pecuniary damages are not the same as pecuniary losses.

g. Another more pragmatic explanation is that non-pecuniary losses are by definition extremely difficult to verify and quantify. It is difficult for any external body, including a court, to verify that a person’s feelings of stress, discomfort or depression exist at all, and when it does, what is the proper monetary amount for compensation? Pain and suffering may be a real loss but the issue is what money can do about it.
h. The problem of verifying its existence and its qualification introduces significant transaction costs into the tort insurance regime which translates into higher premiums and issues of affordability.

i. The transaction costs of establishing whether an injured person is off work and what are his income losses are trivial. But if the person claims headaches, depression or travelling anxiety, it is disproportionately costly to the calculation of losses to ascertain the truth of such complaints and what amount of compensation should be put upon it.

j. This problem introduces disproportionate transaction costs in a compensation system. These disproportionate transaction costs arise through the process of verifying and quantifying non-pecuniary losses relative to pecuniary losses which include the costs of lawyers, medical experts, claims adjusters, and running a court system, which are higher than the cost of evaluating pecuniary losses.

k. Most compulsory no-fault models have adopted a threshold system which precludes tort suits below defined thresholds. Thresholds vary dramatically with some monetary, relating to the level of medical expenditures typically in the range of $1,000 to $5,000 and others verbal, and relating to the severity of the injury. Monetary thresholds are vulnerable to medical expense padding to surmount the threshold and effects of inflation. As well, normal effects of inflation mean that more claims surpass the threshold even without padding.

l. Most worker's compensation schemes provide no, or very limited, benefits for non-pecuniary losses. Automobile no-fault systems reflect the same thinking which is that distributive justice ensures that all traffic injured, whether negligent or otherwise, have their pecuniary losses generously covered and, in order to make such a system affordable, requires a trade-off on the non-pecuniary loss component.

Trebilcock added these conclusions:

a. On the distributive justice issue studies show that paid claims perform better under no-fault and under tort a high fraction of claims relate to low levels of economic losses often less than $5000. Under tort minor claims are over-compensated and severe claims are under-compensated. 50 to 60% of total premium dollars go to non-pecuniary losses. From the viewpoint of distributive justice, there is no justification for such over compensation and under compensation.

b. To keep insurance coverage reasonably affordable, recognition must be given to the realities that consumers will not pay as much for insurance covering non-pecuniary loss as they will for pecuniary losses.

c. Empirical studies show that administration costs are the highest in a tort model because it is an adversarial system with lawyers, claims adjusters, courts and experts. Because the public is concerned about increased premium costs rather than the abstract issues of distributive justice or individual responsibility, the affordability issue cannot be dismissed.

d. Tort awards are a magnet for soft tissue claims and by adding these allegations, claimants and lawyers in threshold systems try to inflate the claim above the threshold and thereby double dip from the no-fault and fault benefits.

e. In summary, pure no-fault schemes entail the most modest premium levels in increases. Add-on schemes are quite costly. Threshold schemes moderate premium increases. Other no-fault schemes reflect lower administrative costs compared to tort states. Administrative costs in the tort system are
the highest, because it is an adversarial system with lawyers, claims adjusters, courts and experts.

f. The current Alberta model with the MIR is a threshold no-fault system.

**Evidence on Canadian Insurance Industry Study**

IBC undertook a study of the Alberta reform. The purpose of the study was to benchmark and evaluate the implementation of the treatment protocols. It was managed by Barbara Sulzenko-Laurie (Laurie) who was qualified to give expert evidence about the development and execution of surveys and studies to measure and evaluate health care service policy initiatives. The methodology of the study was peer reviewed and endorsed by an independent consultant.

The findings of the IBC study concluded:

a. 30% of minor injury victims were represented by lawyers. After the reform, the percentage dropped to 15.5%. It was a concern that more than 40% of soft tissue claims remained open at six months.

b. Laurie thought the 90 day target has not been achieved because the public was not familiar with the protocols and what to expect. She did not agree that a closed claim was a good proxy for recovery as many might not close their claims in fear of a flareup or were anticipating the results of the subject litigation.

c. IBC during the course of the reform suggested an 18 month cut off for functional limitations would impair full recovery and prolong medical rehabilitation treatment. Laurie agreed. She thought imposing a time limit for consequences of an accident would incentivize claimants to remain focussed on their injury condition as opposed to recovery and return to their normal activities.

d. Laurie considered the rewards of the tort system encouraged claimants, their legal representatives and medical rehabilitation providers to prolong the recovery and to transform an injury into one requiring more complex care and a significantly longer duration. That condition can develop if appropriate care is not provided at the outset including appropriate education as to the nature of the condition.

e. IBC viewed the basic definition of minor injuries as too narrow and avenues created for escaping the definition were too easily crossed to serve the purpose of limiting non-pecuniary awards. Laurie recommended other injuries to be included in the minor injury definition such as contusion, lacerations, chipped teeth and the like.

f. IBC was concerned about meeting the objectives of the reform. One component of the reform had to do with reducing premiums. Another had to do with erecting a grid to protect drivers from high rate increases regardless of their experience. Another element of the reforms was to increase the maximum for no-fault benefits. All reform elements had to fit together.

g. IBC was concerned that permitting the number of self-limiting minor injuries to be treated as non-minor would increase the opportunities for stacking the awards. Although the reforms had not achieved 90% recovery in 90 days, the changes since the reform were already dramatic. There was much academic evidence that chronicity of conditions is often due to pending legal proceedings involved. This is a factor in prolonged, delayed recovery.
h. After the Alberta reforms, there was a significant decline in the diagnosis of WAD 1 and other sprains and strains. There was a significant increase in WAD II claims. There were some economic incentives to diagnose WAD IIs. The numbers getting treatment in the benchmark increased from 76% to 91%.

i. While there was no difference in the rates of claims closures for the first 12 weeks, the costs of treatment were increasing. Although the numbers of treatment were not increasing, price per treatment was increasing. Claims closures in 26 weeks were substantially increased. 30% of claims were closed in six weeks and 60% of claims were closed in the second post reform study. The rate of disability claims fell from 17 to 11%. The evidence of disputing cases declined from 20% to 7% in the second post reform study.

j. Closing a file does not assist recovery but is it is a consequence of recovery being impeded by legal proceedings, which could be a factor. Laurie opined that receiving a capped award of $4,000 could improve the patient outcome. She looked at the incidence of disability claims which were significantly down so suggested a relationship.

Actuarial Evidence

Evidence of some of the actuaries who testified in Morrow was discussed above. Some additional points in the evidence are outlined below.

Mr. Ted Zubulake, GOA Actuary, produced a report that said:

a. IBC studies in New Brunswick and Nova Scotia and his own study of Newfoundland and Labrador found that traffic accident soft tissue strains and sprains accounted for a high percentage of bodily injury liability claims and claims payments and most were for pain and suffering;

b. at the time the GOA was considering automobile insurance reforms, auto claims costs were increasing primarily due to higher minor soft tissue injuries;

c. in his opinion, the grid rating system, the new residual market and the risk sharing pools would help insured drivers be provided with insurance at predicted premiums and would mitigate availability and affordability concerns;

d. he thought increases in Section B accident benefits for medical and rehabilitation compensation from $10,000-$50,000 would reduce bodily injury liability costs by reducing the injured person’s out-of-pocket medical and rehabilitation expenses;

e. he opined from his report and studies reviewed that bodily injury coverage financial results contributed to the insurer action between 1986 and 2004;

f. the Newfoundland and Labrador study dated March 2002 reported 67% of claims came from soft tissue injuries and sprains of the neck and back with no other injuries;

g. KPMG found that of 1441 claims of combined close claim studies, 1077 were for minor injuries which constituted 74% of the claims examined as ultimately defined by GOA; and

h. he opined that the $4,000 cap would moderate future annual increases for claims costs and bodily injury liability coverage.

Dr. Ron Miller added these comments:

a. In 2003, before the reforms were effected, claims were disappearing potentially because consumers receiving premium increases of 10% or more may have become conscious of the proposed reforms, the issue of affordability and knew that reporting an
at-fault claim would trigger a large premium increase. He had seen a similar pattern in other jurisdictions, such as New Brunswick and Ontario, showing that when there are dramatic premium increases, claims disappear from the system. He found strong statistical evidence that the third liability claims costs declined by 37%.

b. Since the reforms in January and October 2004, third-party liability bodily injury costs declined dramatically.

c. From his analysis of the Alberta experience to December 31, 2005 he thought it plausible (but admittedly speculation) that post reform some minor whiplash injury claimants were no longer motivated to seek settlement or the protocols were working as intended or both, such that claimants were exiting the system faster or not entering it. In any case this effect leads to a one-time reduction in frequency and severity for both third-party liability.

d. He thought another plausible conclusion was that if claimants and their lawyers climb the learning curve, those who had left the system may begin to re-enter it and all claimants find ways to increase compensable damages resulting in a one-time change to a positive forward trend in claims frequency and claims costs.

e. If Bill 53 and related initiatives were declared illegal, he predicted adverse economic consequences for insurers and consumers, mainly increased costs stemming from higher claims costs. There would be a one-time aggregate additional all industry claims cost to Alberta insurers at the beginning of 2008 of about $630 million or $325 per car insured.

f. There would be an aggregate number for all business classes of about $800 million. None of these costs would be recoverable from future premiums. The premiums as of 2006 would be increased by 15 to 20% without recruitment for sunk costs from prior periods.

g. Declaring the reforms illegal would put costs back in which would result in an average increase in premiums of 15 to 20%.

h. Because the $4,000 was not separated out in the Statistical Plan, he could not separate easily its effect on the results. He agreed it was plausible but did not believe the 2004 and 2005 industry profits were greatly and unnecessarily accelerated by the product reform.

Ms. Barb Addie was retained January 20, 2006 to perform a closed claim study to determine whether New Brunswick and Nova Scotia closed claim data were a reasonable proxy to estimate the impact of the reforms of 2004 being considered by the Alberta government. Her conclusions were:

a. It was reasonable to use that data to estimate the reform costs. Comparison to the 1991 closed claims study from AAIB showed that the percentage of pain and suffering was very similar among the three surveys. The underlying data were adjusted for inflation to bring them to the same point in time.

b. The study showed that 62% of claimants suffered soft tissue injuries only and received 43% of the settlement amounts. Another 29% received settlement amounts for soft tissue and another injury. 91% of all claimants suffered some form of soft tissue injury. These claims represented 93% of the settlement amounts. 71% of the total settlements were for pain and suffering.
D. Analysis Of Alberta Auto Insurance Reforms

Auto insurance reform has a short history in Alberta, driven primarily by premium instability. As current premium levels are again a policy concern, it has become clear that long-term stability will not be possible as long as bodily injury loss costs remain uncontrolled in a tort environment. In addition, recent advances in rehabilitation medicine indicate that the tort environment leads to poor health outcomes for traffic injured Albertans. Analysis of these points follows.

*Alberta Automobile Insurance Board, A Study of Premium Stability in Compulsory Insurance (September 12, 1991)*

As noted in 1991, actuarial evidence presented to AAIB showed:

- a. From 1972 to 1989, loss costs had increased dramatically.
- b. The rise in loss costs, i.e. 12.9% between 1988 and 1990, more than twice that of the Consumer Price Index, was caused mainly by the rate of increase of bodily injury loss costs.
- c. The third-party liability premium increases in 1989 and 90 were not yet sufficient to bring premiums into balance with the current expected costs.

*AAIB* key findings included the following:

- a. Claimants with minor injuries are overcompensated in the tort side of the system relative to all other traffic injured. Claimants with catastrophic injuries are undercompensated in the tort side relative to all other traffic injured.
- b. At-fault claimants are inadequately compensated for their economic losses relative to tort claimants.
- c. There were structural deficiencies in the delivery of benefits in the current system.
- d. All payments required under the current system are subject to delays.
- e. The then current data proved that there was a pricing problem in the system which would persist in the future without some measures to counteract it.
- f. Loss costs would continue to increase because of continuing increases in frequency and quantum of claims unless bodily injury costs were curtailed and effective cost saving measures were undertaken.

The Committee observes that despite the passage of three decades, the above problems identified in the Alberta hybrid tort/no-fault model remain present at this date.

Further the Committee observes that Professor Trebilcock’s testimony in the Morrow case in 2008 remained consistent with the advice he provided to the AAIB in 1991.

Accordingly, the AAIB's conclusions on the alternative models remain applicable:

- a. Cost savings would be higher under a pure no-fault model similar to that in place in Québec than would be attainable under any other model. The pure no-fault model was superior in producing lowest premium costs and would provide the highest degree of operational efficiency of all models.
b. Administrators in Québec reported a high degree of consumer satisfaction, although trade-offs were initially necessary and did not meet with approval of all groups of consumers.

c. Cost savings would be higher under the threshold model implemented in Ontario which resembled the Michigan model and had greater potential for premium savings and price stability in the long term.

d. An elective or choice model such as that proposed in 1989 to the Ontario Automobile Insurance Board would result in increasing divergence of average premiums between the two options which would cause all drivers to choose no-fault and, in effect, convert the system to a pure no-fault model.

e. The tort model scored very poorly on the attainment of low premium costs and last on compensation coverage and operational efficiency.

f. There was overcompensation in cases of minor injuries and undercompensation in cases of catastrophic injuries. Some tort claimants were probably overcompensated for their wage loss as claimants represented by lawyers usually received higher recovery than those that did not. There was an unusually high inflation rate in bodily injury claims and some delays in receipt of compensation on the tort side.

However, certain other of the AAIB’s conclusions and recommendations did not stand the test of time. For example, auto insurance compensation history elsewhere and Alberta’s own auto insurance history has shown that the pricing problems were not adequately met by implementing modest tort reforms to attain premium stability in the short term, to reduce litigation and to curtail the inflationary effect of claims costs over time.

The AAIB’s suggested implementation of a threshold no-fault system with an enhanced no-fault benefit package and restricting the right to sue to only the most serious claims was proven by the Ontario experience to have been a failed enterprise. Instead, the history in most other jurisdictions have produced compelling evidence that certain of the problems with the tort system are irreparable.
Revisit of the 1991 AAIB analysis (with 2020 hindsight)

AAIB’s prediction that loss costs would continue to increase because of continuing increases in frequency and quantum of claims unless bodily injury costs were curtailed and effective cost saving measures were undertaken has been proven correct in the interval from 1991 to the present.

Both Osborne and AAIB rejected the pure no-fault model in the expectation that preserving tort in a threshold no-fault model could provide long-term premium stability. This expectation was later proven to be unfounded. Between 1991 and the present, both Saskatchewan and Manitoba converted to pure or nearly-pure no fault models with the predictable consequences of higher cost savings, lowest premium costs and highest degree of operational efficiency of all models. Moreover, there is no evidence in those provinces of significant consumer dissatisfaction.

In hindsight, the best explanation the Committee discerns for the AAIB conclusion to reject consideration of the pure no-fault model is that there prevailed in the late 1980s and 1990s a lingering suspicion over the concept of accident benefits so that there was resistance to the broadening of their application. As well there prevailed steadfast belief in the tort precepts that wrongdoers should pay and the court system can best evaluate and measure accident losses, including non-pecuniary general damages.

As well, AAIB and Osborne both were strongly influenced toward the intuitive belief that these concepts were not to be minimized at the expense of other goals of auto insurance compensation models. Accordingly, if rebalancing was required, both concluded that it should occur on the no-fault side of the system, with only minor reforms to ancillary aspects to the tort model.

These are the explanations the Committee finds for the preference of Osborne for a continued tort model even in the face of his candid conclusions that:

a. Continued use of tort on its own cannot be justified on compensation grounds.

b. The tort system provides a disincentive to the public interest goal of rehabilitation for all traffic injured and which cannot be realistically achieved through the tort system.

c. He found no credible evidence that eliminating tort law for a no-fault alternative would increase accident frequency, that no-fault alternative models caused significant adverse effect on accident rates or that tort liability exerted a statistically measurable effect on the level of safe driving.

The Committee concludes that reports of Osborne, AAIB and the experience of the reforms in New South Wales in 2000 all reinforced the belief that if the benefit resources were simply reallocated, claimants would seek to recover only what was needed. The bodily injury loss costs would then cease to escalate, but instead stay stable and predictable in future, so that, in turn, premium levels would do the same.

Despite its own findings that the pricing problem in the auto insurance system would persist unless some curtailment of tort compensation occurred, the AAIB preferred the strategy of gradual reduction of tort components over time to avoid the shock to participants in the system of a comprehensive one-time transformation.
This Committee concludes that the AAIB viewpoint was likely arrived at in reliance upon both the Osborne conclusions, the Ontario government's decision to implement a threshold no-fault model, and because it accorded with its own concerns about the difficulties in undertaking legislative reform.

If as the Committee concludes, the experience in Ontario from 1990 to the present is of educative value on this front, it follows that gradual transformation of auto insurance systems or efforts to preserve all components to satisfy all participants is not an effective strategy for securing long term affordability, availability, stability and sustainability of reasonable premium levels.

**Process of 2003 Alberta reform**

**Premium Increases**

As noted, at the trial of Morrow v Zhang, there was no dispute among the actuaries’ testimony as to the cause of premium increases between 1986 and 2004, recited below for ease of reference:

- a. the average pain and suffering cost for minor injuries in 1990 was almost $3,000 whereas in 2003 the average pain and suffering cost for minor injuries was almost $17,000 in 2005 dollars;
- b. this increase was in excess of 10% per year;
- c. minor injury accident related injuries such as soft tissue strains and sprains represented a high proportion of bodily injury liability claims costs;
- d. bodily injury coverage financial results contributed to the insurer action between 1986 and 2004;
- e. between 2000 and 2003 auto insurance premiums sharply increased and coverage became less available mostly due to escalating bodily injury claims costs, more particularly minor soft tissue injury claims costs;
- f. from 1984 to 1999 the average cost of third-party liability bodily injury coverage was increasing at a steep rate compared to the all Canada CPI;
- g. from 1994 to 1998 claims frequency increased on average by about 2 to 3% per year while claims severity increased by 7.3% per year resulting in an increase in claims cost per car on average of 9.8 %, while CPI inflation averaged only 1.6% per annum which was likely the cause of the increase in rates, consumer dissatisfaction and resulting reform measures;
- h. from 1999 to 2001 claims costs decreased and then spiked to the highest point in 2004;
- i. in 2000 the loss ratios at 100% and 110% were the result of the increase in bodily injury claims costs not being offset by sufficient premium increases;
- j. between 1986 and 2002 bodily injury claims were rising faster than CPI by 28%;
- k. between 1986 and 2002 bodily injury claims per 1000 vehicles had increased 72%, thus significantly contributing to premium increases; and
- l. auto insurance premiums in 2002 and 2003 increased mainly because bodily injury costs were rising at about 120% more than CPI. In hindsight, if insurers had realized that was occurring at that time consumers would have had to pay 45% more than CPI in that period. This trend, if it continued, would promote unaffordable auto insurance.
Developing Concerns

The problems emerging in the auto insurance system were reinforced by the AAIB findings in 2002 which noted:

a. a 100% increase in injury loss costs over the previous 10 years;

b. between 1986 and 2002, bodily injury claims costs per vehicle had tripled while property damage claims grew only 23%; and

c. there was nothing in the system to control bodily injury loss cost increases.

The problems emerging in the auto insurance system which began to concern Alberta Finance (AF) and the Government of Alberta (GOA) in 2002 included the following:

a. In 1995 damages awarded for most soft tissue injuries ranged from $6,000 – $10,000. By 2000 awards averaged $24,000 and at 2002 awards averaged $29,000. Those increases revealed that soft tissue injury damage awards were increasing at a higher rate than average and were affected by inflation.

b. Premium increases, on average, were 11% in 2002 and 13% in 2003 and even larger for high-risk drivers and those under age 25.

c. Comparisons with other provinces showed that Alberta had much higher premiums than public systems for inexperienced young drivers and risks such as drivers with lapses in coverage. Rates approaching $7,000 were unaffordable to many drivers.

d. A reduction in capital translated into declining coverage and accessibility problems for consumers.

e. The Office of the Superintendent of Financial Institutions reported that the financial position of the property casualty industry had been deteriorating for several years due to rising claims costs, not matched by increases in premium revenue, especially in auto insurance.

f. AF also identified a problem with inadequacy of Section B benefits dating back to the 1991 AAIB report.

The Committee considered it important to reflect on the actuarial evidence that the average pain and suffering costs for minor injury claims increased from approximately $3,000 in 1992 to approximately $17,000 in 2003 in 2005 dollars. This sharp escalation in amounts over a short interval was replicated in information from the GOA showing that between 1985 and 2000 the average soft tissue injury awards escalated from $8,000-$29,000. These examples starkly demonstrate the profound effect of tort producing overcompensation of minor traffic injuries, a problem identified in 1991 by the AAIB.
Political Process

The Committee considered the examination of the reform process in Alberta between April 2003 and June 2004 to be instructive for several reasons. First, it revealed how the competing goals to be served under any auto compensation system create an ongoing polarizing effect on the views of the participants, the service providers, the legislators and those charged with implementation. Second, the process demonstrated the challenges of forecasting the costs and cost savings of various alternative solutions which involve health outcomes and costs of a mandatory product. Third, it illustrated that modifying the proposed goals during a reform process with the aim of balancing all the competing views of various members of the public can have unintended adverse consequences.

For example, the Committee noted that articulated purpose of the reform seemed to shift during the course of the process, beginning with:

- the reform goal to make the cost of insurance more affordable and to pass the savings onto the consumer, then
- to solve the problem of young drivers finding insurance unaffordable and to reduce premiums that were unacceptably high for some drivers without making other drivers pay those costs, then
- to reduce premiums especially for young drivers, seniors and FA candidates, then
- to balance premiums against claims costs and consider the long-term viability of the auto insurance industry, then
- to reduce premiums and increase accident benefits funded by the savings from the proposed cap and the Bill 33 tort reforms, then
- to avoid any changes on the premium side that would unfairly affect the ability of traffic injured to make claims, then
- to allow only minor strains and sprains that heal quickly to be subject to a cap and to develop the definition in consultation with organizations representing injured persons, consumers, insurers, lawyers and healthcare professionals, and then
- to benefit individual Albertans who were paying too much for their premiums and not being treated properly for their injuries.

Since the definition of minor injury was continually restricted over the course of the reform process, the original intention to cover a large number of traffic injured was lost and the compromise reduced the number of persons affected by the cap, which in turn reduced the premium savings. In the end, the amount of the intended savings could not be calculated.

The Cabinet’s freezing premiums and legislating rollbacks on October 30, 2003 produced $25 million in premium reductions for the last two months of 2003 and $100 million for 2004 and, ultimately, the insurers were required to absorb the cost of the freeze.

Although the GOA on November 19, 2003 announced that the reform package would save $250 million, the GOA officials admitted it was harder to show at the end of the process what the total savings would be.

The GOA did not determine the cost of benefits added back into the system for minor injury claims or the extent to which enlargement of Section B benefits would benefit the minor injury victims who would heal within 10 weeks of their accidents. Nor did it calculate the amount of savings attributable to the application of the cap from April 1, 2005 to March 31, 2006.
Since October 1, 2004 the AIRB had decreased premiums in mandatory coverage by 15 – 18%.

The population of FA had fallen and convictions for uninsured drivers fell by 10% from 2003 to 2005.

Since the cap was implemented, the health levy increased but other than premiums no other funds were injected into the system to fund increases in the health levy.

The Committee also observed that the 2004 Alberta reform considered but rejected implementation of the elective/choice model referenced in the 1991 AAIB Report.

Revisit of Morrow expert evidence (with 2020 hindsight)

The Claims and Costs Study for Treasury Board and Finance dated November 2019 (Cheng Claims and Cost Study) revealed that the automobile insurance premiums continued to increase between 2004 and 2019 with a short period of premium leveling after the 2004 reform was implemented. These findings would suggest the auto insurance reform of 2004 was insufficient to produce premium stability in the long term.

From the health experts’ evidence there emerged three consistent new trends:

a. tort systems undermined the early and effective recovery of non-catastrophic traffic injured;

b. the introduction of uniform diagnostic and treatment protocols without adversarial components improved health outcomes of traffic injured; and

c. those diagnostic and treatment protocols introduced in Alberta in 2004 were in line with innovations in treatment of traffic injured in other jurisdictions which showed better health outcomes with removal of tort components in auto insurance systems.

These trends evidenced emerging scientific data from other no-fault jurisdictions that were able to make comparisons of health outcomes after reduction of tort components and clinical experience of health practitioners as to the adverse effect on health recovery in a litigation environment.

The emerging health evidence since 2000 to the present date, which strongly indicates that tort undermines health outcomes for traffic injured, bolsters the GOA decision in 2003 to select against an elective/choice model for Alberta.

The Committee notes that as the 1991 AAIB Report recommended reforms proceed along a continuum, and that Professor Trebilcock described the 2004 reform as a threshold no-fault model, it follows that the next alternative model for consideration is the pure no-fault model.
Comparison of Alberta, New South Wales and Ontario Reform Processes

The Committee compared the auto insurance reform processes in Alberta in 2003 with those in New South Wales from 1999 to 2017 and Ontario from 1990 to 2017.

Alberta 2003

As noted, the legislative reform process in Alberta ended with a compromise. The recommendations of the implementation team were continually modified and required to be undertaken with continuous consultation with external service providers. The media commentary inflamed the views of the public, the elected officials and the Premier which resulted in further restrictions on the proposed reform. At the end of the legislative process, none of the service providers pronounced themselves satisfied with extent of consultation or the result.

As noted elsewhere, this pattern of political compromise also occurred in Nova Scotia.

These legislative reform experiences in two different Canadian provinces in a similar time period might lead to the conclusion that this is the process to be expected to unfold when transforming an accident compensation system for traffic injured and insured motorists.

However, the New South Wales reform of 1999 proves that an alternate method of system redesign by a select group of auto insurance subject matter experts is possible. Given the first-hand experience with this reform, the Committee concluded that it was worth comparison.

New South Wales 1999

As noted, the facilitator engaged a working group of knowledgeable participants of the compensation system which produced a redesign of the New South Wales auto insurance model in a period of about 60 days (from February to March 1999).

The working group was comprised of representatives of all the involved service providers. The members began with an agreement to examine together the entire accident compensation process starting with the date of a traffic injured accident and concluding with the process of renewal of auto insurance premium. The object of the enterprise was to insert features which benefitted the traffic injured and motorists and to eliminate those that did not.

There was no involvement of elected officials during the redesign process. There was no consultation with any service providers outside the working group during the reform process. There was no involvement of the media and no comment to the public during the process.

The working group challenged its members to analyze and reanalyze the developing reform model, taking into account how each proposed improvement would impact other features, so that it continued to build and refine a cohesive design that contemplated each service provider interacting with the traffic injured and policyholders until it had arrived at specific set of reforms which eliminated extraneous processes detrimental to the traffic injured experience and produced the desired amount of premium reduction. That proposed premium reduction was verified by the actuaries in the working group.
The intention was to establish mechanisms to enable the injured person to proceed along a recovery path in a collaborative environment with health providers, insurers and subject matter experts in place of the litigation features of the existing model, such as between the health providers and the injured person, and between the insurers and the injured person.

Only after the traffic injured had achieved recovery as far as possible were the future income and treatment claims evaluated by an independent panel of claims assessors. The intention was to eliminate the involvement of duelling experts and advisors, which even health providers advocated.

Importantly the redesign provided for elimination of all non-economic loss awards for persons whose injuries did not exceed 10% permanent impairment of the whole body.

The redesign established as its primary goal the need to provide early and effect of rehabilitation to traffic injured and eliminate as far as possible pre-existing adversarial processes. It established an independent medical review panel to provide conclusive determinations of the extent of the injury and future health requirements. After this panel had provided its determinations, the traffic injured could proceed to a second expert review panel to determine the necessary financial compensation for losses caused by the accident. The design then provided for recourse to the court for any disagreement with the panel findings.

The redesign also provided for enhancing private sector competition by relating the premium to more effective risk rating.

All members of the working group endorsed the final design.

The blueprint presented to the legislature to enact had been approved by the working group on the understanding that it would not be minimized or modified by the usual process undertaken by elected representatives. In the event, it received passage with only minor amendments by June of 1999 and was implemented by October 1999.

The medical and claims assessment panels were overseen by a principal claims assessor who was a statutory officer with legislative responsibilities pertaining to the assessment of claims. There was a roster of approximately 150 externally contracted medical assessors.

Although tort lawyers, whose roles were the most substantially reduced under the reformed model, expressed dissatisfaction with the reform, the remaining service providers, supported the changes.

According to reports the reform effected savings of $300 million (Au) annually and in the first ten years following, also produced reliable evidence of improved health outcomes for traffic injured. As of 2017 these features of the current model had been reported to be successful.

**Ontario 1990-2015**

The threshold no-fault model implemented in 1990 in Ontario began to reveal problems by the mid-1990s. The governments in 1994, 1996, 2013 and 2015 repeatedly attempted to resolve these problems by legislative changes both on the tort and accident benefits side, all of which by 2017 according to Marshall constituted a series of failed attempts to control premium costs.
Conclusions

From the analysis of the history of Alberta automobile insurance reform when compared to other similar hybrid tort models, the Committee drew the following lessons for Alberta:

a. the various experiments undertaken by hybrid tort/no-fault auto insurance models from 1990 to 2017 in Canadian provinces and elsewhere when compared to pure no-fault models clearly show that the pure no-fault models have performed more effectively in terms of premium stability;
b. those jurisdictions that endeavored to balance both tort and no-fault accident benefit components in one traffic accident compensation model were unsuccessful in delivering affordability, availability, stability in premiums in the medium and long term;
c. auto insurance reform models that preserve a tort component or tort components have been criticized for the adverse effects upon the health outcomes of traffic injured;
d. pure no-fault models reduce recovery times, enhance health outcomes, expedite claims resolution for the benefit of the traffic injured and reduce premium costs for the benefit of insured motorists;
e. a legislature contemplating a fundamental reform of its automobile insurance system should recognize that a broad consensus among all constituents, including both the traffic injured and the policy holders and service providers is unlikely to be achieved; and
f. a legislature which undertakes a fundamental reform of its automobile insurance system should expect to receive some initial opposition from various sectors of the public because such a transformation will be disruptive to certain service providers whose roles will be transformed, diminished or eliminated altogether.
Legal Considerations
A. Statutory Framework

Under the distribution of powers in s. 91 and 92 of the Constitution Act, s. 92(13) in particular, the provinces have legislative authority to create, modify or abrogate causes of action in tort, legislative authority in relation to automobile insurance and the authority to enact a no-fault regime.

Case authorities have established that the administration of a no-fault motor vehicle accident plan by an administrative agency rather than the courts does not violate s. 96 of the Constitution Act. Workers’ compensation boards and the Québec Régie are examples.

The authority of a province to modify tort rights and to enact no-fault auto insurance is clear, subject to compliance with the Canadian Charter of Rights and Freedoms (Charter).
B. Challenges Under the Charter

Charter challenges to automobile insurance and compensation laws have been made to reforms that capped non-pecuniary damages and have argued primarily that revoking tort rights discriminates against accident victims with minor injuries in a manner that offends Charter s.15 (1) or s. 7, which also brings into focus Charter s. 1. For reference these sections are set out below.

**Section 1**

s.1. The *Canadian Charter of Rights and Freedoms* guarantees the rights and freedoms set out in it subject only to such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society.

**Section 7**

s.7. Everyone has the right to life, liberty and security of the person and the right not to be deprived thereof except in accordance with the principles of fundamental justice.

**Section 15(1)**

s.15 (1) Every individual is equal before and under the law and has the right to equal protection and equal benefit of the law without discrimination and, in particular, without discrimination based on race, national or ethnic origin, colour, religion, sex, age or mental or physical disability.

In 2003, Alberta enacted a reform which capped “pain and suffering” damages (“PSD”) of minor injury victims of auto accidents and brought in enhanced no-fault benefits with standardized medical protocols. A Charter challenge was brought. The trial judge upheld the challenge in *Morrow*, but the Alberta Court of Appeal (ACA) reversed that decision ruling that the legislation did not offend the Charter.

Two things about *Morrow* are of special note here:

a. the method of analysis used by the ACA because it will serve as the standard for the future; and

b. the ACA’s ultimate conclusion that a minor injury claimant’s interest in PSD is not an interest which is fundamental, either societally or constitutionally, because this will foreclose future challenges of similar reforms.
C. Method Of Analysis

**Morrow v. Zhang**

Based on *Morrow*, the following steps would be followed in analyzing an automobile insurance reform:

a. consider the entire reform package and the interrelationships and interdependencies of its components: [in this case, the reform capped PSD for minor injuries at $4,000 but the package included enhanced no-fault medical benefits with standardized medical protocols to deliver prompt and effective treatment for minor injuries];

b. define the group whose Charter rights are said to be infringed: [in this case minor injury claimants whose PSD are capped];

c. determine if the reform impacts of one or more of the characteristics listed in s. 15 (1) of the Charter or analogous thereto: [in this case the reform did arguably impact the s. 15 (1) characteristic of “disability” which consists of (i) physical or mental impairment, (ii) a functional limitation and (iii) the imposition of a disadvantage or socially constructed handicap]; and

d. determine if the differential treatment of the group discriminates in a substantive sense as by perpetuating prejudice, stereotyping or historical disadvantage.

In determining whether the reform discriminated against minor injury claimants in a substantive way, the ACA considered several contextual factors:

a. whether minor injury claimants are subjected to stereotyping or prejudice: [in this case the ACA noted that the reform provided an individualized assessment and no-fault treatment benefit in accordance with standardized medical protocols for all injury claimants which were inconsistent with stereotyping or prejudice];

b. whether there is correspondence between the reform and the needs and circumstances of minor injury claimants: [in this case the individualized assessment and access to prompt no-fault medical benefits led to the conclusion that there was sufficient correspondence between the reform and the needs of minor injury claimants to uphold the reform];

c. whether the reform has other ameliorative purposes and effects: [in this case there were none]; and

d. what is the nature and scope of the interest affected by the reform: [in this case the right of minor injury claimants to seek recovery of more than $4,000 for their PSD was not of constitutional or societal significance, nor did it restrict access to a fundamental social institution or affect a basic aspect of full membership in Canadian society].

**Hartling v. Nova Scotia (Attorney General)**

In 2003 Nova Scotia enacted a reform that capped PSD awards for minor injuries in order to achieve a reduction in mandatory auto insurance. The reform package there did not include the enhanced no-fault medical benefits with standard treatment protocols as it had in Alberta. A Charter challenge ensued. The trial judge decided that the reform did not offend the Charter and the Nova Scotia Court of Appeal (NSCA) agreed.
The challenge was brought on behalf of several differently placed individuals in order to enable the claimants to argue that the reform was discriminatory based on physical disability, mental disability and sex.

Because the trial judge dismissed the challenge, the expert evidence that he heard is noteworthy:

a. The NSCA noted evidence of Dr. J. David Cassidy, an expert Epidemiologist, specializing in Injury and Musculoskeletal Epidemiology, who testified:

i. that the adversarial system may in fact hinder recovery;

ii. his Saskatchewan study found the elimination of compensation for pain and suffering is associated with decreased incidents and an improved prognosis of whiplash injury;

iii. they suspect the elimination of payments for pain and suffering might have affected the decision to claim for an injury in some cases;

iv. as to improved prognosis, they believe the tort system is more adversarial and that legal conflict can delay recovery;

v. an adversarial system focussed the patient on pain and disability which is counter to the best methods of treatment which focusses patients on their abilities, [emphasis added]; and

vi. tort insurance is counter-productive to proper health care after injury.

b. Ms. Riis, a physiotherapist in practice for over 20 years testified that:

i. she did not agree that there is a general disapproval attached to victims of soft tissue injuries and chronic pain;

ii. since she began physiotherapy practice, she has seen growth in publicity around the prevalence of these conditions and a commensurate increase in the research effort and in the academic journal articles making the results of this research available to health professionals;

iii. in her experience when patients become involved in legal proceedings arising from an injury, they may feel quite uncomfortable with the processes involved;

iv. by their very nature, such suits can involve various medical examinations and questioning by representatives of all the parties involved in the case;

v. these processes can be arduous, even exhausting and, as a treating practitioner, she has seen the emotional impact they can have on people; and

vi. she also with some frequency encountered surprise and resistance from injury victims when their health care providers advise and advocate active approaches to treating conditions such as chronic pain, including an emphasis on movement, exercise and return to function in spite of ongoing pain.

The trial judge concluded:

“Unfortunately, the nature of the tort recovery system which is adversarial requires patients to focus on their pain and disability which is counter to the best methods of treatment which focusses patients on their abilities. I conclude that the evidence advanced by the applicants falls markedly short of meeting the onus that persons suffering soft tissue injuries, even those that result in chronic pain, are stereotyped, stigmatized or disadvantaged by society.”

The NSCA followed a method of analysis similar to that used by the ACA in Morrow. It began with a proposition that the reform treated minor injury claimants differently to their disadvantage.
and that this justified an inquiry into whether the disadvantage arose from prejudice or stereotyping. The NSCA determined that the evidence fell short of establishing that the reform perpetuated prejudice or stereotyping sufficient to trigger section 15 (1).

In coming to its conclusion, the NSCA referenced four contextual factors:

a. as to the factor of pre-existing disadvantage, the NSCA rejected the claimants’ arguments that the reform created a new disadvantage based on pre-existing stereotyping because the trial judge had found the evidence of stereotyping was extremely limited and primarily a product of the adversarial system;

b. as the correspondence between the claimants’ circumstances and the reform, the NSCA, noting that the reform included a number of measures aimed at premium reductions which would benefit the entire driving public and concluded that the reform sufficiently accommodated the claimants’ needs, capacities and circumstances by capping, not eliminating, PSD for minor claims, leaving intact all of the rights of recovery such as wage loss, out-of-pocket costs, and cost of future care;

c. the factor of ameliorative purposes or affects was not applicable; and

d. as to the nature of the interest affected, the NSCA concluded that the reform was sufficiently attentive to the needs, capacities and circumstances of the claimants.

The Nova Scotia reform was also challenged as discriminating against women on the premise that, as women have historically been disadvantaged in the workplace, the cap on minor injury PSD affects them disproportionately. The NSCA acknowledged this effect but concluded that it did not trigger s. 15 (1) based on analysis of two of the contextual factors:

a. regarding correspondence between the reform and the needs of women as a group, the root problem is gender discrimination in the workplace, not the reform; and

b. regarding the interest affected, PSD remains an economic interest where exact quantification is elusive, carrying engrained elements of arbitrariness and the reform leaves all pecuniary heads of damage untouched.

**Hernandez v. Palmer**

*Hernandez v. Palmer* 15 C.C.L.I. 2d 187 (Ont. Ct. J 1992), (Hernandez) was a 1992 decision of the Ontario Supreme Court noteworthy because the Ontario reform, unlike those considered in *Morrow* and *Hartling*, involved curtailment of the right to sue in tort for PSD in all but the most serious injury cases. In addition, substantially enhanced no-fault benefits were brought in.

The reform was upheld. The judge’s reasons included:

a. the question of whether an individual’s ability to sue in tort should be limited in the public interest is a matter that “lies in the realm of general public policy” and determination of the matter falls within the exclusive domain of Ontario’s elected representatives;

b. a court should not frustrate a scheme considered and designed by a Legislature to rectify a serious problem. Where tradeoffs are involved, there must be a reallocation of resources, and would have to affect some rights;
c. the reform did not offend s. 7 of the Charter. Restricting the ability of some traffic injured to sue in tort for damages did not infringe the principles of fundamental justice;

d. auto accident victims are a diverse collection of individuals without any common characteristics or history, linked only by the chance occurrence of having been injured by a motor vehicle. Everyone is a potential member of this class;

e. automobile accident victims do not constitute a traditionally afflicted group of the type that s. 15(1) is meant to protect. Thus, automobile accident victims are not a ‘discrete and insular minority’ that has suffered political, social and legal disadvantage in Canadian society;

f. there was no differentiation using a trait listed in s. 15(1) since traffic injured had not been victims of prejudice or subject to any historical, sociological or political disadvantage. Nor did it impose disadvantages on traffic injured as a class;

g. the legislation does not deprive individuals of rights but exchanges their present right of action with a right to comprehensive no-fault benefits;

h. the establishment of a no-fault insurance scheme for persons injured in automobile accidents therefore does not create inequality within the meaning of the Charter s. 15(1);

i. each group above and below the threshold is entitled to receipt of all the benefits available so the legislation is not subject to being successfully challenged;

j. what remained is a differentiation premised upon the severity and nature of the injuries sustained, which was not related to the personal characteristics of the victim and therefore is not a mental or physical disability as enumerated in s. 15(1) or a ground analogous thereto.

The reform considered in Hernandez was preceded by an inquiry conducted by Mr. Justice Osborne of the Ontario Supreme Court. The constitutional aspects of his report which were based largely on a legal opinion secured from Professor Peter Hogg included:

a. a no-fault regime would provide less benefits than common law damages and would deprive some or all traffic injured of a tort action but such a reform would not in infringe either s. 7 or s. 15 of the Charter and would in any event be saved by s.1 of the Charter; and

b. justification of Worker’s Compensation models which remove the right to sue in tort would apply equally to automobile insurance no-fault plans.
1. Although no one can ever predict whether a legal challenge will be made following an auto insurance law reform, the prevailing judicial authority has clearly established that pure no-fault auto insurance regimes, like those that have been in force in Manitoba and Québec, are within the scope of provincial legislative authority and since they treat every member of the driving public equally, a challenge under the Charter would be without merit.

2. The decision of the Alberta Court of Appeal in Morrow v Zhang has satisfied the Committee that a Charter challenge to a future auto insurance reform would be untenable provided that, like the 2003 reform, it is developed and implemented as a package, balanced, interrelated and interdependent.

The foregoing discussion, analysis and conclusions are offered on the basis of a detailed review of the relevant judicial authorities. No members of the Committee are active members of the Law Society of Alberta, nor were any consulted in connection with this section. Readers are cautioned to consult their own legal advisors for professional legal advice, if required.
VI Review of Health Outcomes Evidence
Historically, tort based motor accident insurance regimes have been driven, at least implicitly, by the conventional wisdom that “more is better” when it comes to medical and health treatment for soft tissue injuries as well as compensation for pain and suffering. This rationale has been based more on assumption than on scientific study or statistical analysis. In more recent times however there have been numerous studies informed by real data which have demonstrated the opposite conclusion: health outcomes for soft tissue and other traffic injuries are improved by minimal early care that promotes activation and are aggravated by the opportunity to pursue money compensation for pain and suffering in an adversarial tort process. Examples are discussed below.

A. Literature Review of Health Outcomes after Legislation Removing Compensation for Pain and Suffering

In an article published in the New England Journal of Medicine in 2000 and co-authored by Dr. J. David Cassidy, (then with the Alberta Centre for Injury Control and Research, Department of Health Sciences, University of Alberta, Edmonton) the authors concluded that the elimination of compensation for pain and suffering is associated with the decreased incidence and improved prognosis of whiplash injury. This study also reported:

- a 28% reduction of the incidents of whiplash claims and the median time to the closure of claims was reduced by more than 200 days;
- whiplash injury is less of a problem in jurisdictions where
  - there is a little expectation of symptoms, disability, or compensation and
  - the involvement of healthcare providers is minimal;
- providing compensation for pain and suffering after a whiplash injury increases the frequency of claims for compensation and delays the closure of claims and recovery;
- a strong and consistent association between the time to the closure of claims and indicators of recovery from injury;
- fewer persons filed claims for whiplash injury under the no-fault system, and those who did recovered faster than similar claimants under the tort system;
- under a tort system, claims are filed in a potentially adversarial environment that can promote the persistence of symptoms in claimants;
- in the course of proving that their pain is real, claimants may encounter conflicting medical opinions, unsuccessful therapies, and legal advice to document their suffering of disability;
- tort claimants are more likely than no-fault claimants to report that they had never experienced neck pain before the injury;
- tort claimants reported slightly higher levels of pain and slightly higher percentages of the body that were affected by the pain;
j. under the no-fault system, there is no financial incentive to delay recovery since claimants have immediate access to medical care and other benefits without being required to substantiate their injuries;

k. claimants who did not initially seek care or who initially saw only a physician closed their claims faster than those who initially saw a physical therapist or chiropractor, practitioners who are more likely to intervene actively;

l. minimal intervention in the acute period aids recovery; and

m. under both the tort and the no-fault systems, the involvement of a lawyer was associated with delayed claims closure.

Effect of Eliminating Compensation for Pain and Suffering on the Outcome of Insurance Claims for Whiplash Injury

A study evaluated the utility of the Québec Classification of Whiplash-Associated Disorders as an initial assessment tool, assess its ability to predict persistence of symptoms at 6, 12, 18, and 24 months post-collision. The results supported the use of the Québec Classification of Whiplash-Associated Disorders as a prognostic tool for emergency department settings.

Prognostic Value of the Quebec Classification of Whiplash-Associated Disorders

A study was undertaken in the Australian state of Victoria to determine the relationship between compensable status in a no-fault compensation scheme and long-term outcomes after orthopaedic trauma involved patients aged from 18 to 64 admitted between September 2003 in August 2004 with orthopaedic injuries and funded by the no-fault compensation scheme for transport related injury and deemed non-compensable. The results showed that compensable patients were more likely than non-compensable patients to report moderate to severe disability at follow up for the physical and mental summary scores. Compensable patients were less likely than non-compensable to have returned to work or study. The authors said their finding of worse outcomes for compensable orthopaedic trauma patients, compared with non-compensable trauma patients added to the evidence that compensation schemes may impede recovery from injury.

Similar results have been produced in Alberta in respect of recovery periods for mild traumatic brain injury.

Prediction of Vocational Status 3 to 4 months After Treated Mild Traumatic Brain Injury

In 1995, a Québec Task Force developed the Québec Classification of Whiplash-Associated Disorders to assist health care workers in making therapeutic decisions. It was applied to a cohort of patients presenting for emergency medical care following their involvement in a rear-end motor vehicle collision.

A study was undertaken to determine whether patterns of early clinical care involving visits to general practitioners, chiropractors, or specialists were associated with different rates of recovery. The conclusions were that the type and intensity of clinical care initiated within the first month after the injury is associated with the rate of recovery from whiplash injuries and did not support the hypothesis that early aggressive care promotes faster recovery.

The Marshall Report quoted from the above study as follows (p 33):

"We found that increasing the intensity of care beyond two visits to (family doctors), beyond six visits to chiropractors, or adding chiropractic to medical care was associated with slower recovery from whiplash injuries even after controlling for initial injury severity. Clinicians who promote frequent visits may inadvertently encourage patients to cope passively with their pain...patients who cope passively with their pain may demand more clinical care. Relying on repetitive clinical care likely reinforces some patients’ belief that whiplash is a serious disorder with a long, disabling course. As with low-back pain aggressively treating patients with acute whiplash injuries likely promotes illness behaviours and disability rather than return to normal activities."

A follow-up study was undertaken by the same authors to test the reproducibility of the finding that the intensity of health care utilization during the first month after the injury for whiplash injuries is associated with delayed recovery under a tort system of insurance. The authors found that increasing the intensity of care to >2 visits to a general practitioner, 6 visits to a chiropractor, or adding chiropractic care to general practitioner care was associated with slower recovery which was consistent with the findings of their previous study. Under no-fault insurance, patients who consulted a general practitioner and a specialist had a slower recovery than those who consulted a general practitioner once or twice.

The authors concluded that too much health care too early after a soft tissue injury negatively influences the prognosis of whiplash patients. The combination of chiropractic and general practitioner care significantly reduces the rate of recovery and appears to confer no benefit to patients. In short, early minimal care that promotes activation improves prognosis.

The authors noted that because patient pressure is a known predictor of physician behavior, doctors may use treatments, schedule follow-up visits, and refer patients when not medically needed, which in turn may lead to adverse outcomes and even prolong recovery by legitimizing patients’ fears and creating unnecessary anxiety.

The authors suspected that a tort system may influence patients’ perception of their medical needs and how insurers/tort require them to legitimize their injury and then influence the patients to pressure clinicians for referrals.

The Marshall Report commented on the above study as follows (p 32):

“The majority of injury claimants report that they have “minimal” or “minor” injuries at time of the accident. While symptoms may manifest themselves long after an accident, the fact is that most people are not seriously injured. Some 83 per cent of motor vehicle injuries involve whiplash or other soft tissue injuries such as a sprained back, which, most of the time, can be treated by relatively simple, short-term and inexpensive procedures that are well understood by health care providers.”

A study conducted in the Australian state of New South Wales concluded that legislative change which both removed financial compensation of pain and suffering for whiplash and introduced clinical practice guidelines for its treatment had a beneficial effect on disability pain and recovery. The study noted that whiplash was the most prevalent injury in a compulsory, fault-based, third-party motor vehicle insurance scheme in New South Wales, Australia. It examined an auto insurance reform in 1999 that contained four key legislative changes:

a. removal of payment for compensation for pain and suffering for whiplash injured;
b. introduction of clinical practice guidelines for treatment of whiplash;
c. regulation to ensure earlier acceptance of compensation claims; and
d. earlier access to treatment for all types of injury.

The study produced evidence that showed health outcomes for people with whiplash were substantially improved after legislative change that restricted access to compensation for non-economic loss, introduced clinical guidelines for the management of whiplash, and provided earlier acceptance of compensation claims and greater provision of early treatment. The superior outcomes were sustained in a second group sustaining their injuries after the legislative change. Improvement was demonstrated in both the degree of disability, physical functioning in pain together with percentage of people recovered. The findings produced evidence that the structures of compensation schemes can positively influence health outcomes for injured people. The data also suggest that psychosocial factors contribute to the development of the disability after a whiplash injury.

The study showed a significant improvement in health status as assessed in relation to disability, pain and physical functioning after legislative change that reduced compensation for disability for whiplash injury and encouraged earlier acceptance of insurance claims and early treatment. The improvements in health outcomes were maintained for more than four years after the legislative change. The authors concluded that as the health status of people with whiplash improved after legislative change, design of compensation schemes should be undertaken with the understanding that the scheme structure may have substantial effects on the long-term health of injured people.
**Legislative Change is Associated with Improved Health Status in People with Whiplash** - *SPINE* Volume 33, Number 3, pp 250-254 @2008, Lippincott Williams and Wilkins, Ian D. Cameron, PhD, Trudy Rebbeck, PhD, Doungkamol Sindhusake, PhD, George Rubin, PhD, Anne-Marie Feyer, PhD, John Walsh BSc and William Scofield MA.

A study of the effects of a population-based media campaign providing positive messages about back pain in the Australian state of Victoria produced findings to suggest that strategy can be highly effective in reducing back related disability.

B. Expert Testimony in Recent Cases

Expert testimony in recent Canadian trials in Alberta and Nova Scotia pertaining to the constitutional validity of new legislation which capped awards for traffic injuries with certain defined soft tissue injuries is consistent with studies referred to above.

Morrow v. Zhang, 2008 ABQB 98

Dr. Larry Ohlhauser (Ohlhauser) gave testimony about his engagement by the Alberta government to provide advice regarding the 2003 Alberta tort reforms. His testimony is summarized as follows:

a. Prior to 2003 there were no regulated standards of care applicable to the diagnosis and treatment of whiplash associated disorders, sprain or strains.

b. There were no well recognized tools to help the patient quantify pain. In about 2003 in the medical community the reporting of pain was essentially using subjective tools. Quantifying pain medically in his view required the subjective opinion of the patient and the practitioner.

c. There was nothing in the medical literature to define a “minor” injury.

d. He was retained to develop a process to help Alberta traffic injured to recover more quickly and effectively, provide advice as to the definition of “minor injury” and to develop protocols and guidelines for diagnosis and treatment to improve their prognosis.

e. When asked in September 2003 to find certain medical terms to develop regulations dealing with motor accident soft tissue injuries, Ohlhauser reported that the assessment, diagnosis and treatment of some minor injuries have been inconsistent and there was no effective patient focussed process for reassessing injuries for those who did not recover in the expected timeframe.

f. He considered the majority of injuries such as sprains and strains properly diagnosed and treated should heal within three months. He suggested a guideline to help improve recovery. His priority was to build a model that would be acceptable to patients.

g. He said the priority of healthcare providers should be to focus on assisting quick and effective recovery and any dispute resolution process dealing with entitlement to damages be set out in a separate regulation to involve practitioners other than those providing the care to the injured person.

h. He conducted a literature review, engaged professionals and representatives of healthcare groups, proposed a model for consideration and enlisted a core working group to provide input as to the diagnosis and treatment of all soft tissue injuries. He interviewed clinicians experienced in treating soft tissue injuries and interviewed others. There was a wide variation in recovery times for whiplash associated disorder (WAD) injuries in different circumstances and countries.

i. He determined that an evidence-based approach to diagnosing and treating whiplash injuries was consistently advocated.

j. It was important to identify those less likely to recover quickly and uneventfully by referring to certain alerting factors. Once identified, those persons would more likely require multidisciplinary assessment and treatment by an inter-disciplinary rehabilitation team.
k. The object was to reduce the numbers of persons complaining of chronic whiplash symptoms. Improved recovery time could occur if care was managed properly which included making an accurate diagnosis, an appropriate injury treatment plan and identifying early the poor prognostic factors.

l. He believed if the model was developed properly, more people would receive appropriate treatment and cost savings might result in future. He took into consideration that a time frame for recovery as part of the definition could ignore the physiological response expected from injured tissue and also secondary gain could be sought by continuing treatment for monetary gain or for attention.

m. He familiarized himself with identifying flags or alerting factors for some who may not progress to full recovery but instead lead to chronicity. He advised that biopsychosocial models identify that medical problems exist and address assistance to re-integrate into the community.

n. He met with Dr. Ferrari and reviewed other compilations including the Québec Task Force report which had a useful classification system for grading whiplash associated disorders and enhancing communication between practitioners and insurers regarding the patient condition.

o. The core working group originally included members of the Colleges of Physicians and Surgeons, Physical Therapists, and Chiropractors of Alberta, the Alberta Association of Occupational Therapists, Alberta Medical Association, Massage Therapists and Psychologists Associations. Their object was to understand the context of developing the “minor injury” definition, agree to a process to develop diagnostic criteria and treatment protocols, finalize the definition of minor injury and improve the section B no-fault benefit processes.

p. The model he designed recognized some items which are impairment but may not result in disability. He agreed some persons with chronic pain syndrome could also have a disability. He expected that most patients under his model would be pain free within three months although some would still report pain.

q. On March 3, 2004 he met with the core working group which agreed in principle with many of the presented concepts including diagnosing injuries and categories of WAD injuries.

r. Since he knew some practitioners may not have the interest or skills to effectively manage the injured person, he introduced the concept of an injury management consultant to provide early consultation where diagnosis was in question or the person not progressing as expected. He concluded if those persons could be early identified, they could be moved out of the protocols into a multidisciplinary assessment process using the biopsychosocial model to address factors that would otherwise be a barrier for efficient and effective recovery.

s. He and the experts agreed to reduce the likelihood of developing chronic conditions and ongoing impairment the primary healthcare practitioner in the case of a WAD I or II injury with alerting factors to recommend reassessment within 21 days of the accident and if the injury was not appropriately resolving, to refer the person to an injury management consultant for an assessment and report.

t. In April 2004 he provided a draft of the Minor Injury Regulation and Diagnostic And Treatment Protocols Regulation (DTPR) for comment. He advised of the steps to be
taken if the patient has not fully recovered by 12 weeks. The injury management consultant could provide early consultation before that and after assessment recommend multidisciplinary assessment or interdisciplinary rehabilitation.

u. The target outcome for sprain, strain and WAD I and II injuries was expected to be 90% by 12 weeks, if properly managed according to the DTTPR. Potential barriers would include the patient not participating in the recovery, the practitioner not following protocols, or lack of further support by insurers in a timely manner for the multidisciplinary assessments in rehabilitation when requested by the practitioner.

v. After the regulations were passed on June 21, 2004, Ohlhauser worked to address implementation issues as to the time to educate practitioners, develop and distribute interpretive materials and prescribe forms and develop qualification standards for injury management consultants and certified examiners in clarifying final procedures.

w. He completed preparation of an interpretive bulletin in September 2004 outlining new protocols for diagnosis and treatment of auto accident minor injuries which went into effect on October 1, 2004.

x. He developed standardized forms to provide a record of the client, assist with administrative process, record information that may be required for legal processes and ensure proper disclosure and consent by the clients, practitioners and other parties. The forms were also intended to gather information for ongoing review and evaluation of the DTTPR.

y. He assisted to develop standards to identify appropriately qualified individuals to be certified examiners and injury management consultants. He developed processes and guidelines, training materials and related resources for all service providers which were distributed to print or electronically.

z. He intended the DTTPR to be evaluated on an ongoing basis to assess the effect of the reforms on the recovery of injured persons. Outcomes were expected to improve recovery, reduce cost to the insurance system for these injuries and reduce the frustration of participants with the rehabilitation process.

aa. After October 1, 2004 fees were established and published in the Alberta Gazette. Educational seminars were given to primary healthcare practitioners and injury management consultants.

ab. The objective of the DTTPR was to attain recovery to patients and restore them to the same level of functionality as pre-accident. He considered being able to advise patients to expect recovery within 12 weeks would be an advance compared to pre-reform and would enable them to seek recovery without involvement. Except for massage therapists the core working group was unanimous.

ac. He made a plea for the regulations to differentiate treatment from disputes over the nature of the injury because the health community did not want to become legal experts when treating patients.

Dr. Richard Mayou had undertaken research since 1990 to examine psychological and behavioural complications of road accidents at the Oxford Accident and Emergency Department in the United Kingdom. His follow up study of traffic injured including whiplash injury revealed their considerable dissatisfaction with the procedures for seeking compensation. His evidence about this included the following:

a. Subjects were more often concerned with recognition of the distress and suffering than with the size of their financial settlement.
Many said money was not the most important issue but rather they wished those responsible showed awareness of their suffering.

b. Reasons for dissatisfaction with the compensation system were mainly to do with the amount or need for personal contact, flow of information and a satisfactory conclusion. The principal specific complaints were lack of information and a feeling that little more could be done without continual pressure and delays caused by apparent inefficiency.

c. The Oxford studies were the largest bodies of evidence using comprehensive quantitative measures of quality of life outcomes. Continuing care for those with persistent problems is often disorganized with poor communication between patients and health professionals. Innocent victims want recognition of their suffering, effective care, better information and more sympathetic and straightforward compensation procedures.

d. Evidence supported early immobilization, early return to normal activity, early exercise and multi model treatment for acute whiplash. Data also showed multidisciplinary biopsychosocial rehabilitation with a functional restoration approach improves pain and function. Well-designed early interventions to provide information and psychologically and behaviourally informed advice can be valuable in improving satisfaction and outcomes. Routine clinical care of WAD disorders is generally in line with the recommendations of the Québec Task Force.

e. Canadian researchers have played a leading role. In particular, Cassidy showed the benefits of introducing no-fault in Saskatchewan and that the type and intensity of clinical care initiated in the first month after the injury is associated with the rate of recovery from whiplash injuries.

f. He concluded that the traditional compensation procedures are prolonged, highly frustrating for victims and do not promote good early treatment but often delay specialist care of complications. Those seeking compensation want early recompense for their financial losses and sympathetic recognition of the reality of their distress and problems. He said those he has interviewed would be greatly reassured by recognition of their needs and the promise of the good care of the types set out in the DTPR.

g. In a 1997 paper reporting on interviewees who sought compensation, he found the victims reported long delays, lack of explanation, a feeling that the system did not believe in what they were saying or understand their situation. Whiplash victims felt frustrated and that financial losses and recompense was given begrudgingly and very late. Even if recognized, the treatment has been delayed.

h. He said injured people usually believe there are things they can do for themselves or with their family. They want to know what those things are and prefer to have some control over their futures.

i. His publications reported that innocent victims considered the compensation system did not seem sympathetic. They found it unpleasant to go through a court experience. Their encounters with the legal system did not give them the apologies, concern or sympathy they felt entitled to.

j. He noted their frustration related to the slow and arduous process, conducted in a way that conveyed no sympathy, even if liability was admitted. They were frustrated with the long time it took to settle and settlement
was generally seen as a relief. They did not worry about the amount of the settlement but simply wanted to shorten the length of the process.

k. Most said in the end it was not the money that was important because it did not get them back to their pre-accident state. Money was not totally what they were concerned about. What concerned interviewees were pecuniary losses which caused the difficulties and delays in obtaining recompense for them.

l. His research showed that traffic injured want to get back to normal and are upset by obstructions and delays. It is the injury and disability that caused the distress often exacerbated by legal procedures. He saw the separation of high quality medical care from insurance procedures as a major advantage.

m. He considered it an advantage that insurance and compensation had been separated from the medical care in the Alberta reforms. Although some will not have substantial financial recognition, it is more important that people are treated with concern and sympathy in a positive way.

n. He said various aspects of compensation proceedings leave people with psychological stress, but he thought if the cap was present as part of an entire package with treatment and advantages it would not cause stress.

o. He did not agree the cap eliminated uncertainties and frustrations or the stress involved with dealing with lawyers and advancing a claim for compensation. He said traditional compensation procedures are prolonged and highly frustrating for victims.

p. The benefits of diagnostic and treatment protocols were substantial. Protocols remove barriers to care, strongly promote early evidence-based care for all, reduce delay and meet the need for better treatment for the large number of traffic injured in a way that is feasible and efficient. The proposed number of treatments is in line with literature on optimal care.

q. He considered the protocols meet the wishes and needs of patients for more organized acute care information and early recognition of problems. He expected the improvements in content and delivery of routine early care would have marked benefits in reducing the incidence of chronic complications.

r. The provision of significant treatment and continuing review for all cannot be demeaning.

s. He did not agree that the protocols suggested a standard approach for all but saw the reform legislation as accepting the genuineness and treatment needs of those accident victims and providing ways for ensuring appropriate treatment.

Dr. Robert Ferrari (Ferrari) was presented as an expert in musculoskeletal medicine, soft tissue injuries, related medical conditions, related associated disorders, clinical management, diagnosis, treatment and management of injuries and conditions. In the following evidence:

a. Regarding the Alberta reforms he did NOT agree that:
   i. reforms would increase stress and unwanted negative reaction of many patients, the reforms stated injuries were unreal or less deserving of treatment;
   ii. the protocols do not require objective proof of injury or impairment in the sense of certainty;
   iii. a number of persons injured with sprain, strain or WAD are as seriously affected as other injured types;
   iv. minor injury claimants are subject to limitations and compensation under the legislation. If they were as dramatically
affected as conjectured, they would be assessed as having a serious impairment and would not be subject to the compensation limits;

v. the protocols treat all persons the same;

vi. the protocols fail to recognize the different rehabilitation, biomechanical, vocational, occupational and comprehensive needs of patients suffering from such injuries or recognize the complex nature of many of such injuries; or

vii. the protocols impaired a physician’s ability to act in accordance with good and ethical medical standards and thus affect the accuracy of the diagnosis or there were time restrictions on undertaking treatment.

b. In his opinion:

i. the protocols provide general guidelines, allow a wide array of treatment approaches and add adjunctive therapies which could be individually tailored to the injured person’s needs;

ii. the protocols pre-authorized a wide array of treatment and then provided access to Section B expenses up to $50,000 and encourage evidence-based assessment;

iii. the psychosocial measures such as education, reassurance and discussing the social effects of re-establishing normal activities and self-care and the disadvantage of extended dependence on healthcare providers are emphasized throughout the protocols;

iv. the protocols place no restriction on what primary healthcare practitioners may prescribe for the individual injured person;

v. it was an unfounded fear that some insurance systems may lead to premature termination of treatment or other benefits for a significant number of patients who experience chronic pain;

vi. the reforms made the definition of pain impairment and disability straightforward. A health professional need not measure impairment or pain but only conclude that the person injured states that the pain is at a severity that it interferes with their function;

vii. the protocols provided all practitioners with evidence-based guidelines and a new injury management consultant process which are both important and prevent delays in therapy;

viii. he was always able to make a diagnosis of a WAD I or II on the first visit;

ix. requiring immediate categorization of the patient would not have a significant impact unless it was the difference between a WAD II or III; and

x. the categorization could affect the patient’s decisions which could have medical and legal consequences.

When asked by patients of the advantages of being treated under the protocols Ferrari advised they would get information about treatment without delay. His main concern was to talk to patients about treatment. He said for legal implications remaining in or opting out of protocols, he advised them to consider legal advice.

Ferrari had published views that outcomes for chronic whiplash patients may be adversely affected by getting involved in the legal process. He noted studies showed the more patients talk about their symptoms the more severe the symptoms become.

Ferrari advised patients to not maintain a pain journal because studies showed the more patients rate their own pain, the more severely it is rated. Also he said paying too close attention to symptoms and worrying over them made them more severe.
From a medical perspective Ferrari did not have a concern about the use of the term “minor injury” but agreed that layperson could object to the view that their own injury was “non-minor”. He agreed a soft tissue injury would be a more appropriate term.

Ferrari’s published article stated that he does not consider that whiplash suffers are driven by a desire for compensation but likely the entire litigation process often drawn out for years may be an adverse factor and removing an interest or a convenience for pursuing of litigation process may actually reduce numbers of chronic care patients.

In Ferrari’s view the Minor Injury Regulation was mainly designed to save money for all society including insurers, insurance providers, and those who pay for insurance.

Traffic injured may choose to enter litigation or not. If they do, he thought they should be aware of the potentially adverse effects psychologically of the process and those effects should be discussed and addressed through the course of the litigation.

In Ferrari’s view:

a. the DTPR was intended to improve the health of Albertans;

b. a change in the compensation system that makes compensation an automatically brief process would be helpful;

c. traffic injured are often attended by lawyers, therapists, the media, and others who encourage illness behaviour that is at best maladaptive and at worst grief driven; and

d. studies showed that being in litigation can affect a person’s health.

Barbara Sulzenko-Laurie (Laurie) was qualified as an expert in developing and working with surveys and studies to measure and evaluate policy initiatives and proposals with particular reference to health care service.

Laurie said IBC has undertaken significant initiatives in researching best practices and identifying and treating traumatic injuries.

She led a task force in 2003 for IBC that developed an evidence-based program of care for the treatment of whiplash, WAD I and II injuries. She worked with the medical rehabilitation community in implementing an evident-based program of care called pre-Preapproved Frameworks which are part of the Ontario regulations.

The project was undertaken to monitor the insurance system and to provide continuous quality improvement to monitor and identify problems and benchmark how it operated for soft tissue injuries, sprains and strains prior to and subsequent to the reform and to determine if objectives have been met, to determine what issues have emerged and unanticipated issues emerging from the reform. They looked mainly at administrative outcomes.

The purpose of the study was to establish a benchmark to allow evaluation of the implementation of protocols and to produce a baseline picture from 52 weeks of experience with 600 claims. The distribution of diagnoses showed that about 37% of injuries were WAD I. Significantly less than 50% were WAD II. The remainder were either sprain or strain injuries. Many claimants were not getting treatment in the first 12 weeks. In 12 weeks fewer than 10% of claims were closed and by 26 weeks almost 1/3 of claims were closed. This indicated it would be a challenge to obtain full recovery of 90% of soft tissue injuries within 90 days.
After the reforms, there was a significant decline in the diagnosis of WAD 1 and other sprains and strains. There was a significant increase in WAD II claims. There were some economic incentives to diagnose WAD IIs. The numbers getting treatment in the benchmark increased from 76% to 91%.

While there was no difference in the rates of claims closures for the first 12 weeks, the costs of treatment were increasing. Although the numbers of treatment were not increasing, price per treatment was increasing. Claims closures in 26 weeks were substantially increased. 30% of claims were closed in six weeks and 60% of claims were closed in the second post reform study. The rate of disability claims fell from 17 to 11%.

The evidence of disputing cases declined from 20% to 7% in the second post reform study.

Dr. Kim Burton (Burton), a PhD in clinical epidemiology and bio mechanics, was qualified as an expert to opine on evidence-based practice relating to whiplash associated disorders, sprains, strains and other back problems including the cause, nature and management of such injuries and conditions and comparisons to other jurisdiction guidelines and protocols.

Burton was retained by the GOA to review the Minor Injury Regulation (MIR) and the DTPR and to comment on the definitions of minor injuries, serious impairment, strains, sprains and WAD injuries and the appropriateness of the protocols. He was asked to compare the MIR and the DTPR with guidelines and protocols pertaining to whiplash associated disorders in other countries and with scientific evidence in general. His evidence included:

a. Most strains sprains and whiplash associative disorders are common health problems characterized by high prevalence rates in the population, symptoms without permanent impairment, high probability of rapid recovery and return to work, although long-term incapacity is the exception rather than the rule.

b. Predictors were unreliable as to which persons would proceed to long-term incapacity. Multi model intervention help to solve this concern which requires that all involved in the recovery including patients, health professionals, employers and insurers have the same common goals to act in a consistent and coordinated way to achieve resolution of the condition and return to normal participation.

c. Unless managed well, whiplash injuries can be problematic for patients and society. More WAD patients will recover within three months if improved treatment approaches can be implemented. Even if symptoms persist, they are not necessarily constant but rather come and go with fluctuating intensity and do not always require further care.

d. It can be uncertain whether those symptoms are directly related to a motor vehicle accident or simply a reflection of the high prevalence of musculoskeletal disorders among the general population. For example, 25% of persons experience neck pain for at least one day over the course of a week and over 2/3 find it difficult to carry out normal activities.

e. Some experience persisting symptoms that can be related to the injury but in most cases, there is no indication they have experienced a more severe injury, rather they have faced obstacles to recovery and have drifted into a chronic pain experience. The range covers the possibility of inadequate treatment or
individual psychological reactions to injury and pain. It is well accepted that the most effective management is early return to normal activities.

f. Failure to recover may be due to psychosocial obstacles not adequately addressed and may signify a transition to a chronic pain syndrome. WAD I and II are minor injuries and strains, sprains and WAD are common health problems and for most people represent nothing more than a transient experience that settles uneventfully with a combination of healthcare and self-management. A high proportion of such patients could recover within 90 days through the Alberta model but a final answer would only come from randomized controlled trials.

g. His research was funded by the Association of British Insurers. He said 25% of patients were still symptomatic two years post injury which meant they would still experience some symptoms. He did not advise patients that entering a claim would adversely affect their health and lead to chronic pain because that was not a clinical issue.

h. He said there was research indicating that persons engaged in litigation have a poorer outcome that people who do not.

Hartling et al. v. Nova Scotia (Attorney General) et al. (2009), 278 N.S.R. (2d) 112; 70 CCLI(4th) 25; 2009 NSSC2

In Hartling et al. v. Nova Scotia (Attorney General) et al. (2009), 278 N.S.R. (2d) 112 (Hartling), certain expert medical evidence was adduced and commented upon by the trial judge. The Nova Scotia Court of Appeal noted:

a. the evidence of Dr. J. David Cassidy who suggested that the adversarial system may in fact hinder recovery:

"¶ 62 Dr. Cassidy has extensive experience and qualifications. All parties agreed that Dr. Cassidy was qualified as an expert Epidemiologist, specializing in Injury and Musculoskeletal Epidemiology."

"¶ 76 Dr. Cassidy was asked to explain why the elimination of compensation for pain and suffering is associated with a decreased incidents and an improved prognosis of whiplash injury and said that they observed these findings in Saskatchewan but cannot state with certainty why this happened. He said that they suspect the elimination of payments for pain and suffering might have affected the decision to claim for an injury in some cases. With respect to improved prognosis, he commented that they believe the tort system is more adversarial and that legal conflict can delay recovery. An adversarial system focussed the patient on pain and disability which is counter to the best methods of treatment which focusses patients on their abilities [emphasis added]. He stated ‘in essence, tort insurance is counter-productive to proper health care after injury’."
b. evidence of Viivi Riis, a physiotherapist, as follows:

‘... I do not agree that there is a general disapproval attached to victims of soft tissue injuries and chronic pain. Indeed, since I began practising as a physiotherapist more than twenty years ago, I have seen significant growth in the amount of publicity around the prevalence of these conditions. There has been a commensurate increase in the research effort in this area and in the academic journal articles making the results of this research available to health professionals.

It is my experience that when patients become involved in legal proceedings arising from an injury, they may feel quite uncomfortable with the processes involved. By their very nature, such suits can involve various medical examinations and questioning by representatives of all the parties involved in the case. These processes can be arduous, even exhausting and, as a treating practitioner, I have seen the emotional impact they can have on people. I have also with some frequency encountered surprise and resistance from injury victims when their health care providers advise and advocate active approaches to treating conditions such as chronic pain. These approaches include an emphasis on movement, exercise and return to function in spite of ongoing pain.’

c. The judge’s comment:

*Unfortunately, the nature of the tort recovery system which is adversarial requires patients to focus on their pain and disability which is counter to the best methods of treatment which focuses patients on their abilities.*
C. Other Studies

Other studies have pointed to long recovery times and over-treatment of injured persons.

The Pinnacle Study in Ontario showed increases in claims for soft tissue injuries associated with increases in legal representation.

Comparisons with the statistics between this study and those from the time of the Osborne Report showed the following:

a. 91% of the claimants had some type of legal representation. At the time of the Osborne report, 54% of claimants had legal representation.

b. The majority of claimants ultimately commenced legal action against the insurer (83%). This is an increase of 60% since the Osborne report. The ultimate severity for claims in which legal action commenced was 14% higher than average.

c. The percentage of claimants with psychological trauma increased from 1.1% in the Osborne report to 36.2% in the current study. The percentage of claimants with mild neck injuries and mild back injuries increased from 3.4% to 27.2% and 1.5% to 25.3%, respectively. The percentage of claimants with shoulder soft tissue injuries also increased by 15.3%, from 14.9% to 30.2%.

d. The percentage of claimants with soft tissue neck injuries decreased from the Osborne report to the current study, going from 58.7% to 36.1%.

e. The actual time lost from work increased from the Osborne report where the median time lost from work was two months to the current claim study where the median time lost is seven months. In the Osborne report, 77% of the claims were settled before an action commenced. In the current claim study, 16% of the claims were settled before an action commenced.

Automobile Insurance Third Party Liability Bodily Injury Closed Claim Study in Ontario

The conclusions drawn in the Marshall Report on these findings were instructive:

a. Marshall observed that by comparison of the Pinnacle Study findings with that the Association of Worker’s Compensation Benefit Systems in Canada the average duration of injury claims for 2015 (the length of time taken to get a worker back to health and to close the file) is just 76 days, about two and a half months, whereas it is one year to two years or more to resolve minor injury claims in the auto insurance system.

b. Moreover, the provincial worker’s compensation systems in Canada find that the proportion of claims awarded permanent impairment benefits across Canada is about 13.5 per cent or almost half that found in the auto insurance system in Ontario.

c. Marshall concluded that soft tissue injuries should not normally develop into permanent impairments if they are treated properly to begin with. The rate of impairment in the threshold no-fault Ontario model is a warning sign that medical care is not being properly handled. Appropriate medical treatment has been shown to reduce or prevent the development of permanent impairments from soft tissue injuries by as much as 80 per cent.

A collaborative study conducted by a comprehensive group of health professionals in
its 2015 report proposed a new classification of traffic injuries, including Type I, Type II and Type III with these explanations:

a. The natural history of the initial injury is the basis for classification. A Type I injury is likely to recover within days to a few months of the collision; but during the period of recovery the patient may benefit from education, advice, reassurance and time-limited evidence-based clinical care. Type I injuries are the focus of this report. A Type II injury is not likely to undergo spontaneous recovery, and the injured person may require medical, surgical and/or psychiatric/psychological care. Type III injuries are a subset of Type II injuries, that involve permanent catastrophic impairment or disability. The care for Type II and Type III injuries is not covered in this report.

b. Persons with Type I injuries should be educated and reassured from the outset that their own inherent healing capacities are likely to lead to a substantial recovery. They should also be informed that only a discrete set of treatments show evidence of any benefit; and that the same evidence shows that benefit is largely on the basis of pain alleviation. Healthcare professionals need to listen to the patient’s concerns and emphasize measures to assist them to cope, recognize and avoid complications.

c. Interventions for Type I injuries should only be provided in accordance with published evidence for effectiveness, including parameters of dosage, duration, and frequency; and within the most appropriate phase. The emphasis during the early phase (0-3 months) should be on education, advice, reassurance, activity and encouragement. Health care professionals should be reassured and encouraged to consider watchful waiting and clinical monitoring as evidence-based therapeutic options during the acute phase. For injured persons requiring therapy, time-limited and evidence-based intervention(s) should be implemented on a shared decision-making basis, an approach that equally applies to patients in the persistent phase (4-6 months).

d. Type II injuries typically involve a substantial loss of anatomical alignment, structural integrity, psychological, cognitive, and/or physiological functioning. The majority of patients with such injuries will require (in addition to natural healing) a significant amount of medical, surgical, rehabilitation, and/or psychiatric/psychological intervention to ensure an optimal recovery. There is an evidentiary basis for major concern about both the extent of recovery and about the likelihood of complications developing and/or persisting in the absence of such expert care; significant impairment and disability are primary concerns. Examples of traffic collision-induced Type II injuries include fractures of the femur and hip, shoulder dislocation/fracture, facial fractures, depression or post-traumatic stress disorder.

e. Type III injuries refer to the subset of Type II injuries which fall within the conceptual framework of catastrophic impairment within the Ontario Statutory Accident Benefits Schedule (SABS). In Ontario, there is a special set of entitlements available to patients whose injuries are extremely serious and permanent such as amputation, spinal cord injuries and severe brain injuries. Extended benefits are available for long-term attendant care, and medical and rehabilitative goods and services.

D. New South Wales Introduction of No-Fault Long-Term Care for Catastrophically Injured – 2006-2007

In 2005 the New South Wales government (NSW) determined that the 1999 auto insurance reform had led to a stable and affordable scheme which made it possible to expand coverage to all catastrophically injured persons whether they could prove fault or not.

NSW identified that about 125 people in New South Wales were catastrophically injured annually who had significant daily needs including care, personal assistance, domestic support and ongoing equipment and medical needs. It proposed a scheme that would provide:

a. medical treatment;
b. acute inpatient care;
c. rehabilitation;
d. specialist and expert medical care; and
e. pharmaceutical expenses for life.

The model contemplates appointment of lifetime care coordinator to work with the person and the person’s family. The coordinator would focus on helping the person adjust to the disability and help them regain as much daily function and independence as possible. It would also identify options for accommodation, transport, education, employment, social and recreational activity. In the acute care and rehabilitation phase, the coordinator would work with the injured person to help develop rehabilitation and community participation plans that identify short and long-term goals consistent with desire.

The coordinator would also help the injured person and their family develop a community participation plan to enable the person to access all available activities and opportunities. The long-term planning process would include:

a. Specific goals of the injured person including educational social and employment;
b. services and support required including identifying any specific skills;
c. time frames;
d. specific service entry, exit and transitional strategies;
e. roles and responsibilities of those involved and support;
f. agreed review date to assess the adequacy of the plan; and
g. support for carers.

Following the rehabilitation towards discharge, the life care coordinator would help the person and family focus on living with their disability and identify their ongoing support needs. Following discharge the scheme would typically provide daily services such as:

a. aids and appliances;
b. home and transport;
c. personal care;
d. domestic services;
e. childcare services;
f. nursing care;
g. assistance with community access;
h. educational and vocational services; and
i. respite care.

The program would provide lifetime care and support through a fully funded statutory trust. The government would also provide support for the scheme including medical costs.

An actuarial analysis estimated approximately 124 persons would be eligible to enter the scheme annually. This would include about
37 with spinal cord injury, 84 with traumatic brain injury, three with other injury such as bilateral amputee, major internal injuries and severe burns.

Guidelines would establish the extent of the injury.

Standards would be developed for service providers covering a range of skills, training and experience. Care providers would be approved by the LTCS authority to ensure quality of service. The model of service delivery would as far as practicable, give control of the selection of service providers and coordination of services to the injured person and/or their family.

It proposed a board of the long-term care program with authority that would:

a. oversee the fund, including its investment;
b. approve the guidelines for eligibility and care need assessment;
c. approve the assessor fee schedule; and
d. approve the care provider fee schedule.

An Advisory Council would be established including two practicing health professionals with relevant experience in treating persons with catastrophic injuries, consumer representatives from relevant disability organizations and care provider representatives. The Council would advise the minister and the government on the operation of the scheme.

The scheme would be fully funded through a levy on motorists collected in conjunction with motor accident insurance.

Funds paid into the scheme would be the full cost of providing lifetime care and medical treatment services to injured people. The pooling of the funds would protect against the possibility of poor estimation of an individual claimant.

For those eligible to enter the LTCS scheme, lump sums would no longer reflect compensation for future treatment lifetime care and domestic assistance performed on an unpaid basis, but would be provided through the scheme. Payments for damages for pain and suffering and economic loss would remain unchanged. In determining the levy, the LTCS Authority would rely on independent actuarial advice to ensure that the fully funded principle is maintained.

The NSW government obtained an actuarial no-fault long-term care costing study which gave a cost estimate based on the number of people injured in the 2005/2006 accident year.

The NSW government ultimately introduced the lifetime care and support scheme (icare) to improve the quality-of-life of the injured person and their family on 1 October 2006 for children under 16 and on 1 October 2007 for adults.
1. The foregoing peer-reviewed scientific evidence collected from evaluations of traffic injured recovery under no-fault compensation models since 2000 prove that health outcomes of traffic injured are improved after elimination of money compensation for pain and suffering.

2. The scientific evidence supports the contention that under a tort system claims are filed in a potentially adversarial environment that can promote the persistence of symptoms in claimants. In the course of proving that their pain is real, claimants may encounter conflicting medical opinions, unsuccessful therapies, and legal advice to document their suffering or disability.

3. The evidence suggests a tort system may influence patients’ perception of their medical needs and how insurers/tort require them to legitimize their injury and then influence the patients to pressure clinicians for referrals.

4. A study under the tort system confirmed that too much health care too early after a soft tissue injury negatively influences the prognosis of whiplash patients. Early minimal care that promotes activation improves prognosis.

5. Fewer persons file claims for whiplash injury under the no-fault system, and those who did recovered faster than similar claimants under the tort system. Similar results have been produced in Alberta in respect of recovery periods for mild traumatic brain injury.

6. Scientific data studying long-term outcomes after orthopaedic trauma led to the conclusion that compensation schemes may impede recovery from injury by producing worse outcomes for compensable orthopaedic trauma patients, compared with non-compensable patients.

7. Under both the tort and the no-fault systems, the involvement of a lawyer was associated with delayed claims closure.

8. All of the foregoing medical evidence support the finding of the trial judge in the Hartling decision that:

   Unfortunately, the nature of the tort recovery system which is adversarial requires patients to focus on their pain and disability which is counter to the best methods of treatment which focusses patients on their abilities.
9. Under a no-fault system, there is no financial incentive to delay recovery since claimants have immediate access to medical care and other benefits without being required to substantiate their injuries.

10. The consistently developing medical evidence from 2000 to the present demonstrates that health outcomes of traffic injured are not well served by the tort system and preservation of any of its components in the Alberta automobile insurance compensation system is not justified.

11. This is supported by testimony of health practitioners in the recent court challenges in Alberta and Nova Scotia.

12. Experience from other jurisdictions consistently suggests extended treatment and some investigative procedures, such as imaging and invasive treatment, are not recommended for most soft tissue injuries and can be linked with dependence and poor health outcomes.

13. New South Wales and Ontario experience provides further caution that fee for service payment models’ treatment of traffic injured tend to support quantity over quality. Overtreatment occurs in compensation systems because sometimes the practitioner is not aware of or committed to best practice guidelines for soft tissue injuries and others are influenced to recommend treatment or extend treatment in response to pressure from patients or their families.

14. A study of patterns of early clinical care involving visits to general practitioners, chiropractors, or specialists did not show that early, aggressive care promotes faster recovery. Whiplash injury is less of a problem in jurisdictions where the involvement of healthcare providers is minimal.

15. In addition to establishing objective evidence that no-fault models are superior to tort models from a health outcome perspective, pure no-fault models have demonstrated the greater opportunity to collect reliable treatment data to inform, innovate and improve treatment modalities to traffic injured.

16. The implementation of the pure no-fault model in Québec enabled the Québec Task Force to utilize the data to establish a classification system for whiplash associated disorders as WAD I, II and III, and this system is now being used worldwide. This experience is strong evidence that a pure no-fault model for accident compensation can not only provide ongoing data to inform consistent, appropriate treatment for various categories of traffic injuries but is also better suited to utilize the data collected to implement innovative techniques to improve treatment more effectively and expeditiously.

17. The New South Wales’ experience also supports the importance of collecting and analyzing data on patterns of rehabilitation and recovery to validate approaches that produce optimal health and functional outcomes for soft tissue injured persons. It provides supporting evidence that any reformed medical assessment model must ensure that treatment paths are consistent with established and current best practice guidelines to facilitate optimal recovery and containment of treatment costs. Recognition is also necessary of those claimants with reduced motivation to comply with essential self-management aspects of a treatment program.
18. The New South Wales’ experience also reinforced support for an independent panel of medical specialists who are the sole decision makers about assessment and treatment issues, noting that accessibility to skilled and qualified experts prevents delay and adversarial elements, such as duelling experts that can result in delay, increased cost and potential impaired recovery.

19. The evidence and experience pertaining to the development and implementation of the Diagnostic and Treatment protocols since 2004 provides reliable validation of the benefits of that innovation and should be used as a foundation in the transformation of treatment of traffic injured in Alberta.

20. The Committee was satisfied that all the peer-reviewed health evidence it examined further bolstered its conclusion that a pure no-fault model would be the optimal choice for treatment of Alberta traffic injured.
F. Recommendations

1. Medical and health treatment for all traffic injured in Alberta should be reformed to incorporate and conform to consistent evidence-informed practices.

2. All reforms that can align with improved health outcomes for traffic injured should be incorporated into a reformed care and compensation traffic insurance model.

3. In light of compelling evidence that being involved in litigation can adversely affect a person’s health, any services provided under the current model that directly or indirectly promote or sustain litigation, adversarial conditions, points of dispute, duplication of examinations and assessments or that otherwise do not promote prompt and optimal recovery of traffic injured should be eliminated.

4. Specifically, roles of service providers of treatments, follow-up visits, and referrals when patient health benefit, or medical need is not based on reliable evidence, or consultations in respect securing benefits, or income replacement, which may as a consequence prolong recovery by legitimizing patients’ fears and creating unnecessary anxiety, should be eliminated.

5. Reform legislation should promote early acceptance of genuineness of reported symptoms of traffic injured and delivering prompt and appropriate pathways for ensuring appropriate treatment.

6. New protocols for treatment of all traffic injured must be introduced and regularly reviewed and refined with data developed and analyzed to minimize or eliminate overtreatment, undertreatment or ineffective and incorrect treatment of traffic injuries.

7. A reformed care model for Alberta should build on the existing DTPR model and expand it to be available all traffic injured under a pure no-fault care model.

8. The long-term care medical professionals should be engaged to assist in implementation of a long-term care model that would best serve the needs of those severely injured in traffic accidents.

9. The no-fault long-term care model established in New South Wales in 2007 should be considered as an example for persons severely injured in traffic accidents. The property and casualty insurers who distribute automobile insurance policies in Alberta should be engaged in dialogue to determine the viability of establishing a funding pool model to support a long-term care program.
10. A pure no-fault care model for Alberta will optimize development and application of data technology including innovations such as artificial intelligence to further identify and add evidence-based improvements to diagnosis and treatment to provide continued renewal of treatment modalities.
Actuarial Evidence from Tort Accident Injury Compensation Systems
The findings and conclusions from various actuarial studies and testimony pertaining to tort accident injury compensation systems reviewed shows that between 1974 and 2019 the main reason for automobile insurance premium increases in tort motor accident compensation models was and remains continually increasing bodily injury loss costs. The key features are summarized below.

The Cheng 1990 report to the AAIB documented the following findings:

a. About 2/3 of injured claimants including passengers and pedestrians were not at-fault and could claim for both tort and no-fault benefits. Over half the claimants had soft tissue injuries and received about 25% of the total claims dollars. About 10% of claimants had permanent injuries and about 3% of claimants had permanent and total disability.

b. In 1990 claims under $10,000, 83.1% of the claims related to non-pecuniary losses. For claims between $10,000-$75,000 non-pecuniary claims represented 57.1% of the claims. For claims over $75,000 non-pecuniary damages represented 18.2% of the claims.

c. Injury claims were increasing at 12.9% per annum which was more than twice the CPI increase. Claimants with counsel received more claim dollars for similar injuries. The rate of increase from 1988 to 1990 was 14% which was about 3% higher than claims without counsel.

d. 50% of claimants were represented by counsel.

e. The study could not fully capture the entire spectrum of legal expenses, only some payments of party and party costs which are expenses payable by a litigant for appearing or carrying on as a party to a proceeding which are allowed by the court according to Schedule C of the Rules of Court. It noted that the entire amount of payment of legal fees to claimants’ lawyers was unknown.

f. After examining the data from 1972 to 1989, it found loss costs had increased dramatically since 1985 mainly due to the increase in bodily injury loss costs.

g. Claimants with minor injuries were overcompensated in the tort side of the system relative to all other traffic injured. Claimants with catastrophic injuries were undercompensated in the tort side relative to all other traffic injured.

h. At-fault claimants were inadequately compensated for their economic losses relative to tort claimants.

i. There were structural deficiencies in the delivery of benefits in the current system.

j. All payments required under the current system were subject to delays.

k. The data proved that there was a pricing problem in the system which would persist in the future without some measures to counteract it.

l. Loss costs would continue to increase because of continuing increases in frequency and severity of claims unless bodily injury costs were curtailed and effective cost saving measures undertaken.
B. 1998 New South Wales Ernst & Young Report

The 1998 New South Wales Ernst & Young reported in NSW that:

a. claims costs were rising at a much higher rate than was the Consumer Price Index with no reason to believe that this unsatisfactory claims cost change rate trend would end;

b. the compensation benefits were not fairly distributed among automobile accident victims;

c. persons with severe injuries did not receive adequate sums to fund future care and those with non-severe injuries received more than they needed;

d. a large percent of the scheme’s resources (approximately 50%) were diverted to service providers involved in the determination of eligibility of benefits; and

e. future changes had to address the scheme’s cost structure and a more equitable distribution of benefits.

The *KPMG report*, which was prepared for ICBC and the government of British Columbia, made the following findings:

- **a.** motor vehicle insurance costs increased at rates higher than the rate of inflation from 1986 to 1996;
- **b.** the average premium increased by 135% over the same period;
- **c.** claims costs represented about 79% of total expenditures and increased at more than 6.5% per year after inflation;
- **d.** claims operating cost expenses and commissions grew 5% per year faster than inflation from 1985 to 1995;
- **e.** the introduction of premium tax in 1987 added to the increase in product costs;
- **f.** bodily injury claims represented $0.50 of every dollar of claims, including legal and other tort claims costs;
- **g.** the real bodily injury claims cost per insured vehicle nearly doubled over the ten year period;
- **h.** the trend was due to increases in claims frequency and average cost per claim;
- **i.** bodily injury claims grew at 7% per year, far faster than rate of property damage claims;
- **j.** bodily injury claims increased 50% over the past 10 years;
- **k.** the propensity to file personal injury claims increased by 40% over the 10 years;
- **l.** the average bodily injury claim was four times the average property damage claim; and
- **m.** rising claims costs and numbers appeared to due to:
  - **i.** increasing propensity and ability to maximize awards especially due to non-economic losses;
  - **ii.** growing sense of entitlement to receiving motor vehicle insurance payments;
  - **iii.** growing inclination to focus on pain and suffering;
  - **iv.** increased advertising by lawyers and tendency to seek legal representation;
  - **v.** willingness of courts to increase types and amounts of compensation awards; and
  - **vi.** increased incidence of fraud.

A cost breakdown of ICBC dollars from 1995 data showed:

- **a.** 80% of the costs related to payments to claimants and claims related expenses;
- **b.** 8% of costs were paid for distribution of the product;
- **c.** 9% of total expenses or $223 million represented total legal costs;
- **d.** $670 million were paid to external suppliers, including defence counsel, glass repair shops, car rental agencies, medical payments and the like; and
- **e.** brokers were paid $151 million.

In total, only 2/3 of claims costs and expenses were put in the hands of claimants for their claims or damage repairs. For personal injury claims, claimants received only 72% return with 17% paid to legal services.

An explication of legal costs for 1995 to ICBC was as follows:

- **a.** BC in-house legal department – about $7 million;
- **b.** ICBC external defence counsel hired to defend tort claims – about $53 million;
c. cost for expert reports, independent adjusters and private investigators required for litigated claims – about $17 million; and

d. estimated plaintiffs’ costs including contingency fees and disbursements – about $146 million.

D. KPMG – 2003 Government of Alberta Implementation Team

In 2003, KPMG was retained by the Alberta implementation team to advise what average premium would be required in Alberta to align it with other provinces and then calculate the reduction required to achieve the caucus policy directive. The number was between $200 and $250 million. It was asked to determine the amount that would be saved by imposing a cap of $4,000 on minor injury claims. The definition of “minor injury” was continually restricted by Caucus with the result that the cost saving was continually reduced and never accurately calculated.

E. Addie Closed Claims Study 2003

The closed claim study comparison performed by Barb Addie (Addie) showed that 62% of claimants suffered soft tissue injuries only and received 43% of the settlement amounts. Another 29% received settlement amounts for soft tissue and another injury. 91% of all claimants suffered some form of soft tissue injury. These claims represented 93% of the settlement amounts. 71% of the total settlements were for pain and suffering.

Comparison to the 1991 closed claims study from AAIB showed that the percentage of pain and suffering was very similar among the three surveys. The underlying data were adjusted for inflation to bring them to the same point in time.

Had Addie’s 2006 study data been used by KPMG for the Implementation Team, instead of the 2002 New Brunswick study, a larger cap would have been needed to achieve the government’s objective of reallocating 20% bodily injury costs to lower premiums and enhance Section B benefits.
F. Testimony of Actuaries – Morrow Case 2008

Mr. Ted Zubulake, GOA actuary, produced a report that said:

a. Between 2000 and 2003 auto insurance premiums sharply increased and became less available in the regular insurance market.

b. These insurer actions were mostly due to bodily injury claims costs.

c. The escalation of bodily injury costs was likely driven by minor soft tissue injury claims costs.

d. IBC studies in New Brunswick and Nova Scotia and his own of Newfoundland and Labrador found that traffic accident soft tissue strains and sprains accounted for a high percentage of bodily injury liability claims and claims payments, and most were for pain and suffering.

e. The Newfoundland and Labrador study dated March 2002 reported 67% of claims came from soft tissue injuries and sprains of the neck and back with no other injuries.

f. At the time the GOA was considering automobile insurance reforms, auto claims costs were increasing primarily due to higher minor soft tissue injuries.

g. Increases in Section B accident benefits for medical and rehabilitation compensation from $10,000-$50,000 would reduce bodily injury liability costs by reducing the injured person’s out-of-pocket medical and rehabilitation expenses.

h. Bodily injury coverage financial results contributed to the insurer action between 1986 and 2004.

i. The greatest increase in costs through those periods was third-party liability coverage and escalation of bodily injury loss costs driven by minor soft tissue injury claims costs.

j. KPMG found that of 1441 claims of combined closed claim studies, 1077 were for minor injuries which constituted 74% of the claims examined as ultimately defined by GOA.

k. The average pain and suffering cost for minor injuries in 1990 was almost $3,000. In 2003, the average pain and suffering cost for minor injuries was almost $17,000 in 2005 dollars. This increase, greater than 10% per year, was in excess of the compounded rate of growth. Thus, minor injury accident related injuries such as soft tissue strains and sprains represented a high proportion of bodily injury liability claims costs.

Dr. Ron Miller, actuary, testified that:

a. From 1984 to 1999 the average cost of third-party liability bodily injury coverage was increasing at a steep rate compared to the all Canada CPI.

b. From 1994 to 1998 claims frequency increased on average by about 2 to 3% per year while claims severity increased by 7.3% per year resulting in an increase in claims cost per car on average of 9.8 %, while CPI inflation averaged only 1.6% per annum. Those results imposed large stress on the system which was likely the cause of the increase in rates, consumer dissatisfaction and resulting reform measures.

c. From 1999 to 2001 claims costs reduced and then spiked to the highest point in 2004.

d. In 2000 the loss ratio at 100% and 110% was unprofitable (for insurers), reflective of the increase in bodily injury claims costs not being offset by sufficient premium increases.
e. In 2003, before the reforms were effected, claims were disappearing. A possible explanation for this was that consumers receiving premium increases of 10% or more may have become conscious of the proposed reforms, the issue of affordability and knew that reporting an at-fault claim would trigger a large premium increase.

f. Miller had seen a similar pattern in other jurisdictions, such as New Brunswick and Ontario showing that when there are dramatic premium increases, claims disappear from the system. He found strong statistical evidence that the third-party liability claims costs declined by 37%.

g. Since the reforms in January and October 2004, third-party liability bodily injury costs declined dramatically.

h. It was plausible that:
   i. post reform some minor whiplash injury claimants were no longer motivated to seek settlement or the protocols were working as intended or both, such that claimants were exiting the system faster or not entering it. In any case this effect leads to a one-time reduction in frequency and severity for both third-party liability.
   ii. if claimants and their lawyers climb the learning curve, those who had left the system may begin to re-enter it and all claimants find ways to increase compensable damages resulting in a one-time change to a positive forward trend in claims frequency and claims costs.

Miller did not believe the 2004 and 2005 industry profits were greatly and unnecessarily accelerated by the product reform.

Miller noted that KPMG opined that the cap would be responsible for 70% of the savings and 30% would be due to the gross to net and collateral sources amendments.

Miller did not agree that the insurance cycle would have corrected the premium problems.

Mr. Joe Cheng, Actuary, testified that:

a. between 1986 and 2002 bodily injury claims were rising faster than the CPI by 28%;

b. between 1986 and 2002 bodily injury claims per 1000 vehicles had increased by 72%, which is a significant factor contributing to premium increases;

c. compounding the increase in claims by 72% and the inflation over the CPI at 28% presents 120% rising faster than the CPI;

d. premium increases in 2001 to 2003 were mainly due to higher bodily injury claims costs and the need to redress the accumulated premium deficiency;

e. auto insurance premiums in 2002 and 2003 increased mainly because of the high cost of bodily injury costs which were rising at about 120% more than the CPI. In hindsight, if insurers had realized that was occurring at that time consumers would have had to pay 45% more than the CPI in that period; and

f. if that trend continued, Albertans would find their own insurance premiums less affordable.
G. **Pinnacle Study 2017**

The *Pinnacle Study in Ontario*, which examined third-party liability bodily injury closed claims pointed to long recovery times and over treatment of injured persons, according to Marshall. In particular, it found that:

a. soft tissue injuries or associated with claimants accounted for 67% of the total claim payments in the study;

b. roughly 70% of the claimants were classified in the police report as having no, or minimal or minor injuries. Nonetheless the majority of the claimants developed serious and permanent impairment and the median time lost from work for these claimants was seven months; and

c. in Ontario annually about 25% of injured persons make bodily injury tort claims and to pass the verbal threshold, must produce medical evidence that they have suffered a permanent serious impairment of an important physical mental or psychological function a very high level of impairment from what were mostly soft tissue injuries.
The 2019 Claims and Cost Study, J. S. Cheng & Partners, Inc. November 7, 2019 established that:

a. Between the years of 2011 and 2017 Alberta had the lowest casualty rates among the 10 provinces. Since 2010 most of the claims cost escalation was found to be attributed to bodily injury claims which accounted for 71% of the change in claims cost per vehicle from 2010 to 2018.

b. Adjusting the 2010 claims cost per vehicle to 2018 by the change in the CPI, bodily injury claims cost accounted for almost 100% of the escalation.

c. Non-pecuniary damages are the major cost driver with an annual inflation rate of approximately 9.9%. A significant increase in the incidence of four injury types: chronic pain, psychological injury, concussions and injuries involving the temporomandibular joint was found. These accounted for 78% of the non-catastrophic claims in 2017. (4 top injuries)

d. There were found two compounding factors: first, the number of claims with one or more of these four injuries increased by more than 88% and second, once a claim was presented with one or more of these injuries, its settlement value multiplied by 6 to 8 times versus other non-catastrophic injuries. Combining these two factors showed these four injuries were the fastest growing injury segment accounting for 46% of bodily injury loss dollars in 2010 and 78% in 2017.

e. In 2017, 7% of claimants presented their claims with injuries involving TMJ and the claims amount was 15% of all bodily injury claims amounts.

f. This report recommended the government consider no tort or non-pecuniary damages for automobile accidents occurring in Alberta for a long-term solution to bodily injury claims cost. In return mandatory accident benefits would include a schedule of lump sum benefits for non-pecuniary loss. This solution was used in Québec in controlling bodily injury loss costs because the scale of benefits does not increase faster than the CPI.
1. The foregoing actuarial information shows a continuous trend in Alberta from 1974 to 2019 as first reported upon in 1990, namely, that bodily injury loss costs in the Alberta traffic accident compensation system have been increasing, often at more than twice the rate of increase in CPI and have been the primary cause of auto insurance premium increases.

2. The same trend was found in British Columbia and New South Wales, and elsewhere in Canada.

3. Until the 2003 reforms in Alberta, no substantive measures had been legislated to slow or halt the inflationary problem. The original intent of those reforms was directed to a much larger reduction in the tort component than was eventually put into effect.

4. In the result, the 2003 tort reforms produced only a temporary curb on the increase in bodily injury loss costs. From the latest Cheng closed claim study, it could be seen that the tort component after 2004 to 2019 directed its focus on elevating certain other non-catastrophic injuries above the cap, and produced a strong spike in bodily injury loss costs despite reduction in frequency of traffic accidents.
1. From the actuarial evidence reviewed, the Committee concluded that since non-pecuniary awards for catastrophic injuries and minor injuries have been capped, where those four categories of injuries isolated in the 2019 Cheng Claims and Cost Study were not, claimants in those four categories have been overcompensated relative to the minor and catastrophically injured.

2. The primary cause of high and continuing increases in auto insurance premiums in Alberta and in other tort jurisdictions is that uncapped bodily injury loss costs continually increase and at a rate well in excess of Consumer Price Index increases for other market commodities.

3. Efforts in other tort jurisdictions to provide a solution to the excessive effect of tort on the cost of bodily injury claims have failed despite well considered experiments to preserve and balance both tort and no-fault components, as for example, in Ontario and New South Wales. The actuarial evidence supports the conclusion that the only effective and sure means to secure premium stability and sustainability in the long term is to remove the tort components altogether and to replace them with the best and proven innovations resulting from the pure no-fault models implemented in other jurisdictions.
Consultations
The following summary documents consultations with service providers, industry experts, Legislative members and others during the auto insurance reform process in 2003. The original reform proposed was to impose a monetary limit (cap) upon most injuries except the most severe. There were many consultations some of which resulted in the cap being restricted to a far more limited group. Even with this substantial restriction, in the end there was no broad consensus supporting the reform package. As well, a failed challenge to the legislation was launched extending through some years before final determination by the Court of Appeal.

Summary of consultations on auto insurance reform in Alberta 2002-2004

In 2002, Alberta Finance (AF) released a discussion paper seeking feedback on issues including limiting loss of income awards to net rather than gross wages, preventing double recovery on lost income and medical and rehabilitation expenses for more than one insurance plan, providing enhanced benefits for person with catastrophic injuries and giving drivers the option of increasing their Section B accident benefits. It asked for feedback as to other measures to attain a balance between Alberta motorists and traffic injured.

2003

In January 2003 responses were received from Insurance Bureau of Canada (IBC), Alberta Civil Trial Lawyers Association (ACTLA), Insurance Brokers Association of Alberta, the Canadian Paraplegic Association and others. Following the consultations, AF drafted legislation tabled as Bill 33 but instead decided to conduct further consultation on broader ranges of options.

The GOA asked ACTLA and IBC to recommend a joint solution for automobile insurance reforms which the GOA would seriously consider. These associations could not agree on several major issues and thus issued separate responses. (April)

An implementation team was formed consisting of Donahue, Renner, Brian Kapusianyk, Gregg Hansen, Nick Geer, Shelley Miller and Alain Thibault. Messrs. Hansen and Thibault were insurance company executives. Mr. Geer was the then CEO of ICBC. Kapusianyk and Miller were Calgary and Edmonton lawyers respectively.

The implementation team was given briefing and background material pertaining to the Alberta insurance system, the process for rate setting, information pertaining to the Facility Association, the Motor Vehicle Accident Claims Fund, a summary of other Canadian auto insurance systems, complaints received from the GOA, an analysis of media coverage, submissions from ACTLA, IBC, information about reviews from Nova Scotia, New Brunswick and Ontario, numerous independent studies and a summary of Alberta whiplash decisions between 1992 and 2002.
The team consulted with various service providers and interest groups. The potential for a cap was the subject of much public discussion. (August).

The team began to look at the soft tissue injury definition but then a scare campaign was initiated that the government was going to cap all claims in the province.

The minor injury definition became very important to GOA Standing Policy Committee (SPC) and evolved several times due in large measure to feedback from SPC, stakeholders, insurers, legal industries, consumers and victim groups.

There was still a huge media campaign about minor injuries and increasing premium costs. Insurers were still applying to the AAIB for premium increases and the concern was that premiums were still increasing and reductions would reduce something already arising. Insurers were very upset. (October)

After consultation with victims, lawyers and other stakeholders, the team developed proposals presented to SPC on October 15, 2003.

At an SPC meeting on October 15, 2003, discussion with 25 to 30 Legislative members ensued as to what should comprise minor injuries which resulted in a consensus that they should consist of sprains and strains.

During the development of the minor injury definition and protocols, there were consultations from certain insurers, IBC and ACTLA for feedback.

After drafting the Minor Injury Regulation, relying on the advice from Dr. Larry Ohlhauser, Ohlhauser met with the team on November 7, 2003 and discussed the definition of minor injury. He engaged professionals and representatives of healthcare groups, proposed a model for consideration and enlisted a core working group to provide input as to the diagnosis and treatment of all soft tissue injuries. He interviewed clinicians experienced in treating soft tissue injuries and interviewed others. He prepared a presentation for meetings with consumer and injury groups including insurance and legal. He received feedback from IBC and WCB.

Ohlhauser engaged a core working group which originally included members of the Colleges of Physicians and Surgeons, Physical Therapists, and Chiropractors of Alberta, the Alberta Association of Occupational Therapists, Alberta Medical Association, Massage Therapists and Psychologists Associations.

Ohlhauser presented to the College of Physicians and Surgeons, the Alberta Medical Association and other service providers to explain the planned regulatory changes.

2004

In February 2004 the team consulted with interest groups and disseminated regulations to various organizations and received numerous responses.
At a meeting on May 4, 2004 the remaining regulations were deferred. Between this date and the next meeting certain service providers wrote to object to the proposed regulations.

Ohlhauser had meetings attended by over 600 practitioners across Alberta during September 2004. He completed preparation of an interpretive bulletin in September 2004 outlining new protocols for diagnosis and treatment of auto accident minor injuries which went into effect on October 1, 2004.

Dennis Gartner, then Superintendent of Insurance, (Gartner) considered the main aspect of the debate was the insurance industry demanding a cap and trial lawyers rejecting any cap being imposed.

Gartner admitted that the insurance industry, the trial lawyers, IBC and the brokers considered the consultation was inadequate but he concluded there was much consultation. He did not think it would have resulted in a consensus and his view was the consultation was adequate.

After the legislation was passed, insurance industry representatives objected to various aspects of the reform.

As well, a failed challenge to the legislation was launched extending through some years before final determination by the Court of Appeal.
Based on the foregoing, as well as review of experience from other provinces, the Committee concludes that automobile insurance reform is not a topic on which legislators can expect to secure broad support for the reasons that the subject is examined by so many different persons and groups from different angles, as well as from short, medium and long term perspectives. Previous attempts in Alberta to negotiate auto insurance reform for consensus among groups with vested interests showed that the original goal was diluted through disagreement among constituents, which resulted in half measures and undermined the long-term solutions the reform originally intended.
B. Findings from 2020 Public Survey

In addition to providing the Committee with specific terms of reference to develop and provide recommendations for reform of Alberta’s automobile insurance system, the Minister of Finance announced on December 18, 2019 that the Committee would engage with Albertans, industry stakeholders, and legal and medical experts as it gathered information and developed recommendations on how government can improve Alberta’s automobile insurance system.

In furtherance of the public engagement, the Committee invited all Albertans to respond to a questionnaire it prepared. The Committee’s designed survey included fifteen pre-set questions, one question inviting the respondents’ opinions on how to reduce costs of vehicle repairs or replacement and a final question inviting the respondents to provide any general comments they desired. A copy of the Committee survey is attached as Appendix 2A.

Service providers including insurers, legal and health professionals were specifically invited to respond to five pre-set questions with the additional option of providing a written submission to the Committee. Samples of the questions to service providers are attached as Appendix 2B.

The survey was communicated on February 18, 2020 to Albertans through the Government of Alberta website and through social media, which included links to the survey with a posted completion date deadline of March 6, 2020. A total of 45,571 completed surveys were submitted to the Committee throughout the period of 18 days for response.

In addition, the Committee issued invitations for responses via direct email to some 98 service providers to which it received 34 written responses. After review of those responses, the Committee invited follow-up meetings resulting in 21 interviews. Due to the procedures implemented following the Covid-19 pandemic, those interviews occurred via videoconference with consent of the participants.

After the deadline for receipt of the public survey responses, the Committee learned that, unfortunately, some interference had taken place which rendered 14,552 of the survey responses suspect and contaminated the overall results.

The Leger firm was subsequently retained to complete an analysis of the survey and results, and its report is attached as Appendix 2C to this Report. The characteristics of the 14,552 suspect results are discussed in the Leger Report under the heading of Data Quality.

The Committee also received criticism of the public survey, including that the questions were not framed properly, it did not provide adequate balance between options and that a survey that relies upon responses from only anonymous persons who choose to fill out a public survey is not as reliable as a survey which undertakes a random selection of the broader community to complete the array of viewpoints.

The results of the 14,552 suspect responses were excluded from consideration. The Committee took into consideration the criticisms of the public survey process and information provided in the 31,019 responses and addresses the criticisms as follows.
First, the Committee takes full responsibility for the flaws alleged present in the survey questions. However, the Committee can confirm that its survey was not designed to secure any specific oriented results but was modelled after a similar survey circulated recently in a jurisdiction with nearly twice the population of Alberta. All the questions in the Committee’s survey pertained to issues that were contained in the Committee mandate.

Although the Committee accepts that 31,019 responses in relation to the entire Alberta population of about 4.3 million may be fairly said to not clearly represent the views of the majority of motorists, it also recognizes that over 30,000 responses are a robust result in comparison to public surveys generally.

The Committee is grateful to those Albertans in excess of 30,000 who took the time to complete the survey since they demonstrated, at a minimum, that the topic is important and they are concerned.

At the same time, the Committee specifically accepts that the issues surrounding the topic of auto insurance reform are usually both complex and emotionally charged for the public and that seeking to obtain informed responses to questions that are concise but contain terms that are open to interpretation by the reader may be marginally helpful at best. This is one reason why the Committee has undertaken to include in this Report comprehensive and detailed explanations about:

a. auto insurance reform in Canada and elsewhere between 1946 and the present,
b. auto insurance reform in Alberta since 1990,
c. health professionals’ testimony in recent court challenges to auto insurance reform,
d. scientific studies showing better health outcomes in jurisdictions where tort was reduced or eliminated,
e. actuarial studies and testimony about rising insurance premiums well in excess of the Consumer Price Index increases due mainly to rising bodily injury loss costs, and
f. findings in exhaustive studies of other auto insurance models that have similarities to the Alberta compensation system listing in detail the problems with the operation of auto insurance in balancing the cost of auto insurance against the cost of benefits to traffic injured.

The Committee considers that in light of the foregoing, the Government of Alberta may wish to conduct a more individually focused and reliable survey that selects at random a group of consumers who are familiar with the terms pertaining to auto insurance reform adopted in this Report and desirous of providing informed responses.

The views of several service providers who delivered written submissions and those who attended interviews provided more detail in their responses. These are analyzed in greater detail in Section VIII C below. However, it should not be taken from those lengthier discussions in the interviews that the Committee overlooked the importance of the views of the true stakeholders, namely the motoring public and the traffic injured, whose interests the Committee kept top of mind in every stage of its investigation.

That said, the Committee accepts that the responses to the public surveys could not be viewed as definitive in informing the Committee’s final recommendations and did not include or compile in this Report the entirety of the contents of responses received. However, it carefully considered the findings of Leger which, with technological tools, was able to measure topics that were frequently mentioned and salient to the survey. Themes were
identified by linking key words and expressions which in turn represented common ideas in consumer responses.

The Committee found the most salient features of the responses as follows:

a. 63% of respondents indicated that they do not feel their premiums are fair and reasonable;

b. 56% and 64% respectively indicated they would prefer access to affordable insurance rates, as well as immediate to medical/rehabilitation and income replacement over the right to sue for a cash settlement;

c. 77% of respondents indicated that at-fault drivers should be subject to penalties which could include fines, convictions and higher insurance rates; and

d. 42% of respondents indicated their desire to retain their right to sue in the event of a serious permanent injury.

Respondents clearly indicated that they considered auto insurance premiums are too high, and greater emphasis should be placed on rewarding good drivers and lowering repair costs.

In response to the two questions (Q16 and Q17) dealing with consumer opinions, a total of 26,316 responses were received and frequently mentioned common ideas outlined below.

With respect to Q16, “reducing vehicle repair and replacement costs caused by collisions, theft, weather and the like”, the following items were frequently mentioned:

a. higher premiums for expensive cars and bad driving records;

b. development of a parts replacement strategy that pertain to the use of aftermarket parts, i.e. non original equipment manufacturer (OEM);

c. regulate repair shops, caps on repairs and insurance rates;

d. no penalties for hail, theft claims and the like; and

e. increasing deductibles.

With respect to Q17 inviting suggestions with respect to automobile insurance reform, the following were considered both frequently mentioned and salient:

a. making automobile insurance more affordable, offering more discounts and cost control;

b. cap profits and the like;

c. “incentives for good driving, prices do not reflect clean records”;

d. “preference for right to sue, don’t take away right to sue at-fault driver”; and

e. “larger healthcare access, full recovery of out of pocket expenses and provide necessary treatment.”

The Committee has in various other sections of this Report dealt in fuller detail with the subject of reducing automobile insurance rates in the long term so they are more affordable, accessible and provide sustainability.

The Committee did observe however that certain of the above listed issues, such as premiums for expensive vehicles, effect of bad driving records and reducing repair costs with equipment replacement strategy deserve specific comment.
Higher premiums for expensive vehicles

The AIRB regulates auto insurance premiums for all motor vehicles. Insurers utilize a system named “Canadian Loss Experience Automobile Rating” (CLEAR) to assess expected and actual claims experience of all private passenger vehicles, which takes into consideration elements such as repairability, damageability, risk of theft and other claim factors of each make and model of vehicle. They are then subject to a rating between 1 to 99. The cost of a vehicle does not necessarily pose a higher risk of loss or damage. On the other hand, vehicles more prone to being stolen, such as a 2009 Honda Civic, will be accorded a higher premium due to the higher proven risk factor. Some vehicles such as a 2016 Lexus may attract higher repair costs but may include added safety features that reduce the risk of accidents, which may result in a lower premium reflecting a blend of offsetting risks.

Bad driving records

Individual driving records are another relevant factor in ascertaining the appropriate premium for an insured motorist. However, as the law in Alberta makes the purchase of automobile insurance mandatory for all motorists, there is a requirement to ensure premiums are affordable. Any driver may commit the occasional driving error, but those who commit frequent errors or errors that constitute criminal driving conduct are expected to take responsibility for such conduct in the form of higher premiums to deter high-risk driving conduct.

To oversee the proper balance between high-risk driving behavior and affordable insurance for the majority of drivers, a system for developing premiums for such drivers known as the “Grid” has been in place in Alberta since 2004. This system requires a complete review to ensure fairness to all Albertans that responds to reflective premiums for good drivers and accessible and appropriate premiums for bad drivers. This system is discussed in more detail in VIII C below.

Development of an improved parts replacement strategy and oversight of repair businesses

One suggestion frequently referenced in the public survey to reduce auto repair costs was use of aftermarket parts in place of parts supplied by original equipment manufacturer (OEM).

The suggestion reflects the increasing costs of repair of vehicle damage due to a myriad of factors. Under the current system, newer vehicles are required to rely on original equipment manufacturers (OEM) for parts as well as service which has been shown to increase the cost of repair and narrow the number of repair facilities. Owners of newer vehicles are encouraged to attend pre-approved facilities with OEM parts with the implication that vehicle warranties may be at risk if other facilities or parts are selected.

The issue is whether motorists would be served as well if permitted to choose to repair their vehicles with aftermarket parts which may have been previously used or new, but manufactured by entities other than the original vehicle manufacturer.
A voluntary organization known as Canadian Automotive Service Information Standard (CASURE) exists, which provides a framework for the sharing, training, and vehicle repair information between OEM and the aftermarket industry to enable the aftermarket industry to operate and provide consumer choice for vehicle repairs and service. It emerged in response to a demand from consumers after some automobile manufacturers declined to make available all their services, for example, diagnostic tools, parts information and training information, to independent service and repair facilities.

Some other jurisdictions in Canada and other countries have or are developing “Right to Repair” frameworks for new legislation to require OEMs to release all relevant information to allow consumers to choose repair facilities and parts used. The Committee considers AIRB might investigate the benefits of enacting comparable legislation in Alberta to benefit consumers and reduce the cost of vehicle damage repairs.

**Caps on insurance rates**

The Alberta automobile insurance industry operates in a highly regulated environment and the regulator’s process of reviewing insurance rates before authorizing insurers to charge the same to consumers already endeavors to ensure the premiums fairly reflect the risk of loss and damage.

The Committee is concerned to ensure that Albertans understand that asking or demanding government to “freeze rate increases” is a process that does not address at the same time the cause of rate increases, such as expenses or claims costs, and as a result artificially suppresses rates and leads to unexpected rate increases in the longer term which does not achieve either premium stability or consumer protection.

**Making automobile insurance more affordable**

The Committee recognizes that of the more than 30,000 responses from Albertans, 63% responded that they do not feel their premiums are fair and reasonable. In its list of recommendations, it has considered the viewpoints expressed through these responses as well as others.

In the result, however, the Committee recognizes that even with an optimally designed survey, it would be impossible to secure certain voices, such as those individuals who have never been, but will be injured in traffic accidents, including, most importantly, the approximately 160 Albertans who will be catastrophically injured in motor vehicle accidents annually in the years to come.

The Committee recognizes that even with an optimally designed survey, it may not capture the viewpoints of those Albertans who have appetite to digest the entirety of the analysis contained in this Report in order to make more informed responses, or otherwise do not have the time or appetite to contribute to the many faceted dialogue due to other understandable circumstances.
It is for these reasons that the Committee has taken pains to:

a. gather information from as many sources as practical on as many aspects of the operation of the current system that pertain to:
   i. the cost of insurance premiums;
   ii. the impact of the cost of compensation to traffic injured; and
   iii. the increasing costs for property damage,

b. synthesize and analyze all such information in order to make cogent and comprehensive recommendations so that the Legislature can determine what reforms to the current auto compensation system will best serve the combined interests of the only true stakeholders, the traffic injured and the insured motorists.
1. The responses to the public surveys could not be viewed as definitive in informing the Committee’s final recommendations, however, it carefully considered the findings of Leger and noted the following most salient features of the responses as follows:

a. 63% of respondents indicated that they do not feel their premiums are fair and reasonable;

b. 56% and 64% respectively indicated they would prefer access to affordable insurance rates, as well as immediate access to medical/rehabilitation and income replacement over the right to sue for a cash settlement;

c. 77% of respondents indicated that at-fault drivers should be subject to penalties which could include fines, convictions and higher insurance rates; and

d. 42% of respondents indicated their desire to retain their right to sue in the event of a serious permanent injury.

2. Respondents clearly indicated that they considered auto insurance premiums are too high, and greater emphasis should be placed on rewarding good drivers and lowering repair costs.
C. Submissions of Insurance Industry Service Providers

Property Damage Product Reform

Under the current system in cases where the insured motorists have optional property damage coverage, sustain property damage and were not at-fault, their insurers will arrange for the repairs and then apply time and resources to recover the amounts paid, including the motorists’ deductibles from the at-fault motorists’ insurers, under a legal process known as subrogation.

The Committee found broad agreement from the service providers that the property damage component of the auto insurance compensation system should be converted to a no-fault model known as Direct Compensation Property Damage (DCPD).

Under the proposed DCPD, the insured motorists’ insurers will process the costs of repair directly in any event of fault, and thereby eliminate the time and administrative costs of subrogation. A driver who caused the collision will continue to be found responsible for the purpose of assessing appropriate rate adjustment. This reform will deliver a simpler, faster claims process, improve the communication and service to the insured, enable the insurer to predict future loss costs more accurately and likely result in some reduction in premium costs. This model has been implemented successfully in Ontario and the Atlantic provinces.

Reforms to address risky driving behavior

The Committee also found broad agreement from the service providers in favour of increasing enforcement and penalties for high-risk driving offences to punish and deter such offenders. The service providers also consistently supported maintaining data to inform increased and wider spread education about the dangers and consequences of risky driving behavior.

The Committee also heard that the graduated licencing program was widely viewed by young and new drivers as designed to build revenue rather than promote safe driving practice and that the efficacy of this program and driver training programs, including retesting of penalized drivers, should be reviewed to improve outcomes of intended goals.

Reform of the Regulatory process

Rate Regulation

As stated in the Osborne report, the goals of rate regulation should be premium fairness measured against sound insurance principles and market stability to benefit the consumer. The Committee agrees that appropriate rate regulation should provide a cost-efficient mechanism to ensure premiums charged by insurers are fair, predictable and ensure market stability.
There are two types of regulation in provinces where automobile insurance is delivered by the private sector, neither of which contemplates the setting of rates by the regulator. These are, with some modifications, (a) prior approval and (b) file and use.

Prior approval regulation requires the filing and regulatory approval of proposed rates before they are used. Alberta has maintained a prior approval system since 1970 which was provided by an independent agency created by statute. Its jurisdiction was confined to the compulsory section of the policy. Under legislation, it was subsequently replaced by the Automobile Insurance Rate Board which reports to the Minister of Finance and continues the prior approval model.

Under the file and use model, the insurer may put proposed rate changes into effect after filing the same with the regulatory agency. The filing typically includes evidence on losses, expenses and underwriting profits or losses and the proposed rates. Hearings may be held if the regulatory body has questions about the submission.

The Committee is of the view that a privately delivered auto insurance system requires some form of outside review of mandatory and optional insurance premiums to:

a. ensure external protection of the consumer against unreasonable or unjust premiums;

b. provide a modifying influence on insurer conduct;

c. ensure insurers’ practices are transparent, and accord with acceptable governance practices; and

d. ensure market stability, accessibility and fairness.

Many insurers suggested as a more effective model:

a. transforming the rating oversight model to file and use;

b. greater transparency in the application of the legislation and regulations;

c. eliminating duplication between the regulators’ roles; and

d. oversight of insurers led by principal-based regulation.

Specifically, it was recommended that:

a. there be a separation of the role of the AIRB from the Alberta Superintendent of Insurance so that the latter would focus on regulation, compliance and solvency of insurers;

b. the AIRB would be, and be seen as, independent from government, objective, empowered with full jurisdiction over rating issues; and

c. with such transformation, the AIRB could
   i. respond more quickly to changing consumer needs and market conditions;
   ii. continually calibrate the existing regulations in the best interests of Alberta motorists;
   iii. deliver more consistent enforcement and oversight of the compliance requirements of insurers to provide a more responsive regulatory environment for participants; and
   iv. promote modernizing regulations to enable more digital capability and frictionless consumer processes.
The Committee is of the view that so as to ensure minimal cost to the economy and the consumer, a reformed regulatory model should not be overly intrusive in the rating procedures so as to inhibit market innovation to the detriment to consumers where less intrusive measures will adequately resolve perceived problems, facilitate market innovation, competition and increase product choice for the benefit of consumers.

**All comers’ rule and the Grid**

As part of the auto insurance reforms in 2004, the Government of Alberta introduced two regulations, one known as the “all comers rule” which required auto insurers to accept all applications for automobile insurance for private passenger vehicles at a reasonable premium and another known as the Grid rating system (Grid), the goal of which was to define and separate motorists with high risk for accidents from those with low or no risk driving behaviors.

There is broad consensus among auto insurers, the Facility Association and some regulators that the Grid is no longer achieving the goal originally intended. Instead, it has become cumbersome, complex and costly to administer and most critically, low or no-risk motorists are subsidizing high-risk drivers. At the same time technical innovations have provided insurers with greater pricing sophistication and in turn ability to differentiate between low and high-risk drivers.

However, there is not broad consensus as to what should be implemented in place of the all comers’ rule and Grid. On the one hand, regulators must ensure that all motorists have a reasonable opportunity to purchase the minimum mandatory auto insurance product at a rate that properly reflects their own risks. On the other hand, insurers should be encouraged to utilize their superior technological assets to better deliver varied pricing to motorists at affordable levels, subject to the requirement to adhere to fair marketing practices. History has shown that some insurers or future participants have the appetite to further segment the group of drivers who cannot demonstrate long accident free history yet in other ways are provable low risks.

**Territories**

The Committee heard broad consensus that the current practice of maintaining only four rating territories for Alberta was no longer serving the purpose originally intended, which was to accurately assess accident risks according to geographic location. Current data collectable by insurers indicates that other more appropriate and accurate territorial factors affect accident risk and the existing four territory restriction results in unfairness to many insurers.
Reform of the *Judgment Interest Act*

The Committee also found broad agreement from the service providers for amendment of the *Judgment Interest Act* to make the rate for non-pecuniary general damages correspond with the prevailing rate of judgment interest for pecuniary losses.

Some service providers also suggested removal of the judgment interest for non-pecuniary damages while others, including some legal providers, suggested that such interest not apply for the first two years after the date of loss.

Optional Insurance Products

User-based insurance

The Committee heard submissions about the benefits of a new universal telematics tool, known as user-based insurance (UBI) that could improve the insurers’ task of proper risk rating of insured motorists. The concept is that a device is activated when a motorist uses the vehicle and objectively tracks driving habits, including miles driven, braking habits, acceleration and time spent driving. Motorists who agree to use of the device will benefit by receiving a discount to their premiums if the information collected demonstrates the operator has low risk driving practices. This tool can objectively and, arguably, fairly reduce or eliminate cross subsidization.

The Committee heard that some insurers are offering a UBI program at no cost on a limited basis with the result that those motorists whose collected information establishes low risk driving behavior earn discounts on the price of their premium.

It was suggested that increased education and endorsement of the UBI programs could foster greater acceptance of its use for more of the motoring public and encourage better education and encouragement of the benefits of good driving behavior for both new and experienced motorists. It was suggested that wide use of such programs would induce safer driving habits, improve traffic safety and reduce accidents.

Some insurers recommended that such programs be made mandatory to allow consumers to benefit from lower rates due to lower usage or due to provable good driving behavior. On the other hand, concerns were also expressed about the disadvantages of making the use of such programs mandatory. First, there was concern that would adversely affect certain motorists to the extent that their insurance premiums would be unaffordable. Second, there was concern that a mandatory program would infringe a motorist’s right to privacy or produce unfair results. Third, there was a concern that not all auto insurers currently operating in Alberta have the resources to deliver such programs and would be adversely affected from a competition standpoint. One regulator expressed concern that such programs might result in adverse selection of certain motorists, contrary to public policy.
Legislation to mandate use of winter tires

Service providers were in accord that the government should legislate mandatory use of snow tires to reduce collisions and serious injuries. The 2019 Cheng Claims and Cost Study (Cheng) noted that the study conducted by the Ministère des Transports du Québec in 2011 revealed that road collisions in winter and serious injuries due to winter road collisions decreased by 5 percent and 3 percent, respectively. It also noted that after the first two seasons of enforcement it confirmed the use of winter tires from December to March 15 would reduce the accident rate. Cheng noted that collision rates increase from October to January. Others indicated the required use of winter tires should extend to March.

The Committee is satisfied that required use of winter tires would contribute to prevention of collisions and fatalities and reduction of health and hospital emergency costs.

Section B Benefits

The Committee also received reports of concerns as to whether Section B benefits are serving the needs of Alberta motorists. It was also reported to us that in too many instances traffic injured, usually with legal counsel, negotiate a one-time lump sum compensation which is distributed after deduction of the legal fee. The injured person will divert some or all of the remaining cash to unrelated matters while their injuries remain unresolved. The result is that they must resort to the provincial health care system which diverts resources that the insurance claim was intended to cover and ongoing medical treatment for more serious injuries must be borne by social assistance agencies, and, ultimately the tax payers.

One group contended that traffic injured rarely utilized the entirety of the limit of Section B accident benefits. On the other side, concern was expressed about increasing legal representation on Section B claims and that Section B claims costs were escalating by concerning percentage amounts in recent years. In both cases, optimal utilization of these benefits was not being achieved.

Others expressed concern that Section B benefits did not provide full income replacement and in cases of long-term serious injuries, the Section B Benefits are insufficient or do not reflect situational circumstances.

The Committee observed insurers’ preparedness to now design competitive and well-structured optional income replacement coverages for consumers at the time of purchase of their auto insurance policy to elect to purchase additional amounts of coverage to ensure compensation for the entirety of their provable income losses.

The Committee considered that if those optional products were subject to reasonable oversight by an independent traffic accident medical expert regulatory body it would ensure appropriate treatment plans were prepared and followed with regular review and adjustment based on data collection feedback and new health treatment innovations, such optional products could address concerns about incomplete coverage for some traffic injuries.
With increasing availability of these options, however, there were also calls for balancing of the greater coverage capacity by the establishment of a maximum recovery standard to orient all participants, including claimants and health providers, toward the goal of restoring the traffic injured as far as possible to preaccident health.

A maximum recovery standard would encourage all participants to move toward closure of the claim at the appropriate recovery milestone, which goal would be better supported by the removal of monetary gain incentives.

**The tort/no-fault issue**

The greatest area of differing opinions was expressed in the area of monetary payments for traffic injured. A spectrum of views ranging from leaving the tort compensation component, with a minimum of “tweaks”, as is, to the view that tort components were the primary cause of the increases in premiums and accordingly should be fully extinguished or largely diminished, except perhaps a short term retention of tort for a better defined category of catastrophically injured.

It is important to recall that the current auto insurance model in Alberta is in fact a blend of tort and no-fault compensation, otherwise also described as a hybrid or threshold model.

When Albertans, either individually or as a group, say they favour or oppose no-fault, we take them to mean that they oppose or favour enhancing the existing no-fault component of the current system to further reduce or eliminate the tort component.

Those who advocated a full or pure no-fault model intended that all traffic injured receive early and appropriate health treatment, individual assessment and treatment by certified collaborating medical and health experts and expert panels of claims assessors to evaluate and determine their income losses and care costs, past and future. They recognized that an alternative regulatory tribunal making final determinations as to the extent of recovery and impairment and extent of pecuniary losses would provide a replacement to the individual evaluations currently supplied by the tort system. They also recognized that a quick, efficient, and independent alternative appeal process free of legal disputation features would be required and desired.

Another key component of the tort/no-fault debate, apart from proper or enhanced health treatment for all traffic injured, is whether the extent of monetary compensation afforded by the current model should be reduced.
Reported weaknesses and abuses of the current tort/no-fault model

Discourages full compliance with treatment and encourages sickness behavior

Some of the industry participants expressed that the current court system encourages the traffic injured to delay their own recovery in the hope of later monetary compensation and encourages service providers to increase treatments for monetary gain. There is scientific and other data to support this view, as set out elsewhere in this Report.

Negotiated lump sum settlements leave some traffic injured untreated and encourage claims where no treatment is required

As noted with the concerns about lump sum settlements under Section B where the injured person will divert some or all of the remaining cash to unrelated matters while their injuries remain unresolved, which leaves ongoing medical treatment for more serious injuries to be borne by social assistance agencies, and, ultimately the tax payers, the Committee considers these same concerns may arise under the tort recovery model.

Exaggeration or dishonesty in claims behavior for monetary gain

Service providers have reported cases to us where injured claimants have exaggerated the extent of injuries and losses but have still been awarded substantial monetary court awards. The concern these kinds of cases pose is that other claimants will be encouraged to exaggerate claims. Some service providers have reported concerns about vulnerable traffic injured pursuing litigation with the hope of a future high cash payout while their health, physical, emotional and financial, remains sub-optimally addressed.

The extension of the above concern, also reported by insurers, was increased instances of fraudulent claims, which required increased costs to detect and disallow.

Diminution of the intended Effect of the Minor Injury Regulation and increased claims

We have heard that the effectiveness of the Minor Injury Regulation and cap has substantially deteriorated since 2011. It was reported to us that:

a. between 2011 and 2019, bodily injury loss costs increased by 70%;

b. sprains and strains with no impairment decreased from 68% to 42%;

c. sprains/strains lasting longer than six months increased by 700%;

d. concussion injuries increased by 500%; and

e. since 2012, payouts for pain and suffering increased by 40%.

We were not convinced that the majority of these percentage increases were due to greater medical advances or evidenced better identifying injuries, especially in the case of the 700% increase in sprains/strains lasting longer than 6 months.

It was recommended to us that cash settlements for traffic injured should be disallowed where injuries remain unresolved, that compliance with medically designed treatment plan should be a mandatory condition
of settlement and that such ongoing medical treatment should also be incorporated under the Section B accident benefits.

This concern, repeated to us frequently, refers to the non-pecuniary general damage award legislated by the Minor Injury Regulation in 2004, which currently stands at $5,296, as it is indexed for inflation. It was expressed that this award is claimed by many traffic injured instead of receiving the treatment they need. It also implies that some of those claimants may not have sustained a physical injury requiring any treatment. This means that such payouts are not benefitting the traffic injured the legislation intended to benefit, yet result in ongoing and increasing costs to motorists.

It was also reported that the current model does not encourage early return to work and thus income benefits should be scaled to produce incentives for that goal. Most quarters who advocated a more robust no-fault model supported a well-defined and thought out approach to standardize evidence-informed treatment plans, rules on experimental procedures and medications, and independent medical assessments to eliminate the adversarial behavior in the current model and provide a suitable substitute for individual assessment of injuries, losses and damages.

It was also recommended that generous benefit levels with affordable rates with income replacement at levels to cover most income earners would eliminate the need for tort. Insurers expressed an appetite to provide excess insurance for high income earners and supported regular indexing of benefits to ensure coverage levels were current.

**Substantial percentage increases in Section B Claims**

It was reported that medical rehabilitation costs under Section B had increased from 2011-2018 in ranges of 63% - 246%. The Committee was concerned that such increases might be partly due to suboptimal health treatment resulting in poor health outcomes.

**Uncertainty caused by Court decisions redefining the wording of regulations**

It was viewed by many participants in the current compensation system that the original intent of the Minor Injury Regulation has been eroded by the effect of court decisions reinterpreting the definition of minor injury and promoting uncertainty by declining deference to the Certified Examiner process contrary to the original legislative intent. One insurer reported its experience that the number of bodily injury exposures settled within the cap has decreased by 25%.

Legal service providers argued that the courts decisions are the sole and proper arbiter of how the legislation should be interpreted and if further litigation around the boundary of the threshold has resulted in a spike in bodily injury cases, that is how the tort system is intended to respond.

Some contended that between 2004 and early 2012 there was an accepted understanding among the participants about what injuries were subject to the limits of the regulation (i.e. the cap limiting the amount of monetary recovery) which resulted in stability of premiums for a short time. However, after a court decision in January 2012, a certain category of injury was ruled to be outside the cap which effect resulted in increased bodily injury claims costs. In turn,
some insurers reported the result produced a 6.4% cost increase annually since 2014 and added pressure to the premium levels.

In May 2018 the Government amended the Minor Injury Regulation to reverse the effect of the court decision but participants agree that this intervention leaves ongoing uncertainty about the impact those changes will have on the extent of future increasing bodily injury loss costs and in turn, ongoing premium instability.

What is often overlooked in this gradual ratchet effect on bodily injury monetary compensation awards is that the cost of automobile insurance is never adjusted downward. Instead it creates a consistent, sometimes gradual, sometimes sharp, increase. The continuing uncertainty benefits neither of the two true stakeholder groups, the traffic injured and insured motorists. The endeavor to maintain the level of auto insurance premiums at a threshold that the majority of insured motorists can financially bear, while all the service providers’ fees gradually increase, is not the optimal mechanism for delivering affordability, availability and sustainability of the auto insurance system in Alberta.

What is often also overlooked through a longer lens, namely the period between 1990 and 2018, is that the only interval where premium levels decreased was between 2004 to 2011, following the 2004 modest tort law reform. The eventual erosion of the law reform caused the trend to revert to an upward trajectory from 2012 to 2018. This trend was continued with period of price instability between 2018 and December 2019. This is ample evidence in the view of the Committee that the current model does not provide long term stability or certainty. For those contending that the current model requires only tweaks, the Committee concludes that none would provide stability, certainty or sustainability.

Except for personal injury lawyers, all service providers emphasized different examples from their own experience of the costly burden of litigation produced in the current system. While those costs are paid by insurers, they are ultimately borne by insured motorists and those traffic injured who are also insured motorists.

Some service providers recommended that a specific definition of what constitutes a catastrophic injury should be defined in the legislation or regulations and the right to sue for tort damages for traffic injuries should be limited to the category of those catastrophically injured. Others recommended all catastrophically traffic injured should receive full no-fault coverage even where they cannot prove their injuries were due to a negligent driver.

Insurers have consistently expressed a developing appetite to deliver optional medical and disability products for consumers who desire additional protection in case the benefits provided by the standard auto product do not cover their specific medical expenses. This appears to be intended to deal with the most serious injuries. It appears insurers have appetite to provide in those products an option to the consumer to litigate the measure of the awards in court.

**Expert fees in tort cases reported to be excessive**

The Committee also found broad agreement from the service providers that the cost of expert fees in tort cases has continued over time to increase dramatically.

The amount of fees chargeable by experts is not regulated. Experts may charge their customers what the market will bear. When those fees are required to be reimbursed by an opposing party in the form of court costs, there is a limited right for review. For the most part,
the defendants insurers become responsible for the amount that the claimants’ lawyer agreed to pay as expert fees.

Various insurers reported that the fees charged by subject matter experts, including medical doctors, engineers, and economists, were adding significant costs to tort claims. Insurers estimated the amount of expert reports at the conclusion of a claim to amount to 1/3 of the settlement amount paid to the claimant and, in turn, ultimately borne by the insured motorists.

One medical expert active in the injury trial process explained that the prevailing fee for medical reports had increased from a range of $800 in 1986 to $3,000-$5,000 at the present date. He himself expressed surprise at how high the range had escalated between 1986 and 2010.

However insurers, self-insurers and some legal voices confirmed that subject matter expert reports fees frequently now range from $20,000-$25,000. For those cases where multiple expert reports were sought from economists or medical experts, in the same or overlapping disciplines, the combined amounts are escalating to ranges of 5 and 6 figures.

Insurers reported cases in which economists’ fees were very high because the expert was asked to provide not simply one report but also ongoing advice over the course of the legal proceedings. Others gave examples where two economists had been retained on one file by the claimant’s lawyer to opine on different aspects of the pecuniary losses. We also heard that multiple expert reports costs were presented on individual files for an array of medical experts retained to opine on differing injuries.

Insurers reported that even where they attempted to tax or dispute the propriety of those amounts before a court or a taxing officer, they were rarely successful.

Insurers gave specific examples, including one where the trial judge commented unfavorably on the presentation of multiple health experts in a case that was neither difficult nor complex, but the costs required to paid by the insurer were in the range of $400,000 all the same.

Insurers’ counsel retain for the defendant opposing experts so that large fees are also incurred on the defence side which add to the ultimate cost of claims.

In a follow up discussion the medical expert commented that the fee levels regulated by the Worker’s Compensation system for medical experts were far lower, but cautioned that reducing the maximum fee for medical experts in the Alberta tort system to such levels would deter those experts from delivering expert opinions.

This one example was informative for several reasons. First, it illustrated the extent of inflation of medical expert report fee levels over time. Second, it revealed that current expert fees were in some cases 5 times as high as he thought. Third, it revealed that medical expert opinions were provided in pure no-fault injury compensation models for even lower levels than his own experience in the tort system. Fourth, it revealed that medical experts have a diminishing appetite for participating in tort cases unless it is sufficiently remunerative.
Concerning examples of undesirable practices to secure optimal tort awards

Insurers expressed the concern that claimants’ lawyers had no limits imposed as to the number or timing of experts that could be secured prior to trial while defendants had limits on their numbers of follow up defendant medical examinations and the timing before trial at which they can secure the same and such inequality is exacerbated by the excessive delay in booking trial dates.

Concern was also expressed that some claimants’ lawyers would use, as a negotiating tactic with a defendant insurer, the prospect that if an initial settlement proposal was not accepted early in the litigation phase, the claimant’s lawyer would retain numerous experts and the fees for same would be added to the bill of costs for payment by the insurer at the end of the process.

Concern was also expressed that defendant insurers often do not learn of a claim by a traffic injured until 2 years after the date of loss when a lawyer must issue a statement of claim to preserve the limitation period. They have no early access to the information about health treatment or income losses and cannot participate in the recovery or return to work of the traffic injured.

As to the concern expressed that that traffic injured seeking recovery under Section B benefits would retain a lawyer to negotiate a lump sum settlement of their benefits and might spend the remaining funds unwisely and then have resort only to the Alberta health care system, legal service providers told us they personally did not engage in this practice. One suggested there should be legislated or regulated prohibition disallowing insurers from entering into lump sum settlements of Section B benefit claims.

Since these areas of the litigation process are not independently regulated and the personal injury legal community does not have the authority to police such excesses, there is no method by which to determine the extent of such practices, either in the Section B realm or elsewhere in the tort system. Accordingly, the reported existence of such practices together with absence of independent regulation is another matter of concern to the Committee.

Ever increasing amounts for various heads of damages

Insurers have reported that pecuniary and non-pecuniary damage awards continue to escalate and expressed related concerns including court awards increasingly allowing:

a. only small deductions to awards for failure of a plaintiff to mitigate;

b. awards for loss of housekeeping in addition to non-pecuniary general damages where previously those awards were included as a component;

c. loss of earning capacity awards without clear calculation of how the loss was arrived at;

d. duplication of income losses that include both loss of competitive advantage and loss of earning capacity; and

e. generous awards even after finding the plaintiff was not credible.

Insurers expressed concerns that such developments have the unintended consequence of encouraging claimants to pursue tort actions for the hope of increased monetary claim with little downside risk. The tort
system contains no additional mechanism to monitor or control the extent of such examples of escalation.

These matters are concerning to the Committee. It knows that Albertans expect their premium dollars to be allocated to actual and reasonable losses and not increasing numbers of cases where all the surrounding circumstances suggest plaintiffs have secured more than full compensation.

Cost of legal service providers

Except for legal service providers, who strongly disagreed, the Committee found broad agreement from other service providers that mandatory automobile insurance would be more affordable for motorists if a significant amount of or all legal costs were removed from the system. There was consensus that this could be accomplished by enriching first-party accident benefits and limiting or eliminating the right to sue.

Some insurers expressed concerns about lawyers’ contingency fee arrangements with traffic injured including the following:

a. there is no restriction on the amount the plaintiff lawyer may negotiate with a claimant/client;

b. while they may enable claims that have merit to be brought, they also encourage the advancement of claims that have none;

c. although lawyers justify contingency fee agreements and the percentages they charge on the reasoning that the lawyer assumes the risk of the litigation, some argue that in many cases liability is not in dispute and there is little risk that the lawyer will not secure some recovery, so the risk is minimal or non-existent;

d. litigation lawyers now have access to litigation loans and adverse cost insurance and this further reduces any risk of loss to them; and

e. people who rely on a contingency fee arrangements are often vulnerable due to poverty, impact of injuries, educational status or other social disadvantages. [See: M.S. v. DM Junior et al 2014 ABQB 702 (Canlii)]

Accordingly, some have advocated, as with expert witness, fees for caps on lawyer contingency fees.

The Committee conducted some exploration with legal service providers as to the percentages of fees charged under contingency agreements. The legal service providers stated first that contingency fee agreements are private and none volunteered to disclose any of their own fee structures. They seemed prepared to opine that fees could range from 22.5% to 40%. Only one specific example was provided of one, not in their group, who charged a 35% contingency fee for whatever stage the case was settled.

The Committee concluded from this information as well as its own personal knowledge of prevailing contingency fee percentages that that it was appropriate to assume a calculation of 33% as the average percentage recovery of plaintiff lawyers in Alberta traffic injury claims.

Concerns have been expressed that after impecunious traffic injured have eventually settled the claim years later, a large component or even most of the ultimate settlement has been reduced by legal contingency fees and fringe lenders’ fees.
Fringe lenders

The Committee also explored with the legal providers the participation of fringe lenders in the automobile insurance system in Alberta. They told us fringe lenders are financial companies that offer loans to traffic injured persons to help pay for their immediate financial requirements. They exact interest payments on the loans that may range from 24-30%. In addition, they will charge an administration fee which becomes payable if the loan has not been repaid within six months. Repayment is usually secured by an assignment of settlement funds and direction to pay.

Lawyers have expressed muted views about fringe lenders. Some say they discourage their traffic injured clients from taking such loans. Some take a neutral position. Some say if not for their involvement, some traffic injured would not be able to maintain a lawsuit.

No one has measured the effect of these fringe lending service providers who deduct their fees from the traffic injured ultimate settlement.

The Committee considers the comments of the Alberta court in M.S. v. DM Junior et al, 2014 ABQB 702 (Canlii) stating that people who rely on contingency fee arrangements are often vulnerable due to poverty, impact of injuries, educational status or other social disadvantages apply with equal or even greater force in respect of fringe lenders.

The foregoing circumstances indicate to us that the lack of regulation of the activities of all service providers in the tort system contribute to continually escalating costs for the traffic injured and in turn, the motoring public. As well, there may be ongoing practices purportedly to benefit them, but which are not in their long-term best interest.
Evidence-informed health treatment for traffic injured

The Committee also found broad agreement from the service providers in favour of immediate and better health treatment for traffic injured.

Other than legal service providers, service providers submitted that removing or reducing the tort component would lessen the strain of litigation demands on medical and health professionals whose main professional purpose was treating traffic injured.

Service providers made varied suggestions as to the optimal alternative for health treatment for traffic injured, including:

a. support early, active, and appropriate evidence-informed treatment aligned with and for traffic injuries;

b. pre-approved treatment frameworks for common injuries based on evidence-informed care with associated schedules and policy limits;

c. expedited access to care from prescribed providers;

d. reducing transactional administrative burdens in the system;

e. reducing duplication of services and overutilization;

f. optimize appropriate treatment modalities with consistent quality improvement to achieve recovery timeframe of 2 to 3 years for most injuries;

g. codifying causation so that there can be reasonable finality of injury claims and proper evaluation of the injuries caused or contributed to by the traffic accident as distinct from other causes; and

h. Establishing
   i. definitions of serious and catastrophic injuries;

ii. definitions of chronic pain and psychological injuries;

iii. expert medical panels to make conclusive determinations as to which claimants fall into which categories;

iv. treatment regimes that will include an intended resolution date for the claimant and the service providers;

v. an independent oversight body to supervise treatment providers to ensure that health providers are following evidence-informed guidelines in regimens to ensure optimal recoveries for traffic injured;

vi. a structured review process for traffic injured who are not recovering within the normal treatment guidelines or whose recovery has plateaued so that they can be referred for alternative treatment;

vii. clear return to work guidelines for claimants seeking disability payments to encourage gradual return to work programs, modified duties or retraining for different occupations;

viii. regulation of fees for health and dental health providers;

ix. means of collecting and aggregating health treatment data to ensure ongoing monitoring and evaluation of care programs, outcomes and continuous improvement of first-party compensation based on reliable data; and

x. implementation of an electronic system for auto insurers in conjunction with a traffic injury regulator, health care and ancillary service providers to expedite transmission and processing of claim forms.
Evaluating the value of the tort component of the compensation system against the burdens

Delays and increased costs due to tort system

Legal service providers maintained that preserving tort actions for traffic injured was an essential civil right. However, the majority of service providers endorsed the notion that tort actions have an adverse effect on health recovery and claims duration. That majority expressed concern about the delays resulting from the tort system which added costs to settlements and delayed resolution to the detriment of traffic injured.

Legal service providers conceded that the court system was overburdened and thus delays were experienced in setting trial dates or judicial dispute resolution (JDR) dates. Dates for long trials were currently being set for 2023 and 2024. However, since they rarely take cases to trial, they said it does not have a large impact in the majority of cases. On the other hand, insurers reported that many of their litigated claims do not resolve even by settlement until between 3-4 years and occasionally from 5-8 years after the date of loss.

Lawyers also conceded that it was increasingly difficult to book JDR dates with the judges in a timely way because other types of court actions often took priority over traffic injury cases.

Lawyers indicated when they preferred to expedite a settlement process and not endure long delays, they would propose mediation. They said mediators’ charges were in the range of $3,000-$6,000. The original intention in mediation agreements was that the parties would split the cost of the mediator in order that both sides took an equal risk and would be equally motivated to arrive at a resolution. The practice was soon replaced by the acceptance by insurers to pay the entirety of the mediation fee. One insurer indicated that 7% of its litigation claims did not settle until mediation.

The Committee concluded that based on input from service providers, the system is likely incurring costs due to mediation which might have been avoided if the JDR system was not overloaded.

In response to requests to the Court of Queen’s Bench of Alberta for statistical information concerning traffic injury lawsuits, the following information was provided:

a. Between January 1 and December 31, 2019, 8,562 Statements of Claim for motor vehicle accidents were filed province-wide in the Court of Queen’s Bench.

b. Between January 1 and December 31, 2019, 6,393 Discontinuances of Statements of Claim for motor vehicle accidents were filed province-wide in the Court of Queen’s Bench.

d. Of those Discontinuances, 1,104 originated from Statements of Claim for motor vehicle accidents also filed in 2019.

e. Between January 1, 2019 and December 31, 2019, 429 JDRs were scheduled province-wide. Of those JDRs scheduled, 165 proceeded.

f. The court did not schedule JDRs between January 1-17 and 27-31 2019 due to other commitments.
g. Six JDRs were scheduled in Edmonton in January 2019 of which 4 proceeded. 17 were scheduled in Calgary in February 2019 of which 10 proceeded.

h. Typically, the court has scheduled JDRs for a full day but due to the current pandemic is now considering scheduling JDRs for half days.

**Benefits of retaining Tort**

Legal service providers were supportive of proposals from other service providers to strengthen traffic safety measures, reform of the property insurance product and changes to the regulatory regime to improve the environment for rating. Their suggestions to reduce costs regarding the tort component of the system were:

a. to amend the rate of pre-judgment interest;

b. to restrict claims for judgment interest until an action has been commenced;

c. to prohibit insurers from entering into lump sum settlements in Section B benefit claims; and

d. to introduce caps on expert fees.

The legal service providers contended that:

a. there was no compelling evidence that the system required enhancing the no-fault features of the current system;

b. mere “tweaks” such as those listed above would be sufficient to restore the affordability, availability and sustainability of insurance premiums to Albertans;

c. the evidence they had seen did not present adequate proof that the system was becoming unstable; and

d. the veracity of claims by other service providers that the costs of claims incurred was exceeding the amounts of premiums collected was questionable.

The viewpoints in the above paragraph were not shared by any of the other service provider groups.

**Case for fundamental reform**

The Committee evaluated all the submissions presented on this issue, including groups that were self-insurers, and concluded there are real and costly obstacles present in the tort system that adversely affect the best interests of the traffic injured and the insured motorists of Alberta, some of which include the following:

a. delays in resolution of injury claims;

b. negative impact on health outcomes of traffic injured due to intervention of litigation into the medical treatment regimen for traffic injured;

c. no provision in the tort system for litigation support providers to mitigate such adverse consequences for the traffic injured or the motoring public including the harmful effects of delays, increased costs, and continually escalating costs of settlement recovery;
d. the numbers of medical appointments and expert reports arranged to schedule for traffic injured clients ostensibly to maximize their financial recovery, can prolong the plaintiffs’ sickness experience long after the tort action has been concluded; and

e. delays in claims resolution do not adversely affect the fee recovery of litigation support service providers including court experts, mediators, health corporations that provide litigation support, fringe lenders, investigators and the like.

The Committee recognized the underlying concern of legal service providers that fundamental tort reform could have substantial negative impact on their businesses. Accordingly, it took careful account of all their submissions. Nevertheless, it was necessary to recognize certain weaknesses in their submissions which are documented here for the benefit of all involved service providers.

While legal service providers see themselves as performing an important and perhaps indispensable role in representing the current and future traffic injured, and preserving fundamental legal rights, the Committee notes as follows:

a. they do not represent or speak for the majority of traffic injured Albertans who were at fault for their losses and cannot sue for damages in tort,

b. they do not represent or speak for that group of traffic injured who have the right to sue but choose to process their injury claims directly with insurers,

c. they do not represent or speak for those members of the medical and health community that will not accept as patients traffic injured who intend to pursue litigation,

d. they do not serve traffic injured interests after resolving their monetary claims, and

e. all service providers in the compensation system, including health and insurance providers, may rightly claim to represent the future traffic injured.

The Committee considered the contention of the legal service providers that insurers were not being sufficiently transparent about claims of unprofitability in Alberta and that the public information to date did not credibly or authentically verify those facts.

The Committee concluded those contentions were without foundation having regard to the following contradictory factors:

a. auto insurers are subject to substantial regulatory obligations to the Federal Office of the Superintendent of Insurance, under the Insurance Act of Alberta, to the Alberta Superintendent and the Automobile Insurance Rate Board, including payment of premium tax;

b. insurers in Alberta are answerable to those regulators as to the profits they earn from their automobile business and those profits regulated by being taken into consideration when the AIRB evaluates filings for rate approvals;

c. all of those regulators have imposed substantial reporting requirements on auto insurers and provide continuous oversight for the protection of motorists who must pay a mandatory premium;

d. as stated by the Alberta Court of Appeal in Morrow v. Zhang, “the (MIR) legislation deals with automobile insurance which is private, but highly regulated”;

e. no one has suggested these regulators are not properly and continuously performing their statutory supervisory oversight responsibilities in auto insurance in Alberta;
f. the evidence from the Morrow case proved that as a result of the October 2003 rate freeze, the insurance industry was required to absorb substantial financial losses;

g. the reports provided to us from insurers confirmed that many of them had again sustained significant financial losses as a result of the rate cap imposed by the Government of Alberta in 2019;

h. information from the AIRB confirmed that the auto industry in Alberta as a whole paid out more in claims than it collected in premiums in 2018 from which we conclude that rising claims costs resulted in subsequent increase in premium prices; and

i. auto insurers are not answerable to the legal service providers for the profits they receive from the auto insurance business they conduct.

Lawyers who make the same argument to the Committee as regards auto insurers’ profitability do not see any contradiction in their position, notwithstanding they are not subject to the same level of government regulation.

The legal services providers told the Committee that it is no one’s business but the traffic injured how he or she spends their settlement funds. After they have provided legal services to ensure a precise calculation of each of the heads of damages claimable to compensate for past lost income, future lost income, future care, etc. and after lawyers deduct their contingency fee, what is certain under the existing system is that the funds received by the traffic injured will be less than the future care costs and income loss as calculated.

A settled claimant begins with a shortfall and at some point may be left to rely on the health care system to support their long-term care needs. If that claimant spends the settlement unwisely, that day may come even sooner.

If settled claimants are required to be supported by the Alberta Health system or the social services agencies because of shortfalls in their net settlement due to deduction of fees or misspending or both, it is certainly the business of all Alberta taxpayers.

Moreover, the motoring public, which ultimately pays for the mandatory auto insurance product, at rates which have consistently exceeded the Consumer Price Index increases over the last 30 years due to increasing bodily injury loss cost claims, might well consider itself entitled to know more about the composition of those costs including the fees of injury lawyers and may desire that the fees of all other service providers in the automobile insurance compensation system, lawyers, expert witnesses, fringe lenders and mediators be regulated.

The Committee has concluded that the injury lawyers’ contention that the auto insurance industry claim that losses have exceeded premium income in recent years is not made in good faith is groundless. It tends to undermine without justification public confidence in auto insurers and the regulators who oversee premiums for the benefit of the motoring public.

By contrast, the submissions of the other service providers, including self-insurers, were more constructive, particularly as regards optimizing better health outcomes for traffic injured, and minimizing transaction costs in the current compensation system.

The Committee observes that its terms of reference provide that the automobile insurance compensation system of Alberta will continue to be delivered by private enterprise automobile insurance service providers.
Given that the insurance industry in Alberta, whatever other flaws it has, has been given the present opportunity to continue to provide the mandatory product to Alberta motorists, the Committee must consider reforms that preserve the role of insurers in any remodelled recommendation and permit them to better fulfill their responsibilities to both of the true stakeholders. They have an obligation to price the mandatory insurance product appropriately for all motorists and traffic injured. They have an obligation to deliver injury compensation benefits to traffic injured.

The evidence in the Morrow case proved the willingness of the auto insurance industry to apply their resources to research and study into the issues of treatment modalities to improve health outcomes of traffic injured, including in Alberta.

Moreover, with the history of the imposition of rate caps overruling the regulators and resulting in sudden unexpected financial costs, the fact that insurers are prepared to continue to conduct business in Alberta is a measure of the recent past accountability to the motoring public including traffic injured of auto insurers who carry on business in Alberta.

Under a reformed model, insurers will continue to be subject to oversight delivered by independent regulators with necessary subject matter expertise as regards all aspects of mandatory automobile insurance in Alberta.

The Committee notes that the information it received and evaluated demonstrated that competent health service providers working collaboratively with the private insurers will have on the whole the relevant insight to respond to the requirements of fundamental reform. This is so even weighing that the reform will require transformative changes to health services delivery to traffic injured and more comprehensible and responsive oversight and regulation of insurers and as regards their claims, compensation and rating practices.

While some service providers were prepared to recommend that retaining tort for the catastrophically injured would be acceptable, and others that tort be retained for pecuniary claims only, the Committee observed that the majority favoured reforms that would minimize the tort component as far as possible without compromising the evidence-informed needs of the individual traffic injured. The industry also indicated preparedness to offer optional insurance products to consumers to allay concerns about receiving less than full compensation under a more robust no-fault model.

The Committee is satisfied there will be a sufficient appetite among competent health providers and insurers to collaborate in the design and delivery of a fundamental reform of the accident compensation model to eliminate adversarial conduct and unnecessary commercial operations currently existing between the traffic injured and the administrative health delivery and compensation services they require.

The Committee is satisfied there should be a fully redesigned traffic injury regulatory body populated by independent subject matter experts to establish and maintain optimal health treatment and delivery of services for all traffic injured, for early and appropriate claims assessment.

In the interim the Government of Alberta may wish to establish regulations to limit fees for services for all such litigation support providers, including lawyers, to appropriate and transparent levels for so long as any tort component is retained in the accident compensation system.
Increase scope of anti-fraud conduct

One consistent argument presented in favour of eliminating cash settlements, awards for non-pecuniary general damages and the tort component is the removal of incentive for claimants to delay resolution for the hope of a higher monetary award. This has already been referenced in terms of slowing or undermining optimal health outcomes. A separate supporting contention is that this reform would also reduce the motivation for fraud and cut significant unwarranted costs from the system.

In addition, there was advocated a provincial fraud coalition strategy to combat all forms of fraud in the system including increasing penalties for fraudulent conduct, permitting insurers to take underwriting action in cases of misrepresentation and fraud on applications and claims, as well as regulatory action to delist fraudulent healthcare providers.

Time to implement reforms

Various entities cautioned that fundamental reform particularly on the bodily injury claims component of the system could require between 12 to 18 months for complete implementation in order to provide all service providers sufficient time to retrain, re-educate and redirect resources. They counselled that interim law reform measures implemented for effect during the transition period could expedite reduction of auto insurance rate levels. The Committee concluded those could include amending judgment interest legislation, regulating fees of certain service providers, such as plaintiff lawyer contingency agreements, expert witnesses, fringe lender loan arrangements, and capping of non-pecuniary general damage awards for non-catastrophic injuries.

Short term solutions, even implemented promptly, should not be treated as a substitute for substantive reforms that will address the long-term underlying problems of affordability, availability and sustainability.
D. Conclusions

Property damage product reform
1. The Committee concluded that a no-fault model known as Direct Compensation Property Damage (DCPD) would deliver a simpler, faster claims process, improve the communication and service to the insured motorist, enable the insurer to predict future loss costs more accurately and likely result in some reduction in premium costs.

Reforms to address risky driving behavior
2. The Committee concluded that the GOA should increase enforcement and penalties for high-risk driving offences, collect, maintain and disseminate results and data to help further educate consumers about the dangers and consequences of risky driving behavior.

3. The Committee concluded that the GOA should reform the graduated licencing and other driver training programs, including possible inclusion of retesting of penalized drivers, to build public confidence that such programs can effectively promote safe driving practices.

Reform of the Regulatory Process
4. Prior to 2004, the auto insurance industry typically reported that the then Alberta rate board was nimble, accessible and good to work with. Its areas of oversight and responsibilities were separate and distinct from those of the Superintendent of Insurance. Osborne in his report of 1988 said: “the Alberta board takes a relatively informal approached with deliberations in part borne of the belief that competition is the best method to improve the price to the public…it would appear that the Alberta rate review process is functioning well.”

5. Auto insurers and the non-profit Facility Association expressed a number of concerns to the Committee, including the operation of the prior approval process, operation of the Grid, all-comers rule, territories, and use of rating factors, resulting in delay and confusion. The Committee concluded that the legislative reforms to the regulatory process in 2004 either are no longer meeting their intended goals or have created new problems, or both.
6. The Committee concluded that one of the reasons for the industry concerns is the overlapping jurisdiction of the AIRB and the Office of the Alberta Superintendent over rating conduct which results in conflicting and reportedly confusing rulings to insurers as well as delays over approvals, which weakens market relevance of the rate applications during the lapse of time.

7. The Committee concluded that the best initial remedy would be to separate the roles of the AIRB and the Superintendent pertaining to auto insurance rating. The AIRB should take exclusive jurisdiction over all rating issues while the Superintendent should govern insurance solvency, financial reporting and other areas it supervised before the 2004 reforms. The Committee was reinforced in this view by the long and successful record of rating management enjoyed by the AIRB’s predecessor, the AAIB.

8. The Committee concluded that AIRB, either as it presently exists or reconstituted to enlarge its mandate, should re-examine:
   a. the prior approval model and a file and use model with a designed set of principles;
   b. whether to publish guidelines to apprise insurers of what information is appropriate to include in rating applications relative to risk assessment;
   c. the “all comers rule” and the Grid;
   d. previous Facility Association ceding arrangements and oversight of its premiums to ensure adherence to social policy considerations and actuarial evidence;
   e. the current territories designation;
   f. the benefits of enacting comparable legislation in Alberta to benefit consumers and reduce the cost of vehicle damage repairs;
   g. establishing and publishing a list of prohibited rating factors;
   h. remedies for non-compliance with guidelines; and
   i. the benefit of retaining a delegate of the Superintendent of Insurance in the rate approval process.

9. The Committee concluded that:
   a. reforms in these areas are likely to:
      i. minimize or eliminate the need for sudden legislative corrective actions such as rate freezes;
      ii. reduce cross subsidization of bad drivers by good drivers;
      iii. reflect the driving risk across geographic areas of Alberta; and
      iv. assist more drivers to qualify for mandatory insurance.
   b. greater transparency, education and timely disclosure to consumers of amounts of the premium which are allocated for premium tax, medical treatment, the Alberta health care levy, cost of physical damage claims and bodily injury claims are likely to enhance the consumers’ understanding of the components of the mandatory premium.
Reform of the *Judgment Interest Act*

10. The Committee concluded that the Judgment Interest Act should be amended to make the rate for non-pecuniary damages the same as the rate for pecuniary claims and to suspend claims for judgment interest on non-pecuniary damages for a period of two years from the date of accident loss, as this would reduce the cost of insurance to motorists.

Optional Property Insurance Products

**User-Based Insurance**

11. The Committee concluded that the user-based optional insurance products could be beneficial to consumers and to insurers alike. Expanding the areas of its current use subject to what restrictions or guidelines would be fair to consumers and insurers is a question that should be examined and determined by the AIRB, either as it presently exists or as reconstituted.

Legislation to mandate use of winter tires

12. The Committee concluded use of winter tires for the winter months in Alberta will reduce the occurrence and frequency of auto accidents and injuries.

Section B benefits

13. The Committee concluded that the Section B Benefits under the current model had demonstrated many flaws and were not delivering the original goals intended. As a result many Section B claimants were not receiving optimal treatment and recovery. These reports satisfied the Committee that a fundamental transformation of the current system for compensation for no-fault benefits was required. The Committee was fortified in this conclusion by the current appetite of the insurance industry to provide optional supplemental medical benefits coverage to those consumers desirous of purchasing the same.

The tort/no-fault issue

14. The Committee concluded that the list of concerns about the tort features of the current model was extensive and there should be no efforts expended on seeking to implement modest and piecemeal reforms which have been demonstrated in other jurisdictions to be ineffective. Given that any auto insurance reform is likely to result in dislocation and disruption, the Committee concluded that one fundamental reform on one occasion to all aspects of the current model will best achieve the goals of optimal health outcomes to traffic injured, together with affordability, accessibility and long-term sustainability of auto insurance premiums.
15. The Committee concluded that insurers’ preparedness to now design competitive and well-structured optional income replacement coverages can address concerns about incomplete coverage for some traffic injuries. It will allow consumers at the time of renewal or issuance of their auto insurance policy to elect to purchase additional amounts of coverage to ensure compensation for the entirety of their provable income losses.

16. The Committee concluded that those optional products should be subject to reasonable oversight by an independent traffic accident regulatory body to ensure fairness to consumers from pricing and coverage perspectives.

17. The Committee concluded that under a reformed pure no-fault model, insurers should continue to be subject to oversight delivered by independent regulators with necessary subject matter expertise as regards all aspects of mandatory automobile insurance in Alberta.

**Evidence-informed health treatment for traffic injured**

18. The Committee concluded the service providers favour immediate and better health treatment for traffic injured. Other than legal service providers, most participants supported the view that removing or reducing the tort component would lessen the strain of litigation demands on medical and health professionals whose main professional purpose was treating traffic injured.

19. The Committee concluded that under a pure no-fault model there were many opportunities to optimize health treatment for traffic injured. These many opportunities are specifically listed below in our Recommendations.

20. The Committee concluded that competent health service providers working collaboratively with the private insurers will have on the whole the relevant insight to respond to the requirements of fundamental reform. This is so even weighing that the reform will require transformative changes to health services delivery to traffic injured and more comprehensible and responsive oversight and regulation of insurers as regards, their claims, compensation and rating practices.

21. The Committee concluded that there will be a sufficient appetite among competent health providers and insurers to collaborate in the design and delivery of a fundamental reform of the accident compensation model to eliminate adversarial conduct and unnecessary commercial operations currently existing between the traffic injured and the administrative health delivery and compensation services they require.

**Reforms to the assessment of injury and pecuniary loss process**

22. The Committee concluded from the submissions of many service providers that there is a superior alternative to a tort compensation model. Almost all agreed that to be an effective alternative to the current model, the alternative regulatory injury evaluation and compensation regime must exclude conflict, disputation and adversarial features that increase cost, delay and added stresses to the injured claimant, the system and the service providers that desire to expedite optimal recovery and rehabilitation outcomes for traffic injured.
23. The Committee concluded that the market preparedness to offer a complete suite of optional products to provide first-party coverage of those losses previously addressed under the tort model would satisfactorily fill any gaps for any traffic injured not fully made whole by the benefits provided in a reformed pure no-fault compensation model.

24. The Committee concluded that a composition of a series of mandatory benefits made available to all traffic injured under a mandatory policy supplemented by a series of optional enriched benefit that a consumer may choose or decline is the superior version of a choice model for motorists and traffic injured.

25. The Committee concluded that there should be a fully redesigned traffic injury regulatory body populated by independent subject matter experts to establish and maintain optimal health treatment and delivery of services for all traffic injured, for early and appropriate claims assessment.

26. The Committee concluded that in the transition period, the Government of Alberta may wish to establish regulations to limit fees for services for all such litigation support providers, including lawyers, court experts, and mediators to appropriate and transparent levels for so long as any tort component is retained in the accident compensation system.
E. Recommendations

Property damage product reform

1. The Committee recommends that the property damage component of the auto insurance compensation system be converted to a no-fault model known as Direct Compensation Property Damage (DCPD) under which the insured motorists’ insurers will process the costs of repair directly in any event of fault. A driver who caused the collision will continue to be found responsible for the purpose of assessing appropriate rate adjustment.

2. The Committee recommends oversight of this program should be reposed under the AIRB, or as it may be reconstituted under a reform model. Implementation of this reform should be subject to transitional legislative change provisions to allow for orderly resolution of existing claims, including those under the Motor Vehicle Accident Claims Act.

Reforms to address risky driving behavior

3. The Government of Alberta should legislate increased penalties to punish and deter all types of risky driving behaviour.

4. The Government of Alberta should help enhance data collection of accident statistics to inform an education program to promote traffic safety. As well, all service providers should assist the government in:
   a. collecting relevant collision data about traffic collisions including by use of technological and other innovations;
   b. participating in providing more and consistent education about the dangers of and penal consequences for risky driving behavior;
   c. modifying the graduated licencing program to be principle-based and more affordable for new drivers; and
   d. developing consistent and informative education programs for consumers to foster a greater understanding of automobile insurance issues.
Reform of the Regulatory Process

5. The Committee recommends that the AIRB, or as it may be reconstituted to enlarge its mandate, determine and advise GOA whether the goals of auto insurance regulation would be better served by:

   a. retaining the prior approval model or converting to a file and use model with a designed set of principles;
   b. establishing a practice of publishing guidelines to apprise insurers of what information is appropriate to include in rating applications relative to risk assessment;
   c. evaluating, eliminating or replacing the “all comers rule” and the Grid;
   d. exploring reverting to previous Facility Association ceding arrangements and overseeing its premiums to ensure adherence to social policy considerations and actuarial evidence;
   e. revising, expanding or eliminating the current territories designation;
   f. publishing and disallowing use of only those rating factors that are prohibited;
   g. establishing and enforcing remedies for non-compliance with those guidelines;
   h. preserving a voice for a delegate of the Superintendent of Insurance in the rate approval process;
   i. consultation with its counterparts in other provinces, the Facility Association and auto insurers who carry on business in Alberta, to investigate whether to replace or maintain the all comers’ rule and the Grid or devise an alternate mechanism that will be optimally responsive to market conditions as they evolve from time to time, and has regard to the following guiding principles:
      i. The premium charged to all motorists, including new entrants, fairly represents their risks;
      ii. The alternative solution must be transparent, easy to understand, administratively viable and sustainable;
      iii. The alternative solution must strive to minimize cross-subsidization within the reasonable limits of an insurance system;
      iv. the mechanism must ensure that no consumers are subject to unfair market practices;
      v. the alternative solution must be flexible and adaptable to technological advances; and
      vi. the alternative solution must be reviewed periodically to ensure it continually responds to needs of consumers.

6. Either the AIRB or a newly established Traffic Regulator should investigate provision for coverage for claims by pedestrians and cyclists not otherwise covered by auto insurance.

Judgment Interest Act

7. The Committee recommends the GOA amend the Judgment Interest Act to make the rate for non-pecuniary damages the same as the rate for pecuniary claims and to suspend claims for judgment interest on non-pecuniary damages for the two year period from the date of loss.
Optional property insurance products

User-Based Insurance

8. The Committee recommends that the AIRB, either as it presently exists or reconstituted to enlarge its mandate, should have exclusive authority:
   a. to collect more data about the potential costs and benefits of UBI;
   b. to determine whether expanding the areas of its current use would be fair to consumers and insurers;
   c. to determine what restrictions or guidelines should be implemented;
   d. to determine what information and education should be distributed and provided to motorists; and
   e. to determine what recommendations should be made to GOA to reform regulations pertaining to the same.

Legislation to mandate use of winter tires

9. The Committee recommends the Government of Alberta enact legislation to make mandatory use of winter tires for motor vehicles for some specified period between October and March of each winter season.

Section B benefits

10. The Committee recommends that the current component of no-fault Section B benefits be replaced by a pure no-fault model to provide appropriate insurance coverage to all traffic injured regardless of fault. The Committee recommends that the AIRB, either as it presently exists or reconstituted to enlarge its mandate, should have co-extensive authority to monitor and oversee the array of optional insurance products offered by insurers to supplement the health benefits provided to Alberta motorists under the reform from a pricing and consumer fairness perspective.

Evidence-informed health treatment for traffic injured

11. The Committee recommends removing the tort component to lessen the strain of litigation demands on medical and health professionals whose main professional purpose was treating traffic injured and replacement with a pure no-fault model under which enhanced care programs should be developed for all categories of injuries including psychological, chronic pain, and combinations and clusters of accident injuries.

12. The Committee recommends a fundamental reform to the delivery of health care to all traffic injured under a pure no-fault model to include as far as possible the following features:
   a. supporting early, active, and appropriate evidence-based treatment aligned with and for traffic injuries;
b. pre-approved treatment frameworks for common injuries based on evidence-informed care with associated schedules and policy limits;

c. expedited access to care from prescribed providers;

d. reducing transactional administrative burdens in the system;

e. reducing duplication of services and overutilization;

f. optimize appropriate treatment modalities with consistent quality improvement to achieve recovery timeframe of 2 to 3 years for most injuries;

g. codifying causation so that there can be reasonable finality of injury claims and proper evaluation of the injuries caused or contributed to by the traffic accident as distinct from other causes; and

h. establishing

i. definitions of serious and catastrophic injuries;

ii. definitions of chronic pain and psychological injuries;

iii. expert medical panels to make conclusive determinations as to which claimants fall into which categories;

iv. treatment regimes that will include an intended resolution date for the claimant and the service providers;

v. an independent oversight body to supervise treatment providers to ensure that health providers are following evidence-informed guidelines in regimens to ensure optimal recoveries for traffic injured;

vi. a structured review process for traffic injured who are not recovering within the normal treatment guidelines or whose recovery has plateaued so that they can be referred for alternative treatment;

vii. clear return to work guidelines for claimants seeking disability payments to encourage gradual return to work programs, modified duties or retraining for different occupations;

viii. regulation of fees for health and dental health providers;

ix. means of collecting and aggregating health treatment data to ensure ongoing monitoring and evaluation of care programs, outcomes and continuous improvement of first-party compensation based on reliable data; and

x. implementation of an electronic system for auto insurers in conjunction with a traffic injury regulator, health care and ancillary service providers to expedite transmission and processing of claim forms.

13. The Committee recommends that the GOA engage a team of competent health providers to collaborate with the regulators and insurers in the design and delivery of a fundamental reform of the accident compensation model to eliminate adversarial conduct and unnecessary commercial operations currently existing between the traffic injured and the administrative health delivery and compensation services they require.
Reforms to the assessment of injury and pecuniary loss process

14. The Committee recommends replacement of the current model with pure no-fault care model to compensate all traffic injured without the requirement to prove fault of a negligent driver to be overseen and regulated by alternate traffic accident administrative structure, similar to Alberta workers’ compensation and other workers’ compensation models, which provide individualized assessments by a panel of medical experts and claims assessments by panels of experts. However, in the case of an Alberta traffic accident compensation model, the Committee recommends a model that takes the most effective features of those successful models and designs additional features that address the needs of the array of traffic injured that vary greatly from workers.

15. The Committee recommends the Traffic Accident Regulatory model establish groups of subject matter experts that will serve on panels to provide conclusive and final medical evaluations, conclusive income loss assessments, oversight of health service providers to ensure ongoing education and professional development, and evidence-informed results.

16. The Committee recommends such alternative model select the most highly qualified medical and health experts, and the most highly qualified financial and vocational experts, the most highly qualified educators, all of whom will provide expert advice and will work collaboratively to determine medical impairment and future treatment issues, income calculations, and future care needs. Such collaborations will eliminate the need to prepare written reports for litigation proceedings, promote evidence-informed practices and protocols and hasten incorporating new innovations that can speed up treatment and recovery of traffic injured.

17. The Committee recommends the traffic injury medical regulator establish maximum recovery standards to encourage and enable all participants, including traffic injured, health providers and claims navigators to move collaboratively toward closure of claims at the appropriate recovery milestones. These goals would be optimally delivered by removal or diminution of monetary gain incentives. Where insurers have developed an array of optional pecuniary and non-pecuniary insurance products, those can provide suitable supplements to consumers who desire to purchase the same for additional protection and security.

18. The Committee recommends that where a medical expert panel concludes injury recovery has been attained as far as possible, benefit and income claims are referred to claims assessor panel for final resolution. If optional products are offered by the industry, those coverages may, subject to the Alberta regulators, establish contractual terms for provision of the benefits.
IX Proposed Reform of the Alberta Auto Insurance Compensation System
In the introduction to this Report, the complexity of the task ahead was described with specific emphasis and identification of the two true stakeholder groups at its heart. It was important to the Committee to ensure it maintained a balanced perspective of the views of various service providers who expressed preferences as to what was best for the true stakeholders but who also had vested commercial interests in the continued existence of their roles in the current system. The Committee was sensitive to the concerns expressed by all who gave their opinions about how broad the recommended changes might be and how negatively their existing roles might be impacted, and accordingly gave all the views expressed serious, respectful consideration and attention.

Before making its final determinations as to conclusions and recommendations, the Committee took into consideration the following:

a. the history of proposed and actual auto insurance compensation reforms elsewhere in Canada and other countries;
b. the history of auto insurance reform in Alberta from 1990 to the present;
c. medical and health studies and evidence of medical and health expert witnesses;
d. applicable Charter law;
e. actuarial evidence and studies of Alberta claims experience;
f. information received during public consultations, including surveys;
g. information gleaned from a health advisory committee; and
h. its own combined experience of several decades in the Alberta automobile insurance compensation system.

The Committee secured statistical information from the Government of Alberta (GOA) indicating that as of July 1, 2019 the population of Alberta was 4,371,316. As of March 2019, there were 3,642,336 motorized vehicle registrations, excluding trailers, off-highway vehicles, and dealer plated vehicles. The total number of licenced drivers in 2019 was 3,229,821.

The AIRB confirmed that although there were 69 property and casualty insurers licenced to conduct auto insurance business in Alberta as of 2018, only 46 were active, 10 of which represented 93% of the share of the market.

The AIRB reported that in 2018 the auto insurance industry collected $3,500,000,000 in insurance premiums and paid a total of $3,800,000,000 in claims and operating expenses. In 2018 Albertans made 287,000 claims.
A. Additional Studies from Consulting Actuary

The Committee also requested two studies from its consulting actuary. The first was a comparison between the increase in written premium for insured vehicles from 1990 to 2018 and the average adjusted Consumer Price Index. A graph displaying this comparison is attached as Appendix 3 and is included below for ease of reference:

Alberta private passenger third party liability written premium per vehicle

This graph confirms other evidence that increases to auto insurance premiums for insured Alberta motorists have continuously exceeded the Consumer Price Index increases for the past 3 decades, and have been sharply escalating since 2014. The Committee has been well satisfied from its analyses that the current Alberta auto insurance compensation model does not deliver stability of premiums or long-term sustainability.
The second study requested from its consulting actuary was an estimation of the transaction costs of private passenger motor vehicle litigation in Alberta expressed in 2018 dollars. The full report is attached as an Appendix 4. For ease of reference, the table showing distribution of transaction costs by item at page 11 of the report is reproduced below:

Our review of auto insurance reform from many angles reveals the complexity of the auto insurance compensation system. As a result, there are many views about how it should be corrected and improved. The Committee has taken into consideration all the views expressed as well as its own experience in the practical operation of claims practices, tort litigation including from the perspective of plaintiffs and defendants, health treatment, supply of the insurance product, and problems of availability, affordability and sustainability of the injury compensation system.

Nevertheless, the history of auto insurance reform shows there will always be differences of opinion and usually public controversy which heightens the concerns of all consumers and service providers about changes that will diminish their entitlements.

It is thus always the Legislature whose responsibility it is to take informed decisions about how scarce resources must be reallocated by selecting a wise blend of choices and trade-offs for the best interests of all its constituents. The Committee has made its best objective efforts to provide the GOA with its conclusions after analysis of all the relevant considerations.

It was evident from our study that there are serious systemic problems in the current Alberta model. These are exacerbated by entrenched practices and processes that have not kept pace with the health needs of the traffic injured but have in fact prevented or delayed the implementation of modern innovations to improve health outcomes for the traffic injured and to prevent worsening of traffic injuries due to delays in claims resolution.
The increased transaction costs resulting from the tort components are clearly correlated with some of the premium increases. The above shown table clearly depicts the cost pressures the current tort system imposes on the premiums, most notably, legal fees. Reduction or elimination of the legal counsel and plaintiff lawyer contingency fees, expert fees and reports would have reduced costs in the range of $340,000,000 in 2018.

The Committee considers the small number of active auto insurance carriers conducting business in Alberta is a risk to the goals of affordability and accessibility to auto insurance. Improving conditions to increase competition, market innovation and expanded optional insurance products would be beneficial to the traffic injured and insured motorists in the way of allowing consumers to choose specific insurance products that are more tailored to their particular needs, which would protect them more appropriately in the event of traffic injury and loss and produce reduced premiums for those insured motorists who decline the additional optional products.

B. Health Outcomes for traffic injured Sub-optimal under the Current Model

The Committee found that health treatment for the majority of traffic injured is not delivered consistently or in an evidence informed manner contrary to the best interests of early and effective recovery. This is not the fault of hard-working health professionals. It is the result of the defects in the current system that do not serve the traffic injured and do not serve the health professionals.

A large part of that deficiency is due to the characteristics of the tort system which have historically resulted in delays in claims resolution, duplication of costs and services, undercompensating of those who are catastrophically injured and overcompensating those who are not. This is not the fault of the members of the legal profession or the judiciary. However, it is the result of serious and worsening defects in the current system that history has shown cannot be improved in a gradual continuous fashion but can be meaningfully addressed only by fundamental reform.

The Committee is satisfied that all Albertans, including those who do not form part of the insured motoring public, will be better served if the automobile insurance system provides at least a modicum of evidence-informed medical and health treatment to help all traffic injured receive prompt and appropriate medical and health treatment, participate optimally in their own recovery and see an expedited return to normal life activities including employment and leisure.
C. Compensation of All Traffic Injured Sub-Optimal under Current Model

First, those traffic injured who are currently excluded from the auto compensation system or whose health benefits were restricted because their injuries were not provably due to a negligent driver are in the result not monitored to ensure receipt of the most effective health treatment for their injuries. Their ongoing health problems are redirected to the health system or social agencies which result in a greater financial burden to all Alberta taxpayers.

Second, those persons may have sustained injuries due to circumstances that could happen to anyone. As examples, the following Alberta traffic injured cannot obtain maximum recovery under the current tort model:

- injuries sustained due to the collision with an animal on the highway;
- injuries sustained in accidents due to extremely icy highways and road, whiteout, smoke or fog conditions reducing visibility to nil; and
- injuries due to an unidentified driver or a driver who was not legally at fault for the collision.

It is noted that even for traffic injured who have a right of action, court or settlement awards for the catastrophically injured are not always fully paid because the amount of the award exceeds the insurance policy limits of the motorist whose conduct caused the accident.

Third, the two principal rationales for maintaining a tort model in automobile insurance compensation, subject to debate since mandatory insurance was introduced to the system, have become even more seriously weakened over the last three decades in Alberta due to changing social, economic and commercial conditions.

D. Failure of Auto Insurance Reform by Piecemeal Increments to Deliver Long-term Stability

Failure to promote the early and effective recovery or resolution of claims of traffic injured to the detriment of their health outcomes has been also verified by health professionals in the Alberta auto insurance compensation system.

The Minor Injury Regulation (MIR) and the Diagnostic Treatment and Protocols Regulation (DTPR) were initially met with criticism, opposition and objection from many service providers. As a result, there was probably additional uncertainty, confusion and anxiety about whether and the extent to which important rights were being taken away in the name of cost reductions. Those reforms were put into effect in 2004 but, until the Court of Appeal decision issued in 2009, it was not clear to the service providers, traffic injured or motoring public whether those reforms constituted valid law.
The MIR and DTPR, in the first phases of operation, initially proved to be a satisfactory and, some would argue, a superior model for delivering health benefits and outcomes to traffic injured sustaining certain types of temporary soft tissue injuries. Those reform benefits likely also reduced some costs which enured to the benefit of all members of the motoring public.

However, there has been continuing disagreement among service providers since 2009 about what injury cases should be covered or excluded from the MIR and the DTPR. This uncertainty produced continuing litigation over the interpretation of the regulations which was an unintended consequence. One insurer reported to the Committee that its soft tissue injury claims that lasted longer than 6 months increased over the last 5 years by 700%. The growing divergence between the intent and the result of the 2004 reforms is detrimental to the traffic injured and the motoring public, as is ongoing uncertainty flowing therefrom.

It is detrimental to the traffic injured as a group because they cannot be sure whether a new court decision might result in a determination that their case has cleared the MIR cap and in turn allows the pursuit of increased monetary compensation in their cases. When a new court decision from time to time produces such results, it would reasonably leave traffic injured whose cases were settled before the decision wondering if they were insufficiently compensated.

The GOA endeavored to clarify the uncertainty resulting from court decision in 2012 by enacting additional measures in late 2017 and 2018. Despite its best legislative efforts, continuing calls for adjustment due to concerns over unaffordability, unavailability and unsustainability combined to add to the ample evidence in Alberta or in other private enterprise auto insurance models elsewhere that gradual and piecemeal tort reform has not succeeded and will not in future succeed in delivering a viable and sustainable insurance system, or significantly reduced or eliminated costs from the system.

As a result, while the Committee agreed that individual evaluation of each injured person’s injuries and losses is an important goal to preserve in any reformed auto insurance compensation system, based on all the evidence, research, studies, viewpoints and, its own experience with the existing model, it was satisfied that an alternative administrative health delivery model outside the tort system can provide individual evaluation of each injured person’s injuries and losses, and can do so more effectively, more swiftly and with superior health outcomes for traffic injured than the current model.
E. The Tort Principle of Deterrence Does not Deliver Intended Goal

The argument that a fault-based tort system must be maintained to deter motorists from risky driving conduct, again always subject to debate, has over time also become increasingly irrelevant. The original practical consequence under the tort system was that when a motorist was sued for damages for negligence causing injury, that person was frequently informed shortly after the accident that an injury had been alleged, and there would be an investigation and possibly a lawsuit, naming that motorist as a defendant. A lawsuit would determine the motorist’s liability for alleged faulty driving conduct and the amount of damages payable to the injured person.

The motorist defendant might be required to participate in pre-trial and trial proceedings. The injured person would also give evidence about the injuries and losses. Such trials were open to the public. The evidence and the verdict might later be reported in the print media.

These consequences of the event could be seen to deliver specific deterrence to the individual driver and general deterrence to members of the public. But over the decades these consequences have disappeared from the current system.

Instead, when a motorist is involved in a minor collision with another motorist, now especially if it initially appeared due to a momentary and inadvertent driving error, there may be no indication that any injury resulted. After reporting the incident to the insurer, the motorist often hears nothing until well over two years later, because an injured claimant is not required to formally commence a lawsuit until within two years of the date of loss and has another year after that to serve notice of the lawsuit on the alleged at-fault motorist.

Some motorists in these circumstances never learn when the claim was finally settled or for what amount. As confirmed by all litigation service providers, such actions rarely proceed to trial. If the claim is settled before a trial, the results are not reported to the public. Moreover, not all trial decisions are publicized in news outlets or law reports. Even at conclusion of the claim, the motorist is not called upon to contribute financially to the amount of the assessed losses. In the result, the motorist who caused the accident does not normally experience an immediate cause and effect from the negligent driving on the day of the loss to the date of resolution.

This example is similar to many auto insurance cases in the current tort system. It demonstrates that practically, the intended effect of the principle of deterrence has lost its efficacy and the principle of deterrence is no longer a convincing justification for maintaining the tort system in auto insurance. The Committee concluded that deterrence of risky driving is more effectively achieved with increased enforcement of traffic laws, increased penalties for traffic infractions, more extensive education about the consequences of risky driving and the pricing mechanism that requires reckless drivers to pay higher premiums for insurance, if they are not precluded altogether from driving due to traffic enforcement laws.
F. The Tort Principle of Quantifying Damages on an Individual Basis Subject to Increasing Costs and Delays

The next principle tort proponents advance for maintaining tort is the need to ensure individual evaluation of each injured person’s injuries and losses. However effective delivery of this goal has also departed widely from its original intent.

First, no service providers dispute that only a very small percentage of lawsuits launched to determine the true measure of damages in an individual case proceed to trial and determination by an impartial jurist after receipt of all the evidence in an open court.

Second, it is not disputed that only a small percentage of cases are resolved after an informal opinion is secured from a Queen’s Bench trial judge in a judicial dispute resolution (JDR) process.

Third, it is common ground that there is much delay in scheduling dates for both these court processes due to overburdening of the resources in the court system.

The remaining claims advanced by traffic injured, if legal counsel is retained, are resolved by negotiating settlements by representatives of the parties rather than by an objective and impartial judicial determination of the proper measure of damages in each case.

As described in much detail in the Marshall report, additional concerning collateral deficiencies are resulting from the negotiation processes in injury claims, which are costly in terms of time, resources, and expenses, and which diminish the amounts of benefits and settlements ultimately delivered to the traffic injured.

As also described in much detail in the Marshall report, all of the foregoing circumstances are having a further important adverse effect of delaying recovery of traffic injuries and in some instances, exacerbating the extent of the pain and suffering of the injured person.
G. Lump Sum Payments for Pain and Suffering subject to misuse and abuse

Service providers including those in the legal community agreed that in the example of a claimant negotiating a lump sum payment in lieu of the established and accepted health benefits, it was undesirable to have the unintended consequence of the injured person paying a portion of his benefits to his legal advisor and then redirecting the balance of his lump sum payments to other unrelated purposes. This produced the result that the injuries remained and required further health treatment that would then have to be paid for by the Alberta taxpayers.

From the Committee’s perspective, concern over this admitted, undesired consequence has equal application to all traffic injured, including those with more complicated and serious ongoing chronic pain, psychological consequences, jaw joint and concussion, or clusters of injuries, as well as the catastrophically injured.

The legal community, no matter how competent and careful, cannot ensure that any traffic injured person at any level of severity of injury, at the resolution of a lawsuit will responsibly preserve their remaining settlement funds and apply them appropriately to future care or loss of income.

The Committee further considers that an enhanced and enriched version of the originally designed DTPR will provide meaningful reduction and elimination of pain and suffering and loss of enjoyment of life, by way of improved and expedited health outcomes. Finally, it considers that the commitment of the insurance industry to offer additional optional insurance policies to those consumers who wish to purchase that protection will provide a reasonable replacement for the withdrawal of those benefits.
H. Need to extend and expand principles of DTPR to all non-catastrophic traffic injured

The members of the medical and health community and certain other service providers reported that the original intent of the MIRR was for medical and health assessments of Certified Examiners (CEs) to be conclusive so that claims could be finalized promptly and decisively. However, over time, disputes by claimants often with legal representation arose over the CE conclusions resulting in some court decisions overruling the CE decisions and in turn, the deference intended to be accorded to those CEs. These consequences resulted in delays in resolution of claims and protracted recoveries.

There were also reports that various health practitioners subsequently failed to consistently follow the protocols, since there was no process to oversee, supervise and enforce compliance. This lack of compliance also weakened the original intent of the DTPR.

It was also identified that often skilled health practitioners declined treatment to patients who reported they were engaging in litigation, due to the subsequent requirement to be involved as a duelling expert.

The long delays endemic in tort litigation could be corrected by substitution of medical review panels established under an administrative model to have the authority to make conclusive determination at appropriate milestones after an accident as to issues of medical impairment and future treatment requirements.

The requirement for duelling doctors to be engaged by both sides in litigation to expend large amounts of time, resources and expense to craft written reports and prepare for possible cross-examination on their credentials and credibility is counterproductive. Instead doctors should be enabled to lead the inquiry, collaborate in a non-controversial, non-adversarial environment, and take factors into consideration that in a legal environment may have been excluded for procedural reasons. This will produce a more comprehensible and speedier resolution, to the benefit all participants and will permit final conclusions about the health condition of traffic injured much earlier than typically occurs in the litigation process.

As regards the reported problems of non-compliance by service providers under the DTPR, the original design of the DTPR remains sound and provided there were regulatory processes established to address the non-compliance and the weakening of the original intent, the DTPR could continue to serve the traffic injured in Alberta well in future. The Committee concluded that the DTPR should be further developed and expanded in its design to deal with all other injuries.

The development and extension of the existing DTPR under a properly designed regulatory process will address the problems of some traffic injured in Alberta receiving inadequate, wrong or duplicative treatment that does not benefit their recovery. Such additional treatment protocols when reviewed, refined, and enforced in line with current evidence-informed practices will establish greater uniformity of treatment, will allow for greater relevant data collection and feedback to inform and track recovery methods that are safe and effective.
I. The Tort model requires replacement by a Pure No-fault Model

The Committee concluded that the Alberta tort system has lost the ability to best serve the traffic injured and motoring public. Alternative pure no-fault models have rebalanced the goals of a traffic compensation resulting in fair, accessible and affordable insurance, timely and appropriate outcomes when claims are made, and viable and sustainable automobile insurance systems. With modernized assessment and treatment protocols for all traffic injured, a pure no-fault model will produce greater opportunities to deliver improved health and benefits.

Improved health benefits delivered to all traffic injured will benefit families and dependants of the traffic injured as well as the motoring public and Alberta taxpayers. Better health outcomes would likely reduce the duration of recovery times, which in turn would result in earlier return to work and life activities and lower the nature and amounts of claims for pecuniary losses.

A redesigned pure no-fault accident compensation model will enable and incentivize health providers to develop consistent assessment and treatment protocols and collect patient feedback and objective treatment data to continue to inform those protocols. In the result the redesign will produce opportunities to deliver superior health outcomes for traffic injured and without the delays, duplications in services, adversarial processes and costs that exist under the current model.

Such reallocation of resources under a pure no-fault model will also reduce and eliminate current costs in the system that benefit neither of these true stakeholder groups, in amounts that would exceed a range of $340 million annually.
J. Need for No-Fault Care and Compensation Model for All Catastrophically Injured

Despite careful consideration, the Committee ultimately rejected the suggestion that the tort model should be retained for the catastrophically injured who could prove fault of a negligent driver. If weakness of the tort components do not serve the traffic injured under the existing model due to delay in treatment, delay in receipt of benefits and delay in assessment of their income losses and cost of care needs, there is no logical justification for leaving the catastrophically injured out of the plan to reform receipt of the optimal benefits of the health care program for traffic injured.

The catastrophically injured group, more than any other, requires and deserves prompt expert medical and rehabilitation evaluation of the extent of injuries, optimal care and health benefits, long-term care and loss of income needs and prompt provision of those services, without the need to endure conflict over their entitlement. Moreover, the statistics presented to the Committee showed that the frequency of catastrophic injuries had decreased.

The primary purpose of a reformed automobile compensation system should be the optimal proper medical and health treatment of traffic injured, based on:

a. Evidence-informed practices, consistently evaluated;
b. improved treatment modalities;
c. established and continually improved from reliable data collection and analysis derived from modernized information technology; and
d. application and reliable feedback from traffic injured and health providers.

It is in the best interest of all Albertans, including those tax payers who pay for the health care system and social service agencies, that the optimal medical and health treatment proposed for the fundamental reform also should be available most especially, to all catastrophically traffic injured Albertans.

The design of a health care model that provides appropriate medical evaluation, assessment and treatment modalities for all of those traffic injured who may have permanent incapacity and long-term care needs before recovery or resolution as far as medically possible is a complex task. It is better addressed by transforming the health care model so that medical, health and vocational expertise currently utilized in the tort system can be redirected to an administrative model that eliminates the features of adversity, conflict and dispute for better efficiency and cost.

The Committee has considered features of the proven long-term care model implemented in 2007 in New South Wales that could be applied in the Alberta traffic context.
The Committee recognizes that in a private sector delivery model for automobile insurance, there is one claims resolution concern in providing in a new in a pure no-fault model properly calculated long-term care and compensation to the sector of traffic injured that have permanent catastrophic injuries and will never return to a pre-accident condition. That is because the insurer’s obligation may extend indefinitely into the future.

Despite that obstacle, the Committee foresees that there would otherwise be added benefits of having the private enterprise system partner in the pursuit of excellence in managing long-term care for catastrophically injured.

The Committee considers that one viable solution to that obstacle is to develop for the long-term catastrophic injury care program a pool developed and funded by the property casualty industry through collection and delivery of a certain earmarked portion of each auto insurance policy. The Facility Association is an example of such an effective pool as was suggested in the Osborne report if such a catastrophic fund was to be created.

The Committee would foresee the management of the catastrophic injury fund by the independent Facility Association type entity, to ensure timely collection, and most prudent investment of the pool funds, pending requests for distribution by the Traffic Injury Regulator for the purposes of the long-term care program. Once the insurer had provided proper transfer of the funds earmarked for the pool, it could conclude and close its claims file.

In the view of the Committee, this proposed mechanism could provide a balanced approach to satisfy the industry, the catastrophically injured, the long-term care rehabilitation and vocational care community, and the Alberta motoring public.

In summary, a catastrophic injury long-term care program, as described in Section X of this Report, would be better suited for all Alberta traffic injured and the motoring public but would before implementation require consultation with insurance industry experts, and long-term care and rehabilitation health experts as to the optimal design and operation.
K. Delivery of goals listed in Mandate by Pure No-Fault Compensation Model

The Committee proposes replacement of the current model with a pure no-fault model characterized by the following central features:

a. implementation of an administrative traffic accident regulatory structure to replace the court for assessment of extent of injuries and pecuniary losses to traffic injured;

b. individual assessment of injuries, extent of recovery or impairment, and requisite future treatment to be conclusively determined by expert medical review panel within 2 years from the accident date for most cases and within 3 years of all remaining cases;

c. defined rehabilitation and care benefits and in the case of the most seriously injured, impairment benefits will replace lump sum payments for pain and suffering and loss of enjoyment of life; and

d. individual assessment of economic losses and future care entitlements to be conclusively determined by financial, vocational and rehabilitation expert review panel within 2 years from the accident date for most cases and within 3 years of all remaining cases.

L. Administrative Traffic Accident Regulatory Structure to replace the Court Assessment of Extent of Injuries and Pecuniary Losses

Replacing the tort system, including the traditional rules of the court system with a pure no-fault model, will require a new regulatory framework designed and committed to oversee the proper treatment of traffic injured in the claims process, including health services to address recovery, rehabilitation or ongoing care, and evaluation of medical and financial status for purposes of determining appropriate financial benefits to restore losses due to injury.

The Committee recommends the establishment of a board and tribunal, sometimes described in this Report as the Traffic Accident Regulator, to be funded primarily by insurers but led by a statute appointed independent administrator, to oversee all operations and act as the authority of last appeal. It would:

a. serve as regulatory accident compensation tribunal for oversight of claims processes to ensure fair determination and provision of claimants’ health and financial entitlement to benefits;

b. serve as regulatory accident compensation tribunal for oversight of health and medical treatment, assessment and evaluation of permanent injury to ensure fair determination and provision of claimants’ entitlement to health benefits;
c. serve as regulatory accident compensation tribunal for oversight of claims assessment panels to ensure fair determination and provision of claimants’ financial entitlement to benefits and compensation;

d. establish liaison and exchange of relevant information with the Traffic Insurance Regulator; and

e. be structured in a manner similar to the current Alberta Workers’ Compensation Board model although led by a statute appointed leader to ensure independence.

The Committee recommends that the Traffic Accident Regulator establish several administrative arms to oversee specific aspects of the pure no-fault accident compensation system.

One specific arm is described in this Report as the Traffic Claims Regulator and would be responsible for:

a. a standardized claims process for traffic injured to present claims for health treatment and monetary compensation;

b. a claim support service to provide comprehensive services for an end to end claims process and pathway;

c. a process for overseeing delivery of services by providers; and

d. processes for establishing qualifications and certifications of those who will be engaged in the provision of services for traffic injured.

Another specific arm is described in this Report as the Traffic Injury Regulator and would be responsible for:

a. a comprehensive process of individual assessments of accident losses for traffic injured including diagnosis, evaluation of appropriate health treatment, benefits and finalized impairment determination;

b. a comprehensive medical assessment process structured with panels whose decisions are conclusive evidence as to the degree of permanent impairment of the injured person, subject to a defined review and appeal process;

c. establishing a roster of panellists with appropriate training, qualifications, knowledge, experience and personal skills to evaluate and determine issues to be heard by medical and claims assessment panels; and

d. establishing a defined review and appeal process from the panel decisions.

Another specific arm is described in this Report as the Traffic Claims Assessment Regulator and would be responsible for:

a. a comprehensive claims assessment process structured with panels whose decisions are conclusive evidence as to entitlement to monetary payments for future care and income replacement claims; and

b. establishing a roster of panellists with appropriate training, qualifications, knowledge, experience and personal skills to evaluate and determine quantum of financial claims and benefits for traffic injured based on certificates issued by the Traffic Injury Regulator.
Another specific arm is described in this Report as the Traffic Insurance Rate Regulator and would be responsible for:

a. the duties of the existing Automobile Insurance Rate Board; and  
b. any expanded duties delegated to it as it is reconstituted under the pure no-fault model.

The insurers carrying on business in Alberta will be underwriting a portion of the administrative costs of the new model. Many health professionals will be recruited to deliver the health services under a new health care model. The GOA will be responsible for legislation and periodic revision of regulations governing this model. To ensure optimal participation, exchange of information, feedback and contributions for continuous improvement, in service of the traffic injured and the motoring public, there must be sufficient representation of all of these views to, or at, the board.

M. Individual Assessment of Injuries and Treatment by review panel of medical and health experts within 2-3 years from the accident date

The details of the reforms are further described in Section X of this Report.
N. Defined Rehabilitation, Care or Impairment Benefits for most seriously injured

The pure no-fault care model will deliver, in place of awards for pain and suffering and loss of enjoyment of life, a set of defined rehabilitation or impairment benefits for various injured categories to improve recovery and health outcomes in the short, medium and long term and are more fully detailed in Section X of this Report.

Improved Health Outcomes

A pure no-fault model would put an end the ongoing uncertainty about what treatment and compensation should be afforded to what category of injury. The Committee proposes a pure no-fault reform model that will be more transparent and more comprehensible to traffic injured and motorists.

A pure no-fault auto insurance compensation model will promote innovation and encouragement of optimal health treatment for Alberta traffic injured in an environment devoid of legislated adversarial conduct. Traffic injured, like all persons who suffer ill health, are better served if all their service providers are pulling in the same direction. This collaborative approach induces the injured to also take an active participatory role in their own recovery.

One example that demonstrates the value of a pure no-fault model is the case of Québec which, shortly after its model was put into place, was able to develop categories of soft tissue injury treatment now adopted worldwide, namely the Whiplash Affected Disorder I, II and III.

Improved Environment for Health Service Providers

Transferring the Alberta traffic injury compensation to an administrative body that oversees individual assessment of all traffic injured and provides evidence-informed treatment individually will also provide a healthy environment for its health services providers.

A pure no-fault model will reduce or eliminate delays in resolution of injury claims that attend the tort system, and the negative impact on health outcomes of traffic injured due to intervention of clusters of service providers into the medical treatment regimen for traffic injured.

The Committee expects that a new continuum of care model for all traffic injured will induce return to the health professional service providers who declined to treat traffic injured who presented as litigants and will elevate the quality and consistency of treatment in an environment characterized by mutual collaboration.

The numbers of medical appointments arranged for traffic injured will be reduced and will be based on effective evidence-informed health results.
0. Individual Assessment of Economic Losses and Future Care Entitlements by review panel of financial, vocational and rehabilitation experts within 2-3 years from the accident date

The Committee’s reasoning behind substituting medical expert panels for the duelling experts of the tort model applies with equal force to financial, vocational and rehabilitation experts. It would eliminate the adversarial proliferation of economists, accountants and vocational experts, all expending large amounts of time, resources and expense to craft written reports and prepare for possible cross-examination on their credentials and credibility.

Instead, an expert panel would lead the inquiry, collaborate in a non-adversarial environment, and take factors into consideration that in a legal environment might have been excluded for procedural reasons. This transformation will produce a more comprehensible, transparent and speedier resolution to the benefit all participants. It will further permit finalized conclusions about the income and other pecuniary losses of traffic injured much earlier than typically occurs in the litigation process, in most cases within two years from the date of the accident.

The Committee initially contemplated that its proposed pure no-fault reform model provide full reimbursement of all provable pecuniary losses to be conclusively determined by a review panel of subject matter financial experts, supplemented with vocational and rehabilitation experts where the case required.

However, after examining alternative pure no-fault compensation models including those in Saskatchewan, Manitoba and Worker’s Compensation systems, the Committee recognized that pure no-fault models usually stipulate some standard percentage such as 80% or 90% of full income replacement. The Committee recognized that this feature is likely incorporated in the interest of public policy to promote return to employment. It also noted that this type of calculation is consistent with the rationale and practice of group insurance compensation models.

The Committee also observed that under the current tort model, claimants represented by legal counsel also do not receive full recovery of their income losses due to the deduction of legal fees which may reduce the income recovery to around 70% of the total loss. The Committee recognizes the counterargument that claimants with legal counsel may recover additional amounts due to the skill in proving additional components of financial losses.

Nevertheless, the transformed pure no-fault panel of economic and financial experts will better serve the traffic injured and motoring public by producing dispositions of pecuniary claims based on established economic considerations and will be capable of modification and adjustment based on the ongoing review and consideration of prevailing economic conditions applicable to the injury claimants.

The costing of the pure no-fault compensation model together with three variations is contained in Section XII of this Report.
Elimination and Reduction of Costs

In addition to improving the health benefits of all traffic injured, the proposed pure no-fault model will eliminate numerous costs from the current system, including:

a. costs of subject matter court experts;
b. costs of duplicate assessments by duelling court experts;
c. delays in resolution of litigation cases;
d. service providers declining to serve clients who have elected litigation;
e. legal costs;
f. costs to maintain the court system; and
g. costs to the health system.

In addition to improving the health benefits of all traffic injured, a proposed pure no-fault model will eliminate suboptimal effects of the tort process including:

a. reduction of recovery to the traffic injured by engaging fringe lenders;
b. exaggerated or fraudulent claims to boost monetary recovery; and
c. adverse effects of spending lump sum settlements before injury recovery.

Limitations on monetary awards will eliminate the incentive to traffic injured to prolong, even unconsciously, sickness experience in the pursuit of a financial reward. There will be a rebalancing of compensation among all traffic injured to eliminate overcompensation in some cases and undercompensation in others. For those Albertans who wish to retain the opportunity to purchase insurance coverage for fuller protection of their losses, the insurance industry has committed to deliver optional insurance policies to cover the withdrawal of those benefits.
P. Legal Challenges to Fundamental Auto Insurance Reform

The Committee very carefully considered warnings that any no-fault reform recommended could be subject to legal Charter challenge. It reviewed comments by the Alberta Court of Appeal (ACA) in *Morrow v Zhang* as regards the authority of the Legislature to cap soft tissue injury claims.

The Committee took particular guidance from the following key points:

a. given that full costs of care are awarded, damages for pain and suffering can be moderated by policy considerations: For example, workers’ compensation regimes limit or replace non-pecuniary damages;

b. every injured person is subject to the “cap” that exists by virtue of the limits of the tortfeasor’s insurance or his own S.E.F. 44 endorsement;

c. the nature of the interest of traffic injured claimants is not of “fundamental” societal or constitutional importance;

d. the legislation deals with automobile insurance which is private, but highly regulated…;

e. other courts have found a cap or a threshold to be constitutional; and

f. the cap on soft tissue injuries … is not discriminatory because the legislation does not perpetuate the stereotype and it responds to the needs of the claimants.

The Committee observed that the ACA reasons affirm that the Legislature may enact a pure no-fault traffic accident compensation model. It further observed that where the reforms limited the awards available for pain and suffering in place of established assessment and treatment protocols, such legislation would not violate the Charter so long as the reforms are implemented as a package, balanced, interrelated and interdependent.

Q. Reform will promote long term stability and sustainability

The proposed reform will reduce the frequency of calls to GOA to reform deficiencies in the auto insurance compensation system because the regulatory regime to be put into place will be populated by subject matter experts who can advise how to respond more promptly to changes needed, whether health or medical, income loss calculation, rating practices, property damage repair processes, anti-fraud, traffic safety and the like on an on-going basis.
R. Further cost savings and improved competition will result from regulatory and property insurance reform processes

There are also similar problems in the regulatory component of the current system which suffer deficiencies for similar reasons as well as overlapping regulatory roles. These are not the fault of the industry members or regulators but are the result of entrenched processes that do not lend themselves to rapid response and continuous review and adjustment for the best interests of the insured motorists.

In the following sections of the Report, the Committee details proposals for a pure no-fault auto insurance compensation model that will properly and adequately treat traffic injuries of all Albertans, and encloses a report of its consulting actuary that details costing of its preferred pure no-fault model, as well as two other models to illustrate the type of projected savings under different variations. A fourth quasi-model displays the potential cost savings during a transition period before implementation.

The Committee recommends that the ultimate details of a reformed pure no-fault auto insurance compensation model should be developed in consultation with selected health and medical experts, and, thereafter, ancillary health service providers.

The Committee recommends that there be consultation with insurance industry experts to determine what modifications are optimally delivered without compromising the reasonable needs of motorists.

The Committee recommends that the most successful and applicable features of the current Alberta Workers’ Compensation model in terms of administrative regulatory structure be utilized as a guide in the design and then modified for the traffic accident injury context.

S. Reforms to benefit the traffic injured require trade-offs to also ensure affordability, accessibility and sustainability of fair premiums

To extend the optimal treatment assessment and benefits to all traffic injured, regardless of the ability to prove fault, there must be reductions and eliminations of the awards, most particularly those associated with pain and suffering claims, available under the current model. This is an example of the necessary trade-off in exchange for more transparent and balanced recalibration of benefits to be reallocated to all Alberta traffic injured and paid by the motoring public through fair, accessible and affordable auto insurance premiums.
T. Preservation of tort action outside insurance compensation model against motorists found guilty of criminal driving conduct causing bodily injury

Despite its view that the tort insurance model currently does not effectively deliver the goal of deterrence, in the case of motorists convicted of criminal driving offences that caused injuries, the Committee sees merit in the Legislature considering whether to preserve a cause of action for any provable damages not covered under the pure no-fault model, or the optional coverages in place. Such preserved right of action would necessarily be conditioned on the premise that only the convicted motorist would be personally liable to the traffic injured plaintiff for any judgment. In short, there would be no right of action against the motorist’s insurer for any amounts under such judgement.

U. Establishment of an Ombudsperson Office for Consideration of Additional Compensation in Exceptional or Extraordinary Cases

The Committee recommends that the GOA give consideration to the establishment of an ombudsperson or ombudsperson office for which application may be made for additional compensation in exceptional or extraordinary cases. Such an office may serve to identify any cases that do not appropriately fall within one of the categories of injuries, or warrant additional consideration due to extenuating circumstances.
V. Conclusions

1. Increases to auto insurance premiums for insured Alberta motorists have continuously exceeded Consumer Price Index increases for the past 3 decades, and have been sharply escalating since 2014. The current Alberta auto insurance compensation model does not deliver stability of premiums or long-term sustainability.

2. There are serious systemic problems in the current Alberta model. These are exacerbated by entrenched practices and processes that have not kept pace with the health needs of the traffic injured but have in fact prevented or delayed the introduction of modern innovations to improve health outcomes for the traffic injured and to prevent worsening of traffic injuries due to delays in claims resolution.

3. The Committee concluded that all Albertans, including those who do not form part of the insured motoring public, will be better served if the automobile insurance system provides at least a modicum of evidence-informed medical and health treatment to help all traffic injured receive proper care, participate optimally in their own recovery and see an expedited return to normal life activities including employment and leisure.

4. The Committee concluded that growing divergence between the intent and the result of the 2004 reforms is detrimental to the traffic injured and the motoring public, as is ongoing uncertainty flowing therefrom.

5. The Committee concluded that an alternative administrative health delivery model outside the tort system can provide individual evaluation of each injured person’s injuries and losses, and can do so more effectively, more swiftly and with superior health outcomes for traffic injured than the current model.

6. The principle of deterrence is no longer a convincing justification for maintaining the tort system in auto insurance. Deterrence of risky driving is more effectively achieved with increased enforcement of traffic laws, increased penalties for traffic infractions, more extensive education about the consequences of risky driving and the pricing mechanism that requires reckless drivers to pay higher premiums for insurance, if they are not precluded altogether from driving due to traffic enforcement laws.
7. The long delays endemic in tort litigation could be avoided by substitution of medical review panels established under an administrative model. These would have the authority to make conclusive determination at appropriate milestones after an accident as to issues of medical impairment and future treatment requirements.

8. The requirement for duelling doctors to be engaged by both sides in litigation to expend large amounts of time, resources and expense to craft written reports and prepare for possible cross-examination on their credentials and credibility is counterproductive. Instead doctors should be enabled to lead the inquiry, collaborate in a non-controversial, non-adversarial environment, and take factors into consideration that in a legal environment may have been excluded for procedural reasons. This will produce a more comprehensible and speedier resolution, to the benefit of all participants and will permit final conclusions about the health condition of traffic injured much earlier than typically occurs in the litigation process.

9. The original design of the DTPR remains sound and should be further developed, enhanced in its design and extended to deal with all other injuries. The development and extension of the existing DTPR under a properly designed regulatory process will address the problems of some traffic injured in Alberta receiving inadequate, wrong or duplicative treatment that does not benefit their recovery. Such additional treatment protocols when reviewed, refined, and enforced in line with current evidence informed practices will establish greater uniformity of treatment, will allow for greater relevant data collection and feedback to inform and track recovery methods that are safe and effective.

10. The Alberta tort system has lost the ability to best serve the traffic injured and motoring public. A pure no-fault model can rebalance the goals of traffic compensation resulting in fair, accessible and affordable insurance, timely and appropriate outcomes when claims are made viable and sustainable automobile insurance systems with modernized assessment and treatment protocols for all traffic injured. A pure no-fault system will produce greater opportunities to deliver improved health and benefits.

11. Improved health benefits delivered to all traffic injured will benefit families and dependants of the traffic injured as well as the motoring public and Alberta taxpayers. Better health outcomes would likely reduce the duration of recovery times, which in turn would result in earlier return to work and life activities and lower the nature and amounts of claims for pecuniary losses.

12. A redesigned pure no-fault accident compensation model will enable and incentivize health providers to develop consistent assessment and treatment protocols and collect patient feedback and objective treatment data to continue to inform those protocols. In the result the redesign will produce opportunities to deliver superior health outcomes for traffic injured and without the delays, duplications in services, adversarial processes and costs that exist under the current model.

13. The design of a health care model that provides appropriate medical evaluation, assessment and treatment modalities for all of those traffic injured who may have permanent incapacity and long-term care needs is a complex task. It is better addressed by transforming the health care model so that
medical, health and vocational expertise currently utilized in the tort system can be redirected to an administrative model that eliminates the features of adversity, conflict and dispute for better efficiency and cost.

14. A pure no-fault auto insurance compensation model will promote innovation and encouragement of optimal health treatment for Alberta traffic injured in an environment devoid of legislated adversarial conduct. Traffic injured, like all persons who suffer ill health, are better served if all their service providers are pulling in the same direction. This collaborative approach induces the injured to also take an active participatory role in their own recovery.

15. Transferring the Alberta traffic injury compensation to an administrative body that oversees individual assessment of all traffic injured and provides well informed treatment individually will also provide a healthy environment for its health services providers.
1. The Committee recommends the establishment of a board and tribunal, described in this Report as the Traffic Accident Regulator, to oversee all operations and an authority of last appeal which:
   a. serves as regulatory accident compensation tribunal for oversight of claims processes, to ensure fair determination and provision of claimants’ health and financial entitlement to benefits;
   b. serves as regulatory accident compensation tribunal for oversight of health and medical treatment, assessment and evaluation of permanent injury to ensure fair determination and provision of claimants’ entitlement to health benefits;
   c. serves as regulatory accident compensation tribunal for oversight of claims assessment panels to ensure fair determination and provision of claimants’ financial entitlement to benefits and compensation; and
   d. structured in a manner similar to the current Alberta Workers’ Compensation Board model although led by a statute appointed leader to ensure independence.

2. The Committee recommends that the Traffic Accident Regulator establish several administrative arms to oversee specific aspects of the pure no-fault accident compensation system as described in Section IX of this Report.

3. The Committee recommends that the ultimate details of a reformed pure no-fault auto insurance compensation model should be developed in consultation with selected health and medical experts, and, thereafter, ancillary health service providers.

4. The Committee recommends that there be consultation with insurance industry experts to determine what modifications are optimally delivered without compromising the reasonable needs of motorists.

5. The Committee recommends that the most successful and applicable features of the current Alberta Workers’ Compensation model in terms of administrative regulatory structure be utilized as a guide in the design and then modified for the traffic accident injury context.

6. The Committee recommends that the GOA give consideration to establishment of an ombudsperson or ombudsperson office for which to make application for additional compensation in exceptional or extraordinary cases. Such an office may serve to identify any cases that do not appropriately fall within one of the categories of injuries or due to extenuating circumstances warrant additional consideration.
Proposed Reform of Health Care Model
Health care professionals are committed by training and motivation to aid in the recovery of traffic injured patients. Commitment to health outcomes is vital to the success of any treatment model but it is vulnerable. Tort system aims at the recovery not of health but of money in an adversarial process that often pits healthcare professionals against each other in contests that may call into question their credibility, their competence, their motivations and the correctness of their professional opinions. Reform is required to ensure that health outcomes are the primary objective.

A. Pre-2004

Consultations with health care providers in Alberta prior to enactment of the Diagnostic Treatment Protocols Regulations (DTPR) revealed consensus that early diagnosis and treatment is known to hasten recovery of traffic injured and expedite their return to work and normal life activities.

However, there was no established consensus in the health community as to the optimal methods of assessment and treatment modalities for the category of traffic injuries now known as soft tissue injuries, including Whiplash Associated Disorders.

Prior to the introduction of the DTPR in 2004, individuals who were injured in a motor vehicle collision, except for treatment from their medical doctors, were required to pay from their own pockets for their assessment and treatments. This process often caused delays and disagreements regarding the type and extent of treatment required.

B. DPTR Model

Goals and Principles

The primary goal of DTPR was to ensure delivery to traffic injured covered by the regulation of prompt and effective health treatment to assist their recovery.

First, the DTPR introduced the principle of using best evidence for diagnosis and treatment to achieve better health outcomes.

Second, the DTPR introduced the practice of direct billing to insurers for a specified type and amount of initial treatment. This was designed to ensure that the initiation of treatment for traffic injured with soft tissue injuries was not delayed pending insurer approval.
The DTPR applied specifically to the following types of injuries: sprains, strains, whiplash-associated disorders (WADs), some temporomandibular disorder (TMD) injuries, and related physical or psychological symptoms. Other injuries such as fractures, internal injuries, permanent incapacitating and catastrophic injuries were excluded.

The DTPR specifically outlined the types of treatments recommended for strains, sprains and WAD injuries, specified limits on the number of visits and treatments required and authorized payment for treatments.

The DTPR was intended to streamline the assessment and treatment process for both traffic injured and primary health care practitioners (PHCPs). It also included provision for a second level health care assessment opinion for instances of traffic injured who were not recovering as expected. For example, if the PHCP was uncertain about the nature of the injury, or believed that the injury was not resolving appropriately or within the expected timelines, the DTPR provided for referral of the traffic injured to an Injury Management Consultant (IMC).

The IMC could:

a. provide advice;
b. following review of all relevant information regarding the injury, examine the patient with reference to the diagnosis and treatment under the DTPR;
c. report on the diagnosis and treatment; and
d. recommend a further assessment or a multidisciplinary assessment of the injury.

If a traffic injured was diagnosed with a WAD I or II injury and had any alerting characteristics that could influence progress, the PHCP was required under the DPTR to seek to reassess the patient within 21 days of the collision and if the injury was not resolving, refer the patient to an IMC for an assessment and report.

The IMC would provide a report to the PHCP and the insurer about the diagnosis and treatment of the traffic injured.

**Erosion of Model**

Enactment of the DTPR established initial consensus and acceptance by health professionals for an improved assessment and treatment of WAD injuries. However, the full potential of the model was not achieved.

Over time, lack of full compliance with the DTPR became more frequent, and as regards traffic injuries outside the DTPR, there was continued inconsistency of treatment, including probable overtreatment, undertreatment and ineffectual treatment.

In particular, the original purpose for which the IMC process was intended, namely improving clinical outcomes by conducting further investigations and assessments, confirming the diagnosis and prognosis or recommending other treatment modalities for the traffic injured was often ignored. Instead the IMC became focussed on requests for additional treatments under the DTPR.

The use of the alerting factors process was rarely followed.

Not all PHCPs respected the intent of the DTPR and some ignored information in the interpretive guides provided by the Superintendent of Insurance.

The DTPR process was not managed on behalf of the traffic injured, not universally monitored and there was a lack of accountability to ensure the clinical improvement of the patient.
There developed greater focus on active treatment, rather than evidence-informed patient education. As well, passive treatments which were meant to be a short term adjunct sometimes became instead the sole form of treatment.

After the 90 day DTPR process, the insurer was responsible to obtain a Medical Status Examination (MSE), or select a multidisciplinary assessment and treatment program. The health care provider had no authority to obtain an MSE or select a multidisciplinary assessment and treatment.

The Certified Examiner (CE) process has not met the intended purpose under the Minor Injury Regulation (MIR). It has been subject to erosion with the result that the CE roster is not current, and there is insufficient management, oversight and accountability of the CE process.

There is no system accountability to ensure reports are completed on a timely basis, consistent with the intent of the MI 3 forms under the MIR, or contain their opinions confirming the motor vehicle collision was the primary cause of the injury. As well, fees submitted for professional services were frequently not in compliance with the legislative guideline. Certain of these factors may have caused or contributed to courts declining to defer to CE opinions as the DTPR originally intended.

The current DTPR has no, or no effective, incentives for patients to recover and no, or no effective, incentives for PHCPs to improve patient outcomes.

Finally, the intervention of service providers in the litigation system dedicated to helping their clients to establish and maintain money claims for consequences of traffic injuries sometimes conflicted with, or delayed achievement of the goals of the health providers under DTPR.
C. Reform

Continuum of Care Model

The Committee is of the view that the diagnosis and treatment of all traffic injured would be better served by rededication to the original goals of the DTPR and extending its reach, with appropriate modifications and additions, so that it can have application as a superior care model for all Albertans injured in motor vehicle collisions.

Health outcomes would also be optimized by elimination of litigation, adversarial processes and friction points between the traffic injured and their health providers.

The Committee concluded that under a pure no-fault compensation model, Alberta could deliver these results by building further upon the original design of the existing DTPR so as to develop and deliver a modern, innovative, enhanced continuum of care model (hereafter COC), which continues to be principle-based, evidence-informed and apply to all traffic injuries.

The principle features of such an Alberta designed COC model will include the following:

a. encouraging collaboration among PHCPs, traffic injured and insurers;

b. incorporating in place of tort system service providers and representatives, independent injury navigators to advise and advocate on behalf of the traffic injured;

c. encouraging traffic injured at all stages to participate and remain engaged in their recovery, via for example, shared decision-making regarding choice of provider and treatment options;

d. eliminating any features that discourage traffic injured from early and effective recovery choices and encouraging those that do so; and

e. encouraging and incentivizing PHCPs to retain focus on improved health outcomes for the traffic injured.

For maximum health outcomes, the COC process must be independently and continuously managed, including continuously updating the COC with best available evidence, creating and maintaining ongoing education and training for PHCPs, independent injury navigators, and insurers.

The goals of all participants are aligned to help traffic injured patients resume as far as possible their normal pre-collision activities, assist in recovery and offset economic hardship as a result of the motor vehicle collisions.

A proposed enhanced COC model would ultimately require review, refinement and reassessment during a robust implementation phase involving service providers who would assist the culture shift, the transformation and develop and provide supporting roles. For the purposes of this Report, a proposed example is set out below for consideration.
Proposed Enhanced COC

Creation of new classifications of injuries

First, the Committee suggests creation of a classification of traffic injuries with neutral nomenclature to eliminate perceptions of stereotyping of persons who are traffic injured. The proposal is to create three classification of injuries as Type I, Type II and Type III.

Typical Symptomology and Treatment of Type I Classification

Traffic injuries that will normally fall into the Type I classification include strains and sprains of a musculoskeletal nature that from initial health assessment are expected to have a favorable recovery time ranging from a few days to a few months and leaving no permanent or serious impairment.

Since a Type I injury is likely to recover within days to a few months of the collision, patients should be educated and informed from the outset that their own inherent healing capacities are likely to lead to a substantial recovery and that while these injuries are disruptive and uncomfortable, they are not expected to have serious, long-term consequences.

During the period of recovery the patient may benefit from education, advice, reassurance and time limited evidence-informed clinical care in accordance with published evidence for effectiveness, including parameters of dosage, duration, and frequency.

For example, both patient and health providers should be reminded that most interventions produce at best, short-term benefits in the form of symptom relief and/or increased function and there is little evidence that higher dose intensity, more frequent attendance or prolongation of course of treatment are beneficial.

Diagnosis, treatment and rehabilitation

Type I injury diagnosis will be provided initially by a PHCP, which include medical doctors, physical therapists, chiropractors and nurse practitioners.

Primary Type I rehabilitation is contemplated to be provided independently by PHCP with reference to, and compliance with, enhanced protocols founded upon the former DTPR. Initially, it will not include psychological assessment, counselling or intensive daily programs.

Where, within 30 days of the primary rehabilitation, it is identified that the traffic injured is not resolving as expected, there will be a referral for an independent MSE. Following the MSE, a secondary rehabilitation may be recommended.

Secondary rehabilitation will entail a more comprehensive rehabilitation program provided by an interdisciplinary team that includes an assessment and all components of primary care. The PHCPs do not provide but are kept informed about this rehabilitation.

The emphasis of rehabilitation under secondary rehabilitation is treatment under the BioPsychSocial model (as currently defined under the existing DTPR) with the focus on restoration of function, reduction of pain and psychological sequelae.

Under the COC, clinical experts from all relevant disciplines, including psychology, psychiatry, neurology, and dentistry will assist in implementation design to develop and apply optimal practical protocols for assessment and treatment of complex injury cases that
involve concussion, TMD, chronic pain and psychological sequela and will be applicable to both traffic injured and healthcare providers.

The injury navigator will monitor treatment and progress of the traffic injured.

Where during or at the conclusion of the secondary rehabilitation it is identified that the Type I injury will not resolve as initially expected, there will be referral for an interdisciplinary assessment and treatment using tertiary rehabilitation.

This innovation is expected to expedite recovery of the estimated 10-14% of traffic injured that did not previously respond to expected recovery milestones due to inappropriate assessment, untimely or ineffective treatment or delayed recovery including adversarial processes interfering with the focus of the traffic injured on optimal participation in treatment, or a combination of the foregoing.

Tertiary rehabilitation will provide the most comprehensive level of service, focussed more intensely on components of targeted treatment of the chronic pain and psychological sequela.

However, injuries which initially include symptoms or complaints relating to TMD pain or mild traumatic brain injury (concussion) or otherwise will be referred for Specialist Assessment and Care.

**Typical Symptomology and Treatment of Type II Classification**

A Type II injury typically will involve some type of loss of anatomical alignment, surgical integrity, such as fractures or dislocations or psychological, cognitive, and/or physiological functioning.

As well, there may be found evidence for major concern in the absence of expert care about the likelihood of complications developing and/or persisting and potentially significant impairment and disability.

A Type II injury is not likely to undergo spontaneous recovery and the traffic injured may require medical, surgical and/or psychiatric/psychological care to attain optimal recovery.

**Diagnosis, treatment and rehabilitation**

Type II injury diagnosis initially may be provided by PHCP or emergency room physicians, and may require specialized consultation and/or inpatient hospitalization. Type II injuries will require specialist assessment and treatment that may involve inpatient care.

Type II injuries may be assessed, diagnosed and have treatment initiated by PHCP, but due to the severity of the injury, ultimately by specialist medical practitioners.

Rehabilitation for traffic injured with Type II injuries may require direction of medical doctors and include interdisciplinary team provision of ongoing care.

The injured person may require in-patient care. Their recovery may entail absence from work duties and they may need support for their daily care.

Monitoring of this traffic injured will require a specialist injury navigator.

The qualifications and certification of injury navigators contemplated under the COC for each of the injury classifications would be developed in consultation with subject matter experts in the implementation phase of the reform.
Typical Symptomology and Treatment of Type III Classification

Type III injuries are catastrophic injuries and typically include a severe injury to the brain, spine or spinal cord, and may also involve fractures of the skull or spinal column resulting directly from trauma in a crash, or indirectly from complications associated with the original injury. These injuries are extremely serious and permanently incapacitating and will require a specific regulatory definition such as the catastrophic impairment under the current Ontario Statutory Accident Benefits Schedule (SABS).

Although those currently catastrophically injured in Alberta will comprise a small and perhaps decreasing number, Type III treatment and rehabilitation will consist of a long-term specially designed engagement of health, vocational and long-term care specialists involving interdisciplinary teams.

The Committee proposes that Type III injuries will be managed under a specially designed program from a diagnostic, treatment and long-term care perspective, and funded by allocation of a specified portion of each auto insurance policy premium to a pool, with a pool fund entity manager and structure similar to the current Facility Association.

Diagnosis, acute treatment and short and long-term rehabilitation will be placed under the direction of a specialist medical and rehabilitation panel and monitoring of progress and care of Type III traffic injured. They will require a specialist injury navigator since these traffic injured will have significant daily needs including care, personal assistance, domestic support and an ongoing equipment, medical needs and require benefits available for long-term attendant care and services.

The Committee proposes to be included under reformed COC, features such as those observed under the NSW example, including the following:

a. provision for:
   i. medical treatment;
   ii. acute inpatient care;
   iii. rehabilitation;
   iv. specialist and expert medical care; and
   v. pharmaceutical expenses for life.

b. assignment of a provider certified as either specialist injury navigator or a lifetime care coordinator to:
   i. work in collaboration with the injured person, healthcare providers and insurers in the acute care and rehabilitation phases to help develop rehabilitation and community participation plans that identify short and long-term goals consistent with desire;
   ii. focus on helping the person adjust to the sequelae of the permanent injuries;
   iii. help regain as much daily function and independence as possible;
   iv. identify options for accommodation, transport, education, employment, social and recreational activity; and
   v. help the injured person and their family develop a community participation plan to enable the person to access all available activities and opportunities.

c. undertaking of a planning process to include:
   i. specific goals of the injured person including educational, social and employment;
   ii. services and support required including identifying any specific skills;
   iii. time frames;
iv. specific service entry, exit and transitional strategies;
v. roles and responsibilities of those involved in support;
vi. agreed review date to assess the adequacy of the plan; and
vii. support for carers.

Following the rehabilitation towards discharge, the life care coordinator would help the person and family focus on living with long-term injury sequelae and identify their ongoing support needs. Following discharge the program would typically provide daily services such as:

a. aids and appliances;
b. home and transport;
c. personal care;
d. domestic services;
e. childcare services;
f. nursing care;
g. assistance with community access;
h. educational and vocational services; and
i. respite care.

This lifetime care and support program would be financed through a fully funded pool collected from a portion of every auto insurance premium, using the current Facility Association structure as a model for the purpose of managing the fund and making distributions in accordance with the approval of the Traffic Injury Regulator (described under Section XI of the Report) according to established guidelines.

The guidelines would establish the particulars of the lifetime care and support and means by which the pool funds could be invested prior to use for the long-term benefit of the Type III injured.

Standards would be developed for service providers covering a range of skills, training and experience. Care providers would be approved by the Traffic Injury Regulator to ensure quality of service. The model of service delivery would, as far as practicable, give control of the selection of service providers and coordination of services to the traffic injured and or their families.

It may be advisable to establish an advisory council or board of the long-term care program with authority that would:

a. oversee the fund, including its investment;
b. approve the guidelines for eligibility and care need assessment;
c. approve the assessor fee schedule; and
d. approve the care provider fee schedule.

An advisory council would include two practicing health professionals with relevant experience in treating persons with catastrophic injuries, consumer representatives from relevant disability organizations, care provider representatives and members of the insurance industry. The advisory council would advise and report to the Minister or the GOA as to the operation of the model.

Funds paid into the program would be to provide the full cost of providing lifetime care and medical treatment services to this group of traffic injured. The pooling of the funds would protect against the possibility of poor estimation of the program. Lump sums would no longer reflect compensation for future treatment lifetime care and domestic assistance performed on an unpaid basis, but would be provided through the program.
Impairment benefits for pain and suffering and economic loss Type III injured would remain consistent with what is currently provided under the current accident compensation model.

In determining the portion of the premium to be dedicated to this fund, the Traffic Accident Regulator and the pool fund entity manager would rely on independent actuarial advice to ensure that the fully funded principle is maintained.

**Continuum of care model to enhance optimum recovery for all traffic injured**

Type I injuries are assessed, diagnosed and treated by PHCP using evidence-informed practice protocols defined in the COC.

The PHCP will engage the traffic injured in their rehabilitation, providing them with choice of provider and control of their rehabilitation within the COC.

The PHCP will complete the appropriate documents to initiate primary traffic injureds likely to recover. All documentation is to be collected by an independent injury navigator.

Recovery is attained when in the determination of the PCHP, or a medical panel when the case requires, the traffic injured is able to resume as far as possible, their normal, pre-collision activities.

Progress toward recovery is under the supervision of the PHCP, and initially, documented at or before 30 days, and reported to the injury navigator who will monitor the progress.

A maximum cost to the insurer for 90 days will be $3,500.

The traffic injured are incentivized to recover, by engaging in their rehabilitation programs and if there is agreement by the traffic injured, the PHCP and the injury navigator, that recovery is attained prior to 90 days, the file will be closed with the insurer and will not be opened again. At that point, monies that had not been required for rehabilitation will be placed into a Rehabilitation Maintenance Account (RMA).

The RMA will be accessible by the traffic injured to be used with prior joint approval and agreement of the PHCP and the injury navigator for purposes that sustain the recovered person’s health and wellness, for example, personal training or health equipment.

At or before 30 days of rehabilitation, if there are alerting factors with a WAD diagnosis, progress is not moving forward as expected or the PHCP does not believe the injured person will likely recover, a referral for an independent Medical Status Examination (MSE) by a qualified practitioner must be made.

The MSE will recommend continued participation under the COC, a secondary rehabilitation program or an Interdisciplinary Assessment (IDA).

The secondary rehabilitation program is a more comprehensive rehabilitation program provided by an interdisciplinary team, but not the PHCP. The BioPsychoSocial model will be the focus of this program, in addition to restoration of function and reduction of pain and psychological sequelae. Reporting will occur on a regular basis to an injury navigator with a higher level of knowledge and experience to monitor the progress to recovery.

The secondary rehabilitation program will conclude within 90 days of the injury and costs will be within the original $3,500.
The traffic injured are incentivized to recover by engaging in their secondary rehabilitation program and if there is prior joint approval by the injured person, the PHCP and the injury navigator that recovery is attained within 90 days, the file is closed with the insurer and will not be opened again. Monies that had not been required for secondary rehabilitation at that point will be placed into an RMA.

The RMA can be accessed with the agreement of the PHCP and the injury navigator to be used for purposes to enhance the recovered person’s health and wellness, for example, personal training or health equipment.

If recovery is not attained within 90 days, a tertiary rehabilitation program will be initiated. This is the most comprehensive level. It will be delivered more intensely with additional components of treatment for chronic pain and psychological sequelae. Reporting will occur on a regular basis to an injury navigator with the highest level of knowledge and experience to monitor the progress to recovery.

The maximum cost to the insurer for rehabilitation program from 90 – 180 days will be $2,500.

The traffic injured is incentivized to recover by engaging in their extended tertiary rehabilitation program and if there is prior joint agreement by the injured person, the PHCP and the injury navigator that recovery is attained within 180 days, the file will proceed to final closure with the insurer. Monies that had not been applied for this final tertiary rehabilitation at that point, will be placed into an RMA.

The RMA can be in future accessed only for approved purposes to enhance the recovered person’s health and wellness with the prior joint agreement of the traffic injured, the PHCP and the injury navigator.
Medical Expert Panels

If recovery is not attained by 240 days, a Medical Panel of experts will be convened.

The purpose of the Medical Panel is to provide its consensus opinion as to whether the traffic injured has reached a maximum medical outcome and no further improvement would be expected as well as a consensus opinion on the percentage of permanent or partial impairment (according to an impairment schedule designed and approved by the Traffic Injury Regulator) if any, that remains with that traffic injured.

At or before 2 years from the collision, a Medical Panel of experts will be required to deliver a consensus opinion as to when the injured person has reached maximal medical outcome and percentage of impairment for the purpose of assessing benefit entitlement.

The Committee is of the view that the Alberta Workers’ Compensation Board medical panel is an example of a successful model to be emulated.

In a recent article entitled Medical Panels in Victoria Australia and Alberta Canada, Carol Newlands, (2019) 27 JLM 239, the features of the medical panels and Appeals Commission under the Alberta Workers’ Compensation system were reviewed. The following points are noted:

a. The Workers’ Compensation scheme in Alberta is an administrative system in which “the courts play only a supervisory role in ensuring that decisions are … reasonable”.

b. Medical panels were introduced in 2002 following the enactment of the Workers’ Compensation Amendment Act 2002 SA 2002, c. 27. Mr. Dunford, Minister of Human Services and Employment stated that “the purpose of the medical panel is to get an independent, expert consensus based medical opinion, adding that “this would be binding” on the Workers’ Compensation Board (responsible for administering the compensation scheme) and the Appeals Commission (the final appeal body).” – Alberta, Parliamentary Debates, Legislative Assembly, 29 April, 2002, 1014.

c. This model has continued to function for 17 years and panels are seldom used (only 19 referrals in 2016 and 16 in 2018). Medical panels may be called upon to provide medical findings where the Board or the Appeals Commission request assessment assistance with a medical issue during their evaluation of a claim. If either evaluating body determines there are conflicting medical opinions in relation to an injured worker’s claim, a panel referral is mandatory. Workers’ Compensation Act RSA 2000 c. W-15 s. 46.3(2).

d. The Appeals Commission has “exclusive jurisdiction to examine, inquire into, hear and determine all matters and questions… arising under the compensation legislation and regulations pertaining to it. S.13.1(1)”. Such decision is “final and conclusive and is not open to question or review in any court.” S. 13.1(1).

e. The panels are administered by the Medical Panels’ Office staffed by the Medical Panels Commissioner, an independent medical practitioner appointed by Lieutenant-Governor in Council and any Deputy Medical Panels Commissioners similarly appointed. The Commission has a number of duties under the legislation, including the appointment of appropriate medical practitioners to a medical panel when one is requested.
f. Each panel consists of three medical practitioners, one selected by the worker, one chosen by the employer and one chosen by the Board. The Commissioner starts the selection process by drawing up a list of eligible members from the general list held by the College of Physicians and Surgeons of Alberta. The practitioner selected must have expertise in the medical matter under consideration, be registered in Alberta or have equivalent status in another province and be available and willing to undertake the role.

g. A practitioner who has treated the worker cannot serve as a member of the assessing panel nor can one who has been consulted regarding the worker’s injury, except under special circumstances, [Medical Panels Regulation Alta Reg 21/2018 s. 2 (6)(b)] nor can one serve who has provided services to the worker or the employer or as a partner or associate of such a practitioner.

h. The injured worker, the Compensation Board and the employer may each choose a preferred practitioner. If the worker is self-employed, a member of the employer’s family or is a partner or director in the employer’s company, the Medical Panels Commissioner will choose a physician on the individuals behalf. Similarly, the Commissioner will choose a practitioner if any of the three selectors fails to do so within two weeks of receiving the compiled list.

i. The appointed panel receives and must review all available relevant documentation pertaining to the matter and may interview and examine the claimant worker. If the worker has elected to appoint a medical professional advisor, the latter may provide input and make representations to the panels.

j. After completing the steps, the hearing panel is required to provide a “report of its medical findings, including reasons supporting the medical findings …”. Regulation 21/2018 s. 5

k. The legislation states that “[t]he medical findings of a medical panel are binding on the Board, the Appeals Commission and all other persons with a direct interest in the claim. The medical findings of a medical panel are final and conclusive and not open to question or review in any court.” WCA RSA 2000 c.W-15 s. 46.3 (12) (13]

l. As such, there could be no review on the merits of the panels’ medical findings. See Alberta (Workers’ Compensation Board) v. Alberta (Appeals Commission for Alberta Workers’ Compensation) 2010 ABQB368 (31 May 2010), where Hillier J. held that under the legislation, the Appeals Commission had “exclusive jurisdiction to examine, inquire into, hear and determine all matters and questions arising under (this) Act and the regulation…” (WCA s.13.1(1).

m. Hillier, J. further held that the Appeals Commission had been vested with a “very broad and comprehensive authority”… (p 81) to undertake its given role,… and that as such, it was the role of the Commission to interpret the relevant legislation and to do so in a manner “that is consistent with the scheme and the intention of the Act and that ensures coherence and avoids absurdity”. (Page 82) He further noted that having received the findings of a medical panel, it was the responsibility of the appellate body to determine compensability issues by application of the required legal test. (p 85-88)
Benefits Assessor Panels

A panel of experts in medical and rehabilitation services will determine the level and extent of impairment benefits the traffic injured will be entitled to receive according to a schedule designed and approved by the Traffic Injury Regulator, such as that in place used under the no-fault benefits model used currently in Saskatchewan.

A panel of experts in future care and income replacement cost calculations will determine the future care costs and loss of past and future income and other related financial claims.

This panel would be modelled after the medical experts panel described above with appropriate modifications.

Additional costs may include home care costs, medical equipment for home care and the like.

Certain Specific Costs of Care Model

It is the Committee’s understanding that the cost of diagnostic investigation, acute treatment and rehabilitation is currently billed to Alberta Health Services (AHS) and recovery of costs included in a health care levy negotiated with insurers. The reforms proposed may result in changes to the costs currently borne by the GOA and the insurance industry, and the costs currently transferred between the insurance industry and other entities such as Alberta WCB and self-insured entities and require appropriate cost transfer adjustment to eliminate or minimize cross subsidization.
D. Conclusions

1. The Committee concluded that the redesigned continuum of care model outlined combines the most useful features of existing health care treatment regimes with views of subject matter experts. It establishes a new paradigm that will encourage collaboration, innovation and continuing improvement among service providers based on evaluation of performance, health outcomes and research.

2. The proposed continuum of care model will address the deficiencies identified in the current system, namely delay, conflict, inappropriate and ineffective treatment and duplications in service. It will reallocate resources to produce better health outcomes for all, not merely a portion of all traffic injured in Alberta.

3. The continuum of care model will provide more rational individualized diagnosis and treatment of Alberta traffic injured. In turn it will encourage the collaborative pursuit of optimal health outcomes among the health service providers, insurers, the Traffic Accident Regulator and the traffic injured themselves.

4. Because the proposed continuum of care model will extend to all traffic injured including those at fault, the Committee expects that the key elements of the new model, including the elimination of current costs that did not improve health outcomes, the reduction and elimination of certain lump sum payments for pain and suffering, the implementation, management and oversight of superior evidence-informed protocols and health provider practices, will deliver much improved health outcomes. It further expects that over time, this redesign will reduce the cost of medical treatment and income compensation due to improved health outcomes. Reduced stabilized costs will result in sustainable, predictable and stabilized premium levels over the long term.

5. The Committee concluded that the proposed pure no-fault private enterprise model should trend toward expediting recovery of Type I and Type II injuries, and optimizing treatment and long-term care for Type III injuries, all of which, in turn, should result in reduced medical costs and income claims over time. This trend will be achieved through the maximum effort of all participants to deliver optimal performance which will be verified by collecting and examining all the relevant data and the use of modern technology including artificial intelligence and applying medical innovations.
The Committee recommends the foregoing continuum of care model be adopted as part of its proposed pure no-fault accident compensation model, with the intention that its service providers be subject to oversight of a new Traffic Injury Regulator.
XI Proposed Reform of Auto Insurance Regulatory Regime
In concluding that conversion to a pure no-fault auto insurance compensation model would be the optimal solution for the needs of the Alberta traffic injured and the motoring public, the Committee took into consideration that a pure no-fault standard mandatory policy which delivered an expert designed, enhanced continuum of health care built upon the features of the existing DTPR would provide a superior collaborative, research oriented and evidence and performance based environment for treating all traffic injured. The new standard automobile insurance policy would be more affordable and accessible to motorists and would provide long-term sustainability. The optional products would deliver an additional layer of choice in the provision by insurers of a sufficient array of additional insurance coverages to a basic mandatory automobile insurance product. A pure no-fault auto insurance model provided by a private enterprise delivery system could allow Albertans to extract the best of both worlds: greatest cost transparency, swiftest ability to react and adjust to changing economic conditions, provision of innovative solutions to the true stakeholders and potentially superior results from business and scientific partnerships resulting in quickly and efficiently delivered optimal health outcomes. It recognized that the new model must be culturally shifted to be evidence-informed and principle-based. Finally, it recognized that transitioning the regulatory regime to a pure no-fault accident compensation model for Albertans will require a wise blend of the best features of existing pure no-fault auto insurance compensation models, informed by the strong collaborative efforts of those remaining and emerging service providers necessary to the success of the reformed model to contribute thoughtful and informed views as to its modernized state. The Committee sets out its observations as to optimal features of a reformed regulatory model taking into account some additional features presented by the fact of private enterprise delivery.
A. Making the Changes Necessary for Fundamental Alberta Auto Insurance Reform

The Government of Alberta (GOA) remains the ultimate legislative authority over the reformed auto insurance compensation model to enact statutory and regulatory laws applicable to Albertans. The Committee concludes that a reformed traffic accident regulatory structure would include reporting to GOA as required, responding to GOA requests and keeping it apprised of changing circumstances that required input and direction.

The Committee recognized that too much regulation can hinder the best efforts of private industry to provide products and services to consumers, while too little regulation can leave consumers unprotected. In the case of the standard mandatory insurance product, the Committee proposes a regulatory structure that will oversee all aspects of the accident compensation system. In the case of optional insurance products, with a much lighter regulatory touch, the traffic accident regulatory structure should attain a superior blend of innovation and improved provision of services from the competitive private enterprise participants.

The Committee concludes that for these twin goals to be attained, the traffic accident regulatory structure will be most responsive to both government and industry, if it is designed and operated independently of both, while still responsible to government for its performance and results and responsive to industry for timely adaptation to change and improvement as economic conditions require.

A meaningful shift in culture, model and processes requires participation and support from both existing and exiting service providers including insurers, health care providers, legal practitioners, ancillary providers and the existing regulators as well as the motoring public.

In particular, key service providers under the reform model, namely the remaining auto insurers and the health care providers, will need to undergo a significant culture shift from their current modes of operation. Their services will be streamlined, however, the goals will be to target and enhance superior outcomes. The new environment will enable facilitation of more performance-based interaction and connection among their sectors. The partnerships developed should enhance and coordinate their delivery of benefits to traffic injured.

The Committee observes that after transformation, the reformed regulatory regime must not be or become overly bureaucratic, since optimal health outcomes for traffic injured require swift delivery of effective treatment. The continuum of care model contemplates rapid review of treatment data to ensure treatments are effective and to allow adjustment, modification and innovation to be quickly translated to ensure continuous improvement. Proper oversight of qualification and training and continuous improvement of claims and health delivery is essential to ensure the high standards of performance initially established are maintained, updated and upgraded where needed. An independent structure with the authority to issue guidelines in respect of the performance of interrelated services should enhance coordination and innovation.

The Committee concludes that there exist in the current system many competent and able service professionals who may be recruited to adapt and adjust their skills to participate effectively and with employment satisfaction.
in a new collaborative accident recovery environment that encourages joint participation to achieve common goals.

While it is not the intention of this Committee to prescribe a specific structure of the new regulatory regime, since the proper design requires more detailed dialogue in an implementation phase, the Committee outlines below the key features it has extracted from its study to guide those who undertake the implementation.

Needs of the new model

The Committee concluded that a culturally shifted, robust automobile insurance compensation system should address at least the following needs:

a. emphasis on recovery and wellness of the individual;

b. immediate and proactive treatment and return to work;

c. increased efficacy of health professional service in assessment and treatment of traffic injured;

d. greater predictability that ensures affordability of premiums and long-term stability;

e. monitoring of skills, capability, qualification and service patterns of all service providers;

f. independent oversight through a new auto insurance administration consisting of coordinated regulators and support staff to ensure fair determination and provision of claimants’ entitlement to benefits;

g. sufficient authority for regulators, for example, to issue guidelines for effective monitoring, managing, incentivizing and sanctioning participants to ensure effectiveness; and

h. coordination and cooperation between regulators and service providers, including insurers, and health and claims assessors to adopt:

i. effective data driven claims management; and

ii. effective information technology to continuously analyze evidence to improve health recovery outcomes and to inform ongoing recalibration of regulatory guidelines and performance standards.

Changes in Culture

A robust auto compensation system culturally shifted toward these priorities would require:

a. adherence by all service providers to evidence-informed treatment guidelines and possible stipulated cost allowances to ensure uniform, effective and fair claims management and medical treatment;

b. undertaking by insurers to retrain and recruit future claims managers and currently employed claims management insurance staff with skillsets more appropriate to the reform model; and

c. accreditation of all service provider specialists participating in the new system.

A robust automobile compensation system culturally shifted toward these priorities would need to meet the following challenges:

a. maintaining balance and fairness of best practices in claims management process without legal representation;

b. exploring possibility of establishing a formal link with employers (as WCB does) to align rather than impede the guidance and management of treatment directed at rapid recovery and return to work;

b. collaborating with insurers to develop effective independent oversight;

d. designing guidelines to establish cooperative participation in delivering swift and effective management and resolution of claims;
e. ensuring insurers’ healthy relationships with their claimants are preserved during the claims management and resolution process so as to facilitate the ability to manage the injured person’s return to health and work; and
f. identifying fraudulent and managing exaggerated claims and methods to eliminate the same.

B. The New Model and Processes

The proposed pure no-fault model that replaces the tort system will substitute a new regulatory framework designed and committed to oversight of the proper treatment of traffic injured in the claims process, including health services to address recovery, rehabilitation or ongoing care, and evaluation of medical and financial status for purposes of determining appropriate financial benefits to restore losses due to injury.

The Committee concluded that the Alberta Workers’ Compensation model provides a useful example of an administrative structure that delivers the services required for an entire provincial pool of injured persons, in place of tort. The Committee concluded that a Traffic Accident Regulator, independent from government and the auto insurance industry, can provide equal or superior oversight and regulation as regards the claims process, delivery of health benefits, assessment and determination of health status and claims, review or appeal processes, and certification and qualification of all service providers who participate under the reform model.

The Committee recommends implementation of an alternative administrative regulatory system, described in this Report as a Traffic Accident Regulator, that will replace tort components of the current model and provide for:

a. a standardized claims process for traffic injured to present claims for health treatment and compensation for pecuniary losses;
b. a comprehensive process of individual assessments of accident losses for traffic injured including diagnosis, evaluation of appropriate health treatment, benefits and finalized impairment determination;
c. a comprehensive process for determination of income replacement benefits; and
d. a process for overseeing delivery of services of providers including:
i. health service provider certification;
ii. insurer rating practices and processes;
iii. income replacement service provider certification;
iv. traffic research and innovation;
v. accident injury research and innovation; and
vi. research to combat fraudulent conduct, including theft and fire loss claims.

The reformed pure no-fault model requires a claim support service which would:

a. be funded by insurers but supervised by an independent administrator; and
b. provide at least the following services:
   i. central claims lodgement portal;
   ii. transparent, clear and comprehensive information to traffic injured claimants about claims processes;
   iii. greater knowledge and control for traffic injured with little or no experience in the claims process;
iv. assistance with administrative steps such as submission of claims form;

v. assistance to claimants to navigate the issues and options in their claims;

vi. advice on review processes and requirements;

vii. in certain limited cases where warranted, assistance to communicate with the insurer;

viii. a claimant advocate, navigator, or enhanced advice service available to persons who require enhanced support due to being socially disadvantaged, disabled, challenged due to diverse cultural or linguistic backgrounds so that they have multilingual, culturally appropriate and accessible information and basic advice to expedite the claims recovery process and provide cost effective information to claimants and their families;

ix. claims advocates or navigators that would support traffic injured;

x. informal claims process that would minimize bureaucracy;

xi. research on best practice approaches to injury prevention management and optimizing recovery;

xii. incentives to encourage more consumer-centric claims management with emphasis on wellness of injured consumer;

xiii. advice and assistance to service providers such as health, community services and government service providers;

xiv. collaboration between regulator and service providers to vigilantly identify and combat fraudulent and exaggerated claims; and

xv. exploration of possible insurance protection for employers who provide paid work for traffic injured who recovered to partial capacity.

The new model requires a medical assessment process to provide:

a. the following services:

i. implementation of a reformed medical assessment model that ensures treatment paths are consistent with established and current best practice guidelines to facilitate optimal recovery and containment of treatment costs;

ii. establishment of a single entry point;

iii. early intervention including health provider screening for risk factors that may impede predicted recovery;

iv. mandatory assessment processes after certain time period for all accident claims;

v. with proactive treatment for injury, recognition of those claimants with reduced motivation to comply with essential self-management aspects of a treatment program;

vi. single medical assessment conducted by a certified panel of medical specialists selected from a rotating roster;

vii. establishing regulated treatment allowances aligning to best practice guidelines to be used uniformly by all insurers;

viii. establishment of an independent panel of medical specialists as sole decision makers about assessment and treatment in lieu of duelling experts resulting in associated delay, increased costs and potential impaired recovery; and

b. be structured with:

i. provision that the panel decisions will be conclusive evidence as to the degree of permanent impairment of the injured person; and
ii. provision that a review/appeal tribunal may not reject a medical panels’ certificate as to the degree of permanent impairment and substitute its own determination unless there has been a denial of procedural fairness in the issue of the certificate and the tribunal is satisfied admission of the certificate would cause a substantial injustice to a party to the proceedings.

The new model requires a financial claims assessment process:

a. with these objectives:
   i. establish a roster of panellists with appropriate training, qualifications, knowledge, experience and personal skills to evaluate and determine quantum of financial claims and benefits for traffic injured based on certificates issued by the Traffic Injury Regulator;
   ii. set up and administer processes for claims assessments; and

b. within a framework containing:
   i. provision that the panel decisions will be conclusive evidence as to the benefits and financial compensation based on statutory table of claims; and
   ii. provision that a review/appeal tribunal may not reject a claims assessment panels’ certificate as to the nature and amount of benefits and financial compensation and substitute its own determination unless there has been a denial of procedural fairness in the issue of the certificate and the tribunal is satisfied admission of the certificate would cause a substantial injustice to a party to the proceedings.

The new model requires a reconfigured rate regulator to continue the current role and duties of the AIRB and to take on additional responsibilities and to interact with the other arms of the Traffic Injury Regulator as has been described extensively in Sections VIII and IX of this Report.

The new model requires a reconfigured rate regulator to continue the current role and duties of the AIRB and to take on additional responsibilities and to interact with the other arms of the Traffic Injury Regulator as has been described extensively in Sections VIII and IX of this Report.

The new model requires a board to oversee all operations and final appeals which:

a. serves as regulatory accident compensation tribunal for oversight of claims processes to ensure fair determination and provision of claimant’s health and financial entitlement to benefits;

b. serves as regulatory accident compensation tribunal for oversight of health and medical treatment, assessment and evaluation of permanent injury to ensure fair determination and provision of claimant’s entitlement to health benefits; and

c. serves as regulatory accident compensation tribunal for oversight of claims assessment panels to ensure fair determination and provision of claimant’s financial entitlement to benefits and compensation.

The Committee foresees that such a board could be structured in a manner similar to the current Alberta WCB model although led by a statute appointed leader to ensure independence.

Given that the insurers carrying on business in Alberta will be underwriting a portion of the administrative costs of the new model, there must be sufficient representation of their views on the board to ensure appropriate participation and feedback.
C. The Transitional Period

Role of Government
The GOA will need to provide certain communication services during the transition including:

a. an ongoing education for traffic injured and the motoring public about the model changes to ensure a sound understanding of the recovery model and set an expectation that traffic injured should receive timely support for return to health, social and economic participation;

b. an effective communications strategy to emphasize goal of recovery and wellness to encourage behavioral attitude shift during reform implementation process;

c. an effective communication strategy focussing on rapid recovery during reform period, such as the Traffic Accident Commission promotion activities in Victoria, Australia during its scheme transformation; and

d. periodic review, such as every three years, to determine, measure and adjust for impact on claimant experience, timeliness of benefits, performance and satisfaction of service providers, insurer profits and the like.

Role of Service Providers
Requirements for service providers choosing to transition and participate in the reformed model include:

a. adopting an approach to assist claimants in recovery, benefits management and finalization rather than claims and payment benefits disputes; and

b. all service provider specialists to undergo and receive appropriate accreditation.

Role of Insurers
Insurers will need to:

a. retrain future claims managers and currently employed claims management staff;

b. retrain and recruit staff with skillsets more appropriate to the new recovery model; and

c. adhere to guidelines and to ensure uniform, effective and fair market conduct in relation to injury claimants.

Role of Participating Medical/Health Professionals
Medical/health professionals will need to:

a. pursue increased efficacy of health professional service in assessment and treatment; and

b. undergo and receive appropriate specialist’s accreditation where required.

Role of Legal Professionals
Legal service providers choosing to transition and participate in the reformed model may find opportunities to serve a reformed regulatory role in the way of advising service providers or accepting term appointment to the accident compensation tribunal.

Future alignments
The establishment of the Traffic Accident Regulator board may be assisted by guidance from the past and current members and staff of the AIRB, which has been by all accounts, an effective regulator in a private enterprise model, to better inform the new roles and ensure linkages between the information as
to recovery and health outcomes and health innovations that may assist in forecasting future premium levels.

After implementation there may arise opportunities for collaborative relationships to develop between certain healthcare providers and insurers to maximize efficiencies and health outcomes. The Committee’s view of the reform is that there should be space to foster development of such opportunities, provided that the oversight of the Traffic Accident Regulator always ensures the maintenance of, and compliance with, the standards it has established. These collaborations could have long-term advantages in providing reliable information for insurers to improve their array of optional programs and in turn those could inform improvements to the services delivered as regards the mandatory product.

Once implemented this model is expected to potentially reduce costs to the Alberta health system and to the court system.

It is worth keeping a weather eye on these potential reductions, if the government realizes savings it would otherwise have spent in maintaining the court system, while insurers are underwriting the cost of the replacement administration.

If the proposed reforms establish greater savings than anticipated over the medium and long term, those amounts should be monitored so that either refunds or reduced premiums are passed on to consumers. By the same reasoning, it may be necessary for the AIRB, in a reconstituted form, to be assigned an expanded role to monitor profit levels of insurers during the transition and going forward to ensure the profits do not reach excessive levels.

There should be a recognized role for the insurer associations such as IBAA, IBC and FA to participate in the information exchange and research projects for the mutual benefit of the Alberta traffic injured and motorists.
D. Traffic Injury Innovation

The Committee foresees opportunities to harness the benefits of a consolidated network of service providers to deliver accurate, easily understood and disseminated information to the motoring public and the traffic injured to encourage their participation in the pure no-fault accident compensation model for a combined effort to decrease the loss costs of automobile usage, and at once maximize the benefit of and reduce cost of health delivery services to traffic injured.

Where the new arms of a Traffic Accident Regulator can collate and refresh most informed information about ways to improve and optimize delivery of a new accident compensation system, they can also in combination improve all outcomes by sharing forward such information to all service providers with a view to educating and reinforcing the relevant information to the true stakeholders. Moreover, bolstering this process will deliver greater transparency of information exchange.

For example, educational information can be formulated for consistency among the Traffic Accident Regulator and registry agents, driver trainers, insurance agents and brokers, insurers, health providers, auto dealers, auto repair and car rental businesses, government departments and other social agencies and then delivered on a continuous stream to consumers.

The experiences of the Traffic Accident Claims Regulator can be informed and improved by ongoing exchange of information and innovations between insurer employees, and such improvements in turn communicated to consumers.

Opportunities for private enterprise service providers that are recruited under the new model may arise to improve delivery of products and services to consumers. One detailed example relates to health and medical clinics that currently serve the traffic injured.

The Committee was guided by the endorsement of the health strategies referenced in the Marshall Report (Porter Lee Article Harvard Business Review October 2013 Issue) and observed potential goals for a newly established traffic injury model could include:

- a. eliminating features of a value-based system with decades long entrenched interests and practices;
- b. encouraging clinicians to shift focus from the desire to maintain their traditional autonomy and practice patterns to prioritize patients’ needs and patient value and have the discipline to progress through the resistance and disruptions that will result;
- c. providers adopting the value goal, a culture of patients first, and the expectation of constant, measurable improvement;
- d. establishing the primary goal of attaining health outcomes that matter to patients relative to the cost of achieving those outcomes;
- e. shifting the focus from physician visits, hospitalizations, procedures, and tests to the patient outcomes achieved;
- f. replacing with a system in which services for traffic injured are concentrated in health-delivery organizations and in the right locations to deliver high-value care;
g. shifting the care coordination, especially for patients with costly needs, to organizing around the patient’s medical condition;

h. improving outcomes without raising costs or lowering costs without compromising outcomes, or both;

i. recognizing that providers who can improve patient outcomes, can improve the efficiency of providing excellent care;

j. delivering care by a dedicated, multidisciplinary team of clinicians who devote a significant portion of their time to the medical condition; and

k. encouraging such team to assume responsibility for the full cycle of care for the condition, so that

i. providers see themselves as part of a common organizational unit;

ii. patient education, engagement, and follow-up are integrated into care;

iii. the unit has a single administrative and scheduling structure;

iv. a clinical care manager oversees each patient’s care process;

v. the team measures outcomes, costs, and processes for each patient using a common measurement platform;

vi. joint accountability is accepted for outcomes and costs;

vii. focus to achieve the best outcomes at the lowest cost; and

viii. as outcomes improve, with the tools to manage and reduce costs, even as reimbursements plateau and eventually decline, providers with teams with more experience and better data will improve value more rapidly and attract still more volume.

The Committee suggests consideration be given to a joint Traffic Injury Innovation Panel comprised of insurance industry and health experts to continue to research and review ways to optimize treatment for traffic injured.

With exploration of the viability of integrated patient units (IPUs), there could be added benefits and outcomes including:

a. potential for patients to miss fewer days of work and need fewer physical therapy visits;

b. better care can lower costs, and increase productivity;

c. producing faster treatment, better outcomes, lower costs, and, usually, improving the condition due to restructuring of work;

d. improving and excelling by tracking progress over time and comparing their performance to that of peers;

e. rigorous measurement of outcomes and costs may improve health care, and systemic measurement of results in health care can improve results; and

f. clinicians who document their patients’ outcomes (such as their time to return to work) or the actual resources used in treating those patients over the full care cycle can objectively prove added value.

The joint Traffic Injury Innovation Panel could study the potential benefits of establishing agreed factors to assess the patient experience with the health status achieved such as:

a. degree of health or recovery:

   i. functional level achieved;

   ii. pain level achieved;

   iii. extent of return to physical activities; and

   iv. ability to return to work.
b. time to recovery:
   i. time to begin treatment;
   ii. time to return to physical activities; and
   iii. time to return to work.

c. disutility of care or treatment process:
   i. delays and anxiety; and
   ii. pain during treatment.

d. sustainability of health or recovery:
   i. nature of recurrence;
   ii. maintained functional level;
   iii. ability to live independently; and
   iv. need for revision or replacement.

Porter and Lee have reported that:

a. health care providers should consistently measure outcomes by condition to enable universal comparison and stimulate rapid improvement;

b. outcomes are starting to be incorporated in real time into the process of care, allowing providers to track progress as they interact with patients; and

c. providers should measure costs at the medical condition level, tracking the expenses involved in treating the condition over the full cycle of care.

In the view of the Committee, a collaborative approach among the regulators, auto insurers, health industries and all ancillary service providers could well provide a superior accident care compensation model for all Alberta traffic injured and motorists utilizing a collective aptitude and appetite for high-performance and proven outcomes.

Such a model would likely reduce health costs in the short and long term in properly treating traffic injured by eliminating costs of overtreatment, ineffective treatment and wrong treatment, and expediting delivery of health treatment and benefits.

Such a model would encourage all service providers to provide optimal service.

Such a model would eliminate substantial costs of the tort components of the existing system and redirect those savings to the motoring public.

Such a model would likely also reduce the financial burden on the Alberta health care system as regards those traffic injured who are not currently receiving any or any proper treatment for traffic injuries.

Such a model would reduce the costs to the court system, which resources could be redirected to other classes of cases.
E. Alignment with other government agencies

The Committee recognizes that implementation of this model will impact the existing roles of certain programs operated by other government and industry agencies which will require review and alignment, in particular about how to maintain appropriate deterrence of intentional driving misconduct, and how to treat traffic injured and wrongdoer motorists who do not have automobile insurance, including pedestrians and cyclists.

Other existing programs overseen by Alberta Health, and municipal and federal governments must also be reviewed to determine needs for alignment and to ensure duplication of services is eliminated and that appropriate cost sharing of accident benefits is undertaken.
F. Conclusions

1. The Committee has included in its recommendations extension of the jurisdiction of the AIRB or, alternatively, expanding its mandate under a new reform model. It offers a few additional words of guidance with respect to AIRB’s role in future.

2. The Committee observes that the predecessor Alberta Auto Insurance Board was first constituted in approximately 1970 as a statutory body established independent from the Government of Alberta. From that date until about 2003, it functioned efficiently in delivery of rate and rate related decisions as a prior approval board.

3. In about 2003, the Alberta Auto Insurance Board was reconstituted as the Alberta Insurance Rate Board (AIRB) and since then reported directly to the Minister of Finance, as a part of the Government of Alberta, although it has been funded by the automobile insurance industry. While the jurisdiction of the AIRB is similar to that of its predecessor, as noted under Section VIII C of this Report, some overlapping jurisdiction has emerged with that of the Alberta Superintendent of Insurance which has resulted in concerns about the efficiency of the operation of both regulators.

4. The Committee concluded that while the AIRB has worked well under the existing model, the motoring public would be better served if it reverted to its former status, so that it could provide independent expert advice to the government from time to time as circumstances dictate, and on a regular basis interact more nimbly and informally with auto insurers and other affected parties as regards rate and rate regulating issues.

5. With its existing expert knowledge about the specific operation of prior approval, the Grid, Territories, rating factors that should be permitted and prohibited and new optional products such as UBI, the AIRB members and staff are in a unique and valuable position to offer advice and guidance in an implementation phase.
G. Recommendations

1. The Committee recommends that the Auto Insurance Rate Board should be reformulated to comprise an essential part of a Traffic Injury Regulator. Those features that work well under the current private enterprise model should be retained and blended with those features that work well under the current Alberta Workers’ Compensation Model and which could be appropriately adapted to a comprehensive Traffic Injury Regulator in a private enterprise environment.

2. The Committee recommends that more expanded collaborative dialogue be undertaken among the auto insurance industry providers, health providers, claims providers, proposed injury navigators and government officials prior to and in the implementation phase before a final design is adopted. Collaborations among these providers could have long-term advantages in providing reliable information for insurers to improve their array of optional programs and in turn those could inform improvements to the services delivered as regards the mandatory auto policy.
XII Actuarial Forecast of Impact of Proposed Reforms on Premiums and Benefits
The Committee intends that its proposed vision of the pure no-fault auto insurance compensation model should be viewed as an outline which is to be further reviewed and refined after fulsome dialogue with those service providers who will participate in the delivery of the new products and services contemplated. However, for the purpose of demonstrating that its proposed pure no-fault auto insurance compensation model would meet the requirements under its Mandate, the Committee engaged a consulting actuary to provide a preliminary costing of its proposed model together with three variations.

As discussed in Section XI of this Report, the Committee retained a consulting actuary to predict potential saving of premium costs of its proposed pure no-fault model. The Committee provided the actuary with a series of assumptions upon which to proceed with its costing exercise.

The Committee explained its theory of a continuum of care program for traffic injured identified as Type I, II and III categories, as well as the proposal for a long-term care program that envisioned a fully funded pool for catastrophically injured, and managed by the Traffic Injury Regulator.

We asked the actuary to assume the creation of a new administrative infrastructure described as a Traffic Accident Regulator that would independently deliver a claims process for traffic injured, decisions by medical and financial expert panels to provide final determinations of permanent medical impairments and calculation of financial benefits. This regulator would include the tribunal to conduct reviews or appeals of panel decisions.

The Committee asked the actuary to base its costing on the experience of the Alberta Workers’ Compensation Board as regards the number of claims and appeals under its existing system.

The Committee asked the actuary to assume the infrastructure cost for these offices would be borne by auto insurance premiums.

The Committee asked the actuary to cost a reformed model (Model 1) based on an assumption of 90% of full income replacement, in line with the provision in the Saskatchewan and Manitoba no-fault models. As noted, this percentage of recovery would be higher than the income recovery of tort claimants represented by legal counsel under the current model due to the estimated 33% reduction for contingency fees. However, it could, in other circumstances be lower than income replacement recovery of claimants who were not represented by counsel.

While the Committee is of the view that a pure no-fault model that delivers 100% recovery (other than in exceptional or extraordinary circumstances, such as traffic injured who are infants and children) is not appropriate on public policy grounds, it recognized that the final decision on the amount of replacement income rests with the Legislature.

Accordingly, for the purpose of making a comparison, the Committee instructed the actuary to cost a second model (Model 2) that would contain all of the components in Model 1 except for the assumption of 100% replacement income.
The Committee recognizes that more consultation with the service providers, regulators and government would be required, for example, to ascertain the viability of optional income replacement insurance products for consumers, before the precise percentages and other factors were finally selected for implementation.

The actuary was instructed to assume:

a. no change to the calculation of the health care levy paid to Alberta Health Services;
b. the Government of Alberta (GOA) would legislate mandatory use of winter tires for the winter seasons; and
c. the GOA would authorize conversion of property damage compensation to a direct compensation model (DCPD).

The actuary was instructed to disregard any savings that would accrue to automobile insurance from the reduction of overhead due to the creation of the Traffic Accident Regulator.

Although the Committee found no justification for any serious consideration to be applied to the elective/choice no-fault model as exists currently in Saskatchewan, for the purpose of comparing the premium cost of a tort automobile insurance policy in Alberta under an elective/choice no-fault version, the Committee requested its consulting actuary to perform that calculation and to include it in a third costing model (Model 3) for comparative purposes only.

Both the Committee and the consulting actuary recognized that the exploration of a costing exercise in an elective/choice scenario was problematic because there were many difficulties and questions surrounding the manner in which the Traffic Accident Regulator would deal with a component that pre-existed the current system. Accordingly, the model for this scenario is highly theoretical and must be treated as undertaken only for purposes of providing a general comparison of premium costs.

Finally, the Committee requested its consulting actuary to calculate the potential savings that could be achieved during the transitional period of the reform (Model 4). This version is not a stand-alone model, in fact, but an endeavor to assist the GOA in determining whether interim measures to reduce existing costs in the current system pending implementation of a pure no-fault model could produce savings and ease additional stress on the premium dollar for the benefit of the motoring public.

We confirm that:

a. the assumption referenced in paragraph 3 at page 266 was applied to the costing of Model 1 and 2;
b. the assumption in paragraph 4 at page 266 was implicit in its costing; and
c. when the tort option is selected under Model 3, all accident benefits recoverable were the same as those in the currently existing model.

The conclusions demonstrated that under the Model I, the pure-no fault compensation system would be expected to produce a 9.4% reduction in auto insurance premiums for the majority of consumers who purchase the full package of insurance.

While AIRB describes third-party liability and accident benefits as “basic” and all others as “additional coverages”, the Committee intends the term “full package” in this Report to include third-party liability, accident benefits, uninsured and underinsured motorist, collision and comprehensive coverages.
The Committee observes that if the auto insurers were able to deliver on the expected reduction in cost of overhead, by reason of the creation of the Traffic Accident Regulator, the 9.4% reduction might well increase to as much as 10%.

The Committee expects that once the operation of the model delivers the maximum expected improved health outcomes, the Basic premium rates will remain stable or decrease in the medium term, i.e., three years, and should thereafter rise no more than 1% above Consumer Price Index increases in the long term.

For those consumers who desire and require more extensive coverage for their potential medical, health and financial losses after a traffic injury, the optional products the insurance industry has committed to make available should allow for a wide array of choice for consumers to tailor to their individual needs.

The report of Joe S. Cheng, F.C.I.A, describing the outcomes of the 4 various costing models follows.
May 27, 2020

Automobile Insurance Advisory Committee  
c/o Treasury Board and Finance  
4th Floor, Terrace Building  
9515-107 Street  
Edmonton, AB T5K 2C3  

Dear Advisory Committee Members:

RE:  Actuarial Modelling

The Government of Alberta has asked the Automobile Insurance Advisory Committee ("the Advisory Committee") to develop alternate insurance compensation models to the current model. Treasury Board and Finance has engaged J. S. Cheng & Partners Inc. (JSCP) to assist the Advisory Committee in estimating the likely impact that the proposed automobile insurance models would have on private passenger automobile claims costs and consumer premiums in Alberta.

We are pleased to submit our report for your review. Please let us know if you have any questions or comments about our report.

Yours truly,

Joe S. Cheng, FCIA

EXECUTIVE SUMMARY

The purpose of this report is:

- To determine the premium rate adequacy of the Alberta private passenger automobile insurance product for policies issued in policy year 2022;
- To estimate the impact on private passenger automobile (PPA) claims costs of proposed models of Alberta’s automobile insurance system;
- To estimate the impact of the same proposed models on PPA premiums paid by consumers.

The proposed models were provided by the Advisory Committee and are briefly described below.

- Model 1 is a pure no fault insurance scheme that bars tort action for automobile accidents in Alberta. Besides higher benefits for medical, rehabilitation, attendant care or homecare, and income replacement, this scheme also provides benefits for diminished quality of life on a no fault basis. All no fault benefits are indexed to the Alberta CPI.

- Model 2 is the same as Model 1 except the income replacement benefit (IRB) for wage earners is set at 100% of net income (i.e. after tax, CPP contributions and EI premiums) vs 90% in Model 1.

- Model 3 offers insureds a choice between Model 1 and a tort option. When the tort option is selected, no fault benefits are the same as under the current product. All tort benefits would be paid by the insured’s insurer (the one that collects the bodily injury liability premium). This is direct compensation for bodily injury liability claims.
Model 4 is a transitional insurance scheme. The Advisory Committee recommends the following changes to the current product:

a) Adjust the prejudgment interest (PJI) rate for non-pecuniary loss to match the interest rate for pecuniary loss.

b) Cap claimant lawyer contingency fees at 25% of a settlement and all expert fees in the range of $3,000 to $5,000 per case.

Some new features would also be common among all four models. Direct compensation for vehicle damage (DCPD) would be introduced in Alberta with all licensed auto insurers automatically participating. Out of province insurers would be allowed to participate if they are signators to such an agreement. Non-vehicular damage and out of Alberta accidents would continue to be paid by the at fault party. Also, winter tires would be mandatory for the winter season, and insurers would be required to offer a discount for bodily injury, accident benefits, DCPD, collision and all perils.

The detailed benefits of each model are shown in Appendix 6.

The best way to compare the current product against all four models is to measure the loss cost (per vehicle) and premium for a full package policy.

</table>

* Target premium is the premium that will produce a 7% profit margin on premium

---

1 Most policyholders purchase a full package policy. A full package policy includes third party liability, accident benefits, uninsured and underinsured motorist, collision and comprehensive coverages. AIRB describes third party liability and accident benefits as Basic; all others are Additional coverages.
If Model 1, 2 or 3 should be adopted, accident benefit claims over five years in duration could be funded by a portion of automobile premiums, and managed by an organization similar to the Facility Association.

This report is intended for the management of Treasury Board and Finance (TBF) and the Advisory Committee. Its sole purpose is to estimate the impact of proposed models on Alberta PPA claims costs and premiums.

This report is neither intended nor necessarily suitable for any other use. Distribution beyond the intended audiences is permitted provided that it is authorized by TBF and the recipient is made aware that they are a third party to this report and that JSCP will be available for further questions on this report.

Parties other than the management of TBF are third parties to this report. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. JSCP accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.
DATA AND RELIANCE

We used the following data to produce our estimates:

- GISA’s 2018 Actual Loss Ratio Exhibit (Bulletin No: 2019-16)
- GISA’s Industry Expense Report (Bulletin No: 2019-06)
- GISA Accident Benefit Data by Transaction (2016-2018) and Kind of Loss Code
- AIRB’s March 27, 2020 Bulletin: 01-2020
- AIRB’s published approved rate level changes published for 2017Q4 to 2020Q1
- 2016 Alberta Census
- 2019 Alberta Closed Claims Survey
- OSFI financial data for property and casualty companies.

We have relied on the general accuracy of the above information, without audit or independent verification, and we assumed it was complete. The accuracy of our results is dependent upon the accuracy and completeness of this underlying data.
DEFINITIONS

**Accident year 20XX** is defined as the 12-month period in which claims occur. For example, accident year 2020 is the 12-month period from January 1 to December 31, 2020.

**Accident year loss ratio** is defined as ultimate (undiscounted) losses occurring in a 12-month period divided by the earned premiums in the same 12-month period. This is the loss ratio shown in GISA’s actual loss ratio report.

**AHS** means Alberta Health Services.

**AIRB** is the Automobile Insurance Rate Board.

**ALAE** means allocated loss adjustment expenses.

**Basic Coverage** is third party liability plus accident benefits.

**Full Package** consists of Bodily Injury (BI), Direct Compensation (DC), Property Damage (PD), Accident Benefits (AB), Uninsured Automobile (UA), Underinsured Motorists (UM), Collision (CL or “Col.”), and Comprehensive (CM or “Comp.”) coverages.

**Gender neutral**: In this report, the term “he” is meant to include either he or she.

**GISA** is the General Insurance Statistical Agency.

**Health Levy** is the loss cost earmarked for AHS. According to GISA’s 2018 Actual Loss Ratio Exhibit (Bulletin No: 2019-16), the Alberta health levy percentages are applied to earned Third Party Liability premiums with the resulting amount then added on to otherwise ultimate loss costs for the Third Party Bodily Injury coverage.
**Injury Type** is described in the Advisory Committee Report as Type I, II, or III. With the recommended treatment, Type I injuries are expected to have a favourable recovery time ranging from a few days to a few months and leaving no permanent or serious impairment. Type II injuries may involve some type of loss of anatomical alignment, surgical integrity (such as fractures or dislocations), or psychological, cognitive and/or physiological functioning. For costing, we subdivided Type II into 2S and 2L, where S and L stand for short and long duration, respectively. Type III is a catastrophic injury.

**Loss Cost** is the ultimate loss and ALAE per vehicle. Depending on the context, it may also include ULAE, Health Levy and catastrophe (CAT) loading. Loss cost is used interchangeably with claims cost.

**Medical panel** is an expert committee responsible for assessing the degree of impairment of severely injured claimants.

**Net income** means after tax and deductions for CPP and EI.

**Policy year loss ratio** is defined as losses against policies issued in a 12-month period divided by written premiums of the same policies.

**PPA** means Alberta private passenger automobile excluding vehicles rated as farm use.

**Rate adequacy** means a rate level that can achieve at least 7% of premiums as profit in accordance with AIRB’s rate filing guidelines. A rate level that fails to achieve 7% of premiums as profit is deemed to be inadequate.

**Target loss ratio** is discounted losses (at an appropriate rate per annum) divided by target premiums that can achieve exactly 7% of premiums as profit.
Target premium means a premium level that can achieve exactly 7% of premiums as profit.

ULAE means unallocated loss adjustment expenses; they are insurers’ salaries and overhead for the claims department.

Ultimate losses mean the sum of all claim payments (past and future payments excluding time value of money).

Uncertainty load is added to all no fault benefits in Models 1 and 2. It is added to reflect uncertainty in a new insurance scheme or where the data is limited. This is widely used in agriculture insurance ratemaking.
CURRENT RATE ADEQUACY METHODOLOGY

To determine the rate adequacy, we compare:

- March 31, 2020 written premium (based on 2018 written premium and approved rate changes from 2018 to March 31, 2020)
- Policy Year 2022 target premium (based on losses trended to January 1, 2023 and discounted to July 1, 2022)

March 31, 2020 Written Premium

As published by AIRB for each automobile insurance company from 2017Q4\(^2\) to 2020Q1, we listed (i) the approved rate changes (basic and alternative/additional) effective January 1, 2018 to March 31, 2020, (ii) renewal date, and (iii) market share. The province-wide average approved rate change was the market share weighted average rate change of each company. The average rate adjustments are (see Appendix 5.7):

<table>
<thead>
<tr>
<th>Description</th>
<th>Rate Adjustments to March 2020</th>
<th>Coverages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic</td>
<td>26.01%</td>
<td>Third Party Liability and Accident Benefits</td>
</tr>
<tr>
<td>Alternative/ Additional</td>
<td>8.33%</td>
<td>Underinsured Motorist, Collision, Comprehensive, Specified Perils and All Perils</td>
</tr>
</tbody>
</table>

We brought the GISA 2018 written premium per vehicle by coverage to March 31, 2020 level by applying the average approved rate changes (see Appendix 5.9).

\(^2\)Rate changes published in one quarter may have renewal dates effective in later quarters. For example, some rate changes published in 2017Q4 were effective in 2018Q1.
Policy Year 2022 Target Premium

To calculate the Policy Year 2022 target premium per vehicle, we divide loss cost (trended to January 1, 2023 and discounted to July 1, 2022) by the target loss ratio.

The main steps are (details below):

- Develop ultimate loss cost (without ULAE and Health Levy)
- Remove actual catastrophe (CAT) losses
- Select ULAE factors
- Add Health Levy
- Trend ultimate loss cost (with ULAE and Health Levy)
- Select weights for undiscounted loss cost (with ULAE and Health Levy)
- Determine and apply Covid-19 factors
- Discount Loss Cost (with ULAE and Health Levy)
- Apply CAT loading
- Apply commissions, taxes, other acquisition expenses, general expenses and profit margin

(1) Develop Ultimate Loss Cost (without ULAE and Health Levy)

We used the earned vehicle and ultimate loss and ALAE from GISA’s Incurred Loss Development Factor Report to determine the ultimate loss cost by coverage.

(2) Remove Actual Catastrophe (CAT) losses

GISA’s Catastrophe Report Alberta showed the catastrophe loss and expense for Comprehensive, Specified Perils and All Perils. We removed these CAT losses from the loss cost in the previous step to avoid distorting the analysis. An expected CAT provision (“CAT Loading”) would be added after discounting the loss cost (details below in step 9).
(3) Select ULAE Factors

GISA’s Actual Loss Ratio exhibit showed the ULAE. For each accident year (2016-2018), we calculated ULAE factor by taking the ratio of the ULAE per earned vehicle to the ultimate loss and ALAE per earned vehicle (see Appendix 5.4). We selected 9.25% based on the three year average (9.24%).

The ultimate loss and ALAE per earned vehicle (i.e. loss cost) were grossed up for ULAE using the selected ULAE factor.

(4) Add Health Levy

According to GISA’s 2018 Actual Loss Ratio Exhibit (Bulletin No: 2019-16), the Alberta Health Levy percentages are applied to earned Third Party Liability premiums with the resulting amount then added on to otherwise ultimate loss costs for the Third Party – Bodily Injury coverage. For each accident year (2016-2018), we calculated the Health Levy and added it to the Bodily Injury loss cost.

(5) Trend Ultimate Loss Cost (with ULAE and Health Levy)

For each accident year (2016-2018), ultimate loss and ALAE per earned vehicle were trended using factors from AIRB’s March 27, 2020 Bulletin 01-2020 by coverage from July 1 of each accident year to the average accident date of policies issued in policy year 2022 (January 1, 2023). The cut-off date for the past and future trends is April 1, 2019. For details of the trend factor, please refer to Appendix 5.4.

(6) Select Weights for Undiscounted Loss Cost (with ULAE and Health Levy)

We selected weights of 0%, 40% and 60% for accident years 2016, 2017 and 2018, respectively because we could not get 2019 data in time for this study. The selected ultimate loss cost for policy year 2022 is the weighted average of the trended loss cost from the previous step (see Appendix 5.3).
(7) Determine and apply COVID-19 factors

From mid-March 2020, some jurisdictions issued measures to either self-isolate or stay at home because of the COVID-19 pandemic. Even though these orders were gradually removed starting mid-May 2020, some people will continue to work from home and, therefore, spend less time travelling on the road. As a result, the frequency of vehicular collisions may decrease. Therefore, for coverages affected by the frequency of vehicular collisions, the ultimate loss cost per vehicle may also decrease. The table below summarizes the impact.

<table>
<thead>
<tr>
<th>Coverage</th>
<th>Covid-19 Impact</th>

<tr>
<td>Specified Perils (SP)</td>
<td>No impact (not affected by frequency of accidents)</td>
</tr>
<tr>
<td>All Perils (AP)</td>
<td>2/3 of Collision impact</td>
</tr>
</tbody>
</table>

Note: Accident Benefits include Uninsured Motorists

We selected 15% for (accident year) 2020, 5% for 2021 and 2.5% thereafter. For details, please refer to Appendix 5.8. The impact of Covid-19 on the Basic loss cost of the current model is depicted in the following chart but it affects all models in this report equally.
Since we are estimating the loss cost for policy year 2022, only the 2.5% is applicable to this report.

(8) Discount Loss Cost

We derived the payment patterns by coverage (see Appendix 5.6) from the GISA-2018-2 Loss Development Exhibits PPA-excl. Farmers Alberta Paid Loss and Expense triangles and the GISA projected ultimate losses. We selected a discount rate of 3.00% based on the 2019 investment yield for Canadian P&C companies (see Appendix 5.10). Loss costs were discounted to the average date of premium receipt (July 1, 2022) in order to offset any investment income earned on premiums prior to losses and expenses being paid out (see Appendix 5.2).

(9) Apply Catastrophe (CAT) Loading

There are 3 coverages with a CAT loading: Comprehensive, Special Perils and All Perils. For Comprehensive, the CAT loading was 57% of the loss cost based on AIRB’s March 27, 2020 Bulletin 01-2020. The All Perils CAT loading is equal to the Comprehensive CAT loading loss cost. For Specified Perils, we selected a
CAT loading 52.5% of the loss cost based on the 10-year average of CAT losses (from GISA’s Catastrophe Report) as a percentage of non-CAT losses (see Appendix 5.5). In Appendix 5.1, we applied the CAT loading to the discounted loss cost.

(10) Apply Commissions, Taxes, Other Acquisition Expenses, General Expenses and Profit Provision

Commissions, taxes, other acquisition and general expenses as percentages of written premiums were taken from Industry Expense Report (Bulletin No: GISA 2019-06) summed to 26.2% (see Appendix 5.1).

We used the calculated loss cost divided by 66.8% (one minus expenses [26.2%] minus profit provision of 7.0%) to derive the target premium by coverage.
MODEL COSTING METHODOLOGY

The detailed description of all four models is in Appendix 6. An abbreviated version is as follows:

Model 1

Model 1 is a pure no fault and no tort model for automobile accidents in Alberta. Vehicle damage is paid by one’s insurer under direct compensation property damage (DCPD) if the motorist is not at fault; if the motorist is at fault, the damage is paid under collision provided that the coverage is purchased.

Coverage for all accidents outside of Alberta and optional coverages remain unchanged from today. No fault benefits are expanded as follows:

1. Funeral benefits are based on reasonable expenses up to $10,000.
2. Death benefits are $100,000 for the head of household; benefits for surviving dependents are also increased.
3. Medical expenses are increased from $50,000 to $500,000 with benefits payable until death.
4. Certified attendant care and homecare expenses for approved claimants are available up to $500,000.
5. Income replacement benefit (IRB) for wage earners is set at 90% of net income up to $1,000 per week. Benefits are payable as long as the individual meets the disability definition. Employer benefits (net of taxes, CPP and EI) are deducted from the IRB. There is a 7-day waiting period.
6. IRB for non-wage earners is payable subject to a medical and claims panel's determination for those over 18 years of age. There is a 6-month waiting period.
7. Diminished quality of life benefit is payable to eligible claimants up to $300,000.
8. Housekeeping expenses for approved claimants are payable up to $150 per week and $100,000 in aggregate.
All accident benefits are indexed by regulation.

**Model 2**

Model 2 is a variation of Model 1. The only difference is Model 2 provides 100% net income to disabled wage earners versus 90% net income in Model 1.

**Model 3**

Another variation of Model 1, Model 3 provides a choice to the motorist. Each owner of a vehicle can choose either Model 1 or a tort version. The tort option is the same as the current policy except the bodily injury (tort) benefits will be delivered by one’s own insurer when the motorist is not at fault.

**Model 4**

Model 4 is a transition model as any of Models 1, 2 and 3 will need some lead time to implement. Model 4 is the same as the current policy except for the following:

1. **Prejudgment interest rate.** The prejudgment interest rate on non-pecuniary loss shall be set by regulation to match the prejudgment interest rate on pecuniary loss.
2. **Claimant lawyer contingency fee.** The contingency fee charged by claimant lawyers will be capped by regulation at 25% of the total settlement or award.
3. **Expert fees.** The expert fees charged in automobile litigation claims will also be capped by regulation.
Costing of Model 1

First, we started with the loss cost for each coverage of the current policy as of December 31, 2018. Where more refinement is needed in accident benefits, we used transactional data by kind of loss code and claim ID to develop our loss cost estimate for June 30, 2018 accident date.

The following pages briefly describe our methodology by coverage.

1. Accident Benefits

1.1 Funeral benefit (Appendix 1.1)
From the GISA transactional data, we obtained a range of funeral expenses in 2016-2018. We applied the proposed benefits and weighted them using the above distribution.

1.2 Death benefit (Appendix 1.2)
From the GISA transactional data, we mapped the status of the deceased and the number of surviving dependents to the current benefit schedule. Then we applied the proposed benefit schedule to the distribution we obtained from the 2016-2018 data. The loss cost is simply the total death benefits from the above mapping divided by the number of vehicles.

1.3 Medical/Rehabilitation expense (Appendix 1.3)
The Advisory Committee in its Continuum of Care (COC) process defines 3 types of injuries. We used GISA’s transactional data to allocate all claimants into these 3 types of injuries. First, we validated our assumptions to reconcile our estimate to the loss cost in accident year 2018 at the current benefit level. Once our estimate matched the 2018 loss cost, we adjusted the benefit level of the 0.5% of catastrophically injured to $500,000.
1.4 Certified attendant care or homecare expense (Appendix 1.4)
This is a new coverage. We reviewed Ontario’s attendant care experience as well as Alberta’s IRB for wage earners. We examined their respective claim durations. Based on our discussion with the Advisory Committee, we understand the process to approve a certified attendant care or homecare benefit will be based on the assessment of a medical panel. Additionally, there will be no lump sum cash settlement. Therefore, the duration will be more like that of Alberta IRB claims.

We used a weighted average of the two claim durations (Ontario attendant care and Alberta IRB) to select the attendant care/homecare expense duration. For a catastrophically injured recipient, the average duration is 77 months. Applying the appropriate monthly benefit in accordance with the model description allows us to obtain the loss cost.

1.5 IRB for wage earners (Appendix 1.5)
The current policy has a maximum benefit duration of 2 years. We allocated the current Alberta IRB claimants into 3 injury types. We used the 2016 Alberta census to obtain the age, gender and wage distributions. We assumed the number of claimants to be 2800 in 2022. Then we simulated a pool of 2800 claimants’ IRB using 2019 tax software. We validated our simulation so that our model replicated the average claim size in 2016 accident year.

Once we reconciled our simulation with the current product, we changed the weekly benefit in our simulation to the Model 1 level and produced the benefits for 2800 claimants. To arrive at the loss cost, we divided the total benefits by the number of vehicles. The range of benefits by gross wage band is shown in Appendix 1.5.
1.6 IRB for non-wage earners (Appendix 1.6)

The data for this benefit is extremely limited in the current policy. Therefore, we examined Ontario’s experience and the 2019 Alberta Closed Claim Survey to estimate the potential number of non-wage earner claimants in Model 1. For every four wage earners claiming IRB, we assumed there may be one non-wage earner eligible for some form of IRB. However, IRB for non-wage earners is only available for those 18 years of age or older and has a 6-month waiting period. After this adjustment, we settled for 261 claimants per year. We used the same simulation model for wage earners to generate an estimate of the non-wage earners’ benefit. The loss cost is simply total non-wage earners IRB divided by the number of vehicles.

1.7 Diminished quality of life (Appendix 1.7)

The Advisory Committee noted that no amount of medical treatment may be able to restore every injured person to a pre-accident state. For those who have residual impairment after receiving the recommended treatment and reaching the maximum medical outcome, a medical and benefit panel will assess the amount of impairment and determine a permanent impairment (PI) score. The benefit payable would equal the PI score multiplied by the maximum PI benefit (starting at $300,000 on January 1, 2022).

In our costing, we used the Saskatchewan Impairment Benefit Schedule\(^3\) as a proxy for this PI determination process. From the 2019 Alberta Closed Claim Survey, we had a sample of over 2,000 claimants with various types of injuries. For the purpose of this report, we used our judgment to assign a PI score to each claimant. Recognizing that any injury type could have 3 levels of severity (minor, medium, or severe), we used the actual non-pecuniary claim amount as a surrogate for the level of severity. Within each type of injury, a larger non-pecuniary claim amount was assumed to be a more severe injury.

Every claimant in the sample was assigned an injury description, level and PI score. The aggregate PI amount for all claimants is the product of (i) the number of claims by injury level, (ii) PI score, (iii) the maximum PI benefit. The aggregate amount divided by the number of vehicles would give the loss cost. We assumed the PI benefit would be paid no later than 2 years after the accident because the medical and benefit panel would need time to confirm that the impairment is permanent before an assessment commences.

1.8 Housekeeping (Appendix 1.8)
Subject to the approval of the medical panel, the housekeeping benefit would be paid periodically up to the maximum eligible amount based on injury type II or III. We used the Alberta IRB claim duration and Ontario housekeeping frequency multiplied by $150 per week to estimate the loss cost.

1.9 Supplementary benefits
These are accident benefits paid when an Alberta motorist has an accident outside of Alberta, but the benefits scale in the place of the accident is higher than Alberta’s. The loss cost of this benefit is small currently and should become smaller if Model 1 is adopted. As there was insufficient data, we applied judgment to make an estimate.

1.10 Uninsured or unidentified motorist
The GISA data showed a very low loss cost. Under Model 1, the benefit will not be applicable for accidents in Alberta. Again, we applied judgment to estimate the loss cost of this benefit.

An uncertainty load is added to all no fault benefit (1.1 to 1.10) loss cost estimates.
1.11 Bodily Injury in Alberta
The loss cost would be zero. However, healthcare continues to be provided by AHS under all models. We assumed the same levy for all models. The loss cost indicated is for the health levy only.

1.12 Bodily Injury for accidents outside of Alberta
From the Closed Claims Survey we estimated the proportion of bodily injury losses outside of Alberta. We applied this percentage to the GISA bodily injury loss cost as an estimate for this benefit.

1.13 Vehicle damage in Alberta
One of the arguments in favour of DCPD is the ability to service one’s own customers better by using preferred service providers to repair vehicles and provide rental cars. We assumed a 25% greater usage of preferred service providers with the insurers getting a 5% savings on average. This produced a 1.25% reduction in loss cost for vehicle damage in Alberta.

1.14 All other property damage
Vehicle damage outside of Alberta and all non-vehicular property damage will be settled on a tort basis. From Ontario (which is a DCPD province), we estimated the amount of tort property damage and applied the proportion to the historical property damage loss cost to estimate the non-DCPD percentage. Once we got the split between DCPD and all other property damage, we applied the Ontario percent allocation to Alberta property damage loss cost.

1.15 Underinsured Motorist
There are no changes from the current policy to any of the five coverages. Their loss costs are derived in Appendix 5.
1.16 Collision
There are no changes from the current policy to any of the five coverages.
Their loss costs are derived in Appendix 5.

1.17 Comprehensive
There are no changes from the current policy to any of the five coverages.
Their loss costs are derived in Appendix 5.

1.18 All Perils
There are no changes from the current policy to any of the five coverages.
Their loss costs are derived in Appendix 5.

1.19 Specified Perils
There are no changes from the current policy to any of the five coverages.
Their loss costs are derived in Appendix 5.

2. Trending to January 1, 2023 (Appendix 7)

From section 1, we obtained the loss cost of each coverage on June 30, 2018.
We applied the trend factors in AIRB bulletin March 27, 2020 (01-2020) for all coverages except accident benefits in Models 1 and 2, and developed loss costs at the January 1, 2023 level.

For Models 1 and 2, we used the following annual trend factors:

i) 4% for medical (2% plus 2% CPI)

ii) 0% for death, non-wage earners IRB, diminished quality of life, supplemental benefit, and uninsured motorist as these benefit level will start on January 1, 2022

iii) 2% for all other accident benefits.
3. **COVID-19 factor**

After the COVID-19 pandemic, we assume that some people may work from home from time to time. The average usage of vehicles should decrease and result in a reduction of collisions. We assumed a 2.5% reduction in policy year 2022.

4. **Mandatory winter tires in the winter season**

Based on a Quebec study, the use of winter tires in the winter season should reduce collision frequency by 3-5%. As a large number of Alberta motorists already use winter tires in the winter season, we assumed a 2.5% reduction in bodily injury, DCPD, accident benefits and collision.

**Costing of Model 2**

The methodology for costing Model 2 is the same as for Model 1 except the loss cost for wage earners is 100% of net income. Details are in Appendix 2.

**Costing of Model 3**

3.1 **Accident Benefits**

The loss cost of accident benefits is the same as the Model 4 policy.

3.2 **Bodily injury in Alberta**

As the tort benefit will be paid by the motorist’s own insurer, there should be better integration with accident benefits and employer contribution resulting in better savings. The average reduction of loss cost is 8.33%. Details are in Appendix 3.
3.3 Bodily injury outside of Alberta
The loss cost would be the same as the current policy.

3.4 Vehicle damage in Alberta
The loss cost is the same as Model 1.

3.5 All other property damage
The loss cost is also the same as Model 1.

3.6 Others (Underinsured Motorist Coverage, Collision, Comprehensive, All Perils and Specified Perils)
The loss costs are the same as Model 1.

Costing of Model 4

4.1 Accident Benefits
The loss cost is 97.5% of the current policy due to the mandatory winter tire requirement during the winter season.

4.2 Bodily Injury in Alberta
The change in PJI rate, capping claimant lawyer’s contingency fees to 25% of a settlement and expert fees to $3,000-$5,000 per case would result in 11.05% savings in loss cost. On top, there would be 2.5% savings due to the mandatory winter tire requirement during the winter season. The cumulative reduction in loss cost should be 13.28%. Details are in Appendix 4.
4.3 Bodily Injury outside of Alberta
The loss cost would be the same as the current policy.

4.4 Vehicle damage in Alberta
The loss cost is the same as Model 1 due to the mandatory winter tire requirement during the winter season and DCPD.

4.5 All other property damage
The loss cost is the same as Model 1.

4.6 Others (Underinsured Motorist Coverage, Collision, Comprehensive, All Perils and Specified Perils)
These are the same as Model 1.
The target premiums were determined as claims cost divided by 66.8% (expected claims ratio to premium). Claims costs (other than accident benefits) were discounted at 3% p.a. to recognize future investment income from the premiums received but not yet paid out in claims and expenses; accident benefits in Model 1 and 2 were discounted at 1% p.a. to reflect the indexing feature of the benefits. The general expenses were set to equal the current level so that the insurers would have sufficient time to reduce its human resources through attrition should any of the Models 1, 2, or 3 be adopted. Implicit in this assumption is an allowance for the cost of the Traffic Injury Regulator as defined by the Advisory Committee. The cost impact of all 4 models is as follows:

<table>
<thead>
<tr>

</tr>
<tr>
<td>Total Premium</td>
<td>100.0%</td>
<td>2,052.82</td>
<td>1,541.82</td>
<td>1,553.24</td>
<td>1,981.54</td>
<td>1,951.72</td>
</tr>
</tbody>
</table>

Mar 2020 Premium: 1,702.71
Savings(+)/Inadequate(-)(§) (350.11) 160.89 149.37 (278.83) (249.01)
Savings(+)/Inadequate(-)(%)(6) -20.6% 9.4% 8.8% -16.4% -14.6%

Notes:
(1) Full package = TPL + AB + Underinsured Motorists + Collision + Comprehensive
(2) Premium cost allocation is from Industry Expense Report (Bulletin No: 2019-06)
(3) Target Profit is 7%. It is based on March 27, 2020 Bulletin:01-2020 from Automobile Insurance Rate Board.
(4) General expenses were determined as 7.3% of the target premium of the current model
(5) = Savings or Inadequate(-)(§) / Mar 2020 Premium

The above analysis shows that the current model could experience 20.6% premium rate increase between April 2020 and 2022. Model 1 or 2 would have a potential premium reduction of 9.4% or 8.8%, respectively.

Model 3 or 4 would reduce claims cost but not enough to provide premium reduction from the March 31, 2020 level.
CONCLUSIONS

The Advisory Committee has considered four models:

Model 1: Pure No Fault with a Traffic Injury Regulator to deliver timely best practice medical treatment in a cost-effective manner.

Model 2: Every coverage is the same as Model 1 except IRB is increased from 90% of net income to 100%.

Model 3: Choice between tort or no tort. If a motorist chooses the tort option, the policy is essentially the current product. The no tort option is Model 1.

Model 4: A transitional model. This is similar to the current product except the pre-judgment interest rate would be set to match the rate for pecuniary losses. Claimant lawyer contingency fees and expert fees would be capped.

All models would require mandatory winter tires during the winter season and vehicle damage in Alberta would be settled on a DCPD basis.

In terms of cost, Model 1 is the least expensive.

### Type 3 Severity & Duration

Type 3 Model 1 is a lifetime benefit with an aggregate limit of $500,000.

For this analysis, we assumed it takes 180 months to close a claim.

Type 3 monthly severity is, (13)= 4,030 = [Type 3 row (10)] / 24

Therefore, the expected model 1 type 3 severity, is (14)= 725,474 = [Type 3 row (10)] + (13) x [180 - 24]

(15) Type 3 severity is $500,000, which is the lower of (14) $725,474 and aggregate limit $500,000.

(16) With $500,000 as Type 3 severity, the expected time to close a claim (duration) is 77 months.

JSCP Reference Bodily Injury Closed Claim Study in Alberta

Q14 Please describe the claimant’s injuries.* Select all that apply.

S or S
- a. Sprain or strain
- b. Whiplash Associated Disorder (WAD) I
- c. WAD II
- d. WAD III

TMJ no damage
- e. Any a. to d., plus Temporomandibular Joint (TMJ) injury with no damage to bone or teeth or displacement of articular disc

TMJ with damage
- f. Any a. to d., plus TMJ injury with objective damage to bone or teeth or displacement of articular disc

Chronic
- g. Any a. to d. with duration lasting longer than six months (i.e. a chronic injury)

Impairment
- h. Any a. to d. resulting in impairment of a physical or cognitive function

Concussion
- i. Concussion

Bony/lacerations/burns
- j. Bony injuries, lacerations, burns, etc.

CAT
- k. Catastrophic injury, e.g. paralysis or brain injury

Psych
- l. Psychological injury or Post-Traumatic Stress Disorder (PTSD)

Other
- m. Other, please specify

Q42 2) Non-pecuniary losses

- g. pain and suffering
- h. loss of consortium

</table>

Assumptions:

1 BI Medical/Rehab payment is deducted by AB Medical, with an aggregate cap of $500,000. Excess Medical/Rehab stays in BI.
2 BI Loss of Income payment is deducted by Income Replacement Benefit (IRB). For wage earner, benefit is calculated lesser of $400 or 80% gross income weekly, maximum 2 years; for non-wage earner, benefit is maximum $135 weekly, maximum 26 weeks. Excess Loss of Income stays in BI. There are no non-wage earners within selection criteria, assumed no savings are applicable.
3 No PJJ reform.
4 No Contingency fee reduction.
5 ALAE reduction is assumed to be proportional to the reduction in loss payment from all above reforms.

<td>0.00%</td>
<td>7.25%</td>
<td>([0.5] - [0.1] - [3.3] - [4.4]) / [0.1] x [3.2]</td>
</tr>
</tbody>
</table>

5 Calculate BI Savings from ALAE

<table>
<thead>
<tr>
<th></th>
<th>In Alberta</th>
<th>Outside of Alberta</th>
<th>Total</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1 ALAE as % of BI</td>
<td>8.28%</td>
<td>8.92%</td>
<td>8.34%</td>
<td>[0.6] / [0.1]</td>
</tr>
<tr>
<td>5.2 % Reduction in ALAE</td>
<td>11.13%</td>
<td>0.00%</td>
<td>11.02%</td>
<td>= 1 - [1 - [1.3]] * [3.3] * [0.6] * [0.7] / [0.1] x [3.2]</td>
</tr>
<tr>
<td>5.3 ALAE Savings</td>
<td>0.92%</td>
<td>0.00%</td>
<td>0.85%</td>
<td>[5.1] x [5.2]</td>
</tr>
</tbody>
</table>

6 Total Savings BI Reform

<table>
<thead>
<tr>
<th></th>
<th>In Alberta</th>
<th>Outside of Alberta</th>
<th>Total</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1 Total Savings in BI</td>
<td>12.05%</td>
<td>0.00%</td>
<td>11.05%</td>
<td>[1.3] + [2.3] + [3.3] + [4.4] + [5.3]</td>
</tr>
</tbody>
</table>

Assumptions:
1 No BI Medical deduction applicable.
2 No BI Loss of Income benefit deduction applicable.
3 The non-pecuniary PJI reform assumes the interest rate reduce from 4% annually to 1%.
4 Contingency Fee assumed to be capped at 25% compare to 33%.
5 ALAE reduction is assumed to be proportional to the reduction in loss payment from all above reforms.

</tbody>
</table>
5.5 Income replacement benefit (IRB) for wage earners
IRB is payable if a person as a result of an automobile accident cannot perform the occupation that they trained for during the first 2 years of disability and any occupation thereafter for wage earners cannot perform normal daily activities, IRB is payable if a person as a result of an automobile accident does not return to their occupation for a period of at least 7 days. For those who are employed and disabled after 61, full benefits will be extended at 90% of net income for 5 years beyond 65 as long as they satisfy the definition of disability (2 or more occ and all occ thereafter). There is a waiting period of 7 days for this benefit.

5.6 IRB for non-wage earners
the injured person must be 18 or over; after the waiting period, a claim panel will assess the loss of earning capacity and assign a percent loss; IRB is payable if a person as a result of an automobile accident does not return to their occupation for a period of at least 7 days for wage earners cannot perform normal daily activities, IRB is payable if a person as a result of an automobile accident does not return to their occupation for a period of at least 7 days. For those who are employed and disabled after 61, full benefits will be extended at 90% of net income for 5 years beyond 65 as long as they satisfy the definition of disability (2 or more occ and all occ thereafter). There is a waiting period of 7 days for this benefit.

5.7 Death benefit
$100,000 for the head of household or $100,000 for a spouse or adult interdependent partner plus $50,000 for each dependent child under 18 plus $25,000 for each dependent relative over 18 living in the same household; the aggregate benefit is $300,000.

### Note:

Past and Future trends are from AIRB 2020 Mid-year Review

2020 Jan 01 factor is the 18-month factor to bring the July 01, 2018 (base) to the Jan 01, 2020 level

COVID-19 Factors are applied to all sub coverages except for comprehensive and Specified Perils; for All Perils, the impact is expected to be 2/3 of the collision. The factor is assumed to be 0.983 = 1 - (2.5% × 2/3).

### Note:

- CPI forecasting is from Government of Alberta 2020 fiscal plan (economic outlook section).
- AB are trended using CPI related factors. Medical Benefit is trended by CPI+2%. Other sections are trended by AIRB factors.
- Death Benefit, non-earner disability benefit, diminished quality of life, supplementary benefit and uninsured motorist are assumed to have no trend.
- COVID 19 factors are assumed to be as same as current model.

**Note:**

CPI forecasting is from Government of Alberta 2020 fiscal plan (econometric outlook section)

2020 Jan 01 factor is the 18-month factor to bring the July 01, 2018 (base) to the Jan 01, 2020 level

AB are trended using CPI related factors. Other sections are trended by AIRB factors.

Death Benefit, non-earner disability benefit, diminished quality of life, supplementary benefit and uninsured motorist are assumed to have no trend

COVID 19 factors are assumed to be as same as current model
## Summary of Cost by Coverages Model 3

Survey questionnaire
The Alberta Automobile Insurance Review Committee was formed by the Alberta Government to examine the current Automobile Insurance System. It is important that the Committee receive your personal feedback on this important issue.

It will take approximately 10 minutes to answer this survey. Please select the most accurate response for each of the ten questions that follow, according to your assessment of each. When the information refers to current system, this refers to as it is today.

*The personal information is being collected and used pursuant to section 33(c) and section 39(1)(a) of the Freedom of Information and Protection of Privacy Act (FOIP). Questions about the FOIP Act or regarding the collection, use, or disclosure of this information, may be directed to the Information Access and Privacy office at 780-427-9687.*

**1: How old are you?**
- Under 18
- Between 18 and 24
- Between 25 and 44
- Between 45 and 64
- 65 or over
- Prefer not to say

**2: Are you…**
- Male
- Female
- Non-binary/third gender
- Prefer not to say

**3: What are the first three digits of your postal code?**
_______________________

**4: Do you have a private passenger vehicle?**
By this, we mean a passenger vehicle which you personally use, and you (or a member of your household) are responsible for obtaining automobile insurance
- Yes
- No
5: Please indicate if you or any member of your household are currently employed in any of the following professions. (Select all that apply)

- Medical community or health care practitioner
- Legal community
- Insurance industry
- None of the above

6: In the past 2 years, have you...

Under Alberta’s current automobile insurance system:

- Medical benefits (called “accident benefits”) are available to anyone injured in a collision regardless of fault, but those benefits are limited to $50,000 and are limited for two years following the collision (accident).

- Damages as a result of the actions of an at-fault driver, can either be negotiated or resolved directly with the at-fault driver’s insurer, or the person suffering damages can sue the at-fault driver to recover those damages from the insurer.

- When people are injured in collisions, those not at-fault can claim against the at-fault driver for care costs that are not covered by the publicly-funded health system, as well as for lost income and pain and suffering damages.

- At-fault drivers are limited to claiming the no-fault medical and disability benefits available to them under their automobile policies (Accident Benefits). Seriously or catastrophically injured Albertans who are at-fault may not have access to the care that they need.

In developing reforms in auto insurance in Alberta, there will be trade-offs. Please indicate your preferences of various elements of models below.

10: In a situation where you were injured as a result of the actions of an at-fault driver, which would be more important to you? (select one.)

- The right to sue the at-fault driver for a cash settlement.

- Having coverage that provides immediate access to medical treatment and rehabilitation as well income replacement.

- Don't know / no preference
Alberta’s current automobile insurance system focuses on the ability to make monetary claims against at-fault drivers. As a result, litigation is one of the main cost drivers in the system: hiring legal representatives and medical experts to support parties’ interests is expensive and time consuming. Settlement costs, including interest, pain and suffering damages, and other damages, add cost pressure to the system. This, in turn, results in higher insurance rates for Albertans.

11: Please indicate which of the following is more important to you:
- The right to sue an at-fault driver for a cash settlement; or
- Access to more affordable automobile insurance rates
- Don’t know / no preference

12: If you were injured in an automobile collision, what would be more important to you:
- The right to sue with the potential to receive a cash settlement at some point in the future that you would use to pay for all treatment and rehabilitation that you may require.
- No right to sue regardless of fault, however all medically required treatment and rehabilitation with income replacement are provided as long as required, potentially for the rest of your life.
- Don't know / no preference

13: Would you be willing to give up your right to sue an at-fault driver for a cash settlement if it meant that:

a) you received the treatment and rehabilitation you needed to get better;

b) you received the income replacement you needed to help pay your bills while you recover; and

c) you could pay less for your automobile insurance.

- Yes
- No
- Don't know
14: Would you be in favor of giving up your right to sue an at-fault driver for a cash settlement for pain and suffering if it meant that all Albertans suffering serious permanent injuries (such as loss of a limb, loss of eyesight, serious brain or spinal cord injuries) would be eligible to receive a one-time, lump-sum permanent impairment benefit?

- Yes
- No
- Don't know / no preference

The vast majority of collisions do not occur intentionally. They happen because drivers make mistakes, errors in judgment, or due to weather conditions. In today’s environment drivers who are at-fault are limited to claiming the no-fault Accident Benefits available to them under their automobile policies.

As a result, Albertans who suffer a serious or catastrophic injury (such as severe brain injury or spinal cord injury), and are deemed at-fault for the accident, may not have access to the care or income support that they need. At-fault drivers are also subject to penalties under law and face higher insurance premiums.

15: If a driver is at-fault in a collision, how should they be held responsible for their actions:

- By giving them less access to treatment, rehabilitation, and income replacement benefits than would be available to injured Albertans who are not at-fault.

- By making them subject to penalties which could include fines, convictions and/or driving restrictions along with higher insurance rates.

- Don’t know / no preference
One of the cost pressures in the current automobile insurance system is vehicle repair and replacement.

On average, Albertans drive some of the most expensive vehicles in Canada. In addition, as vehicles have become more automated and have additional technology and safety features, they also tend to be much more expensive to repair after a collision. For example: A replacement bumper that may have cost $500 a few years ago may now cost several thousand dollars because repair or replacement includes sensors and cameras. Headlights that once cost $30 to replace can now exceed $1,700.

16: Please provide us with your ideas to help reduce the costs of vehicle repair or replacement (caused by collisions, theft, vandalism, weather, etc.)

Max 250 characters.

17: Do you have any other comments or suggestions that you would like to share with the committee on automobile insurance reform? Max 500 characters.
Letter submitting queries to service providers
Subject: Alberta Automobile Insurance Advisory Committee

Automobile Insurance Survey

The Alberta Automobile Insurance Advisory Committee (the Committee) invites submissions for automobile insurance reform for Albertans. The Committee is seeking your input and feedback on a series of questions related to automobile insurance in Alberta. Responses to the survey questions will be used as one source of information that will assist in the formulation of the recommendations by the Committee: [https://extranet.gov.ab.ca/opinio6/s?s=AutoInsurance](https://extranet.gov.ab.ca/opinio6/s?s=AutoInsurance)

In addition to the online survey, your organization may also choose to make a written submission to the Committee. Submissions may be sent to auto.advisorycommittee@gov.ab.ca. We request that you provide your written submissions during the same timeframe as the survey, from February 18 – March 6, 2020.

As part of your written submission, the Committee is seeking input on the following issues:
1. How to optimize treatment and claims outcomes for traffic injured;
2. How to reduce the timelines for securing treatment and claims compensation;
3. How to optimize accessible and affordable insurance for Alberta motorists;
4. How to satisfy Alberta motorists there is fairness in mandatory auto insurance pricing;
5. How to ensure long term viability and sustainability of the automobile insurance system;
6. How and what recommendations would you make to reduce costs in the current system.

Please provide contact information for your organization in the event the committee requires clarification or further information on your submission.

FOIPP Disclosure

The information provided to the Advisory Committee as collected by Alberta Treasury Board and Finance for the survey and any written submissions is being collected, used and disclosed under the authority of Alberta’s Freedom of Information and Protection of Privacy Act sections 33-40. The information you provide will be used to inform support for elements of a proposed automobile insurance reform report. All submissions received will become the property of Alberta Treasury Board and Finance.

If you have questions about the collection of your personal information, please contact: auto.advisorycommittee@gov.ab.ca (mailto: auto.advisorycommittee@gov.ab.ca).

The Government of Alberta reserves the right to use and disclose information, as applicable from any submission in accordance with the provisions of the Freedom of Information and Protection of Privacy Act.

Analysis of Automobile Insurance Survey

April 9, 2020
BACKGROUND & METHODOLOGY

Online Survey
February 18 – March 6, 2020
Automobile Insurance Reform

Background

An expert advisory committee has been tasked with reviewing Alberta’s automobile insurance system to reduce costs for consumers and ensure the system is sustainable. As part of the review, the committee sought input from Albertans, service providers and other stakeholders through online or written submissions.

The Government of Alberta contracted Leger Marketing to summarize feedback from Albertans, service providers and other stakeholders.

Online Survey Methodology

• The online survey was accessible between February 18 and March 6, 2020 on Alberta.ca.
• As is common with public engagement surveys, participation was voluntary and self-selected (i.e., does not represent a random sample of the Alberta population, but instead focuses on reaching as many members of the population as possible to ensure a diverse range of views is represented).
A total of 45,571 online surveys were submitted between February 18 and March 6, 2020.

Within this total, there were a significant number (14,552) of ‘short’ survey submissions, completed in 20 seconds or less, and without responses to either of the survey's two open-ended questions.

It is Leger’s opinion that these responses represent an automated attempt to amplify or skew a particular viewpoint for the committee’s attention, and do not represent legitimate feedback from individual Albertans.

The characteristics of these responses, and evidence of survey interference is discussed in the section ‘Data Quality’, and the distribution of excluded submissions is presented in the Appendix for reference.
Summary

The following results summary is based on the 31,019 survey submissions received between February 18 and March 6, excluding the ‘short’ survey submissions.

Quantitative survey results indicate:

• Most Albertans (63%) do not feel their insurance premiums are fair and reasonable.

• Having coverage that provides immediate access to medical treatment and rehabilitation as well income replacement is preferred over the right to sue for a cash settlement.

• One-third (33%) of Albertans would be willing to give up their right to sue an at-fault driver for a cash settlement for pain and suffering to ensure that all Albertans suffering serious permanent injuries would be eligible to receive a one-time, lump-sum permanent impairment benefit.

• Most (77%) of Albertans feel that at-fault drivers should be subject to penalties which could include fines, convictions and/or driving restrictions along with higher insurance rates, rather than giving them less access to treatment, rehabilitation, and income replacement benefits.
Summary

Qualitative Survey Results:

• An analysis of the 26,316 responses to the survey’s two open-ended questions surfaced several common and salient themes. Analysis was completed using a combination of Natural Language Processing (software categorization) and Leger’s coding team.

• On ideas to reduce the cost of repairs and replacements, common and salient themes include:
  • Increasing premiums for expensive vehicles, and those with poor driving records;
  • Decreasing rates in general;
  • Lowering repair costs through the use of used/aftermarket parts;
  • Incentivizing the insurance of older, smaller, or more standard vehicles;
  • Evaluating or inspecting vehicle condition; and
  • Increasing deductibles amounts.

• Among additional comments for the committee to consider, common and salient themes include:
  • Making insurance more affordable;
  • Incentivizing good drivers with clean records, and penalizing those with poor driving's records;
  • Considering the hardships of ordinary Albertans;
  • Preference for the right to sue;
  • Greater focus on rehabilitation; and
  • Regulating insurance companies or having caps that limit profit.

A dataset of all responses to open-end questions is attached, allowing the committee to further explore specific suggestions and themes.
Online Survey: Respondent Profile

- Respondent profiles are shown in the table on the right, relative to the target audience (Albertans aged 18 and over)
- Efforts to promote public participation resulted in substantial coverage of the Alberta population and a diverse mix of age, gender and geographic regional groups.

</table>
Under Alberta’s current automobile insurance system:

- Medical benefits (called “accident benefits”) are available to anyone injured in a collision regardless of fault, but those benefits are limited to $50,000 and are limited for two years following the collision (accident).
- Damages as a result of the actions of an at-fault driver, can either be negotiated or resolved directly with the at-fault driver’s insurer, or the person suffering damages can sue the at-fault driver to recover those damages from the insurer.
- When people are injured in collisions, those not at-fault can claim against the at-fault driver for care costs that are not covered by the publicly-funded health system, as well as for lost income and pain and suffering damages.
- At-fault drivers are limited to claiming the no-fault medical and disability benefits available to them under their automobile policies (Accident Benefits). Seriously or catastrophically injured Albertans who are at-fault may not have access to the care that they need.

In developing reforms in auto insurance in Alberta, there will be trade-offs. Please indicate your preferences of various elements of models below.

<table>
<thead>
<tr>
<th>In a situation where you were injured as a result of the actions of an at-fault driver, which would be more important to you?</th>
<th>Survey Responses (n=31,019)</th>
</tr>
</thead>
<tbody>
<tr>
<td>The right to sue the at-fault driver for a cash settlement</td>

</tr>
<tr>
<td>No response</td>
<td>2%</td>
</tr>
</tbody>
</table>
Alberta’s current automobile insurance system focuses on the ability to make monetary claims against at-fault drivers. As a result, litigation is one of the main cost drivers in the system: hiring legal representatives and medical experts to support parties’ interests is expensive and time consuming. Settlement costs, including interest, pain and suffering damages, and other damages, add cost pressure to the system. This, in turn, results in higher insurance rates for Albertans.

Please indicate which of the following is more important to you:

<table>
<thead>
<tr>
<th>Option</th>
<th>Survey Responses (n=31,019)</th>
</tr>
</thead>
<tbody>
<tr>
<td>The right to sue an at-fault driver for a cash settlement; or</td>
<td>30%</td>
</tr>
<tr>
<td>Access to more affordable automobile insurance rates</td>
<td>56%</td>
</tr>
<tr>
<td>Don’t know/no preference</td>

</tbody>
</table>
Alberta’s current automobile insurance system focuses on the ability to make monetary claims against at-fault drivers. As a result, litigation is one of the main cost drivers in the system: hiring legal representatives and medical experts to support parties’ interests is expensive and time consuming. Settlement costs, including interest, pain and suffering damages, and other damages, add cost pressure to the system. This, in turn, results in higher insurance rates for Albertans.

If you were injured in an automobile collision, what would be more important to you:

| Survey Responses (n=31,019) |
|-----------------------------|-----------------|
| The right to sue with the potential to receive a cash settlement at some point in the future that you would use to pay for all treatment and rehabilitation that you may require. | 36% |
| No right to sue regardless of fault, however all medically required treatment and rehabilitation with income replacement are provided as long as required, potentially for the rest of your life. | 48% |
| Don’t know/no preference | 9% |
| No response | 6% |
Alberta’s current automobile insurance system focuses on the ability to make monetary claims against at-fault drivers. As a result, litigation is one of the main cost drivers in the system: hiring legal representatives and medical experts to support parties’ interests is expensive and time consuming. Settlement costs, including interest, pain and suffering damages, and other damages, add cost pressure to the system. This, in turn, results in higher insurance rates for Albertans.

Would you be willing to give up your right to sue an at-fault driver for a cash settlement if it meant that:

- a) you received the treatment and rehabilitation you needed to get better;
- b) you received the income replacement you needed to help pay your bills while you recover; and
- c) you could pay less for your automobile insurance.

<table>

Online Survey: Detailed Results

The vast majority of collisions do not occur intentionally. They happen because drivers make mistakes, errors in judgment, or due to weather conditions. In today’s environment drivers who are at-fault are limited to claiming the no-fault Accident Benefits available to them under their automobile policies.

As a result, Albertans who suffer a serious or catastrophic injury (such as severe brain injury or spinal cord injury), and are deemed at-fault for the accident, may not have access to the care or income support that they need. At-fault drivers are also subject to penalties under law and face higher insurance premiums.

<table>

Responses were analyzed using Ascribe text analysis software, and aided by Leger’s qualitative coding team.
Qualitative Analysis: Methodology

Ascribe text analysis software automatically analyzes, categorizes and visualizes themes and opinions from verbatim comments. Ascribe is fueled by Natural Language Processing (NLP), a type of Artificial Intelligence (AI), referring to the ability of the software to understand human language as it is spoken and written. It mines text to look for patterns and adjusts program actions accordingly.

While software continuously improves, human guidance is still required to ensure quality results. Leger’s coding team refined the analysis by suppressing extraneous information (i.e. irrelevant to the topic or too general to be useful) and improving the categorization of the vast quantity of text into meaningful themes and subthemes. For example, broad themes such as “automobiles” and “insurance” are not helpful in understanding public opinion on automobile insurance reform.

The process in Ascribe begins with the software examining each verbatim comment and building topics based on its algorithm and based on rulesets that can modify or alter some of the parameters of this algorithm. Essentially, the verbatim comments are compared to identify common expressions and extracts (most used words and expressions). These expressions and extracts are used to define the topics.
Qualitative Analysis: Interpretation

Measures Used in this Analysis

Two measures are used in this text analysis: mentions and salience. In combination, these measures describe both the frequency with which topics are mentioned as well as the importance of the topics to human readers.

Leger advises readers of this report to take both of these measures into account, and to pay particular attention to themes that are frequently mentioned and salient.

Mentions (Frequency)

This refers to the frequency with which a topic is mentioned. Traditional text analysis has focused on this kind of measure, the interpretation being that the more a topic is mentioned the more important it is.

Salience (Importance)

This refers to the importance of the topic, taking into account the types of words that are used (e.g., nouns, verbs), placement within the comment, etc. Essentially, salience measures the extent to which it is predicted that humans would place importance on, or pay attention to, the topic.

Themes

The themes were identified by linking key words and expressions together to represent common ideas that relate to the questions that were asked. Leger’s coding team focused on identifying specific, solution-oriented themes, as opposed to broader themes which are more vague and less actionable. This approach, as well as the focus on salience in addition to frequency, leads to a long list of themes that each tend to have lower frequency (fewer mentions) than for a more broadly focused approach.
Q16: Please provide us with your ideas to help reduce the costs of vehicle repair or replacement (caused by collisions, theft, vandalism, weather, etc.)

A diverse range of responses were provided, included many comments that were off-topic. The most frequently mentioned themes that relate to the question asked are charging higher premiums where deserved, and lowering insurance rates / premiums, as shown below. Charging higher premiums where deserved is also highly salient, as shown on the following page. Other themes that are frequently mentioned and have relatively high salience are insurance costs being high / expensive, and repairs using used or aftermarket parts / part replacement strategies.

Top 10 Most Frequently Mentioned Themes (ordered by number of respondents)

- Higher premium where deserved (e.g., for more expensive vehicles, bad driving record) 350
- Lower insurance rates / Lower premiums 330
- Repairs with used/aftermarket parts (e.g., non-OEM) / Part replacement strategy 316
- Establish reasonable/fair prices / Stop inflated prices 314
- Higher insurance cost / More expensive insurance 308
- Reduce costs / More discounts (generally) 266
- Cap rates / Put on reasonable caps (on insurance, repairs, etc.) 239
- Overhaul/regulate repair shop system (more options, more audits, public guides, etc.) 233
- Accountability for at-fault drivers/owners (charge them cost of repairs, higher rates, etc.) 226
- Incentives for good driving record / No penalties for hail, theft, etc. 211
Ideas to Reduce Costs
Mentions vs. Salience

Q16: Please provide us with your ideas to help reduce the costs of vehicle repair or replacement (caused by collisions, theft, vandalism, weather, etc.)

Salient but Not Frequently Mentioned
- Incentivize older/smaller/more standard vehicles (for salvaging, aftermarket parts, etc.)

Themes Frequently Mentioned and Salient
- Higher premium where deserved (e.g., for more expensive vehicles, bad driving record)
- Repairs with used/aftermarket parts (e.g., non-OEM) / part replacement strategy

High mentions, lower salience:
- Lower insurance rates / lower premiums
- Establish reasonable/fair prices / stop inflated prices
- Reduce costs/more discounts
- Cap rates / put on reasonable caps (on insurance, repairs, etc.)
- Overhaul/regulate repair show system (more options, more audits, public guides, etc.)
- Accountability for at-fault drivers/owners (charge them cost of repairs, higher deductibles, etc.)
Ideas to Reduce Costs
By Responses to Q13

The following page shows a comparison of the most frequently mentioned themes based on whether Albertans would be willing to give up their right to sue an at-fault driver for a cash settlement if it meant that: a) they received the treatment and rehabilitation they needed to get better; b) they received the income replacement they needed to help pay their bills while in recovery; and c) they could pay less for their automobile insurance.

The comparison shows that the theme of repairs with used or aftermarket parts / repair strategy is the most dominant theme among Albertans who would be willing to give up their right to sue, while it is only the eighth most mentioned theme for those who would not be willing to give up that right.

Accountability for at-fault drivers / owners is the fifth most frequently mentioned theme among those who would not give up the right to sue, while it is ranked 10th among those who would give up that right.

Most of the other top mentioned themes are ranked similarly by both groups.

Other Comments and Suggestions
Mentions (Frequency)

Q17: Do you have any other comments or suggestions that you would like to share with the committee on automobile insurance reform?

The most frequently mentioned themes are cost control / discounts on rates / more affordability, and acting on insurance companies (regulate corporate greed, cap profits, etc.), as shown below. Cost control / discounts on rates / more affordability also has relatively high salience, as shown on the following page. Another theme that is frequently mentioned and has relatively high salience is incentives for good driving / prices being too high for drivers with clean records.

Top 10 Most Frequently Mentioned Themes
(ordered by number of respondents)

- Cost control / discounts on rates / more affordability: 3098
- Act on insurance companies (regulate corporate greed, cap profits, etc.): 2575
- Incentives for good driving / prices are too high for clean records: 2029
- Higher penalties / rates for bad driving record (e.g., higher fines, suspensions, etc.): 1941
- Preference for right to sue / don't take away right to sue at fault driver: 1747
- Larger healthcare access (preexisting conditions, full recovery, out-of-pocket costs, etc.): 1372
- Bring back cap / put on reasonable caps (on insurance, repairs, etc.): 1323
- Insure full / proper / necessary treatment: 618
- Preference for no fault system: 603
- Fair / adequate compensation for all victims / don't penalize victim: 594
Other Comments and Suggestions
Mentions vs. Salience, for Top 10 Most Salient Themes

Q17: Do you have any other comments or suggestions that you would like to share with the committee on automobile insurance reform?

Reform should consider hardships of ordinary Albertans
The Most Salient Themes Are Not Mentioned Frequently

Higher Insurance Price
Greater focus on rehabilitation
Keep current system in place / no need for reform

Themes Frequently Mentioned and Salient
Cost control / discounts on rates / more affordability
Incentives for good driving / prices are too high for clean records

Higher deductible

Adjust rates for driver types (too expensive for youth compared to old, male vs. female, etc.)
Need to reform (more fairness, less bias, too flawed, etc.)

High mentions, lower salience:
- Act on insurance companies (regulate corporate greed, cap profits, etc.)
- Preference for right to sue / don’t take away right to sue at fault driver
- Larger healthcare access (pre-existing conditions, full recovery, out-of-pocket costs, etc.)
- Bring back cap / put on reasonable caps (on insurance, repairs, etc.)
- Insure full/proper/necessary treatment
- Preference for no fault system
- Fair/adequate compensation for all victims / don’t penalize victim
Other Comments and Suggestions
By Responses to Q13

The following page shows a comparison of the most frequently mentioned themes based on whether Albertans would be willing to give up their right to sue an at-fault driver for a cash settlement if it meant that: a) they received the treatment and rehabilitation they needed to get better; b) they received the income replacement they needed to help pay their bills while in recovery; and c) they could pay less for their automobile insurance.

The comparison shows that the themes are ranked quite differently by the two groups.

Notably, those who would give up their right to sue most frequently mention the theme of cost control / discounts / affordability, followed by incentives for good driving / prices being too high for drivers with clean records. These themes are mentioned less - ranked 4\textsuperscript{th} and 9\textsuperscript{th} respectively - among those who would not give up the right to sue.

Those who would not give up the right to sue most frequently mention a preference for the right to sue, indicating a consistent position across the two survey questions. Some of those who would give up the right to sue also mention wanting the right to sue, with that theme ranked 7\textsuperscript{th}. However, when faced with making a choice, they chose treatment and rehabilitation, income replacement, and the idea of paying less over having the right to sue.

DATA QUALITY
Online Survey
February 18 – March 6, 2020
To protect respondent confidentiality, the Government of Alberta does not store personally-identifiable (including IP addresses) with individual survey responses.

However, a review of server activity by Service Alberta during the fielding of this survey revealed that, between February 27 and March 6, five (5) IP addresses made more than 130,000 requests to load an image embedded within the online survey, appearing on each of the 9 survey pages.

Over the same time period 14,552 ‘short’ surveys were submitted, initially identified by:
• A completion time of 20 seconds or less; and
• Providing no qualitative (text) responses

A closer analysis also revealed that all 14,552 ‘short’ surveys followed the same (identical) response pattern:
• All indicated a preference for the ‘right to sue’
• Randomization of demographic questions, and other attitudinal questions that do not address ‘right to sue’

Results from these ‘short’ surveys have not been included in the main body of this report, as they appear to be a deliberate attempt to skew results and over represent a particular viewpoint for the committee’s attention, and/or discredit the results of a survey that tens of thousands of Albertans provided input on. Combined results from these short surveys have been included in the Appendix for reference.

It should be noted that the Government of Alberta has fielded dozens of Public Engagement surveys in the past years, without interference from what appears to be a large-scale attempt to skew results. The evidence of such interference in this survey has lead to a review with the GOA of how public engagements can remain accessible to public participation, with security measures that do not compromise an individuals right to provide feedback anonymously.

Under Alberta’s current automobile insurance system:

- Medical benefits (called “accident benefits”) are available to anyone injured in a collision regardless of fault, but those benefits are limited to $50,000 and are limited for two years following the collision (accident).
- Damages as a result of the actions of an at-fault driver, can either be negotiated or resolved directly with the at-fault driver’s insurer, or the person suffering damages can sue the at-fault driver to recover those damages from the insurer.
- When people are injured in collisions, those not at-fault can claim against the at-fault driver for care costs that are not covered by the publicly-funded health system, as well as for lost income and pain and suffering damages.
- At-fault drivers are limited to claiming the no-fault medical and disability benefits available to them under their automobile policies (Accident Benefits). Seriously or catastrophically injured Albertans who are at-fault may not have access to the care that they need.

In developing reforms in auto insurance in Alberta, there will be trade-offs. Please indicate your preferences of various elements of models below.

<table>
<thead>

</tbody>
</table>
Alberta’s current automobile insurance system focuses on the ability to make monetary claims against at-fault drivers. As a result, litigation is one of the main cost drivers in the system: hiring legal representatives and medical experts to support parties’ interests is expensive and time consuming. Settlement costs, including interest, pain and suffering damages, and other damages, add cost pressure to the system. This, in turn, results in higher insurance rates for Albertans.

**Would you be willing to give up your right to sue an at-fault driver for a cash settlement if it meant that:**

a) you received the treatment and rehabilitation you needed to get better;  
b) you received the income replacement you needed to help pay your bills while you recover; and  
c) you could pay less for your automobile insurance.

The vast majority of collisions do not occur intentionally. They happen because drivers make mistakes, errors in judgment, or due to weather conditions. In today’s environment drivers who are at-fault are limited to claiming the no-fault Accident Benefits available to them under their automobile policies.

As a result, Albertans who suffer a serious or catastrophic injury (such as severe brain injury or spinal cord injury), and are deemed at-fault for the accident, may not have access to the care or income support that they need. At-fault drivers are also subject to penalties under law and face higher insurance premiums.

Appendix 4 – Cheng Transaction Cost Report
April 20, 2020
ESTIMATE OF THE
ANNUAL TRANSACTIONAL COSTS OF
PRIVATE PASSENGER MOTOR VEHICLE
LITIGATION IN ALBERTA
EXPRESSED IN 2018 DOLLARS

Prepared by: Joe S. Cheng, F.C.I.A
For: Treasury Board and Finance
Date of Letter: April 8, 2020
April 8, 2020

Automobile Insurance Reform Advisory Committee
c/o Treasury Board and Finance
4th Floor, Terrace Building
9515-107 Street
Edmonton, AB  T5K 2C3

Dear Advisory Committee Members:

RE: Estimate of the Annual Transactional Costs of Private Passenger Motor Vehicle Litigation in Alberta

You have asked J. S. Cheng & Partners Inc. (JSCP) to estimate the annual transactional costs pertaining to litigation in the private passenger automobile (PPA) third party liability insurance system. Transactional costs are defined as:

1. Disbursements,
2. Insurers’ lawyers fees (internal and external),
3. Adjusters’ fees (internal and external),
4. Defence medical, expert reports and other related expenses, and
5. Contingency fee paid by the plaintiff

We have used the 2018 all-industry PPA data and the 2019 Alberta closed claim survey to conduct this estimate. In our opinion, the 2018 transactional costs in the Alberta PPA third party liability insurance system was about $383 million for accidents in Alberta. On a per vehicle basis, transactional costs were about $140 per vehicle or 20.2% of third party liability premiums.
We are pleased to submit our report for your review. Please let us know if you have any questions or comments about our report.

Yours truly,

Joe S. Cheng, FCIA

Encl.
Data and Reliance
We have relied on the general accuracy of the information provided by General Insurance Statistical Agency (GISA) and surveys completed by several licensed Alberta insurers, without audit or independent verification, and we assumed it was complete. The accuracy of our results is dependent upon the accuracy and completeness of this underlying data.

Distribution and Use
This report is intended for the management of Treasury Board and Finance (TBF). Its sole purpose is to provide an estimate of annual private passenger motor vehicle litigation transactional costs in Alberta.

This report is neither intended nor necessarily suitable for any other use. Distribution beyond the intended audiences is permitted provided that it is authorized by TBF and the recipient is made aware that they are a third party to this report and that JSCP will be available for further questions on this report.

Parties other than the management of TBF are third parties to this report. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. JSCP accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

</tbody>
</table>
1. **Purpose of the Report**  
The purpose of this report is to estimate the annual transactional costs of private passenger motor vehicle litigation in Alberta.

2. **Data**  
We have relied on information provided by licensed Alberta insurers in the form of completed surveys. In addition, we have used various General Insurance Statistical Agency (GISA) Alberta automobile exhibits.

3. **Definitions**  
**Allocated Loss Adjustment Expenses (ALAE)** is the sum of the following items:

<table>
<thead>
<tr>
<th>Insurer’s Outside Counsel Fees</th>
<th>Defence Medical Reports</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insurer’s In-house Counsel Fees</td>
<td>Other Expert Fees (such as actuary, economist)</td>
</tr>
<tr>
<td>Independent Adjuster Fees</td>
<td>Other Claim Expenses (such as police reports)</td>
</tr>
<tr>
<td>Insurer’s In-house Adjuster Fees</td>
<td></td>
</tr>
</tbody>
</table>

**Unallocated Loss Adjustment Expenses (ULAE)** are expenses incurred that cannot be attributed to a specific claim such as salary and rent of claims department.

**Settlement amount** includes past and future pecuniary losses (i.e. loss of income, medical and rehabilitation, etc.), non-pecuniary losses (i.e. pain and suffering, loss of consortium, etc.), prejudgment interest, plaintiff lawyer’s costs and disbursements.

**Loss** and settlement amount are used interchangeably in this report.

**Transactional costs** are the sum of ALAE, disbursements, and contingency fees.
Total Loss & ALAE is the sum of settlement and ALAE. The following diagram shows the total loss & ALAE and the approach to derive the transactional costs in the total loss & ALAE.

4. **Methodology**
   a. ALAE and settlement amount by claim are taken from the surveys completed by licensed Alberta insurers. The survey includes claims that were closed in years 2010, 2012 and 2017.

   b. For the purpose of this report, we segregated the ALAE and settlement amount into two categories: Accidents in Alberta and accidents outside of Alberta.

   c. Contingency fee is embedded in the settlement amount. The Automobile Insurance Reform Advisory Committee suggested that we use 33% of the total settlement amount less disbursements as the contingency fee of each claim.

   d. For each claim, ALAE and settlement amount are trended from the date of the accident to June 30, 2018 (average accident date in 2018) using a trend rate of 8.5%. The trend rate is established using average severity of Alberta tort bodily injury claims from accident years 2010 to 2018. See Appendix C for details.
e. We divided the trended settlement amount into three components: plaintiff’s share of settlement, disbursements, and contingency fees. Disbursements as well as contingency fees are added to ALAE to form the total transactional costs.

f. Total transactional costs (from step e) are then divided by the total trended loss and ALAE to derive the transactional costs percentage. See Appendix B for details.

g. Finally, we applied the transactional costs percentage (from step f) to the total loss and ALAE amount for accident year 2018 to derive the transactional costs at 2018 level.

h. To express the transactional costs as a percentage of premiums, we divided the 2018 transactional costs by the total third party liability (TPL) premiums in 2018. The total TPL premiums are taken from GISA’s report.

The following table shows the estimated 2018 transactional costs in aggregate dollars and on a per vehicle basis:

<table>
<thead>
<tr>
<th>Accident Year 2018</th>
<th>Accidents</th>
<th>Accidents</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

6. **Sensitivity Testing on Trend Rate Selection**

In this report, we have trended all historical settlement amounts and ALAE to 2018 level using a trend rate of 8.5%. To ensure using a different trend rate would not affect the results significantly, we have repeated the calculations with a trend rate 1% higher and lower than the selected rate. This table shows the estimated 2018 transactional costs in aggregate dollars and per vehicle using 7.5% and 9.5% trend rates:

<table>
<thead>
<tr>
<th>Accident Year 2018</th>
<th>Selected Trend Rate</th>
<th>Accidents in Alberta only</th>
<th>7.50%</th>
<th>8.50%</th>

BULLETIN NUMBER: 04-2016

TITLE: ALBERTA STANDARD AUTOMOBILE INSURANCE POLICY FORM - TRANSPORTATION NETWORK S.P.F. No. 9

DATE: June 28, 2016

A. PURPOSE
The purpose of this Bulletin is to provide information about a new standard automobile insurance policy form named the Alberta Standard Automobile Form – Transportation Network S.P.F. No. 9 (“SPF9”) approved for use in Alberta effective July 1, 2016. The SPF9 provides automobile insurance for Transportation Network Companies (“TNC”), and their authorized TNC drivers. The SPF9 is approved pursuant to section 551(3) of the Alberta Insurance Act (“Act”) and is not an ‘owner’s policy’ as this term is defined in the Act. Accordingly, not all provisions of Subpart 2 – Automobile Insurance of the Act will apply to the SPF9. A copy of the SPF9, including a declaration page and TNC Insurance Information Form, is attached.

B. COVERAGE SUMMARY

<table>
<thead>
<tr>
<th>Use period of the vehicle</th>
<th>SPF9 policy coverages</th>
<th>Report claim to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Period 0: Personal use; driver is not logged onto a TNC network for the purpose of providing transportation services.</td>
<td>None</td>
<td>Only driver’s own insurer</td>
</tr>
</tbody>
</table>

Superintendent of Insurance

402 Terrace Building
9515 – 107 Street
Edmonton, AB T5K 2C3
Telephone: 780-427-8322
Facsimile: 780-420-0752
www.finance.alberta.ca
### Period 1: Driver has logged onto a TNC network for the purpose of providing transportation services but has not accepted a ride request.

- **$1,000,000** third party liability.  
  This coverage is contingent on driver’s own insurer denying coverage for an accident occurring during this Period.  
- Statutory accident benefits as provided for in the [Automobile Accident Insurance Benefits Regulations](#).  
- No physical damage coverage (e.g. collision).

#### Both TNC insurer and driver’s own insurer.

### Period 2: Driver has accepted a ride request and is en route to pick up passenger(s).

- Third party liability coverage.  
- Statutory accident benefits as provided for in the [Automobile Accident Insurance Benefits Regulations](#).  
- Optional physical damage coverage (e.g. collision).

#### Only TNC insurer.

### Period 3: Passenger(s) are in the vehicle, being transported, and ending when the last passenger departs from the vehicle.

- Third party liability coverage.  
- Statutory accident benefits as provided for in the [Automobile Accident Insurance Benefits Regulations](#).  
- Optional physical damage coverage (e.g. collision).

#### Only TNC insurer.

### C. INFORMATION FOR CONSUMERS USING TNC SERVICES

The SPF9 only provides insurance coverage for rides that have been booked electronically using the TNC application. It provides no insurance coverage when passengers have street-hailed a ride.

Even though the SPF9 is approved for use in Alberta, it does not mean that a TNC has actually purchased this policy. Before using the services of a particular TNC, be sure to confirm that the TNC and its drivers have appropriate insurance. There are various places you can confirm this information:

---

**Superintendent of Insurance**

402 Terrace Building  
9515 – 107 Street  
Edmonton, AB T5K 2C3  
Telephone: 780-427-8322  
Facsimile: 780-420-0752  
[www.finance.alberta.ca](http://www.finance.alberta.ca)
• Check whether the TNC is properly licenced. In some municipalities, such as Edmonton and Calgary, a TNC and their driver must provide proof of appropriate automobile insurance to be licensed to operate in the municipality.

• Review a TNC’s insurance policy on the TNC’s website. The Superintendent of Insurance has asked TNCs to ensure their automobile insurance policy is made available for public viewing.

• An insurance company that issues the SPF9 must ensure that a TNC Insurance Information Form is provided to all drivers. You may ask the driver to show you this form, which is permitted to be displayed electronically. For more information on this form, please see section ‘G’ of this bulletin.

• In addition, the TNC may provide a copy of its automobile insurance policy to its authorized drivers, via the driver’s smartphone application, for review by passengers.

D. INFORMATION FOR TNC DRIVERS
If the TNC you drive for has purchased the SPF9, you are not covered while carrying street-hailed passengers or if you are transporting cargo. You are only covered for periods when you are using your vehicle for TNC operations as defined in the SPF9. As described in the Coverage Summary chart found in section ‘B’ of this Bulletin, coverage is more restrictive during Period 1 when you are logged into a TNC network for the purpose of providing transportation services but have not yet accepted a ride request.

DO NOT assume that your own personal automobile insurance policy will automatically cover you when the SPF9 does not. You are contractually obligated to notify your personal insurance company that you are a TNC driver. Your personal insurance company may decide to charge an additional premium and continue insuring you, or, as is permitted, may decide to terminate your policy. To locate an insurance company who may accommodate you using your vehicle for TNC driving, please contact your insurance broker or agent.

E. INFORMATION FOR TNCs
The SPF9 is designed to provide coverage only during the time a vehicle is used as a TNC automobile. It also can provide coverage for physical damage to TNC vehicles, should the insurer offer it, and should a TNC choose to purchase it. To purchase the SPF9, please check with your insurance broker. Insurers are not obligated to offer the SPF9; however, if they do, they are expected to meet the minimums set out in the Traffic Safety Act, the Insurance Act, and their associated regulations. If you have purchased the SPF9, the Superintendent of Insurance expects that you will ensure a
copy of your SPF9 is available for public view on your website. Because there are coverage limitations, be sure to communicate these limitations to your TNC drivers, so they may take steps to ensure they have arranged insurance for the period when the coverage limitations apply (see chart above). In a claims coverage investigation or for underwriting purposes, it is expected that a TNC and its insurer will cooperate with other insurers to facilitate the exchange of information, including the dates, times and circumstances of an accident involving a TNC driver and the precise times that the TNC driver logged in and was logged out of the TNC’s digital platform. The SPF9 is not the only way to appropriately insure TNC automobiles, and depending on how the TNC is structured, other approved automobile insurance forms may be appropriate. Please discuss these with your insurance broker.

F. INFORMATION FOR INSURANCE COMPANIES AND INSURANCE BROKERS
This SPF9 is now available for use in Alberta. There is also an approved standard application form (SAF9) for TNCs to use when applying for the SPF9. A copy of the SAF9 is attached. Fleet rating programs may be used with the SPF9. Insurers should contact the Automobile Insurance Rate Board to determine if they need approval for premiums associated with this policy form. The SPF9 contingent coverage for Period 1 provides for $1,000,000 third party liability coverage.

The following standard endorsement forms are approved for use with the SPF9:

1. SEF#44 Family Protection Endorsement
2. SEF#23a Mortgage endorsement
3. SEF#21a & 21b Blanket basis fleet endorsements
4. SEF#13D limited glass
5. SEF#13H hail deletion
6. SEF#20 loss of use
7. SEF#43R&L limited waiver of depreciation

In a claims coverage investigation, the Superintendent of Insurance expects a TNC insurer will cooperate with other insurers involved in the claims coverage investigation to facilitate the exchange of information, including the dates, times and circumstances of an accident involving a TNC driver and the precise times that the TNC driver was logged in and was logged out of the TNC’s digital platform.
G. TNC INSURANCE INFORMATION FORM

The SPF9 is not an ‘owner’s policy,’ and as such the TNC insurer is not obligated to provide a Financial Responsibility Card (pink card). Instead, included on page two of the SPF9 (reproduced in Appendix 1 below), the Superintendent of Insurance has stipulated the minimum information which insurers must provide to insured TNC drivers either directly or through the TNC. This form is not intended to replace the driver’s own pink card: each driver should have both a pink card for the vehicle owner’s policy, and a TNC Insurance Information Form for the TNC policy. The SPF9 TNC Insurance Information Form is permitted to be in electronic or paper form. The driver is expected to provide this form to all claimants and potential claimants for all accidents occurring during Periods 1, 2, and 3. Because the personal automobile insurance of TNC drivers provides coverage when TNC drivers are not using their vehicles for TNC operations, in the event of an accident that occurs during such a period, TNC drivers must still produce their financial responsibility card to any peace officer, witnesses or anyone sustaining loss or injury.

If you have any questions about this Bulletin, please contact one of our compliance officers at 780-643-2237, or by email at tbf.insurance@gov.ab.ca.

INSURING AGREEMENT

In consideration of the payment of the premium specified and of the statements contained in the application and subject to the limits, terms, conditions, definitions, exclusions stated in this policy and to the provisions of any endorsement attached to this policy.

The coverages provided by this policy are limited and they only apply to accidents that arise from the use or operation of the automobile as a transportation network automobile. Damages caused in any accident where the automobile is being used for a purpose other than as a transportation network automobile are not recoverable under this insurance policy.

SECTION A – THIRD PARTY LIABILITY

The insurer agrees to indemnify the insured against the liability imposed by law upon the insured for loss or damage arising from the use or operation of the automobile as a transportation network automobile and resulting from bodily injury to or the death of any person or damage to property.

For the purposes of this section, use or operation of the automobile as a transportation network automobile means:

(a) anytime a transportation network driver operating a transportation network automobile is logged onto a transportation network for the purposes of accepting requests for transportation services for compensation from prospective passenger(s); or

(b) anytime from the moment a transportation network driver operating a transportation network automobile has accepted a ride request through a transportation network, continuing while such transportation network driver is enroute to pick up prospective passenger(s) to provide transportation services for compensation, and ending when the first passenger enters the transportation network automobile or a trip is cancelled whichever is later; or

(c) anytime from the moment a transportation network driver operating a transportation network automobile has passenger(s) in a transportation network automobile, continuing while such passenger(s) are being transported for compensation, and ending when the last passenger departs from the transportation network automobile.

The insurer shall not be liable under this section,

(a) for any liability imposed by any workers’ compensation law upon any person insured by this section; or
(b) for loss or damage resulting from bodily injury to or the death of any employee of any person insured by this section while engaged in the operation or repair of the automobile; or

(c) for loss or damage to any property owned or rented by any person insured by this Policy; or

(d) for any amount in excess of the limit(s) stated in section A of item 4 of the application and expenditures provided for in the Additional Agreements of this section; or

(e) for any liability arising from contamination of property carried in the automobile; or

(f) for any liability resulting from use or operation of the automobile for any purpose other than as a transportation network automobile; or

(g) for any loss or damage resulting from bodily injury to or death of any person or loss or damage to property sustained while a transportation network driver operating a transportation network automobile is logged onto a transportation network for the purposes of accepting requests for transportation services for compensation from prospective passenger(s) but has not accepted a request to transport passenger(s) unless the insurer of an owner’s policy issued to a transportation network driver or transportation network automobile owner has denied liability for the loss or damage. Where the insurer of an owner’s policy issued to a transportation network driver or transportation network automobile owner has denied liability for the loss or damage, the insurer’s liability is limited to $1,000,000 and the expenditures provided for in the Additional Agreements of this section.

See also General Provisions, Definitions, Exclusions and Statutory Conditions of this Policy

**ADDITIONAL AGREEMENTS OF INSURER**

Where indemnity is provided by this section the Insurer shall,

(1) upon receipt of notice of loss or damage caused to persons or property, serve any person insured by this Policy by an investigation and negotiations with the claimant and by settlement of any resulting claims that are expedient by the insurer; and

(2) defend in the name and on behalf of any person insured by this Policy and at the cost of the Insurer any civil action which may at any time be brought against any person insured on account of such loss or damage to persons or property; and

(3) pay all costs taxed against any person insured by this Policy in any civil action defended by the Insurer and any interest accruing after entry of judgment upon that part of the judgment which is within the limit(s) of the Insurer’s liability; and

(4) in the case of an injury to a person, reimburse any person insured by this Policy for outlay for any medical aid as may be immediately necessary at the time; and
(5) be liable up to the minimum limit(s) prescribed for that province or territory of Canada in which the accident occurred, if that limit(s) is higher than the limit(s) stated in Section A of this Policy; and

(6) not set up any defence to a claim that might not be set up if the policy were a motor vehicle liability policy issued in the province or territory of Canada in which the accident occurred.

AGREEMENTS OF THE INSURED

Where indemnity is provided by this section, every person insured by this Policy:

(1) by acceptance of this policy, constitutes and appoints the insurer their irrevocable attorney to appear and defend in any province or territory of Canada in which action is brought against the insured arising out of the ownership, use or operation of the automobile as a transportation network automobile;

(2) shall reimburse the Insurer, upon demand, in the amount which the Insurer has paid by reason of the provisions of any statute relating to automobile insurance and which the Insurer would not otherwise be liable to pay under the Policy.

SECTION B – ACCIDENT BENEFITS

The Insurer agrees to pay the benefits outlined in this Section B to or with respect to each insured person as defined in this section who sustains bodily injury or death directly and independently of all other causes by an accident arising out of the use or operation of the automobile as a transportation network automobile.

The coverage for benefits under this Section B is primary until such time as the insurer of an owner’s policy issued to a transportation network driver or transportation network owner accepts liability for the benefits.

For the purposes of this section, use or operation of the automobile as a transportation network automobile means:

(a) anytime a transportation network driver operating a transportation network automobile is logged onto a transportation network for the purposes of accepting requests for transportation services for compensation from prospective passenger(s); or

(b) anytime from the moment a transportation network driver operating a transportation network automobile has accepted a ride request through a transportation network, continuing while such transportation network driver is enroute to pick up prospective passenger(s) to provide transportation services for compensation, and ending when the first passenger enters the transportation network automobile or a trip is cancelled whichever is later; or
(c) anytime from the moment a transportation network driver operating a transportation network automobile has passenger(s) in a transportation network automobile, continuing while such passenger(s) are being transported for compensation, and ending when the last passenger departs from the transportation network automobile.

Subsection 1 - Medical Payments

(1) In respect of

(a) injuries to which the *Diagnostic and Treatment Protocols Regulation* applies and that are diagnosed and treated in accordance with the protocols under that Regulation, the expenses payable for any service, diagnostic imaging, laboratory testing, specialized testing, supply, treatment, visit, therapy, assessment or making a report, or any other activity or function authorized under that Regulation, and payment must be made in the manner and subject to the provisions of that Regulation, notwithstanding anything to the contrary in Section B, and

(b) injuries

(i) to which the *Diagnostic and Treatment Protocols Regulation* applies but that are not diagnosed and treated in accordance with the protocols under that Regulation,

(ii) to which the *Diagnostic and Treatment Protocols Regulation* ceases to apply but for which the insured person wishes to make a claim under provision (3) of “Special Provisions, Definitions, and Exclusions of Section B”, and

(iii) to which Section B applies, other than those injuries referred to in subclauses (i) and (ii),

all reasonable expenses incurred within 2 years from the date of the accident as a result of those injuries for necessary medical, surgical, chiropractic, dental, hospital, psychological, physical therapy, occupational therapy, massage therapy, acupuncture, professional nursing and ambulance services and, in addition, for other services and supplies that are, in the opinion of the insured person’s attending physician and in the opinion of the Insurer’s medical advisor, essential for the treatment or rehabilitation of the injured person,

...
(a) expenses payable in respect of chiropractic services provided under provision (1)(b) are limited to $750 per person;

(b) expenses payable in respect of massage therapy services provided under provision (1)(b) are limited to $250;

(c) expenses payable in respect of acupuncture services provided under provision (1)(b) are limited to $250.

(3) Subject to provision (4), the Insurer is not liable under this provision for those portions of expenses payable or recoverable under any medical, surgical, dental or hospitalization plan or law or, except for similar insurance provided under another automobile insurance contract, under any other insurance contract or certificate issued to or for the benefit of any insured person.

(4) Except for those portions of expenses payable or recoverable under any law, provision (3) does not apply to expenses payable or recoverable for an injury to which the Diagnostic and Treatment Protocols Regulation applies.

Subsection 2 - Death, Grief Counselling, Funeral and Total Disability

Part 1 - Death, Grief Counselling and Funeral Benefits

Subject to the provisions of this Part 1, for death, a payment of a principal sum - based on the age and status at the date of the accident of the deceased in a household where the head of the household or the spouse/adult interdependent partner or dependants survive - of the following amount:

<table>
<thead>
<tr>
<th>Age of Deceased at Date of Accident</th>
<th>Status of Deceased at Date of Accident</th>
<th>Head of Household</th>
<th>Spouse/Adult Interdependent Partner</th>
<th>Dependent Relative</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to age of 4 years</td>
<td></td>
<td>-</td>
<td>-</td>
<td>$1000</td>
</tr>
<tr>
<td>5 to 9 years</td>
<td></td>
<td>-</td>
<td>-</td>
<td>2000</td>
</tr>
<tr>
<td>10 to 17 years</td>
<td></td>
<td>$10 000</td>
<td>$10 000</td>
<td>3000</td>
</tr>
</tbody>
</table>
In addition, funeral service expenses up to the amount of $5000 in respect of the death of any one person.

In addition, grief counselling expenses up to the amount of $400 per family in respect of the death of any one person.

In addition, with respect to the death of the head of household,

(a) where there are 2 or more survivors who are

   (i) a spouse/adult interdependent partner and one or more dependent relatives, or

   (ii) 2 or more dependent relatives,

the principal sum payable is increased 20% for each survivor other than the first,
and

(b) where there is a spouse/adult interdependent partner or dependent relative survivor living in the household, the death benefit is increased

   (i) by $15 000 for the first spouse/adult interdependent partner or dependent relative survivor, and

   (ii) by a subsequent $4000 for each of the remaining survivors.

For the Purposes of this Part 1

(1) “head of household” means that member of a household with the largest income in the year preceding the date of the accident;

(2) “dependent relative” means a person

   (a) under the age of 18 years for whose support the head of household or the spouse/adult interdependent partner of the head of household (or both of them) is legally liable and who is dependent upon either or both of them for financial support; or

   (b) 18 years of age or over and residing in the same dwelling premises as the head of household who, because of mental or physical infirmity, is principally
dependent on the head of household or the spouse/adult interdependent partner of the head of household (or both the head of household and the spouse/adult interdependent partner) for financial support;

(2.1) If the head of household has both a spouse and an adult interdependent partner, a reference to spouse/adult interdependent partner or surviving spouse/adult interdependent partner means

(a) the spouse or surviving spouse, or

(b) the adult interdependent partner or surviving adult interdependent partner,

living in the same dwelling premises as the head of household.

(3) The total sum payable shall be paid with respect to death of head of household or spouse/adult interdependent partner to the surviving spouse/adult interdependent partner. If there is no surviving spouse/adult interdependent partner in the household, no amount shall be payable unless there are surviving dependent relatives, and in that event the total sum payable shall be divided equally among the surviving dependent relatives;

(4) The total amount payable with respect to death due to a common disaster of head of household and spouse/adult interdependent partner shall be paid equally to surviving dependent relatives;

(5) The sum payable with respect to the death of a dependent relative shall be paid to the head of household or, if he does not survive, to the surviving spouse/adult interdependent partner of the head of household but, if neither the head of household nor the spouse/adult interdependent partner survives, no amount is payable;

(6) Amounts payable under this Part I shall be paid only to a person who is alive 60 days after the death of the insured person;

(7) The amount payable under this Part I for the death of any person shall be reduced by the amount of any payments made to or for such person with respect to the same accident under Part II, Total Disability;

(8) The amount payable under this Part for grief counselling is payable to the spouse/adult interdependent partner or other immediate family member of the deceased in respect of grief counselling for the immediate family members of an insured person who dies as a result of the accident.
Part II - Total Disability

A weekly benefit for the period during which the injury shall wholly and continuously disable such insured person, provided

(a) such person was employed at the date of the accident;

(b) within 60 days from the date of the accident such injury prevents him from performing any and every duty pertaining to his occupation or employment;

(c) no benefit shall be payable for the first seven days of such disability or for any period in excess of 104 weeks.

Amount of Weekly Benefit - The weekly benefit payable shall be the lesser of:

(a) $400 per week, and

(b) 80% of the average gross weekly earnings, less any payments for loss of income from occupation or employment received by or available to such insured person under Subsection 2(A) of this Section B.

The above benefits shall be subject to the terms of provision (3) below.

For the purpose of this Part II

(1) an insured person who is 18 years of age or over and who is not engaged in an occupation or employment for wages or profit and is completely incapacitated and unable to perform any of his or her household duties shall, while so incapacitated, receive $135 per week for not more than 26 weeks;

(1.1) average gross weekly earnings is the greater of

(a) average gross weekly earnings from an occupation or employment for the 4 weeks preceding the accident, and

(b) average gross weekly earnings from an occupation or employment for the 52 weeks preceding the accident;

(2) a person shall be deemed to be employed

(a) if actively engaged in occupation or employment for wages or profit at the date of the accident, or

(b) if 18 years of age or over, so engaged for any six months during the 12 months preceding the date of the accident.
(3) if the benefits for loss of time payable under this Part, together with benefits for
loss of time under another contract, including a contract of group accident
insurance and a life insurance contract providing disability insurance, exceed
the average gross weekly earnings of the insured person, the weekly benefit
shall be calculated in accordance with the following formula:

\[ WB = \frac{80\% \text{ of } WE \times PB}{PB + OB} \]

where

\( WB \) is the weekly benefit,
\( WE \) is the average gross weekly earnings of the insured person,
\( PB \) is the lesser of $300 and 80% of \( WE \),
\( OB \) is the total of all other weekly benefits payable to the insured person
under other contracts, including a contract of group accident insurance
and a life insurance contract providing disability insurance, excluding
benefits under the Employment Insurance Act (Canada) and the Canada
Pension Plan (Canada);

(4) the disability of the insured person shall be certified by a duly qualified medical
practitioner, if so required by the Insurer.

Subsection 2(A) - Supplemented Benefits
Respecting Accidents Occurring Outside
Alberta in a No-fault Jurisdiction

(1) In this Subsection, 2(A)

(a) “accident” means an event resulting in bodily injury caused by the use or
operation of the automobile as a transportation network automobile;

(b) “applicable laws” means, with respect to a no-fault jurisdiction, the laws in
force from time to time governing the system of no-fault automobile insurance
in that jurisdiction;

(c) “insured person” means an individual who is a resident of Alberta and who
(i) is an occupant of the automobile which is being used or operated as a
transportation network automobile at the time of the accident, or
(ii) while a pedestrian, is struck by the automobile or a newly acquired or temporary substitute automobile as defined in this policy, which is being used or operated as a transportation network automobile;

(d) “no-fault jurisdiction” means the Province of Quebec, Ontario, Manitoba or Saskatchewan;

(e) “pedestrian” means an individual who is not an occupant of an automobile;

(f) “resident of Alberta” means an individual who

   (i) is authorized by law to be or to remain in Canada and is living and ordinarily present in Alberta, and

   (ii) meets the criteria for non-residency in the no-fault jurisdiction established by the applicable laws of the no-fault jurisdiction.

(2) The definition of “insured person” under the heading Special Provisions, Definitions, and Exclusions of Section B does not apply to this Subsection.

(3) Where an insured person suffers personal injury as a result of an accident occurring in a no-fault jurisdiction, the insurer agrees to pay to the insured person the amount that would be payable under the applicable laws of the no-fault jurisdiction as if the insured person were a resident of the no-fault jurisdiction.

(4) For the purposes of calculating an amount payable under (3) in respect of an accident occurring in Quebec, references in the Automobile Insurance Act (Quebec) to other statutes or regulations of Quebec used to calculate an amount payable under (3) shall be read as references to corresponding Alberta statutes or regulations or federal statutes or regulations that apply in Alberta.

(5) In any claim or action in Alberta arising out of an accident in Alberta, the insurer agrees not to exercise its right of subrogation against a resident of Manitoba or Saskatchewan in respect of Section B - Accident Benefits paid to a resident of Alberta under an automobile insurance policy issued in Alberta.

(6) No exclusion or limitation in Section B or in the General Provisions, Definitions and Exclusions and the Statutory Conditions of this policy may be raised by the insurer in respect of a claim by an insured person under (3).

**Subsection 3 – Uninsured Motorist Cover**

All sums which every insured person shall be legally entitled to recover as damages for bodily injury and all sums which any other person shall be legally entitled to recover as
damages because of the death of any insured person, from the owner or driver of an uninsured or unidentified automobile as defined herein.

1. **The Insurer shall not be liable under this subsection,**

   a. to any person who has a right of recovery under an unsatisfied judgment or similar fund or plan in effect in any jurisdiction of Canada or the United States of America;

   b. to any person who, without the written consent of the Insurer, makes directly or through his representative any settlement with or prosecutes to judgment any action against any person or organization which may be legally liable therefor;

   c. for any amount in excess of the minimum limit(s) for automobile bodily injury liability insurance applicable in the jurisdiction in which the accident occurs regardless of the number of persons so injured or killed, but in no event shall such limit(s) exceed the minimum limit(s) applicable in the jurisdiction stated in Item 1 of the application.

2. **Uninsured automobile defined**

   An “uninsured automobile” under this section means an automobile with respect to which neither the owner nor driver thereof has applicable and collectible bodily injury liability insurance for its ownership, use or operation, but shall not include an automobile owned by or registered in the name of

   a. the named insured or any transportation network driver or any person residing in the same dwelling premises of the transportation network driver; or

   b. the governments of Canada or the United States of America or any political sub-division thereof or any agency or corporation owned or controlled by any of them; or

   c. any person who is an authorized self-insurer within the meaning of a financial or safety responsibility law; or

   d. any person who has filed a bond or otherwise given proof of financial responsibility with respect to his liability for the ownership, use or operation of automobiles.

3. **Unidentified automobile defined**
An “unidentified” automobile under this subsection means an automobile which causes bodily injury or death to an insured person arising out of physical contact of such automobile with the automobile which is being used or operated as a transportation network automobile of which the insured person is an occupant at the time of the accident, provided

(a) the identity of either the owner or driver of such automobile cannot be ascertained, and

(b) the insured person or someone on his behalf has reported the accident within 24 hours to a police, peace or judicial officer or to an administrator of motor vehicle laws and shall have filed with the Insurer within 30 days thereafter a statement under oath that the insured person or his legal representative has a cause or causes of action arising out of such accident for damages against a person or persons whose identity cannot be ascertained and setting forth the facts in support thereof; and

(c) at the request of the Insurer, the insured person or his legal representative makes available for inspection the automobile of which the insured person was an occupant at the time of the accident.

(4) Limitation of liability

(a) If claim is made under this subsection and claim is also made against any person who is an insured under section A – Third Party Liability of this Policy, any payment under this subsection shall be applied in reduction of any amount which the insured person may be entitled to recover from any person who is insured under section A;

(b) Any payment made under section A or under subsections 1 or 2 of section B of this Policy to an insured person hereunder shall be applied in reduction of any amount which such person may be entitled to recover under this subsection.

(5) Determination of legal liability and amount of damages

The determination as to whether the insured person shall be legally entitled to recover damages and if so entitled, the amount thereof, shall be made by agreement between the insured person and the Insurer.
If any difference arises between the insured person and the Insurer as to whether the insured person is legally entitled to recover damages and, if so entitled, as to the amount thereof these questions shall be submitted to arbitration of some person to be chosen by both parties, or if they cannot agree on one person, then by two persons, one to be chosen by the insured person and the other by the Insurer and a third person to be appointed by the persons so chosen. The submission shall be subject to the provisions of The Arbitration Act and the award shall be binding upon the parties.

(6) Notice of legal action

If, before the Insurer makes payment of loss hereunder, the insured person or his representative shall institute any legal action for bodily injury or death against any other person owning or operating an automobile involved in the accident, a copy of the writ of summons or other process served in connection with such legal action shall be forwarded immediately to the Insurer.

Special Provisions, Definitions, and Exclusions of Section B

(1) “INSURED PERSON” DEFINED

In this section, the words “insured person” mean

(a) any person while an occupant of the automobile or of a newly acquired or temporary substitute automobile as defined in this policy and which is being used or operated as a transportation network automobile at the time of the accident;

(b) in subsection 1 and 2 of Section B only, any person, not the occupant of an automobile or of railway rolling-stock that runs on rails, who is struck in Canada, by the automobile or a newly acquired or temporary substitute automobile as defined in the policy and which is being used or operated as a transportation network automobile at the time of the accident.

(1.1) “Prescribed claim form” defined - In this section, the words “prescribed claim form” mean a form prescribed by the Minister under section 803 of the Insurance Act.

(1.2) “Spouse/adult interdependent partner” defined - In this section, the words “spouse/adult interdependent partner” mean the spouse or adult interdependent partner, as the case may be.
(2) **EXCLUSIONS**

(a) The Insurer shall not be liable under provision (1) of subsection 1, nor under Part II of subsection 2 of this section B for bodily injury to any person

(i) resulting from the suicide of such person or attempt thereat, whether sane or insane; or

(ii) who is entitled to receive the benefits of any workmen’s compensation law or plan as a result of the accident; or

(iii) where the person at the time of the accident is engaged in a race or speed test; or

(iv) caused directly by sickness or disease; or

(v) who is using the automobile for any illicit or prohibited trade or transportation.

(b) The Insurer shall not be liable under Part II of Subsection 2 of this Section B for Bodily injury

(i) sustained by any person who is convicted of an offence under section 253(b) of The Criminal Code (driving with more than 80 milligrams of alcohol in 100 millilitres of blood) or under section 253(a) of The Criminal Code (driving while ability to drive impaired by alcohol or a drug) occurring at the time of the accident, or

(ii) sustained by any person driving the automobile which is being used or operated as a transportation network automobile who is under the age prescribed by the law of the jurisdiction in which the accident occurs as being the minimum age at which a licence or permit to drive the automobile may be issued to him; or

(iii) sustained by any person driving the automobile which is being used or operated as a transportation network automobile who is not for the time being either authorised by law or qualified to drive the automobile.

(3) **NOTICE AND PROOF OF CLAIM**

Subject to the *Diagnostic and Treatment Protocols Regulation*, the insured person or the insured person’s agent, or the person otherwise entitled to make a claim or that person’s agent, shall

(a) deliver personally,
(b) mail,

(c) fax, or

(d) send by e-mail if both parties have agreed to this method of sending and receiving notices and other documents,

a properly completed prescribed claim form, containing at least the information referred to in provision (3.1), to the chief agency or head office of the Insurer in Alberta within 30 days of the accident, or if giving notice within 30 days is not reasonable, as soon as practicable after that.

(3.1) Contents of Claim Form - The completed prescribed claim form must include

(a) details of the injury, and

(b) details of the accident that are within the personal knowledge of the insured person.

(3.2) Responsibility for Expenses Related to Completion of Claim Form - The Insurer shall pay all expenses incurred by or on behalf of the insured person in completing the medical report portion of the prescribed claim form.

(3.3) Total Disability Claim - With respect to a total disability claim, the insured person shall, if so required by the Insurer, furnish a certificate from a duly qualified medical practitioner as to the cause and nature of the accident for which the claim is made and as to the duration of the disability caused thereby.

(4) Medical Reports - Subject to provision (4.1), the Insurer has the right and the claimant shall afford to a duly qualified medical practitioner named by the Insurer an opportunity to examine the person of the insured’s person when and as often as it reasonably requires while the claim is pending, and also, in the case of the death of the insured person, to make an autopsy subject to the law relating to autopsies.

(4.1) Exemption - The Insurer has no right and the claimant is under no obligation under provision (4) with respect to

(a) injuries to which the Diagnostic and Treatment Protocols Regulation applies during the period and with respect to any service, diagnostic imaging, laboratory testing, specialized testing, supply, treatment, visit, therapy, assessment, making a report or other activity or function authorized under that Regulation;

(b) subject to provision (4.2), any other injuries for which the following services are provided:
(i) chiropractic services;

(ii) massage therapy services;

(iii) acupuncture services;

(iv) the following services to the extent of the specified limit:

   (A) psychological services, up to $600 per person;

   (B) physical therapy services, up to $600 per person;

   (C) occupational therapy services, up to $600 per person.

(4.2) Non-application - Provision (4.1)(b) does not apply to those injuries to which the Diagnostic and Treatment Protocols Regulation ceases to apply.

(5) RELEASE

Notwithstanding any release provided for under the relevant sections of the Insurance Act (Alberta), the insurer may demand, as a condition precedent to payment of any amount under Section B of the Policy a release in favour of the insured and the Insurer from liability to the extent of such payment from the insured person or his personal representative or any other person.

(6) WHEN MONEYS PAYABLE

(a) Except for the expenses authorized to be paid in accordance with the Diagnostic and Treatment Protocols Regulation, all amounts payable under Section B other than benefits under Part II of Subsection 2 shall be paid by the Insurer within 60 days after it has received a completed prescribed claim form. The initial benefits for loss of time under Part II of Subsection 2 shall be paid within 30 days after the Insurer has received the completed prescribed claim form, and payments shall be made thereafter within each 30-day period while the Insurer remains liable for payments if the insured person, whenever required to do so, furnishes, prior to payment, proof of continuing disability.

(b) No person shall bring an action to recover the amount of a claim under this section unless the requirements of provisions (3) and (4) are complied with, nor until the amount of the loss has been ascertained as provided in this section.
(c) Every action or proceeding against the Insurer for the recovery of a claim under this Section B must be commenced not later than 2 years after the cause of action against the insurer arose.

See also General Provisions, Definitions, Exclusions, and Statutory Conditions of this policy.

SECTION C – LOSS OF OR DAMAGE TO INSURED AUTOMOBILE

The insurer agrees to indemnify the Insured against direct and accidental loss of or damage to the automobile, including its equipment while the automobile is being used or operated as a transportation network automobile.

For the purposes of this section, use or operation of the automobile as a transportation network automobile means:

(a) anytime from the moment a transportation network driver operating a transportation network automobile has accepted a ride request through a transportation network, continuing while such transportation network driver is enroute to pick up prospective passenger(s) to provide transportation services for compensation, and ending when the first passenger enters the transportation network automobile or a trip is cancelled whichever is later; or

(b) anytime from the moment a transportation network driver operating a transportation network automobile has passenger(s) in a transportation network automobile, continuing while such passenger(s) are being transported for compensation, and ending when the last passenger departs from the transportation network automobile.

Insurance under this Section C is for those perils for which a premium is specified in item x of the application.

Subsection 1 – ALL PERILS – from all perils;

Subsection 2 – COLLISION OR UPSET – caused by collision with another object or by upset;

Subsection 3 – COMPREHENSIVE – from any peril other than by collision with another object or by upset;

The words “another object” as used in this subsection 3 shall be deemed to include (a) a vehicle to which the automobile, which is being used or operated as a transportation network automobile, is attached and (b) the surface of the
ground and any object therein or thereon. Loss or damage caused by missiles, falling or flying objects, fire, theft, explosion, earthquake, windstorm, hail, rising water, malicious mischief, riot or civil commotion shall be deemed loss or damage caused by perils for which insurance is provided under this subsection 3.

Subsection 4 – SPECIFIED PERILS – caused by fire, lightning, theft or attempt thereat, windstorm, earthquake, hail, explosion, riot or civil commotion, falling or forced landing of aircraft or of parts thereof, rising water, or the stranding, sinking, burning, derailment or collision of any conveyance in or upon which the automobile, which is being used or operated as a transportation network automobile, is being transported on land or water;

DEDUCTIBLE CLAUSE

Each occurrence causing loss or damage covered under any subsection of Section C except loss or damage caused by fire or lightning or theft of the entire automobile, which is being used or operated as a transportation network automobile, covered by such subsection, shall give rise to a separate claim in respect of which the Insurer’s liability shall be limited to the amount of loss or damage in excess of the amount deductible, if any, stated in the applicable subsection of section C of Item 4 of the application.

EXCLUSIONS

The Insurer shall not be liable,

(1) under any subsection of Section C for loss or damage

(a) to tires or consisting of or caused by mechanical fracture or breakdown of any part of the automobile or by rusting, corrosion, wear and tear, freezing, or explosion within the combustion chamber, unless the loss or damage is coincident with other loss or damage covered by such subsection or is caused by fire, theft or malicious mischief covered by such subsection; or

(b) caused by the conversion, embezzlement, theft or secretion by any person in lawful possession of the automobile under a mortgage, conditional sale, lease or other similar written agreement; or

(c) caused by the voluntary parting with title or ownership, whether or not induced to do so by any fraudulent scheme, trick, device or false pretense; or

(d) caused directly or indirectly by contamination by radioactive material; or
(e) to contents of trailers or to rugs or robes; or

(f) to tapes and equipment for use with a tape player or recorder when such tapes or equipment are detached therefrom; or

(g) where the insured drives or operates the automobile

(i) while under the influence of intoxicating liquor or drugs to such an extent as to be for the time being incapable of the proper control of the automobile; or

(ii) while in a condition for which he is convicted of an offence under section 253 of the Criminal Code (Canada) or under or in connection with circumstances for which he is convicted of an offence under section 254 of the Criminal Code (Canada); or

(h) where the insured permits, suffers, allows or connives at the use of the automobile by any person contrary to the provisions of (g);

(2) under subsections 3 (Comprehensive), 4 (Specified Perils) only, for loss or damage caused by theft by any person or persons residing in the same dwelling premises as the Insured, or by any employee of the Insured engaged in the operation, maintenance or repair of the automobile whether the theft occurs during the hours of such service or employment or not.

See also General Provisions, Definitions, Exclusions and Statutory Conditions of this Policy

ADDITIONAL AGREEMENTS OF INSURER

(1) Where loss or damage arises from a peril for which a premium is specified under a subsection of this Section, the Insurer further agrees:

(a) to pay general average, salvage and fire department charges and customs duties of Canada or of the United States of America for which the Insured is legally liable;

(b) to waive subrogation against every person who, with the insured's consent, has care, custody or control of the automobile, provided always that this waiver shall not apply to any person (1) having such care, custody or control in the course of the business of selling, repairing, maintaining, servicing, storing or parking automobiles, or (2) who has (i) committed a breach of any condition of this policy or (ii) driven or operated the automobile in the
circumstances referred to in (i) or (ii) of paragraph (g) of the Exclusions to
Section C of this policy;

(c) to indemnify the Insured and any other person who personally drives a
temporary substitute automobile as defined in the General Provisions of this
Policy against the liability imposed by law or assumed by the Insured or such
other person under any contract or agreement for direct and accidental
physical loss or damage to such automobile and arising from the care,
custody and control thereof; provided always that:

(i) such indemnity is subject to the deductible clause and exclusions of
each such subsection;

(ii) if the owner of such automobile has or places insurance against any
peril insured by this section, the indemnity provided herein shall be
limited to the sum by which the deductible amount, if any, of such other
insurance exceeds the deductible amount stated in the applicable
subsection of this Policy;

(iii) the Additional Agreements under section A of this Policy shall insofar
as they are applicable, extend to the indemnity provided herein.

(2) Loss of Use by Theft – Where indemnity is provided under subsections 1, 3 or 4 of
section C hereof the Insurer further agrees, following a theft of the entire
automobile covered thereby, to reimburse the Insured for expense not exceeding
$25.00 for any one day nor totalling more than $750.00 incurred for the rental of a
substitute automobile including taxicabs and public means of transportation.

Reimbursement is limited to such expense incurred during the period commencing
seventy-two hours after such theft has been reported to the Insurer or the police
and terminating, regardless of the expiration of the policy period, (a) upon the date
of the completion of repairs to or the replacement of the property lost or damaged,
or (b) upon such earlier date as the insurer makes or tenders settlement for the
loss or damage caused by such theft

GENERAL PROVISIONS, DEFINITIONS AND EXCLUSIONS

1. TERRITORY

This Policy applies only while the automobile is being used or operated as a
transportation network automobile and is operated, used, stored or parked within
Canada, the United States of America or upon a vessel plying between ports of
those countries.
2. OCCUPANT DEFINED

In this Policy the word “occupant” means a person driving, being carried in or upon or entering or getting on to or alighting from an automobile.

3. CONSENT OF OWNER

No person shall be entitled to indemnity or payment under this Policy who is an occupant of any automobile which is being used without the consent of the owner thereof.

4. GARAGE PERSONNEL EXCLUDED

No person who is engaged in the business of selling, repairing, maintaining, storing, servicing or parking automobiles shall be entitled to indemnity or payment under this Policy for any loss, damage, injury or death sustained while engaged in the use or operation of or while working upon the automobile in the course of that business or while so engaged is an occupant of the described automobile or a newly acquired automobile as defined in this Policy.

5. AUTOMOBILE DEFINED

In this Policy except where stated to the contrary the words “the automobile” mean:

Under sections A (Third Party Liability), B (Accident Benefits), C (Loss of or Damage to Insured Automobile)

(a) The Described Automobile – an automobile, specifically described in the Policy or within the description of insured automobiles set forth therein;

(b) A Newly Acquired Automobile – an automobile, ownership of which is acquired by the insured and, within fourteen days following the date of its delivery to him, notified to the Insurer in respect of which the insured has no other valid insurance, if either it replaces an automobile described in the application or the Insurer insures (in respect of the section or subsection of the Insuring Agreements under which claim is made) all automobiles owned by the Insured at such delivery date and in respect of which the Insured pays any additional premium required; provided however, that insurance hereunder shall not apply if the Insured is engaged in the business of selling automobiles;

and under sections A (Third Party Liability) and B (Accident Benefits) only
(c) A Temporary Substitute Automobile – an automobile not owned by the Insured, nor by any person or persons residing in the same dwelling premises as the Insured, while temporarily used as the substitute for the described automobile which is not in use by any person insured by this Policy, because of its breakdown, repair, servicing, loss, destruction or sale;

6. TWO OR MORE AUTOMOBILES

(a) When two or more automobiles are described hereunder with respect to the use or operation of such described automobiles, each automobile shall be deemed to be insured under a separate policy;

(b) A motor vehicle and one or more trailers or semi-trailers attached thereto shall be held to be one automobile with respect to the limit(s) of liability under insuring Agreements A and B and separate automobiles with respect to the limit(s) of liability, including deductible provisions, under Insuring Agreement C.

7. WAR RISKS EXCLUDED

The Insurer shall not be liable under section B or C of this Policy for any loss, damage, injury or death caused directly or indirectly by bombardment, invasion, civil war, insurrection, rebellion, revolution, military or usurped power, or by operation of armed forces while engaged in hostilities, whether war be declared or not.

8. EXCLUDED USES

Unless coverage is expressly given by an endorsement of this Policy, the insurer shall not be liable under this Policy while:

(a) the automobile is rented or leased to another person;

(b) the automobile is used to carry explosives, or to carry radioactive material for research, education, development or industrial purposes, or for purposes incidental to those purposes. “Radioactive material” means

(a) spent nuclear fuel rods that have been exposed to radiation in a nuclear reactor,

(b) radioactive waste material,

(c) unused enriched nuclear fuel rods, or
(d) any other radioactive material of such quantity and quality as to be harmful to persons or property if its container were destroyed or damaged;

(c) the automobile is used as a taxicab, public omnibus, livery, jitney or sightseeing conveyance.

9. LIMITATION OF ACTIONS

Every action or proceeding against the insurer for the recovery of insurance money payable under this contract is absolutely barred unless commenced within the time set out in the Insurance Act.

10. DEFINITIONS

In this Policy:

(a) “transportation network” means any online enabled application, digital platform, software, website, or any other system offered, used or operated by a transportation network company and that is used by persons to prearrange the transportation of passenger(s) for compensation in a transportation network automobile.

(b) “transportation network automobile” means an automobile used to provide prearranged transportation of passenger(s) for compensation through the use of a transportation network.

(c) “transportation network company” means a corporation, partnership, sole proprietorship, association or other entity or individual that connects passenger(s) with transportation network drivers for prearranged transportation exclusively through the offering, use or operation of a transportation network.

(d) “transportation network driver” means a person authorized by a transportation network company to use a transportation network automobile to provide prearranged transportation of passenger(s) for compensation through the use of a transportation network.

(e) “transportation network automobile owner” means the owner of a transportation network automobile, or if the transportation network automobile is leased, the lessee and lessor of the transportation network automobile.

11. Additional Insureds
The insurer agrees to indemnify as an insured person every transportation network driver and every transportation network automobile owner; however, transportation network drivers and transportation network owners shall not have the right to cancel, renew or otherwise amend this contract.

**STATUTORY CONDITIONS**

In these Statutory Conditions, unless the context otherwise requires, “insured” means a person insured by the contract whether named in the contract or not.

(i) Statutory Condition 3 does not apply when the contract does not insure against liability for loss or damage to persons and property;

(ii) Statutory Condition 4 does not apply when the contract does not insure against loss of or damage to the automobile. Statutory Conditions 2, 3, 4, 5, 6 and 7 shall not apply to Section B- Accident Benefits.

**Material Change in Risk**

1. (1) The insured named in this contract must promptly notify the insurer or its agent in writing, of any change in the risk material to the contract and within the insured’s knowledge.

(2) Without restricting the generality of subparagraph (1) of this condition, “change in the risk material to the contract” includes

(a) any change in the insurable interest of the insured named in the contract in the automobile by sale, assignment or otherwise, except through change of title by succession, death or proceedings under the Bankruptcy and Insolvency Act (Canada); and

(b) in respect to insurance against loss of or damage to the automobile,

   (i) any mortgage, lien or encumbrance affecting the automobile after the application for the contract, and

   (ii) any other insurance of the same interest, whether valid or not, covering loss or damage insured by the contract or any portion of the contract.

**Prohibited Use by Insured**

2. (1) The insured must not drive or operate the automobile
(a) unless the insured is for the time being either authorized by law or qualified to drive or operate the automobile,

(b) while the insured’s licence to drive or operate an automobile is suspended or while the insured’s right to obtain a licence is suspended or while the insured is prohibited under order of any court from driving or operating an automobile,

(c) while the insured is under the age of 16 years or under any other age prescribed by the law of the province in which the insured resides at the time the contract is made as being the minimum age at which a licence or permit to drive an automobile may be issued to the insured,

(d) for any illicit or prohibited trade or transportation, or

(e) in any race or speed test.

Prohibited Use by Others

(2) The insured must not permit or allow the use of the automobile

(a) by any person

(i) unless that person is for the time being either authorized by law or qualified to drive or operate the automobile, or

(ii) while that person is under the age of 16 years or under any other age prescribed by the law of the province in which the person resides at the time the contract is made as being the minimum age at which a licence or permit to drive an automobile may be issued to the person,

(b) by any person who is a member of the household of the insured while the person’s licence to drive or operate an automobile is suspended or while the person’s right to obtain a licence is suspended or while the person is prohibited under order of any court from driving or operating an automobile,

(c) for any illicit or prohibited trade or transportation, or

(d) in any race or speed test.
Requirements Where Loss or Damage to Persons or Property

3. (1) The insured must

   (a) promptly give to the insurer written notice, with all available particulars,
       of any accident involving loss or damage to persons or property and of
       any claim made on account of the accident,

   (b) verify by statutory declaration, if required by the insurer, that the claim
       arose out of the use or operation of the automobile as a transportation
       network automobile, and that the person operating or responsible for
       the operation of the automobile at the time of the accident is a person
       insured under the contract,

   (c) forward immediately to the insurer every letter, document, advice or
       writ received by the insured from or on behalf of the claimant, and

   (d) in addition to the requirement of (a), promptly give to the insurer the
       precise times that a transportation network driver logged onto a
       transportation network for the purposes of accepting requests for
       transportation services for compensation from prospective
       passengers(s) and logged out of a transportation network.

   (2) The insured must not

       (a) voluntarily assume any liability or settle any claim except at the
           insured's own cost, or

       (b) interfere in any negotiations for settlement or in any legal proceeding.

   (3) The insured must, whenever requested by the insurer, aid in securing
       information and evidence and the attendance of any witness, and must co-
       operate with the insurer, except in a pecuniary way, in the defence of any
       action or proceeding or in the prosecution of any appeal.

Requirements Where Loss or Damage to the Automobile

4. (1) When loss of or damage to the automobile occurs, the insured must, if the
       loss or damage is covered by the contract,

       (a) promptly give notice of the loss or damage in writing to the insurer with
           fullest information obtainable at the time,
(b) at the expense of the insurer, and as far as reasonably possible, protect the automobile from further loss or damage, and

(c) deliver to the insurer within 90 days after the date of the loss or damage a statutory declaration stating, to the best of the insured’s knowledge and belief, the place, time, cause and amount of the loss or damage, the interest of the insured and of all others in the automobile, the encumbrances on the automobile, all other insurance, whether valid or not, covering the automobile and that the loss or damage did not occur through any wilful act or neglect, procurement, means or connivance of the insured.

(2) Any further loss or damage accruing to the automobile directly or indirectly from a failure to protect it as required under subparagraph (1) of this condition is not recoverable under the contract.

(3) No repairs, other than those that are immediately necessary for the protection of the automobile from further loss or damage, may be undertaken and no physical evidence of the loss or damage may be removed

(a) without the written consent of the insurer, or

(b) until the insurer has had a reasonable opportunity to make the inspection for which provision is made in Statutory Condition 5.

Examination of Insured

(4) The insured must submit to examination under oath and must produce for examination at any reasonable place and time designated by the insurer or its representative all documents in the insured’s possession or control that relate to the matters in question, and the insured must permit extracts and copies of the documents to be made.

Insurer Liable for Cash Value of Automobile

(5) The insurer is not liable for more than the actual cash value of the automobile at the time any loss or damage occurs, and the loss or damage must be ascertained or estimated according to that actual cash value with proper deductions for depreciation, however caused, and must not exceed the amount that it would cost to repair or replace the automobile, or any part of the automobile, with material of similar kind and quality, but if any part of the automobile is obsolete and unavailable, the liability of the insurer in respect of
the automobile is limited to the value of that part at the time of loss or damage, not exceeding the maker’s latest list price.

**Repair or Replacement**

(6) Except where a dispute resolution process has been initiated, the insurer, instead of making payment, may, within a reasonable time, repair, rebuild or replace the property damaged or lost with other of similar kind and quality if, within 7 days after the receipt of the proof of loss, it gives written notice of its intention to do so.

**No Abandonment, Salvage**

(7) There must be no abandonment of the automobile to the insurer without the insurer’s consent.

(8) If the insurer exercises the option to replace the automobile or pays the actual cash value of the automobile, the salvage, if any, vests in the insurer.

**In Case of Disagreement**

(9) In the event of disagreement as to the nature and extent of the repairs and replacements required, or as to their adequacy, if effected, or as to the amount of the loss or damage, those questions must be determined by a dispute resolution process as provided under the *Insurance Act* before there can be recovery under the contract, whether the right to recover under the contract is disputed or not, and independently of all other questions.

(10) There is no right to a dispute resolution process until

(a) a specific demand for it is made in writing, and

(b) the proof of loss has been delivered.

**Inspection of Automobile**

5. The insured must permit the insurer at all reasonable times to inspect the automobile and its equipment.

**Time and Manner of Payment of Insurance Money**

6. (1) The insurer must pay the insurance money for which it is liable under the
contract within 60 days after the proof of loss has been received by it or, where a dispute resolution process is conducted under Statutory Condition 4(9), within 15 days after the decision is rendered.

When Action May Be Brought

(2) The insured may not bring an action to recover the amount of a claim under the contract unless the requirements of Statutory Conditions 3 and 4 are complied with or until the amount of the loss has been ascertained as provided for under Statutory Conditions 3 and 4 or by a judgment against the insured after trial of the issue, or by agreement between the parties with the written consent of the insurer.

Who May Give Notice and Proofs of Claim

7. Notice of claim may be given and proofs of claim may be made by the agent of the insured named in this contract in the case of absence or inability of the insured to give the notice or make the proof, such absence or inability being satisfactorily accounted for or, in the like case or if the insured refuses to do so, by a person to whom any part of the insurance money is payable.

Termination

8. (1) The contract may be terminated

(a) by the insurer giving to the insured 15 days’ notice of termination by registered mail or 5 days’ written notice of termination personally delivered, or

(b) by the insured at any time on request.

(2) If the contract is terminated by the insurer,

(a) the insurer must refund the excess of premium actually paid by the insured over the prorated premium for the expired time, but in no event, may the prorated premium for the expired time be less than any minimum retained premium specified, and

(b) the refund must accompany the notice unless the premium is subject to adjustment or determination as to the amount, in which case the refund must be made as soon as practicable.

(3) If the contract is terminated by the insured, the insurer must refund as soon as practicable the excess of premium actually paid by the insured over the
short rate premium for the expired time, but in no event may the short rate
premium for the expired time be deemed to be less than any minimum
retained premium specified.

(4) The 15-day referred to in subparagraph 1(a) of this condition starts to run on
the day the registered letter or notification of it is delivered to the insured’s
postal address.

Notice

9. (1) Any written notice to the insurer may be delivered at, or sent by registered
mail to, the chief agency or head office of the insurer in the province.

(2) Written notice may be given to the insured named in the contract by letter
personally delivered to the insured or by registered mail addressed to the
insured at the insured’s latest postal address as notified to the insurer.

(3) In this condition, “registered” means registered in or outside Canada.
1. APPLICANT’S FULL NAME AND POSTAL ADDRESS (INCLUDING COUNTY OR DISTRICT)

2. POLICY PERIOD

3. PARTICULARS OF THE DESCRIBED AUTOMOBILE(S) (EACH DESCRIBED AUTOMOBILE IS AND WILL BE CHIEFLY USED IN THE PROVINCE OF ALBERTA, CANADA)

4. INSURING AGREEMENTS

5. HAS ANY INSURER, TO THE KNOWLEDGE OF THE APPLICANT, CANCELLED, DECLINED OR REFUSED TO RENEW OR ISSUE AUTOMOBILE INSURANCE TO THE APPLICANT WITHIN THE THREE YEARS PRECEDING THIS APPLICATION? IF SO, NAME OF INSURER, AND POLICY NUMBER IF AVAILABLE.

5 (B). DETAILS OF APPLICANT’S MOST RECENT AUTOMOBILE INSURANCE

6. WILL THE AUTOMOBILE BE RENTED OR LEASED, OR USED FOR CARRYING EXPLOSIVES OR RADIOACTIVE MATERIAL? IF SO, PROVIDE DETAILS

6 (B). WILL THE AUTOMOBILE BE USED FOR THE TRANSPORTATION OF GOODS FOR COMPENSATION? IF SO, STATE CLASS OF LICENCE OR CERTIFICATE AND RADIUS OF OPERATIONS (Note: the SPF9 does not provide coverage for the transportation of goods for compensation)

7. Where (a) an Applicant for a contract, (i) gives false particulars of the described automobile to be insured to the prejudice of the Insurer, or (ii) knowingly misrepresents or fails to disclose in the application any fact required to be stated therein; or (b) the Insured contravenes a term of the contract or commits a fraud; or (c) the Insured willfully makes a false statement in respect of a claim under the contract, a claim by the Insured is invalid and the right of the Insured to recover indemnity is forfeited.

The applicant acknowledges that all of the information given by the applicant in items 1 through 6 is true and the applicant hereby applies for a contract of automobile insurance to be based on the truth of the said information.

I am applying for automobile insurance based on the information provided in this application. I authorize you to collect, use and disclose the information on this form and any additional information about the driving record, automobile insurance policy and claims history of the drivers of the Described Automobile’s from whom I declare I have obtained consent for these purposes. I understand that this personal information is necessary to assess the risk, issue the insurance contract, renewal or change, detect and prevent fraud and investigate and settle any claims. If I apply for a premium payment plan, I authorize you to obtain and use my credit report.

My name is Jeff Kucera. I am here today representing the Casualty Practice Council of the American Academy of Actuaries. I am employed as a senior consultant with EMB America LLC, an actuarial consulting firm. I am a fellow of the Casualty Actuarial Society and a member of the American Academy of Actuaries. I will be addressing actuarial practice applicable to risk classification and specifically, the use of credit-based insurance scores for rating and underwriting purposes. I am also here to offer the assistance of the Casualty Practice Council in your continued exploration of credit-based insurance scores.

In particular, my comments will demonstrate that the use of credit-based insurance scores allows the insurer to better segment insurance risks for the purpose of charging appropriate rates. I will address the following items:

- Current economic circumstances;
- Definition of what constitutes a credit-based insurance score;
- Evaluation of how insurers use credit-based insurance scores; and
- Discussion of how current economic conditions have affected policyholder premiums related to credit-based insurance scores.

Most companies now use credit-based insurance scores in the rating of personal lines such as private-passenger automobile or homeowners’ insurance. The use of credit-based insurance scores helps insurance companies charge those risks that are likely to generate greater costs higher premiums, while those likely to generate lower costs get lower premiums. The removal of such insurance scores will not lower overall insurance premium; rather, it will redistribute the premium charges so that those risks with lower expected costs will pay more than is actuarially fair, while those with greater expected costs will pay less than is actuarially fair.

---

1 The American Academy of Actuaries is a 16,000-member professional association whose mission is to serve the public on behalf of the U.S. actuarial profession. The Academy assists public policymakers on all levels by providing leadership, objective expertise, and actuarial advice on risk and financial security issues. The Academy also sets qualification, practice, and professionalism standards for actuaries in the United States.
Current Economic Circumstances

As we are all aware, the United States is suffering from a major economic crisis, which has imposed considerable hardship on both individuals and businesses. A significant aspect of the current economic crisis is the severe tightening of the credit markets. This may suggest that credit standards are being tightened by banks and other sources of commercial credit. This comes at a time when increasing numbers of Americans are experiencing loss of income, including decreases in the value of many of their assets and unemployment. These problems are significant and ongoing, and they raise questions regarding the use of credit rating in insurance. These issues span multiple lines of insurance, but for individuals, they have the greatest impact on private-passenger auto and homeowners’ insurance.

The American Academy of Actuaries is the public policy organization for actuaries practicing in all specialties within the United States. A major purpose of the Academy is to act as the voice of the profession on public policy issues. The Academy regularly prepares testimony for Congress, provides information to federal elected officials, comments on proposed federal regulations, and works closely with state officials on issues related to insurance.

The purpose of my presentation on behalf of the Casualty Practice Council today is to assist the NAIC in its analysis of these questions and to offer to work with the NAIC in its continuing study of these issues. The Casualty Practice Council has a history of working with the NAIC on this and many other topics. In fact, the Risk Classification Subcommittee of the Academy’s Products, Pricing, and Market Committee presented the NAIC with a report, “The Use of Credit History for Personal Lines of Insurance,”2 in November 2002, which is still relevant today.

The NAIC has identified three issues to serve as a basis for discussion. Our comments will provide an actuarial context for each of these issues.

Definition of What Constitutes a Credit-Based Insurance Score

An insurance score is a numerical score or ranking assigned to an insurance risk (i.e., a prospective insured) based on that risk’s underlying characteristics. A common purpose of insurance scoring is to generate useful information in underwriting and pricing insurance for the individual risk being scored. The score provides a relative measure of the expected cost to the insurance company associated with the risk.

A credit-based insurance score utilizes various attributes found in a typical individual’s credit report. There are several different scoring models currently in use to calculate credit-based insurance scores, including models developed by third-party vendors and proprietary models built by individual insurance companies. The type of credit attributes generally having the

---

greatest effect on an individual’s insurance score include: number of inquiries into opening new accounts, accounts 30 days or more past due. While the attributes and relative values are not identical for all companies, generally the higher the credit-based insurance score, the better an individual’s credit rating.

The importance of credit-based insurance scores is that there is a strong correlation between them and the expected costs associated with the risk. In other words, in a group of insureds who are identical in every other way, insureds with favorable insurance scores are significantly more likely to have better loss experience than insureds with unfavorable insurance scores. Consequently, credit-based insurance scores are a statistically reliable tool for segmenting risks into different groups with different expected cost levels. This has been demonstrated in a number of studies and reports, some of which we have listed in Appendix A.

**Evaluation of How Insurers Use Credit-Based Insurance Scores**

Most state insurance laws prohibit the use of insurance rates that are excessive, inadequate, or unfairly discriminatory. Principle 4 of the Casualty Actuarial Society’s *Statement of Principles Regarding Property and Casualty Insurance Ratemaking* states that, “A rate is reasonable and not excessive, inadequate, or unfairly discriminatory if it is an actuarially sound estimate of the expected value of all future costs associated with an individual risk transfer.” Thus, the overall average rate level should be set so that the total premium collected from all risks is sufficient to cover the total expected costs. Additionally, the individuals’ rates should be set such that the premium collected from each individual risk, or group of similar risks, reflects the expected costs for that individual risk (or group of similar risks).

In a 2001 survey, 90 percent of the responding insurers (from the top 100 personal lines companies) indicated that they were using credit data. According to the survey, the use of credit data is a relatively recent trend; more than half of the responding insurers using credit said that they began using credit in 1998 or later. Today, the number of companies using credit is likely even greater. Some insurers use insurance scores simply to determine whether a prospective insured qualifies to be written by the company. More typically, insurers also use insurance scores to help segment risks into different groups with similar expected costs for the purpose of rating. In such cases, the insurer may use the insurance score directly as a rating factor, also called a “risk classification factor,” similar to an amount of insurance for homeowners’ insurance or prior violations for private-passenger auto insurance. Alternatively, an insurer with multiple “tiers” representing different levels of expected cost may use the insurance score to help assign risks to the appropriate tier. Whether insurance scores are being used as a risk classification or

---

tiering factor, the impact is the same: insurance scores are being used to segment risks into homogenous groups so that appropriate premiums can be charged.

With respect to insurance scores as a risk classification or tiering factor, the actuary is guided by Actuarial Standard of Practice (ASOP) No. 12, *Risk Classification*.\(^5\) Rating plans for individual lines of insurance generally include several different risk classifications. For example, private-passenger auto lines use such risk classifications as the make and model of the car, age of the driver, prior traffic violations and accidents, etc. For homeowners’ insurance, examples of risk classification include amount of insurance, type of home construction, prior loss history, etc. The key section of ASOP No. 12 that is applicable to the use of insurance scores is section 3.2.1., which reads in part as follows:

**Relationship of Risk Characteristics and Expected Outcomes**—The actuary should select risk characteristics that are related to expected outcomes. A relationship between a risk characteristic and an expected outcome, such as cost, is demonstrated if it can be shown that the variation in actual or reasonably anticipated experience correlates to the risk characteristic. In demonstrating a relationship, the actuary may use relevant information from any reliable source, including statistical or other mathematical analysis of available data. The actuary may also use clinical experience and expert opinion.

Rates within a risk classification system would be considered equitable if differences in rates reflect material differences in expected cost for risk characteristics. In the context of rates, the word *fair* is often used in place of the word *equitable*.

The actuary should consider the interdependence of risk characteristics. To the extent the actuary expects the interdependence to have a material impact on the operation of the risk classification system, the actuary should make appropriate adjustments.

The summary of articles on credit in Appendix A includes several studies that have shown that credit scores reflect significant differences in expected loss costs. Thus, credit scores are appropriate tools for risk differentiation. Rates based on groups differentiated by insurance score are not excessive, inadequate, or unfairly discriminatory.

The removal of such insurance scores will not lower overall premium collected; it will only redistribute the premium collected such that risks with lower expected costs will pay more, and those with greater expected costs will pay less.

While the evidence may only be anecdotal, most companies report that the use of insurance scores, along with multivariate rating and other new rating factors, have allowed them to write more risks from the general population than before these features were introduced.

If the NAIC determines that further studies may be appropriate, the Casualty Practice Council would be pleased to assist the NAIC in such studies.

**Discussion of How Current Economic Conditions Have Affected Policyholder Premiums Related to Credit-Based Insurance Scores**

While our current economic condition is certainly on everyone’s mind, it is still uncertain exactly how this will affect overall insurance costs and, therefore, overall insurance prices. Some regulators or other public officials may be concerned that if the current economic crisis causes insurance scores to worsen, it will lead to unwarranted premium increases. It is important to consider both the impact on the aggregate premium and on individuals’ premium.

First, it is important to consider the impact on the aggregate premium. Insurers use insurance scores to determine appropriate rate relationships between risk classes, not to determine overall premium need. Assume for a moment that insurers continue to maintain the same rate relationships for different insurance score ranges, and that the current economic crisis causes every insureds’ insurance score to worsen. The actuary would observe this distributional shift or change and adjust overall rate levels so that the total premium collected by the insurance company remains the same and the integrity of the rate relationships among risks remains intact.

This is no different than any other distributional shift, such as an increase in the average value of homes, which an actuary has to consider when setting the overall rate level. Part of a typical actuarial rate review is an analysis of any shifts in distributions that affect the premium level. The actuary would adjust for these shifts in determining appropriate future rates. As a result of this standard ratemaking practice, any shift in insurance scores due to the current adverse economic conditions will not result in any long-term impact on overall premium collected.

Second, it is important to consider the impact on the individuals’ premium. As stated earlier, studies have demonstrated that insurance scores are an effective means of segmenting risks. Because of this, many companies now vary the rates charged to risks with different insurance scores. Some regulators or other public officials may be concerned that a dramatic shift in credit scores could disrupt the current relative rates among risks with insurance scores; in other words, perhaps the difference in expected cost levels among insureds with favorable and unfavorable scores will be less significant.

This, too, is not a problem that is unique to insurance scores. The gender and age of drivers have long been recognized as important rating characteristics for personal automobile insurance. There have been, and still are, very significant differences between the rates charged to young

---

6 It is important to remember that any distribution shift is likely to have a smaller effect on renewal business than on new business, because some states and/or companies only permit the use of such scores for renewals if it results in a more favorable rate for the individual insured.
males and young females, reflecting the higher cost of auto insurance for young male drivers compared to young female drivers. However, over time, the driving habits of young males and young females have become more similar, and while the difference in risk is still significant, it is not nearly as large as it was in the past. As this trend has developed, insurers adjusted classification plans to reduce the rate differentials to reflect it. If the actuary regularly analyzes the indicated rate differentials for different insurance score ranges, the rate differentials will be changed if more recent data suggests it. This potential shift in group differentials, and motivation or intent to be competitive, provide incentives for companies to regularly review their rate differences.

One of the other roles of an actuary is to regularly review the data to decide whether the overall average rate level is appropriate and whether the rate differentials for risks with different insurance scores need to be adjusted. By doing this, the actuary can ensure that the rates are actuarially sound,7 regardless of the effect the current economic crisis has on personal insurance scores.

It is possible that a sudden or immediate distribution shift could result from the current economic conditions, and that, by the time it works its way into the actuary’s data, many insureds will have already been harmed. While we have been suffering through the current economic conditions for approximately six months, we are unaware of any quantifiable evidence that has surfaced to demonstrate that such a dramatic shift has been occurring. It is our opinion, based on anecdotal evidence, that any shift thus far has been minor. This could be because renewal business, which makes up the majority of any company’s business, is less likely to be affected by a shift. Ascertaining whether an actual shift of any significance has occurred would require a study to look at the distribution of insurance scores of several companies over a period of time. The Casualty Practice Council is willing to assist the NAIC should it decide to pursue such a study.

On behalf of the Academy and the Casualty Practice Council, I thank you for the opportunity to speak to you today. To the extent that we can further assist the NAIC in its endeavors on this topic, the Casualty Practice Council volunteers its services. We look forward to working with you.

If time permits, I am happy to answer any questions you may have.

Appendix A – Summary of Additional Articles on Credit Scoring

Several studies have already been conducted on the use of credit for rating and underwriting for both homeowners’ and private-passenger auto insurance. In particular, the following studies may warrant review:

- *Use of Credit Reports in Underwriting* by the Commonwealth of Virginia, State Corporation Committee, Bureau of Insurance (1999).
- *Use of Credit Information by Insurers in Texas* by the Texas Department of Insurance (December 2004).
- *Use of Credit Information by Insurers in Texas – the Multivariate Analysis* by the Texas Department of Insurance (January 2005).
- *Report to the Congress on Credit Scoring* by the Board of Governors of the Federal Reserve System (2007).
The purpose of this study note is to educate actuaries on certain basic reinsurance accounting topics that may be omitted in other syllabus readings. Specifically, this study note provides examples of how ceded reinsurance impacts an insurer’s financial statements and key financial metrics.

Ceded Reinsurance Impact on Financial Statements

The book “Reinsurance Principles and Practices” by Connor Harrison lists the following six principal functions of reinsurance.

1. Increase large line capacity
2. Provide catastrophe protection
3. Stabilize loss experience
4. Provide surplus relief
5. Facilitate withdrawal from a market segment
6. Provide underwriting guidance

This paper will give an example of each of these types of reinsurance, and examine the impact to the ceding company on the following:

- Surplus
- Loss reserves
- Unearned Premiums
- Leverage ratios
- Income statement

The financial statements shown in the examples follow the SAP convention of offsetting ceded liabilities against gross liabilities.

1. Increase large line capacity

This example deals with the situation where a company is only willing to expose itself to a certain amount of loss per policy, but portions of its potential market demand greater coverage.

**Beginning Assumptions (the “Without” column):**

- XYZ insurance company writes homeowners insurance. It is unable or unwilling to write policies for homes with insured values over $500,000 without a suitable reinsurance program.
- XYZ writes $1 million of annual premium for this market, in a steady state with a level premium volume. The loss ratio is 75%. The only expense is commissions, which equal 20% of premium.
- Loss reserves = $750,000 and surplus = $1.5 million. Since XYZ is in a steady state, reserves and surplus are constant throughout the year.
- XYZ holds cash equal to 10% of gross loss reserves, agent balances equal to 10% of premium, and the remainder of its assets in bonds. The bonds and cash earn investment income at a rate of 5%.
- There are no income taxes.

**Altered Assumptions (the “With” column):**

- XYZ buys a “surplus share” pro rata reinsurance treaty that cedes premiums and losses for higher valued homes, with the ceding percentage for each policy equal to the excess of the home value over $500,000 divided by the total home value. (For example, for a home worth $625,000, the ceded percentage would be 125/625, or 20%.)
- This is the only reinsurance purchased by XYZ.
- The altered assumptions again reflect level premium volume and a steady state, in which XYZ has been writing identical business over a period of years.
• With access to the higher-value market, XYZ writes 40% more business and achieves $1.4 million in gross written premium. However under the treaties it cedes $300,000 of premium.
• The loss ratio remains 75% on both net and ceded business. However reserves increase relative to loss, because claims on more expensive properties take longer to develop.
• The expense ratio remains 20% of net written premium. The reinsurer pays a ceding commission to compensate for commissions on ceded business, so there is no net additional commission on ceded premium.
• Agent balances remain equal to 10% of premium, of which a portion, equal to the percent of premium ceded, is due to the reinsurer.
• We arbitrarily assume only a small increase in surplus, matching the increase in current year income.

**Analysis of impact (from Exhibit 1)**

- Surplus – We assumed no impact on surplus other than earnings on additional business opportunities. In reality, given the additional premium and reserves and reinsurance collectability risk, the ceding company may desire (or be forced to) hold more surplus to support these greater risks. Alternatively, it could decide to reduce volume to retain the same level of surplus relative to risk.
- Loss reserves – Both gross and net loss reserves increase, partly due to increased premium volume and partly due to the nature of new business being pursued, with slower development on larger claims.
- Unearned Premiums – increase, but remain the same in proportion to premium
- Leverage ratios – Net leverage ratios increase slightly because of the change in business model. Gross leverage ratios begin to differ materially from the net leverage ratios, and reinsurance leverage becomes important due to the purchase of reinsurance.
- Income statement – Little changed on a net basis, but over time the riskier book and changing cost of reinsurance may introduce greater volatility.

2. **Provide Catastrophe Protection**

This example deals with the situation where the company desires to reduce its potential loss from a catastrophic event.

**Beginning Assumptions (the “Without” columns):**

- ABC insurance company is in the same situation as XYZ insurance company in Exhibit 1, prior to the purchase of reinsurance. Hence, the “without” column in Exhibit 1 also applies to Exhibit 2, unless a catastrophe event occurs.
- If a cat event occurs, ABC incurs an additional $500,000 in loss, of which $50,000 is paid by the end of the year and the remainder is reserved.

**Altered Assumptions (the “With” columns):**

- ABC buys a catastrophe treaty on January 1\(^{st}\), for 5% of gross premium, that pays for losses from a single event in excess of 10% of premium. This premium is payable at the start of the year. *(Note that this assumption leaves zero ceded unearned at December 31\(^{st}\). Ceded unearned would be greater than zero if the ceded reinsurance policy term had not yet expired.)*
- This is the only reinsurance purchased by ABC.
- If a cat event occurs, ABC incurs an additional $500,000 in loss. This activates the cat treaty and the reinsurer assumes responsibility for the excess of event losses over 10% of premium, or $500,000 minus $100,000 = $400,000. Non-cat loss levels are unaffected by this event.
- Once again only 10% of the cat losses are paid by year-end, with the rest paid the following year. Note that the reinsurer does not begin paying until paid losses exceed 10% of premium, so the entire $400,000 of ceded loss is ceded reserve.
- The cat treaty has a mandatory reinstatement premium provision, with the reinstatement premium due once the cat treaty attachment is reached on a paid basis. This reinstatement premium charge is 2% of gross premium.
- The only surplus change is due to the change in underwriting results.

**Analysis of impact (from Example 2)**

- **Surplus** – Buying the cat reinsurance decreases surplus if no cat event occurs, due to the cost of reinsurance. But it can substantially mitigate the risk of significant drops in surplus if large cats occur. Note that the cost of the reinsurance in the event of a cat includes both the original premium and the reinstatement premium.
- **Loss reserves** – Net reserves are not impacted unless a covered cat event occurs. In that case, gross loss reserves can increase significantly for a relatively short period of time (i.e., the length of the cat payout pattern). Net reserves will return to normal levels sooner than gross reserves, as the retained portion of the cat is generally paid first before the ceded portion of the cat.
- **Unearned Premiums** – Little to no change (depending on the cat reinsurance policy term and accounting date), as cat reinsurance is normally a limited portion of total premium.
- **Leverage ratios** – If no cat event occurs, the biggest impact may be from reduced surplus in the denominator of many leverage ratios. If a cat does occur, then gross ratios and net ratios are significantly impacted without the reinsurance, while only the gross ratios are significantly impacted with the reinsurance (with the exception of ceded reinsurance leverage ratios). In general, ceded reinsurance leverage (i.e., ceded balances1 as a percent of surplus) can be significantly impacted in the period after a major cat, prior to the runoff of the resulting cat loss reserves.
- **Income statement** – Investment income is reduced by purchasing reinsurance. But underwriting income is substantially protected, with the loss limited to the original ceded premium, plus the retention and reinstatement premium if a covered cat occurs. (This assumes that the cat stays within the maximum limit of the cat reinsurance program.)

3. **Stabilize loss experience**

This example deals with the situation where loss experience may fluctuate from year to year more than management desires. Management desire may in turn be driven by capital provider demands, or management may wish to simplify the capital management process (including the determination of shareholder dividends).

**Beginning Assumptions (the “Without” columns):**

- DEF insurance company is in the same situation as XYZ insurance company in Exhibit 1, prior to the purchase of reinsurance. The “normal losses without” column reflects a “normal” loss year with a loss ratio of 75%, as per Exhibit 1.
- However, this example also recognizes the possibility that a “high” loss year may occur, with a loss ratio of 125%. If a high loss year occurs, DEF incurs an additional $500,000 in loss, of which $50,000 is paid by the end of the year and the remainder is reserved.

**Altered Assumptions (the “With” columns):**

- DEF buys an aggregate excess of loss treaty for the entire book on January 1st, for 10% of gross premium, that returns 90% of losses above a loss ratio of 100%. The reinsurance premium is payable at the start of the year. *(Note that this assumption results in zero ceded unearned at December 31st. Ceded unearned would be greater than zero if the ceded reinsurance policy term had not yet expired.)*
- This is the only reinsurance purchased by DEF.
- In the high loss example, DEF incurs an additional $500,000 in loss for a loss ratio of 125%. This activates the aggregate excess treaty and the reinsurer assumes responsibility for 90% of losses above a loss ratio of 100%, or ($1,250,000 minus $1,000,000) * 90% = $225,000.

---

1 Ceded balances are those balance sheet values arising from ceded reinsurance. In the above examples, they include ceded loss reserves and ceded unearned premiums. In a real-life example, they would also include reinsurance recoverables from amounts billed but not yet collected.
Once again only 10% of the additional losses (over and above “normal” losses) are paid by year-end, with the rest paid the following year. Note that the reinsurer does not begin paying until paid losses exceed 100% of premium, so the entire $225,000 of ceded loss is ceded reserve.

The only surplus change is due to the change in underwriting results.

Analysis of impact (from Example 3)

- Surplus – The expected value of surplus is lower after buying reinsurance, but with less period-to-period variation. The reduction is caused by the expected net cost of reinsurance. Note that while the expected impact of surplus is a reduction, the impact from year to year may vary between reductions and increases as gross losses are lower or higher than expected.
- Loss reserves – Stabilizing loss experience net of reinsurance generally translates into stabilizing net of reinsurance loss reserves. Gross reserves reflect the full volatility of year-to-year results, but net reserves should be smaller and more stable. (They may also be easier to estimate, as the situations that cause loss experience to fluctuate may also cause claim liability estimation to be more difficult.)
- Unearned Premiums – Reduced on a net basis due to the purchase of reinsurance, unless (as in our example) the reinsurance is purchased with a single effective date and the accounting date being used is the reinsurance expiration date.
- Leverage ratios – These ratios on a net basis should be more stable but slightly higher (due to reduced surplus), assuming there is a positive net cost of the reinsurance.
- Income statement – Underwriting results over time would be expected to be lower, due to the net cost of the reinsurance, and investment income would be lower. But the underwriting results from year-to-year should be more stable.

4. **Provide surplus relief**

This reinsurance deals with the situation where leverage ratios are higher than desired. Reinsurance is therefore purchased with the intent of reducing leverage ratios net of reinsurance.

**Beginning Assumptions (the “Without” column):**

- XYZ insurance company here is in the same situation as XYZ insurance company in Exhibit 1 prior to the purchase of reinsurance, except that it has fewer bonds and therefore only has $500,000 in surplus.

**Altered Assumptions (the “With” column):**

- XYZ buys reinsurance with a 50% quota share, in order to reduce its net premium to surplus and net reserves to surplus leverage ratios. This is a straight quota share, with 50% of premiums and losses ceded, with a ceding commission of 20% (consistent with the gross expense ratio).
- This is the only reinsurance purchased by XYZ.
- The altered assumptions once again reflect a steady state with consistent gross and ceded premium from year to year.
- The only surplus change is due to the change in underwriting and investment income during the year.

| Other Financial Statistics |         |       |            |
| Gross WP/Surplus    | 200%    | 226%  | 26%        |
| Net WP/Surplus      | 200%    | 113%  | -87%       |
| Gross Loss Reserves/Surplus | 150% | 169% | 19% |
| Net Loss Reserves/Surplus | 150% | 85%  | -65%       |
| Ceded Reserves/Surplus | 0%    | 141%  | 141%       |
Analysis of impact (from Example 4)

- Surplus – Liabilities decrease because half of the losses and unearned premium are ceded, but assets decrease because of the cost of the reinsurance. The net effect in our example is a small decline in surplus, since the ceded business was profitable. This quota share reinsurance would only increase surplus if the business was being written at a loss.
- Loss reserves – Net reserves are a fixed percentage of gross reserves.
- Unearned Premiums – Net reserves are a fixed percentage of gross reserves.
- Leverage ratios – Net leverage ratios are significantly improved, although ceded reinsurance leverage ratios are significantly increased. Hence, the insurer’s solvency becomes more reliant on its reinsurers’ solvency. Note that ceding half the gross business does not halve the net leverage ratios, due to the impact of the cession on surplus. While premiums and loss reserves drop in half, surplus does not stay constant. Hence, a cession of more than 50% would be required to obtain a 50% reduction in net premium and reserve ratios to surplus.
- Income statement – Underwriting income is cut in half, and investment income is significantly reduced.

5. Facilitate withdrawal from a market segment

This example deals with the situation where management wants to exit a market, and is not willing to wait until the runoff of existing obligations.

Beginning Assumptions (the “Beginning Balance” and “Without” columns):

- XYZ insurance company here is in the same situation as XYZ insurance company in Exhibit 1 except that it stopped writing new business at the beginning of the current year. The beginning balances come from Exhibit 1, “without” column.
- Written premium for the current year therefore drops to zero. XYZ continues to earn premium, and incur losses, on business written during the prior year.
- The accounting paradigm does not recognize Deferred Acquisition Costs, so XYZ incurs a zero expense ratio on runoff earned premium.
- XYZ earns investment income on the average of beginning and ending cash and bonds.
- All loss reserves as of the beginning of the year (for events occurring in earlier years) are closed and paid at the reserve amount before the end of the year.
- Half of all losses occurring during the year are paid by the end of the year.
- Surplus changes, during the year, only due to underwriting and investment income.

Altered Assumptions (the “With” column):

- XYZ buys prospective reinsurance on January 1st to cede 100% of the remaining unearned premium, and all losses occurring after the beginning of the year. A ceding commission is included to cover the commission portion of the unearned premium, which XYZ paid during the previous year.
- XYZ does not buy retroactive reinsurance. Once again all loss reserves as of the beginning of the year (for events occurring in earlier years) are closed and paid by XYZ at the reserve amount before the end of the year.
- Surplus changes, during the year, only due to underwriting and investment income.

Note: This example assumes withdrawal from all business. These results would need to be combined with results from ongoing businesses to see the combined balance sheet and income statement impact.

Analysis of Impact (from Example 5)

- Surplus – Liabilities decline to zero as losses and unearned premium are ceded, but assets decrease because of the cost of the reinsurance. The net effect, once again, is a small decline in surplus, since the ceded business was profitable. However surplus will be less volatile if there are unexpectedly large or small losses during the runoff year.
- Loss reserves – Gross reserves are unchanged, but net reserves disappear, hence exposure to the volatility of net reserve estimates disappears.
- Unearned Premiums – Gross reserves disappear over the year as the business runs off. Net reserves disappear immediately when the unearned premium is ceded.
- Leverage ratios – Net leverage ratios are zero, hence the only remaining insurance risk is reinsurance collectability risk. Hence, surplus that was supporting the runoff business should now be free to support existing or new business, subject to supporting the residual reinsurance collectability risk.
- Income statement – Underwriting results reflect a profit because the ceding commission offsets expenses which were paid the previous year. This profit is slightly smaller than if the business had not been ceded. However the risk in the results is now greatly reduced (and limited to the risk in reinsurance collectability and in investment results).

6. **Provide underwriting guidance**

This reinsurance function arises in the situation where management wishes to enter a new market, or believes that it must be in one market to support another of its markets, but does not feel comfortable with its expertise in that new market. It therefore heavily reinsures its writings in that new market, relying on the reinsurer’s expertise in pricing and underwriting that market correctly.

No numeric example will be provided for this situation. It is conceptually equivalent to Exhibit 1 wherein reinsurance creates new business opportunities for the insurer. The impact on surplus and income will depend on the profitability and volume (after reinsurance cessions) of the new business.
SECTION I

All property and casualty (P&C) insurance companies are required to complete a uniform Quarterly and Annual Supplement P&C return, although jurisdictions may apply certain conditions to meet their own particular requirements.

The P&C returns are designed to enable regulators to monitor the financial condition and operating results of insurers, as well as certain compliance requirements.

These instructions are generally applicable to all jurisdictions, but insurers should refer any specific P&C return questions to their primary regulator.

Canadian insurance companies may be registered federally under the Insurance Companies Act (ICA), or incorporated under the incorporation statutes of a province or territory and, in some cases, under private bill. Foreign P&C insurance companies must be registered federally under the ICA to insure in Canada a risk. Regardless of the jurisdiction of incorporation, all insurers must first obtain a licence in a province or territory before operations can commence. Completion of some schedules in the P&C return depends on the insurer’s jurisdiction of incorporation and/or provincial licensing. Please refer to the “Table of Contents” of the P&C return and Section VI for detailed instructions.

Insurers must comply with the legislation of the primary regulator with respect to record retention.

Foreign P&C Insurance Companies

The P&C return of a foreign company should reflect only the company’s risks that were insured in Canada. Under Part XIII of the ICA regulatory reporting of a foreign entity’s business is now based on the location of the insurance rather than the location of the risk. For this reason, risks located outside Canada but insured in Canada by the Canadian branch should also be reported on the regulatory return. Conversely, risks located in Canada but insured outside Canada (e.g. by Home Office) would not be included.

Please refer to the Advisory 2007-01-R1, Insuring in Canada of Risks. This advisory provides guidance on indicia to consider in determining, for the purpose of the ICA, whether a foreign entity is insuring in Canada a risk and states how OSFI will apply these indicia to various business models.
This definition of business in Canada is to be applied on a retroactive restatement basis by adjusting the opening balance sheet on January 1, 2010 through the Head Office Account for:

- Previously unreported business; and/or
- Removal of business where prior approval has been received from OSFI.

Amendments to the ICA do not change the obligation for foreign entities to comply with provincial requirements. New pages have been added to satisfy these requirements. Therefore, pages 85.40, 85.45 and 85.60 must be completed based on location of risk and must include risks located in Canada that have been insured in Canada and/or abroad. Conversely, risks outside Canada but insured in Canada (e.g. by Home Office) would not be included.

Please refer to OSFI’s website for a list of all current validation rules.

**Accounting Principles – Quarterly and Annual Supplement Returns**

The Canadian Accounting Standards Board (AcSB) has adopted International Financial Reporting Standards (IFRS) as Canadian Generally Accepted Accounting Principles (CGAAP) for publicly accountable enterprises (PAEs). As P&C insurers have fiduciary responsibilities, they are considered to meet the definition of a PAE and are required to report using IFRS for fiscal years beginning on or after January 1, 2011.

**For the purposes of the regulatory return instructions, the term “IFRS” will refer to requirements under “Part I- International Financial Reporting Standards” of the CPA Canada Handbook.**
Consolidated Financial Statements (Canadian P&C Insurance Companies)

With the implementation of IFRS, consolidated reporting within the P&C return is required, except for life company subsidiaries, which are expected to be reported using the equity method.

All regulatory return core financial statements, notes, supporting schedules and exhibits are to be completed on a consolidated basis in accordance with IFRS, with the exception of non-consolidated items as noted on the schedule and life company subsidiaries as noted above.

Non-consolidated statements, additional supporting pages and exhibits should be reported on an IFRS basis, except for investments in subsidiaries, interests in joint ventures and variable interest entities, which should be reported on an equity basis.

Statutory Authority

Each jurisdiction has its own statutes which govern the reporting requirements of the particular insurer. Certain jurisdictions will allow an insurer licensed in their jurisdiction but domiciled in another to follow the reporting requirements of the home jurisdiction. Insurers are advised to be aware of the statutes of all jurisdictions in which they are licensed. Relevant legislation for federally and provincially registered insurers is noted in “Section V - Jurisdictional Requirements.”

Guidelines and Bulletins

Guidelines and bulletins issued by regulators are listed under the applicable jurisdictions in “Section V - Jurisdictional Requirements.”
Language Preference

The P&C returns and related instructions are available in both official languages. Some jurisdictions will accept filings in either official language. See “Section V- Jurisdictional Requirements” for specific details.

General

The Canadian Council of Insurance Regulators (CCIR) Forms Committee is interested in your comments on any aspect of the return and/or instructions. Please direct your comments to the:

Office of the Superintendent of Financial Institutions
Regulatory Information Division
255 Albert Street, 12th floor
Ottawa, ON K1A 0H2

Attention: Chairperson
CCIR Forms Committee

Email: carole.gagnon@osfi-bsif.gc.ca
Definitions have been included in these instructions to assist insurers with the preparation of their filings.

This section is not a complete set of insurance and insurance accounting definitions or interpretations. It is related specifically to the preparation of the P&C Quarterly and Annual Supplement Returns.

Other definitions are contained in the federal Insurance Companies Act and the various provincial and territorial insurance acts.

Additional sources of definitions include:

- IBC Glossary
- A.M. Best Glossary of Insurance Terms
- IRMI Risk and Insurance and Risk Management Terms

However, definitions contained in this section take precedence, for the completion of the P&C return, over any definition of the same terms contained in non-legislative sources.

There may be jurisdictional differences in the interpretations of certain terms; please consult your primary regulator for technical interpretations.
Classes of Insurance Definitions

The classes of insurance are defined below for ease of reference; however, please refer to your primary regulator's legislation or regulations.

The classes of insurance are defined in the order they appear on the forms listed in the return.

Property - Personal means insurance against the loss of, or damage to, property, and includes insurance against loss caused by forgery. It includes such classifications as habitational property and multi-peril policies, including residential contents of buildings such as apartments, rooming houses, motels, manufacturing and mercantile buildings and the liability exposure of personal package policies issued with indivisible premiums. This line would include fire policies, householder contents and homeowner personal risks, residential burglary and theft and special residential glass coverage. Casualty coverage such as personal liability for bodily injury would not be included in this category.

Home Warranty refers to a contract of insurance issued by a warranty provider covering defects in the construction of a new home and consequential losses or costs incurred by the owner.

Product Warranty means insurance not incidental to any other class of insurance against loss of, or damage to, personal property, other than a motor vehicle, under which an insurer undertakes to pay the costs of repairing or replacing the personal property.

Property - Commercial means insurance against the loss of, or damage to, property, and includes insurance against loss caused by forgery and all commercial property and multi-peril policies, but excludes all separate classes of insurance as defined by regulators (i.e. lines 10 through 70 of exhibits showing classes of insurance in the Annual Return).
**Classes of Insurance Definitions** (cont’d)

**Aircraft** means insurance against

(i) liability arising from bodily injury to, or the death of, a person, or the loss of, or damage to, property, in each case caused by an aircraft or the use of an aircraft; or

(ii) the loss of, the loss of use of, or damage to, an aircraft.

**Automobile** means insurance

(i) against liability arising from bodily injury to, or the death of, a person, or the loss of, or damage to, property, in each case caused by an automobile or the use or operation of an automobile;

(ii) against the loss of, the loss of use of, or damage to, an automobile; or

(iii) that falls within clause (i) or (ii) of the definition of accident and sickness insurance, if the accident is caused by an automobile or the use or operation of an automobile, whether or not liability exists in respect of the accident, and the policy includes insurance against liability arising from bodily injury to, or the death of, a person caused by an automobile or the use or operation of an automobile.

Insurers are encouraged to report automobile classes of insurance on a basis consistent with those reported to the General Insurance Statistical Agency (GISA) for the statistical plans.

Insurers should report under three sub-classes of coverage on the standard automobile insurance policy form as follows:

<table>
<thead>
<tr>
<th>Sub-Class</th>
<th>In all provinces excluding Quebec</th>
<th>In Quebec:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Liability</td>
<td>Section A</td>
<td>Chapter A</td>
</tr>
<tr>
<td>Personal Accident</td>
<td>Section B</td>
<td>Endorsements #34, #34A</td>
</tr>
<tr>
<td>Other</td>
<td>Section C (include Section D for Ontario)</td>
<td>Chapter B and all other endorsements</td>
</tr>
</tbody>
</table>
Classes of Insurance Definitions (cont’d)

**Boiler and Machinery** means insurance

(i) against liability arising from bodily injury to, or the death of, a person, or the loss of, or damage to, property, or against the loss of, or damage to, property, in each case caused by the explosion or rupture of, or accident to, pressure vessels of any kind or pipes, engines and machinery connected to or operated by those pressure vessels; or

(ii) against liability arising from bodily injury to, or the death of, a person, or the loss of, or damage to, property, or against the loss of, or damage to, property, in each case caused by a breakdown of machinery.

**Equipment Warranty** means the sub-class of boiler and machinery insurance that covers loss of or damage to a motor vehicle or to equipment arising from its mechanical failure, but does not include automobile insurance or insurance incidental to automobile insurance.

**Credit Insurance** means insurance against loss to a person who has granted credit if the loss is the result of the insolvency or default of the person to whom the credit was granted.

**Credit Protection** means insurance under which an insurer undertakes to pay off credit balances or debts of an individual, in whole or in part, in the event of an impairment or potential impairment in the individual’s income or ability to earn an income.

**Fidelity** means insurance against loss caused by the theft, the abuse of trust or the unfaithful performance of duties by a person in a position of trust; and insurance under which an insurer undertakes to guarantee the proper fulfilment of the duties of an office.

**Hail** means insurance against the loss of, or damage to, crops in the field caused by hail.

**Legal Expenses** means insurance against the costs incurred by a person or persons for legal services specified in the policy, including any retainer and fees incurred for the services, and other costs incurred in respect of the provision of the services.
Classes of Insurance Definitions (cont’d)

Liability means insurance, other than insurance that falls within another class of insurance,

(i) against liability arising from bodily injury to a person or the disability or death of a person, including an employee;

(ii) against liability arising from the loss of, or damage to, property; or

(iii) if the policy includes the insurance described in sub-clause (i), against expenses arising from bodily injury to a person other than the insured or a member of the insured’s family, whether or not liability exists.

Insurers are encouraged to report liability classes of insurance on a basis consistent with those reported to the General Insurance Statistical Agency (GISA) for the statistical plans.

Insurers should report under seven sub-classes of coverage the liability class of insurance as follows:

Comprehensive General Liability (with products) means general liability policy. These include, but are not limited to, the following coverages:

a) Bodily injury and property damage liability;

b) Personal injury liability;

c) Products and completed operations liability;

d) Employers’ liability and voluntary compensation (injury not covered by workers’ compensation);

e) Contractual liability;

f) Owners’, landlords’ and tenants’ liability.

Comprehensive General Liability (without products) means a CGL policy with an endorsement excluding products and completed operations liability.

Cyber Liability means coverage of risks associated around liability to third parties for losses arising out of the use of e-commerce or internet related activities. Examples of this coverage include:

a) Privacy liability

b) Identity theft response

c) Network computer security

d) Internet media liability

e) Cyber extortion
**Classes of Insurance Definitions (cont’d)**

**Directors and Officers Liability** means liability as a result of accepting a position within a corporation.

**Excess Liability** means coverage that operates to supplement limits of liability that are available at the primary level of a particular underlying policy. For policies that provide pure excess coverage over other separate policies, regardless of the type of liability coverage provided.

**Professional Liability** means a policy which provides coverage for those “professionals” who have a liability exposure arising from a specialized service provided (e.g. giving advice, providing counselling or administering a service). Includes errors and omissions and malpractice coverages. Excludes Directors and Officers coverage.

**Umbrella Liability** means liability coverage that provides both excess coverage for underlying liability policies and primary level insurance for the broader coverage it provides.

**Pollution Liability** means coverage for pollution or environmental liability that is written as a separate policy.

**Other** means any insurance written under the liability class of insurance license that does not fall within the above categories.

**Mortgage** means insurance against loss caused by default on the part of a borrower under a loan secured by a mortgage or charge on, or other security interest in, real property.

**Other Approved Products** means insurance against risks that do not fall within another class of insurance.

**Surety** means insurance under which an insurer undertakes to guarantee the due performance of a contract or undertaking or the payment of a penalty or indemnity for any default.

Insurers should report separately for contract surety and all other surety.
Classes of Insurance Definitions (cont’d)

**Title** means insurance against loss or damage caused by

(i) the existence of a mortgage, charge, lien, encumbrance, servitude or any other restriction on real property;

(ii) the existence of a mortgage, charge, lien, pledge, encumbrance or any other restriction on personal property;

(iii) a defect in any document that evidences the creation of any restriction referred to in sub-clause (i) or (ii);

(iv) a defect in the title to property; or

(v) any other matter affecting the title to property or the right to the use and enjoyment of property.

**Marine** means insurance against

(i) liability arising from

   (A) bodily injury to, or the death of, a person; or

   (B) the loss of, or damage to, property; or

   (C) the loss of, or damage to, property, occurred during a voyage or marine adventure at sea or on an inland waterway, or during a delay or a transit other than by water that is incidental to a voyage or marine adventure at sea or on an inland waterway.

**Accident and Sickness** means insurance

(i) against loss resulting from bodily injury to, or the death of, a person caused by an accident;

(ii) under which an insurer undertakes to pay a sum or sums of money in the event of bodily injury to, or the death of, a person caused by an accident;

(iii) against loss resulting from the sickness or disability of a person not caused by an accident, but excludes loss resulting from the death of the person as a consequence of sickness;

(iv) under which an insurer undertakes to pay a sum or sums of money in the event of the sickness or disability of a person not caused by an accident; or

(v) under which an insurer undertakes to pay a sum of money in respect of the health care, including dental care and preventative care, of a person.
Other Definitions

Acquisition Expenses
Policy acquisition expenses are those expenses incurred in the acquisition of new and renewal business. They include items such as commissions, premium taxes and an allocation of operating expenses.

Ancillary Operations
Any function that provides support or service to the insurance or investment operations can be considered an ancillary operation.

Associate
An associate is an entity, including an unincorporated entity such as a partnership, over which the investor has significant influence and that is neither a subsidiary nor an interest in a joint venture. “Significant influence” is defined in accordance with IFRS. For further detail on the definition of the term “associated”, please refer to OSFI’s MCT Guideline.

Claims Ratio
With respect to any particular period, for any policies issued by an insurer for a particular class of insurance, the ratio of claims incurred, including adjustment expenses, during that period under those policies, to net premiums earned during that period for those policies, expressed as a percentage.

Claims Ratio - By Year of Accident
The claims ratio calculated using the claims and premiums pertaining to a specific accident year.

Claims Ratio - By Year of Account
The claims ratio calculated using the claims and premiums pertaining to a specific calendar year.
**Other Definitions** (cont’d)

**Contingent Commission**
Any commission not exclusively attributable to premium volume is a contingent commission and would be considered non-deferrable. Refer to the instructions for page 80.10 for further details on commissions.

**Control**
Control is the power to govern the financial and operating policies of an entity so as to obtain benefits from its activities, in accordance with the meaning of the term under IFRS.

**Counselling Fees**
Fees paid for investment advice.

**Deferred Commissions**
The estimated amount of commission expense on direct and assumed premiums relating to the coverage period beyond the current year end. Deferred commissions arising from direct and assumed business must not be reduced by unearned commissions arising from ceded business, and must be estimated by class of insurance.

**Experience Rating Refunds**
A refund to the insured that is based on a clause or agreement in an insurance contract that allows the insured to share in the favourable underwriting results of the contract. Also known as a “retrospective rating refund.”

**Financing Reinsurance**
Where an agreement that is called a reinsurance agreement does not have as its primary purpose the transfer of insurance risk, such an agreement will be regarded as a financing or funding agreement rather than a reinsurance agreement and must be reported accordingly.

**Government Grade**
Refer to the [Minimum Capital Test (MCT) Guideline](#) for guidance on government grade obligations.
Other Definitions (cont’d)

Incurred But Not Reported (IBNR)
The additional claim reserves established to cover claims, including related adjustment
expenses, which have occurred but which have not been reported to the insurer before
the date of valuation, and for additional reserves set up to allow for an anticipated
development in case reserves.

IFRS
International Financial Reporting Standards, as contained within “Part I” of the *CPA
Canada Handbook*.

Insurance-Linked Securities
An insurance-linked security (ILS) is any instrument by which insurance risk is
transferred to capital markets. While not exhaustive, such instruments would include
catastrophe bonds, swaps, industry loss warranties, derivatives contracts and sidecars.

Insurer
Includes insurance companies, reinsurance companies, (farm) mutual insurance
companies or societies, captive insurance companies, and reciprocal insurance
exchanges. In Quebec, certain professional corporations are also considered insurers.

Internal Target Capital Ratio
The level of capital, based on the company’s own risk and capital adequacy assessment
process, necessary to cover the risks specified in the capital tests as well as all other
risks of the insurer. Refer to OSFI’s *Guideline A-4* for further details.

Investment Properties
Investment in land and/or buildings other than for use in the insurance operations of the
insurer.
**Other Definitions** (cont’d)

**Joint Venture**
A contractual arrangement whereby two or more parties undertake an economic activity that is subject to joint control.

**Notional Principal Amount**
The notional principal amount is:

(i) the stated notional amount, except where the stated notional amount is leveraged or enhanced by the structure of the transaction. In these cases, insurers must use the actual or effective notional amount when determining potential future exposure;

(ii) nil, where the credit exposure on single currency floating/floating interest rate swaps would be evaluated solely on the basis of their marked-to-market value; or

(iii) for contracts with multiple exchanges of principal, the sum of the remaining payments.

**Nuclear Risk**
Nuclear risk is not a separate class of insurance. The physical damage portion of nuclear risk coverage must be reported as property insurance, and the third-party liability portion must be reported as liability insurance.

**Policy Dividends**
Amounts paid to participating policyholders as determined by the insurer, and as prescribed by the insurance contract.

**Premium Deficiency**
A premium deficiency exists where the unearned premiums will not be sufficient to discharge all the expected liabilities that will accrue to the policies, including all expenses associated with the servicing of the policies.
Other Definitions (cont’d)

Private Passenger Auto excluding Farmers (PPAxF)
PPAxF is defined as a combination of type of business 0, 1, 4, 5, 8, 9 and type of business 1-19. Other personal-use vehicles are classified as non-private passenger. All commercial vehicles including public-use vehicles are to be classified as non-private passenger.

Rating Refunds
Refer to the definition of Experience Rating Refunds.

Reciprocal Insurance Exchanges
A group of subscribers exchanging reciprocal contracts of indemnity of inter-insurance with each other through a principal attorney as defined in some provincial jurisdictions.

Registered and Unregistered Insurer
The terms “registered” and “unregistered” are relevant in determining whether credit can be taken for reinsurance placed by federally regulated insurers and provincially incorporated insurers, respectively.

Please refer to the MCT Guideline for further clarification.

- Provincially Incorporated Insurers:

Registered insurers in a particular jurisdiction are insurers that are licensed in that jurisdiction. Certain regulators will also accept (re)insurers not licensed in their jurisdiction, but incorporated and licensed in another jurisdiction, as registered. Please verify with your primary regulator.

Unregistered insurers are insurers not licensed by one or more provincial regulators, and are not federally registered.

Regulator
The federal, provincial or territorial government agency responsible for the control and regulation of the insurance industry under its jurisdiction. The primary regulator is the regulator in the jurisdiction under which the insurer (a) obtained its order to carry on business; or (b) was incorporated.
Other Definitions (cont’d)

Retrospective Rating Credits
Refer to the definition of Experience Rating Refunds.

Salvage and Subrogation Recoverable
Salvage is the residual value that belongs to the insurer as a result of paying an insured’s claim for the property covered by a policy issued by the insurer.

Subrogation is the assumption by an insurer of an insured’s legal right to collect damages.

Short-Term Investments
Includes items such as treasury bills, commercial paper, short-term unsecured promissory notes issued by financial institutions and industrial corporations, interest-bearing deposits with a deposit-taking institution, bank deposit certificates, trust company guaranteed investment certificates, bonds and debentures.

Significant Dependencies
Examples include 10% or more of total premiums from one source; fundamental operations or systems provided by others (claims, information technology, policy issuance, etc.).

Structured Settlements
Refer to “Section IV - Special Topics.”

Subordinated Indebtedness
Includes all indebtedness of the insurer that, in the event of the insolvency or winding-up of the insurer, are subordinate to all policy liabilities of the insurer and all other liabilities except those that rank equally with, or are subordinate to, such indebtedness.

Refer to the MCT Guideline for further information.
Other Definitions (cont’d)

Subsidiary
In accordance with IFRS, a subsidiary is an entity, including an unincorporated entity such as a partnership, that is controlled by another entity (known as the parent).

Substantial
Any share transfer involving 10% or more of the voting rights or any transfer of shares that result in a change of control of the insurer.

Substantial Investment
For federally registered insurers, section 10 of the Insurance Companies Act (ICA) defines a substantial investment as follows:

• “the voting rights attached to the aggregate of any voting shares [owned] exceed 10 per cent of the voting rights attached to all of the outstanding voting shares;”
  or
• “the aggregate of any shares” which are owned “represents ownership of greater than 25 per cent of the shareholders’ equity.”

Subsection 495(4) of the ICA provides that a property and casualty insurance company wanting to acquire or increase a substantial investment in a financial institution must control the financial institution (that is, must have more than 50% of the votes to elect directors), except as permitted under subsection 495(5).

For provincially incorporated insurers, please consult with your primary regulator for any jurisdictional differences.

UCAE
Refers to Unpaid Claims and Adjustment Expenses (including IBNR).

Unearned Commissions
The estimated amount of commission revenue on ceded premiums relating to the coverage period beyond the current year end. Unearned commissions arising from ceded business must not be reduced by deferred commissions arising from direct and assumed business, and must be estimated by class of insurance.
Other Definitions (cont’d)

Unrecognized (Assets and Liabilities)
   Assets and liabilities that are not recognized under applicable accounting standards and are off balance sheet.

Unregistered Insurer (Company)
   Refer to the definition under Registered and Unregistered Insurers.

Unregistered Reinsurer
   Refer to the definition under Registered and Unregistered Insurers.
SECTION IV

Facility, Facility Association (FA), FA Risk Sharing Pool (FARSP) and Plan de répartition des risques (P.R.R.)

The Facility, the FA, the FARSP and the P.R.R. of the Groupement des assureurs automobiles are distinct organizations with similar functions.

Premiums, commissions and losses relating to automobile insurance policies transferred to the Facility or to the P.R.R. are to be treated in the insurer’s books as negative direct business. Premiums and commissions that have not actually been accepted by the Facility or the P.R.R. at its closing date must be entered into each insurer’s books as direct premiums and commissions.

Premiums, commissions and losses transferred to the insurer, according to the allocation made by the Facility or the P.R.R., must be entered as direct business in the insurer’s books.

Similarly, premiums and losses received from the FA must also be reported as direct business.

Insurers participating in the P.R.R. are required to make the following adjustments in their books:

(i) Set up a provision for the insurer’s portion of the total unearned premiums as at year end on automobile insurance policies transferred to the P.R.R. and accepted as at November 30.

(ii) Set up a provision for the insurer’s portion of the total losses reported or unreported and incurred in the last month of the statement year on policies transferred to the P.R.R. as at year end.

(iii) Set up, as receivable from the P.R.R., losses paid on policies that the insurer has transferred to the P.R.R. whether they have been accepted or not as at year end.

Insurers participating in the Facility, the FA and the FARSP should enter into their books an estimate of the premiums written and the losses paid after the organizations’ closing dates.
Facility, FA, FARSP and P.R.R. (cont’d)

The following table outlines the details for each entity:

<table>
<thead>
<tr>
<th>ORGANIZATION</th>
<th>YEAR END</th>
<th># MONTHS ACCRUAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facility</td>
<td>Oct. 31</td>
<td>2</td>
</tr>
<tr>
<td>Facility Association</td>
<td>Oct. 31</td>
<td>2</td>
</tr>
<tr>
<td>FA Risk Sharing Pool</td>
<td>Oct. 31</td>
<td>2</td>
</tr>
<tr>
<td>Plan de répartition des risques</td>
<td>Nov. 30</td>
<td>None required</td>
</tr>
<tr>
<td>Unsatisfied Judgement Recovery Fund</td>
<td>Cash basis</td>
<td>None required</td>
</tr>
</tbody>
</table>

The organizations provide the calculations of various provisions and estimates needed to make the above-noted adjustments.

The Facility, the FA, the FARSP, the P.R.R. and the Unsatisfied Judgement Recovery Fund amounts must be included under automobile statistics. At the end of each year, the fund managers will provide insurers with the automobile liability figures representing:

(i) the unpaid assessments for claims paid by the Unsatisfied Judgement Recovery Fund in the year of account; and

(ii) an estimate of the claims awaiting settlement by the funds.

These figures must be included in a worksheet supporting line 19 of page 60.30 for the examiner’s review. The Unsatisfied Judgement Recovery Fund has been replaced in Quebec by the Régie de l'assurance automobile du Québec.
Letters of Credit / Deposits of Reinsurers

Letters of Credit

For Canadian insurers, to a limited extent, regulators are prepared to recognize approved letters of credit as security maintained in Canada for purposes of reducing the capital otherwise required for unregistered reinsurance.

For Foreign insurers, to a limited extent, regulators are prepared to recognize approved letters of credit as security maintained in Canada for purposes of reducing the assets and margin otherwise required for unregistered reinsurance or a self-insured retention and the total value of assets otherwise required to be maintained in Canada.

Refer to “Section V - Jurisdictional Requirements” for more information on federal requirements and the provincial requirements of Quebec and Ontario. Please also refer to “Section VI - Detailed Instructions” for assistance in completing page 70.38/70.39 and to obtain additional guidance with respect to letters of credit.

Deposits of Reinsurers

Deposits provided by unregistered reinsurers may also be used to reduce the capital/margin otherwise required for unregistered reinsurance, provided that such deposits materially reduce the risk associated with the reinsurer’s credit quality.

For additional information on how to complete page 70.38/70.39, refer to “Section VI - Detailed Instructions.”
Role of the Chief Agent and Record Keeping Requirements

Please refer to OSFI’s Guideline E-4A.

Self-Insured Retention

Self-insured retention (SIR) represents the portion of a loss that is payable by the policyholder, either to the insurer directly or to an intermediary. In some cases, SIRs may be included in the policy declaration or in an endorsement to the policy, stipulating that the policy limit applies in excess of the SIR. When policy wordings are controlled by provincial statute, the SIR arrangement is usually the subject of a separate agreement between the insurer and the policyholder.

Whether the insurer has to pay the entire claim to the policyholder or to a third party (either in accordance with the terms of the policy or the separate agreement), the amount of the SIR portion of the unpaid claim must be reported on page 20.20, line 22 as “Self-Insured Retention (SIR) portion of unpaid claims” with the equivalent amount recoverable reported as an “Other Recoverables” on page 20.10, line 37.

To admit SIR recoverables for statutory test purposes, regulators must be satisfied with the collectibility of the recoverables. Regulators may require acceptable collateral to ensure the collectibility of the recoverables. Any acceptable collateral, for example letters of credit, is subject to a capital charge based on the credit rating of the issuing/confirming bank and the term to maturity of the letter of credit on page 30.77. The total capital requirement from page 30.77 is to be reported on page 30.70, line 50.

Appropriate reserves, including a reasonable IBNR provision, must be maintained with respect to SIR accounts. The adequacy of these reserves should be addressed in the insurer’s actuarial report.
Structured Settlements

A structured settlement refers to a contractual arrangement whereby a third party makes periodic payments to a claimant of an insurer.

The periodic payments are normally funded through the purchase by the insurer of an annuity from a life insurance enterprise and are usually arranged so that the payments are tax free in the hands of the claimant.

The insurer may have to report a financial liability and a financial asset on its balance sheet, depending on the type of contractual arrangement, and must disclose the information required in its notes to the financial statements.

There are essentially two types of structured settlements.

**Type 1**

Type 1 structured settlements have the following characteristics:

a) An annuity is purchased by an insurer who is named as the owner. There is an irrevocable direction from the insurer to the annuity underwriter to make all payments directly to the claimant.

b) Since the annuity is non-commutable, non-assignable and non-transferable, the insurer is not entitled to any annuity payments, and there are no rights under the contractual arrangement that would provide any current or future benefit to the insurer.

c) The insurer is released by the claimant to evidence settlement of the claim amount.

d) The insurer remains liable to make payments to the claimant in the event and to the extent the annuity underwriter fails to make payments under the terms and conditions of the annuity and the irrevocable direction given.

Under this type of structured settlement arrangement, the insurer does not have to recognize a liability to the claimant, nor does it have to recognize the annuity as a financial asset. However, the insurer is exposed to credit risk by guaranteeing the obligation of the annuity underwriter to the claimant.

The insurer should disclose in its notes to the financial statements the terms and conditions, the credit risk and the fair value of this financial guarantee.
**Structured Settlements** (cont’d)

Any gain or loss should be recorded as an adjustment of incurred claims expense.

The insurer also should not recognize a financial asset at the time of purchase where the terms of the annuity make it commutable in the event the liability to the claimant becomes fully settled or otherwise discharged. In these circumstances, the insurer could record a gain amounting to the residual value after the liability is fully settled.

In this case, the contingent gain should be assessed for disclosure in the notes with respect to its amount, nature and terms and conditions.

**Type 2**

Type 2 structured settlements differ from Type 1 in that:

a) the annuity is commutable, assignable or transferable; that is to say, there is some form of reversionary interest or continuing right to a benefit for the insurer; and

b) a legal release is not necessarily obtained from the claimant.

The commutation rights of the insurer have the potential for terminating the claimant’s right to future payments in advance of the annuity being exhausted.

The extent of the rights held by the insurer sometimes indicates that the insurer has contracted with the annuity underwriter to provide only administrative services with respect to the periodic payments.

Under this type of arrangement, the financial liability must be recognized on the insurer’s balance sheet, and the annuity must be recognized as a financial asset.

The annuity should be carried initially at its cost to the insurer, and the liability should be measured in the same manner as other outstanding claim liabilities of similar type.

The insurer should disclose in its notes to the financial statements the terms and conditions, the credit risk and the fair value of the annuities recognized as assets on the balance sheet.

Refer to the section on federal guidelines and bulletins in “Section V - Jurisdictional Requirements.”
SECTION V

Insurers must accommodate for the differences in legislation from jurisdiction to jurisdiction in Canada.

Each jurisdiction’s requirements can now be found in this section, including filing requirements/dates and mailing addresses.

Also included are the statutory references that may be used as authoritative sources for the completion of each jurisdiction’s filing.

Newfoundland and Labrador

Other specific instructions enabling insurers to meet Newfoundland and Labrador’s requirements may be circulated by the Superintendent to the appropriate insurers prior to year end.

Legislation

*Insurance Companies Act*, R.S.N.L. 1990, chapter I-10

Language

Contact the regulator for information on language requirements.

Signature Requirements

There is no section in the *Insurance Companies Act* of the province of Newfoundland and Labrador stating specifically who must verify the Annual Return.

Actuary’s Report

Only Insurers incorporated in the Province of Newfoundland and Labrador are required to submit a full copy of the Actuary’s Report with their annual filing. The actuary’s Certificate of Opinion is considered an integral part of the annual filing, and failure to include it would render the filing incomplete.

Foreign insurers are not required to file a copy of their Actuary’s Report.

Statutory Filings by Federally Registered Insurers

Federally registered insurers submit their statutory filings only to the Office of the Superintendent of Financial Institutions Canada.

**Statutory Filings by Insurers Incorporated in a Province Other than Newfoundland and Labrador**

Only the following pages of the P&C statutory filings are required to be filed:

Pages 67.10 to 67.31 and 93.30 to 93.50
**Jurisdictional Requirements (Section V)**

**Newfoundland and Labrador (cont’d)**

Quebec

Under the Insurers Act, CQLR, c. A-32.1, (the “Act”), every insurer is required to file with the Autorité des marchés financiers (the “AMF” or the “Authority”) in such form as the AMF may determine, the documents and information it requires.

The AMF will no longer send a letter each year listing the documents and information required under the Act. This information will now be available only through the AMF Bulletins and postings on the AMF website.

For further information, consult the Notice on filing for P&C Insurers on the AMF website at:

Legislation

Business Corporations Act, CQLR, chapter S-31.1
Insurers Act, CQLR, chapter A-32.1

Regulation under the Act respecting insurance, CQLR, chapter A-32, r.1 – Revoked on June 13, 2019 (This regulation is now found under chapter A-32.1, r. 1.)

Signature Requirements

In accordance with section 132 of the Act, the two persons signing the Annual Return must be directors of the insurer.
Quebec (cont’d)

Special Reporting

Every insurer licensed to write business in Quebec, whether incorporated under the laws of Quebec, the laws of Canada or some other jurisdiction, must:

(a) for Canadian insurers, complete pages 10.16, 60.10, 80.20, 93.35, 95.10 and 95.20 of the Annual filings;
(b) for foreign insurers, complete pages 10.16, 60.10, 80.20, 85.40, 85.45, 85.60 and 85.65 of the Annual filings;
(c) for Canadian insurers, complete page 93.35 if insurer has written, during the current year or in a prior year, policies for a term of more than 12 months. The data reported on page 93.35 must include
   ▪ for policies for a term not exceeding 12 months
      - total premiums for policies written during the current year;
   ▪ for policies for a term of more than 12 months
      - only the portion of premiums applicable to the twelve months during the current year.

A copy of the major letters of credit and/or confirmation from trustees of deposits held for the account of the insurer (reported on page 70.40) must be attached to the Annual Return.

Loans and Advances to Subsidiaries, Associates and Joint Ventures (with Greater than 10% Ownership Interest)

Quebec-incorporated insurers must show loans and advances to subsidiaries, associates and joint ventures (with greater than 10% ownership interest) on page 50.32. See the instructions for page 50.32 in the document “Section VI - Detailed instructions.”
Quebec (cont’d)

Exhibits NOT Required

The following exhibits or sections of exhibits need not be completed by Quebec-incorporated insurers that transact insurance in Quebec only.

Actuary’s Report

Pursuant to section 128 of the Act, every insurer authorized to underwrite “damage” (property and casualty) insurance in Quebec must attach an actuary’s Expression of Opinion on the valuation of the provisions and reserves to its Annual filing.

A copy of the Actuary’s Report that establishes and presents the provisions and reserves must be forwarded to the Autorité des marchés financiers upon request.

The actuary will have to include a description of the assumptions and methods used in the valuation of the said reserves or provisions and also state and justify the criteria that have served as the basis for choices made.

Moreover, the AMF may require certain insurers to include other information in the report.

Insurers with charters from outside Quebec that transact insurance in Quebec must file a copy of the Actuary’s Report filed with their home jurisdiction.

A copy of the resolution of the board of directors concerning the appointment of the actuary must be forwarded to the AMF within 10 days of the actuary’s initial appointment or at the change of the actuary.
Quebec (cont’d)

Actuary’s Report (cont’d)

For foreign insurers, the Actuary’s Report must contain a certificate testifying that:

(i) the reserves maintained by the insurer to guarantee its obligations toward the insured are not less than the reserves required by the Act or by its “Act of Incorporation”, if it is more restrictive;

(ii) the reserves of provisions are calculated on the basis of appropriate assumptions with respect to the circumstances of the insurer and its contracts of insurance; and

(iii) the reserves make good and sufficient provision to cover all obligations under such contracts.

Auditor Report

For Quebec-incorporated insurers, the report is to be addressed to the AMF. All other insurers licensed in Quebec must submit a copy of the Auditor Report addressed to their regulator.

In addition, Canadian insurers are expected to provide the AMF with a copy of their Annual Report including the Auditor Report to the shareholders and members. Foreign insurers are expected to provide the AMF with a copy of the Annual Report for their total business.
Letters of Credit

Letters of credits may be used to reduce capital otherwise required for unregistered reinsurance or a self-insured retention, this up to a prescribed limit, and are subject to a capital charge as specified in the Autorité’s Guideline on capital adequacy requirements. The limit is applicable to all insurers licensed in Quebec. General requirements concerning letters of credit are set out below:

(i) Letters of credit must be in Canadian dollars and payable in Canada. Letters of credit must be issued by a Canadian bank or confirmed by a Canadian bank if issued by a foreign bank;

(ii) They must be for a fixed term, at least one year;

(iii) They must be for a stipulated dollar amount;

(iv) They must be irrevocable except with at least three months notice to the Regulator. This condition can be satisfied either by a provision in letter of credit or by a letter of confirmation from the issuing bank; and

(v) The issuing bank and the confirming bank must not have any claim on the assets of the Canadian insurance company as security for the letters of credit.

A copy of the major letters of credit must be sent with the Annual Return.

Financial Statements of Subsidiaries and Associates

Insurers licensed in Quebec must file a copy of their subsidiaries’ and associates’ financial statements (where required) with their Annual Return, for those subsidiaries and associates reported on page 92.10, line 40.

Minimum Capital Test (MCT) – (Pages 30.61 to 30.92)

Instructions for completing these pages for insurers incorporated in Quebec are in the guideline on capital adequacy requirements available on the AMF’s website.

Consequently, instructions in Section VI do not apply to those insurers.
Quebec (cont’d)

Registered insurer/reinsurer:

To be deemed approved, the insurer must be approved in Quebec or another province, or subject to federal regulation.

Registered reinsurer: A reinsurance agreement is deemed registered if it was assumed by an insurer constituted under the laws of Quebec, of another province, or of Canada, and in this case, licensed by one or more provincial regulator(s). A reinsurance agreement is also deemed registered if it was assumed by the branch of a foreign company authorized by the federal authority and licensed by one or more provincial regulator(s), and if the branch maintains assets guaranteeing the fulfilment of its obligations under the agreement.

Filing Requirements

Please consult the Notice on the AMF website.
Ontario

Other specific instructions enabling insurers to meet Ontario’s requirements may be circulated by the Chief Executive Officer to the appropriate insurers prior to year end.

**Legislation**

*Corporations Act*, R.S.O. 1990, chapter C.38  

Regulations to the *Insurance Act*, specifically:  
*Regulation 669, Financial Statements*

**Guidelines**

Bulletin 13/92 - *Use of the Canadian Depository for Securities Limited*  
Bulletin 01/02 - *Investments by Insurers Guideline*  
Bulletin 08/04 - *Minimum Capital Test for P&C Insurance Companies*

**Earthquake**

Refer to the OSFI’s *Earthquake Exposure Sound Practices* guidelines.

**Letters of Credit**

In general, letters of credit may be used to offset the reserve for unregistered reinsurance to the extent of 10% of the total amount of the unearned premiums and outstanding losses recoverable from assuming reinsurers.

The Chief Executive Officer must be made aware of the details of letters of credit from affiliated unregistered reinsurers.
Ontario (cont’d)

Discounting

Starting with the 2003 Annual Return, actuarial liabilities are required to be reported on a discounted basis. The discounting requirement will apply to Ontario-incorporated property and casualty insurance companies and to reciprocal exchanges in Ontario for which the Actuary’s Report is required.

Language

Filings in either official language are acceptable.

Statutory Filings by Federally Registered Insurers

In accordance with section 102 of the Ontario Insurance Act, federally registered insurers licensed in Ontario must submit their statutory filings only to the Office of the Superintendent of Financial Institutions Canada.

Ontario FOIPPA Consent Form

The Freedom of Information and Protection of Privacy Act, R.S.O. 1990, chapter F.31 (FOIPPA) provides that where information about an individual is not collected directly from the individual, the collection is lawful only if, among other things, it is authorized by a statute. Further, whenever information is collected about an individual, that individual must be informed of the legal authority for its collection and the principal purpose for which the personal information is intended to be used.

Since the Annual Return includes personal information, the Consent and Notification Form issued pursuant to the FOIPPA must be completed by all provincially incorporated insurers. The insurer must provide a copy to each individual named in page 10.15 of the Annual Return. Since the insurer is aware of many of these individuals, it is strongly recommended that the insurer begin the notification process well in advance of the filing due date. The certificate is to be signed by the same person who signs the Annual Return.
Ontario (cont’d)

Actuary’s Report and Auditor Report

Actuary’s Report

Subsection 121.13 of the Insurance Act (Part II.1) requires that every insurer incorporated in Ontario, except those described in subsection 121.20, must submit with its Annual Return a valuation report by the appointed actuary on his/her evaluation of actuarial and other policy liabilities of the insurer. The exception under subsection 121.20 applies if the insurer is a mutual insurance corporation that is a member of the Fire Mutuals Guarantee Fund.

The Report must be addressed to the Chief Executive Officer, Financial Services Regulatory Authority of Ontario (FSRA), and must comprise a certificate and a report, both of which must be signed. Detailed instructions for completing the Report were forwarded to the insurers and will be updated separately through correspondence with the companies.

Note: Federally regulated insurers are not required to file an Actuary’s Report with FSRA.

Auditor Report

All insurers incorporated in Ontario are required to have their Auditor Report addressed to the Chief Executive Officer, FSRA. All other insurers licensed in Ontario should refer to the general instructions in Section II.

All provincially incorporated insurers licensed in Ontario are expected to provide the FSRA with a copy of their Annual Report including the Auditor Report to the shareholders and members when published.
Ontario (cont’d)

**General Information**

All Ontario-incorporated insurers must complete the general information pages 10.10 to 10.60.

Except for the insurers prescribed in section 102(9) of the Act or in the Regulations, all Ontario-incorporated insurers must complete the statutory compliance pages for the MCT (30.70, 30.71 and 30.73). The MCT is to be completed using the Superintendent’s guideline 08/04.

**Working Papers**

In accordance with section 443 of the Act, insurers licensed in Ontario are required to maintain appropriate working papers to support the information contained in the Annual Return.

**Signature Requirements**

The Annual Return must be verified by the president, vice-president or managing director, or other director appointed for the purpose by the board of directors and by the secretary or manager of the insurer.

**Securities Lending**

Securities lending is prohibited for companies incorporated in Ontario.

**Financial Statements of Subsidiaries**

Ontario-incorporated insurers should have a copy of the current financial statements of each subsidiary available at head office.

(R) Insurers whose certificates of registry are limited to reinsurance.
Jurisdictional Requirements (Section V)

Saskatchewan

Other specific instructions enabling insurers to meet Saskatchewan’s requirements may be circulated by the Superintendent to the appropriate insurers prior to year end.

Legislation

The Saskatchewan Insurance Act, R.S.S. 1978, chapter S-26

Regulations to The Saskatchewan Insurance Act:
Saskatchewan Insurance Regulations, 2003

Discounting

Actuarial liabilities are required to be reported on a discounted basis. The discounting requirement will apply to Saskatchewan-incorporated P&C insurance companies and to reciprocal exchanges in Saskatchewan for which the Actuary’s Report is required.

Filing Requirements

Provincially Incorporated Insurers and Reciprocal Insurance Exchanges

1. Complete Annual Filings including the auditor’s opinion (section 86).
2. Actuary’s Report if required by the Superintendent.
3. Audited financial statements with the auditor’s opinion.
4. Audited financial statements for any subsidiaries with the auditor’s opinion.
5. If subsidiaries are regulated financial institutions, the filings with the primary regulators.

In addition to the above, all reciprocal insurance exchanges need to file the following:

6. The name and address of the attorney for the reciprocal insurance exchange.
7. The particulars respecting the reserve fund and guarantee fund maintained by the reciprocal insurance exchange.
Saskatchewan (cont’d)

Extraprovincial Insurers

Extraprovincial insurers must file pages 10.10 (corporate information), 99.10 (Non-Quebec Incorporated Insurer) and 99.20 (Quebec Incorporated Insurer) of the P&C Annual Supplement and pages 67.10 and 67.30, of the P&C Quarterly Return.

Federally Registered Insurers

Federally registered insurers are required to file only the Federally Regulated Insurance Company Information form provided by the Saskatchewan Superintendent of Insurance.

Filing Deadlines

All annual filings must be provided as follows:

1. If limited by the Superintendent to reinsurance only, 105 days after the financial year end (subsections 86(3) and 87(3)).

2. For all other insurers, 60 days after the financial year end (subsections 86(3) and 87(3)).

Language

Contact the regulator for information on language requirements.

Signature Requirements

For provincial insurers, the Annual filings must be verified by the president, vice-president or managing director, or other director appointed for the purpose by the board of directors and by the secretary or manager of the insurer.

For reciprocal insurance exchanges, the Annual filings must be verified by the attorney-in-fact and a director appointed for the purposes by the board.

* Required if produced.

(R) Insurers whose certificates of registry are limited to reinsurance.
Alberta

*Legislation*

Regulations to the *Insurance Act*: Regulations can be found on Alberta’s website.

*Guidelines and other Guidance*

Refer to the Alberta Superintendent of Insurance’s website for the Guidelines that are applicable to Property and Casualty Insurers and Reciprocal Insurance Exchanges.

*Language*

Annual Returns must be submitted in English.

*Signature Requirements*

Alberta incorporated insurers – Section 44(3)(f) of the *Insurance Act* states the Annual Return (affidavit on page 99.10) must be approved and signed by the president, vice-president or managing director or other director appointed for the purpose by the board of directors and by the secretary or manager of the company.

Reciprocal insurance exchanges – Section 91(3)(d) of the *Insurance Act* states that the Annual Return (affidavit on page 99.10) must be signed by the principal attorney and at least two members of the advisory board or committee of subscribers. Refer to Alberta’s website for a copy of the affidavit containing three signature lines.
Alberta (cont’d)

**Actuary’s Report**

Pursuant to section 44(3)(d) of the *Insurance Act*, Alberta-incorporated insurers licensed under this Act must submit, with the Annual Return, an opinion, in accordance with section 405.

The *Insurance Act* requires that two reports be submitted with the Annual Return, one in respect of premium reserves and one in respect of claim reserves. If the same person is signing both reports, there is no reason why the two reports cannot be combined into one document.

The Actuary’s report is required to include an Unpaid Claims and Loss Ratio Analysis Exhibit, consistent with the OSFI requirements.

Federally and extraprovincially incorporated insurers are not required to file their Actuary’s Report.

**Discounting of Reserves**

Effective January 1, 2003, the reporting of actuarial liabilities on a discounted basis by Alberta-incorporated property and casualty insurance companies and reciprocal insurance exchanges is optional.

Insurers are expected to file on either a discounted or undiscounted basis consistently. Insurers who wish to change the basis on which they file must notify the Superintendent prior to making the change.

**Format of the Actuarial Opinion and Report**

The opinion should state the status of the signatory, his or her title, his or her relationship to the insurer, and, if not a Fellow of the Canadian Institute of Actuaries, how he or she qualifies.
Alberta (cont’d)

Auditor Report

Pursuant to section 43(1), all insurers licensed in Alberta must submit a copy of their audited financial statements within 180 days of the insurer’s year end.

Alberta requires the following reports be filed with the Annual filings:
- Auditor Report addressed to the Alberta Superintendent of Insurance;
- Auditor Report for the Minimum Capital Test.

Annual Report

All Alberta incorporated insurers are expected to file a copy of their Annual Report including the Auditor’s Report to the shareholders and members when published.

Financial Statements of Subsidiaries

A copy of the current financial statements of each subsidiary must be made available on request.

Security Interests

Refer to section 113 of the Alberta Insurance Act.
Alberta (cont’d)

**Filing Requirements**

Refer to the Alberta Superintendent of Insurance’s website for instructions on electronic filing of annual returns.

- Alberta-incorporated insurers and reinsurers are required to file a fourth quarter P&C Return and an Annual Supplement in both ASCII and special Excel file formats.
- All extra provincially incorporated insurers are required to file a fourth quarter P&C Return and an Annual Supplement in an ASCII file format.
- Federally registered insurers are required to file a fourth quarter P&C Return and Annual Supplement with the Office of the Superintendent of Financial Institutions Canada. This will satisfy the reporting requirement for the comparable period.

All filings must be received within 60 days after the company’s fiscal year end, except for reinsurers, which must be received within 105 days after the company’s fiscal year end.

Alberta only accepts electronic filings.

(R) Insurers whose certificates of registry are limited to reinsurance.
British Columbia

For current instructions relating to British Columbia's filing requirements, please consult the website of the BC Financial Services Authority (BCFSA) at www.bcfsa.ca.

Legislation

Financial Institutions Act, R.S.B.C. 1996, chapter 141
Insurance Act, R.S.B.C. 2012, chapter 1
Business Corporations Act, S.B.C. 2002, chapter 57

Regulations under the Financial Institutions Act (FIA) and the Insurance Act applicable to all insurance companies can be found on BCFSA’s website.

Registered and Unregistered Reinsurance

To be considered an authorized (re)insurer, the (re)insurer must be authorized in BC. To be considered a registered reinsurer, the reinsurer must be licensed, registered or otherwise authorized to carry on the business of reinsurance in Canada. (Insurance Company Reinsurance Limitation Regulation B.C. Reg. 324/90).

Filing Requirements

Unless otherwise specifically noted in the filing table below, filing deadlines for annual filings for insurers and reinsurers are no later than 60 days after fiscal year end and 30 days after each fiscal quarter for interim filings.

For reciprocal exchanges, the filing deadline for the annual permit renewal is no later than March 31st.

Only BC incorporated insurers are required to file interim (quarterly) returns unless BCFSA has made a specific request for an insurer or reciprocal exchange to file.

Language

Annual filings must be submitted in English.
British Columbia (cont’d)

**Signature Requirements**

Original signatures are not required. BC will accept scanned or electronic versions of original signatures.

**Auditor’s Report**

Besides the auditor’s reports noted in the table below, insurers incorporated in British Columbia must file the report of the auditor required under section 212 of the *Business Corporations Act*.

All federally regulated insurers and non-BC incorporated insurers are required to file a copy of the auditor’s reports filed with their primary regulator in Canada. Foreign branch insurers must also file the auditor’s report filed in their home jurisdiction with their corporate audited statements.

Reciprocal exchanges must file a copy of the auditor’s report on the annual return with their annual permit renewal.

**Actuary’s Report**

Insurers incorporated in British Columbia must file a report prepared by the appointed actuary in accordance with the instructions set out by OSFI in its annual memorandums to the appointed actuary.

All federally regulated insurers and non-BC incorporated insurers are required to file a copy of the expression of opinion or certificate of opinion on the valuation of the provisions and reserves filed with their primary regulator in Canada. Please note that BCFSA may request at any time copies of the complete actuary report.

Reciprocal exchanges must file with their annual permit renewal a report prepared by the appointed actuary or approved actuary in accordance with the instructions set out by OSFI in its annual memorandums to the appointed actuary.
British Columbia (cont’d)

Financial Statements of Parents, Subsidiaries and Associates

Insurers incorporated in British Columbia must file with their annual return consolidated financial statements that include the financial positions of any subsidiary and the parent company when applicable.

They must also file separate unconsolidated statements of the insurer, and for each subsidiary used to prepare the consolidated statements.

If the insurer is a subsidiary, submit parent company audited financial statements within 60 days from year end.

Earthquakes

Property & Casualty insurance companies are required to file an earthquake return by May 31st.

Discounting of Reserves

Insurers incorporated in British Columbia must report their actuarial liabilities on a discounted basis.

All federally regulated insurers and non-BC incorporated insurers must report their actuarial liabilities on the basis specified by their primary regulator.

Reciprocal exchanges must report their actuarial liabilities on a discounted basis.

Electronic Filing

All filings noted above should be filed in ASCII, PDF, or Excel format, as appropriate, by email to filings@bcfsa.ca. The email subject line should include the company name and the word “filing.” If you have any problem with your electronic filings, contact Financial Reporting and Standards at filings@bcfsa.ca.

For further information, please refer to BCFSA’s website.

Jurisdictional Requirements (Section V)

Federal

*Insurance Companies Act (ICA)*

Regulations that are applicable to federally regulated property and casualty companies can be accessed on Justice Canada’s website.

*Guidelines and Other Guidance*

Guidelines that are applicable to property and casualty insurance companies are available on the OSFI website.

OSFI also issues other guidance (i.e. letters, bulletins) that is accessible its website.

*Auditor Report to Shareholders/Policyholders*

The Auditor Report to shareholders/policyholders, together with the annual financial statements, is to be filed with OSFI’s Regulatory Information Division no later than 21 days prior to the annual meeting. If the annual meeting is held by resolution in writing, the report is to be filed no later than 30 days following the date of signing of the resolution in writing.

*Auditor and Appointed Actuary Reports*

Federally regulated insurers must electronically file their Auditor Reports and Appointed Actuary’s Report as separate documents as defined in the *Regulatory Reporting System (RRS) User Guide.*

*Financial Statements of Subsidiaries*

Federally regulated insurers are required to make available a copy of the current financial statements of each subsidiary at the insurer’s head office upon request.
Federal (cont’d)

Unpaid Claims and Adjustment Expenses - (page 20.20, line 13)

In accordance with section 667 of the Insurance Companies Act, insurers must not report an amount for unpaid claims and adjustment expenses that is lower than the Actuary’s best estimate.

Dividends Declared to Shareholders - (page 20.40, line 11)

The insurer’s MCT ratio (page 30.70, line 90) must be at least 150% on a post-dividends declared basis.

Net claims and Adjustment Expenses – Run-off

Transitional Instructions – (pages 60.040 to 60.043)

For foreign P&C branches, the Claims Runoff exhibits may also be prepared on a prospective basis with no restatement of prior years. Information for the current accident year will be based on insurance business in Canada as per Part XIII of the ICA. However, where there are significant changes to prior years, it would be preferable that these exhibits be restated where this can be done on a practical basis.

Letters of Credit

Letters of credit must be in the standard wording prescribed by OSFI and must conform to the General Guidelines for Use of Letters of Credit as specified on OSFI’s website. Letters of credit from associated unregistered reinsurers must be approved by OSFI in order to be recognized.

Letters of credits may be used to reduce capital otherwise required up to a prescribed limit and are subject to a capital charge as specified in OSFI’s MCT Guideline.
Federal (cont’d)

**Affidavit Verifying Annual Return** - (pages 99.10, 99.11 and 99.15)

The affidavit on page 99.10 must be signed by the president/CEO and another executive officer or director.

The affidavit on page 99.11 must be signed by the chief agent.

The affidavit on page 99.15 must be signed by the head office president / CEO (refer also to “Section VI - Detailed Instructions” for page 99.15).

**Electronic Filing**

For electronic filing instructions, please refer to the *Regulatory Reporting System (RRS) – Guide for OSFI RRS Users* located on the OSFI website.

SECTION VI

Detailed instructions are provided to assist insurers in clarifying filing requirements; they are not provided for every page or field in the P&C return.

The instructions are applicable to all insurers regardless of their jurisdiction of incorporation, unless specified otherwise in this section or in “Section V - Jurisdictional Requirements.”

Reference page numbers in the left hand column of certain pages of the P&C return indicate the supporting exhibit pertaining to the particular statement item. For these items, the insurer should also refer to the instructions in this section for the page number of the supporting exhibit.

All references to “pages” refer to pages of the P&C return.

Insurers are required to include the reference numbers to applicable note disclosures in the Financial Statement (FS) Notes Reference, in the second column on the left-hand side of certain pages of the P&C return.

Any reference to “section” refers to a part of these instructions. Statutory reference to a section of legislation will be presented as “sec.”

Please refer to Section II for instructions on how to embed objects within the special Excel file.

Page 10.10 - Contact

The contact is the person primarily responsible for the preparation of the P&C return who can answer questions from regulators.

- Head Office and Chief Agency

In addition to the address of the Head Office and Chief Agency in Canada, the mailing address, telephone number and fax number of the Chief Agency in Canada are required.
Page 10.10 - Officers

The full name of the officer and the postal address of his/her residence (not business) must be sufficiently complete to serve as a mailing address.

A complete list of all officers is not required.

- External Auditor – Partner

The name of the partner in charge of the audit is requested in addition to the name of the accounting firm.

Page 10.15 – Directors

Canadian insurers incorporated in a provincial jurisdiction must file this page on a quarterly basis. Canadian Federally regulated insurers are only required to file this page with their 4th quarter filing.

The full name of each director and the postal address of his/her residence (not business) must be sufficiently complete to serve as a mailing address.

Include the names of directors who are also officers. After Chairperson of the Board, Chairperson of the Audit Committee and Chairperson of the Conduct Review Committee, directors should be listed alphabetically.

If there is no Audit Committee or Conduct Review Committee, enter “Not applicable” on the Name line under the Committee.

Page 10.16 – Annual Corporate Information – Chief Representative in Quebec

All insurers licenced in Quebec must complete this page.

As stated in sec. 207, chapter A-32, of An Act Respecting Insurance, “Every legal person not constituted under an Act of Québec which does not have its head office in Québec shall, when applying for a license, appoint a chief representative in Québec.

The representative must be a person in authority who is resident in Québec.”
**Page 10.17 – Annual Corporate Information – Board Committees**

This page is required for all provincially incorporated insurers.

The committee name and listing of all of the committee members should be provided for each board committee mandated by law. Additional lines can be added into the form if required.

**Page 10.20 - Shareholders**

**– Line 40 – Change in Ownership**

“Substantial” means any share transfer involving 10% or more of the voting rights or any transfer of shares that result in a change of control of the insurer.

**- Lines 61 to 89 - Shareholders**

When a registered shareholder who holds 10% or more of the shares of the insurer is controlled by another individual or corporation, the name of the individual or corporation that controls the shareholder must be shown in brackets after the name of the direct shareholder.

Similarly, where a substantial shareholder is identified by a nominee name or trust account number, the name of the actual controlling shareholder must be shown in brackets.

For stock insurers, the name of each director must appear in the list of shareholders. Any exceptions (directors without shares) must be explained in a footnote to the list of shareholders.

Some insurers may prefer to submit the requested information by means of a separate, confidential letter. In this case, they should contact their regulator.

Shareholders must be grouped by class of shares owned within each common or preferred share category. With the exception of directors, shareholders owning less than 5% of the shares in one class can be grouped together.

Column 04 “% of Voting Rights” must show the percentage of the total votes that each shareholder holds. This information is required to indicate the actual percentage when the number of shares does not equal the number of votes.
Page 10.30 – Corporate Organization Chart

The corporate organization chart should show the interrelationships between the insurer, its immediate and ultimate parent, and all other associated corporations (upstream and downstream) that are:

- publicly traded companies within the group;
- banks and trust companies within the group;
- other insurance companies within the group;
- insurance companies in which the insurer has a controlling interest (such as joint ventures);
- subsidiaries of the insurer; or
- insurance management companies within the group.

Page 10.40 – Other Information

This page should be filled out on a non-consolidated basis.

– Line 10 – Amendments

This question refers to articles of association and instruments of incorporation.

Page 10.41 – Other Information (cont’d)

This page should be filled out on a consolidated basis.

– Lines 03-70 – Class of Insurance

For additional information on the classes of insurance, refer to “Section III - Definitions.”
Page 10.41  – Lines 03-70 – Maximum Policy Limit and Net Retention

The maximum policy limit is the maximum amount of insurance coverage (actual policy limit, not probable or foreseeable maximum loss) that the insurer provided during the reporting period on any one risk in the particular class of insurance. This refers to all risks insured in Canada, including those that are written by the insurer in connection with global business and/or fronted.

Net retention (direct insurers) is the maximum amount of net insurance coverage that the insurer retained in the reporting period on any one risk or exposure in the particular class of insurance, after the application of all reinsurance applicable to the risk.

Net retention (reinsurers) The maximum amount of coverage that the reinsurer accepted in the reporting period on any one risk or exposure in the particular class of insurance, either on a given assumed treaty or on a group of treaties covering the same risk or exposure for the same ceding insurer, less all retrocession applicable to the risk.

– Lines 03, 04, 05, 07, 10, 13, 17, 32, 33, 38, 68 – Total Insured Value (column 05)

This column should include the total insured values (TIVs) for all risks in force at the statement date. The amounts reported should be in thousands of dollars ($000s).

For the property class of insurance, it is a measure of total insured physical property losses, i.e. buildings and contents.

For the automobile class of insurance, it is a measure of the total insured value of all vehicles with comprehensive coverage, including any endorsement applicable, where appropriate.

For subscription policies, the reported TIV should be the pro-rated share of the total insured value of the property being insured. If participating on an excess layer, the value reported should be excess of the attachment point.

For marine business, TIV should reflect the estimated value of the cargo (and should be consistent with the value used in pricing the product). The amount should be reported per trip, per ship.

– Lines 88 and 89 - Non-liability Business Reported Under Liability Class of Insurance

Disclose if, on page 60.10, amounts recorded under the liability class of insurance includes any property or auto classes of insurance.
Page 10.41 – Line 90 – Discount Rate

The insurer should provide an average discount rate expressed as a percentage for all lines of business. The ratio should be limited to one decimal point and is the same average discount rate calculated and used in the Appointed Actuary’s Report.

– Line 91 – Duration of Bonds

The insurer should determine the duration of the bond portfolio reported on page 20.10, lines 04 and 05 and expressed in years. The ratio should be limited to one decimal point and should be the same average duration as used in the minimum capital test calculations for interest rate risk.

Page 10.42 – Encumbered Assets

For the purposes of these returns, an asset should be treated as encumbered if a security interest has been granted. A security interest may be created in many ways, including if an asset has been pledged or if it is subject to any form of arrangement to secure, collateralise or credit-enhance any on-balance sheet or off-balance sheet transaction that it cannot be freely withdrawn. Assets pledged that are subject to any restrictions on withdrawal, such as assets that require prior approval before withdrawal or replacement by other assets should be considered encumbered.

Examples of encumbered assets include: providing deposits against reinsurance obligations, mortgaging real estate or derivatives.

Assets used in securities lending activities should be recorded on lines 40 and 45 of this page.

Please refer to “Section V - Jurisdictional Requirements” before creating and reporting a security interest.

- Column 1 – Counterparty Legal Name

Identify the counterparty to an encumbered asset.

- Column 2 – Counterparty Domicile

The name of the jurisdiction in which the counterparty is incorporated, legally registered or the contract identifies as the jurisdiction of governing law.
**Page 10.42 - Column 3 – Pledged/Lodged as Collateral**

Record the type of collateral being provided by the insurer, e.g. cash, government securities, subordinated debt, listed equity instruments.

- **Column 4 – Asset Type**

Record the type of asset that the collateral is securing (e.g. reinsurance contract, derivative, mortgage.)

- **Column 7 – Brief Description of the Encumbrance**

Narrative describing the purpose of the security interest being created and any other information relevant for the assessment of the asset encumbrance.

- **Line 20 – Significant Dependencies**

If the answer to the question on line 20 is “yes,” please indicate on the lines provided (21 - 25) the name(s) of the organization(s) and the nature of each dependency. Significant dependencies are not restricted to related-party transactions.

**Page 10.43 – Outsourcing and Service Agreements**

This page should be filled out on a consolidated basis.

Numerical values for Row 09 should be included for Columns 05 and 06. Additional details on outsourcing agreements may be included in the embedded special Excel file.

- **Column 1 – Service Outsourced**

Services to be reported include those provided under contract to a party outside of the reporting entity authorized under the relevant insurance legislation in Canada, as described below. For greater clarity, this includes outsourcing contracts/agreements and for branch insurers, management service agreements with home office.

List all outsourced services that are critical to the business of providing insurance, including services outsourced to an affiliated party or head office, and services provided by non-affiliate vendors. Critical services may include, but are not limited to: underwriting, claims management and valuation, investment counselling, administration and accounting services. Data and IT services are considered critical to the business of providing insurance if the insurer uses electronic platforms for claims or underwriting.

List all financially material non-critical outsourced services. Where applicable, these services may be grouped together by functional category (e.g. maintenance, landscaping, cleaning, etc). The financial materiality of the total cost should be assessed and reported if deemed material.

All services provided from affiliated parties should be disclosed.
Page 10.43 - Column 2 – Provider Name

The full legal name of the service provider should be reported. Where services are grouped by function, the function should be clearly described. Column 07 can be used to clarify or elaborate on the function description if necessary.

- Column 3 – Provider Head Office Address

The city, subnational jurisdiction (e.g. state or province) and national jurisdiction of the head office of the service provider should be reported.

- Column 4 – Location where services provided

The address(es) of the location where the services are provided should be reported.

- Column 5 – Annual Fee/Cost of Services

The annual fee/cost of services reported should be the total annual contractual obligation, regardless of the start/end date of the contract.

Page 10.60 – Summary of Selected Financial Data for Five Years

Canadian insurers are requested to provide data on a consolidated basis for appropriate years where consolidated results and comparatives have been filed. For prior years when non-consolidated results were filed, insurers can report non-consolidated data but should identify it as such within the year column.

Foreign insurers are requested to provide all data on a non-consolidated basis.

Insurers are required to report using IFRS data for years where such data has been filed, including comparatives, and CGAAP data for preceding years. There is no requirement to restate the preceding years.

- Line 01 – Assets/Assets Vested in Trust

Foreign branches should report assets vested in trust on this line.
Page 10.60 – Line 04 – Adjusted Equity

This line applies to Canadian insurers only.

“Adjusted equity” is defined as:

<table>
<thead>
<tr>
<th>Equity (page 20.20, line 49)</th>
<th>Minus</th>
<th>Non-controlling interests (page 20.20, line 48)</th>
<th>Minus</th>
<th>Capital required for catastrophes (page 30.61, line 24)</th>
<th>Minus</th>
<th>Capital required for reinsurance ceded to unregistered insurers (page 30.61, line 26)</th>
</tr>
</thead>
</table>

– Line 08 – Gross Claims Incurred

The figures must include claims incurred with respect to direct written and reinsurance assumed business.

– Line 31 – Claims Ratio by Year of Accident

This ratio represents incurred claims as a percentage of premiums earned. The claims data for the accident year should be extracted from the claims run-off exhibit for the current year.

<table>
<thead>
<tr>
<th>Incurred claims</th>
<th>Equals</th>
<th>Amounts paid during year (page 60.41)</th>
<th>Minus</th>
<th>Investment income from UCAE and IBNR for the accident year, from the beginning of the accident year up to the end of the current year (page 60.41)</th>
<th>Plus</th>
<th>Unpaid claims for that accident year at the end of the current year (page 60.41)</th>
</tr>
</thead>
</table>

Accident year net premiums earned are taken from the appropriate column of page 10.60, line 07, and are the same as the net premiums earned used for the claims ratio by calendar year.
## Page 10.60 – Line 33 – Expense Ratio

<table>
<thead>
<tr>
<th>Expense ratio</th>
<th>Equals</th>
<th>Page 20.30, lines 66 + 68 + 12 + 14 + 16</th>
<th>Divided by</th>
<th>Net premiums earned</th>
</tr>
</thead>
</table>

- **Line 43 – Overlay approach adjustment for financial instruments**  
  (Reclassification from P&L to OCI)

Refer to the instructions for page 20.30, line 48.

- **Line 46 – Investment Yield**

Investment yield is to be calculated according to the following formula:

\[
Yield = \frac{2(I + PI)}{(V_b + V_e) - I - PI} \times 100
\]

where
- \(I\) = net investment income including recognized gains (losses) on investments (page 20.30, line 39)
- \(PI\) = Share of net income (loss) of pooled funds equity accounted (page 20.30, line 47)
- \(V\) = cash, investment income due and accrued, and total investments (page 20.10, lines 01, 02, 45 and 19, column 01) at the beginning and end of the year

- **Line 48 – Return on Equity**

This line applies to Canadian insurers only.

Return on equity is to be calculated according to the formula:

\[
Return = \frac{2NI}{(E_b + E_e)} \times 100
\]

where
- \(NI\) = net income after tax for the year (page 20.30, line 89, column 01)
- \(E\) = equity at the beginning and end of the year (page 20.20, line 49, columns 01 and 03).
Page 10.60 – Line 74 – What is the company’s internal target capital ratio?

For the regulatory definition of the internal target, refer to OSFI’s *Guideline A-4 - Internal Target Capital Ratio for Insurance Companies*.

- Lines 50 to 68 – Equity and Other Ratios

These lines apply to Canadian insurers only.

- Line 66 – Agents and Brokers Balances and Amounts Due from Subsidiaries and Associates

<table>
<thead>
<tr>
<th>Agents and brokers balances and amounts due from subsidiaries and associates</th>
<th>Equals</th>
<th>Receivables-unaffiliated agents and brokers (page 20.10, line 20)</th>
<th>Plus</th>
<th>Receivables-subsidaries, associates and joint ventures (page 20.10, line 25)</th>
<th>Divided by</th>
<th>Adjusted equity (page 10.60, line 04)</th>
</tr>
</thead>
</table>

- Line 68 – Claims Development as a Percentage of Adjusted Equity

<table>
<thead>
<tr>
<th>Claims development as a percentage of adjusted equity</th>
<th>Equals</th>
<th>Amount excess (deficiency) (page 60.41, line 54, column 10)</th>
<th>Divided by</th>
<th>Adjusted equity (page 10.60, line 04)</th>
</tr>
</thead>
</table>

- Lines 19 to 27 - Total World-Wide Business

These lines apply to foreign insurers only.

These amounts should be reported, non-consolidated, in the currency of the insurer's home jurisdiction. Please include a description of the currency.

**Pages 20.10 to 20.60 – “Consolidated” Financial Statements**

For Canadian insurers, the financial statements should be reported on a consolidated basis.

For foreign insurers, the financial statements should be reported on a non-consolidated basis.

The financial statements should be completed in accordance with IFRS.
Page 20.10  – Assets

Opening prior year restated: To be completed by insurers that make a retrospective restatement or reclassification of items in accordance with International Accounting Standard (IAS) 1, paragraph 10(f).

- Columns 02, 04 and 06 – Vested in Trust

These columns apply to foreign insurers only and should exclude deposits of reinsurers held in special trust accounts.

– Line 01 – Cash and Cash Equivalents

Insurers must not offset credit balances in one depository institution against debit balances in another depository institution. Netting is allowed only between branches of the same depository institution.

– Line 04 – Investments: Short-Term Investments

Include items such as Treasury Bills, commercial paper, short-term unsecured promissory notes issued by financial institutions and industrial corporations, interest bearing deposits with a deposit-taking institution, bank deposit certificates, trust company guaranteed investment certificates, bonds and debentures. Investments that mature in one year or less are included on this line.

– Line 05 – Investments: Bonds and Debentures

Include bonds and debentures with a maturity term greater than one year on this line. Investments are split by maturity term into three categories; less than one year, greater than one year and less than or equal to five years, and greater than five years. Note that as an investment nears its maturity date it moves through the three categories.

- Line 09 – Investment Properties

Include right-of-use assets that are considered investment properties.

– Line 20 – Receivables: Unaffiliated Agents and Brokers

See instructions for page 50.20.
Page 20.10  – Line 22 – Receivables: Instalment Premiums

Policy premiums that are payable over several periods (multiple payments and instalments) should be reported on this line.

Policies that provide for premiums to be paid by instalments should be reported and accounted for in accordance with the term of the policy and not the payment mode.

- Line 23 – Receivables: Other Insurers

Receivables from Other Insurers includes receivables from insurers other than those included in line 25.

– Line 30 – Recoverable from Reinsurers: Unearned Premiums

The reinsurer’s portion of unearned premiums must be reported on this line and agree with the total on page 60.10, line 89, column 03.

– Line 31 – Recoverables from Reinsurers: Unpaid Claims and Adjustment Expenses

Recoverables from reinsurers regarding unpaid claims must be reported on a discounted basis where discounting is required by the insurer’s primary regulator. Please refer to “Section V - Jurisdictional Requirements” for further guidance.

The portion of recoverables (salvage and subrogation) from third parties that will be payable to reinsurers must be reported as a reduction of “recoverables from reinsurers” reported on this line. The amounts recoverable from reinsurers must also be reported by class of insurance on page 60.30 in column 07.

– Line 37 – Other Recoverables on Unpaid Claims

Refer to the instructions for page 60.30, columns 05 and 06.

The amount of any self-insured retention (SIR) recoverable must also be reported on this line. For additional information on SIRs, refer to “Section IV - Special Topics.”

– Line 41 – Property and Equipment

Include right-of-use assets that are considered Property and Equipment.

Also see instructions for page 40.70, lines 79, 80 and 69.
Page 20.10  – Line 43 – Deferred Policy Acquisition Expenses

Line 43 should exclude acquisition expenses in respect of individual non-cancellable accident and sickness policies.

– Line 45 – Investment Accounted for Using the Equity Method: Pooled Funds

Report investment pooled arrangements between affiliated companies accounted using the Equity Method.

- Column 2 – Investment Accounted for Using the Equity Method: Pooled Funds – Vested in Trust (effective Q1 2018)

Use value included in line 34 column 12 on page 40.07. The two data points should provide the same number. This will not impact the total reported assets balance on page 20.10 line 89 column 2.

<table>
<thead>
<tr>
<th>Line 45, column 2 on page 20.10</th>
<th>Equals</th>
<th>Line 34, column 12 on page 40.07</th>
</tr>
</thead>
</table>

- Line 58 – Defined Benefit Pension Plan

Report defined benefit pension plan net surpluses on this line.

– Line 88 – Other Assets

Record the aggregate amount of all other balance sheet assets not reported above.

Page 20.20  – Liabilities, Equity, Head Office Account, Reserves & AOCI

Opening prior year restated: To be completed by insurers that make a retrospective restatement or reclassification of items in accordance with IAS 1, paragraph 10(f).

- Line 05 – Payables: Other Insurers

Payables to Other Insurers include payables to insurers other than those included in line 06.
Page 20.20 – Line 13 – Unpaid Claims and Adjustment Expenses

Unpaid claims and adjustment expenses must be reported at gross value, and where discounting is required by the insurer’s primary regulator, on a discounted basis. Please refer to “Section V - Jurisdictional Requirements” for further guidance.

- Lines 20 and 34

These lines should only be used to report pool arrangements between affiliated companies regulated by the primary Regulator. Do not report regular reinsurance arrangements on these lines.

– Line 22 – Self-Insured Retention Portion of Unpaid Claims

Report any SIR portion of unpaid claims. For additional information on SIR, refer to “Section IV - Special Topics.”

- Line 23 – Defined Benefit Pension Plan

Report defined benefit pension plan net deficits on this line.

– Line 25– Subordinated Indebtedness

This line applies to Canadian insurers only.

Refer to “Section III - Definitions” for further guidance.

- Line 26 – Preferred Shares – Debt

This line applies to Canadian insurers only.

- Line 28 – Provisions and Other Liabilities

Include lease liabilities.

- Lines 41-89 – Equity

These lines apply to Canadian insurers only.

- Lines 51-79 – Head Office Account, Reserves & AOCI

These lines apply to foreign insurers only.
Page 20.30 – Statement of Income

– Line 07 – Service Charges
Report only service charges to policyholders. Insurers that do not identify service charges separately or are not permitted to do so should continue to include these service charges with premiums on line 01.

– Line 08 – Other
Report the amount of policyholder dividends and rating refunds.

Experience rating refunds and retrospective rating credits are not to be deducted from premiums written and must be treated as a payment to policyholders in the same way as dividends to policyholders.

– Line 62 – Gross Claims and Adjustment Expenses
The recovery of health care costs paid by automobile insurers to provinces is to be reported as a claims and adjustment expense.

– Line 16 – General Expenses
Regulatory assessments are to be included with general expenses. Refer to instructions for page 80.20.

– Line 20 – Premium Deficiency Adjustments
Adjustments to any premium deficiency liability reported on page 20.20, line 15 must be reported on this line.

– Line 40 – Income (Loss) from Ancillary Operations
This line applies to Canadian insurers only.

There are three datapoints to be completed on this line: current (column 01), prior (column 02) and an inside datapoint (column 05). The inside datapoint is labelled “net of expenses of $000 ______________”. 
Page 20.30 – Line 41 – Share of Net Income (Loss) of Subsidiaries, Associates and Joint Ventures

This line applies to Canadian insurers only.

The insurer must report its pro rata share of the net income (loss) using the equity method of accounting for subsidiaries and associates and, where applicable, joint ventures.

– Line 42 – Gains (Losses) from Fluctuations in Foreign Exchange Rates

Gains or losses should be shown on line 42 unless gains or losses are included with the actual revenue or expense items to which they relate, for example, the payment of certain claims.

– Line 44 – Other Revenues

Revenues that should be reported on line 44 include:
  • interest income earned on deposits made by the assuming insurers as security for reinsurance assumed;
  • investment income from the Facility, the Facility Association, the Risk Sharing Pool or the Plan de Répartition des Risques (P.R.R.);
  • refunds received from any reinsurer(s); and
  • interest on financing activities.

– Line 46 – Other Expenses

Mutual insurance societies and reciprocal insurance exchanges should report the refunds given to their members based on the year’s surplus.

– Line 47 – Share of Net Income (Loss) of Pooled Funds using Equity Method

Report share of Net Income (Loss) from investment pooled arrangements between affiliated companies accounted using the Equity Method.
Page 20.30 - Line 48 – Overlay approach adjustment for financial instruments
(Reclassification from P&L to OCI)

This line applies to recorded realized gains and losses and unrealized gains and losses for
financial assets that were previously recorded using the measurement criteria under IAS 39
(Financial Instruments: Recognition and Measurement) and now reported temporarily using
the IFRS 9 (Financial Instruments) overlay approach between Jan 1, 2018 and December
31, 2020. The overlay approach option is temporary and is to alleviate the volatility that may
arise when applying IFRS 9 before the forthcoming IFRS 17 Insurance Contracts Standard
which will be effective January 1, 2021.

Under the overlay approach, an insurer is permitted, but not required to reclassify from P&L
to OCI an amount equal to the difference between:

a) The amount reported in P&L when IFRS 9 is applied to qualifying financial assets
   (that are newly measured at FVPL under IFRS 9); and
b) The amount that would have been reported in P&L if IAS 39 were applied to those
   assets.

In Canada the Overlay approach applies only to P&C companies.

Page 20.31 - Statement of Income (Budget) (for BC incorporated insurers only)

Only Canadian insurers that are incorporated in the province of British Columbia are
required to fill in this schedule.

Report year to date budget to the end of the quarter in the same format as described on page
20.30.

See general instructions under page 20.30.

Page 20.37 - Statement of Income (Annual Budget for Next Fiscal Year) (for BC
incorporated insurers only)

Only Canadian insurers/societies that are incorporated in the province of British Columbia
are required to fill in this schedule.

Report annual budget numbers for next fiscal year in the same format as described on page
20.030.

See general instructions under page 20.030.
Comprehensive Income (Loss) and Accumulated Other Comprehensive Income (Loss)

General Instructions

All amounts should be reported on an after-tax basis.

- Lines 15 and 16 – Overlay Approach: Change in Unrealized Gains and Losses related to overlay approach for financial instruments

These lines apply to recorded unrealized gains and losses for financial assets that were previously recorded using the measurement criteria under IAS 39 (Financial Instruments: Recognition and Measurement) and now reported temporarily using the IFRS 9 (Financial Instruments) overlay approach between Jan 1, 2018 and December 31, 2020. The overlay approach option is temporary and is to alleviate the volatility that may arise when applying IFRS 9 before the forthcoming IFRS 17 Insurance Contracts Standard which will be effective January 1, 2021.

- Lines 60 and 62

These lines apply to Canadian insurers only.

Head Office Account

This table applies to foreign insurers only.

Any transitional adjustments / balances from the adoption of a new accounting standard should be reported on line 04 in the year of transition.

- Line 20 – Advances (Returns)

This line represents the equivalent of a capital transfer from (to) the head office.

- Line 21 – Expenses

This line represents the settlement of any expense agreement with the head office.

- Line 22 – Premiums/Claims

This line represents the settlement of any premium or claim transaction with the head office.
Page 20.45 - Line 23 – Other

This represents any other transfers not included above.

Page 20.45 - Reserves

- Line 96 – Nuclear Reserve

Insurers issuing nuclear risk policies are required to record an additional provision of 100% of net premiums written, less commissions, on line 96. In the absence of meaningful statistical data on the severity and frequency of losses, regulators consider it appropriate for insurers to reverse this reserve after 20 years.

- Line 98 – General and Contingency Reserves

This line applies to Canadian insurers only.

Page 20.54 - Statement of Changes in Equity

This page applies to Canadian insurers only.

Page 20.60 – Notes to Financial Statements

In addition to the notes normally required under the applicable accounting standards, these notes should include the following items, where relevant:

- the existence of financing reinsurance arrangements and their financial impact;
- the percentage of the insurer’s participation in a pool, and disclosure of its share of the amount of direct premiums written, reinsurance assumed and reinsurance ceded in the pool; and
- the amount by which deferred policy acquisition expenses have been written down due to a premium deficiency. This amount should be broken down by commission expense, commission income, premium taxes and other acquisition expenses, as applicable. The note must also indicate details of the adjustment made to page 80.10, column 10, lines 09 to 79.
**Page 20.70 – External Auditor Reports**

The External Auditor Report for the financial statements should be addressed to the primary regulator. The External Auditor Report must cover pages 20.10 to 20.60 of the P&C return. This includes the (consolidated) Balance Sheet, Statement of Income, Comprehensive Income (Loss) and Accumulated Other Comprehensive Income (Loss), Statement of Cash Flows, Statement of Changes in Equity and Notes to the Financial Statements.

Canadian insurers are required to provide an annual External Auditor Report for the Minimum Capital Test (MCT), confirm this requirement with your primary regulator or refer to “Section V – Jurisdictional Requirements.” Federally regulated branches of foreign insurers are required to provide OSFI with an annual External Auditor Report for the Branch Adequacy of Assets Test (BAAT). The annual audit of the MCT/BAAT is required to be a separate audit report from the one provided for the audited financial statements. For further details, please refer to OSFI’s [MCT Guideline](#).

For filing requirements, refer to “Section V - Jurisdictional Requirements.”

**Page 20.80 – Appointed Actuary’s Report**

The Appointed Actuary’s Report must be signed by the actuary most recently appointed by the insurer’s board of directors.

For filing requirements, refer to “Section V - Jurisdictional Requirements.”

For additional information, refer to the primary regulator’s instructions to the appointed actuary.

**Pages 30.61 to 30.92 – Minimum Capital Test (MCT) and Branch Adequacy of Assets Test (BAAT)**

This section must be completed in compliance with OSFI’s [MCT Guideline](#) unless otherwise noted in “Section V - Jurisdictional Requirements.”

Insurers incorporated in Quebec must complete this section in compliance with the AMF’s guideline on capital adequacy requirements.
Page 30.61  – Minimum Capital Test/Branch Adequacy of Assets Test: Capital (Margin) Required and MCT (BAAT) Ratio

The MCT must be calculated using financial data based on the scope of consolidation defined in the MCT Guideline.

- Lines 01 and 09

These lines apply to Canadian insurers only.

- Lines 11 and 19

These lines apply to foreign insurers only.

- Line 24 – Capital (Margin) Required at Target: Insurance Risk: Catastrophes

Refer to section 4.5 of the MCT Guideline for details.

- Line 52 – Capital (Margin) Required at Target: Less: Diversification Credit

The amount of diversification credit should be calculated based on the formula provided in chapter 8 of the MCT Guideline.

- Line 68 – (Specify) Blank Line

Report the transitional amount for equity derivatives, common shares held short and eligible hedges calculated in accordance with section 1.2.3 of the MCT Guideline, whether positive or negative, divided by 1.5.

Page 30.62  - Minimum Capital Test: Capital Available

This page applies to Canadian insurers only.

For further details on capital available, refer to chapter 2 of the MCT Guideline.
Page 30.62 – Line 01 – Capital Available: Qualifying category A common shares

Report the total amount of common shares issued and paid that meet the qualifying criteria for inclusion of capital instruments in category A for regulatory capital purposes as per chapter 2 of the MCT Guideline.

- Line 02 – Capital Available: Contributed Surplus

The total amount reported in this line should include contributed surplus resulting from the issuance of category A common shares.

– Line 04 – Accumulated net after-tax fair value gains (losses) in the company’s own credit risk

Report the net after-tax impact of changes in fair value due to changes in the company’s own credit risk for the company’s financial liabilities that are classified as held for trading that were recorded on the income statement prior to the adoption of IFRS 9.

– Line 05 – Capital Available; Retained Earnings; Less: Unrealized Net After-Tax Fair Value Gains (Losses) on Own-Use Properties at Conversion to IFRS – Cost Model

At the point of conversion to IFRS, insurers may have elected to fair value their own use properties as the opening IFRS balance sheet valuation. In this case, unrealized fair value gains at conversion are reflected in equity. These unrealized gains must be deducted from capital available on an after-tax basis. The amount entered in this line at conversion is an ongoing deduction to capital available and can only be changed as a result of a sale of own-use properties (owned at the time of IFRS conversion) and the resulting recognition of actual gains (losses).

Line 06 – Capital Available; Retained Earnings; Add: Accumulated Net After-Tax Revaluation Losses in Excess of Gains on Own-Use Properties – Revaluation Model

Where an insurer has chosen to use the revaluation model for own-use properties, there is a possibility that unrealized losses in fair value could exceed unrealized gains. If this occurs, the net loss will be added back to capital available to maintain the value of own-use properties at or near the value when using the cost model.
In the case where EPR is not used as part of financial resources to cover a P&C insurer’s earthquake risk exposure, i.e. the company has enough financial resources to cover its earthquake risk exposure without the voluntary reserve, the EPR can be deducted from Capital available instead of being added to total capital requirements. For further details, refer to section 4.5.1 of the MCT Guideline.

– Line 16 – Capital Available; Less: Accumulated Net After-Tax Fair Value Gains (Losses) Due to Changes in the Company’s Own Credit Risk

Report the net after-tax impact of changes in fair value due to changes in the company’s own credit risk for the company’s financial liabilities that are classified as held for trading.

– Line 17 – Capital Available; Accumulated Other Comprehensive Income (Loss); Less: Accumulated Net After-Tax Unrealized Gains on Own-Use Properties – Revaluation Surplus

Net after-tax revaluation gains on own-use properties must be deducted from accumulated other comprehensive income.

– Line 18 – Less: Shadow Accounting Impact

If the company has elected to use the shadow accounting option within IFRS, the after tax income effects must be reversed for capital available purposes.

– Lines 20 to 24 – Capital Available; Qualifying Category B and Category C Instruments

The values reported in these lines must be for instruments meeting category B and/or category C qualifying criteria, not exceeding the applicable limits as per chapter 2 of the MCT Guideline. The values reported in these lines also include share premium amounts resulting from the issuance of instruments meeting category B and/or C criteria.
Page 30.62  – Lines 30 to 46 – Capital Available

Deductions

For MCT purposes, the definition of associate relates to the notion of significant influence as defined in IFRS and includes the addition of insurance brokers that are economically dependent on the insurer.

Refer to chapter 2 of the MCT Guideline for further details relating to regulatory deductions and adjustments to capital available.

Insurers incorporated in Quebec should refer to Appendix 1 of the AMF’s guideline on capital adequacy requirements.

   – Lines 36 – Receivables and Recoverables from Unregistered Insurers Not Covered by Acceptable Non-Owned Deposits and LOCs

Report the total from line 29 column 42 from page 70.60.

   – Lines 60 and 61 – Validation Test: 40% Limit for Category B and C Capital Instruments and 7% Limit for Category C Instruments

The values in these lines serve as a check to compare the dollar amount reported under category B and category C instruments to the allowable limits as per chapter 2 of the MCT Guideline.

   – Lines 70 to 78 – Memo Items

The requested data points in these lines are for information and validation rules purposes.

Page 30.92  - Branch Adequacy of Assets Test: Net Assets Available

This page applies to foreign insurers only.

Refer to chapter 3 of the MCT Guideline for further details on net assets available for foreign branches.

   - Line 61 – Receivables from agents and policyholders (including brokers)

Only amounts due from unaffiliated brokers are to be reported on line 61.
Page 30.92 - Line 62 – Add: Revaluation Losses in Excess of Gains on Own-Use Properties

Where an insurer has chosen to use the revaluation model for own use properties, there is a possibility that unrealized losses in fair value could exceed unrealized gains. If this occurs, the net loss will be added to available assets to maintain the principal of carrying own use properties at or near the value using cost model.

- Line 63 - Less: Recoverable from Unregistered Reinsurers Not Covered by Acceptable Non-Owned Deposits and LOCs

Report recoverables from unregistered reinsurers in excess of acceptable collateral per page 70.61, line 29, column 42.

- Line 64 – Less: Unrealized Fair Value Gains (Losses) from Own Use Properties at Conversion

At the point of conversion to IFRS, insurers may have elected to fair value their own use properties as the opening IFRS balance sheet valuation. In this case, unrealized fair value gains at conversion are reflected in head office account. These unrealized gains must be deducted from available assets on an after tax basis. The amount entered on this line at conversion is an on-going deduction to available assets and can only be changed as a result of a sale of own use properties (owned at the time of IFRS conversion) and the resulting recognition of actual gains (losses).

- Line 66 – Less: Shadow Accounting Impact

If a branch has elected to use the shadow accounting option within IFRS, the after tax income effects must be reversed for available assets purposes.

- Line 70 – Amounts due from federally regulated insurers and approved reinsurers that can be legally netted against actuarial liabilities

Only amounts that meet the requirements under section 3.1.3 of the MCT Guideline are to be reported on line 70 including a prior review by OSFI of the netting agreement and legal opinions.
Page 30.64 - MCT (BAAT) Insurance Risk: Capital (Margin) Required for Unpaid Claims and Premium Liabilities

Refer to chapter 4 of the MCT Guideline for details on capital requirements for insurance risk.

Mortgage insurance companies are not required to complete this page.

The unpaid claims risk margin is calculated on the net amount of risk (i.e. net of any reinsurance, salvage and subrogation, and self-insured retentions) less PfADs multiplied by the risk factors.

The premium liabilities are to be reported after deducting reinsurance recoverables and PfADs. The premium liability risk factors are applied to the greater of the net premium liabilities net of PfADs and 30% of the net written premiums by line of business for the past 12 months.

The total reported in Column 10, line 89 is to be reported on page 30.61, line 22 and the total reported in Column 29, line 89 is to be reported on page 30.61, line 20.

Page 30.65 - MCT(BAAT) Insurance Risk: Capital (Margin) Required for Accident and Sickness Business

This page applies only to insurers writing accident and sickness business.

Refer to section 4.6 of the MCT Guideline for details on the capital requirements for accident and sickness business.

The premiums margin is calculated on the annual earned premiums multiplied by the risk factors. The unpaid claims margin is calculated by multiplying the unpaid claims relating to prior years by the risk factors. To compute the components for accidental death and dismemberment, the risk factors in section 4.6.2 of the MCT Guideline are applied to the net amount at risk.

The total reported in column 5, line 39 is to be reported on page 30.64, column 29, line 70 and the total reported in column 25, line 89 is to be reported on page 30.64, column 10, line 70.

Insurers are to report the amount of their PfADs and expected claims loss ratio for accident and sickness business by product type.
Page 30.66 - MCT(BAAT) Market Risk Capital (Margin) Required

Refer to chapter 5 of the MCT Guideline for details on capital requirements for market risk.

The following amounts should be carried forward:

Page 30.71 – Capital Required for Balance Sheet Assets

This page applies to Canadian insurers only.

Refer to chapter 6 of the MCT Guideline for details on capital requirements for balance sheet assets.

The shaded lines in the “Capital Required” column denote items that are risk weighted at 0% or whose capital requirements are captured elsewhere in the return.

- Lines 06, 07 and 25 – Investments: Long-Term Obligations Including Term Deposits, Bonds, Debentures and Loans; Short-Term Obligations Including Commercial Paper; and Preferred Shares

Use page 30.73, “Capital (Margin) Required for Balance Sheet (Vested) Assets Based on External Credit Ratings,” to calculate capital required for these lines.

- Lines 14, 15, 16, 17 and 23 – Loans (at amortized cost)

Loans are reported at amortized cost for the purpose of calculating capital required. The difference between the balance sheet values of loans and loans at amortized cost must be reported on line 19.

- Line 35 – Investments: Other Investments

For further details on capital treatment of other investments, refer to chapter 6 of the MCT Guideline.
Page 30.71 – Column 04 – Redistribution of exposure for collateral/guarantees

Where a Canadian company holds a guarantee or collateral backing an asset, the exposure of the asset can be reduced by the value of the collateral or guarantee. This collateral or guarantee will be reported in column 04. The net exposure in column 05 will be multiplied by the risk factors in column 1.

All amounts reported in column 04 are to be reported on page 30.73 in the appropriate category in columns 10, 12 or 14 in order to determine the capital required on the collateral or guarantee. The amounts reported as a reduction on page 30.71 are to be reported as a positive number on page 30.73.

Page 30.81 – BAAT Credit Risk: Margin Required for Balance Sheet Assets

This page applies to foreign insurers only.

Shaded lines in the margin required column denote items that are risk weighted at 0% or whose margin requirements are captured elsewhere in the return.

Refer to chapter 6 of OSFI’s MCT Guideline for details on capital requirements for asset risks.

- Lines 06, 07 and 25 – Investments: Long-Term Obligations Including Term Deposits, Bonds, Debentures and Loans; Short-Term Obligations Including Commercial Paper; and Preferred Shares

Use page 30.73 Capital (Margin) Required for Balance Sheet (Vested) Assets based on External Credit Ratings to calculate margin required for these lines.

- Lines 14 and 15 – Loans (at amortized cost)

Loans are reported at amortized cost for the purpose of calculating margin required. The difference between the balance sheet values of loans and loans at amortized cost must be reported on line 19.

- Line 51 – Other (allowable) Recoverables on Unpaid Claims Including SIRs not deducted from net available assets

Include salvage & subrogation and self-insured retentions (SIRs) to the extent permitted.
Page 30.81  - Line 54 – Instalment Premiums (not yet due)

Include instalment premiums receivable (see Instructions for page 20.10, line 22) arising from the recording of premiums in advance of the services being provided.

   – Column 04 – Redistribution of Exposure for Collateral/Guarantees

Where a foreign insurer holds a guarantee or collateral backing an asset, the exposure of the asset can be reduced by the value of the collateral or guarantee. This collateral or guarantee will be reported in column 04. The net exposure in column 05 will be multiplied by the risk factors in column 01.

All amounts reported in column 04 are to be reported on page 30.73 in the appropriate category in columns 10, 12 or 14 in order to determine the margin required on the collateral or guarantee. The amounts reported as a reduction on page 30.81 are to be reported as a positive number on page 30.73.

Page 30.73  – MCT (BAAT) Credit Risk: Capital (Margin) Required for Balance Sheet (Vested) Assets Based on External Credit Ratings

The ratings for long-term obligations including term deposits, bonds, debentures and loans apply to investments with an initial term greater than one year.

Refer to chapter 3 of the MCT Guideline.

   – Columns 10, 12 and 14 – Redistribution of Exposure for Collateral/Guarantees

The amounts reported in columns 10, 12 and 14 will be a combination of redistributions of exposures for collateral/guarantees backing balance sheet (vested) assets as reported on page 30.73 and the redistributions from page 30.71, column 04; page 30.81, column 04 and page 30.75, columns 11, 21 and 31.

For redistributions of collateral and guarantees among the categories on page 30.73, the amounts will offset within columns 10, 12 and 14. Line 89 for columns 10, 12 and 14 should be the sum of line 89 on page 30.71 column 04; page 30.81, column 04 and page 30.75, columns 11, 12 and 31.

The total reported on line 89, column 09 should be reported on page 30.61, line 40.

Refer to section 6.2 of the MCT Guideline for further information relating to this page.
Detailed Instructions (Section VI)

Page 30.75 – MCT (BAAT) Credit Risk: Capital (Margin) Required for Off-Balance Sheet Exposures

Refer to chapter 6 of the MCT Guideline for further information relating to this page.

- Columns 11, 21 and 31 – Redistribution of Exposure for Collateral/Guarantees

Where a P&C insurer holds a guarantee or collateral backing an off-balance sheet exposure, the exposure of the off-balance sheet instrument can be reduced by the value of the collateral or guarantee. This collateral or guarantee will be reported in columns 11, 21 or 31 depending on the remaining term to maturity.

All amounts reported in columns 11, 21 and 31 are to be reported on page 30.73 in the appropriate category in columns 10, 12 or 14 in order to determine the capital (margin) required on the collateral or guarantee. The amounts reported as a reduction on page 30.75 are to be reported as a positive number on page 30.73.

The total reported on line 89, column 39 should be reported on page 30.61, line 42.

Page 30.77 – MCT (BAAT) Credit Risk: Capital (Margin) Required for Collateral held for unregistered Reinsurance Exposures and Self-Insured Retentions

Refer to chapter 6 of the MCT Guideline for further information relating to this page.

The calculation for credit risk on self-insured retentions is to be calculated separately from the credit risk margin on collateral held for unregistered reinsurance exposures and the amounts for the capital (margin) required are added together and reported on line on page 30.61, line 44.

Page 30.79 – MCT (BAAT) Operational Risk Capital (Margin) Required

Premiums written, assumed and ceded are to be calculated on a rolling 12 month basis.

Refer to chapter 7 of the MCT Guideline for further information relating to this page.

The total reported on line 89, column 9 should be reported on line 50, page 30.61.
**Page 40.07 – Summary of Investments**

For foreign insurers, investments are vested in trust. All amounts must be denominated in Canadian dollars using the appropriate exchange rate in effect at the reporting date.

This page requires investment to be reported by look through basis same as MCT requirement. Include underlying investments of pooled arrangements regardless how they are reported on the balance sheet page 20.10 (i.e. Common Shares, Other Invested Assets or using the Equity Method). These pooled arrangements include but not limited to mutual funds, segregated funds and limited investment partnerships.

- **Column 01 – Fair Value Through Profit or Loss (FVTPL)**
  Report the balance sheet value of investments included in the category at fair value through profit or loss classified as held for trading.

- **Column 03 – Fair Value Through Other Comprehensive Income (FVOCI)**
  Report the balance sheet value of investments classified as available for sale but measured at amortized cost.

- **Column 05 – Hedges**
  Report the balance sheet value of derivative instruments that are part of designated cash flow or fair value (FV) hedging relationships. For a fair value hedge, also report the balance sheet value of the hedged item. For a cash flow hedge, the balance sheet value of the hedged item should be reported in column 09.

- **Column 07 – FV Option/Investment Properties Fair Value**
  Report the balance sheet value of investments designated as at fair value through profit or loss and investment property valued using the fair value method.

- **Column 09 – Amortized Cost**
  Report the balance sheet value of financial instrument investments measured using amortized cost including investments classified as held to maturity, loans and receivables and cash flow hedges.

  Include investment properties valued using the cost method.
Page 40.07 – Column 13 – Pooled Funds

Report pooled funds amounts included in columns 01 to 09.

– Column 15 – Realized Gains (Losses)

Record all pre-tax realized gains and losses on the sale of investments, hedge ineffectiveness, any permanent write-down of investments, including impairment losses on investments classified as available for sale, and all allowances for loan impairments.

– Column 16 – Income Excluding FV Option

Record pre-tax income from investments including interest income, dividend income, unrealized fair value gains (losses) from items classified as held for trading and fair value hedges and amortization.

– Column 19 – Unrealized Gain/Loss from FV Option

Record pre-tax unrealized gains (losses) on investments recorded in column 07, designated at fair value through profit or loss.

Aggregate Holdings (Canadian Insurers)

– Line 01 – Short-Term Investments (one year or less)

| Columns 01 to 12, line 01 on page 40.07 | Equals | Columns 10 to 29, line 99 on page 40.12 |

Holdings of bonds and debentures are to be included on lines 06, 02 or 05 depending on their maturity terms.

| Sum of columns 12, line 01 and 06 on page 40.07 | Equals | Columns 01, line 04 on page 20.10 |
Page 40.07  – Line 06 – Bonds and Debentures (one year or less)

</tr>
</thead>
</table>
Page 40.07 - Lines 01, 06, 02 and 05 – Short-Term Investments, Bonds and Debentures (Foreign insurers)

Short term investments (line 01, column 02) includes items such as Treasury Bills, commercial paper, short-term unsecured promissory notes issued by financial institutions and industrial corporations, interest bearing deposits with a deposit-taking institution, bank deposit certificates, trust company guaranteed investment certificates.

Short term investments, bonds and debentures that mature, or can be repurchased by the issuing company, in one year or less must be recorded on lines 01 or 06. All others (including perpetual bonds) must be included on line 02 that mature greater than one year and less than or equal to 5 years with greater than 5 years on line 05.

Holdings of Canadian government or government guaranteed bonds are to be included on lines 06, 02 or 05 depending on their maturity terms.

| Sum of columns 12, line 01 and 06 on page 40.07 | Equals | Columns 02, line 04 on page 20.10 |

– Lines 03 and 04 – Mortgage Loans

Report only the residential and commercial mortgage loans where the total value of the loan(s) outstanding on the property is less than 80% of the loan-to-value ratio of the property at the time of writing the loan on line 03. All other mortgages must be recorded on line 04.

The balance sheet value reported for each mortgage loan is the net balance sheet value after deducting any allowance for loan impairment.

– Lines 10 and 11 – Preferred Shares

Record preferred shares that are treated as debt in accordance with the applicable accounting standard on line 10 and all other preferred shares on line 11.

– Line 20 – Investment Properties

Complete each column for all investment properties reported on page 40.70. See also instructions for page 40.70, “Investment Properties.”

– Line 30 – Other Loans and Invested Assets

Complete each column for all investments reported on page 40.80. See also instructions for page 40.80.
Page 40.07  – Line 32 – Pooled Funds – items not captured in above rows

Report other pooled funds amounts not captured by above rows 01 to 30. These amounts could include but not limited to accounts receivables, payables and derivatives of the pooled funds.

– Line 34 – Deduct: Pooled Funds accounted using the Equity Method

Include pooled funds amounts accounted using the Equity Method reported from rows 01 to 30.

– Line 39 – Total Investments

| Column 12, line 39 on page 40.07 | Equals | Column 01, line 19 on page 20.10 |

– Line 40 – Out of Canada

The following criteria should be used to determine whether an investment should be classified as “out of Canada”:

- Cash/deposits held through a Canadian financial institution located outside Canada (e.g. U.S. branch) or through a foreign financial institution.
- Securities where the instruments are physically located outside Canada (e.g. with foreign depositaries/custodians).
- “Book-based only” securities held/cleared through a foreign depository (e.g. the Depository Trust Company) where either
  1) the insurer/owner is a direct member of the foreign depository; or
  2) the financial institution custodian that represents the insurer, and that is a direct member of the foreign depository, is not a Canadian financial institution located in Canada.
- Mortgage loans on property physically located in Canada where documentation evidencing indebtedness is located outside Canada.
- Mortgage loans on property physically located outside Canada.
- Real estate physically located in Canada where documentation evidencing ownership is located outside Canada.
- Real estate physically located outside Canada.
- Other investments physically located in Canada where documentation evidencing ownership/indebtedness is located outside Canada.
- Other investments physically located outside Canada.

Investments not meeting these criteria should not be included.

Record the total balance sheet value of all investments included in the total investments (line 39) that are held outside of Canada in column 12.
Page 40.07  – Line 41  – Foreign Pay Securities

Investments in Canadian and foreign bonds, debentures, shares and other investments whose principal, interest, dividends or payments are denominated in a currency other than Canadian dollars.

Record the total balance sheet value of all investments included in total investments (line 39) that are in Canadian and foreign bonds, debentures, shares and other investments whose principal, interest, dividends or payments are denominated in a currency other than Canadian dollars.

Individual Holdings

This section is to be completed for all investments excluding direct obligations of, and that portion of obligations directly, explicitly, irrevocably and unconditionally guaranteed by:

   i) The Government of Canada;
   ii) A Canadian province or territory; or
   iii) A sovereign rated AA- or better or its central bank.

   – Lines 50 and 51  – Largest and Second-Largest Exposure to an Entity or Connected Group

Record the largest (and second-largest) exposure to an entity or a connected group of entities that is not a government grade investment.

The exposure is the sum of all loans to and investments in (including debt, equity and derivative securities) that entity or connected group of entities.

An entity is connected with another entity in respect of loans if any two of the following three conditions are or would be met:

   • The source of repayment of the loans would be wholly or substantially dependent on a common source of money.
   • The loans would be, in substance, a single loan or would substantially serve the same purpose in the same or a related transaction.
   • The loans would be dependent on the same security.
Pooled holdings are investments in a unit of a composite pool of investments. They include a company’s investments in mutual funds, segregated funds, mortgage-backed securities (MBS), and other similar securitized assets.

Investments in pooled holdings must be recorded on those lines that best describe the underlying assets of the pool. For example, a $100 investment in a mutual fund that in turn invests:

- 100% in bonds—20% short term and 80% long term—will be recorded as $20 on line 01 and $80 on line 02.
- 40% of its assets in long term bonds and 60% of its assets in common shares will be recorded as $40 on line 02 and $60 on line 15.

The investment objectives of the fund may be used as a proxy for determining the composition of the investments provided that the fund has a history of investing in accordance with its investment objective.

For entities whose primary regulator is Alberta, investments in pooled holdings must be recorded as common shares.

Record the largest (and second-largest) investment in any one or group of related mutual funds or other pooled holdings that is not a government grade investment. A fund or other pooled holding is related when the management or ownership of the pooled holding is common.
Pages 40.12 to 40.52 – Consolidated Investments

These pages apply to Canadian insurers only.

Insurers must:

- populate all subtotals and totals for each of these pages; and
- provide investment details to support subtotals either by inserting additional lines or embedding a file. Please refer to Section II for instructions on how to embed objects within the special Excel file.

For each investment category, the balance sheet value of the total investments should be reported in the columns based on their classification.

Refer to the MCT Guideline for a description of the ratings.

The “Where/By whom kept” in column 01 is the name of the trustee or the servicer.

The due dates for interest are the next payment date from the date of the statement.

Page 40.12 – Investments: Short-Term Investments (excluding bonds and debentures)

Include items such as but not limited to Treasury bills, commercial paper, short-term unsecured promissory notes issued by financial institutions and industrial corporations, interest-bearing deposits with a deposit-taking institution, bank deposit certificates, trust company guaranteed investment certificates.

| Short-Term Investments reported on line 99, columns 10 through 29 on page 40.12 | Equals | Short-Term Investments reported on line 01, columns 01 through 12 on page 40.07 |

The detailed holdings for non-government, short-term investments are listed within the applicable rating categories.

Short term investments that mature in one year or less are included on this page.
Page 40.22  – Investments: Bonds and Debentures

This represents holdings of Canadian government or government guaranteed bonds shown in total only on lines 09, 19 and 29.

Balances reported on lines 09, 19 and 29 of page 40.22 must be split by time to maturity and reported on lines 06, 02 and 05 on page 40.07.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The detailed holdings of foreign government bonds are to be listed on line 35. The country of the foreign bond should be clearly displayed within the description in column 02.

The detailed holdings for non-government bonds and debentures are listed within rating grades. Bonds and debentures that mature or can be repurchased by the issuing company in one year or less must be included in line 39 or 69. All others (including perpetual bonds) that mature in more than one year and less than five years must be included in line 49 or 79, and those that mature in more than five years in line 59 or 89.
Page 40.22 – Investments: Bonds and Debentures (cont’d)

The date of issue in column 06 should be the original issue date of the bond. It is not the date of acquisition.

Investments are split by maturity term into three categories: less than one year, greater than one year and less than or equal to five years, and greater than five years. As an investment nears its maturity date, it moves through the three categories.

Page 40.32 – Investments: Mortgage Loans

The amounts in columns 07 and 09 reflect the original amounts, not the latest values at renewal. The amount in column 08 reflects the current market value of the property.

Page 40.70 – Investment Properties

– Line 49 – Total Investment Properties

The split between investment properties and own-use properties as shown on this page reflects the balance sheet treatment under the applicable accounting standards.

Insurers should indicate in the description of the property which of the real estate items have been allocated between the two categories.

Properties should be listed in accordance with the province or country of location, with subtotals where applicable. The list should follow the alphabetical order of provinces and territories first, followed by countries other than Canada, where applicable.

Amounts shown in columns 04, 05 and 06 are gross (i.e. including encumbrances, which are shown separately on page 20.20, line 11).

- Column 07 – Balance Sheet Value - Vested in Trust

This column applies to foreign insurers only.
Page 40.80 – Other Loans and Invested Assets

Other loans and invested assets include, where permitted, broker loans, investments in non-financial investments including, but not limited to, precious metals, coins and art as well as positive marked-to-market derivative instruments and other recognized financial investments not included in other investment categories, such as letters of credit. This balance should tie to page 40.07, line 30.

When reporting broker loans, a detailed listing is required, either directly on the form or embedded within the special Excel file.

For all recognized financial instruments listed in other investments, additional information should be attached to the insurer’s Annual Return on each type and class of instrument held during the year and outstanding at year end, including the following:

- notional amount and remaining term to maturity;
- underlying assets;
- whether it is an over-the-counter or exchange traded instrument;
- whether the instrument is held for
  (i) trading purposes;
  (ii) hedging purposes; or
  (iii) other purposes; and
- the maximum credit risk exposure for each type of instrument.

The notional principal amount is:

- the stated notional amount, except where the stated notional amount is leveraged or enhanced by the structure of the transaction. In these cases, insurers must use the actual or effective notional amount when determining potential future exposure;
- nil, where the credit exposure on single currency floating/floating interest rate swaps would be evaluated solely on the basis of their marked-to-market value; or
- for contracts with multiple exchanges of principal, the sum of the remaining payments.

- Column 05 – Balance Sheet Value – Vested in Trust

This column applies to foreign insurers only.
Page 50.20 – Receivable from/Payable to Non-Associated Agents and Brokers

To be completed for direct written business only.

Information respecting agents and brokers whose accounts represent 10% or more of the total year-end amounts receivable/payable, or whose annual premium volume is 10% or more of total direct written premium, must be listed separately.

The number of non-associated agents and brokers reported must be the total of all agents and brokers (other than associates) that have written at least one policy during the fiscal year.

– Other Receivables

Only amounts that represent 10% or more of the total (line 89) need to be listed separately. Amounts representing less than 10% may be aggregated.

Page 50.32 – Intra-Group Transactions

Sections I to IV apply to Canadian insurers only.

The following instructions are applicable for Sections I through IV of this page.

Where there is greater than 10% ownership in joint ventures, all amounts must be reported in detail. Associated brokers as defined in the MCT Guideline should also be reported here.

For all interests in joint ventures (with greater than 10% ownership) consolidated within the MCT, non-qualifying subsidiaries and all associates, provide the information in the relevant sections.

- Column 01 – Name of Entity

Include the name of the entity.

- Column 04 – Description of Shares

Include a description of the:
- share (preferred/common, conversion/redemption rights);
- loan or advance (secured/subordinated, conversion/redemption rights, maturity); and
- receivable (insurance/reinsurance/trade).
Page 50.32 - Columns 06 to 14 – Interests/Loans Considered as Capital

Identify the initial cost of the shares at acquisition (column 12) and the current market value (column 14).

Section III:
Interests in common and preferred shares or loans/advances to joint ventures (with greater than 10% ownership), non-qualifying subsidiaries and all associates must be identified separately. The equity method will be used for valuing these interests in column 16. Column 18 reflects the difference between column 12 and column 16.

For loans and other debt instruments that are considered as capital, complete columns 14, 16 and 18 only.

- Column 08 – % Owned
Enter the percent of the total shares of the type being reported that the interest represents.

- Column 20 – Loans not Considered as Capital – Balance Sheet Value
For loans that are not considered as capital, complete columns 14, 18 and 20.

Page 50.32 - Section V - Columns 23 to 31 – Intra-group reinsurance transactions

For Line 42 the totals from Pages 70.50, columns 18, 20+22, 24, 26 and 28 should be included in columns 23, 25, 27, 29 and 31 respectively.

For Line 44, the totals from Page 70.60/70.61, line 09, columns 18, 20+22, 24, 26, 28 and 39 should be included in columns 23, 25, 27, 29, 31 and 33, respectively.

Page 50.32 - Section VI - Column 35 – Intra-group outsourcing

Enter the total of Line 09 from Column 05 on page 10.43 from the Annual Supplement. If there is a change of provider during the period, this change should be reflected in the total of the quarterly filing.
Page 50.32 - Section VII - Columns 40 and 42 – Intra-group transactions resulting in asset encumbrance

Enter the total of line 19 from column 05 on page 10.42 from the Annual Supplement. If there is a change of greater than 10 per cent during the period, this change should be reflected in the total of the quarterly filing.

In addition, any securities lending to related parties included in the amounts on page 10.42, lines 40 and 45 should be included in Section VII.

Page 50.40 - Receivable from/Payable to Subsidiaries, Associates & Joint Ventures

Refer to the definition of the term "associate" in “Section III – Definitions.”

For Canadian insurers, amounts receivable from/payable to non-qualifying subsidiaries, all associates and joint ventures (regardless of ownership level) arising out of insurance, reinsurance and any other activities must be shown for each company.

For foreign insurers, amounts receivable from/payable to associates arising out of insurance, reinsurance and any other activities must be shown for each company.

Pages 60.10 to 60.30 – Premiums and Claims

All companies are requested to follow the “Type of Use” guidance provided in chapter 5 of the “Automobile Statistical Data Reporting Requirements” – Automobile Statistical Plan Manual including underwriting information tracking.

Private passenger auto includes only the code classification specified in the General Insurance Statistical Agency (GISA) manual for private passenger auto excluding farmers.

Private passenger auto does not include the Facility Association Residual Market (FARM) business. This business is to be reported separately on lines 22, 23 and 24.

Classes of Insurance

For additional information on the classes of insurance, refer to “Section III - Definitions.”
Page 60.10  - Unearned Premiums

This page applies to all insurers licensed in the province of Quebec or Alberta.

  – Line 80 – Out of Canada Liabilities

This line applies to Canadian insurers only.

This line must include the out-of-Canada portion of unearned premiums which is included in line 89.

Page 60.20  – Column 21 – Number of Policies in Force

Each class (or sub-class) requires the number of policies, where coverage is provided, at year-end. Number of policies in force refers to direct policies issued by the insurer.

In some circumstances, the premium for one policy is allocated to sub-classes (i.e. automobile policies), or is allocated to different lines of business (i.e. commercial policies). In those instances, the policy-in-force count should include each sub-class or additional line of business where coverage is provided. The policy-in-force count will not be additive to the total line (line 89).

Example: Company with two policies in force—one automobile policy and one commercial lines policy.

– **Column 25 – Unearned Premiums from a Portfolio Transfer**

This column represents the unearned premium as at the date of a portfolio transfer that occurred in the current year.

**Page 60.30 – Claims and Adjustment Expenses – Paid, Current Year and Unpaid, Current and Prior Year**

The amounts shown must include both the internal and external claims adjustment expenses and a provision for IBNR.

– **Line 80 – Out of Canada Liabilities**

This line applies to Canadian insurers only.

This line must include the out-of-Canada portion of unpaid claims and adjustment expenses which are included in line 89.

– **Columns 05 and 06**

The salvage and subrogation recoverable amounts determined by the appointed actuary should be netted against gross unpaid claims and IBNR on page 20.20, line 13.

If specific contractual third-party obligations exist with respect to salvage and subrogation, the gross amount estimated to be recoverable from third parties and included on page 60.30 in columns 05 and 06 must be reported on a discounted basis.
Page 60.30 – Column 07 – Reinsurance Ceded

This column must include the portion of salvage and subrogation estimated to be recoverable from third parties that will be payable to reinsurers in accordance with their agreements (see summary and the following example).

**Reporting salvage and subrogation – summary:**

<table>

Page 60.30 – Column 09 – Net Provision at Prior Year End

<table>
<thead>
<tr>
<th>Net provision at prior year end</th>
<th>Equals</th>
<th>Total unpaid claims (claims, adjustment expenses), net of reinsurance, as reported for the prior year (line 51, column 12, page 60.41 or page 60.40)</th>
<th>Plus</th>
<th>Total unpaid claims (IBNR), net of reinsurance, as reported for the prior year (line 52, column 12, Page 60.41, or page 60.40)</th>
</tr>
</thead>
</table>

- Column 11 – Net Provisions for Portfolio Acquisition/Disposition at Transaction Date

When an acquisition / disposition of portfolio occurred during the current year, you must indicate in this column the net provisions at the date on which the acquisition / disposition took place on claims that occurred during prior years.

- Column 13 – Investment Income on Unpaid Claims of Prior Years (to be completed by insurers reporting unpaid claims on a discounted basis)

Amounts reported in this column are equal to the product obtained by multiplying the average for the year of net unpaid claims and adjustment expenses of prior years (the average of columns 09 and 15) times the investment yield (page 10.60, line 46(1)).

If the following formula applies:

\[(A+B+C+D-E-F) > \text{average total investments} \]

\[(\text{page 20.10, sum of lines 01, 02 and 19)}\]

where:

- \(A\) = the average net\(^{(2)}\) unpaid claims and adjustment expenses for the year
- \(B\) = the average net\(^{(2)}\) unearned premiums for the year
- \(C\) = the average unearned commissions for the year
- \(D\) = the average premium deficiency for the year
- \(E\) = the average deferred policy acquisition expenses for the year, and
- \(F\) = the average receivables from agents and brokers, policyholders and instalment premiums for the year.

Then the investment yield should first be multiplied by the following ratio:

\[
\frac{\text{Average total investments}}{A+B+C+D-E-F}
\]

(1) Insurers may select a different methodology/investment yield than this default (e.g. companies allocating specific assets to their liabilities or with a material amount of investment income from the Facility Association).

(2) Net of reinsurance and salvage and subrogation.
**Page 60.30** – Column 15 – Net Provision at Period End for Claims of Prior Years

This column must include the total unpaid claims and adjustment expenses, net of reinsurance, determined at the end of the current period, for all prior accident years.

**Page 60.40** – Net Claims and Adjustment Expenses – Run-off *(to be completed on an undiscounted basis)*

The excess or deficiency in the unpaid claims must be calculated at each prior year end.

Amounts shown on lines 50 to 59 must be taken from the insurer’s claims records for the current year, and allocated by loss year. Lines 01 to 49 must be completed on the basis of the figures reported in the prior years, unless there has been a prior-period adjustment. The prior-period adjustments must be allocated to the proper loss year.

Beginning with the December 31, 2016 filing, the “Portfolio acquisition/disposition” lines will need to be completed gradually. At December 31, 2016 only line 45 will need to be completed. At December 31, 2017 both line 45 and line 35 will need to be completed and so on each year until all of lines 05, 15, 25, 35 and 45 are completed for the December 2020 filing and each year thereafter.

IBNR claims must include their related adjustment expenses allocated to each of the years included in the run-off.

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Page 60.41**  – Net Claims and Adjustment Expenses – Run-off - Discounted  
*(to be completed by insurers reporting unpaid claims on a discounted basis)*

Amounts shown on lines 50 to 53 must be taken from the insurer’s claims records for the current year, and allocated by loss year. Lines 01 to 49 must be completed on the basis of the figures reported in the prior years, where applicable, unless there has been a prior-period adjustment. The prior-period adjustments must be allocated to the proper loss year.

Beginning with the December 31, 2016 filing, the “Portfolio acquisition/disposition” lines will need to be completed gradually. At December 31, 2016 only line 45 will need to be completed. At December 31, 2017 both line 45 and line 35 will need to be completed and so on each year until all of lines 05, 15, 25, 35 and 45 are completed for the December 2020 filing and each year thereafter.

IBNR claims must include their related adjustment expenses allocated to each of the years included in the run-off.

Refer to page 60.40 for instructions related to excess (or deficiency) ratio.

– Lines 13, 23, 33, 43 and 53 – Investment Income from Unpaid Claims and Adjustment Expenses (including IBNR)

Report the product obtained by multiplying the average net\(^{(1)}\) unpaid claims and adjustment expenses (including IBNR) for the year times the investment yield selected for the particular calendar year. For the current reporting year, the sum of all prior accident years’ investment income allocation on exhibit 60.41, column 10, line 53 must equal the investment income allocated to prior years’ claims for the year on exhibit 60.30, column 13, line 89. (Refer also to the instructions for page 60.30, column 13, where applicable.)

\(\text{(1) Net of reinsurance and salvage and subrogation.}\)

**Page 60.50**  – Direct Adjustment Expenses

– Line 01 – Internal Adjustment Expenses

These are the paid expense amounts allocated to a claim file.
Pages 67.10 to 67.31 – Provincial and Territorial Exhibits

Distribution of premiums and claims by province and out of Canada is based on location of risks.

Refer to pages 60.10 to 60.30 for further guidance.

Classes of Insurance

For additional information on the classes of insurance, refer to “Section III - Definitions.”

Pages 67.10 to 67.31 – Provincial and Territorial Exhibits (cont’d)

Insurers Licensed in the Province of Quebec

– Lines 04, 05 and 33 – (column 05)

Insurers licensed in the province of Quebec must not include any amount on lines 04, 05 and 33.

According to the Regulation under the Act respecting insurance (chapter A-32, r. 1), “property insurance” and “boiler and machinery insurance” are defined as follows:

17. Insurance in the “property insurance” class is insurance whereby the insurer undertakes to indemnify the insured against loss of or damage to property, to the extent that the insurance does not cover property that is more specifically covered by another class of insurance.

18. Insurance in the “boiler and machinery insurance” class is insurance providing one or more of the following protections:

(1) Insurance whereby the insurer undertakes to indemnify the insured against material loss or damage sustained by the insured by reason of the explosion or rupture of a boiler or any other pressure vessel, including any mechanism, component or accessory incidental to its operation, or material loss or damage resulting from an accident in the course of its operation.

However, sub-categories disclosed on lines 04, 05 and 33 do not exist in Quebec. Insurers are required to include these protections in the class of insurance that represent the nature of the insurance contract.
Page 67.10  – Provincial and Territorial Exhibit of Premiums Written

   – Line 01  – Licensed (Y/N)

Insurers must answer “Yes” or “No” in each of columns 01-14, based on whether or not the insurer was licensed in the applicable jurisdiction as at the end of the year of the Annual Return.

   – Line 99  – Dividends - Direct

Dividends must be reported on a direct-incurred basis.

Page 67.31  – Provincial and Territorial Exhibit of Claims Incurred Including Adjustment Expenses – Undiscounted

Incurred loss data is to be entered in columns 01 through 18 by line of business, by province and territory.

Page 70.10  – Premiums and Claims – Reinsurance Ceded

Report premiums earned and claims incurred by type of reinsurance arrangement and by line of business.

The amount of total premiums earned reported on line 89, column 06 must be equal to the total premiums ceded to reinsurers plus or minus the change in reinsurance ceded unearned premiums for the year.

Page 70.21  – Summary of Intragroup Reinsurance

This page is designed to collect information on an assumed and ceded basis related to business that is pooled among related entities who are a party to a pooling business. Institutions are to include registered and unregistered related insurers with whom they have reinsurance pooling or participation arrangements.
Pages 70.50, 70.60 and 70.61 – Reinsurance Ceded Summary (Registered/Unregistered Reinsurance)

- Column 01 – Name of Assuming Insurer

The complete legal name of the reinsurer to which the insurer has a counterparty exposure. The counterparty name should be reported exactly as per the signed contract.

- Columns 02,04,06,08 – Rating agency identifier code

The unique rating agency identifier used by AM Best, S&P or other rating agencies

Enter for all rating agencies that rate the assuming insurer.

If unrated enter “1” in column 8

- Column 10 – Reinsurer domicile

The domicile where the reinsurer counterparty is legally incorporated

Use the 2 letter International Standard country codes defined in ISO 3166 (International Organization for Standardization).

- Column 12 - Reinsurer Group Domiciliary Jurisdiction

The domicile where the ultimate incorporated insurance group owning the reinsurer counterparty is legally incorporated. If the counterparty does not belong to a group, leave this column blank.

Use the 2 letter International Standard country codes defined in ISO 3166 (International Organization for Standardization).

- Column 14 – Business covered

Underlying class of insurance risk ceded. E.g. Property, Auto, Surety etc.

For reinsurers completing this column, Out of Canada business should be classified as Out of Canada.
Pages 70.50, 70.60 and 70.61 - Column 16 – Type of contract

Type of reinsurance contract using the following two letter codes:
- FA – Facultative
- XS – Excess of loss
- QS – Quota share
- SU – Surplus
- SL – Stop loss

- Column 20 - Unearned Premiums ceded to assuming insurer

The reinsurer’s portion of unearned premiums must be reported on this line. Represents the unexpired portion of premiums ceded and is a balance sheet item.

- Column 22 - Outstanding losses recoverable from assuming insurer

Reinsurance recoverables on unpaid losses and loss adjustment expenses equivalent to amount reported on balance sheet page 20.10, line 31, column 01.

Amount reported on page 20.10, line 31, column 01 includes the total of amounts reported on pages 70.50, 70.60 and 70.61 for registered and unregistered reinsurance ceded.

Includes claims that have been reported but not settled and claims that have been incurred but not reported including loss adjustment expenses that will be recovered from reinsurers

Column 24 - Reinsurance Receivable

Include all receivables on paid losses and paid loss adjustment expenses except for “Outstanding losses recoverable from assuming insurer” recorded in column 22.

Receivables must be reported net of allowance for doubtful accounts
Pages 70.50, 70.60 and 70.61 - Column 26 - Reinsurance Payable

Include funds, other than those for collateral purposes (which should be recorded under column 36 Funds Held), held in the insurer’s bank account; these funds must also be reported on the Balance Sheet.

Amounts payable to assuming reinsurers may be deducted from amounts receivable and recoverable in the calculations in columns 42 and 44 only where there is a legal and contractual right of offset.

Insurers are not to include any amounts payable to assuming insurers that are associates or non-qualifying subsidiaries.

- Column 30 – Aging of Reinsurance Asset

Report amount of Reinsurance Receivable (from column 24) Overdue >90 days plus the reinsurance recoverable on paid losses and loss adjustment expenses, that are not in formal dispute resolution by reason of notification, arbitration or other mechanism under the contract, and remain uncollected > 90 days. A paid loss and paid loss adjustment expense recoverable is due pursuant to original contract terms

Where the reinsurance agreement specifies or provides for determination of a date at which claims are to be paid by the reinsurer, the aging period shall commence from that date

Where the reinsurance agreement does not specify a date for payment by the reinsurer, but does specify or provide for determination of a date at which claims are to be presented to the reinsurer for payment, the aging period shall commence from that date

Reinsurance recoverable on paid losses excludes:

- IBNR loss reserves
- Unearned premiums
- Contingent commissions
- Unpaid case reserves
- Paid losses in formal dispute resolution under the reinsurance contract
Pages 70.60 and 70.61 – Reinsurance Ceded Summary: Unregistered Reinsurance

Page 70.60 should be completed by Canadian insurers only.

Page 70.61 should be completed by foreign insurers only.

- Columns 32 to 38 – Reinsurance Collateral

Only non-owned deposits that are held in a RSA are to be included in column 32. Other acceptable non-owned deposits held outside an RSA are to be reported in column 34.

Deposits of reinsurers that are not owned by an insurer shown in columns 32, 34 and 38 are not to be reported on the balance sheet.

Non-owned deposits held on behalf of an unregistered assuming insurer must be valued at market value as at the end of the reporting period, including the amount of investment income due and accrued respecting these deposits.

For federally regulated insurers:

Non-owned deposits can be reported in column 32 only where a valid and enforceable security interest has been obtained through the establishment of a reinsurance security agreement (RSA) in respect of the unregistered reinsurance.

Non-owned deposits held as security from unregistered assuming insurers are subject to a capital charge, which must be reported as capital required for Counterparty Default Risk for Unregistered Reinsurance Collateral and SIRs on page 30.61, line 44.

Refer to OSFI’s Guidance for Reinsurance Security Agreement and the MCT Guideline for more details.

For provincially incorporated insurers where the reinsurance security agreement (RSA) regime does not apply:

Complete only in cases where a special trust account under the control of the primary regulator has been established with a Canadian trust company in respect of the unregistered reinsurance under a trust agreement prescribed by the regulator.
Pages 70.60 and 70.61 - Column 36 – Reinsurance Collateral – Funds Held

Reinsurance premiums withheld by the ceding company as specified in the reinsurance contract (for example, funds held equal to the unearned premiums and loss reserves), or advances from the reinsurer to the ceding company for the payment of losses.

- Column 38 – Reinsurance Collateral – Letters of Credit

For additional information on LOCs, refer to “Section V - Jurisdictional Requirements.”

LOCs held as security from unregistered assuming insurers are subject to a margin requirement, which must be reported as Counterparty Default Risk for Off-Balance Sheet Exposures of margin required for structured settlements, letters of credit, derivatives and other exposures on page 30.61, line 44.

P&C insurers should refer to General Guidelines for Use of Letters of Credit available on OSFI’s website.

– Column 42 – Recoverables in excess of Acceptable Collateral

The total number reported on line 29, column 42 is a deduction from capital available and is to be reported on page 30.62, line 36, for Canadian insurers and page 30.92, line 63 for foreign insurers.

– Column 46 – Margin Required

The total number reported on line 29, column 46 is to be reported on page 30.61, line 26.

Pages 70.62 and 70.63 – Reinsurance Ceded Summary: Unregistered Reinsurance
(Transition period until December 31, 2022 for Policy Liabilities Ceded on or before December 31, 2019)

The transition period applies to policy liabilities ceded on or before December 31, 2019 and any associated new claims or development on incurred claims until December 31, 2022, the end of the transition period.

Page 70.62 should be completed by Canadian insurers only.

Page 70.63 should be completed by foreign insurers only.

See instructions for pages 70.60 and 70.61.
Page 70.90 – Reinsurance Interrogatories

– Line 01 – Changes in Reinsurance Arrangements

“Significant changes” would include items such as:

- a change in the type of reinsurance (for example, from proportional to excess of loss);
- a change in the make-up of reinsurers (for example, from registered to unregistered);
- a change in the level of protection provided by reinsurance (for example, a change in surplus lines, a change in catastrophe cover, reinsurance not placed or layers not covered);
- a change in reinstatement provisions; and
- any other change that could affect the insurer’s overall financial condition.

– Line 02 – Portfolio Transfer or Commutation of Treaty

Insurers are required to provide details of each balance sheet and statement of income item and amounts involved, as of the date of the transaction. The details should be embedded into the special Excel file. The detail provided should include the type of portfolio transfer as well as the actual transfer date.

The unearned premium amounts related to the portfolio transfer or commutation of treaty must be reflected on page 60.20 by class of insurance.

– Lines 03, 04 and 05

Questions 03, 04 and 05 provide an outline of the insurer’s catastrophe reinsurance program. Insurers should provide details based on the program that is in place at the filing date.

– Line 03 – Upper Limit of Catastrophe Program

Upper limit or total limit of the catastrophe program reflects the amount above which there is no reinsurance protection, e.g. catastrophe coverage of $350 million excess of $20 million would have an upper limit of $370 million.

– Line 04 – Attachment Point for Catastrophe Coverage

The attachment point is the amount that is retained before catastrophe coverage applies to the first loss.
Page 70.90 – Line 05 – Amount of Retention within the Catastrophe Coverage Layers

The retention within the catastrophe coverage refers to any portion of the program that is not 100% placed above the attachment point.

– Line 06 – Gross Estimated Catastrophe Exposure

The gross estimated catastrophe exposure, net of any non-catastrophe coverage, is considered to be the higher of a single catastrophic event within the 95th- to 99th-percentile range or the reserving probable maximum loss (PML) for earthquake as described in the Earthquake Exposure Data Form in accordance with OSFI’s Guideline B9 - Earthquake Exposure Sound Practices and AMF’s Earthquake Exposure risk management guideline.

– Line 07 – Net Retained Loss

The net retained loss considers the attachment point for the catastrophe program and any retention within the identified gross estimated catastrophe exposure as defined in line 06.

– Line 08 – Catastrophe Coverage(s) Reinstatement Cost

This question identifies the full cost of a catastrophe to the insurer. Insurers should provide details based on the program and policies in place at the time of filing.

Based on the gross estimated catastrophe exposure defined in line 06, insurers should indicate their reinstatement cost for a full year under their catastrophe reinsurance programs.

The reinstatement cost would be based on the catastrophe coverage(s) that would be impacted within the identified catastrophe exposure.

– Line 09 – Catastrophe Program Specific to Canadian Operations

A catastrophe program that is specific to the Canadian operations would provide coverage only for the Canadian insurer(s). The yes/no response should be based on the program in place at the time of filing.
Page 70.90 - Summary of non-traditional methods of risk mitigation issued or purchased by insurer or parent for in Canada risk

All amounts should be reported in $'000 Canadian Dollars.

- Columns 03 and 05 – Insurer

This would consider all non-traditional reinsurance (ILS) contracts specific to the Canadian company or branch for in Canada risk.

- Columns 07 and 09 - Parent/Home Office

This would consider all non-traditional reinsurance (ILS) contracts specific to the parent or home office covering in Canada risk.

Page 80.10 – Commissions

Insurers are required to calculate and report separately deferred commissions and unearned commissions for the classes of insurance listed on this page. Net commissions attributable to the year must also be reported for these classes.

Deferred commissions must include commissions paid on direct business and on reinsurance assumed.

Unearned commissions arise from commission revenue on reinsurance ceded.

All commissions, including contingent and other non-deferrable commissions, must be shown on this page. Non-deferrable commissions are those that cannot be readily identified as exclusively relating to and varying with the acquisition of premiums and therefore are not recoverable.

All commissions in respect of individual non-cancellable accident and sickness policies and any renewal commission in respect of other accident and sickness policies must be reported as other non-deferrable commissions.
Page 80.20 – Expenses – Insurance Operations

This exhibit should be completed on an incurred basis for all expenses including internal adjustment expenses.

Insurers should analyse their operations to identify all operating expenses that are allocable to the acquisition of business. Accordingly, acquisition expenses (as defined in “Section III - Definitions”) that are deferred at the end of the year are to be reported in column 01; acquisition expenses that are not deferred or are attributable to the current year, including deferrals of the previous year, are to be reported in column 02.

Expenses that are not allocated to the acquisition of business (excluding adjustment and investment expenses) are to be reported in column 04.

– Column 06 – Internal Adjustment Expenses

Inurred internal adjustment expenses include the change in provisions.

The following definitions and examples of expense items refer to the expenses to be reported on page 80.20.

– Line 54 – Agency (Excluding Commission)

Includes:

- payments for agents’ licences and signs;
- expense of training agents;
- cost of promotional material, souvenirs, etc., in agent’s name only;
- expense of seminars, conventions and meetings for agents;
- allowances, reimbursements and payments for expenses to agents, brokers and producers other than company personnel and not computed as a percentage of premiums.

– Line 60 – Management Fees

Includes:
- services provided by outside related or non-related management corporations or agencies.
Page 80.20 – Line 70 – Occupancy

Includes:
- furniture and equipment;
- insurance, occupancy;
- postage/courier;
- printing and stationery;
- telephone and other communication costs.

– Line 78 – Home Office Overhead

Includes:
- overhead charges levied by the head office of the parent corporation.

– Line 80 – Allowance

Includes:
- allowance for doubtful accounts.

– Line 82 – Regulatory Assessments

Includes:
- statutory assessments by regulators, including regular, special and insolvency assessments by the Property and Casualty Insurance Compensation Corporation (PACICC).

– Line 88 – Other Expenses

Includes:
- any expenses not included above.

Page 90.15 - Out of Canada Operations

This page applies to Canadian insurers only.
Pages 92.10 to 95.20 – Non-consolidated Financial Statements and Schedules

These pages apply to Canadian insurers only.

Insurers are required to fill out these schedules on a non-consolidated basis in accordance with applicable accounting standards and return instructions, with the exception of life insurance subsidiaries, which should be accounted for using the equity method.

The table below references the applicable instructions for the following return pages:

Pages 85.40, 85.45, 85.60 and 85.65 – Insurers Licensed in Quebec (Based on Location of Risk)

These pages apply to foreign insurers licensed in the province of Quebec only.

Pages 85.40, 85.45, 85.60 and 85.65 have been produced by the Autorité des marchés financiers (“AMF”) further to amendments to Part XIII of the Insurance Companies Act, S.C. 1991, c. 47 (“ICA”), which came into force on January 1, 2010.

As a result of the amendments to the Canadian regulatory framework, foreign insurers must now report only risks insured in Canada in their P&C return. Under Part XIII of the ICA, reporting of regulatory data on a foreign entity’s operations must now be based on the location of the entity’s insurance business rather than the location of risks insured.

The AMF’s supervision of your activities in Québec is based on the definition of “insurer” under section 1(a) of An Act respecting insurance, CQLR, c. A-321 (the “Act”). This definition has not been modified. Therefore, the amendments to the ICA do not affect the obligation of foreign entities to comply with provincial requirements.

Section 269 of the Act stipulates that every insurer must maintain adequate assets to guarantee the performance of its obligations in Québec. These pages are intended to ensure compliance with that requirement. They must therefore be completed by all foreign insurers licensed in Québec based on location of risk, and should thus include financial data on all risks located in Quebec, whether insured within or outside Canada. All risks located outside Quebec should therefore be excluded.

---

1 The Act is available on the AMF website at the following address: http://www.lautorite.qc.ca/en/laws-insurance-deposit-institution-pro.html
Page 85.40 - Provincial and Territorial Exhibit of Premiums Written

- Column 05 - Quebec

Include risks located in Quebec that have been insured in Canada.

- Column 18 - Out of Canada

Include risks located in Quebec that have been insured outside Canada.

- Line 99 – Dividends - Direct

Dividends must be reported on a direct incurred basis.

Page 85.45 – Premiums Written (policies with a term of more than 12 months)

Complete page 85.45 if insurer has written, during the current year or in a prior year, policies for a term of more than 12 months. The data reported on page 85.45 must include:

- for policies for a term not exceeding 12 months: total premiums for policies written during the current year;
- for policies for a term of more than 12 months: only the portion of premiums applicable to the twelve months during the current year;

- Column 05 - Quebec

Include risks located in Quebec that have been insured in Canada.
Page 85.45 - Column 18 - Out of Canada

Include risks located in Quebec that have been insured outside Canada.

Page 85.60 - Provincial and Territorial Exhibit of claims incurred including adjustment expenses

- Column 05 - Quebec

Include risks located in Quebec that have been insured in Canada.

- Column 18 - Out of Canada

Include risks located in Quebec that have been insured outside Canada.

Page 85.65 - Risks located in Quebec – Insured outside Canada

- Columns 01, 02, 03, 04 and 05

Refer to the instructions for page 60.10.

- Columns 06, 07, 08, 09 and 10

Refer to the instructions for page 60.30.

Page 99.10 – Canadian Affidavit Verifying Annual Supplement Return

Insurers should refer to “Section V - Jurisdictional Requirements.”

Each filed copy of page 99.10 must bear the original signature of everyone who is required to sign and kept within company records. Please refer to Section II for instructions on how to embed objects within the special Excel file.
Pages 99.11 and 99.15 – Foreign Affidavits Verifying Annual Supplement Return

The affidavit on page 99.11 is to be signed by the insurer's Canadian Chief Agent.

The affidavit on page 99.15 is to be signed by the President/Chief Executive Officer of the company and filed with the P&C return; if it is not possible for the affidavit to be filed with the P&C return, it must be filed within 30 days of the date that the P&C return is due.

Each filed copy of pages 99.11 and 99.15 must bear the original signature of everyone who is required to sign and kept within company records. Please refer to Section II for instructions on how to embed objects within the special Excel file.

Where an affidavit makes reference to the company’s insurance business in Canada, the word “business” refers to an activity carried on in Canada and is not limited to risks located in Canada. For a discussion of which risks are considered insured in Canada, and therefore form part of the company’s insurance business in Canada, please consult Advisory 2007-01-R1, Insurance in Canada of Risks, available on OSFI’s website.

Page 99.16 - Certification

Each filed copy of the certification must bear the original signature of everyone who is required to sign and kept within company records.

1100 Introduction

1110 Application

.01 These Standards of Practice apply to actuarial work in Canada. Responsibility for these Standards of Practice vests in the Actuarial Standards Board (Canada) and approval of standards and changes to standards are made through a process that includes consultation with the actuarial profession and other interested parties. They are intended for the benefit of the public. The work in Canada of a member of a professional actuarial organization is expected to conform to these Standards of Practice.

.02 The existence of standards is not a substitute for professional judgment or consideration for the needs of the user(s) when performing specific work.

.03 The authority of these Standards of Practice derives from the powers of those bodies that recognize them for actuarial work in Canada. Among others, these include professional actuarial bodies and relevant laws such as those regulating pensions and insurance. Compliance with these Standards of Practice is also likely to be taken into account when the quality of actuarial work is being considered in a court of law or in other contested situations. However, in such circumstances, deviation from any provision of these Standards of Practice should not, in and of itself, be presumed to be malpractice.

1120 Definitions

.01 Each term set over dotted underlining has the meaning given in this subsection. A term that is not set over dotted underlining has its ordinary meaning.

.02 Accepted actuarial practice is the manner of performing work in accordance with these Standards of Practice. Unless the context requires otherwise, it refers to work in Canada. [pratique actuarielle reconnue]

.03 Actuarial cost method is a method to allocate the present value of a benefit plan’s obligations to time periods, usually in the form of a service cost and an accrued liability. [méthode d’évaluation actuarielle]

.04 Actuarial evidence work is work where the actuary provides an expert opinion with respect to any area of actuarial practice in the context of an actual or anticipated dispute resolution proceeding, where such expert opinion is expected or required to be independent. A dispute resolution proceeding may be a court or court-related process, a tribunal, a mediation, an arbitration, or a similar proceeding. Actuarial evidence work may include the determination of capitalized values in respect of an individual, or the provision of an expert opinion with respect to a dispute involving an actuarial practice area, such as pensions or insurance, or questions of professional negligence. [travail d’expertise devant les tribunaux]
Standards of Practice

.05 Actuarial present value method is a method to calculate the lump sum equivalent at a specified date of amounts payable or receivable at other dates as the aggregate of the present values of each of those amounts at the specified date, and taking into account both the time value of money and, where appropriate, contingent events. [méthode de la valeur présente actuarielle]

.06 Actuary, as it is used in these standards, means a member of a professional actuarial organization whose work in Canada is expected to conform to these standards. [actuaire]

.07 Anti-selection is the tendency of one party in a relationship to exercise options to the detriment of another party when it is to the first party’s advantage to do so. [antisélection]

.08 Appointed actuary of an entity is an actuary formally appointed, pursuant to legislation, by the entity to monitor the financial condition of that entity. [actuaire désigné]

.09 Appropriate engagement is one that does not impair the actuary’s ability to conform to the precepts of ethical and professional conduct such as those that may be found in the Rules of Professional Conduct of the Canadian Institute of Actuaries or relevant law or regulation. Unless the context otherwise requires, wherever the word “engagement” is used in these standards it refers to an appropriate engagement. [mandat approprié]

.10 Automatic balancing mechanisms automatically adjust contributions, benefits, and/or parameters of a plan in order to restore the balance between its source of financing and its benefits. The mechanism is prescribed by a set of predetermined measures to be taken, either immediately or later as prescribed, upon being triggered by certain demographic, economic, or financial indicators. [mécanismes automatiques de compensation]

.11 Benefits liabilities are the liabilities of a plan in respect of claims incurred on or before a calculation date. [obligations liées aux prestations]

.12 Best estimate means without bias. [meilleure estimation]

.13 Calculation date is the effective date of a calculation; e.g., the calculation date in the case of a valuation for financial statements. It usually differs from the report date. [date de calcul]

.14 Case estimate at a calculation date is the unpaid amount of one of, or a group of, an insurer’s reported claims (perhaps including the amount of claim adjustment expenses), as estimated by a claims professional according to the information available at that date. [évaluation du dossier]

.15 Claim adjustment expenses are internal and external expenses in connection with settlement and administration of claims. [frais de règlement des sinistres]

.16 Claim liabilities are the portion of insurance contract liabilities in respect of claims incurred on or before the calculation date. [passif des sinistres]
.17 Contingent event is an event that may or may not happen, or that may happen in more than one way or that may happen at different times. [événement]

.18 Contribution is a contribution by a participating employer or a plan member to fund a benefit plan. [cotisation]

.19 Contribution principle is a principle of policyholder dividend determination whereby the amount deemed to be available for distribution to policyholders by the directors of a company is divided among policies in the same proportion as policies are considered to have contributed to that amount. [principe de contribution]

.20 Credibility is a measure of the predictive value attached to an estimate based on a particular body of data. [crédibilité]

.21 Credit spread, for a fixed-income asset, is the yield to maturity on that asset minus the yield to maturity on a risk-free fixed income asset with the same cash flow characteristics. [écart de crédit]

.22 Definitive refers to a matter that is final and permanent rather than tentative, provisional, or unsettled. [décision définitive]

.23 Development of data with respect to a given coverage period is the change in the value of those data from one calculation date to a later date. [matérialisation]

.24 Explanatory text is text that appears outside of a box in these standards. [texte explicatif]

.25 External user is a user other than the actuary’s client or employer. Internal user and external user are mutually exclusive. [utilisateur externe]

.26 External user report is a report whose users include an external user. [rapport destiné à un utilisateur externe]

.27 Financial condition of an entity at a date refers to its prospective ability at that date to meet its future obligations, especially obligations to policy owners, members, and those to whom it owes benefits. Financial condition is sometimes called “future financial condition”. [santé financière]

.28 Financial position of an entity at a date is its financial state as reflected by the amount, nature, and composition of its assets, liabilities, and equity at that date. [situation financière]

.29 To fund a plan is to dedicate assets to its future benefits and expenses. Similarly for “funded” and “funding”. [provisionner]
.30 **Funded status** is the difference between the value of assets and the actuarial present value of benefits allocated to periods up to the calculation date by the actuarial cost method, based on a valuation of a pension plan, post-employment benefit plan, or social security program.

[niveau de provisionnement]

.31 **Going concern valuation** is a valuation that assumes that the entity to which the valuation applies continues indefinitely beyond the calculation date. [évaluation en continuité]

.32 **Indexed benefit** is a benefit whose amount depends on the movement of an index such as the consumer price index. [prestation indexée]

.33 **Indicated rate** is the best estimate of the premium required to provide for the corresponding expected claims costs, expenses, and provision for profit. [taux indiqué]

.34 **Insurance contract** is a contract under which one party (the insurer) accepts significant insurance risk from another party (the policyholder) by agreeing to compensate the policyholder if a specified uncertain future event (the insured event) adversely affects the policyholder. Insurance contract includes group insurance, third-party contracts where the owner of the contract and the person who is compensated (the policyholder) differ, and all like arrangements substantively in the nature of insurance. [contrat d’assurance]

.35 **Insurance contract liabilities** in an insurer’s statement of financial position are the liabilities at the date of the statement of financial position on account of the insurer’s insurance contracts, including commitments, that are in force at that date or that were in force before that date. [passif des contrats d’assurance]

.36 **Insurer** is the party that has an obligation under an insurance contract to compensate a policyholder if an insured event occurs. Insurer includes a fraternal benefit society and the Canadian branch of a foreign insurer, but does not include a public personal injury compensation plan or a post-employment benefit plan1. [assureur]

.37 **Internal user** is the actuary’s client or employer. Internal user and external user are mutually exclusive. [utilisateur interne]

.38 **Internal user report** is a report all of whose users are internal users. [rapport destiné à un utilisateur interne]

.39 **Margin for adverse deviations** is the difference between the assumption for a calculation and the corresponding best estimate assumption. [marge pour écarts défavorables]

---

1 The wording of this definition is identical to the corresponding definition appearing in IFRS 4 appendix A, as of November 2009.
.40 Model is a practical representation of relationships among entities or events using statistical, financial, economic, or mathematical concepts. A model uses methods, assumptions, and data that simplify a more complex system and produces results that are intended to provide useful information on that system. A model is composed of a model specification, a model implementation, and one or more model runs. Similarly for “to model”. [modèle]

.41 Model implementation is one or more systems developed to perform the calculations for a model specification. For this purpose “systems” include computer programs, spreadsheets, and database programs. [implémentation du modèle]

.42 Model risk is the risk that, due to flaws or limitations in the model or in its use, the actuary or a user of the results of the model will draw an inappropriate conclusion from those results. [risque de modélisation]

.43 Model run is a set of inputs and the corresponding results produced by a model implementation. [exécution d’un modèle]

.44 Model specification is the description of the components of a model and the interrelationship of those components with each other, including the types of data, assumptions, methods, entities, and events. [spécifications du modèle]

.45 New standards means new standards, or amendment or rescission of existing standards. [nouvelles normes]

.46 Periodic report is a report that is repeated at regular intervals. [rapport périodique]

.47 Plan administrator is the person or entity with overall responsibility for the operation of a benefit plan. [administrateur d’un régime]

.48 Policy liabilities in an insurer’s statement of financial position are the liabilities at the date of the statement of financial position on account of the insurer’s policies, including commitments, that are in force at that date or that were in force before that date. Policy liabilities consist of insurance contract liabilities and liabilities for policy contracts other than insurance contracts. [passif des polices]

.49 Policyholder is a party that has a right to compensation under an insurance contract if an insured event occurs¹. [titulaire de police]

¹ The wording of this definition is identical to the corresponding definition appearing in IFRS 4 appendix A, as of November 2009.
Standards of Practice

.50 **Premium liabilities** are the portions of insurance contract liabilities that are not claim liabilities. [passif des primes]

.51 **Prescribed** means prescribed by these standards. [prescrit]

.52 **Property and casualty insurance** is insurance that insures individuals or legal persons

- Having an interest in tangible or intangible property, for costs arising from loss of or damage to such property (e.g., fire, fidelity, marine hull, warranty, credit, legal expense, and title insurance); or
- For damages to others or costs arising from the actions of such persons (e.g., liability and surety bonds) and for costs arising from injury to such persons (e.g., automobile accident benefits insurance). [assurances IARD]

.53 **Provision for adverse deviations** is the difference between the actual result of a calculation and the corresponding result using best estimate assumptions. [provision pour écarts défavorables]

.54 **Public personal injury compensation plan** means a public plan

- Whose primary purpose is to provide benefits and compensation for personal injuries;
- Whose mandate may include health and safety objectives and other objectives ancillary to the provision of benefits and compensation for personal injuries; and
- That has no other substantive commitments.

The benefits and compensation provided under such public plans are defined by statute. In addition, such public plans have monopoly powers, require compulsory coverage except for those groups excepted by legislation or regulation, and have the authority to set assessment rates or premiums. [régime public d'assurance pour préjudices corporels]

.55 **Recommendation** means text that appears in a box in these standards. Similarly for “recommend”. [recommandation]

.56 **Reinsurance recoverables** in an insurer’s statement of financial position are the assets at the calculation date on account of reinsurance treaties, including commitments, that are in force at that date or that were in force before that date. [ sommes à recouvrer auprès des réassureurs]

.57 **Related experience** includes premiums, claims, exposures, expenses, and other relevant data for events analogous to the insured events under consideration other than the subject experience and may include established rate levels or rate differentials or external data. [expérience connexe]

.58 **Report** is an actuary’s oral or written communication to users about his or her work. Similarly for “to report”. [rapport]
.59 **Report date** is the date the actuary specifies as such in the report. It usually differs from the calculation date. [date du rapport]

.60 **Scenario** is a set of consistent assumptions. [scénario]

.61 **Service cost** is that portion of the present value of a plan’s obligations that an actuarial cost method allocates to a time period, excluding any amount for that period in respect of unfunded accrued liabilities. [cotisation d’exercice]

.62 **Social security program** means a program with all the following attributes regardless of how it is financed and administered:

- Coverage is of a broad segment, or all, of the population, often on a compulsory or automatic basis;
- Benefits are provided to, or on behalf of, individuals;
- The program, including benefits and financing method, is mandated by law;
- The program is not financed through private insurance; and
- Program benefits are principally provided or delivered in the form of periodic payments upon old age, retirement, death, disability, and/or survivorship. [programme de sécurité sociale]

.63 **Subject experience** includes premiums, claims, exposures, expenses, and other data for the insurance categories under consideration. [expérience visée]

.64 **Subsequent event** is an event of which an actuary first becomes aware after a calculation date but before the corresponding report date. [événement subséquent]

.65 **Trend** is the tendency of data values to change in a general direction from one coverage period to a later coverage period. [tendance]

.66 **User** means an intended user of the actuary’s work. [utilisateur]

.67 **Virtually definitive** refers to a matter that is almost certain, but that lacks one or more formalities like ratification, due diligence, regulatory approval, third reading, royal assent, or proclamation. However, a decision that still involves discretion at an executive or administrative level is not virtually definitive. [pratiquement définitive]
Standards of Practice

1120.68 Effective February 1, 2018

Work means work that is commonly, but not necessarily exclusively, performed by actuaries in assessing, measuring, and evaluating risks and contingencies and usually includes:

- Acquisition of knowledge of the circumstances affecting the work that the actuary is undertaking;
- Obtaining sufficient and reliable data;
- Selection of assumptions and methods;
- Calculations and examination of the reasonableness of their result;
- Use of other persons’ work;
- Formulation of opinion and advice;
- Reporting; and
- Documentation. [travail]

1130 Interpretation

Recommendations

.01 These standards consist of recommendations and explanatory text.

.02 A recommendation is the highest order of guidance in these standards.

.03 Each recommendation is in boxed text where it is accompanied by its effective date, shown in square brackets.

Explanatory text

.04 The explanatory text supports and expands upon the recommendations. The explanatory text consists of definitions, explanations, examples, and useful practices.

Effective date of recommendations

.05 The notice of adoption for new standards would indicate their effective date and whether early implementation is permitted and may provide additional direction regarding the application of new standards.

.06 Subject to the notice of adoption, a recommendation applies to work with a calculation date that is on or after the recommendation’s effective date. Superseded recommendations that were in effect at the calculation date would apply to work with a calculation date prior to the effective date of new standards unless early implementation is permitted and applied to the work.

General standards and practice-specific standards

.07 These standards consist of general standards and practice-specific standards. With the exception noted below, the general standards apply to all areas of actuarial practice. In addition, the standards in part 4000 apply to all areas of actuarial practice if the actuary’s work in an area meets the definition of actuarial evidence work.

.08 Usually, the intent of the practice-specific standards is to narrow the range of practice considered acceptable under the general standards.
In exceptional cases, however, the intent of practice-specific standards is to define as acceptable a practice that would not be acceptable under the general standards, in which case that intent is specifically noted by words in a practice-specific recommendation like: “Notwithstanding the general standards, the actuary should...”, followed by the explanatory text.

Drafting

“Should” is the strongest mandating word in these standards, appearing only in recommendations, often in the expression, “The actuary should...”

“Would” is a suggestive word appearing in the explanatory text, often in the expression, “The actuary would...”, and is less forceful than the mandative “should”.

“May” is a permissive word, appearing in both recommendations and the explanatory text, often in the expression, “The actuary may...” and often with conditions attached. It defines a safe harbour. For example, in paragraph 1510.01, the recommendation is that “The actuary may use and take responsibility for another person’s work if such actions are justified.” and the explanatory text describes steps that constitute justification. The actuary who is satisfied that the actions are justified has done all that may be reasonably expected and has therefore complied with accepted actuarial practice, even if the use turns out not to be well-founded.

The examples are often simplified and are not all-inclusive.

1140 Judgment

The actuary should exercise reasonable judgment in applying these standards. A judgment is reasonable if it is objective and takes account of

- The spirit and intent of the standards;
- Precepts of ethical and professional conduct intended to guide the conduct of the actuary;
- Common sense; and
- Constraints on time and resources. [Effective February 1, 2018]

Need for judgment

While these standards are drafted so that they are, as much as possible, understandable by lay persons, the judgment of the actuary is necessary for their application.

The exercise of judgment is not clear-cut, except perhaps in hindsight. A judgment that is reasonable at its making is not made unreasonable by later hindsight.
Standards of Practice

1140.04  Effective February 1, 2018

.04 A judgment that is completely subjective would not be reasonable even though it may be based on honest belief. A reasonable judgment would be objective and demonstrably take account of the criteria listed in the recommendation and discussed below.

.05 There is a reasonable range of assumptions that may be selected by an actuary for particular work and that might produce materially different results. Sometimes, it is desirable that actuaries produce results within a relatively narrow range, in which case the practice-specific standards may prescribe certain assumptions and/or methods to achieve that purpose.

**Spirit and intent**

.06 In applying a specific standard, it is important to be guided by the spirit and intent behind it.

**Common sense**

.07 A strained interpretation of a recommendation is inappropriate.

.08 An outlandish result or a seeming impossibility of applying the standards would indicate either a misinterpretation of the standards or their inapplicability to the situation.

**Constraint on time and resources**

.09 The actuary would normally perform work in compliance with accepted actuarial practice. However, in some circumstances within the scope of an appropriate engagement, the actuary’s work may be constrained by available time and resources. In such circumstances, the actuary would adopt an interpretation and application that strikes a reasonable balance between compliance and modifications due to the constraints, after consideration of accepted actuarial practice with respect to materiality and the use of approximations. The actuary would report to the user any deviation from accepted actuarial practice.

**1150 Accepted actuarial practice**

.01 Work in Canada should conform to accepted actuarial practice except when it conflicts with law or the terms of an appropriate engagement. A user of the actuary’s work may assume that it is in accordance with accepted actuarial practice except when the actuary reports otherwise. [Effective February 1, 2018]
These standards are the only explicit articulation of accepted actuarial practice for work in Canada. Explanation, examples, and other useful guidance may also be found in

- New standards, not yet effective but whose early implementation is appropriate;
- Educational notes of the Canadian Institute of Actuaries;
- Actuarial principles;
- Exposure drafts;
- Historical records;
- Canadian and international actuarial literature; and
- Practices that are generally accepted among actuaries and that are not in conflict with these standards.

The applicability and the relative importance of this other guidance for particular work is a matter for judgment.

Accepted actuarial practice is sometimes called “generally accepted actuarial practice” (for example, in the Insurance Companies Act (Canada)) or “generally accepted actuarial principles”.

1160 Scope

These standards apply to work in Canada. [Effective February 1, 2018]

The application of any recommendations beyond their scope should take account of relevant circumstances. [Effective February 1, 2018]

Work in Canada vs. work in another country

The distinction between work in Canada and work in another country depends primarily on the ultimate purpose of the work. It does not depend on where the actuary lives or where the actuary happens to be when doing the work.
Standards of Practice

.04 Work in compliance with the laws or customs of a country or a particular region within that country is work in that country. Examples include

- A valuation of the liabilities of a pension plan of a Canadian subsidiary of a U.S. multinational for the consolidated financial statements of the multinational is work in the U.S.
- If the work relates to taxation under the U.S. Internal Revenue Code, the work is work in the U.S. Thus, a valuation of the policy liabilities of the U.S. branch of a Canadian insurer for the insurer’s U.S. income tax return is work in the U.S.
- If the work relates to litigation under U.S. law before a U.S. court, the work is work in the U.S. Thus, a report to the lawyer of a Canadian defendant insured by a Canadian insurer on a claim for damages litigated under U.S. law in a U.S. court is work in the U.S.

.05 There may be cases when the distinction is not clear; for example, advice to a Canadian insurer on products to be sold outside Canada. In some of those cases, accepted actuarial practice may be the same in both countries, so the distinction does not matter. If the distinction matters, the actuary would, if practical, agree with the user and report on the appropriate practice and, failing agreement, would report the implications of the distinction.

Work outside Canada

.06 The best guidance for work in another country is the accepted practice for actuarial work in that country. This encompasses the formal guidance that the actuarial profession in that country provides for work in that country. If that guidance does not exist or is limited, these standards may provide useful guidance. The general standards are more likely to provide useful guidance than the practice-specific standards: in either case, however, the actuary would take account of differences between the laws and customs of the other country and those of Canada.
1200 Permitted Deviations

1210 Conflict with law

.01 If accepted actuarial practice conflicts with the law, the actuary should comply with the law, but should report the conflict and, if practical, useful, and appropriate under the terms of the engagement, report the result of applying accepted actuarial practice. [Effective February 1, 2018]

.02 It is practical to report the result of applying accepted actuarial practice unless the work to do so is onerous or the needed data are unobtainable. If a quantified result is not practical, a verbal description of the result is better than no report.

.03 Description of the conflict and disclosure of its effect is useful in order to

- Disclose that the work deviates from accepted actuarial practice;
- Disclose that the work, insofar as the conflict is concerned, is in accordance with the requirements of the legislator or regulator, which vary by jurisdiction, rather than accepted actuarial practice, which is uniform across Canada; and
- Promote eventual adoption of accepted actuarial practice into law.

In determining the usefulness of reporting, the actuary would take into account the needs of the various users.

.04 Accepted actuarial practice does not conflict with the law where the law mandates a practice, or limits practice to a range, that is within the range of accepted actuarial practice.

1220 Conflict with terms of engagement

.01 If accepted actuarial practice conflicts with the terms of an appropriate engagement, the actuary may comply with the terms of that engagement, but should report the conflict and, if practical, useful, and appropriate under the terms of that engagement, report the result of applying accepted actuarial practice. [Effective February 1, 2018]
.02 Usually, the actuary is responsible for all aspects of his or her work and performs it in accordance with accepted actuarial practice. The engagement to which the recommendation applies is usually one in which one or more aspects of work are omitted or are stipulated by the client or employer or the terms of a benefit plan. Examples include situations where

- The actuary uses, but does not take responsibility for, the software system, or the work, of the staff of the client or employer; and
- The client or employer or the terms of a benefits plan stipulates an assumption or a method that is not in accordance with accepted actuarial practice.

.03 Conflict between accepted actuarial practice and the law is not the same as conflict between accepted actuarial practice and the terms of an engagement. In the case of an engagement whose terms call for deviation from accepted actuarial practice, the actuary has discretion to accept or not to accept the engagement.

.04 The practicality and usefulness of reporting a result in accordance with accepted actuarial practice are the same as for subsection 1210, Conflict with law.

**1230 Unusual and unforeseen situations**

.01 Deviation from a particular recommendation or other guidance in these standards is accepted actuarial practice for an unusual or unforeseen situation for which the standards are inappropriate. [Effective February 1, 2018]

.02 The actuary would report without reservation when deviating from a particular recommendation or other guidance in these standards in accordance with this subsection 1230, but it may sometimes be appropriate to describe and justify the deviation in the report.

**1240 Materiality**

.01 Deviation from a particular recommendation or explanatory text in these standards is accepted actuarial practice if the effect of so doing is not material. [Effective February 1, 2018]

---

2 Actuaries are encouraged to bring such situations to the attention of the Actuarial Standards Board, who may wish to consider how standards might be improved so that they do contemplate such situations.
"Material" has its ordinary meaning, but is judged from the point of view of a user, having regard for the purpose of the work. Thus, an omission, understatement, or overstatement is material if the actuary expects it to affect either the user’s decision-making or the user’s reasonable expectations. When the user does not specify a standard of materiality, judgment falls to the actuary. That judgment may be difficult for one or more of these reasons:

- The standard of materiality depends on how the user uses the actuary’s work, which the actuary may be unable to foresee. If practical, the actuary would discuss the standard of materiality with the user. Alternatively, the actuary would report the purpose of the work as precisely as possible, so that the user is warned of the risk of using the work for a different purpose with a more rigorous standard of materiality.

- The standard of materiality may vary among users. The actuary would choose the most rigorous standard of materiality among the users.

- The standard of materiality may vary among uses. For example, the same accounting calculations may be used for a pension plan’s financial statements and the financial statements of its participating employer. The actuary would choose the more rigorous standard of materiality between those two uses.

- The standard of materiality depends on the user’s reasonable expectations, consistent with the purpose of the work. For example, advice on winding-up a pension plan may affect each participant’s share of its assets, so there is a conflict between equity and practicality. The same is true for advice on a policy dividend scale.
Standards of Practice

.03 The standard of materiality also depends on the work and the entity that is the subject of that work. For example,

• A given dollar standard of materiality is more rigorous for a large than for a small entity;
• The standard of materiality for valuation of an insurer’s policy liabilities is usually more rigorous for those in its financial statements than for those in a forecast in financial condition testing;
• The standard of materiality for data is more rigorous for calculating an individual benefit (such as in a pension plan wind-up) than for a valuation of a group benefit plan (such as a going concern valuation of a pension plan); and
• The standard of materiality for work involving a threshold, such as a regulatory capital adequacy requirement calculation of an insurer or a statutory minimum or maximum funding level for a pension plan would become more rigorous as the entity approaches that threshold.

.04 The actuary would not report an immaterial deviation from a particular recommendation or other guidance in these standards except if doing so assists a user to decide whether the standard of materiality is appropriate for that user.

.05 The recommendation applies to both calculation and reporting standards.

Calculation standards

.06 The result of applying a recommendation may not differ materially from the result of a simpler practice requiring less time and expense. For example, the practice-specific recommendations for valuation of insurance contract liabilities for term life insurance have little effect on an insurer whose volume of term life insurance is trivial. To ignore them in that situation is accepted actuarial practice if it helps the actuary to concentrate time and resources on material items.

.07 In considering materiality, it is not appropriate to net items that are reported separately. For example, if simple practices requiring less time and expense than those in the recommendations materially overstate the premium liabilities and materially understate its claim liabilities, but do not materially affect their sum, the understatement and overstatement are each material if the two items are reported separately. In considering materiality, it is, however, appropriate to net components within a separately reported item. To continue the example, it would be appropriate to net the overstatement of premium liabilities with the understatement of claim liabilities if only the sum of the two (i.e., the insurance contract liabilities) is reported.
.08 The effect of using a simpler practice requiring less time and expense than those in the recommendations may be conservative or not conservative. Usually, the criterion of materiality is the same in both cases.

**Reporting standards**

.09 The result of applying a recommendation may provide information that is not useful. For example, disclosure of a material change in the basis for valuing the liabilities with respect to a material class of a benefit plan’s members is not useful if that class was trivial at the previous valuation. Also, description of immaterial provisions of a benefit plan is not useful. To ignore the recommendation is accepted actuarial practice in that situation.
1300  The Engagement

1310  Accepting and continuing an engagement

.01  In accepting an engagement, the actuary should agree on its terms with the actuary’s client or employer and be satisfied that it is an appropriate engagement. [Effective February 1, 2018]

.02  In performing the engagement, if the actuary becomes aware of information that, if known beforehand, would have been an impediment to acceptance of the engagement, the actuary should

- Renegotiate the engagement to remove the impediment;
- Discontinue the engagement; or
- Provided that the engagement continues to be an appropriate engagement, report the impediment and its implications. [Effective February 1, 2018]

.03  The actuary would consider consultation with the predecessor actuary, if any, to determine whether there is any reason not to accept the engagement.

Terms of the engagement

.04  The likelihood that work is satisfactory to all users concerned is enhanced by a clear understanding between the actuary and the client or employer on the terms of the engagement. Detailed identification of the time and resources involved, especially if they are substantial, and of the information needed to be communicated to and by the actuary, especially if it is sensitive or confidential, will avoid misunderstanding.

Appropriateness of engagement

.05  The following guidance is useful in judging if the engagement is an appropriate engagement:

- An engagement is prima facie appropriate if there are practice-specific standards that apply to it, especially if it does not call for a deviation from accepted actuarial practice.
- An engagement’s appropriateness is not likely affected if the actuary’s client or employer selects particular assumptions as part of the terms of the engagement and the report describes the assumption and identifies the source, or chooses a value for certain assumptions from within a range selected by the actuary.
- An engagement to report on alternative scenarios or “What if?” questions is appropriate, given appropriate disclosure.
Standards of Practice

- An engagement is less likely to be appropriate if it denies reasonable opportunity for an external user to question the actuary about his or her report.

.06 An engagement may involve a duty of confidentiality that conflicts with a recommendation on disclosure in reporting. That engagement would be appropriate, however, and the duty of confidentiality would supersede (at least temporarily) the duty of disclosure, if

- Confidentiality is necessary for the legitimate business objective of the client or employer;
- The extent of the information to be kept confidential is reasonable;
- The length of time for which it is to be kept confidential is reasonable; and
- The duty of confidentiality permits reasonable exceptions; for example, if the actuary is permitted to disclose the information to, and to discuss the engagement with, an auditor or a regulator.

.07 For example, the engagement may be appropriate if the actuary temporarily withholds knowledge of

- A mistake that favours his or her client in the report of the actuary engaged by the other side in litigation;
- The imminent closure of a participating employer’s Canadian operations and the consequent job loss and winding-up of the plan in giving advice on its funding, but the actuary would consider the need for an early revaluation or wind-up valuation; or
- An insurer’s imminent acquisition by new shareholders who will alter its business plan in reporting in the insurer’s financial statements, but the actuary would consider the implications of the new business plan in reporting to the insurer’s directors on financial condition.

.08 That engagement would not be appropriate, however, if the information is to be kept confidential in order to conceal improper business conduct, or to withhold information from users of the actuary’s work who may reasonably expect the actuary to report it to them.

.09 Any duty of confidentiality would give way to a duty of disclosure if disclosure is mandated by law, or if disclosure is required by a professional body to whom the actuary is subject.
Whether an engagement is appropriate depends on the actuary as well as on the engagement. For example, an actuary would not accept an engagement to perform work that the actuary is not qualified to do or where the actuary has an undisclosed conflict of interest.

Subsequent information

While performing the engagement, the actuary may become aware of information that, if known beforehand, would have been an impediment to acceptance of the engagement. For example,

- The actuary’s understanding of the engagement differs from that of the client or employer;
- The data are not sufficient or not reliable and cannot be remedied; or
- Promised resources are not forthcoming and a substitute for them is not practical.

Renegotiation that removes the impediment would usually be the preferred alternative. Discontinuance would be the only alternative if the new information reveals the engagement not to be appropriate and renegotiation to make it so is impractical, which would be the case, for example, if an appointed actuary is denied access to needed information.

Failing renegotiation or discontinuance, the actuary would deal with the impediment by reporting it and its implications. Description of the implications would include both qualitative and quantitative aspects and their effect on the actuary’s opinion.

1320 Financial interest of the actuary

The financial interest of the actuary should not influence the result of the actuary’s work. [Effective February 1, 2018]

1330 Financial interest of the client or employer

The financial interest of the actuary’s client or employer should not influence the result of the actuary’s work except to the extent that the client or employer selects assumptions or methods for the work. [Effective February 1, 2018]

The actuary’s client or employer may have a financial interest in the result of the actuary’s work. For example, it may be in the client’s or employer’s interest to maximize or minimize the result. That is usually the case when the actuary’s client is one side of opposing interests; for example, the plaintiff or defendant in litigation, the purchaser or vendor in a sale, and the employer or union in labour negotiations.

In such a case, the actuary’s duty of professionalism supersedes the duty of service to the client or employer.
In giving advice to a participating employer regarding the funding of a benefit plan, the actuary may first calculate a range, at any point of which funding would be appropriate. That range is the crux of the work, so a participating employer’s financial interest would not influence its calculation. It is, however, appropriate and usually desirable for the actuary to consult the participating employer in the selection of the recommended funding within the range. The participating employer’s financial interest—for example, the participating employer’s tolerance of fluctuation in the recommended rate of funding between one funding period and the next—would be taken into account in that consultation.

Note, however, that the recommendation does not preclude the actuary’s use of assumptions or methods selected by the client or employer in an appropriate engagement, but the actuary would report such use.

Note also that the purpose of the work will influence the actuary’s selection of assumptions and methods. The financial interest of the client or employer may shape the purpose of the work if the engagement is an appropriate engagement and the purpose is reported.

### 1340 General knowledge

The actuary should have adequate knowledge of the conditions in the practice area in which the actuary is working. [Effective February 1, 2018]

Where the actuary’s work in a practice area meets the definition of actuarial evidence work, the actuary should have adequate knowledge of the conditions in both the practice area in which the actuary is working and the actuarial evidence practice area. [Effective February 1, 2018]

The relevant conditions may include legislation, accounting standards and policies, taxation, the financial markets, family law, and court practices. The relevant legislation depends on the engagement, and may include legislation governing securities, pensions, insurance, workers’ compensation, and employment standards.

### 1350 Knowledge of the circumstances affecting the work

The actuary should take into account the circumstances affecting the work that the actuary is undertaking. [Effective February 1, 2018]

The circumstances affecting the work include the purpose of the work, the terms of the appropriate engagement under which the work is being performed, and the application of the law to the work.
The relevant knowledge for a corporate entity or benefit plan is that of the operations of the entity itself and may include that of the industry in which the entity operates. Usually, the entity is the actuary’s client or employer but may be a proposed acquisition or merger partner of the client or employer.

In the case of a benefit plan, the entity is the plan itself, but, depending on the engagement, knowledge of the business conditions of the participating employer(s) may also be relevant.

The relevant knowledge for calculation with respect to an individual is the demographics of the individual and the context of the calculation.

Additional conservatism in making a calculation is not a substitute for knowledge of the circumstances affecting the work.
1400 The Work

1410 Approximation

.01 An approximation is appropriate if it reduces the cost of, reduces the time needed for, or improves the actuary’s control over, work without affecting the result. [Effective February 1, 2018]

.02 If the actuary reports an appropriate approximation, the report should avoid unintended reservation. [Effective February 1, 2018]

.03 If the appropriateness of an approximation is doubtful, the actuary should report its use with reservation. [Effective February 1, 2018]

.04 Like materiality, to which it is related, approximation pervades virtually all work and affects the application of nearly all standards. The words “approximation” and “approximate” seldom appear in these standards, but are understood throughout them.

.05 Approximation permits the actuary to strike a balance between the benefit of precision and the effort of arriving at it.

Approximation in selection of a model

.06 Reality is complex. A simple model reduces not only the time and expense of work but also the risk of calculation and data error.

.07 The appropriateness of a simplification depends on the circumstances affecting the work and the purpose of the work. For example, in selecting a model for advice on funding a pension plan, it may be appropriate to allow for indexing by modifying the assumption for a contingency of which the model takes account, such as the investment return assumption, to arrive at an appropriate composite assumption.
Approximation in the selection of assumptions

.08 Simplification of an assumption may be an appropriate approximation. For example,

- Deaths occur continuously over a year; for simplicity, assume that they all occur at the middle of the year;
- Members of a pension plan with early retirement reductions that approximate full actuarial reductions retire at various rates between, say, ages 55 and 65; for simplicity, assume that they all retire at, say, age 62; and
- If the members of a pension plan who die before retirement are entitled to a benefit that is roughly the same as the present value of the retirement benefit, for simplicity, assume that death rates before retirement are equal to zero.

.09 To make no assumption about a contingency is usually tantamount to assuming a zero rate for that contingency, which is rarely appropriate in itself, but may be appropriate when combined with an adjustment to a related assumption. For example, in some circumstances, the calculation of the liabilities in a benefit plan using an explicit wage and price inflation assumption may be approximated by calculating the liabilities without an explicit wage and price inflation assumption and using a lower liability discount rate assumption representative of the real rate of return.

Approximation by sampling

.10 A well-chosen sample avoids the extra work of an examination of the entire universe.

Approximations respecting data

.11 Data may be defective. For example, a benefit plan’s records may lack the date of birth of certain members. In some cases there is an appropriate approximation, for example, sampling, or extrapolation from similar situations for which data are available.

Approximation vs. assumption

.12 A criterion of the appropriateness of an approximation is its effect on the result. If the actuary approximates but is unable to assess the resulting error, the approximation becomes, in effect, an assumption. For example, data are missing and it is not practical to get them. The actuary would consider whether their lack is so important that a report with reservation is necessary, but in any case is obliged to make an assumption about them in order to do the work.
Reporting approximations

.13 To report appropriate approximations in a longer report may provide information useful to users, but such reporting would avoid unintended reservation, as the use of approximations is a usual part of work. The pervasiveness of approximations in work makes their complete reporting impractical.

.14 If the actuary reports an implicit assumption used as an approximation, he or she would also report the corresponding explicit assumption or assumptions. Similarly, if an actuary reports approximations for two offsetting assumptions that result in the same net effect as the underlying explicit assumptions, the actuary would also report the explicit assumptions.

.15 The actuary would not usually use an approximation whose appropriateness is doubtful. That may be unavoidable, however, if data are insufficient or unreliable or if needed resources are lacking. If the engagement is an appropriate engagement, the actuary would report with reservation the use of the approximation, so that a user is aware of a limitation to the actuary’s work.

1420 Event

.01 The following decision tree may assist an actuary in deciding how to reflect an event in the work, if the actuary determines that the event makes the entity different.

Event Decision Tree

<table>
<thead>
<tr>
<th>When did the actuary first become aware of the event?</th>
</tr>
</thead>
<tbody>
<tr>
<td>On or before calculation date</td>
</tr>
<tr>
<td>Reflect the event in the work</td>
</tr>
<tr>
<td>No</td>
</tr>
<tr>
<td>Reflect the event in the work</td>
</tr>
<tr>
<td>Yes</td>
</tr>
</tbody>
</table>

When did the event occur?

| On or before calculation date | After calculation date |
| --- |
| Reflect the event in the work | Does the event make the entity different? |
| On or before calculation date | After calculation date |

What is the purpose of the work?

| Reflect the event in the work | Reflect the event in the work |
| --- |
| Report on entity as it will be as a result of the event | Report event but don’t reflect event in the work |
| (1430.02 second wording) | (1430.03) |
**1430 Subsequent events**

.01 The actuary should correct any data defect or calculation error that is revealed by a subsequent event. [Effective February 1, 2018]

.02 For work with respect to an entity, the actuary should take a subsequent event into account (other than in a pro forma calculation) if the subsequent event:

- Provides information about the entity as it was at the calculation date;
- Retroactively makes the entity different at the calculation date; or
- Makes the entity different after the calculation date and a purpose of the work is to report on the entity as it will be as a result of the event. [Effective February 1, 2018]

.03 The actuary should not take the subsequent event into account if it makes the entity different after the calculation date and a purpose of the work is to report on the entity as it was at the calculation date. Nevertheless, the actuary should report that subsequent event. [Effective February 1, 2018]

**Classification**

.04 A subsequent event is relevant to the recommendation if it reveals an error, provides information about the entity, or is a decision that makes the entity different.

.05 The actuary would correct an error revealed by a subsequent event. The actuary would classify each subsequent event other than those that reveal errors and, depending on the classification, the actuary would either:

- Take that event into account; or
- Report that event, but not take it into account.
Entity

.06 Examples of entities are

- The pension plan, in the case of an actuary doing a valuation of a pension plan;
- The block of annuity business, in the case of an actuary calculating the insurance contract liabilities for an insurance company’s annuity business;
- A combination of the pension plan and the member’s specific data, in the case of the determination of a member’s individual entitlement under a pension plan; and
- The insurance company, in the case of an actuary valuing the insurance contract liabilities of an insurance company.

Event provides information about entity as it was or retroactively makes entity different

.07 Examples of subsequent events that provide information about an entity as it was at the calculation date are

- Publication of an experience study that provides information for selection of assumptions;
- Reporting to an insurer of a claim that was incurred on or before the calculation date; and
- Adoption of a pension plan amendment prior to the calculation date of which the actuary becomes aware after the calculation date.

.08 Examples of events that retroactively make the entity different at the calculation date are definitive or virtually definitive decisions, made after the calculation date but effective on or before the calculation date, to

- Wind-up a pension plan, partially or fully;
- Sell a portion of a participating employer’s business and consequently to spin off the corresponding members from the participating employer’s pension plan;
- Amend the benefits of a pension plan;
- Transfer a portion of an insurer’s policies to another insurer; or
- Invoke a judicial decision that nullifies or significantly modifies the law affecting insurance claims.
Standards of Practice

.09 If an event provides information about the entity as it was at the calculation date or provides information that retroactively makes the entity different at the calculation date, the effect of the subsequent event on the work is the same as if the actuary first became aware of the information on or before the calculation date and the actuary would not report the event as a subsequent event. That is, the actuary would report the event only to the extent that the event would have been reported had the actuary first become aware of the information before the calculation date.

Event makes entity different after

.10 If the subsequent event makes the entity different after the calculation date, the purpose of the work determines whether or not the actuary takes the event into account.

.11 If the subsequent event makes the entity different after the calculation date and the purpose of the work is to report on the entity as it will be as a result of the event, the actuary would take that event into account and would describe it in reporting.

.12 If the subsequent event makes the entity different after the calculation date and the purpose of the work is to report on the entity as it was at that date, the actuary would not take that event into account but would report the event since it would affect the entity’s future operations and the actuary’s subsequent calculations.
Classification not clear

The classification of a subsequent event may be unclear, at least a priori, although the circumstances affecting the work and the actuary’s engagement may make it clear. The following are examples of such events:

- A precipitous fall in the stock market. For financial reporting, one can argue that the stock market crash provides additional information about the entity as it was at the calculation date, because the crash is an indicator of the outlook for common share investments at that date; alternatively, one can argue that the crash makes the entity different only after the calculation date since it creates a new situation. The new situation would be reflected in the financial statements for the subsequent financial reporting period.

- A salary freeze for employees who are members of a pension plan. If the salary freeze is a correction of excessive salaries, it provides additional information about the entity as it was at the calculation date, because the freeze is an indicator of the outlook for salaries at the calculation date. If the salary freeze deals with a recent problem, it indicates a change in conditions that makes the entity different after the calculation date. In either case, the actuary would consider the effect of the freeze on the employees’ pension benefits. It may be that the freeze will have a lasting effect. Alternatively, it may be that the freeze will be compensated for by higher salaries later on, so that the salary inflation assumption based on historical trends continues to be valid.

- Default on a bond. If the default was the culmination of a gradual deterioration in its issuer’s financial circumstances, most of which had occurred before the calculation date but that was not apparent until revealed by the default, the default provides additional information about the entity as it was at the calculation date. If the default was precipitated by a catastrophe, it provides information about a change in conditions that makes the entity different after the calculation date.

- Insolvency of an insurer’s reinsurer. This is similar to default on a bond. If the insolvency was the culmination of a gradual deterioration in the reinsurer’s financial circumstances, most of which had occurred before the calculation date but that was not apparent until revealed by the insolvency, the insolvency provides information about the entity as it was at the calculation date. If the insolvency was precipitated by a catastrophe, it provides information about a change in conditions that makes the entity different after the calculation date.
Standards of Practice

1430.14 Effective February 1, 2018

Reporting

.14 Sometimes, either because the actuary considers it appropriate or the terms of the work require it, the actuary may report as an alternative the opposite calculation; i.e., one that does not take the subsequent event into account when the main calculation does, or that takes the subsequent event into account when the main calculation does not. For example, in a province for which the calculation date for a pension valuation following marriage breakdown is the date of separation, a subsequent event may be the early retirement of the plan member at some time between the calculation date and the report date. The actuary would consider reporting values assuming that this subsequent event had been an established intention at the calculation date, instead of or in addition to retirement scenarios otherwise recommended in the practice-specific standards. In such cases, the actuary would make the same calculations regardless of the purpose of the work but the reporting thereof would depend on the purpose of the work.

1440 Data

.01 The actuary should apply such procedures as are necessary for the actuary to arrive at a conclusion as to the sufficiency and reliability of the data. [Effective February 1, 2018]

.02 Data relevant to the work may include experience data, membership or policyholder data, census data, claims data, asset and investment data, economic data, operational data, benefit definitions, and policy or contract terms and conditions and other data relevant to the work.

.03 Sources of data may include data obtained from inventory or sampling methods. Data may be obtained directly by the actuary or may be provided to the actuary by the client, by an accountant or auditor, by a government or statistical body, from a financial statement, or by others. Data may be specific to the client. Where data specific to the client are not available or not relevant, the actuary would consider using industry data, population data, or other published data with suitable adjustments where relevant and appropriate.

Sufficiency and reliability

.04 Data are sufficient if they include the needed information for the work. For example, participants’ dates of birth are needed to value the liabilities of a pension plan.

.05 Data are reliable if they are sufficiently complete, consistent, and accurate for the purposes of the work.
.06 The actuary would test the sufficiency and reliability of (i.e., validate) the data as may be appropriate for the work but is not normally required to perform a detailed audit and is not responsible for discovering falsified or misleading data. If the terms of an appropriate engagement prevent the actuary from performing a validation of the data, the actuary would so report, and report any apparent or evident shortcomings in the data.

.07 Validation of the data may include reconciliation against financial statements and books of account or other external data, examination of internal and external consistency, comparison with prior periods, availability of independent confirmation from other sources, or detailed confirmation using sampling techniques.

.08 If sufficient and reliable data cannot be obtained or the actuary is unable to ascertain the sufficiency or reliability of the data the actuary would, after first attempting to rectify the data, consider whether to report with reservation in respect of the data or to decline to perform the work.

.09 Data may be rectified by obtaining corrected, more complete, alternative, additional, or supplementary data; by making assumptions with respect to incomplete data; or by making adjustments to the data.

.10 If assumptions or adjustments applied to data by the actuary may cause material uncertainty or bias in the results of the work, the actuary would so report and would report any limitations on the use of the work product where appropriate.

Reliance on others

.11 The actuary usually uses data prepared by another party such as the client, an independent administrator, an auditor, a government body, or an external association. When placing reliance on such data, the actuary would consider the qualifications, competence, integrity, and objectivity of the party providing the data.

1450 Models

.01 When the work involves the use of a model, the actuary should

- choose a model appropriate to the purpose and requirements of the work; and
- understand any limitations in the model that might make the results of the model inappropriate for the intended purpose or might produce a misleading result. [Effective January 1, 2018]

.02 Like approximation, models pervade virtually all work and affect the application of most standards. The word “model” seldom appears in the standards, but is understood throughout them.
Amount of effort required

The amount of effort in validation, documentation and risk mitigation would depend primarily on the influence that the model has on the decisions that it supports, and to a lesser extent on the complexity of the calculations and how they are performed. The actuary would determine how much effort is required for a particular model taking into account the use of the work and the benefit that users would be expected to obtain from enhanced diligence.

- Some models are so simple or otherwise have such low model risk that the actuary is able to exercise appropriate diligence without formal documentation or reporting. Examples of such models are:
  - models that are so simple that they could be performed effectively manually; and
  - models that are used solely to validate other models that are used in the actuary’s work.

- Some models are used repeatedly from the same model specification and the same model implementation but with different input data and/or assumptions. In that case, the diligence for choosing a model and for validating the model specification and model implementation is normally done only once. Documentation for each model run would normally be limited to noting the inputs and the version of the model used; and

- Some models would require extra diligence because of greater financial significance, increased complexity, or greater uncertainty about the fit of the model to the more complex system it represents.

Appropriate Model

A model is appropriate and is used appropriately if:

- the model enables the actuary to better understand a complex reality, at a reasonable cost, while maintaining the aspects of that reality that are important to the work;
- the model specification indicates that the intended purpose can be achieved by the model;
- the model implementation has been verified as an accurate representation of the model specification;
- each model run uses input data and assumptions consistent with the model specification; and
- each model run is interpreted as set out in the model specification.
A standard actuarial method used within a model in its proper context would be considered appropriate without further justification; for example, actuarial present value method for a pension valuation and the chain ladder method and Bornhuetter-Ferguson method for unpaid claims liabilities.

1460 Quality Assurance

.01 This subsection 1460 applies to quality assurance processes that are at the instigation of the actuary responsible for the work. Such processes include quality control in the actuary’s firm or employer as well as review by persons external to the actuary’s firm or employer.

.02 The actuary should implement appropriate quality assurance processes prior to the release of work to users. [Effective July 1, 2019]

.03 In deciding what quality assurance processes are appropriate and proportionate, whether different processes are suitable for different elements of the work, and when the processes would be carried out, the actuary would consider the relevant circumstances, including:

- The degree of difficulty of the various elements of the work, the extent to which professional judgment is required and the overall complexity of the work;
- The purpose of the work and the extent (if any) to which the users may reasonably be expected to challenge it;
- The significance of the work, including any financial, reputational or other consequences for the users;
- The reasonable expectations of the users;
- Whether the way in which the work is carried out makes it vulnerable to errors;
- The novelty of the work and the actuary’s experience in performing similar engagements; and
- Whether there are legislative or regulatory requirements for the work to be peer reviewed.

.04 Quality assurance processes include calculation control procedures and model validation, as described in subsection 1470, calculation result examination as described in subsection 1480, self-checking of the work, repetition of the work and peer review. Appropriate quality assurance processes may differ for different elements of the work.
Peer review is a process by which one or more components of an actuary’s work are considered by at least one other individual for the purpose of providing assurance as to the quality of the work in question. Peer review can be an important component of the quality assurance process for an actuary’s work.

The actuary should select a peer reviewer with the appropriate experience and expertise to perform the peer review. If a person is qualified to have performed the work to be reviewed, then that is prima facie evidence that the person is also qualified to perform the peer review. [Effective July 1, 2019]

The actuary would consider to what extent any peer review should be in the form of independent peer review, whereby one or more components of an actuary’s work are considered by at least one other individual who is not otherwise involved in the work in question, who has the appropriate experience and expertise to perform the peer review, and is in a position to effectively challenge the work. The perceived objectivity of a reviewer is enhanced if the reviewer is independent of the actuary performing the work.

Where one or more individuals is involved in the quality assurance processes, the actuary would clarify each person’s role and responsibilities.

For some types of work, particularly some engagements of actuarial evidence work, peer review may not be required due to the circumstances affecting the work. The absence of peer review of an actuary’s work would not necessarily be considered as an indication of a weakness in the quality of assurance processes applied to the work. Where the actuary is expected or required to be independent in performing the work, the scope of the peer review would be defined so as not to impair such independence.

1470 Control

Control procedures that detect errors and decrease the effect of errors should be performed for calculations. [Effective February 1, 2018]

To mitigate model risk, the actuary should perform model validation and employ other strategies appropriate for the financial significance of the results and the complexity of the model. [Effective January 1, 2018]

A calculation that is data-intensive, that is complex, that involves physically separate steps like manual and data processing steps or parallel data processing steps, or especially, a combination of them, is prone to error that appropriate control procedures may prevent or, failing prevention, detect. Appropriate control procedures also help to meet the need for consistency between the actuary’s work and other related work; for example, a uniform cut-off date in the preparation of financial statements.
Examples of control procedures are procedures to ensure that
  • All steps in the calculation are coordinated;
  • All steps in the calculation have been performed and checked;
  • The actuary’s data processing does not corrupt the data supplied to the actuary;
  • Established procedures (for example, those for a prior period) are not changed inadvertently; and
  • Changes in established procedures are made in an orderly manner.

Examples of control tools are
  • Random sampling;
  • Spot checks; and
  • Audit trails.

The actuary would test that the model implementation uses the data and assumptions as intended by the model specification. The actuary would also verify that the methods used by the model implementation function as intended by the model specification. The reasonableness of the model run may be tested by using alternative models. Various components of a complex model may be compared to results obtained by separate models.

The actuary would validate that the model specification is suitable for its intended purpose. For example, a stochastic model may be more suitable than a deterministic model for the valuation of minimum guarantees in some life insurance policies.

Strategies to mitigate model risk are also pertinent to models developed by third parties and those for which the actuary has limited access to intermediate results, but the range of strategies may be more limited than with other models.

In assessing a model’s suitability, the actuary would understand the model’s basic operations, important relationships, major sensitivities, limitations, strengths, and potential weaknesses.

When a model is to be used for stress tests or is stochastic, the actuary would give appropriate consideration to the statistical distributions used and the magnitude and behaviour of tail events in light of the nature of the work.

### 1480 Reasonableness of result

The actuary should examine the reasonableness of a calculation’s result. [Effective February 1, 2018]
As a result of defective data, defective computer software, an accumulation of individually biased assumptions, or the like, a calculation, especially a complex one like a valuation or financial forecast, may be prone to error that checking of the calculation’s steps does not reveal but that an examination of its result may reveal. Such an examination is therefore useful and prudent.

The examination would consider simple questions like the following.

- How does the result compare to the corresponding result for a prior period or a similar case, or to a related but independently calculated amount? Comparison of a benchmark may be more meaningful than comparison of the result. Examples of a benchmark are the forecasted number of retirees divided by the forecasted number of active employees, the loss ratio implied by claim liabilities, and the change during the year of the result.
- How does the result compare to the corresponding result of a rough approximation?
- Does the result make common sense?

The answers to such questions may indicate a need for more work.

1490 Documentation

The actuary should use his or her best efforts to compile and secure the retention of appropriate documentation. [Effective February 1, 2018]

Documentation consists of letters of engagement, working papers, meeting notes, memoranda, correspondence, reports, copies or excerpts of company or plan data and documents, and work plans. Appropriate documentation describes the course of the work and its conformity with accepted actuarial practice.

Both professional and legal needs may affect the length of time during which documentation is to be retained.

The actuary’s documentation for a model, if required, would typically include

- the intended purpose of the model;
- the appropriateness of the model specification for the intended purpose;
- the limitations of the model specification relevant to the model’s intended purpose;
- the testing of the model implementation; and
- the presence of appropriate mitigating strategies for model risk.
.05 Model documentation would typically be sufficiently detailed to enable another actuary knowledgeable in the matters at hand to form an assessment of the judgments made and of the reasonableness of the model run.

.06 When a model is based in whole or in part on a model developed by a third party, the actuary would document how the actuary assessed the model as being appropriate for the purpose.

.07 The actuary should document the quality assurance processes that were followed in performing the work. [Effective July 1, 2019]
1500 Another Person’s Work

1510 Actuary’s use of another person’s work

.01 The actuary may use and take responsibility for another person’s work if such actions are justified. If the actuary uses but does not take responsibility for another person’s work, the actuary should so report. [Effective February 1, 2018]

.02 Where the work involves the use of data provided by another person, subsection 1440 Data applies.

.03 Use of the work of other persons is a usual, indeed often inevitable, part of work. The actuary uses and takes responsibility for the work of colleagues and assistants; that use is usually straightforward because the actuary is able to assess the appropriateness of their work.

.04 If the actuary uses the work of a person other than colleagues and assistants, the actuary may or may not take responsibility for that person’s work. Taking responsibility may require more work of the actuary and may expose the actuary to risk of legal liability, but may give the user greater confidence that the other person’s work is appropriate.

.05 The actuary would not take such responsibility if doing so would lead a reasonable person to believe that the actuary possessed and purported to exercise the skill and learning of a duly qualified professional in that other person’s profession.

.06 If the actuary does not take such responsibility, the actuary reports with reservation and the user would seek alternative assurance that the other person’s work is appropriate, which may or may not be practical.

Use and take responsibility

.07 The actuary may use and take responsibility for another person’s work, given confidence that such actions are justified as a result of considerations such as the following:

- Early and periodic communication with the other person;
- Confidence in the other person’s qualifications, competence, integrity, and objectivity;
- The other person’s awareness of how the actuary intends to use the other person’s work;
• Communication to the other person of any information known to the actuary that may affect the other person’s work, and vice versa; and
• Study of any report by the other person and discussion of it with the other person, especially of any reservation in the report.

.08 The Canadian Institute of Actuaries encourages its members to use the work of an auditor in accordance with the Joint Policy Statement included in subsection 1520 of these standards of practice. The Joint Policy Statement also provides useful guidance if the actuary uses the work of a person other than an auditor.

.09 Although an actuary may take responsibility for the work of another actuary in accordance with this section, the actuary who performed the work also continues to be responsible for that work.

.10 In the case of use of another actuary’s work, it may also be useful to
   • Identify the differences between accepted actuarial practice in Canada and the practice that the other actuary followed if the other actuary worked outside of Canada; and
   • Review the other actuary’s working papers.

.11 The actuary need not report use of another person’s work if the actuary takes responsibility for that work. To do so may imply a reservation.

Use but not take responsibility

.12 If the actuary uses but does not take responsibility for another person’s work, the actuary would nevertheless examine the other person’s work for evident shortcomings and would either report the results of such examination or avoid use of the work. For clarity, even though the other person may use a model in his or her work, the actuary is not considered to have used that model.

1520 Auditor’s use of an actuary’s work

.01 The actuary should cooperate with an auditor who wishes to use the actuary’s work in accordance with the following Joint Policy Statement. [Effective February 1, 2018]
Joint Policy Statement
concerning communications between auditors and actuaries
involved in the preparation of financial statements

This Joint Policy Statement, effective October 1, 2007, has been approved by the Actuarial Standards Board (Canada) and by the Auditing and Assurance Standards Board (Canada).

Purpose and application

1 The purpose of the Joint Policy Statement is to discuss:
   a) communications between actuaries involved in the preparation of financial statements, and auditors, regarding their respective responsibilities;
   b) how those actuaries and auditors would interact in carrying out their respective responsibilities; and
   c) how their respective responsibilities may be disclosed to readers of financial statements.

2 This Statement applies when an auditor is engaged to carry out an audit of financial statements in accordance with generally accepted auditing standards where the financial statements prepared by management include amounts determined by or with the assistance of an actuary. This Statement also applies when an actuary considers the work of an auditor in connection with conducting the actuarial valuation to determine amounts to be included in the financial statements prepared by management. This statement does not apply to communications with an auditor’s actuary or an external review actuary.

3 The financial statements of a pension plan or post-employment benefits plan and of the sponsor of such plans, and the financial statements of an insurance enterprise, are the best examples of when this Statement applies.
Definitions

4 For the purposes of this Statement:

a) “actuary involved in the preparation of financial statements” means an actuary, either an employee of the company or an independent consultant, who determines and reports on amounts to be included in the financial statements prepared by management.

b) “applicable professional standards” means:

i) when the responding professional is an actuary, the Standards of Practice and the Rules of Professional Conduct of the Canadian Institute of Actuaries; and

ii) when the responding professional is the auditor, the Canadian Auditing Standards in the CICA Handbook-Assurance and the relevant independence and other ethical requirements set out in the rules of professional conduct/code of ethics applicable to the practice of public accounting issued by various professional accounting bodies.

c) “auditor” means an auditor who has been appointed to perform an audit and report on financial statements or to perform specified procedures on data;

d) “auditor’s actuary” means an appropriately qualified actuary who assists the auditor in assessing risk and performing further audit procedures to respond to assessed risk;

e) “data” includes particulars of:

i) invested assets of a pension plan or post-employment benefits plan or an insurance enterprise,

ii) membership of a pension plan or post-employment benefits plan,

iii) policies of and claims against an insurance enterprise, and

iv) reinsurance of an insurance enterprise;

f) “enquiring professional” means the actuary or the auditor, as the case may be, who is considering the work of the other;

g) “external review actuary” means an actuary who reviews the work of another actuary at the request of a regulator and provides an opinion to the regulator as to whether the work meets applicable professional standards and accepted actuarial practice;
Standards of Practice

h) “insurance enterprise” includes the following enterprises, including companies, branches, fraternal benefit societies and other forms of organizations:
   i) life insurance enterprises;
   ii) property and casualty insurance enterprises;
   iii) reinsurance enterprises; and
   iv) workers’ compensation enterprises.

i) “management” refers to any person(s) having authority and responsibility for planning, directing and controlling the activities of an enterprise;

j) “responding professional” means the actuary or the auditor, as the case may be, whose work is being considered by the other.

Responsibilities with respect to financial statements

5 The financial statements are the responsibility of management. The representations contained in the financial statements may include amounts determined by an actuary. In determining those amounts, the actuary is responsible for assessing the sufficiency and reliability of the data used in the valuation. The actuary may consider the work of an auditor with respect to data integrity and controls. In such cases, the actuary involved in the preparation of the financial statements acts as the enquiring professional and the auditor acts as the responding professional.

6 The auditor, on the other hand, has a responsibility to express an opinion on the fairness with which the financial statements present the financial position, results of operations and cash flows in accordance with the applicable financial reporting framework, which will normally be generally accepted accounting principles. When the financial statements include amounts determined by an actuary, the auditor considers the work of the actuary as part of the audit evidence supporting the actuarial valuation. In such cases, the auditor acts as the enquiring professional and the actuary involved in the preparation of the financial statements acts as the responding professional.

Considering the responding professional’s work

7 The enquiring professional may consider the work of the responding professional provided that the enquiring professional takes reasonable care to determine that there is a basis for such consideration. This is done by communicating with the responding professional to establish an understanding of the work to be carried out by each and by considering:
   a) the responding professional’s appointment to do the work;
   b) whether the responding professional has followed the standards of his or her profession in carrying out the work; and
   c) the appropriateness of the responding professional’s findings and opinion.
Communication between the two professionals

8 Communication would be established between the auditor and the actuary involved in the preparation of the financial statements when planning their respective engagements, and further communication would take place as necessary throughout the engagement.

9 On a timely basis, each professional seeks from management the right to:
   a) communicate with the other professional; and
   b) when necessary disclose any relevant information to the other professional.

10 The enquiring professional would:
   a) inform the responding professional of the intended consideration of his or her work in accordance with this Statement;
   b) request confirmation from the responding professional that he or she has been engaged by the shareholders, policyholders, directors, or management to do the work that the enquiring professional intends to consider;
   c) request confirmation from the responding professional that he or she is a professional in good standing;
   d) request confirmation from the responding professional that he or she will carry out the work required in accordance with the applicable professional standards; and
   e) make the responding professional aware of the enquiring professional's needs. This would include a discussion of:
      i) the application of the concept of materiality to determine that the responding professional will be using a materiality level that is appropriate in relation to the enquiring professional's materiality level in accordance with applicable professional standards;
      ii) subsequent events, to determine that the responding professional understands how they are to be treated and that he or she will consider the effect of matters that come to his or her attention up to the date of his or her report;
      iii) the timing of the work to be carried out by the responding professional and the date of his or her report; and
      iv) any questions relating to the responding professional's work.
11 The responding professional would provide a written response to the enquiring professional that would:

a) confirm the expectation that he or she is available to perform the work that the enquiring professional intends to consider;

b) confirm that he or she has been engaged by the shareholders, policyholders, directors, or management to do the work that the enquiring professional intends to consider;

c) confirm that he or she is a professional in good standing;

d) confirm that he or she is qualified to perform the work that the enquiring professional intends to consider (including having the certifications or designations, if any, required for particular areas of practice);

e) confirm that this work will be carried out in accordance with the applicable professional standards;

f) confirm awareness of the enquiring professional’s intended consideration of his or her work; and

g) discuss any problems expected in meeting the needs of the enquiring professional on a timely basis.

The responding professional’s qualifications, competence, and integrity

12 In the case of an auditor, prima facie evidence of professional qualification is membership in good standing in a professional accounting body. In the case of an actuary, prima facie evidence of professional qualification is fellowship in good standing in the Canadian Institute of Actuaries.

13 When the responding professional is not well known to the enquiring professional, the enquiring professional may obtain assurance as to the responding professional’s reputation for competence and integrity by consulting with others who are familiar with the responding professional’s work.
The responding professional’s findings

14 The responding professional’s written response to the enquiring professional after completion of the work would:

   a) identify the purpose of the work;

   b) identify the financial statements or data to which it relates;

   c) identify the responding professional’s relationship to the entity to which the financial statements or data pertain;

   d) confirm awareness that the enquiring professional intends to consider the work in accordance with this Statement; and

   e) when appropriate, include a copy of the report provided to the party who employed or engaged the responding professional that sets out the findings and, when applicable, opinions of the responding professional, including a representation that the work was performed in accordance with the applicable professional standards.

15 When the enquiring professional has a question about an aspect of the responding professional’s work, the question would be raised with the responding professional who would provide a reasonable explanation about that aspect of his or her work. This does not, however, limit the right of the enquiring professional to any information or explanation that may be required in the performance of his or her duties in accordance with the applicable professional standards.

Disclosure of respective responsibilities to the readers of financial statements

16 When required by law or regulation, a description of the respective responsibilities of the auditor and of the actuary involved in the preparation of the financial statements would accompany the financial statements.
1530 Review or repeat of another actuary’s work

.00 The standards in this subsection 1530 apply to a review engagement that is at the instigation of a user. They do not apply to quality control in the first actuary’s firm or employer, even if the reviewer is external to the first actuary’s firm or employer. The standards for a review engagement also apply, mutatis mutandis, to a repeat engagement.

.01 In this subsection 1530,
   • “first actuary” means an actuary whose work is reviewed or repeated,
   • “review engagement” means an engagement to review the first actuary’s work,
   • “reviewer” means the actuary engaged to review or repeat the first actuary’s work, and
   • “repeat engagement” means an engagement to repeat all or part of the first actuary’s work.

.02 Repealed

.03 If the terms of the first actuary’s engagement so permit, then the first actuary should cooperate with the reviewer. [Effective February 1, 2018]

.04 If the terms of the review engagement so permit, then the reviewer should, as soon as practical, discuss the review with the first actuary (unless the reviewer’s agreement with the first actuary’s work makes such discussion superfluous), and should attempt to resolve any difference between them. The reviewer should report the result of such discussion. [Effective February 1, 2018]

.05 If the reviewer reports disagreement with the first actuary’s work but that work is within the range of accepted actuarial practice, then the reviewer should so report. [Effective February 1, 2018]

.06 If a limitation in time, information, data, or resources constrained the quality of the first actuary’s work, then the reviewer should so report. [Effective February 1, 2018]

.07 If discussion between the two actuaries results in improvement to the first actuary’s work or, in the case of periodic reporting, to the work expected for the subsequent report, then the reviewer should so report. [Effective February 1, 2018]

.08 If the first actuary’s work is not within the range of accepted actuarial practice, then the reviewer should so report. [Effective February 1, 2018]
Standards of Practice

Selection of reviewer

.10 The reviewer may be selected by a user of the first actuary’s work or by the first actuary. The latter would not be appropriate if it gives rise to a potential conflict of interest (e.g., where the interests of the user and the first actuary’s client or employer are opposed), but may otherwise be appropriate if it serves to

- facilitate compliance with this subsection 1530; and
- help assure selection of a qualified reviewer.

.11 In selecting a reviewer, the first actuary would take into consideration the user’s objective for the review and would consult with the user as appropriate.

.12 If an actuary is qualified to perform the work of the first actuary, then that is prima facie evidence that the actuary is qualified to be the reviewer.

.13 The perceived objectivity of the reviewer is enhanced if the reviewer is independent of the first actuary.

Timing of the review

.14 The review may take place prior to the release of the first actuary’s report (“pre-release review”) or after such release (“post-release review”). A pre-release review provides the opportunity for the reviewer to suggest improvement to the work. A post-release review allows such improvement to be implemented only in future work and in some cases might require a withdrawal of the report and revision to the work.

.15 Repealed

Difference between the two actuaries

.16 If the reviewer identifies findings for a difference that is material, the reviewer would so report, along with an explanation of the reason for the difference.

.17 If the reviewer identifies findings for a difference that is not material, the reviewer would avoid reporting such a difference if it would lead to an unnecessary dispute with the first actuary. If the reviewer has access to different data, information, or resources, or has different time constraints than the first actuary had at the time of initial preparation of the report, then the reviewer would so report.

.18 If the reviewer believes that access to different data, information or resources would serve to reduce uncertainty in the interpretation of the work, then the reviewer would so report.

.19 Repealed

.20 Repealed
Appropriate review engagement

.21 The reviewer would consider the appropriateness of a review engagement that precludes discussion with the first actuary, especially if the first actuary will not be apprised that the review is to take place. Nevertheless, such an engagement may be an appropriate engagement, where, for example

- the interests of the first actuary’s client or employer and the reviewer’s client or employer are opposed, especially so in the case of actuarial evidence work involving litigation or mediation.
- the reviewer’s client or employer is a judicial, legal or regulatory authority who is investigating the first actuary’s conduct or the conduct of the first actuary’s client or employer.
- the review is merely preliminary to a further review in which timely open discussion between the two actuaries will be possible.

.21.1 An engagement that limits or delays discussion between the two actuaries may be an appropriate engagement if the reviewer’s client or employer wants to ensure that the two reports are independent of each other.

.22 In the case of actuarial evidence work involving litigation or mediation, the reviewer may be asked to report, without discussion with the first actuary,

- results based on assumptions which differ from those in the first actuary’s report,
  or
- alternatives to the first actuary’s reported results that are within the range of accepted actuarial practice.

Such an engagement would be an appropriate review engagement.

.23 Repealed

Repeat engagement

.24 A repeat engagement would be an appropriate engagement if its purpose is to identify or reduce uncertainty in the interpretation of the first actuary’s work.

.25 If the second actuary knows or suspects that the engagement is a repeat engagement, then he or she would take into account the possibility that the client or employer is “opinion shopping” when determining if it is an appropriate engagement. Such an engagement may not be an appropriate engagement.
1600 Assumptions and Methods

1610 Methods

.01 The actuary should select a method that takes account of the circumstances affecting the work. [Effective February 1, 2018]

.02 The basis for calculating actuarial estimates is comprised of a method and one or more assumptions. Methods represent the underlying manner in which actuarial calculations are undertaken. Methods differ from one area of actuarial practice to another and have differed over time.

.03 In selecting an appropriate method, the actuary would consider whether any method is mandated by law, by practice-specific standards or by the terms of the engagement.

1620 Assumptions

.01 The actuary should identify and select each assumption that is needed for the work, except for those that are prescribed, that are mandated by law or that are stipulated by the terms of the engagement. [Effective February 1, 2018]

.02 The actuary should select an appropriate model or data assumption for a matter as the best estimate assumption relating to that matter, modified, if appropriate, to make provision for adverse deviations. In selecting an assumption, the actuary should take account of the circumstances affecting the work, past experience data, the relationship of past to expected future experience, anti-selection, and the relationship among matters. [Effective February 1, 2018]

.03 The appropriate assumption for a matter, other than a model or data assumption, should be continuation of the status quo, unless there is none or unless there is a reasonable expectation that it will change, and the actuary so reports. [Effective February 1, 2018]

.04 Throughout the standards, the word “calculation” appears, but not as a defined term. It can imply a mathematical operation as simple as adding two numbers or as complex as a scenario of financial condition testing. “Calculation” does not necessarily imply that a model is used. The word “calculation”, when used in the context of a model, emphasizes the result of a model run and to a lesser extent model specification and model implementation.

.05 It may be useful, under the terms of the engagement, to report the result of two assumptions without opining on their relative appropriateness and to recommend that each user select that which meets his or her needs.
Standards of Practice

Model assumptions

.06 The model assumptions are quantitative assumptions in a model about

- Contingent events;
- Investment return and other economic matters, such as price and wage indices; and
- Numerical parameters of the environment, such as the income tax rate.

.07 There is a model assumption for each of the matters that the actuary’s model takes into account. Those matters would be sufficiently comprehensive for the model reasonably to represent reality.

.08 A model, whether simple or complex, requires model assumptions. The model depends on the purpose of the work and the sensitivity of the model run to the various matters about which assumptions could be made. The actuary would strike a balance between the complexity needed for reasonable representation of reality and the simplicity needed for a practical calculation. If the model specification does not take into account a matter, the result is an implicit assumption about that matter, usually an assumption of zero probability or of zero rate. The actuary may compensate for an inappropriate implicit assumption regarding a matter that the model specification does not take into account by altering the explicit assumption regarding a matter that the model does take into account.

.09 For models with interrelated model assumptions, the actuary would consider the interaction between assumptions.

Data assumptions

.10 Data assumptions are the assumptions, if any, needed to relieve insufficiency or unreliability in the data.

.11 The available data may be not sufficient or not reliable. For example, files of pension plan members may lack the date of birth of the members’ spouses. Based on sampling, or on comparison with comparable data, it may be appropriate to assume a relationship between spouse and member ages; for example, that a male spouse’s date of birth is three years before the member’s, and that a female spouse’s date of birth is three years after the member’s.

Assumptions other than model and data assumptions

.12 The assumptions other than model and data assumptions are the assumptions about the legal, economic, demographic, and social environment upon which the model and data assumptions depend.
Such other assumptions are usually qualitative, dealing with the environment; for example,

- Legislation, like the Income Tax Act (Canada);
- Student education;
- The medical care system;
- Government social security systems; and
- International treaties.

Those assumptions are needed to the extent that the model assumptions and, in some cases, the data assumptions depend upon them. Such assumptions are numerous and it is not practical to identify all of them.

Continuation of the status quo is usually the appropriate assumption for other than model and data assumptions; for example, an assumption that the fund of a registered pension plan continues not to be taxed or that the capital markets remain more or less as they are. Users may infer that assumption except where the actuary reports otherwise. The actuary would report an assumption

- That is different from continuation of the status quo; and
- Regarding a matter for which there is no status quo, for example, a student’s assumed occupation after completion of education.

Acceptable range

There is a reasonable range of assumptions that may be selected by an actuary for particular work and that might produce materially different results. Sometimes, it is desirable that actuaries produce results within a relatively narrow range, in which case the practice-specific standards may prescribe certain methods and/or assumptions to achieve that purpose.

Circumstances affecting the work

Knowledge of the circumstances affecting the work may require consultation with the persons responsible for the functions that affect experience. For example, if the calculation is to value the assets or liabilities of a benefits plan, the actuary would consult the persons responsible for investments, administration, and plan provisions. If the calculation is to value the policy liabilities of an insurer, the actuary would consult the officers responsible for investments, underwriting, claims, marketing, product design, policy dividends, and policy servicing.

An assumption about a matter would take account of the circumstances affecting the work if those circumstances affect that matter. The circumstances affecting the work are relevant for experience in most matters other than economic matters.
Past experience data

.19 The available and pertinent past experience data are helpful in the selection of assumptions.

.20 Other things being the same, pertinent past experience data are data

- Relating to the case itself rather than to similar cases;
- Relating to the recent past rather than to the distant past;
- That are homogeneous rather than heterogeneous; and
- That are statistically credible.

These criteria may conflict with each other.

Expected future experience vs. past experience

.21 To extrapolate pertinent past experience and its trend to the near future is often, but not necessarily, appropriate.

.22 The appropriateness of the extrapolation depends on the matter assumed. For example, pertinent past mortality experience is a better indicator of the outlook than is pertinent past investment return experience.

.23 An extrapolation would take account of a change that affects the outlook. For example,

- Adoption of a subsidized early retirement option in a pension plan may affect retirement rates;
- A change in an insurer’s case estimate practices may affect its claims development;
- An insurer’s discontinuance of a line of business may affect its expense rates allocable to the remaining lines; and
- A change in judicial practice may affect the settlement of claims.

Anti-selection

.24 Each assumption would normally take account of potential anti-selection.

.25 One party in a relationship may have the right (or the administration of the relationship may give the privilege) to exercise certain options. That party may be, for example, an insurer’s policy owner, a benefits plan’s member, a borrower, a lender, or a shareholder.
Standards of Practice

.26 Examples are the right or privilege of a

- Pension plan member to select his or her retirement date when the pensions at various retirement ages are not actuarially equivalent;
- Policy owner to renew term life insurance at its expiry for a stipulated premium;
- Mortgagor to prepay principal, or an issuer to call a bond or redeem a preferred share; and
- Shareholder to retract a share.

.27 When considering a single relationship, it is reasonable to expect that party to exercise those options to the detriment of the other party in the relationship if it is to the first party’s advantage to do so. However, where a number of such relationships are concerned, such as a portfolio of policy owners or members of a benefit plan, it may not be reasonable to assume that every one of these would exercise such an option in that manner.

.28 The extent of anti-selection depends on

- The size of the advantage from each exercise of the option (for example, anti-selection is dampened if the advantage to each policy owner is small even when the aggregate potential detriment to an insurer is large);
- The concomitance of exercise of the option (for example, election of a favourable early retirement pension may force the plan member into unwanted unemployment, or a policy owner (who is also the life insured) in ill health may be unable to afford to continue an insurance policy with a low premium);
- The policy owner’s or plan member’s difficulty in making the required judgment (for example, everyone knows his or her age, but a person may be unable to gauge the effect of ill health on longevity); and
- The sophistication of the policy owner, plan member, borrower, lender, or shareholder.

Independently reasonable and appropriate in the aggregate

.29 The assumptions that the actuary selects or for which the actuary takes responsibility, other than alternative assumptions selected for the purpose of sensitivity testing, would be independently reasonable and appropriate in the aggregate.
The actuary would select independently reasonable assumptions. The following are examples:

- For a typical defined benefit pension plan valuation, the actuary would adopt an explicit investment assumption, as well as an explicit expense assumption rather than using implicit assumptions incorporated within a net discount rate. However, for a small defined benefit pension plan, the actuary may choose to use approximations for the investment expenses.

- For a typical non-participating life insurance portfolio where experience is not passed on to policy owners, all assumptions would be established independently. However, for a typical participating life insurance portfolio where experience is passed on to policy owners through changes to the dividend scale, a reasonable representation of reality would be to assume that the current dividend scale and current experience persist into the future, as long as any implicit offsets in assumptions simplify the valuation and do not materially affect the amount of the valuation.

The actuary would avoid the use of independently reasonable assumptions that are inconsistent or biased in the same direction, either of which might result in the assumptions not being reasonable in the aggregate. If an assumption is prescribed, is mandated by law or is stipulated by the terms of the engagement, it would not be appropriate to compensate for this prescription or stipulation by modifying other assumptions. The remaining assumptions would be reasonable in the aggregate and to the extent possible be independently reasonable.

The use of independently reasonable assumptions implies that each assumption is explicitly defined. However, there would be no requirement to use explicit assumptions in the model specification, as long as the result of using that model does not produce a material error. For example, for pension valuations, use of a discount rate net of expenses may produce a value very close to the value obtained by using explicit assumptions. In this case, the actuary would disclose both the gross investment rate assumption and the expense assumption.

**Stipulated or mandated assumptions**

Use of an assumption stipulated by the terms of the engagement is use of the work of another person.

If the assumption is mandated by law and an amendment to the law is virtually definitive, it may be useful to report a result that reflects the amendment.
Discount rate

.35 The use of a discount rate is inherent in the actuarial present value method. The discount rate may be constant or it may vary over time. In selecting the best estimate assumption for the discount rate, the actuary, consistent with the circumstances affecting the work, may either

- Take into account the expected investment returns of the assets that support the liabilities; or
- Reflect interest rates on relevant fixed income reference securities.

.36 In selecting the best estimate assumption for the discount rate, the actuary, consistent with the circumstances affecting the work, may assume that the yields on fixed income investments at future dates, either

- Remain at levels applicable at the calculation date; or
- Revert in the long term to expected levels.

1630 Provision for adverse deviations

.01 The actuary should include a provision for adverse deviations in calculations only to the extent required by the terms of the actuary’s engagement or as mandated by law or as prescribed by practice-specific standards. [Effective February 1, 2018]

1640 Comparison of current and prior assumptions

.01 Unless the actuary reports the inconsistency, the assumptions for a calculation for a periodic report should be consistent with those of the prior calculation. [Effective February 1, 2018]

.02 The definition of consistency for the purpose of this recommendation varies among practice areas. For example,

- For advice on funding a pension plan, the assumption at a calculation date is consistent with the corresponding assumption at the prior calculation date if the two are numerically the same; and
- For valuation of an insurer’s insurance contract liabilities for its financial reporting, an assumption at a calculation date is consistent with the corresponding assumption at the prior calculation date if the two assumptions
  - Each reflect the conditions and outlook at their respective calculation dates in the case of a best estimate assumption;
Standards of Practice

- Each reflect the risks at their respective calculation dates in the case of a margin for adverse deviations; and
- Are located at the same point within the range of accepted actuarial practice.

.03 If the assumptions are not so consistent, the actuary would report the inconsistency. If practical, useful and appropriate under the terms of the engagement, the report would quantify the effect of the inconsistency.
1700 Reporting

1710 Reporting: external user report

.01 In an external user report, the actuary should

- Identify the client or employer;
- Describe the work, its purpose, and its users;
- Say that use of the report may not be suitable for another purpose;
- Say whether or not the work is in accordance with accepted actuarial practice in Canada and, if not, disclose the deviation from that practice;
- If useful, disclose any unusual application of accepted actuarial practice;
- If the report is supported by the use of a model, disclose limitations in the model relevant to the intended purpose;
- Disclose any aspect of the work for which the actuary does not take responsibility;
- Describe each assumption used for the work that is material to the results of the work, including the extent of any margin for adverse deviations included with respect to each such assumption;
- Provide the rationale for each such assumption that is material to the results of the work;
- For matters requiring an assumption other than a model or data assumption, disclose any assumption that is different from assumption of continuance of the status quo and, if practical, useful, and appropriate under the terms of the engagement, disclose the effect of alternative assumptions;
- Describe the methods used for the work;
- In the case of a periodic report, disclose any inconsistency between the assumptions and methods of the current and prior reports and the rationale for such inconsistency;
- Describe any subsequent event that is not taken into account in the work;
- Disclose any reservation;
- Express an opinion on the assumptions and methods used for the work;
- Express an opinion on the results of the work;
- Identify himself or herself and sign the report; and
- Date the report. [Effective February 1, 2018]
.02 Any description or disclosure may be in material referred to in the report and either accompany the report or plausibly be available to users. [Effective February 1, 2018]

.03 Subsequently, the actuary should respond to a user’s request for explanation except if that is contrary to the terms of the engagement. [Effective February 1, 2018]

.04 Subsequently, the actuary should withdraw or amend the report if information comes to hand after the report date that invalidates the report. [Effective February 1, 2018]

.05 A duty of confidentiality in an appropriate engagement supersedes any of the foregoing portions of this recommendation with which it conflicts. [Effective February 1, 2018]

Description and disclosure in general

.06 The range of appropriate reports is relatively narrow for external user reports as compared to that for internal user reports. An external user report would be relatively formal and detailed when the actuary does not communicate directly with users or when the interests of an external user and of the actuary’s client or employer are not the same.

.07 Appropriate description and disclosure in a report strike a balance between too little and too much. Too little disclosure deprives the user of needed information. Too much disclosure may exaggerate the importance of minor matters, imply a diminution of the actuary’s responsibility for the work, or make the report hard to read.

.08 The appropriate criterion for description and disclosure is the question, “What qualitative and quantitative information best serves the user’s understanding and decision-making?” The question, “What information does the user want?”, is an insufficient criterion because the circumstances affecting the work may make the actuary aware of information needs of which the user is unaware.

.09 The actuary would consider and address the sensitivity of the results of the work to variations in key assumptions where practical, useful, and consistent with the terms of the engagement.

.10 Disclosure need not necessarily be in the report itself except if its importance so warrants or if it cannot be referenced in material available to users. Disclosure in a short report may place undue emphasis on the information disclosed.
An unintended reservation misleads the user if it implies either that there was a deviation from accepted actuarial practice or that the actuary does not take full responsibility for the work. The following are examples.

- Approximation is a usual part of work. Even a moderately complex calculation may involve many approximations. Disclosure of an appropriate approximation may mislead the user by implying that the actuary’s work falls short of accepted actuarial practice.
- Use of another person’s work is also a usual part of work. If the actuary does not take responsibility for the used work, disclosure is appropriate. Disclosure if the actuary does take responsibility for the used work may mislead the user.
- Deviation from a particular recommendation or other guidance in the standards when the result of doing so is not material is also a usual part of work and its disclosure is undesirable.

The work, its purpose, and its users

Description of the work usually includes the calculation date and the numerical result. If the work is mandated by law, citation of the law is useful.

The amount of detail depends mainly on the needs of users. A separate report may be desirable for a particular user (usually a regulator) whose desire for detail significantly exceeds that of other users.

Description of the purpose of the work and its users permits another person to assess its appropriateness to his or her needs and may thereby avoid unintended use of the work.

The users comprise the addressee(s) of the report, and any others explicitly identified in the report. Where a report has more than one user, the actuary would have regard to the information of value to each user in determining appropriate disclosure.

Accepted actuarial practice

If the work is in accordance with accepted actuarial practice, a simple statement to that effect is a powerful statement, and reassuring even to a user with a limited understanding of what constitutes accepted actuarial practice. If the work is not in accordance with accepted actuarial practice, a statement that it is, except for specified deviations, is a concise description.

Any deviation from accepted actuarial practice would result from either conflict with law or conflict with the terms of an appropriate engagement.

For work in Canada, the actuary would refer to “accepted actuarial practice for work in Canada”, or use other language of equivalent meaning and clarity.
.19 For work outside of Canada, the actuary may choose to refer to

- “Accepted actuarial practice for work in [country]”, if the guidance of a foreign jurisdiction has been applied to the work;
- “Internationally accepted actuarial practice”, if the guidance of the International Actuarial Association has been applied to the work; or
- “Accepted actuarial practice for work in Canada”, if Canadian guidance has been applied to the work because of the absence of applicable foreign guidance.

Unusual application of accepted actuarial practice

.20 The actuary would not usually report a deviation from a particular recommendation or other guidance in these standards as a result of an unusual or unforeseen situation.

.21 If, as is common, accepted actuarial practice for an aspect of the work encompasses a range, the actuary usually reports the work as being in accordance with accepted actuarial practice without drawing particular attention to his or her selection within the range. Disclosure of the selection, and of the reason for selecting it, is appropriate, however, if it is

- Mandated by law or specified by the terms of the actuary’s engagement;
- Excluded from the accepted range by an exposure draft or by approved, but not yet effective, new standards;
- Inconsistent with the corresponding assumption of a prior periodic report;
- Dependent on a special permissive feature in the law for its acceptability; or
- Unusual or controversial.

Limitation to actuary’s responsibility

.22 Any diminution of the actuary’s responsibility for the work as a result of an engagement whose terms call for a deviation from accepted actuarial practice would be disclosed.

Disclosure of assumptions

.23 Where an assumption or method is mandated by law, the actuary would, if relevant, disclose that use of the report, based on the mandated assumption or method, may not be appropriate for purposes other than that for which the report was prepared.
Standards of Practice

Subsequent event not taken into account in the work

.24 An example of a subsequent event not taken into account in the work is a non-retroactive increase in the benefits of a pension plan for which the actuary is advising on funding. The actuary would describe the increase, report that it was not taken into account in the current advice on funding but that it will be taken into account in future advice. If useful, the actuary would quantify its effect, for example, by reporting the pro forma effect on the recommended funding if the benefit increase were effective immediately before the calculation date.

Reservations

.25 A report with reservation may be unavoidable in certain circumstances, such as the following:

- The actuary was obliged to use the work of another person and has doubts about the appropriateness of so doing.
- The actuary was unable to arrive at a conclusion as to the sufficiency and reliability of the data.
- There was an undue limitation to the scope of the actuary’s work. For example, the time, information, or resources contemplated by the terms of the engagement did not materialize.
- There is an unresolved conflict of interest.

.26 The actuary would report any remedy, underway or expected, to the problem causing the reservation.

.27 A serious reservation may call for consulting with another actuary or obtaining legal advice.

.28 Barring explicit disclosure to the contrary in the report, the user is entitled to assume that

- The work is in accordance with accepted actuarial practice and no reservation is required;
- The data are sufficient and reliable; and
- If a periodic report, the method is the same as that in the prior report and the assumptions are consistent with those in the prior report.
Use of models

.29 An external user report would rarely refer directly to a model. Disclosures related to a model are typically found in supporting documents. The report would contain a reference to a model if, for example, the actuary is required to do so by the engagement, the model has limitations relevant to the purpose of the engagement, or the actuary is unable to assess model risk.

.30 Explanation of the limitations of a model and the implications of those limitations would include descriptions of:

• any relevant exclusions from the model, and
• simplifying assumptions made.

.31 If the actuary uses a model outside the domain of actuarial practice and is not able to verify the appropriateness of using such a model, the actuary would so report.

Opinion

.32 In giving an opinion on any matter in the report, the actuary would begin with “In my opinion...” which is a signal that the actuary is giving a formal, professional opinion.

.33 With respect to any assumption or method specified by the terms of the engagement, the actuary would:

• If the actuary considers such assumption or method to fall within the range of accepted actuarial practice, opine that the assumption or method is appropriate;
• If the actuary considers such assumption or method to not fall within the range of accepted actuarial practice, report that the assumption or method is not in accordance with accepted actuarial practice and report that the assumption or method was specified by the terms of the engagement, as applicable;
• If the actuary is unable to easily determine whether the assumption or method falls within the range of accepted actuarial practice, report that the assumption or method may not be in accordance with accepted actuarial practice and report that the assumption or method was specified by the terms of the engagement, as applicable.

.34 It may be convenient to group the opinion statements in the external user report in a section with a heading such as Statement of Opinion that would be signed by the actuary.

Identification

.35 For work in Canada, the actuary would usually identify himself or herself simply as “Fellow, Canadian Institute of Actuaries” (or “FCIA” if users recognize the abbreviation), especially when Fellowship in the CIA is required or expected for the work.
Standards of Practice

Report date

.36 In reporting an opinion, the actuary would consider all available information up to the report date, including subsequent events if the report date is after the calculation date.

.37 The report date would usually be the date at which the actuary has substantially completed the work. The remaining effort may include peer review, typing and photocopying the report, and compilation of documentation.

.38 The date the actuary signs and delivers the report would be as soon thereafter as practical. If there is an unavoidably long delay, however, the actuary would consider any additional subsequent events that would result from a current report date.

.39 The actuary would issue the report within a reasonable time period with regard to the actuary’s terms of engagement and the needs of the users of the report.

Withdrawal or amendment of a report

.40 After the report date, the actuary has no obligation to seek additional information that, if known at the report date, would have been reflected in the work, but, if additional information comes to hand, the actuary would consider if it affects the report. Additional information affects the report if it

- Reveals a data defect or a calculation error;
- Provides additional information about the entity that is the subject of the report as that entity was at the calculation date;
- Retroactively makes that entity different at the calculation date; or
- Makes that entity different after the calculation date and a purpose of the work to report on the entity as it was at the calculation date.

.41 Additional information may consist of both external information and internal discovery of an error in the work. Its classification is similar to the classification of subsequent events. That is, if the additional information results in the actuary determining that an event has occurred that would have to be taken into account in the data, assumptions, or methods for the work, it would affect the report. It does not affect the report if it makes the entity, which is the subject of the report, different after the calculation date and a purpose of the work is to report on the entity as it was at the calculation date; for example, if the additional information changes the outlook for the entity that would lead the actuary to select different assumptions at the next calculation date for a periodic report.
.42 If the additional information results in the actuary determining that an event has occurred that affects the report, the actuary would determine whether the event invalidates the report. If the actuary determines that the event does not invalidate the report, the actuary would consider whether to inform some or all of the users of the report about the event. If the actuary determines that the event invalidates the report, the actuary would withdraw or amend the report. If the actuary withdraws or amends a report, he or she would seek agreement with the client or employer on the notification to be given to users and on the preparation of an amended or replacement report in cases where there is no legal requirement to do so. Failing such agreement, the actuary would consider seeking legal advice on the discharge of his or her responsibilities, taking consideration of the fact that, to the extent practical and useful, all users should so be informed.

.43 The following examples are intended to assist actuaries in determining whether an event of which the actuary becomes aware after the report date may be worthy of disclosure to the users of the report or may require the report to be withdrawn or amended:

- If an event affects a report, but that report has been superseded by another report, typically no action would be taken with respect to the prior report;

- If an event materially affects the financial position, financial condition, or funded status of a pension plan, but does not materially affect the funding of the plan, it may be sufficient to disclose the event to the users of the report rather than withdraw or amend the report;

- If an event results in a situation where an assumption used in the work is obviously erroneous, but the assumption was reasonable at the report date, the actuary would typically not withdraw or amend the report, but would reflect the event in a subsequent report; and

- If an actuary has prepared a report that provides advice on the funding of a pension plan and, subsequent to the report date discovers an error in the report, and the funding recommendations contained in the report would change materially if the error were corrected, the actuary may determine that it is appropriate to withdraw or amend the report.

1720 Reporting: internal user report

.01 In the case of an internal user report, the actuary may appropriately abbreviate the recommendation for external user reports. [Effective February 1, 2018]
.02 The range of appropriate reports is wider for internal user reports than for external user reports. At one end of the range, a formal internal user report may differ little from an external user report. At the other end of the range, an informal, abbreviated, even oral, report may suffice for a representative of the actuary’s employer or client with whom the actuary communicates frequently and who is well-versed in the subject of the report. To abbreviate the standards for an internal user report is efficient for both the actuary and the user provided that complete and clear communication is not thereby compromised.

1730 Reporting: oral report

.01 Oral reporting, especially to an internal user, is both useful and inevitable in some situations. The disadvantage of oral reporting is that the actuary and user may have differing recollections of what was reported. It is therefore good practice to confirm an oral report in writing, especially when there is an external user, or to record it in documentation.

.02 Except for signature and report date, the standards are the same for both oral and written reports.

1740 Summary report

.01 Where required by practice-specific standards, the actuary should prepare a summary report. [Effective February 1, 2018]

.02 The practice-specific standards specify the language to be used in the summary report.

.03 The purpose of the summary report is to simplify the actuary’s communication with users and may be incorporated in a report prepared by the actuary’s employer or client; for example, the financial statements of an insurer, a pension plan or a public personal injury compensation plan. Such a report does not constitute an external user report.

2100  Insurance Contract Valuation: All Insurance

2110  Scope

.01  Part 1000 applies to work within the scope of part 2000.

.02  Section 2100 applies to all kinds of insurance.

.03  Section 2200 applies to property and casualty insurance.

.04  Section 2300 applies to life and health (accident and sickness) insurance.

.05  Sections 2400 and 2500 apply to all kinds of insurance.

.06  Section 2600 applies to property and casualty insurance.

.07  Section 2700 applies to life and health (accident and sickness) insurance.

.08  Part 2000 does not apply to post-employment benefit plans covered by the Practice-Specific Standards for Post-Employment Benefit Plans, nor does it apply to personal injury compensation plans covered by the Practice-Specific Standards for Public Personal Injury Compensation Plans.

.09  The legal form of the insurer is not relevant for purposes of the application of part 2000.

.10  Sections 2100, 2200, and 2300 apply to the valuation of the insurance contract liabilities and reinsurance recoverables in an insurer’s financial statements when the intent is that those statements be in accordance with generally accepted accounting principles in Canada, whether or not the insurer is a publicly accountable enterprise. They also apply where statutory or regulatory instructions require the actuary to value the insurer’s policy liabilities in accordance with accepted actuarial practice.

.11  In certain cases, methodology described in one of sections 2200 or 2300 may be useful for the insurance to which the other section applies. For example, while a simple technique is usually appropriate for valuation of claim liabilities for life and health insurance, the more sophisticated techniques used for property and casualty insurance may be appropriate for life and health insurance contracts for which claim development is complex. Similarly, for travel insurance and other short-term policies sold by property and casualty insurers, a simple technique may be appropriate.

---

1 The CPA Canada Handbook contains both Canadian generally accepted accounting principles applicable to publicly accountable enterprises (i.e., International Financial Reporting Standards) and Canadian generally accepted accounting principles applicable to private enterprises and not-for-profit organizations.
2120 Method

.01 The actuary should value the insurance contract liabilities and the reinsurance recoverables for the statement of financial position and the changes in them for the statement of income. [Effective April 15, 2017]

.02 The actuary should coordinate the valuation with the insurer’s accounting policy as respects the choice between going concern and wind-up accounting, and so that the insurance contract liabilities, reinsurance recoverables, and other items in the statement of financial position

- Are consistent;
- Avoid omission and double counting; and
- Conform to the presentation of the statement of income. [Effective April 15, 2017]

.03 The relevant insurance contracts for the valuation are those that are in force, including those whose issue is then committed, at the calculation date, or that were in force earlier and that will generate cash flow after the calculation date. [Effective April 15, 2017]

.04 The insurance contract liabilities, net of reinsurance recoverables, in respect of each of the relevant insurance contracts should be comprised of the cash flow after the calculation date from the premiums, benefits, claims, expenses, and taxes that are incurred during the term of its liabilities. [Effective April 15, 2017]

.05 The cash flows that comprise the insurance contract liabilities should include the effect of

- Retrospective premium, commission, and similar adjustments;
- Experience rating refunds;
- Reinsurance ceded;
- Subrogation and salvage;
- The exercise of policy owner options; and
- The deemed termination at the end of the term of its liabilities of each policy then in force. [Effective April 15, 2017]

.06 The valuation should take account of the time value of money. [Effective April 15, 2017]
The actuary should ensure that the application of margins for adverse deviations with respect to the insurance contract liabilities and the related reinsurance recoverables results in an increase to the value of the liability net of reinsurance. The provision resulting from the application of all margins for adverse deviations, in addition to increasing the net liability, should be appropriate in the aggregate. [Effective April 15, 2017]

Policy liabilities other than insurance contract liabilities would be valued in conformity with applicable International Financial Reporting Standards and accepted actuarial practice.

Calculation date

Consistent with its definition in part 1000, the term “calculation date” as used throughout part 2000 refers to the effective date of the valuation of assets and liabilities reported in the financial statements (commonly referred to in practice as the “balance sheet date”).

The insurer’s accounting policy

In preparing the insurer’s financial statements, management would choose between going concern and wind-up accounting. The actuary would conform the valuation to that choice. If the actuary believes the choice to be inappropriate, then, after consultation with the auditor, he or she would so report.

Going concern accounting is appropriate for an insurer that is expected to remain open to new business and in satisfactory financial position indefinitely.

Going concern accounting is also appropriate for an insurer that is expected to become closed to new business, but to continue in a satisfactory financial position, either indefinitely or until

- An increase in capital; or
- A combination with, or transfer of its policies to, another insurer in a satisfactory financial condition,

brings financial relief.

Use of the terms “insurance contract liabilities”, “policy liabilities”, “reinsurance recoverables”, “premium liabilities”, and “claim liabilities” is desirable in financial statements, but the choice of the terminology and itemization is a management decision. Regardless of the terminology and itemization chosen, the actuary would ensure that all relevant liabilities are identified and valued.
.14 Insurance contract liabilities and reinsurance recoverables consist of premium liabilities and claim liabilities. Claim liabilities are those in respect of benefits and claims incurred on or before the calculation date. The valuation of claim liabilities would reflect all cash flow related to such claims, including benefit payments, expenses and taxes, occurring after the calculation date. Premium liabilities are those in respect of premiums and all other benefits and claims, including their related expenses and taxes, incurred after the calculation date.

.15 When reporting under International Financial Reporting Standards, insurance contract liabilities reported in the insurer’s statement of financial position would be presented gross of reinsurance recoverables. The value of the reinsurance recoverables is recorded separately and would be valued appropriately. The valuation of the reinsurance recoverables would take account of not only the reinsurer’s share of claims but also reinsurance commissions, allowances, retrospective premium adjustments, and the financial condition of the reinsurer. Where an actuary is valuing, and reporting on, the valuation of policy liabilities other than in compliance with International Financial Reporting Standards, the policy liabilities may be reported net of reinsurance recoverables.

.16 For the purposes of part 2000, the insurance contract liabilities reported in the insurer’s statement of financial position would exclude the liabilities of its segregated funds, but would include, in respect of segregated fund contracts, the liabilities of its general fund related to insurance benefits payable under the terms of such contracts, such as guaranteed minimum benefits in excess of policy owner account values.
.17 The insurer’s accounting policy may report amounts related to insurance contracts and the assets that support insurance contract liabilities, as part of the insurance contract liabilities, or as separate items in the statement of financial position, or as a mixture of the two. Examples of such related items include

- Deposit liabilities (for example, policy dividends on deposit);
- Incurred but unpaid items (for example, taxes incurred but not paid and policy dividends due but not paid);
- Future tax liabilities and assets (for example, those in connection with the timing differences between accounting and tax liabilities);
- Receivables from, payables to, and deposits by reinsurers;
- Amounts recoverable from policy owners;
- Provisions for asset depreciation; and
- Deferred policy acquisition expenses.

The actuary would value the insurance contract liabilities so that

- In the aggregate, the insurance contract liabilities and those separate items are consistent and avoid omission and double counting; and
- The separate reporting of those items does not affect the insurer’s capital.

.18 As respects consistency, the actuary would, for example, ensure that the cash flows included in the insurance contract liabilities and the reinsurance cash flows in respect of the same policies are estimated based on consistent assumptions, except that reinsurance cash flows would also take account of the financial condition of the reinsurer.

.19 As respects double counting and omission, the actuary would, for example, ensure that

- No asset is allocated more than once to support liabilities; and
- The provision for asset depreciation included in the insurance contract liabilities does not duplicate any provision for asset depreciation deducted from the asset side of the statement of financial position.

Relevant insurance contracts

.20 At the calculation date, the relevant contracts for the valuation include

- Policies that are in force at that date;
- Policies which, at that date, the insurer is committed to issue; and
- Policies that were in force prior to that date which could generate cash flow after that date.
There are no amounts included in insurance contract liabilities in the financial statements in respect of other policies expected to be issued after the calculation date, whether or not they are expected to be profitable.

.21 There usually are both premium liabilities and claim liabilities in respect of policies that are in force at the calculation date. There may be reinsurance recoverables in respect of insurance contracts that are in force at the calculation date.

.22 There may be claim liabilities in respect of policies that are not in force at the calculation date as a result of outstanding claims incurred while they were in force. There may be premium liabilities in respect of those policies as a result of the right of policy owners to reinstate them, or of their unpaid

- Retrospective premium, commission, and similar adjustments;
- Experience rating refunds; and
- Subrogation and salvage.

There may be reinsurance recoverables related to policies that are not in force at the calculation date as a result of outstanding claims incurred while they were in force.

**Cash flows comprising the insurance contract liabilities**

.23 The insurance contract liabilities in respect of a relevant policy are comprised of that policy’s cash flows after the calculation date that would be incurred during the term of the liability for that policy. Considerations in determining the term of the liability for life and health (accident and sickness) insurance are discussed in section 2300.

.24 The tax cash flows are limited to those generated by premiums, benefits, claims, and expenses, and by the assets that support the insurance contract liabilities. The expense cash flows are limited to those generated by the relevant policies, including overhead allocations. The tax and expense cash flows exclude, for example, tax on investment income from, and the investment expense of, assets that support capital.

.25 The actual timing of cash flow for a given policy may occur beyond the term of its liabilities as a result of lag between an insured event (e.g., the incurring of a claim) and its resultant cash flow. The extension may be prolonged, for example, for a claim payable in instalments under long-term disability insurance, and a claim under product liability insurance that has a long settlement period.

**Retrospective premium, commission, and similar adjustments**

.26 In determining the value of a contractual right of the insurer to future premiums that depend on past claims experience, the actuary would take account of creditworthiness of the policy owner.
Experience rating refunds

.27 The liability for experience rating refunds would take account of

- The assumptions used in calculating the insurance contract liabilities in respect of those matters which determine experience rating refunds;
- The difference between the basis for the insurance contract liabilities and the corresponding basis in the experience rating; and
- Any cross-rating across coverages in the experience rating.

.28 The experience rating refund element of the insurance contract liabilities would include provision for adverse deviations only for

- Risk of misestimation of interest rates and risk of interest rate changes; and
- Uncertainty in the calculation of the experience rating refund.

.29 The experience rating refund element of the insurance contract liabilities would not be negative except to the extent that in settlement it may be offset against another liability or recovered from policy owners.

.30 Where an insurer holds an asset for an accrued experience rating deficit, the actuary would test the appropriateness and recoverability of the receivable amount using the valuation assumptions and methodology for experience rating refunds, and make an adjustment to the insurance contract liabilities if necessary.

Reinsurance ceded and retroceded

.31 The estimated amount of recovery on account of reinsurance ceded would take account of the financial condition of the reinsurer.

.32 The actuary would assume that the insurer and the reinsurer each exercises its rights under a treaty (e.g., recapture, cancellation or commutation) to its advantage.

Subrogation and salvage

.33 The actuary would either net subrogation and salvage amounts against claims or value them as a separate item, depending on the insurer’s accounting policy.
Exercise of policy owner options

.34 Examples of policy owner options are

- The conversion of group insurance or individual term insurance;
- The election of a settlement option in individual life insurance;
- The purchase of additional insurance or coverage without underwriting; and
- The selection of the amount of premiums for universal life insurance.

Deemed termination of remaining policies

.35 The comprised cash flow in respect of a policy that is deemed to terminate at the end of the term of its liabilities would include any amount then payable by the insurer in the event of its termination, modified to take account of the fact that the termination is deemed and not actual. For example, the modification would

- Forego a surrender charge deducted at an actual termination from the policy’s account value to calculate its cash value;
- Forego a deduction at an actual termination from the policy’s unearned premium to calculate its premium refund; and
- Anticipate a persistency bonus becoming payable at a date after the end of the term of the policy’s liabilities if the policy remains in force to that date.

Time value of money

.36 In this context, “supporting assets” means the insurer’s assets and asset commitments that support its insurance contract liabilities.

.37 To take account of the time value of money is to express the forecast of periodic future cash flows as an equivalent single amount at the calculation date, thereby reflecting in the value of the liabilities the amount of future investment income forecast to be earned on the supporting assets. There are two common methods of doing so – a roll-forward approach (e.g., the Canadian asset liability method) and a discounting approach (e.g., the actuarial present value method).

.38 The discount rates and forecast of supporting assets used in the valuation, would take account of

- The supporting assets owned at the calculation date;
- The insurer’s policy for asset-liability management; and
- Assumptions about investment return after the calculation date.
.39 The actuary would value the insurance contract liabilities and reinsurance recoverables so that their aggregate value in combination with the value of other policy-related items in the statement of financial position appropriately takes account of the time value of money.

**Margin for adverse deviations**

.40 The margin for adverse deviations reflects the degree of uncertainty of the best estimate assumption. This uncertainty results from the risk of misestimation of and deterioration from the best estimate assumption. The potential for misestimation is greater when the past experience has been more volatile and hence would justify a greater margin. However, the margin for adverse deviations would be based on a forward-looking assessment of the expected experience and would not act as a mechanism to absorb changes in observed experience, such as changes caused by statistical fluctuations.

.41 Where ceded reinsurance is involved, the sign (positive or negative) of a margin for adverse deviations for a given assumption would take account of the impact of the assumption on assumed recapture, cancellation, commutation, or other treaty provisions and of the corresponding impact on insurance contract liabilities net of reinsurance recoverables.

### 2130 Reporting

.01 The actuary’s report should describe

- The valuation and presentation of policy liabilities and reinsurance recoverables for the insurer’s statement of financial position and statement of income;
- The actuary’s opinion on the appropriateness of those liabilities and recoverables and on the fairness of their presentation; and
- The actuary’s role in the preparation of the insurer’s financial statements if that role is not described in those statements or their accompanying management discussion and analysis. [Effective April 15, 2017]

.02 If the actuary can report without reservation, then the actuary’s report should conform to the standard reporting language, consisting of

- A scope paragraph, which describes the actuary’s work; and
- An opinion paragraph, which gives the actuary’s favourable opinion on the valuation and its presentation;

otherwise the actuary should modify the standard reporting language to report with reservation. [Effective February 1, 2018]

.03 The actuary’s report would conform to relevant Canadian federal and provincial legislation that require the actuary to value the policy liabilities, not only the insurance contract liabilities and related reinsurance recoverables.
Accounting in the statement of financial position

.04 The amount of the insurance contract liabilities is usually the largest amount in the statement of financial position, so that the disclosure of its main components is desirable.

.05 The reference to “policy liabilities”, “insurance contract liabilities” and “reinsurance recoverables” in the standard reporting language is adequate if the notes to the financial statements or their accompanying management discussion and analysis verbally define “insurance contract liabilities” and “reinsurance recoverables”, and the statement of financial position presents their total amount as a separate item.

Accounting in the statement of income

.06 The standard reporting language implies that the statement of income accounts for the total change in the policy liabilities, consisting of the insurance contract liabilities and the liabilities for policies other than insurance contracts, during the financial reporting period, and that it accounts for the total change in reinsurance recoverables. That accounting is direct in the case of a life insurer’s insurance contract liabilities and reinsurance recoverables, whose change is presented as a separate item in the statement of income. That accounting may be indirect in the case of other policy liabilities, if their change is not separately presented, but is included within other items in the statement of income. For example, the item incurred claims would be equal to

- Claims and claim expenses paid during the financial reporting period; plus
- Claim liabilities (which are part of the policy liabilities) at the end of the financial reporting period; minus
- Claim liabilities at the beginning of the financial reporting period.

Such indirect accounting would be considered fair presentation, as would the direct accounting presentation.

Disclosure of unusual situations

.07 The items that the actuary values for the financial statements may be misleading if the financial statements do not present them fairly. The actuary’s report signals to the reader of the financial statements that there is, or is not, fair presentation.

.08 In an unusual situation, fair presentation may require explanation of an item that the actuary values for the financial statements. Usually, the notes to the financial statements would provide that explanation, including, where appropriate, disclosure of the situation’s effect on income and capital. In the absence of such explanation, the actuary would provide it by a reservation in reporting.
The question, “Will explanation enhance the user’s understanding of the insurer’s financial position?” may help the actuary to identify such a situation. Unusual situations may include:

- Capital appropriated or repatriated on the actuary’s advice;
- Off-balance-sheet obligations (e.g., contingent policy liabilities in connection with market conduct);
- Restatement of items for preceding financial reporting periods;
- Inconsistency among financial reporting periods;
- The impracticality of restating any items that are reported in current period financial statements and that were reported inconsistently in preceding period financial statements;
- An unusual relationship between the items in current period financial statements and the expected corresponding items in future period financial statements;
- A change in the method of valuation that does not have an effect in the current financial reporting period but that is expected to have an effect in future financial reporting periods;
- A difference between the insurer’s present practices (e.g., policy for setting dividend scales) and those which the actuary assumed in valuing the policy liabilities; and
- A subsequent event.

Consistency across financial reporting periods

Financial statements usually present results for one or more preceding financial reporting periods in comparison to those for the current period. Meaningful comparability requires the financial statement items for the various periods to be consistent, which can be achieved by the restatement of preceding period items that were previously reported on a basis which was inconsistent with that for the current period. A less desirable alternative to restatement is disclosure of the inconsistency.

A change in the method of valuation creates an inconsistency. A change in the assumptions for valuation reflecting a change in the expected outlook does not constitute an inconsistency although, if its effect is material, then fair presentation would require its disclosure.

A change in assumptions that results from the application of new standards may create an inconsistency.
Communication with the auditor

.13 Communication with the auditor is desirable at various stages of the actuary’s work. These include

- Use of work in accordance with the CIA/CICA Joint Policy Statement;
- The drafting of common features in the auditor’s report and actuary’s report;
- The drafting of a report with reservations;
- The presentation of the insurance contract liabilities, policy liabilities other than insurance contract liabilities, and the reinsurance recoverables; and
- The treatment of subsequent events.

Description of the actuary’s role

.14 The actuary would report a description of his or her role in the preparation of the insurer’s financial statements only if the financial statements or their accompanying management discussion and analysis do not provide that description.

.15 Here is an illustrative description.

“The Appointed Actuary is appointed by the [Board of Directors] of [the Company]; responsible for ensuring that the assumptions and methods for the valuation of policy liabilities [and reinsurance recoverables] are in accordance with accepted actuarial practice in Canada, applicable legislation, and associated regulations and directives;

required to provide an opinion on the appropriateness of the policy liabilities [net of reinsurance recoverables] at the calculation date to meet all policy obligations of [the Company]. The work to form that opinion includes an examination of the sufficiency and reliability of policy data and an analysis of the ability of the assets to support the policy liabilities; and

required each year to analyze the financial condition of the company and prepare a report for the [Board of Directors]. The analysis tests the capital adequacy of the company until [31 December xxxx] under adverse economic and business conditions.”

The wording of the illustrative description conforms to relevant Canadian federal and provincial legislation that require the actuary to value the policy liabilities, not only the insurance contract liabilities.
Standard reporting language

Here is the standard reporting language.

Appointed Actuary’s Report

To the policyholders [and shareholders] of [the ABC Insurance Company]:

I have valued the policy liabilities [and reinsurance recoverables] of [the Company] for its [consolidated] [statement of financial position] at [31 December XXXX] and their changes in the [consolidated] [statement of income] for the year then ended in accordance with accepted actuarial practice in Canada including selection of appropriate assumptions and methods.

In my opinion, the amount of policy liabilities [net of reinsurance recoverables], makes appropriate provision for all policy obligations and the [consolidated] financial statements fairly present the results of the valuation.

[Montréal, Québec] [Mary F. Roe]
[Report date] Fellow, Canadian Institute of Actuaries

The language in square brackets is variable and other language may be adjusted to conform to interim financial statements and to the terminology and presentation in the financial statements.

An auditor’s report usually accompanies the financial statements. Uniformity of common features in the two reports will avoid confusion to readers of the financial statements. Those common features include

- **Addressees:** Usually, the actuary addresses the report to the policyholders of a mutual insurer and to both the policyholders and shareholders of a stock insurer.

- **Years referenced:** Usually, the actuary’s report refers only to the current year, even though financial statements usually present results for both the current and prior years.

- **Report date:** If the two reports have the same date, then they would take account of the same subsequent events.

**Reservations in reporting**

The examples that follow are illustrative and not exhaustive.
Self-insured organization that is not obligated to have an appointed actuary

.20 Here is an example of a report prepared for an underfunded self-insured organization that is not obligated to have an appointed actuary.

I have valued the outstanding claim liabilities of [the Self-Insured Liability Plan] for its statement of financial position at [31 December xxxx] in accordance with accepted actuarial practice in Canada, including selection of appropriate assumptions and methods.

As explained in Note [XX], the [Plan’s] self-insured liabilities are not fully funded.

In my opinion, and having regard for Note [XX], the amount of policy liabilities makes appropriate provision for all of the [Plan’s] outstanding claims and the financial statements fairly present the results of the valuation.

Note [XX] would quantify and describe the actuary’s assumptions with respect to the asset shortfall, describe the plan, if any, for its funding, and explain its implications for the financial security of participants and claimants.

New appointment

.21 A newly appointed actuary who is unable to use the predecessor actuary’s work, but who has no reason to doubt its appropriateness, would modify the standard reporting language as follows:

I have valued the policy liabilities [and reinsurance recoverables] of [the Company] for its [consolidated] statement of financial position at [31 December xxxx] and, except as noted in the following paragraph, their change in the statement of income for the year then ended in accordance with accepted actuarial practice in Canada, including selection of appropriate assumptions and methods.

The policy liabilities [and reinsurance recoverables] at [31 December xxxx-1] were valued by another actuary who expressed a favourable opinion without reservation, as to their appropriateness.

In my opinion, the amount of policy liabilities [net of reinsurance recoverables], makes appropriate provision for all policy obligations and the [consolidated] financial statements fairly present the results of the valuation. For the reason stated in the previous paragraph, I am unable to say whether or not those results are consistent with those for the preceding year.

.22 If the actuary doubts the appropriateness of the predecessor actuary’s work as a result of a review of it, then the actuary would consider a more serious reservation.
Impracticality of restatement

.23 The actuary would, if necessary, restate the preceding year valuation to be consistent with the current year valuation. If it is not practical to restate the preceding year valuation, then the actuary would modify the opinion paragraph in the standard reporting language as follows:

In my opinion, the amount of policy liabilities [net of reinsurance recoverables] makes appropriate provision for all policy obligations. As explained in Note [XX], the method of valuation for the current year is inconsistent with that for the previous year. Except for that lack of consistency, in my opinion the [consolidated] financial statements fairly present the results of the valuation.

.24 Note [XX] would usually explain the change in the basis of valuation, explain the impracticality of applying the new basis retroactively, and disclose the effect of the change on the opening equity at the beginning of the preceding year.

Takeover of insurer with insufficient records

.25 If the insurer took over another insurer with records that did not provide sufficient and reliable data for the valuation, then the actuary would modify the standard reporting language as follows:

I have valued the policy liabilities [and reinsurance recoverables] of [the Company] for its [consolidated] statement of financial position at [31 December xxxx] and their change in the statement of income for the year then ended in accordance with accepted actuarial practice in Canada, including selection of appropriate assumptions and methods, except as described in the following paragraph.

During the year, [the Company] took possession of the assets, liabilities, and policies of [WWW Insurer], whose policy records are, in my opinion, unreliable. [The Company] is implementing but has not completed the necessary improvements. My valuation with respect to the policies taken over from [WWW Insurer] therefore involves an unusual degree of uncertainty. The associated policy liabilities [net of reinsurance recoverables] comprise [N]% of [the Company’s] total policy liabilities [net of reinsurance recoverables] at [31 December xxxx].

In my opinion, except for the reservation in the previous paragraph, the amount of policy liabilities [net of reinsurance recoverables] makes appropriate provision for all policy obligations and the [consolidated] financial statements fairly present the results of the valuation.
Liabilities greater than those calculated by the actuary

.26 If the financial statements of an insurer report policy liabilities, net of reinsurance recoverables, that are greater than those calculated and reported by the actuary, and if the notes to those financial statements do not provide sufficient disclosure of the rationale for doing so, then the actuary would report as follows:

I have valued the policy liabilities [and reinsurance recoverables] of [the Company] for the statement of financial position at [31 December XXXX] and their change in the statement of income for the year then ended in accordance with accepted actuarial practice in Canada, including selection of appropriate assumptions and methods, except as described in the following paragraph.

In my valuation, the amount of the policy liabilities [net of reinsurance recoverables] is $[X]. The corresponding amount in the [consolidated] financial statements is $[Y].

In my opinion, the amount of policy liabilities [net of reinsurance recoverables] of $[X] makes appropriate provision for all policy obligations and, except as described in the preceding paragraph, the [consolidated] financial statements fairly present the result of the valuation.
2200 Insurance Contract Valuation:  
Property and Casualty Insurance

2210 Scope

.01 This section 2200 applies in accordance with subsection 2110.

2220 Claim liabilities

.01 The amount of the claim liabilities should be equal to the present value, at the calculation date, of cash flow on account of claims (and of related expenses and future income taxes) incurred on or before that date with provision for adverse deviations. [Effective April 15, 2017]

.02 The amount of claim liabilities consists of the following components on a present value basis:

- The amount of the case estimates;
- A provision (which may be positive or negative) for development on reported claims, including claim adjustment expenses;
- A provision for incurred but unreported claims, including claim adjustment expenses; and
- A provision for adverse deviations.

For property and casualty practitioners, this is also referred to as the actuarial present value basis.

.03 The development on reported claims compensates for the inadequacy or redundancy in case estimates.

.04 The incurred but unreported claims are those not yet reported to the insurer, including those reported but not yet recorded.

.05 The development on reported claims and the incurred but unreported claims need not be calculated separately. Some valuation methods calculate only their combined amount.

.06 The selection of valuation methods depends on the circumstances affecting the work. The actuary would usually consider several methods, each of which involves assumptions.
The actuary would consider the circumstances affecting the work in selecting assumptions. The available past claims experience may lack pertinence for assumptions about the insurer’s future claims experience as a result of internal changes, such as changes in

- The insurer’s underwriting practice;
- Its claims handling practice, including case estimate practice;
- Its reinsurance;
- Its data processing; and
- Its accounting;

and as a result of external changes, such as inflation and changes in

- The legal, regulatory, and legislative environment; or
- Residual mechanisms, like the Facility Association.

The past and future claims experience of a pool or association in which the insurer participates tends to be beyond the insurer’s control and may differ from the insurer’s own claims experience.

### 2230 Premium liabilities

.01 The amount of the premium liabilities (after deducting any deferred policy acquisition expense asset) should be equal to the present value, at the calculation date, of cash flow on account of premium development and of the claims, expenses and future income taxes, including provision for adverse deviations, to be incurred after that date on account of the policies in force at that date or an earlier date. [Effective April 15, 2017]

.02 The amount of premium liabilities consists of the following components on a present value basis:

- The future claims and claim adjustment expenses;
- A provision for adverse deviations;
- The expected reinsurance costs (on a net basis only);
- The maintenance costs;
- All other liabilities related to premium development; and
- A premium deficiency, if any.

.03 The actuary would consider the Standards of Practice for claim liabilities in selecting assumptions about claims.
.04 Premium development includes additional premiums such as reinstatement premiums and experience adjustments for policies with retrospective pricing.

.05 Premium deficiency is the amount which, when added to the net unearned premium reserve and unearned (reinsurance) commissions, makes an appropriate provision for future costs arising from the unexpired portion of in-force policies at the calculation date.

2240 Present values

.01 The expected investment return rate for calculation of the present value of cash flows, net of reinsurance, is that to be earned on the assets, taking into account reinsurance recoverables, that support the insurance contract liabilities. The expected investment return depends on

- The assets owned at the calculation date;
- The allocation of those assets and related investment income among lines of business;
- The method of valuing assets and reporting investment income;
- The yield on assets acquired after the calculation date;
- The capital gains and losses on assets sold after the calculation date;
- Investment expenses; and
- Losses from asset depreciation.

.02 The expected investment return rate for calculation of the present value of ceded cash flow may be selected from the following or a combination thereof:

- The investment return rate selected for net present value net of reinsurance (i.e., as described in paragraph 2240.01);
- A risk-free rate; and
- The investment return rate used by the assuming company.

.03 The actuary need not verify the existence and ownership of the assets at the calculation date, but would consider their quality.
Standards of Practice

2250 Margin for adverse deviations – general

.01 The criteria for selection of the margin for adverse deviations for an assumption are based upon the considerations for that assumption. The selected margin for adverse deviations used in the valuation of insurance contract liabilities should tend toward a higher margin for adverse deviations to the extent that the considerations for that assumption, viewed in the aggregate but considering their individual relative importance,

- Have been unstable during the period covered by the experience data on which the selection of the corresponding expected assumption is based and the effect of that instability cannot be quantified; or
- Otherwise undermine confidence in the selection of the corresponding expected assumption;

and should tend toward a lower margin for adverse deviations to the extent that the opposite is the case. [Effective April 15, 2017]

.02 The selected margin for adverse deviations should vary

- Between premium liabilities and claim liabilities;
- Among lines of business; and
- Among accident years, policy years, or underwriting years, as the case may be, according to how the considerations of paragraphs 2250.08 and 2250.09 so vary. [Effective April 15, 2017]

Assumptions subject to a margin for adverse deviations

.03 The actuary would include a margin for adverse deviations in the assumptions for

- Claims development;
- Recovery from reinsurance ceded; and
- Investment return rates.

Expression of a margin for adverse deviations

.04 The margin for adverse deviations for claims development would be a percentage of the claim liabilities excluding provision for adverse deviations.

.05 The margin for adverse deviations for recovery from reinsurance ceded would be a percentage of the amount deducted on account of reinsurance ceded in calculating the premium liabilities or claim liabilities, as the case may be, excluding provision for adverse deviations.
The margin for adverse deviations for investment return rate would be a deduction from the expected investment return rate per year.

The actuary would not usually include a margin for adverse deviations in the other assumptions. An example of an unusual circumstance that warrants an exception is a salvage and subrogation assumption when presented as an asset separate from the claim liabilities.

Considerations

The actuary would select and evaluate considerations for each assumption that are appropriate to the circumstances of the insurer, including

- Insurer practices, for example, the guidelines for setting and reviewing case estimates;
- Data, for example, the stability of claims frequency and average claim cost;
- Reinsurance, for example, the history of claim and coverage disputes with reinsurers;
- Investments, for example, the matching of assets and liabilities and risk of asset depreciation; and
- The external environment, for example, the effect of regulatory change on claim settlements.

A consideration for an assumption reduces confidence in that assumption as a result of past or future instability of the consideration or a shortcoming in its quality, quantity, or performance. Significant considerations indicating difficulties in properly estimating the best estimate assumption would include, but would not be limited to

- Instability in the guidelines for setting and reviewing case estimates possibly resulting in inconsistent development among accident years;
- The credibility of the company’s experience being too low to be the primary source of data;
- Future experience being difficult to estimate;
- Lack of homogeneity in the cohort of risks;
- Operational risks adversely affecting the likelihood of obtaining the best estimate assumption;
- Past experience not being representative of the future experience and the experience possibly deteriorating; or
- The derivation of the best estimate assumption being unrefined.
2260 Margin for adverse deviations – deterministic analysis

.01 The actuary should select a margin for adverse deviations for an assumption that is at least as much as the amount defined by the low margin for adverse deviations and is not excessive. [Effective April 15, 2017]

.02 The range of margin for adverse deviations would be

<table>
<thead>
<tr>
<th>High</th>
<th>Low</th>
</tr>
</thead>
<tbody>
<tr>
<td>claims development</td>
<td>20%</td>
</tr>
<tr>
<td>recovery from reinsurance ceded</td>
<td>15%</td>
</tr>
<tr>
<td>investment return rates</td>
<td>200 basis points</td>
</tr>
</tbody>
</table>

.03 Usually, a selection above this high margin for adverse deviations would be considered excessive.

.04 A selection above this high margin for adverse deviations would be appropriate, however, for unusually high uncertainty or when the resulting provision for adverse deviations is unreasonably low because the margin for adverse deviations is expressed as a percentage and the best estimate is unusually low.

.05 A selection below the low margin for adverse deviations may be appropriate in unusual situations. For example, in a situation wherein the best estimate discount rate based on the insurer’s asset portfolio is less than 0.25% per annum, a margin for adverse deviations for investment return rates below that specified in paragraph 2260.02 may be reasonable. Similarly, unique situations may support a claims development margin for adverse deviations below that specified in paragraph 2260.02, as in the case of an insurer with aggregate stop loss coverage that is reserved at the stop loss limit.

2270 Margin for adverse deviations – stochastic analysis

.01 The margin for adverse deviations selected based on stochastic techniques should not be less than the low margin for adverse deviations set out in paragraph 2260.02 and should not be excessive. [Effective April 15, 2017]

.02 It is expected that margins for adverse deviations obtained using stochastic techniques would generally be consistent with the range provided in paragraph 2260.02.
In addition to the circumstances described in paragraph 2260.04, a selection above the high margin for adverse deviations set out in paragraph 2260.02 may be appropriate when stochastic modelling indicates variability in estimates of insurance contract liabilities that may not be identified using deterministic analysis.

A selection below the low margin for adverse deviations may be appropriate as set out in paragraph 2260.05.
2300 Insurance Contract Valuation:
Life and Health (Accident and Sickness) Insurance

2310 Scope

.01 This section 2300 applies in accordance with subsection 2110.

2320 Method

.01 The actuary should calculate insurance contract liabilities net of reinsurance recoverables by the Canadian asset liability method. [Effective April 15, 2017]

.02 The amount of insurance contract liabilities using the Canadian asset liability method for a particular scenario is equal to the amount of supporting assets, including reinsurance recoverables, at the calculation date that are forecast to reduce to zero coincident with the last liability cash flow in that scenario. [Effective April 15, 2017]

.03 The term of the liabilities should take account of any renewal, or any adjustment equivalent to renewal, after the calculation date if

- The insurer’s discretion at that renewal or adjustment is contractually constrained; and
- Insurance contract liabilities are larger as a result of taking account of that renewal or adjustment. [Effective April 15, 2017]

.04 In forecasting the cash flow expected to be generated by an insurance contract, the actuary should

- Take account of policy owner reasonable expectations; and
- Include policy dividends, other than the related transfers to the shareholders’ account and other than ownership dividends, in the comprised cash flow from benefits. [Effective April 15, 2017]

.05 The actuary should calculate insurance contract liabilities for multiple scenarios and adopt a scenario whose insurance contract liabilities make sufficient but not excessive provision for the insurer’s obligations in respect of the relevant policies. [Effective April 15, 2017]
.06 The assumptions for a particular scenario consist of

- Scenario-tested assumptions, which should include no margin for adverse deviations; and
- Each other needed assumption, whose best estimate should be consistent with the scenario-tested assumptions and which should include margin for adverse deviations. [Effective April 15, 2017]

.07 The scenario-tested assumptions should include at least the interest rate assumptions. [Effective April 15, 2017]

.08 The scenarios of interest rate assumptions should comprise

- A base scenario, as defined under paragraph 2330.14;
- Each of the prescribed scenarios in a deterministic application;
- Stochastic scenarios, as defined in subsection 2370, in a stochastic application; and
- Other scenarios appropriate for the circumstances of the insurer. [Effective April 15, 2017]

**Liability grouping and asset segmentation**

.09 The actuary would usually apply the Canadian asset liability method to policies in groups that reflect the insurer’s asset-liability management practice for allocation of assets to liabilities and investment strategy. That application is a convenience, however, and would not be expected to preclude the calculation of insurance contract liabilities and reinsurance recoverables that, in the aggregate, reflect the risks to which the insurer is exposed.

**Other methods**

.10 For a particular scenario, another method may be equivalent to, or approximate, the Canadian asset liability method. If the actuary uses that other method, then the calculation for multiple scenarios and the selection of one that makes sufficient but not excessive provision for the insurer’s obligations would be the same as for the Canadian asset liability method.

**Supporting assets**

.11 The value of the assets that support insurance contract liabilities at the calculation date would be their value in the insurer’s financial statements.

.12 The forecasted cash flow of the assets would take account of any related, off-balance sheet, financial instruments.
The value of the assets and forecasted cash flow would take account of the insurer’s hedging instruments existing at the calculation date.

The forecast of cash flow from taxes would take account of permanent and temporary differences between the amortization of capital gains in accordance with generally accepted accounting principles and tax law.

**Term of the liabilities**

If an element of a policy operates independently of the other elements, then it would be treated as a separate policy with its own term of liabilities. Examples are

- A flexible premium deferred annuity where the interest guarantee and cash value attached to each premium are independent of those for the other premiums; and
- A certificate of voluntary non-contributory association or creditor group insurance.

The term of a policy’s liabilities is not necessarily the same as the contractual term of the policy.

In this context,

- “Renewal” means the renewal of a policy at the end of its term, with the insurer having discretion to adjust premiums or coverage for the new term;
- “Adjustment” means an insurer’s unilateral adjustment to a policy’s coverage or premiums equivalent to that in a renewal; and
- “Constraint” means a constraint on the insurer’s exercise of discretion in renewal or adjustment that results from contractual obligations, legally binding commitments, and policy owner reasonable expectations. Examples of constraint are an obligation to renew a policy unless renewal is refused for all other policies in the same class, a guarantee of premiums, a guarantee of credited interest rate, a general account guarantee of segregated fund value, and a limitation on the amount of adjustment. “Constraint” would not include a price-competitive market expected at renewal or adjustment.

The term of a policy’s liabilities takes account of all renewals and adjustments before the calculation date. Depending on the circumstances, that term may also take account of one or more renewals or adjustments after the calculation date.
.19 If the term of the liabilities is not evident, and if selection of a longer term would reduce insurance contract liabilities, then the actuary would be cautious in making such a selection. On the other hand, if selection of a longer term would increase those liabilities, then the actuary would usually select the longer term. Substance would supersede form in the selection; for example, a universal life policy that is in form an annual premium life insurance policy may be in substance a single premium deferred annuity.

.20 The term of the liabilities of

- An insurance contract that has been cancelled by the insurer ends at the effective date of cancellation;
- An insurance contract that has not been cancelled, but that is cancellable by the insurer at or before the date to which its premiums have been paid, ends at that date;
- An individual annual premium life or accident and sickness insurance contract ends at the last day to which the policy owner may prolong its coverage without the consent of the insurer; and
- A certificate of group insurance if the group insurance contract is in effect a collection of individual insurance contracts is the same as if it were an individual insurance contract, unless contributions or experience rating of the group negate anti-selection by certificate holders.

.21 The term of the liabilities of any other insurance contract ends at the earlier of

- The first renewal or adjustment date at or after the calculation date at which there is no constraint; and
- The renewal or adjustment date after the calculation date that maximizes the insurance contract liabilities.
The actuary would extend or amend such term as defined in paragraphs 2320.20 and 2320.21 only

- To permit recognition of cash flow to offset acquisition or similar expenses;
  - Whose recovery from cash flow that would otherwise be beyond such term was contemplated by the insurer in pricing the insurance contract; and
  - Where the value of the additional cash flow recognized by such extension of the term cannot exceed the value of the remaining balance of acquisition or similar expenses; or

For the purpose of the valuation of liabilities related to segregated fund guarantees, as set out in subsection 2360.

The balance of the allowance for acquisition expense would be written down to zero using an appropriate method. Such method would

- Have a term consistent with the extended term established at inception;
- Have a write-down pattern reasonably matched with the net cash flow available to offset these expenses at inception; and
- Be locked in, so that the amount of write-down in each period will not fluctuate from the expected amount established at inception provided such balance is recoverable from the additional cash flow recognized at the calculation date, and where not fully recoverable at the calculation date, is written down to the recoverable amount, with the expected amount of write-down in each future period proportionately reduced.

A change in the outlook may provoke a change in the term of the insurance contract’s liabilities. For example, the constraint of a cost of insurance guarantee that previously lengthened the term of the insurance contract liabilities may no longer do so if the outlook for mortality improves. On the other hand, the constraint of a guaranteed credited interest rate that previously was considered innocuous may become meaningful, and thereby lengthen the term of the insurance contract liabilities, if the outlook changes to one of lower interest rates.
For example, the term of the liabilities ends at

- The **calculation date** for the general account portion of a deferred annuity with segregated fund liabilities but without minimum guarantees (other than a guarantee of an annuity purchase rate); for example, with no guarantee of the segregated fund value;

- The date after the **calculation date** that maximizes the **insurance contract liabilities** for guarantees of the fund value for segregated fund annuities whose contracts have no material constraints, and for consistency, for those contracts that contain material constraints;

- The **first renewal of a group policy** that insures employee benefits, unless there is a constraint at that renewal; and

- The next renewal date or adjustment date even if there is a constraint at renewals and adjustments at and after that date, but the constraint is so weak that its operation does not increase insurance contract liabilities.

**Policy owner reasonable expectations**

The insurer’s policies contractually define its obligations to its policy owners. The contractual definition may leave certain matters to the insurer’s discretion, such as

- The determination of policy dividends, experience-rating refunds, and retrospective commission adjustments; and

- The right to adjust premiums.

Matters left to the insurer’s discretion implicitly include

- Underwriting and claim practices; and

- The right to waive contractual rights and to create extra-contractual obligations.
Policy owner reasonable expectations are the expectations that

- May be imputed to policy owners as their reasonable expectations of the insurer’s exercise of discretion in those matters; and
- Arise from the insurer’s communication in marketing and administration, from its past practice, from its current policy, and from general standards of market conduct. Past practice includes the non-exercise of discretion; for example, long non-exercise without affirmation of a right to adjust premiums may undermine it. The insurer’s communication includes policy dividend and investment performance illustrations at sale of a policy and that of intermediaries reasonably perceived as acting on its behalf.

In selecting assumptions for the insurer’s exercise of discretion in those matters, the actuary would take policy owner reasonable expectations into account. Taking account of policy owner reasonable expectations may affect not only the amount of insurance contract liabilities but also disclosure in the financial statements.

The determination of policy owner reasonable expectations is straightforward when the insurer’s practice has been clear, unvarying, consistent with its communications, consistent with general standards of market conduct, and the insurer does not intend to change it. The actuary would discuss any other practice with the insurer, with a view to clarifying policy owner reasonable expectations.

If the insurer makes a change that will eventually alter policy owner reasonable expectations, then the actuary would consider both the appropriate disclosure of the change in policy owner communication and the financial statements, and the time elapsed before the altered expectations crystallize.

A dispute over policy owner reasonable expectations may lead to class action or other litigation by policy owners against the insurer, which may affect insurance contract liabilities or generate contingent liabilities.

Policy dividends

The assumed cash flow from policy dividends would be that from both periodic (usually annual) dividends and terminal and other deferred dividends, but excluding that from the related transfers from the participating to the shareholders’ account in a stock insurer.
The assumed cash flow from policy dividends would avoid omission and double counting with other elements of the insurance contract liabilities and with liabilities other than insurance contract liabilities. For example, if the actuary has valued the insurance contract liabilities for participating riders and supplementary benefits in participating policies as though they were non-participating—i.e., with provision for adverse deviations in excess of that appropriate for participating insurance—then the assumed cash flow from policy dividends would be reduced for that excess provision for adverse deviations.

The selected policy dividend scales in a particular scenario would be consistent with the other elements of that scenario, but would take account of how insurer inertia, policy owner reasonable expectations, and market pressure may preclude the dividend scale from being responsive to changes assumed in the scenario. Those scales would also be consistent with the insurer’s dividend policy except in a scenario which that policy does not contemplate and which would trigger a change in it.

If the current dividend scale anticipates a future deterioration in experience, then the actuary would assume continuance of that scale in response to that deterioration. If the current dividend scale does not respond to a recent deterioration in experience but the insurer’s policy is to do so, and if the delay in doing so does not provoke a contrary policy owner reasonable expectation, then the actuary would assume such response.

An assumption of cash dividends to all policy owners is appropriate only if the alternative options to cash have equivalent value. If the alternatives do not have equivalent value, the actuary would

- Either adjust the cash dividends to reflect the non-equivalence or make explicit assumption about policy owner exercise of the various dividend options; and
- Provide for the anti-selection that will result from increasing exercise of the more valuable options.

**Forecast of cash flow**

In calculating insurance contract liabilities, the actuary would allocate assets to the liabilities at the calculation date, forecast their cash flow after that date, and, by trial and error, adjust the allocated assets so that they reduce to zero at the last cash flow.

Use of the work of another person may be appropriate for forecasting the cash flow of certain assets, such as real estate.
Income tax and alternative tax

.40 This item deals with cash flow from tax based on income (herein called “income tax”) and other taxes not based on income but which interact with income tax; for example, certain capital taxes in Canada (herein called “alternative tax”).

.41 The cash flow from such taxes would be limited to that in respect of the relevant insurance contracts and the assets that support their insurance contract liabilities, and thus, with the exception of the recoverability of future tax losses described below, would ignore any interaction between that cash flow and cash flow in the rest of the insurer (e.g., it would ignore tax on investment income from assets that support the insurer’s capital). For a particular scenario, forecasted income before tax is equal to zero in each financial reporting period after the calculation date. That is so because that scenario assumes occurrence of the adverse deviations for which it makes provision. If income according to tax rules were equal to income in accordance with generally accepted accounting principles, and if there were no alternative tax, then the corresponding forecasted tax cash flow would also be equal to zero. In reality, however, such tax cash flow may differ from zero because of

- Differences—both temporary and permanent—between income in accordance with generally accepted accounting principles and income in accordance with tax rules;
- The operation of carry-forward and carry-back in the tax rules; and
- Alternative tax and the interaction between it and income tax.

.42 An example of a temporary difference is a difference between insurance contract liabilities and the corresponding tax liabilities.

.43 An example of a permanent difference is a preferential tax rate on the investment income on a class of assets.

.44 The forecast of cash flow from such taxes would therefore take account of positive or negative tax as a result of permanent and temporary differences at, and arising after, the calculation date, and of alternative taxes incurred after the calculation date.

.45 The actuary would make appropriate provision for cash flow on account of such taxes in the insurance contract liabilities. If the insurer’s statement of financial position records a future tax asset or liability in respect of such taxes, then, in order to avoid double counting, the actuary would adjust the insurance contract liabilities otherwise calculated upward to reflect the existence of a future tax asset and downward to reflect the existence of a future tax liability.
The realization of negative tax depends on the simultaneous availability of income that is otherwise taxable. In forecasting such income, the actuary would

- Make provision for adverse deviations;
- Take into account the projected tax position of the company overall; but
- Not take account of the expected release of provisions for adverse deviations in the insurance contract liabilities because, as noted above, their calculation implicitly assumes that those adverse deviations occur.

Adverse deviations borne by policy owners

The insurance contract liabilities need not make provision for adverse deviations to the extent that the insurer can offset its effect by adjustments to policy dividends, premium rates, and benefits. The insurer’s contractual right of such offset may be constrained by policy owner reasonable expectations, competition, regulation, administrative delays, and the fear of adverse publicity or anti-selection.

In some jurisdictions, regulatory approval may be required for the application of such contractual pass-through features and, in such cases, the actuary would consider the ability to recover past losses, the clarity of any regulatory rules for approval, time delays caused by the approval process, and whether interest losses during this period can be recouped in determining an appropriate total provision.

Adoption of a scenario

If the selection of scenarios is deterministic, then the actuary would adopt a scenario whose insurance contract liabilities are within the upper part of the range of the insurance contract liabilities for the selected scenarios. In the case of interest rate scenarios, the insurance contract liabilities would not be less than those in the prescribed scenario with the largest insurance contract liabilities.

If the selection of scenarios is stochastic, then the actuary would establish insurance contract liabilities that are within the range defined by

- The average of the insurance contract liabilities that are above the 60th percentile of the range of insurance contract liabilities for the selected scenarios; and
- The corresponding average for the 80th percentile.

Scenario-tested assumptions

The provision for adverse deviations in respect of scenario-tested assumptions results from calculating the insurance contract liabilities for multiple scenarios and adopting a scenario whose insurance contract liabilities are relatively high.
Other assumptions

.52 The provision for adverse deviations in respect of each assumption other than the scenario-tested assumptions results from a margin for adverse deviations included in that assumption.

.53 The assumptions unique to a particular scenario are the scenario-tested assumptions and each other assumption that is correlated with them. For example, policy dividends and the exercise of options by borrowers and issuers, are strongly correlated with interest rates. Lapses may be correlated or not, depending on the circumstances. The assumption on a matter not so correlated would be common to all scenarios.

Margin for adverse deviations

.54 The margin for adverse deviations would be at least the average of the applicable high and low margin, as specified in subsections 2340 and 2350, whenever at least one “significant consideration” exists, or at least one other consideration is significant in the context of the valuation. Significant considerations vary by type of assumption and are described under subsections 2340 and 2350.

2330 Scenario assumptions: Interest rates

General considerations

.01 An interest rate scenario comprises, for each forecast period between the calculation date and the last cash flow,

- An investment strategy; and
- An interest rate for each risk-free asset and the corresponding credit spread for each fixed-income asset subject to depreciation.

.02 Each interest rate scenario would include an assumption with respect to the rate of inflation that is consistent with that scenario.

.03 The interest rate scenario would be consistent among the insurer’s lines of business.

.04 The investment strategy defines reinvestment and disinvestment practice for each type, depreciation risk classification, and term of the invested assets that support insurance contract liabilities. Assumption of an investment strategy implies investment decisions of reinvestment and disinvestment consistent with that strategy and, hence, the risk inherent in that strategy.

.05 The investment strategy for each scenario would be consistent with the insurer’s current investment policy and would be consistent with the insurer’s expected practice. The insurance contract liabilities would make no provision for any increased risk that may result from a future change in the insurer’s investment policy. The insurer’s expected practice would be determined without taking into consideration any business that could be issued after the valuation date (new sales).
.06 The actuary would ensure that the proportion of non-fixed-income assets in the portfolio, at each duration, would be in accordance with the insurer’s current investment policy.

.07 The number of assumed terms of risk-free assets would be large enough to permit assumption of changes in the shape and steepness of the yield curve. That implies a minimum of a short, a medium, and a long term.

.08 In all scenarios other than the base scenario, credit spreads include margins for adverse deviations as described in paragraph 2340.14. The actuary would also include an additional provision for adverse deviations by modifying the assumptions, if needed, on each fixed-income asset purchased or sold on or after the 5th anniversary from the calculation date, such that

- For assets purchased or sold on or after the 30th anniversary from the calculation date, the difference between the asset’s credit spread and its asset depreciation assumption, the net credit spread is not larger than a maximum promulgated from time to time by the Actuarial Standards Board; and
- For assets purchased or sold between the 5th and 30th anniversary from the calculation date, the net credit spread is not larger than that determined using a uniform transition between the corresponding difference if the asset were purchased on the 5th anniversary from the calculation date and the promulgated maximum if the asset were purchased on the 30th anniversary from the calculation date.

.09 A scenario for a foreign country’s interest rates would be formulated independently of that for Canadian interest rates unless a positive historical correlation is expected to continue.

.10 The importance of the assumptions for a particular forecast period depends on the magnitude of the net forecasted cash flow for that period.

.11 The Actuarial Standards Board will promulgate from time to time the following ultimate risk-free reinvestment rates for use in the base scenario and the prescribed scenarios:

- Short-term ultimate risk-free reinvestment rate-high;
- Long-term ultimate risk-free reinvestment rate-high;
- Short-term ultimate risk-free reinvestment rate-median;
- Long-term ultimate risk-free reinvestment rate-median;
- Short-term ultimate risk-free reinvestment rate-low; and
- Long-term ultimate risk-free reinvestment rate-low.
.12 Ultimate risk-free reinvestment rates at other terms would be determined in accordance with the historical relationship between rates at those terms and the short- and long-term rates. Ultimate risk-free reinvestment rate-low refers to low rates at all terms (including short-term ultimate risk-free reinvestment rate-low and long-term ultimate risk-free reinvestment rate-low), and similarly for ultimate risk-free reinvestment rate-median and ultimate risk-free reinvestment rate-high.

.13 The parameters in the base and prescribed scenarios, including maximum net credit spreads, apply to investments denominated in Canadian dollars. For the base and each prescribed scenario, the actuary would determine the corresponding parameters for investments denominated in a foreign currency from the historical relationship between investments denominated in that currency and investments denominated in the Canadian dollar if the expected continuance of that relationship so permits. Otherwise the actuary would devise independent scenarios for investments denominated in that currency.

**Base scenario**

.14 In the base scenario,

- Risk-free interest rates effective after the calculation date would be equal to the forward interest rates implied by the equilibrium risk-free market curve at that date, for the first 20 years after the calculation date;
- At and after the 60th anniversary from the calculation date, risk-free interest rates would be equal to the ultimate risk-free reinvestment rate-median;
- At the 40th anniversary from the calculation date, the risk-free interest rates would be equal to 30% of the rates at the 20th anniversary plus 70% of the rates at the 60th anniversary;
- Between the 20th and 40th and between the 40th and 60th anniversaries, the risk-free interest rates would be determined using a uniform transition; and
- Credit spreads at all durations would be the best estimate described in paragraph 2340.12.

.15 The provision for adverse deviations for interest rate risk for both deterministic and stochastic applications would be measured as the difference between the reported insurance contract liabilities and the insurance contract liabilities resulting from the application of the base scenario.
Prescribed scenarios

.16 Because future investment returns and inflation rates are so conjectural, it is desirable that the calculation of insurance contract liabilities for all insurers takes account of certain common assumptions. There are, therefore, eight prescribed scenarios as presented below.

.17 The prescribed scenarios apply to fixed-income assets purchased or sold after the calculation date.

.18 For a prescribed scenario, if the net cash flow forecast for a period is positive, then the actuary would assume its application to repay the outstanding balance, if any, of borrowing in accordance with paragraph 2330.19.

.19 For a prescribed scenario, if the net cash flow for a period is negative, then the actuary would assume an offsetting disinvestment or borrowing, or a mix of the two. For insurer-controlled investment decisions, any borrowing would be in accordance with the investment policy, would be short-term, and would be expected to be repayable soon by subsequent positive forecasted net cash flow.

Prescribed scenario 1

.20 The risk-free interest rates for investments purchased or sold

- At the calculation date are those available in the market;
- At the 40th anniversary from the calculation date and beyond, the risk-free interest rates are equal to ultimate risk-free reinvestment rate-low;
- At the 1st anniversary from the calculation date, the risk-free interest rates are equal to 90% of the risk-free interest rates at the calculation date;
- At the 20th anniversary of the calculation date, the risk-free interest rates are equal to 10% of the risk-free interest rates at the calculation date plus 90% of ultimate risk-free reinvestment rate-low; and
- Between each of the calculation date and the 1st, 20th, and 40th anniversaries, the risk-free interest rates are determined using a uniform transition.

Prescribed scenario 2

.21 This scenario is the same as prescribed scenario 1, with the ultimate risk-free reinvestment rate-low replaced by the ultimate risk-free reinvestment rate-high, and the 90% multiplier applicable on the 1st anniversary replaced by 110%.

Prescribed scenario 3

.22 The oscillation period for use in prescribed scenarios 3 to 6 is 20 years.
The long-term risk-free interest rate moves cyclically between long-term ultimate risk-free reinvestment rate-low and long-term ultimate risk-free reinvestment rate-high as follows:

- Over the first quarter oscillation period, the long-term risk-free interest rate moves uniformly from the long-term interest rate at the calculation date to 75% of (80% of the risk-free interest rates at the calculation date plus 20% of ultimate risk-free reinvestment rate-low);
- Over the next quarter oscillation period, the long-term risk-free interest rate moves uniformly from 75% of (80% of the risk-free interest rates at the calculation date plus 20% of ultimate risk-free reinvestment rate-low) to long-term ultimate risk-free reinvestment rate-low;
- Over the next half oscillation period, the long-term risk-free interest rate moves uniformly from the long-term ultimate risk-free reinvestment rate-low to the long-term ultimate risk-free reinvestment rate high; and
- This cycle is repeated for the remaining oscillation periods.

The short-term risk-free interest rate moves as follows:

- Over the first quarter oscillation period, the short-term risk-free interest rate moves uniformly from the short-term interest rate at the calculation date to 50% of (80% of the risk-free interest rates at the calculation date plus 20% of ultimate risk-free reinvestment rate-low);
- Over the next quarter oscillation period, the short-term risk-free interest rate moves uniformly from 50% of (80% of the risk-free interest rates at the calculation date plus 20% of ultimate risk-free reinvestment rate-low) to 60% of the corresponding long-term interest rate; and
- Thereafter remains at 60% of the corresponding long-term interest rate.

Other interest rates are determined using yield rates that are appropriate for the terms of those assets, in accordance with the historic relationship between the rates of those assets and the short- and long-term interest rates.
Prescribed scenario 4

.26 This scenario is similar to prescribed scenario 3, but with the peaks of prescribed scenario 3 coinciding with the troughs of prescribed scenario 4. Over the first quarter oscillation period, the long-term risk-free interest rate moves uniformly from the long-term risk-free interest rate at the calculation date to 125% of (80% of the risk-free interest rates at the calculation date plus 20% of ultimate risk-free reinvestment rate-high). Over the next quarter oscillation period, the long-term risk-free interest rate moves uniformly from 125% of (80% of the risk-free interest rates at the calculation date plus 20% of ultimate risk-free reinvestment rate-high) to long-term ultimate risk-free reinvestment rate-high. Over the next half oscillation period, the long-term risk-free interest rate moves uniformly from the long-term ultimate risk-free reinvestment rate-high to the long-term ultimate risk-free reinvestment rate-low, and this cycle is repeated for the remaining oscillation periods.

.27 The short-term risk-free interest rate moves as follows:

- Over the first quarter oscillation period, the short-term risk-free interest rate moves uniformly from the short-term interest rate at the calculation date to 150% of (80% of the risk-free interest rates at the calculation date plus 20% of ultimate risk-free reinvestment rate-high);
- Over the next quarter oscillation period, the short-term risk-free interest rate moves uniformly from 150% of (80% of the risk-free interest rates at the calculation date plus 20% of ultimate risk-free reinvestment rate-high) to 60% of the corresponding long-term interest rate; and
- Thereafter remains at 60% of the corresponding long-term interest rate.

Prescribed scenario 5

.28 This scenario is the same as prescribed scenario 3, except that the short-term risk-free interest rate at an anniversary of the calculation date is a percentage of the corresponding long-term risk-free interest rate. That percentage moves cyclically in 20% annual steps from 40% to 120% and back. The first cycle is irregular:

- Over the first quarter oscillation period, the short-term risk-free interest rate moves uniformly from the short-term interest rate at the calculation date to 40% of the corresponding long-term interest rate.
- Thereafter the short-term risk-free interest rate moves cyclically in 20% annual steps from 40% to 120% and back.
Prescribed scenario 6

.29 As respects long-term risk-free interest rate, this scenario is the same as prescribed scenario 4.

.30 As respects short-term risk-free interest rate, this scenario is the same as prescribed scenario 5, except that, over the first quarter oscillation period, the short-term risk-free interest rate moves uniformly from the short-term interest rate at the calculation date to 120% of the corresponding long-term interest rate. Thereafter the short-term risk-free interest rate moves cyclically in 20% annual steps from 120% to 40% and back.

Prescribed scenario 7

.31 The risk-free interest rates for investments purchased or sold

- At the calculation date are those available in the market;
- At the 60th anniversary from the calculation date and beyond, are equal to 80% of the ultimate risk-free reinvestment rate-median;
- At the 1st anniversary from the calculation date, are equal to 80% of the risk-free interest rates at the calculation date;
- At the 20th anniversary from the calculation date, are equal to 80% of (30% of the risk-free interest rates at the calculation date plus 70% of ultimate risk-free reinvestment rate-median);
- At the 40th anniversary from the calculation date, are equal to 80% of (10% of the risk-free interest rates at the calculation date plus 90% of ultimate risk-free reinvestment rate-median); and
- Between each of the calculation date and the 1st, 20th, 40th, and 60th anniversaries, are determined using a uniform transition.

Prescribed scenario 8

.32 This scenario is the same as prescribed scenario 7, with the 80% replaced by 120%.

Other scenarios

.33 In addition to the prescribed scenarios, which would be common to the calculation of insurance contract liabilities for all insurers, the actuary would also select other scenarios that would be appropriate to the circumstances affecting the work. The reasonableness of degrees of change of interest rates would be largely dependent on the period of time being considered. Other plausible scenarios would include parallel shifts up and down as well as flattening and steepening of the yield curve.
.34 The number of other interest rate scenarios would be relatively large to the extent that

- The pattern of forecasted net cash flow in the base scenario is such that the classification of scenarios between favourable and unfavourable is unclear;
- Forecasted net cash flow is sensitive to the selection of interest rate scenarios;
- The range of present values of forecasted net cash flow is wide, suggesting exposure to mismatch risk;
- Investment policy does not control mismatch risk;
- Asset-liability management policy allows a wide range of practice; or
- Flexibility to manage assets or liabilities is limited.
2340 Other assumptions: Economic

Margin for adverse deviations

.01 To set the level of the margin for adverse deviations as specified in paragraph 2320.54, significant considerations indicating difficulties in properly estimating the best estimate assumption would include:

- There is little relevant experience;
- Future experience is difficult to estimate;
- Operational risks adversely affect the likelihood of obtaining the best estimate assumption;
- Asset underwriting criteria are weak or poorly controlled;
- There are liquidity concerns;
- There is uncertainty regarding the credit enhancement techniques used;
- The trust structure and legal responsibilities of the different parties for a securitized asset are not clearly understood in a practical and/or legal sense;
- The asset held is from a non-pass-through structure with a repackaging of the credit risk that is difficult to understand;
- The asset held is from a lower-quality tranche from a structure that is not a pass-through structure that repackages credit risks;
- There is uncertainty about the counterparty credit; or
- There is no netting of the aggregate exposure with a counterparty.

.02 Significant considerations indicative of a potential deterioration of the best estimate assumption would include situations where operational risks are present such that the likelihood of continuing to obtain the best estimate assumption is adversely impacted.

Fixed income assets: investment return

.03 The forecast of cash flows from a fixed income asset would be the promised cash flows over the term of the asset, modified for asset depreciation and borrower and issuer options.
Fixed income assets: asset depreciation

.04 The actuary’s best estimate of asset depreciation would depend on

- Asset type, credit rating, liquidity, term, and duration since issue;
- Subordination to other debt of borrower or issuer;
- The insurer’s credit underwriting standards, diversification within a particular type of investment, to the extent that it is indicative of the future, and the insurer’s own experience;
- The insurance industry’s experience;
- Guarantees that offset depreciation, such as that in an insured mortgage; and
- Potential for anti-selection by borrowers and issuers.

.05 Asset depreciation comprises that of both assets that are impaired at the calculation date and assets that become impaired after the calculation date, and includes loss of interest, loss of principal, and expense of managing depreciation.

.06 Asset depreciation is likely to be relatively high after the forced renewal of a mortgage loan; i.e., one where the mortgagor can neither pay, nor find an alternative mortgagee for the balance outstanding at the end of its term but is able to continue its amortization. The explicit forecasting of subsequent cash flow is usually so conjectural that to commute the cost of that asset depreciation to the end of the term of the mortgage would be an acceptable approximation unless it undermines the interest rate assumption in the scenario.

.07 The actuary would not necessarily assume that the best estimate of asset depreciation is less than the asset’s credit spread.

.08 The low and high margins for adverse deviations for a scenario would be respectively 25% and 100% of the best estimate for that scenario, except that

- A higher range would be appropriate where those percentages of an unusually low best estimate are not meaningful; and
- Zero would usually be appropriate for an Organisation for Economic Cooperation and Development (OECD) government’s debt denominated in its own currency.

Fixed income assets: exercise of borrower and issuer options

.09 Examples of borrower and issuer options are the option to prepay a mortgage loan, to extend the term of a loan, and to call a bond.
The assumed exercise of an option may depend on the interest rates in the scenario. Anti-selection by commercial borrowers and issuers would usually occur systematically.

Forecasted cash flows would include any penalty generated by exercise of an option.

**Fixed income assets: credit spreads**

The best estimate of credit spreads

- Would be the credit spreads observable in the market at the calculation date;
- At and after the 5th anniversary from the calculation date, would be based on long-term historical average credit spreads corresponding to assets by type, credit rating, and term; and
- Between the calculation date and the 5th anniversary, would be determined using a uniform transition.

When choosing the best estimate of credit spreads based on long-term historical averages, the actuary would consider

- Using as long a period of history as practicable; and
- Adjusting the assumptions to reduce any inconsistencies that may arise from using different historical periods or sources of information for different asset types, credit ratings, or terms.

The margin for adverse deviations in credit spreads would be

- Zero at the calculation date;
- An addition or subtraction, as appropriate in aggregate, of 10% of the best estimate assumptions at and after the 5th anniversary from the calculation date; and
- Between the calculation date and the 5th anniversary, the margin for adverse deviations as percentage of the best estimate would be determined using a uniform transition.

**Non-fixed income assets: investment return**

Where reliable historical data are available, the actuary would choose the best estimate of investment return on a non-fixed income asset (such as common shares, real estate and other non-fixed income portfolios) such that it would not be more favourable than a benchmark based on historical performance of assets of its class and characteristics.
Where the best estimate for a class of non-fixed income assets is based on reliable historical data, the margin for adverse deviations in the assumption of non-fixed income capital gains would be 20% of the best estimate plus an assumption that those assets change in value at the time when the change is most adverse. That time would be determined by testing, but usually would be the time when their book value is largest. The assumed change as a percentage of market value

- Of a diversified portfolio of North American common shares would be 30%; and
- Of any other portfolio would be in the range of 20% to 50% depending on the volatility relative to a diversified portfolio of North American common shares.

Where the best estimate for a class of non-fixed income assets is based on reliable historical data, the low and high margins for adverse deviations in the assumptions of income on the class (for example, common share dividends and real estate rental income) would be respectively 5% and 20%. Furthermore, if the ratio of income (other than that fixed by agreement) to asset value increases following the assumed change in asset value described in paragraph 2340.16, the margin for adverse deviations in the assumption for income would be adjusted so the ratio five years after the assumed change in asset value is not higher than the ratio immediately before the assumed change in asset value.

Where reliable historical information is not available for a non-fixed income class of assets, the actuary would select a best estimate investment return assumption and margins for adverse deviations such that the assumed return in excess of risk-free interest rates, net of margins, would not exceed the assumed return in excess of risk-free interest rates, net of margins, for a similar asset class for which reliable historical information is available in the same jurisdiction, or in Canada if there is no relevant reliable historical information in the same jurisdiction.

Whether the assumed change is a gain or loss would depend on its effect on benefits to policy owners. A capital loss may reduce insurance contract liabilities as a result of that effect.
.20 If non-fixed income assets are used to support liability cash flows that are not substantially linked to returns on non-fixed income assets, the actuary would include an additional provision for adverse deviations by modifying the assumed investment strategy in the scenario adopted, if needed, so that the amount of non-fixed income assets supporting such liability cash flows at the calculation date and at each duration in the projection does not exceed the amount required to support 20% of cash outflows for the first 20 years and 75% thereafter, where cash outflows are the greater of the annual liability cash flows and zero in each forecast period. The actuary would not consider this additional provision when selecting the scenario used to establish the insurance contract liabilities. This modification of the assumed investment strategy would be applied at each duration independently.

Taxation

.21 The best estimate would be for continuation of the tax regime at the calculation date, except that the best estimate would anticipate a definitive or virtually definitive decision to change that regime. The margin for adverse deviations would be zero.

Foreign exchange

.22 The needed assumptions would include foreign exchange rates when insurance contract liabilities and their supporting assets are denominated in different currencies.

.23 The base scenario used to develop the assumption for foreign exchange rates would be based on currency forwards. If currency forwards are not available, the forward exchange rates would be derived based on risk-free interest rate differentials where available. If neither is available, the actuary would use his or her best judgment to develop an appropriate approach.

.24 A provision for adverse deviations would be developed from a scenario using adverse movements in the exchange rate. Such movements would reflect the historical volatility in the exchange rate over the applicable period. The provision for adverse deviations would be the excess of the insurance contract liabilities based on this adverse scenario over the insurance contract liabilities calculated using the base scenario.

.25 A minimum provision for adverse deviations would apply. This would be the excess of the insurance contract liabilities resulting from the application of an adverse 5% margin to the projected exchange rates underlying the base scenario over the insurance contract liabilities calculated using the base scenario.
2350 Other assumptions: non-economic

Margin for adverse deviations

.01 The actuary would select a margin for adverse deviations between a low margin and a high margin:

- Specified for each best estimate assumption discussed below; and
- Of 5% and 20% (or –5% and –20%), respectively, of each other best estimate assumption.

.02 If a margin for adverse deviations cannot be defined as a percentage of the best estimate assumption, then the related provision for adverse deviations would be taken as the increase in insurance contract liabilities that results from substitution of a conservative assumption for the best estimate assumption.

.03 Significant considerations indicating difficulties in properly estimating the best estimate assumption would include:

- The credibility of the company’s experience is too low to be the primary source of data;
- Future experience is difficult to estimate;
- The cohort of risks lacks homogeneity;
- Operational risks adversely impact the likelihood of obtaining best estimate assumption; or
- The derivation of the best estimate assumption is unrefined.

.04 Significant considerations indicative of a potential deterioration of the best estimate assumption would include:

- A significant concentration of risks and/or lack of diversification;
- Operational risks that adversely affect the likelihood of continuing experience which is consistent with the best estimate assumption; or
- Past experience that may not be representative of future experience and the experience may deteriorate.

Other significant considerations may exist, but are tied to specific assumptions. Where applicable, they are described below.
A selection above the high margin would be appropriate, however, for unusually high uncertainty or if the resulting provision for adverse deviations is unreasonably low because the margin is expressed as a percentage and the best estimate is unusually low.

**Insured life mortality**

The actuary's best estimate of insured life mortality would depend on

- The life insured’s age, sex, smoking habit, health, and lifestyle;
- Duration since issue of the policy;
- Plan of insurance and its benefits provided;
- The insurer’s underwriting practice (that of its reinsurer for facultative reinsurance), including, if applicable to the policy, the absence of underwriting or less stringent underwriting for a group of simultaneously sold policies;
- The size of the policy; and
- The insurer’s distribution system and other marketing practice;

and would include the effect of any anti-selection.

The actuary would consider the inclusion of mortality improvement (a secular trend toward lower mortality rates) in the best estimate assumption and associated margin. The margin for adverse deviations related to the mortality improvement assumption is not restricted to the range of 5% to 20% noted in paragraph 2350.01.

If the inclusion of mortality improvement reduces the insurance contract liabilities, then the resulting reduction would be no greater than that developed using prescribed mortality improvement rates as promulgated from time to time by the Actuarial Standards Board. If, at an appropriate level of aggregation, the inclusion of mortality improvement increases the insurance contract liabilities, then the actuary's assumption would include such improvement. The resulting increase in insurance contract liabilities would be at least as great as that developed using prescribed mortality improvement rates as promulgated from time to time by the Actuarial Standards Board.

The low and high margins for adverse deviations for the mortality rates per 1,000 would be respectively an addition or subtraction, as appropriate, of 3.75 and 15, each divided by the curtate expectation of life at the life insured’s projected attained age. These margins for adverse deviations are applied after mortality improvement.
Annuitant mortality

.10 The actuary’s best estimate assumption of annuitant mortality would depend on
   - The annuitant’s age, sex, smoking habit, health, and lifestyle;
   - Size of premium;
   - Plan of annuity and its benefits provided; and
   - Whether registered or not, whether structured settlement, and whether group
     or individual contract;
and would include the effect of any anti-selection resulting from the annuitant’s option to
select the timing, form, or amount of annuity payment, or to commute annuity payments.

.11 The insurance underwriting in a “back-to-back” insurance/annuity package may unfavourably
   affect the best estimate.

.12 The mortality improvement assumption would include a best estimate assumption and an
   associated margin. The margin for adverse deviations related to the mortality improvement
   assumption is not restricted to the range of 5% to 20% noted in paragraph 2350.01. The
   actuary’s assumption would include mortality improvement, the effect of which is to increase
   insurance contract liabilities, such that the resulting increase would be at least as great as that
   developed using prescribed mortality improvement rates as promulgated from time to time by
   the Actuarial Standards Board.

.13 The low and high margins for adverse deviations for the mortality rates would be respectively a
   subtraction of 2% and 8% of the best estimate.

.14 An additional significant consideration for the determination of the level of margin for adverse
deviations would be the possibility of commuting survival dependent benefits after periodic
payments have started.
Morbidity

.15 The actuary’s best estimate of insured life morbidity would depend on

- The life insured’s age, sex, smoking habit, occupation, industry, health, and lifestyle;
- Duration since issue of the policy;
- In the case of income replacement insurance, definition of disability, unemployment levels, and, in the case of an outstanding claim, cause of disability;
- Plan of insurance and its benefits provided, including elimination period, guarantees, deductibles, coinsurance, return-of-premium benefits, and benefit limits, indexation, and offsets;
- The insurer’s underwriting practice (that of its reinsurer for facultative reinsurance), including, if applicable to the policy, the absence of underwriting or less stringent underwriting for a group of simultaneously sold policies;
- The insurer’s administration and claim adjudication practice;
- The size of the policy;
- Seasonal variations;
- In the case of group insurance, participation level; and
- Environmental factors, such as a change in the offset to government benefits;

and would include the effect of any anti-selection.

.16 If the actuary selects a higher than usual best estimate of disability incidence because of an outlook for a high level of unemployment, he or she would not necessarily select a concomitant higher than usual best estimate of disability termination.

.17 The low and high margins for adverse deviations would be, respectively, an addition of 5% and 20% of the best estimate of morbidity incidence rates, and a subtraction of 5% to 20% of the best estimate morbidity termination rates. The actuary’s selection would reflect any expected correlation between incidence and termination rates.
Additional significant considerations to be taken into account when determining the level of margin for adverse deviations would include:

- Contract wording is not tight enough to protect against medical advances;
- Definitions of claim events are not precise and/or not protecting against potential anti-selection; or
- Interpretation of claim event definitions by the court uncertain.

Withdrawal and partial withdrawal

The actuary’s best estimate of withdrawal rates would depend on:

- Policy plan and options;
- The life insured’s attained age;
- Duration since issue of the policy;
- Method of payment and frequency of premiums;
- Premium paying status;
- Policy size;
- The policy’s competitiveness, surrender charges, persistency bonuses, taxation upon withdrawal, and other incentives and disincentives to withdrawal;
- Policy owner and sales representative sophistication;
- The insurer’s distribution system and its commission, conversion, replacement, and other marketing practices; and
- The interest rate scenario;

and would include the effect of any anti-selection.

The insurer’s withdrawal experience would be pertinent and usually credible. It would not be available for new products and for higher durations on recent products, which is a problem for the actuary if the insurance contract liabilities are sensitive to withdrawal rates.

The automatic payment of insurance premiums by the annuity benefit in a “back-to-back” insurance/annuity package would be a disincentive to withdrawal.

Reinsurance assumed withdrawal rates would depend on practice in the direct insurer.
A “cliff” is a sudden significant increase in the benefit available at withdrawal. That increase may result from increase in cash value, decrease in surrender charge, or availability of a maturity benefit or persistency bonus. Unless there is pertinent persistency experience data to the contrary, the actuary’s best estimate withdrawal rates would grade to zero as the cliff approaches and remain at zero for an interval before the cliff is reached. The same would apply to a return of premium benefit in life insurance and to one in accident and sickness insurance, with modification in the latter case if the benefit is contingent upon zero claims or reduced by the amount of claims.

The actuary’s best estimate withdrawal rate would be zero for a paid-up policy without non-forfeiture benefit.

The low and high margins for adverse deviations would be, respectively, an addition or subtraction, as appropriate, of 5% and 20% of the best estimate withdrawal rates. In order to ensure that the margin for adverse deviations increases insurance contract liabilities, the choice between addition and subtraction may need to vary by interest scenario, age, policy duration, and other parameters. In the case of partial withdrawal, two assumptions would be needed, the amount withdrawn and the partial withdrawal rate.

Additional significant considerations to be taken into account when determining the level of margin for adverse deviations in situations where a decrease in lapse rates increases the insurance contract liabilities would include

- Remuneration policy encouraging persistency; or
- Cancellation of a contract being clearly detrimental to the policy owner.

Additional significant considerations to be taken into account when determining the level of margin for adverse deviations in situations where an increase in lapse rates increases the insurance contract liabilities would include

- Remuneration policy encourages terminations;
- Cancellation of a contract would be clearly beneficial to the policy owner;
- Company’s contracts have provisions where rating decreases may trigger additional withdrawals; or
- There is no market value adjustment on withdrawals for deposits and deferred annuities.
Anti-selective lapse

.28 Strictly speaking, “lapse” means termination of a policy with forfeiture, but in the context of anti-selection has come to include any termination or the election of the extended term insurance non-forfeiture option. “Anti-selective lapse” is a tendency of policies on healthy insured lives to lapse or unhealthy insured lives not to lapse, with a concomitant deterioration in the insurer’s mortality or morbidity experience. To determine whether the tendency has operated in a particular case would require either a re-underwriting of those who have lapsed and those who have not, or a study of the mortality among those who lapsed, neither of which is likely to be practical. Policy owners will, however, make decisions in their own perceived interest, so that anti-selective lapse is plausible whenever that perceived interest is for policies on unhealthy lives not to lapse or for policies on healthy lives to lapse.

.29 It is difficult to estimate with confidence the intensity of anti-selective lapse. It is plausible for the intensity to be proportional to the intensity of policy owner perceived interest. However, anti-selective lapse is merely a tendency provoked by the policy owner’s perceived interest. The policy owner may not know the true state of health of the life insured. The policy owner may imprudently favour, or be obliged by financial pressure to adopt, a short-term interest with long-term detriment; thus, a policy on an unhealthy life may lapse when the premium increases, the policy owner perceiving the policy to be no longer affordable. Through ignorance or inertia, a policy on a healthy life may be continued by a policy owner, even though it could be replaced by a superior one. Moreover, anti-selective lapse is not the unvarying effect of a decision in the policy owner’s perceived interest. For instance, a policy owner may lapse a policy on an unhealthy life, if the policy is no longer needed, or the policy on a healthy life may remain in force if the policy owner perceives a continuing need. Without pertinent and reliable experience, however, the actuary would not assume that the non-lapsation of policies on healthy lives favourably affects the mortality best estimate for the persisting insurance contracts.

.30 The premise to the actuary’s assumptions would be that policy owners’ decisions

- Will tend to serve their perceived interest; and
- Will not serve the insurer’s interest unless the two run together.
Examples where the perceived interest of the policy owners of policies with healthy life insureds may be to lapse include

- Premium increase at renewal of term insurance;
- Unfavourable underwriting decision at renewal of re-entry term insurance;
- Benefit decrease or premium increase of adjustable insurance;
- Premium needed to avoid termination of universal life insurance with exhausted funding;
- Reduction in policy dividend scale;
- Offer or availability of a superior replacement policy, such as by the creation of preferred underwriting class;
- Significant but temporary increase (spike) in non-forfeiture value; and
- Downgrade in the insurer’s credit rating.

**Expense**

The actuary would select a best estimate assumption that provides for the expense of the relevant policies and their supporting assets, including overhead. The insurer’s other expense is irrelevant to the valuation of insurance contract liabilities. Other expense would include

- Expense related to policies that, for the relevant policies, was incurred before the calculation date, such as marketing and other acquisition expense; and
- Expense not related to the relevant policies and their supporting assets, such as investment expense for the assets that support capital.

The assumption would provide for future expense inflation consistent with that in the interest rate scenario.

A stable insurer’s expense experience is pertinent if its expense allocation is appropriate for valuation of insurance contract liabilities (or if the actuary can correct the inappropriateness, e.g., by reallocating corporate expense to operating lines of business).

A particular insurer may have an expectation of reduced expense rates, but the actuary would anticipate only a reduction that is forecasted with confidence.
.36 Investment expense comprises
  - Administration expense, both internal and external;
  - Expense related to investment income, such as deferred fees and commissions and direct taxes; and
  - Interest on money borrowed to finance investment.

.37 The insurer incurs neither cash rental expense nor cash rental income on real estate that it owns and occupies. The actuary would deem such expense and, if the real estate supports the insurance contract liabilities, such income at a reasonable rate in the selection of an assumption of expense and investment return.

.38 Certain taxes are akin to expenses. The actuary would make similar provision for them in the insurance contract liabilities to the extent that they relate to the relevant insurance contracts and their supporting assets. They include both premium taxes, which are straightforward, and taxes whose basis is neither income nor net income but which may be complicated by a relationship with income tax; for example, those currently incurred may be offset against later income tax.

.39 The low and high margins for adverse deviations would be respectively 2.5% and 10% of best estimate expense including inflation thereof. No margin for adverse deviations is needed for a tax, such as premium tax, whose history has been stable.

.40 Additional significant considerations to be taken into account when determining the level of margin for adverse deviations would include
  - Distribution of general expenses by line of business, by product, or by issue and administrative expenses is not based on a recent internal expense study;
  - Allocation is not an appropriate basis for the best estimate expense assumption;
  - Expense study does not adequately reflect the appropriate expense drivers; or
  - Future reductions in unit expenses (before inflation) are assumed.
Policy owner options

.41 Examples of policy owner options are options to

• Purchase additional insurance;
• Convert term to permanent insurance;
• Select the extended term insurance non-forfeiture option;
• Make partial withdrawal from a universal life insurance policy;
• Select the amount of premium for a flexible premium policy; and
• Purchase an annuity at a guaranteed rate.

.42 The actuary would select a best estimate assumption of policy owner exercise of both contractual options and extra-contractual options of which they have reasonable expectations.

.43 The actuary’s best estimate would depend on

• Life insured’s attained age;
• Duration since issue of the policy;
• Plan of insurance and its benefits provided;
• Historical premium payment patterns;
• Method of premium payment;
• Sophistication of the policy owner and the intermediary;
• Perceived self-interest of the policy owner and the intermediary;
• Policy’s competitiveness; and
• Insurer’s distribution system and other marketing practice;

and would make provision for anti-selection.

.44 The actuary would make provision for adverse deviations by testing the effect on insurance contract liabilities of plausible alternative assumptions of policy owner exercise of options and adopting one with relatively high insurance contract liabilities.
Related assumptions

.45 The actuary would consider how the assumptions may be interrelated in determining the best estimate assumptions and appropriate margins. In determining these interrelationships the actuary would take account of potential anti-selection. For example, the actuary would consider what the relationships among term conversions, withdrawals, and mortality might be as a contract nears the end of a term renewal period.

Other examples of how potential anti-selection might affect the selection of assumptions are provided above and in subsection 1620.

2360 Valuation of segregated fund insurance contract liabilities

.01 This subsection addresses considerations applicable to the valuation of insurance contract liabilities related to guarantees provided under the terms of segregated fund contracts. While the requirements of subsections 2310 to 2350 apply generally to all life and health insurance contracts including segregated fund contracts, the nature of the insurance guarantees and other provisions of segregated fund contracts are such that this additional subsection is warranted to supplement, and to clarify the application of, the preceding requirements to such contracts.

Method

.02 The actuary should calculate insurance contract liabilities for the guaranteed benefits of segregated fund contracts by the Canadian asset liability method using stochastic modelling. [Effective April 15, 2017]

.03 If the bifurcated approach is used, the allocation of future fee revenue between recoverability testing of the allowance for acquisition expense and providing for the cost of guarantees should not change from period to period. [Effective April 15, 2017]

.04 A factor-based approach, approved by a regulator, would be considered an appropriate approximation and the actuary would not need to undertake testing to determine the appropriateness of this approximation.
.05 Either of two approaches would be appropriate to value segregated fund policies where guaranteed benefits are involved and an allowance for acquisition expense is being amortized.

- For the bifurcated approach, forecast fee revenue is allocated between recoverability testing of the allowance for acquisition expense and providing for the cost of the guarantees. Where the actuary can reasonably determine an additional charge priced into the contract to cover the cost of guarantees, the portion of revenue allocated to the guarantees would reflect such additional charge, with the remainder of revenue applied to test the recoverability of the unamortized allowance for acquisition expense. The insurance contract liability for the guarantees is calculated separately using the net cash flows allocated to the guarantees while the recoverability of the allowance for acquisition expense is tested excluding those revenues allocated to the guarantees.

- For the whole contract approach, all general account net cash flows associated with segregated funds are considered in calculating the total liability, i.e., the liability for guaranteed benefits less the balance of unamortized acquisition expense. This total liability will change over the reporting period as a result of market movements and other factors and, therefore, may need to be adjusted to remove any write-up to the balance of the allowance for acquisition expense.

.06 Under the bifurcation approach, the requirement to use the Canadian asset liability method applies to the calculation of the liability related to guaranteed benefits and to recoverability testing of the unamortized balance of the allowance for acquisition expenses; whereas under the whole contract approach, the Canadian asset liability method would be used to calculate the total liability. In either case, the balance of the allowance for acquisition expense would be written down to zero using an appropriate method. Such method would

- Have a term consistent with the extended term established at inception;
- Have a write-down pattern reasonably matched with the net cash flow available to offset these expenses at inception; and
- Be locked in, so that the amount of write-down in each period will not fluctuate from the expected amount established at inception provided such balance is recoverable from the additional cash flow recognized at the calculation date, and where not fully recoverable at the calculation date, is written down to the recoverable amount, with the expected amount of write-down in each future period proportionately reduced.
Term of the liability

.07 While the provisions of subsection 2320 concerning the term of the liability apply generally to segregated fund contracts, an exception to paragraph 2320.21 would apply to segregated fund contracts that contain material constraints. In this situation, the term of the liability would end at the date after the calculation date which maximizes the insurance contract liabilities, consistent with the treatment for contracts with no material constraints.

.08 The actuary would extend the term of the liability as determined under subsection 2320

- To permit reflection of hedging arrangements related to segregated fund guarantees by considering both the value of the liability and its associated hedge, where the resulting statement of financial position presentation is consistent with market movements over the reporting period; and
- Where such extension would be subject to constraints on the amount of net cash flow capitalized, consistent with an unhedged position.

Assumptions – non-economic

.09 In addition to considerations discussed in subsection 2350, the following considerations apply to the valuation of liabilities for segregated fund guarantees and recoverability testing of the allowance for acquisition expense.

.10 The actuary's best estimate of withdrawal rates would depend on

- Extent to which the guaranteed values are greater or less than the market value of the funds;
- Time to maturity;
- Systematic withdrawal consistent with the contractual terms of the policies;
- Market conditions; and
- Distribution of investment income from the funds if such amounts are not automatically reinvested.

.11 The actuary would select a best estimate assumption for management expense ratios (including all taxes charged to the fund such as GST) that varies by fund according to the terms of the contract and recent practice of the insurer. The actuary would not assume a change in management expense ratios in the future unless there is a clear and justifiable reason for doing so, taking into account past practices, competitive pressures, and reasonable policy owner reactions.
Policy owner options

.12 The actuary would assume the contract terminates on maturity unless allowing a proportion of the policy owners to roll their contracts over would increase the insurance contract liabilities. The proportion of policy owners that elect to roll their policies over would take into account the experience of the insurer. The actuary would test future maturity dates that the policy owner may elect and would use caution in setting this maturity date assumption.

.13 The actuary would test the effect of fund transfers and shifting asset mix and would exercise caution in assuming that the status quo would be maintained indefinitely.

.14 The actuary would test the effect of future optional deposits to the extent they can reasonably be anticipated and use caution in assuming that the status quo would be maintained indefinitely.

.15 The actuary’s best estimate of rates at which ratchet and reset options are exercised by policy owners would depend on the

[•] Extent to which the guaranteed values are greater than the market value of the funds;
[•] Relationship of the fund value and guaranteed benefit amounts;
[•] Term to maturity; and
[•] Growth of funds.

.16 If resets are discretionary, the actuary would assume that some proportion of policy owners would elect to exercise the reset option when it is in their financial best interest to do so. The actuary need not assume that all policy owners would act with absolute efficiency in an economically rational manner. However, the assumptions would allow the frequency of elective resets to vary according to the current and/or historical economic environment.

.17 The actuary would consider the extent to which an increase in partial withdrawals on segregated funds might lead to deferrals in benefit commencement dates.
2370 Stochastic scenarios

.01 Where the actuary uses stochastic modelling techniques to reflect assumptions for interest rates and/or investment returns, the development of scenarios should consider:
  - Selection of market indices and proxies;
  - Development of economic scenario generators and model parameters; and
  - Calibration of risk-free interest rates and investment returns (i.e., equity returns, bond fund returns and money market returns). [Effective April 15, 2017]

.02 Where investment returns are stochastically modelled, the calibration of stochastic models used in the valuation should meet the criteria for investment returns as promulgated from time to time by the Actuarial Standards Board. [Effective April 15, 2017]

.03 Where the interest rate scenarios selected are stochastically modelled, the actuary’s calibration of stochastic models should meet the criteria for risk-free interest rates as promulgated from time to time by the Actuarial Standards Board. [Effective April 15, 2017]

.04 Where valuation is performed using stochastic scenarios, the actuary would assign a value to the insurance contract liabilities which is within the range defined by:
  - The average of those values that are above the 60th percentile of the range of liability values produced by the entire set of modelled scenarios; and
  - The corresponding average for the 80th percentile.

.05 Each average value referred to above is referred to as a conditional tail expectation and the specific average values described above can for simplicity be denoted by CTE[60] and CTE[80] respectively.

.06 With respect to interest rate scenarios, the actuary would adopt a scenario where the insurance contract liabilities are higher than the midpoint of the range CTE[60] to CTE[80] whenever current long-term risk-free interest rates are near the limits or outside the range of long-term ultimate risk-free reinvestment rate-low to long-term ultimate risk-free reinvestment rate-high or whenever any of the considerations in paragraph 2330.34 exist.
Random number generators

.07 The random numbers generated by computer algorithms are called pseudorandom because they are not truly random. Knowing the algorithm and the seed to the sequence is sufficient to predict the next random number that will be generated. A sound pseudorandom number generator provides a sequence that is statistically indistinguishable from a truly random sequence from the given distribution. The actuary would test the random number generator to demonstrate that it provides a sequence that is statistically indistinguishable from a truly random sequence for the given distribution.

.08 It would be preferable for the results from stochastic modelling to be reproducible, so that a repeatable pseudorandom number generator would be available to an auditor.

Number of scenarios

.09 The actuary would test that the number of scenarios used to calculate the insurance contract liabilities provides an acceptable level of precision that meets the standard of materiality. To increase the precision of the insurance contract liability calculation, it may be necessary to increase the number of scenarios significantly.

.10 The actuary may consider scenario reduction techniques, such as stratified sampling, to reduce the number of scenarios on a sound statistical basis.

Modelling period

.11 The actuary would use a modelling period that is not longer than one month unless testing shows that the liability value is not sensitive to the frequency of election of benefits or features.

Economic scenario generators

.12 The actuary would develop stochastic models for each market index or proxy that is constructed.

.13 The actuary would select economic scenario generators for stochastic models that are robust and statistically sound.

Model parameter estimation

.14 The actuary would estimate model parameters based on historical market data as opposed to recent market performance. The historical data would cover a period at least twice as long as the projection period. However, when historical data are not available or appropriate for use, adjustments may be required.

.15 The actuary would update model parameters regularly to reflect recent changes in market conditions.
.16 When market data for foreign indices are used to estimate model parameters, the foreign exchange rate would be taken into account. The actuary may consider separate parameters for the market index and for the foreign exchange rate, for example, by including an explicit currency exchange model together with using local currency data to estimate the model parameters.

.17 Parameters would take into account appropriate correlations among investment returns for all market indices and proxies that are constructed.

**Selecting investment return assumptions for specific funds**

.18 To develop investment returns for a specific fund, an appropriate proxy for the fund would be constructed. The specific fund’s investment policy, its asset allocation implied by the fund performance objective, its performance history, and its trading activities would be considered and reflected in the proxy asset composition. The proxy may take the form of a combination of recognized market indices or economic sector sub-indices or, less commonly, a well-defined set of trading rules in a specified asset universe. It would be appropriate for there to be a close relationship between the investment return proxy and the specific funds.

Investment returns would be generated on a gross basis, before the application of any fees or consideration of specific product features. The objective would be to model the investment returns independently of any product features. However, care would be taken to assess whether total or price returns are required for the specific funds being modelled.

**Discount rates**

.19 Where a discounting approach is used in conjunction with stochastic modelling as an approximation to the Canadian asset liability method, the actuary would select discount rates (or accumulation rates) to determine the asset balance necessary to support the liabilities under a given scenario using the assets allocated at the calculation date to support the liabilities and reflecting in a reasonable manner portfolio yields that would be projected given the insurer’s investment policy and hedging practices.

**Base scenario**

.20 With respect to investment return scenarios, the base scenario for calculating the provision for adverse deviations would be defined as a notional or implicit scenario, which would result in a liability equal to the average of the insurance contract liabilities for all modelled investment return scenarios. This implicit scenario does not need to be explicitly identified or described.
2400  The Appointed Actuary

2410  Definitions

.01 In sections 2400 and 2500, “senior management” means

• In the case of a Canadian insurer, the chief executive officer, the chief financial officer, and the chief risk officer; and

• In the case of a foreign insurer, both the chief agent for Canada and the person designated by the insurer as having responsibility for its Canadian operation.

.02 In this section 2400, “directors” means an insurer’s board of directors and, in the case of a foreign insurer, includes the person whom they designate as responsible for the insurer’s Canadian branch.

2420  Scope

.01 Part 1000 applies to work within the scope of this section 2400.

.02 This section 2400 applies to an appointed actuary who, pursuant to

• The federal Insurance Companies Act, is the actuary of a company or society;

• The federal Insurance Companies Act, is the actuary of the Canadian branch of a foreign company; or

• A provincial Act, has the access to information, protection against civil liability, and duties in an insurer, that are substantially the same as those of the appointed actuary in the federal Act.

.03 This section 2400 also applies to an actuary who has the access to information and protection against civil liability equivalent to that which the federal Insurance Companies Act grants to an appointed actuary, even if this actuary is not an appointed actuary.

2430  Accepting and continuing an engagement

.01 Section 1300 applies rigorously to the engagement. [Effective February 1, 2018]

Qualifications, experience, and knowledge

.02 The necessary qualifications, experience, and knowledge for the engagement go beyond technical understanding and include the awareness that comes with maturity, communication with other actuaries, discussions at Institute meetings, and familiarity with conditions both internal and external to the insurer, and include communications skills.
Standards of Practice

.03 An actuary accepting an engagement for the first time may wish to arrange professional, formal, and timely access to another actuary with experience as an appointed actuary.

.04 It is important that the insurer’s directors understand and accept the actuary’s role and its requirements for time, resources, and access to information. The actuary may wish written confirmation of the understanding and acceptance unless the role is part of the insurer’s corporate culture.

Information needed

.05 The information necessary for the work consists of the records, accounts, documents, and oral briefings which provide an understanding of the insurer’s operations, its obligations, and the resources available to meet those obligations. That information includes, but is not limited to

- Files of in-force policies and outstanding claims, including their reinsurance;
- Policy provisions and other communications with policy owners;
- Past experience data;
- Past financial data;
- Communications with auditors and regulators;
- Pricing practice;
- Underwriting practice;
- Accounting practice;
- Claims settlement practice (including case estimate practice) and cost;
- Asset-liability management practice;
- Capital management practice;
- Enterprise risk management policy; and
- Own risk and solvency assessment (ORSA) report.
The process to identify and assure timely receipt of that information includes:

- An understanding of the insurer’s decision-making;
- Continual communication with members of management who can supply information; and
- Continual communication with the auditor in accordance with the CIA/CICA Joint Policy Statement.

### 2440 Report on matters requiring rectification

.01 The appointed actuary should identify and monitor matters that may threaten the insurer’s financial condition. The appointed actuary should investigate and then report, as required by law, any such matter that requires rectification to the senior management and, in the case of a Canadian insurer, send a copy of the report to the directors. Depending on the jurisdiction of the insurer, the law may also require that the report be provided to the insurer’s regulator. [Effective April 15, 2017]

.02 The report may include recommendations for rectification and should specify a deadline for rectification that the actuary may later extend if appropriate. If there is no suitable rectification by that deadline or its extension, then the appointed actuary should report the matter to the insurer’s regulator. [Effective April 15, 2017]

.03 The sensitivity of financial condition to adverse conditions and events varies among insurers. Financial condition and hence, the magnitude of the conditions and events that may threaten it, also varies among insurers.

.04 The frequency and intensity of the monitoring depend on the threatening conditions and events and on the circumstances of the insurer. A quarterly review would usually be a minimum.

.05 There would be no such report to senior management of an adverse condition that does not threaten the insurer’s financial condition. Informal notification and consultation would usually precede, and may obviate, that report to senior management.

.06 That report would describe the threatening condition or event and the assumptions and methods in the actuary’s investigation of it. It is desirable that the report includes recommendations for its rectification.

.07 The deadline would allow time, that is reasonable in the circumstances, to arrange rectification.

.08 The report to the regulator would describe the actuary’s investigation, the report to senior management, and senior management’s response to that report. The actuary would advise the directors of the report to the regulator.
2450 Report to the directors

.01 The appointed actuary for a Canadian insurer should report at least yearly to the directors, or to their audit committee if the directors so delegate,

- On the insurer’s financial position and financial condition; and
- If required by law;
  - If the insurer has one or more participating accounts;
    - On the method of allocation of income and expenses to each such participating account;
    - On the management of the participating account(s), the dividend policy and dividend scales for the participating policy owners; and
  - If the insurer has adjustable policies in force, on the criteria established or amended by the directors for changes made by the company to the premium or charge for insurance, amount of insurance or surrender value in respect of its adjustable policies. [Effective April 15, 2017]

.02 The appointed actuary for a foreign insurer should report at least yearly to its chief agent for Canada on its financial position and financial condition. [Effective April 15, 2017]

Allocation of income

.03 The report on allocation of income and expenses among accounts would consider the fairness and equity of such allocation to participating policy owners.

Management of the participating account(s)

.04 The report on the management of the participating account(s) would consider the fairness to participating policy owners of the policy established by the directors respecting the management of the participating account(s).

Dividend policy and dividend scale

.05 The report on the dividend policy would consider the fairness of the policy to the participating policy owners. The report on the dividend scale would consider the conformity of the dividend scale to the dividend policy and its fairness to the participating policy owners.

Adjustments of adjustable policies

.06 The report on adjustable policies would consider the fairness of the criteria for changes to adjustable policies established or amended by the directors, the fairness to adjustable policy owners of the adjustments made, and their conformity to those criteria.
Fairness opinions

.07 Where the applicable law requires that the appointed actuary opine on the fairness of the policies, criteria, or methods established by the insurer with respect to any of

- Management of the participating accounts;
- Dividend policy;
- Dividends declared;
- Policy established respecting the criteria for making adjustments to adjustable policies and the adjustments made under this policy;
- Allocation of investment income to the participating accounts; and
- Allocation of expenses to the participating accounts;

the wording of an unqualified opinion would be as follows:

Management of participating accounts opinion

I have reviewed the policy established by the Board of Directors with respect to the management of the participating accounts of [the Company], [including amendments made during the most recent 12 months]. I conducted my review in accordance with accepted actuarial practice in Canada and pursuant to the guidance of the Superintendent of Financial Institutions.

In my opinion, the policy is fair to the participating policyholders.

Mary F. Roe
Fellow, Canadian Institute of Actuaries
[Place of issue of opinion]

[Date of opinion]
Dividend policy opinion

I have reviewed the policy established by the Board of Directors for determining the dividends [and bonuses or other benefits] of [the Company], [including amendments made during the most recent 12 months]. I conducted my review in accordance with accepted actuarial practice in Canada and pursuant to the guidance of the Superintendent of Financial Institutions.

In my opinion, the policy is fair to the participating policyholders.

Mary F. Roe
Fellow, Canadian Institute of Actuaries
[Place of issue of opinion]
[Date of opinion]

Dividend declaration opinion

I have reviewed the proposed dividends [and bonuses or other benefits], determined by the Board of Directors of [the company] with respect to policy years [ending between XX and YY], and have considered whether they have been determined in accordance with the policy established by the Board. I conducted my review in accordance with accepted actuarial practice in Canada and pursuant to the guidance of the Superintendent of Financial Institutions.

In my opinion, the proposed dividends [and bonuses or other benefits] are in accordance with the policy established by the Board and are fair to the participating policyholders.

Mary F. Roe
Fellow, Canadian Institute of Actuaries
[Place of issue of opinion]
[Date of opinion]
Adjustable policy changes opinion

I have reviewed the criteria established by the Board of Directors of [the company] with respect to any changes to be made to the premium or charge for insurance, amount of insurance or surrender value in respect of its adjustable policies [including amendments made during the most recent 12 months] and the changes made pursuant to those criteria. I conducted my review in accordance with accepted actuarial practice in Canada and pursuant to the guidance of the Superintendent of Financial Institutions.

In my opinion, the criteria are fair to the adjustable policyholders, and the changes made to the adjustable policies during the most recent 12 months are in accordance with those criteria and are fair to the adjustable policyholders.

Mary F. Roe
Fellow, Canadian Institute of Actuaries
[Place of issue of opinion]
[Date of opinion]

Allocation of investment income to participating account(s) opinion

I have reviewed the method established by the Board of Directors for determining the portion of the investment income or losses of [the company] for the financial year ending [XX], including capital gains and losses, that is allocable to the participating account [each participating account] maintained by the company. I conducted my review in accordance with accepted actuarial practice in Canada and pursuant to the guidance of the Superintendent of Financial Institutions.

In my opinion, the method is fair and equitable to the participating policyholders.

Mary F. Roe
Fellow, Canadian Institute of Actuaries
[Place of issue of opinion]
[Date of opinion]
Allocation of expenses to participating account(s) opinion

I have reviewed the method established by the Board of Directors for determining the portion of the expenses, including taxes, of [the company] for the financial year ending [XX] that is allocable to the participating account [each participating account] maintained by the company. I conducted my review in accordance with accepted actuarial practice in Canada and pursuant to the guidance of the Superintendent of Financial Institutions.

In my opinion, the method is fair and equitable to the participating policyholders.

Mary F. Roe
Fellow, Canadian Institute of Actuaries
[Place of issue of opinion]
[Date of opinion]

.08 If the appointed actuary is unable to issue an unqualified opinion, the wording of the opinion would be adjusted to reflect the necessary qualification.

2460 Communication with the auditor

.01 Communication with the insurer’s auditor would be desirable when the actuary makes a report to the insurer’s senior management on a matter requiring rectification or makes an unfavourable report on the insurer’s financial condition.

2470 Certification of capital filings as required by the regulator

.01 This subsection 2470 applies to the appointed actuary of a life insurer when giving an opinion on the appropriateness of regulatory capital calculations pursuant to law or on the appropriateness of internal models used to determine required capital for segregated fund guarantees pursuant to requirements of the regulator.

.02 Such certifications should contain an opinion signed by the appointed actuary. [Effective April 15, 2017]

Appropriateness of regulatory capital calculations

.03 The appointed actuary should prepare a report to support the opinion on the appropriateness of regulatory capital calculations that outlines the areas where the calculation required discretion or significant technical calculations, and the methods and judgments that were applied. The report should be completed before the provision of a signed opinion pursuant to subsection 2470. [Effective February 22, 2018]
.04 The opinion would be provided annually in support of the fiscal year-end regulatory capital filing on form(s) as directed by the regulator.

.05 In providing such an opinion, the actuary would not be opining on whether the underlying factors or specified methods to be followed are appropriate but rather on the appropriateness of any interpretation and discretionary technical calculations and methods with respect to such guidelines.

.06 Here is the standard opinion language [insert appropriate wording where indicated by square brackets].

“I have reviewed the calculation of the Life Insurance Capital Adequacy Test ratios of [company name] as at [date]. In my opinion, the calculations of the components of the base solvency buffer, available capital, surplus allowance, and eligible deposits have been determined in accordance with the regulatory guidelines, and the components of the calculations requiring discretion were determined using method and judgement appropriate to the circumstances of the company.”

[Note: For application to branches “Life Insurance Capital Adequacy Test ratios” is replaced by “Life Insurance Margin Adequacy Test (LIMAT)” and “Base Solvency Buffer” is replaced by “Required Margin” and “Available Capital” is replaced by “Available Margin”.]

[Note: For filings for provincially regulated companies, the ratio definition, and definitions of base solvency buffer, required capital, available capital, surplus allowance, and eligible deposits, would be amended to reflect the appropriate definitions in the provincial requirements.]

**Appropriateness of internal models used to determine required capital for segregated fund guarantees**

.07 The appointed actuary should prepare a report to support the opinion on the appropriateness of internal models used to determine required capital for segregated fund guarantees that outlines how the models comply with the related requirements of the regulator. The report should be completed before the provision of a signed opinion pursuant to subsection 2470. [Effective April 15, 2017]
.08 The opinion would be provided annually in support of the fiscal year-end regulatory capital filing on form(s) as directed by the regulator. The opinion would also be provided to the regulator upon a new application to the regulator for permission to use such a model for required capital purposes and upon request of the regulator when making a modification to an existing model approved by the regulator.

.09 In providing such an opinion, the actuary would not be opining on whether the underlying factors or specified methods to be followed are appropriate, but rather on the compliance with the requirements of the regulator.

.10 Here is the standard opinion language [insert appropriate wording where indicated by square brackets].

“I have reviewed the internal model of [company name] for determining required capital for segregated fund guarantee risks as at [date] in the context of the requirements of [the regulator]. In my opinion, the [proposed] model is compliant in all material respects with the requirements of [the regulator] for an approved model used to determine required capital for segregated fund guarantee risks.”
2500  Financial Condition Testing

2510  Scope

.01  Part 1000 applies to work within the scope of this section 2500.

.02  This section 2500 applies to the appointed actuary of an insurer when reporting on the insurer’s financial condition pursuant to law.

2520  Analysis

.01  The appointed actuary should make an investigation at least once during each financial year of the insurer’s recent and current financial position and financial condition, as revealed by financial condition testing for selected scenarios. [Effective January 1, 2020]

.02  The appointed actuary should make a report of each investigation in writing to the insurer’s board of directors (or to the appropriate committee of the board such as audit committee, risk committee, etc., if they so delegate) or its chief agent for Canada. The report should identify possible actions, and reasons for those actions, for dealing with any threats to satisfactory financial condition that the investigation reveals. The actuary should also comment on the consistency of the results of the investigation and possible actions with the own risk and solvency assessment (ORSA). [Effective January 1, 2020]

.03  The appointed actuary should ensure that the investigation is current. The investigation should take into consideration recent events and recent financial operating results of the insurer. [Effective April 15, 2017]

.04  The timing and frequency of the appointed actuary’s investigations would be sufficient to support timely corrective actions by management and the board of directors or chief agent for Canada.

Recent and current financial position

.05  The investigation would review operations of recent years and the financial position at the end of each of those years.

Financial condition testing

.06  Financial condition testing examines the effect of selected adverse scenarios on the insurer’s forecasted capital adequacy. The actuary can supplement the financial condition testing with the use of other means, such as the ORSA and the business plan.
The purpose of financial condition testing is to identify plausible threats to satisfactory financial condition, actions that would lessen the likelihood of those threats, and actions that would mitigate a threat if it materialized.

Financial condition testing is defensive, i.e., it addresses threats to financial condition rather than the exploitation of opportunity.

**Satisfactory financial condition**

The insurer’s financial condition would be satisfactory if throughout the forecast period,

- Under the solvency scenarios, the statement value of the insurer’s assets is greater than the statement value of its liabilities;
- Under going concern scenarios, the insurer meets the regulatory minimum capital ratio(s); and
- Under the base scenario, the insurer meets its internal target capital ratio(s) as determined by the ORSA.

**Data, methods, and assumptions**

The actuary would start the forecast period using the data as of the most recent available fiscal year-end statement of financial position date.

The assumptions and methods would reflect up-to-date studies and analysis available to the actuary.

The policy liabilities would be revalued at the end of the first financial year of the forecast period if a change in assumption or method that is expected to be made by the insurer would result in a material change to the financial position of the insurer.

The actuary would consider recent events and recent operating results of the insurer up to the date of the report.

If an adverse event occurs between the date of the report and the date of its presentation to the insurer’s board of directors (or its chief agent for Canada), then the actuary would, at a minimum in the presentation to the insurer’s board of directors (or its chief agent for Canada), address the event and its potential implications on the results of the investigation. If appropriate, the actuary would redo the investigation.

**Forecast period**

The forecast period for a scenario would be sufficiently long to be aligned with the risk emergence and the recognition of impacts through the accounting and solvency results, and to capture the effect of management actions.
Scenarios

16 The scenarios would consist of a base scenario and adverse scenarios. Each scenario takes into account not only in-force policies but also the policies assumed to be sold or acquired during the forecast period, and both insurance and non-insurance operations (e.g., asset management, banking, or trust company subsidiaries).

Base scenario

17 The base scenario would be a realistic set of assumptions used to forecast the insurer’s financial position over the forecast period. Normally, the base scenario would be consistent with the insurer’s business plan. The actuary would accept the business plan’s assumptions for use in the base scenario unless these assumptions are so inconsistent or unrealistic that the resulting report would be misleading. The actuary would report any material inconsistency between the base scenario and the business plan.

Adverse scenarios

18 An adverse scenario is developed by stress testing the assumptions used in forecasting the business plan, including the determination of insurance contract liabilities, with regard to risk factors that may trigger potential threats to the insurer’s financial condition. The number and types of adverse scenarios may vary among insurers and over time for a particular insurer.

Solvency scenario

18.1 A solvency scenario is a plausible adverse scenario if it is credible and has a non-trivial probability of occurring. The actuary may use percentile rankings of outcomes to determine whether a solvency scenario is both plausible and adverse.

19 The actuary would consider material, plausible risks or events to the insurer. Reverse stress testing can help assess whether certain risk factors need to be tested, on the grounds that certain risk factors could never deteriorate to the point where they would be a threat to the insurer’s financial condition. The actuary can thereby determine whether a material, plausible risk or event exists for the insurer over the forecast period.

Going concern scenario

19.1 A going concern scenario is an adverse scenario that is more likely to occur and/or less severe than a solvency scenario, and could include risks not considered in solvency scenarios.
Risk categories

.20 The actuary would assess various risk categories and identify those that are relevant to the insurer’s circumstances when considering threats to capital adequacy under adverse scenarios.

.21 Repealed

Integrated scenarios

.22 The actuary would construct integrated scenarios by combining two or more risk factors whose combination gives rise to an adverse scenario.

.23 In developing integrated scenarios, the actuary would consider how risk factors interact. For example, the impact of combining adverse scenarios for two or more risk factors, where each is associated with a relatively high probability, may give rise to an integrated adverse scenario to which the insurer’s financial condition is sensitive. In such cases, an integrated scenario would be constructed by combining stress tests related to two or more risk factors. An integrated scenario would be designed so as to itself constitute an adverse scenario.

.24 Repealed

Ripple effects

.25 In assuring consistency within each scenario, the actuary would consider ripple effects, including policy owner action, management’s routine action, and regulatory action. Although most of the other assumptions used in the base scenario may remain appropriate under the adverse scenario, some may require adjustment to reflect the interdependence of assumptions in the adverse scenario.

.26 Selection of the assumptions for management’s routine action would, where appropriate, take into account

- Effectiveness of the insurer’s management information systems and adjustment mechanisms;
- Insurer’s historical record of promptness and willingness, to respond to adversity;
- Policy owner action; and
- External environment assumed in the scenario.

.27 The actuary would report management’s routine action, so that users may consider its practicality and adequacy. The actuary may also report the results assuming that the insurer does not respond to the adversity.
Ripple effects also include regulatory action, which would vary depending on the regulatory capital ratio requirement breached by the adverse scenario. The actuary would consider action that could be taken by the Canadian regulator(s) as well as action taken by regulators in foreign jurisdictions. Such regulatory action and associated management action would consider the local assessment of solvency regardless of the insurer’s worldwide solvency position as measured by Canadian regulatory standards. The actuary could also review the regulatory actions included in the ORSA’s scenario testing, including internal target-setting exercise, and consider their applicability to the financial condition testing’s adverse scenarios.

Corrective management actions

For each of the adverse scenarios that would result in a threat to satisfactory financial condition, the actuary would identify possible corrective management actions that would lessen the likelihood of that threat, or that would mitigate that threat, if it materialized.

Consideration would also be given to the effectiveness of possible corrective management actions in a volatile or stressed environment.

Management actions

Management actions may include but are not limited to

- Repricing of insurance products;
- Policyholder dividend scale updates;
- Adjustments to non-guaranteed product elements;
- Suspending dividend payments, capital reductions, and transfers to the parent or home office, where applicable;
- Raising additional capital or adopting an approved plan to raise additional capital if and when needed within a reasonable time frame, or, in the case of a branch, requesting transfer of adequate funds from the parent company;
- Strengthening risk management practices;
- Mitigating the risk causing the capital shortfall; and
- An increased level of monitoring and reporting with respect to the insurer’s capital position.

Whether a management action is considered a ripple effect, a corrective management action, or a combination of both, would depend on the scenario analyzed and circumstances of the insurer.
Scope of the investigation and report

.31 The report would contain the key assumptions of the base scenario and the adverse scenarios posing risks to the satisfactory financial condition of the insurer.

.32 The report would disclose each of the risks considered in undertaking the financial condition testing analysis. It is expected that the actuary would scenario test and report at least once during each financial year on the base scenario, and adverse scenarios posing significant risk for the insurer.

.33 The report would also contain the adverse scenarios examined that cause the insurer to fall below its internal target capital ratio(s) as determined by the ORSA. The report would make it clear whether under these scenarios the regulators may impose restrictions on the operations of the insurer, including its ability to write new business.

.34 If the investigation identifies any plausible threat to satisfactory financial condition, then the actuary would identify possible corrective management action that would lessen the likelihood of that threat, or that would mitigate that threat, if it materialized. For each such adverse scenario reported upon, the actuary would report the results both with and without the effect of corrective management action. The actuary would ensure that the disclosure of the corrective management action is sufficiently clear so that users may consider its practicality and adequacy.

.35 The report would present the financial position of the insurer at each fiscal year-end throughout the forecast period.

Revaluation of the policy liabilities

.36 Ideally, for the base and each adverse scenario, the insurance contract liabilities and, if applicable, other policy liabilities or reinsurance assets, would be revalued throughout the forecast period.

Frequency and/or timing

.37 The frequency and/or timing of the report would depend on the urgency of the matters being reported and on the desirability of aligning financial condition testing into the insurer’s financial planning cycle and the ORSA process.

.38 The frequency and/or timing of the actuary’s investigation would be adjusted where an adverse change in the insurer’s circumstances since the last investigation may be so significant that to delay reporting to the time of the next scheduled investigation would be imprudent. For example, failure to meet the internal target capital ratio(s), or adoption of a radically different business plan, may necessitate the preparation of an immediate report.
2530 Reporting

.01 In the case of a Canadian insurer, the appointed actuary should report to the board of directors or to an appropriate committee of the board (audit committee, risk committee, etc.) if they so delegate. In the case of a Canadian branch of a foreign insurer, the appointed actuary should report to the chief agent for Canada and may also report to the responsible senior executive in the parent head office. [Effective February 22, 2018]

.02 In order to give the insurer’s senior management an opportunity to react to the results of the investigation, the actuary would discuss the report with the insurer’s senior management in advance of its submission to the board of directors or chief agent for Canada.

.03 The report would be in writing, but an additional oral report that permits questions and discussions is desirable. An interpretative report would be more useful than a statistical report. The actuary would also consider other reporting such as the ORSA report to ensure, where appropriate, the consistency of messages and/or delivery of consolidated ORSA and financial condition testing results.

.04 The report would be submitted within 12 months following each fiscal year-end.

2540 Opinion by the actuary

.01 The report should contain an opinion signed by the appointed actuary. [Effective April 15, 2017]

.02 In this opinion, “future financial condition” has the same meaning as “financial condition.” The actuary may use the words “future financial condition” in order to comply with legislation or regulation in some jurisdictions.
The wording of the opinion follows: [insert appropriate wording where indicated by square brackets]

“I have completed my investigation of the [future] financial condition of [insurer name] as at [date] in accordance with accepted actuarial practice in Canada.

I have analyzed its forecasted financial positions over an appropriate forecast period under a series of scenarios. As part of my investigation, I have used [the ORSA and its determination of] or [insurer name] internal target capital ratio(s).

[My report includes the identification of corrective management actions that could be taken to mitigate the effect of adverse scenarios threatening [[insurer name] [solvency]] or/and [its ability to operate on a going concern basis]].

In my opinion, the [future] financial condition of the insurer [is satisfactory] or [is satisfactory subject to...] or [is not satisfactory for the following reason(s)...].”

[Montréal, Québec] [Mary F. Roe]
[Report date] Fellow, Canadian Institute of Actuaries
A satisfactory opinion would disclose the action(s) it is subject to for any of the following situations:

- The base scenario projected regulatory capital ratios are maintained or brought back above internal target capital ratios as a result of an existing plan consistent with regulatory expectations.
- For the base scenario:
  - Regulatory capital ratios are projected to decrease below internal target capital ratio(s) at a period beyond the regulator’s monitoring horizon;
  - The insurer has a plan to bring the ratios back above internal targets within a time frame consistent with regulatory expectations; and
  - The appointed actuary is satisfied that such plan is realistic.
- For going concern scenarios, the appointed actuary is satisfied that corrective management actions can restore the insurer’s regulatory capital ratio(s) to above regulatory minimum capital ratio(s) in a manner consistent with regulator’s expectations.
- For solvency scenarios, the appointed actuary is satisfied that corrective management actions under the control of the insurer can restore the insurer’s assets to be sufficient to meet its obligations.

Situations where a satisfactory financial condition is met because of management’s routine actions, would not require the opinion to state those actions.

2600 Ratemaking: Property and Casualty Insurance

2610 Scope

.01 Part 1000 applies to work within the scope of this section 2600.

.02 This section 2600 applies to the derivation of indicated rates for an insurance contract of property and casualty insurance written by an insurer, a reciprocal insurance exchange, or an underwriting syndicate.

.03 This section 2600 does not apply to the derivation of indicated rates for public personal injury compensation plans covered by the Practice-Specific Standards for Public Personal Injury Compensation Plans.

.04 This section 2600 applies to the derivation of indicated rates for any entity, such as a residual market mechanism or an advisory organization, which derives indicated rates for an insurance contract to be written by an insurer, regardless of whether or not that entity is itself an insurer.

.05 This section 2600 applies to the derivation of indicated rates, but not to the recommendation or selection of rates to be charged. The recommended or selected rates may reflect considerations beyond those set forth in this section 2600.

.06 This section 2600 also applies to the derivation of indicated rates for insurance risks accepted by a property and casualty quasi-insurer, similar to insurance risks accepted under an insurance contract. In this section 2600, “property and casualty quasi-insurer” means an entity that assumes insurance risks that a property and casualty insurer may assume, without having the legal form of an insurer. Examples of property and casualty quasi-insurers include

- Federal or provincial crown corporations or agencies acting in a capacity similar to a property and casualty insurer;
- Providers of extended warranties; and
- Self-funding mechanisms, such as those created by members of a professional association, or entities that retain some or all of their property and casualty insurance risk.
2620 Method

.01 The best estimate present value of cash flows relating to the revenue at the indicated rate should equal the best estimate present value of cash flows relating to the corresponding claim costs and expense costs, plus the present value of a provision for profit, over a specified period of time. [Effective April 15, 2017]

.02 The actuary should select appropriate methods, techniques, and assumptions recognizing that such elements depend on the circumstances affecting the work and that a variety of actuarial methods may be appropriate to derive an indicated rate. [Effective February 1, 2018]

Data

.03 The actuary would consider the availability and relevance of subject experience and related experience.

Credibility

.04 The actuary would consider the blending of information from subject experience with information from one or more sets of related experience to improve the predictive value of estimates.

Changes in circumstances

.05 The actuary would consider that the subject experience, related experience, and future cash flows may be affected by changes in circumstances that may affect expected claim costs, expense costs, and provision for profit.
Relevant circumstances subject to change may include items that are largely under the control of the entity providing insurance, such as

- Underwriting practice;
- Distribution system;
- Claims handling and case estimate setting practice;
- Reinsurance arrangements;
- Data processing and accounting systems;
- Distribution or type of business written;
- Provisions of the insurance contract(s), when not legislated;
- Premium rates; and
- Rating variables;

as well as items that are largely not under the control of the entity providing insurance, such as

- Legislated coverage or benefits; and
- The economic, social, and legal environments.

**Development**

The actuary would consider that subject experience and related experience may be subject to development over time.

**Trend**

The actuary would consider that subject experience and related experience may be subject to trend over time.

**Unusual events**

The actuary would consider that subject experience and related experience may or may not have been subject to catastrophes, large losses, or other unusual events.

**Provision for expense costs**

The actuary would determine the provision for expense costs that is appropriate for the period during which the rates are expected to be in effect.
In selecting a provision for expense costs, the actuary would consider:

- The various categories of expense costs that are incurred including, as may be applicable, residual market assessments, statutory assessments, policyholder dividends, and reinsurance costs;
- That expense costs may not be directly proportional to premium; and
- That one-time expense costs may need to be amortized.

The provision for expense costs, or other assumptions that are pertinent to its derivation, may be specified to the actuary under the terms of an appropriate engagement.

**Provision for profit**

An indicated rate would include a provision for profit.

The provision for profit, or other assumptions that are pertinent to its derivation, may be specified to the actuary under the terms of an appropriate engagement.

**Time value of money**

The investment return rate for calculating the present value of cash flows would reflect the expected investment income to be earned on assets that might be acquired with the net cash flows resulting from the revenue at the indicated rate.

Among various possible sets of such assets the actuary would consider:

- Risk-free assets of appropriate duration;
- Fixed-income assets of appropriate duration; and
- Assets which are expected to be acquired.

The actuary would consider the fact that the provision for profit is not independent of the selected investment return rate and its associated uncertainty.
2630 Reporting

.01 If an external user report is required and the actuary can report without reservation, the actuary’s report should include the standard reporting language consisting of the following scope paragraph,

   I have derived the indicated rate(s) in accordance with accepted actuarial practice in Canada, on behalf of [entity commissioning the work], for the following insurance category(ies): [name of insurance category(ies)], to be effective Month XX, 20XX for new business and Month XX, 20XX for renewal business. [Effective February 1, 2018]

.02 If an external user report is required and the actuary cannot report without reservation, the actuary should modify the standard reporting language accordingly. [Effective February 1, 2018]

.03 An additional opinion paragraph may be included to conform to the requirements of an external user.
2700 Policyholder Dividend Determination

2710 Scope

.01 Part 1000 applies to work within the scope of this section 2700.

.02 Section 2700 applies to advice provided on policyholder dividend determination on individual life, annuity, and health policies.

2720 Report on policyholder dividends

.01 There should be a written report which documents the advice on policyholder dividend determination, and which describes the framework of facts, assumptions, and procedures upon which the advice was based. [Effective April 15, 2017]

.02 The report should include
  • A description of the process used to determine dividends;
  • The manner in which policy and experience characteristics are reflected in that process; and
  • The methodology used to calculate dividends, including specific factors used to reflect policy and experience characteristics. [Effective April 15, 2017]

.03 The report should state whether or not the contribution principle has been followed, and, if it has not been followed, the report should describe any deviations and their rationale. [Effective April 15, 2017]

3100 Scope

.00 Part 1000 applies to work within the scope of this part 3000.

.01 The standards in part 3000 apply as follows:

- Section 3200 applies to advice that an actuary provides regarding the funded status or funding of a pension plan, except where such advice is with respect to:
  - The wind-up, in full or in part, of a pension plan; or
  - The financial reporting of a pension plan’s costs and obligations in the employer’s or the pension plan’s financial statements;

- Section 3300 applies to advice that an actuary provides on the funded status or funding with respect to the wind-up, in full or in part, of a pension plan;

- Section 3400 applies to advice that an actuary provides with respect to financial reporting of a pension plan’s costs and obligations in the employer’s or the pension plan’s financial statements; and

- Section 3500 applies to advice that an actuary provides regarding the computation of commuted values in the circumstances described in subsection 3510.

The wind-up of a pension plan involves the settlement of plan benefits and distribution of all plan assets. The cessation of benefit accruals or termination of a plan, not involving the settlement of plan benefits and distribution of plan assets, would not constitute a plan wind-up.

.02 The standards in sections 3200 through 3400 apply to advice with respect to a pension plan, including any arrangement that provides retirement income to its members, whether funded or not, whether registered or not, and whether in the private or public sector, except for:

- A defined contribution pension plan (noting that the standards do apply, however, to any pension plan that is a hybrid of a defined contribution pension plan and a defined benefit pension plan);

- A pension plan whose benefits are all guaranteed by a life insurer; and

- Social security programs such as the Canada Pension Plan, Québec Pension Plan, and the pension provided by the federal Old Age Security Act.
3200  Advice on the Funded Status or Funding of a Pension Plan

.01  This section 3200 applies to advice that an actuary provides regarding the funded status or funding of a pension plan, except where such advice is with respect to:

- The wind-up, in full or in part, of a pension plan; or
- The financial reporting of a pension plan’s costs and obligations in the employer’s or the pension plan’s financial statements.

3210  General

.01  The actuary’s advice on the funded status or funding of a pension plan should take account of the circumstances affecting the work. [Effective February 1, 2018]

.02  The actuary should select an actuarial cost method that is consistent with the circumstances affecting the work. [Effective February 1, 2018]

.03  The actuary should select an asset valuation method that is consistent with the circumstances affecting the work. [Effective February 1, 2018]

.04  The actuary’s advice on the funded status of a pension plan should take account of the pension plan’s benefits at the calculation date, except that the actuary’s advice may anticipate a pending amendment to the pension plan that increases the value of its benefits. [Effective December 31, 2010]

.05  The actuary’s advice on the funded status or funding of a pension plan should take account of expenses if they are expected to be paid from the pension plan’s assets. [Effective December 31, 2010]

.06  The actuary’s advice on the funded status or funding of a pension plan may, consistent with the circumstances affecting the work, take into account the value and the terms of a letter of credit of which the pension plan is the beneficiary. [Effective February 1, 2018]

.07  If the actuary is providing advice on funding:

- The actuary should determine the next calculation date, and
- The actuary’s advice on funding should cover at least the period between the calculation date and the next calculation date. [Effective December 31, 2010]
Standards of Practice

Circumstances affecting the work

.08 For the purposes of section 3200, the circumstances affecting the work would include:

- Whether the actuary’s advice relates to the funded status or the funding of the pension plan, or a combination thereof;
- The terms of the appropriate engagement under which the work is being performed; and
- The application of the law to the work.

.09 In the case of a pension plan registered under the Income Tax Act (Canada), the actuary would be familiar with guidance with respect to the funding of pension plans that has been published by an applicable regulatory authority.

.10 Advice on funding would include:

- A valuation to establish the amount of a letter of credit to secure the payment of pension plan benefits;
- Advice regarding an amount of assets to be earmarked, but not segregated, to a trust fund, to cover pension benefit commitments; and
- Advice on the funding implications of a plan amendment.

.11 The terms of an appropriate engagement may specify applicable objectives of funding, which may include a formal or informal funding policy. For example, the terms of an appropriate engagement for a pension plan registered under the Income Tax Act (Canada):

- May be limited to preparation of an external user report on the basis of applicable law including the minimum contributions required by law;
- May require the preparation of an external user report recommending contributions reflecting objectives of funding specified by the plan sponsor or plan administrator, as applicable, in addition to the requirements of law; and
- Where contributions are fixed, may require the preparation of an external user report reflecting objectives of funding specified by the plan administrator or other appropriate authority, as applicable in addition to the requirements of law.

.12 The terms of an appropriate engagement may specify the use of a particular actuarial cost method and/or a particular asset valuation method, consistent with these standards.
Objectives of funding specified by the terms of an appropriate engagement may include considerations such as the security of benefits and related provisions for adverse deviations, the orderly and rational allocation of contributions among time periods, and/or inter-generational equity.

Depending on the circumstances affecting the work, the actuary’s advice on funding may describe a range of contributions.

**Actuarial cost methods**

Cost allocation methods, which allocate the actuarial present value of projected benefits among time periods, including attained age actuarial cost methods, entry age actuarial cost methods, aggregate actuarial cost methods, and individual level premium actuarial cost methods;

Benefit allocation methods, which allocate a portion of the actuarial present value of projected benefits to a time period as a function of the change in accrued or projected benefits during the period, including the accrued benefit actuarial cost method, the unit credit actuarial cost method and the projected unit credit actuarial cost method; and

Forecast actuarial cost methods, which allocate a portion of the actuarial present value of projected benefits to the forecast period based on:

- The actuarial present value, at the calculation date, of projected benefits at the end of the forecast period including, if appropriate, benefits for those who are expected to become members between the calculation date and the end of the forecast period;

  minus

- The actuarial present value of projected benefits at the calculation date;

  plus

- The actuarial present value, at the calculation date, of benefits expected to be paid during the forecast period.

When using a forecast actuarial cost method, the beginning and ending actuarial present value of projected benefits may be calculated from the perspective of either a hypothetical wind-up valuation or a going concern valuation.

**Asset valuation methods**

The use of an asset valuation method that produces an asset value different from market value may be appropriate depending on the circumstances affecting the work. For example, the use of a smoothed asset value may be appropriate to moderate the volatility of contribution rates for purposes of advice on funding.
The value of assets may be, subject to specific requirements for different types of valuation, any of:

- Their market value;
- Their market value adjusted to moderate volatility in investment returns;
- The present value of their cash flows after the calculation date; and
- Their value assuming a constant rate of return to maturity in the case of illiquid assets with fixed redemption values.

**Deferred recognition of pending amendment**

If, at the calculation date, an amendment to the pension plan is definitive or virtually definitive:

- If the effective date of the amendment is during the period for which the report gives advice on funding, then the advice on funding up to the effective date may disregard the amendment, unless otherwise required by law, but the advice on funding after the effective date would take the amendment into account; or
- If the effective date of the amendment is after the period for which the report gives advice on funding, then the advice on funding may disregard the amendment unless otherwise required by law.

The effective date of the amendment is the date at which the amended benefits take effect, as opposed to the date at which the amendment becomes either definitive or virtually definitive.

**Next calculation date**

The next calculation date is the latest date for which the actuary considers the advice on funding to be applicable. The actuary would take into consideration the law and the terms of an appropriate engagement in determining the next calculation date.

### 3220 Types of Valuations

When giving advice on the funded status or funding of a pension plan, the actuary should undertake one or more types of valuations that are consistent with the circumstances affecting the work. [Effective February 1, 2018]
Types of valuations

.02 There are different types of valuations that an actuary may undertake when giving advice on the funded status or funding of a continuing pension plan, the most common of which are:

- A **going concern valuation**;
- A hypothetical wind-up valuation; and
- A solvency valuation.

3230 Going Concern Valuation

.01 For a **going concern valuation** the actuary should:

- Assume that the plan continues indefinitely;
- Select either best estimate assumptions or best estimate assumptions modified to incorporate margins for adverse deviations to the extent, if any, required by law or by the terms of an appropriate engagement; and
- Consider all benefits of which the actuary is aware, including contingent benefits, payable under the pension plan and should include provision for all such benefits expected to be paid while the plan is ongoing unless:
  - The law requires the valuation to exclude such benefits; or
  - The law permits the exclusion of such benefits and the terms of an appropriate engagement stipulate that the actuary exclude such benefits. [Effective February 1, 2018]

Assumptions

.02 For pension plans that are funded, in selecting the best estimate assumption for the discount rate, the actuary may either:

- Take into account the expected investment return on the assets of the pension plan at the calculation date and the expected investment policy after that date; or
- Reflect the yields on fixed income investments, considering the expected future benefit payments of the pension plan and the circumstances affecting the work.

.03 In establishing the discount rate assumption, the actuary would assume that there will be no additional returns achieved, net of investment expenses, from an active investment management strategy compared to a passive investment management strategy except to the extent that the actuary has reason to believe, based on relevant supporting data, that such additional returns will be consistently and reliably earned over the long term.
.04 If the plan is a “designated plan” as that term is defined in the Income Tax Regulations (Canada) and the purpose of the going concern valuation is to determine the maximum funding permitted by law, then the actuary would use assumptions stipulated by law for that purpose.

### Contingent benefits

.05 An example of a contingent benefit relevant to a going concern valuation is a provision granting the employer or plan administrator the right to waive early retirement reductions to members retiring from active employment. In making provision for such a contingent benefit, the actuary would consider past experience, current circumstances and future expectations relating to the employer’s or plan administrator’s granting of such benefits.

### Benefits stipulated by law

.06 If the plan is a “designated plan”, as that term is defined in the Income Tax Regulations (Canada), and the purpose of the going concern valuation is to determine the maximum funding permitted by law, then the actuary would reflect the benefits stipulated by law for that purpose.

### 3240 Hypothetical Wind-up Valuation

<table>
<thead>
<tr>
<th>Paragraph</th>
</tr>
</thead>
<tbody>
<tr>
<td>.01 A hypothetical wind-up valuation determines the funded status of a pension plan on the assumption that the plan is wound up at the calculation date. The standards for a full wind-up valuation in section 3300 apply to a hypothetical wind-up valuation except for the external user report requirements therein and as superseded by the following recommendations. [Effective September 18, 2013]</td>
</tr>
<tr>
<td>.02 For a hypothetical wind-up valuation, the actuary should determine benefit entitlements on the assumption that the pension plan has neither a surplus nor a deficit. [Effective September 18, 2013]</td>
</tr>
<tr>
<td>.03 In determining the benefit entitlements, the actuary should postulate a scenario upon which the hypothetical wind-up valuation is based, taking account of the circumstances affecting the work. [Effective February 1, 2018]</td>
</tr>
<tr>
<td>.04 The actuary should take account of contingent benefits that would be payable under the postulated scenario for the hypothetical wind-up. [Effective September 18, 2013]</td>
</tr>
<tr>
<td>.05 For a hypothetical wind-up valuation, the actuary may assume that the wind-up date, the calculation date and the settlement date are coincident. [Effective September 18, 2013]</td>
</tr>
</tbody>
</table>
.05.1 For a hypothetical wind-up valuation, the actuary may assume that benefits would be settled by the purchase of annuities regardless of any limitation of capacity in the market for group annuity contracts. [Effective September 18, 2013]

.06 For a hypothetical wind-up valuation, the value of assets should be the market value of assets. [Effective September 18, 2013]

.07 For a hypothetical wind-up valuation, the actuary should select an explicit assumption for expenses expected to be payable from the pension plan’s assets to wind up the pension plan. [Effective September 18, 2013]

Membership data

.08 The precision of the membership data is less critical for a hypothetical wind-up valuation than for an actual wind-up valuation.

.09 Since an actual wind-up is not occurring, pertinent membership data may not be available. The actuary would make appropriate assumptions regarding such missing membership data. For example, it may be appropriate to retroject current earnings based on aggregate historical pay increases in order to estimate final average earnings.

Postulation of scenarios

.10 There are often multiple scenarios regarding the circumstances that may result in the wind-up of a pension plan. For a hypothetical wind-up valuation, the actuary may postulate any reasonable, internally consistent, scenario regarding the circumstances resulting in the wind-up of a pension plan, consistent with the circumstances affecting the work. For the postulated scenario, the actuary would reflect the treatment of any contingent benefits, including:

- Those that are contingent upon the wind-up scenario, such as a plant closure benefit; or
- Those that are required by law, such as a provision for earlier commencement of deferred pension entitlements in the event of plan wind-up; and
- Those that are contingent upon a factor other than the wind-up scenario.

.11 Examples of contingent benefits that are dependent upon factors other than the wind-up scenario or as required by law are:

- A provision granting the employer or plan administrator the discretion to waive early retirement reductions; and
- A provision providing enhanced benefits if funds are sufficient.
Subsequent events

.12 The actuary may reflect subsequent events in the valuation provided that doing so either increases the actuarial present value of the projected benefits at the calculation date or reduces the value of the pension plan’s assets at the calculation date.

Wind-up expenses

.13 Since the actuary would assume that the pension plan has neither a surplus nor a deficit, wind-up expenses related to the resolution of surplus or deficit issues need not be considered.

.14 In developing the assumption for expenses expected to be payable from the pension plan’s assets to wind up the pension plan, the actuary would also make an assumption as to the solvency of the employer. The assumption with respect to the payment of expenses and the assumption with respect to the solvency of the employer would be consistent.

Settlement Methods

.15 A hypothetical wind-up valuation requires the actuary to select assumptions about the methods of settlement.

.16 The actuary may assume a settlement method permitted by law or any relevant regulatory policy or guideline.

.17 The actuary may assume settlement by means of a replicating investment portfolio if permitted by law or any regulatory policy or guideline, or where it is anticipated that annuities could not be purchased due to group annuity capacity limitations. The assumed replicating portfolio would provide for an appropriate level of security for the pension benefits covered.

.18 The actuary may incorporate assumptions as to the exercise of regulatory discretion, a change in law, or a plan amendment which would be required to enable a practical settlement of benefits. When making such assumptions, the actuary would consider any relevant regulatory policy, guidance, or precedent.

.19 For example, for a plan where pensions are indexed with the Consumer Price Index and where it is impractical to purchase annuities indexed with the Consumer Price Index, the actuary may assume that annuities would be purchased with indexing at a fixed percentage rate of comparable value to indexing in accordance with the plan provisions.
3250 Solvency Valuation

.01 A solvency valuation typically is a form of a hypothetical wind-up valuation required by law and the actuary should apply the standards for a hypothetical wind-up valuation unless:
- Otherwise required by law; or
- Otherwise permitted by law and stipulated by the terms of an appropriate engagement. [Effective December 31, 2010]

.02 Examples of exceptions permitted by law for the preparation of a solvency valuation under the law of certain jurisdictions include:
- Use of a value of assets other than market value;
- Use of one or more assumptions that are not best estimate assumptions; or
- Exclusion of certain benefits from the valuation.

3255 Other Valuations

.01 For a valuation that is not a going concern valuation, a hypothetical wind-up valuation, or a solvency valuation, the actuary should select actuarial methods and actuarial assumptions that are consistent with the terms of an appropriate engagement. [Effective December 30, 2012]

.02 To the extent that a valuation is not a going concern valuation, hypothetical wind-up valuation, or solvency valuation, but has characteristics similar to one or more of these types of valuations, the actuary would consider any relevant standards for these types of valuations in undertaking the work.

.03 For example, a valuation for determining the required amount of a letter of credit for a supplemental plan is typically similar to a hypothetical wind-up valuation, but with the actuarial methods and actuarial assumptions stipulated by the terms of the engagement. In such circumstances, the actuary would consider the relevant standards for hypothetical wind-up valuations in undertaking the work.
3260  Reporting: External User Report

.01  An external user report on work pursuant to section 3200 should:

- Include the calculation date, the report date, and the next calculation date;
- Describe the sources of membership data, plan provisions, and the pension plan’s assets, and the dates at which they were compiled;
- Describe the membership data and any limitations thereof;
- Describe the tests applied to determine the sufficiency and reliability of the membership data and plan asset data for purposes of the work;
- Describe the assets, including their market value and a summary of the assets by major category;
- Describe the pension plan’s provisions, including the identification of any pending definitive or virtually definitive amendment;
- Disclose subsequent events of which the actuary is aware, whether or not the events are taken into account in the work, or, if there are no subsequent events of which the actuary is aware, include a statement to that effect;
- State the type of each valuation undertaken under the terms of the appropriate engagement; and
- Describe any significant terms of the appropriate engagement that are material to the actuary’s advice. [Effective February 1, 2018]
.02 For each going concern valuation undertaken by the actuary, the external user report should:

- Describe the rationale for any assumed additional returns, net of investment management expenses, from an active investment management strategy as compared to a passive investment management strategy, included in the discount rate assumption;
- Report the funded status at the calculation date and the service cost or the rule for calculating the service cost between the calculation date and the next calculation date;
- Disclose any pending but definitive or virtually definitive amendment of which the actuary is aware, and whether or not such amendment has been included in determining the funded status and the service cost;
- Describe any contingent benefits provided under the pension plan and the extent to which such contingent benefits are included or excluded in determining the funded status and the service cost;
- Describe any benefits that are not contingent benefits and that have been excluded in determining the funded status and the service cost;
- If there is no provision for adverse deviations, include a statement to that effect. [Effective March 31, 2015]

.03 If an external user report includes one or more going concern valuations then the external user report should, for at least one such valuation included in the report, describe and quantify the gains and losses between the prior calculation date and the calculation date, unless the going concern valuation is based on an extrapolation of results disclosed in a previous external user report. [Effective March 1, 2019]

.04 Repealed

.05 For each hypothetical wind-up valuation and solvency valuation undertaken by the actuary, the external user report should:

- Describe the basis for inclusion and the amount considered in respect of a letter of credit of which the pension plan is the beneficiary;
- Report the funded status at the calculation date;
- Include a description of the postulated scenario; and
- Include a description of the extent to which contingent benefits provided under the pension plan are included or excluded in determining the funded status. [Effective March 31, 2015]
.06 Repealed

.06.1 For each valuation that is not a going concern valuation, a hypothetical wind-up valuation, or a solvency valuation, the external user report should:

- Include a description of the extent to which contingent benefits provided under the pension plan are included or excluded. [Effective March 31, 2015]

.06.2 If an external user report includes one or more going concern valuations then the external user report should, for at least one such valuation included in the report, report the effects of using a discount rate 1.0% lower than that used for the valuation on:

- The actuarial present value, at the calculation date, of projected benefits allocated to periods up to the calculation date; and

- The service cost or the rule for calculating the service cost between the calculation date and the next calculation date;

unless

- The purpose of the valuation is the determination of the maximum funding permitted by law for a “designated plan”, as that term is defined in the Income Tax Regulations (Canada); or

- The going concern valuation is for a pension plan which is not registered under a pension benefits standards act of a province or the federal government of Canada; or

- The going concern valuation is based on an extrapolation of results disclosed in a previous external user report. [Effective March 1, 2019]
.06.3 If an external user report includes one or more hypothetical wind-up valuations or solvency valuations then, for any one such hypothetical wind-up valuation or solvency valuation, the external user report should:

- Report the incremental cost between the calculation date and the next calculation date, in respect of the defined benefit portion of the plan;
- If the external user report does not include a going concern valuation, report the service cost or the rule for calculating the service cost between the calculation date and the next calculation date in respect of the defined contribution portion of the plan;
- Report the effect on the hypothetical wind-up or solvency liabilities, at the calculation date, of using a discount rate 1.0% lower than that used for the valuation; and
- If the external user report does not include a going concern valuation, describe and quantify the gains and losses between the prior calculation date and the calculation date;

unless

- The pension plan is a “designated plan” which has, as members, only persons “connected” with the employer as those terms are defined in the Income Tax Regulations (Canada); or
- The hypothetical wind-up valuation or solvency valuation is for a pension plan which is not registered under a pension benefits standards act of a province or the federal government of Canada; or
- The hypothetical wind-up valuation or solvency valuation is based on an extrapolation of results disclosed in a previous external user report. [Effective March 1, 2019]

.06.4 Where contributions are fixed or restricted by the terms of the pension plan or other governing documents, and the actuarial certification of the funding of the plan in accordance with the law or any regulatory policy or guideline is directly dependent on the results of a stochastic funding model regarding the adequacy of the contributions to the plan to sustain one or more target levels of benefits from the plan, the report should disclose the stochastic funding model results which are relevant to the provision of the actuarial certification. [Effective March 1, 2019]

Plausible adverse scenarios

.06.5 A plausible adverse scenario would be a scenario of adverse but plausible assumptions, relative to the best estimate assumptions otherwise selected for the valuation, about matters to which the pension plan’s financial condition is sensitive. Plausible adverse scenarios vary among pension plans and may vary over time for a particular pension plan.
.06.6 If an external user report includes one or more going concern valuations, then the actuary should consider threats to the pension plan’s future financial condition under plausible adverse scenarios that include, where appropriate, the following risks:

- Interest rate risk, the potential that interest rates will be lower than expected;
- Deterioration of asset values;
- Longevity risk, the potential that pension plan members will live longer than expected;
- For pension plans where contributions are fixed or restricted by the terms of the plan or other governing documents, the potential that the contribution base will be lower than expected;

unless

- The pension plan is a “designated plan” which has, as members, only persons “connected” with the employer as those terms are defined in the Income Tax Regulations (Canada); or
- The valuation is for a pension plan which is not registered under a pension benefits standards act of a province or the federal government of Canada; or
- The valuation is based on an extrapolation of results disclosed in a previous external user report. [Effective March 1, 2019]

.06.7 In considering the plausible adverse scenarios, the actuary may:

- Make reasonable determinations of the asset classes which are classified as fixed income investments;
- Restrict the impact of interest rate risk to the asset classes deemed to be fixed income investments and to the discount rate to the extent that the discount rate is affected by fixed income investments;
- Assess the impact of the risks in combination, but the actuary would not be required to do so;
- Reflect the impact of any compensating adjustments, such as a potential reduction in any margin implicit in the discount rate in response to a lower interest rate scenario;
- Reference any related work, such as asset-liability modelling work, with which the actuary has been involved or which has otherwise been made available to the actuary.
.06.8 If an external user report includes one or more going concern valuations, then the external user report should, for at least one such valuation included in the report, report the effects on:

- The funded status of the plan on a market value or smoothed value basis at the calculation date, separating the effects on assets and liabilities, where applicable; and
- The service cost or the rule for calculating the service cost between the calculation date and the next calculation date;

of the plausible adverse scenarios selected by the actuary for the risk assessments under paragraph 3260.06.6. [Effective March 1, 2019]

.07 An external user report that provides advice on funding should:

- Describe the determination of contributions or a range of contributions between the calculation date and the next calculation date;
- If contributions are fixed by the terms of the plan or other governing documents, then either:
  - Report that the contributions are adequate to fund the pension plan in accordance with the law; or
  - Report that the contributions are not adequate to fund the pension plan in accordance with the law; and
    - Describe the contributions required to fund the pension plan adequately in accordance with the law;
    - Describe one or more possible ways in which benefits may be reduced such that the contributions would be adequate to fund the pension plan in accordance with the law; or
    - Describe a combination of increases in contributions and reductions in benefits that would result in the funding being adequate to conform to the law. [Effective December 30, 2012]
An external user report should provide the following four statements of opinion, all in the same section of the report and in the following order:

- A statement regarding membership data, which should usually be, “In my opinion, the membership data on which the valuation is based are sufficient and reliable for the purpose of the valuation.”;
- A statement as to assumptions, which should usually be, “In my opinion, the assumptions are appropriate for the purpose(s) of the valuation(s).”;
- A statement as to methods, which should usually be, “In my opinion, the methods employed in the valuation are appropriate for the purpose(s) of the valuation(s).”; and
- A statement as to conformity, which should be, “This report has been prepared, and my opinions given, in accordance with accepted actuarial practice in Canada.” [Effective December 30, 2012]

An external user report should be sufficiently detailed to enable another actuary to assess the reasonableness of the valuation. [Effective December 30, 2012]

Membership data

Any assumptions and methods used in respect of insufficient or unreliable membership data would be described.

The actuary may describe limitations on the tests conducted in the review of the data which has been determined to be sufficient and reliable for purposes of the valuation(s). For example, the actuary may describe that the data tests will not capture all possible deficiencies in the data and reliance is also placed on the certification of the plan administrator as to the quality of the data.
Types of valuations

.12 The external user report may provide information with respect to multiple valuations, but would, as a minimum:

- If the pension plan is a registered pension plan and is not a “designated plan”, as that term is defined in the Income Tax Regulations (Canada), provide information with respect to:
  - A going concern valuation, if mandated by law or specified by the terms of an appropriate engagement;
  - A hypothetical wind-up valuation under the scenario regarding the circumstances resulting in the wind-up that, subject to paragraph 3260.19, maximizes the wind-up liabilities, unless the pension plan and the law do not define the benefits payable upon wind-up; and
  - Any other hypothetical wind-up or solvency valuation mandated by law;

- If the pension plan is a “designated plan” as that term is defined in the Income Tax Regulations (Canada), provide information with respect to:
  - A going concern valuation, if mandated by law or specified by the terms of an appropriate engagement;
  - A hypothetical wind-up valuation under the scenario regarding the circumstances resulting in the wind-up that, subject to paragraph 3260.19, maximizes the wind-up liabilities, unless the pension plan and the law do not define the benefits payable upon wind-up or the plan has, as members, only persons “connected” with the employer as that term is defined in the Income Tax Regulations (Canada); and
  - Any other hypothetical wind-up or solvency valuation mandated by law;

and

- If the pension plan is not a registered pension plan, include information with respect to the types of valuations required by the circumstances affecting the work.
Significant terms of appropriate engagement

.13 Significant terms of the appropriate engagement may include matters like:

- The use of a specified actuarial cost method;
- The use of a specified asset valuation method;
- The exclusion of benefits for purposes of a valuation, as permitted by law;
- The extent of margins for adverse deviations, if any, to be included in selecting assumptions;
- A policy to fund only the minimum contributions required by law; and
- Specified methodology for the determination of contribution requirements in excess of the requirements of law.

Service cost

.13.1 For a plan that is a hybrid of a defined contribution pension plan and a defined benefit pension plan, the service cost for a going concern valuation would include the service cost in respect of both the defined contribution portion of the plan and the defined benefit portion of the plan.

Reporting gains and losses

.14 The reported gains and losses for a going concern valuation would include the gain or loss due to a change in the actuarial cost method or a change in the method for valuing the assets and each significant change in assumptions and plan provisions determined at the calculation date. If an amendment to the pension plan prompts the actuary to change the assumptions, the actuary may report the combined effect of the amendment and the resultant change in assumptions.

Discount rate sensitivity

.15 When following the recommendations to illustrate the effect of a change in discount rate on a valuation, the actuary would maintain all other assumptions and methods as used in the underlying valuation.

Incremental cost

.15.1 The incremental cost for a hypothetical wind-up valuation or a solvency valuation represents the present value, at the calculation date, of the expected aggregate change in the hypothetical wind-up liability or solvency liability between the calculation date and the next calculation date, increased for expected benefit payments between the calculation date and the next calculation date.
Methods

.16 For each valuation included in the external user report for which there was a prior valuation, the description of the actuarial cost method would include a description of any change to the actuarial cost method used in the prior valuation and the rationale for such change.

.17 For each valuation included in the external user report for which there was a prior valuation, the description of the method to value the assets would include a description of any differences in change to the asset valuation method used in the prior valuation and the rationale for such change.

Assumptions

.18 For each valuation included in the external user report for which there was a prior valuation, the description of assumptions would include a description of each change to the assumptions from the assumptions used in the prior valuation.

.18.1 When describing the assumptions for methods of settlement for a hypothetical wind-up or solvency valuation, the actuary would describe any related limitations. For example:

- If the settlement method assumes that annuities would be purchased but it might not be possible to purchase annuities on actual wind-up of the plan due to capacity limitations; or
- If the settlement method assumes the exercise of regulatory discretion, a change in law, or a plan amendment for which there is no specific authority.

Scenario that maximizes wind-up liabilities

.19 In reporting the funded status of the pension plan under the scenario regarding the circumstances resulting in the wind-up that maximizes the wind-up liabilities, the actuary would include benefits that are contingent upon the scenario regarding the circumstances resulting in the wind-up or mandated by law. However, the actuary may disregard:

- Benefits that are contingent upon a factor other than the scenario regarding the circumstances resulting in the wind-up or as mandated by law; and
- Possible plan member earnings after the calculation date.

Other types of valuations

.19.1 Valuations that are not going concern valuations, hypothetical wind-up valuations, or solvency valuations are usually similar in nature to one of these three types of common valuations. In preparing the external user report for such a valuation, the actuary would consider the relevant reporting requirements for a type of valuation similar to the valuation undertaken and would include additional disclosures as appropriate.
Statements of opinion

.20 Where different statements of opinion apply in respect of different purposes of the valuation, the above requirements may be modified but would be followed to the extent practicable.

.21 While a separate statement regarding assumptions would generally be included in respect of each purpose of the valuation, the statements regarding assumptions may be combined where the statements do not differ among some or all of the valuation’s purposes. The report would indicate clearly which statement regarding assumptions applies to each of the valuation’s purposes.

.22 While a separate statement regarding methods would generally be included in respect of each purpose of the valuation, the statements regarding methods may be combined where the statements do not differ among some or all of the valuation’s purposes. The report would indicate clearly which statement regarding methods applies to each of the valuation’s purposes.

3270 Disclosure for Stochastic Models Used to Comply with Specific Regulatory Pension Plan Funding Requirements

Purposes

.23 For a statutory funding valuation that specifically requires the use of stochastic models to comply with pension plan funding requirements in accordance with the law or any regulatory policy or guideline, the disclosure of model inputs and outputs are meant to

• Assist the users of the report or work product to understand the assumptions and methods used in the model and the distribution of outcomes from the model; and

• Enable another actuary to assess whether the assumptions and methods used in the model and the distribution of outcomes from the model are reasonable.
Standards of Practice

Model Inputs

.02 The actuary reporting on the results of a statutory funding valuation using stochastic models for the purposes of complying with specific regulatory pension plan funding requirements (e.g., under the New Brunswick Shared Risk Plans Regulation) should disclose the following model inputs:

- Risk management goals, funding policy, deficit recovery plan and funding excess utilization plan or other such policies that require contingent calculations, reflected in the stochastic analysis;
- Number of scenarios and time period over which the scenarios are forecast;
- Methodology used in the stochastic modelling, including the approach to interest rate forecasting and development of the liability discount rate;
- Projected experience decrement assumptions and whether or not these are deterministic or stochastic. If the latter, the volatility for the decrements and a description of the model used to simulate scenarios;
- Future valuations’ decrement assumptions, if applicable;
- Assumptions for the new entrants into the plan, including population growth assumption and new entrant profiles;
- Methodology for wage increases, if relevant, including increases in the year’s maximum pensionable earnings and the defined benefit limit prescribed under the Income Tax Act (Canada);
- Frequency of valuations over the projection period;
- Anticipated expenses charged to the pension fund, broken down separately into
  - Administration expenses (including actuarial, audit, legal, etc.); and
  - Investment management fees, to the extent they are not already reflected in the return assumptions;
- Confirmation of how the discount rate used in valuing the liabilities is affected by the economic scenario. For example, if the discount rate is linked to long-term corporate bond yields, confirmation that the discount rate is adjusted to be consistent with the forecasted scenario, and a description of how that adjustment is made;
Standards of Practice

- Rationale for any variance in and any relationships among the equity returns, inflation, bond yields, or other economic variables;
- Description of any methodology to vary the standard deviations of and correlations among economic variables;
- For the federal bond yield curve, the initial yield at one-year, 10-year, and 30-year terms;
- The initial credit spreads for provincial and investment-grade corporate bonds at the one-year, 10-year, and 30-year terms, if applicable; and
- The rationale for any trend in bond yields (including any assumption of normalization of the yield curve). [Effective July 1, 2019]

.03 For each of the model inputs listed above, the actuary would indicate material changes and reasons for changes relative to the previous valuation.
Model Outputs

.04 To assist users of the report to understand the model outputs and assess their reasonableness, the following summary of forecasted economic variables should be disclosed as a minimum:

- For inflation and all asset class returns (and wage increases if they incorporate a stochastic component different than inflation):
  - Mean of the annualized compounded value over the entire period;
  - Average annual standard deviation; and
  - Average correlation matrix among these variables over the entire period.
- For the federal bond yield curve, the mean yield at the end of the projection period at the one-year, 10-year, and 30-year terms;
- The mean credit spread for provincial and investment-grade corporate bonds at the end of the projection period at the one-year, 10-year, and 30-year terms, if applicable;
- For at least every other year over the first 10 years and at least every five years thereafter, the following distribution information for the total portfolio return after investment management fees:
  - Percentiles 5%, 25%, 50%, 75%, 95%, mean, and standard deviation; and
- The initial discount rate and mean of the discount rate at the end of the projection period. [Effective July 1, 2019]

.05 The following average forecasted key demographic summary statistics should be disclosed at a minimum of every other year for the first 10 years and every five years thereafter:

- Total number of active participants and their average age, average service, and average projected salary, if relevant;
- Total number of inactive members and the total amount of annual pensions being paid; and
- Mean total liability and active/inactive liability split. [Effective July 1, 2019]
.06 The actuary should provide the following statistics for the projected liability, projected assets, projected funded status, and any other key output from the model upon which the actuary expresses an opinion (e.g., open group funded ratio):

- Percentiles 5%, 25%, 50%, 75%, 95%;
- Mean;
- The average of those values that are below the 5th percentile of the range of values produced by the entire set of modelled scenarios or above the 95th percentile, according to which side of the distribution should be considered unfavorable. As an example, values below the 5th percentile should be expected to be used for value of assets and funded status, whereas values above the 95th percentile should be expected to be used for liabilities; and
- The corresponding average for the values below the 2.5th or above the 97.5th percentile.

These statistics should be provided as a minimum for every other year for the first 10 years and every five years thereafter. [Effective July 1, 2019]

Disclosure Statements

.07 The actuary signing a report on the stochastic modelling should include the following statements:

- While the actuary believes that the model inputs are reasonable at the time this report has been prepared, other reasonable model inputs could be used, resulting in potentially very different distributions of forecasted outcomes; and
- The disclosures in this report have been prepared in compliance with Subsection 3270, Disclosure for Stochastic Models Used to Comply with Specific Regulatory Pension Plan Funding Requirements. [Effective July 1, 2019]

.08 The actuary signing a funding report requiring stochastic modelling should provide the following statement, with appropriate reference to any separate stochastic modelling report:

- The funding valuation assumptions are consistent with the stochastic model inputs. [Effective July 1, 2019]
3300  Full or Partial Wind-up Valuation

.01 This section 3300 applies to advice that an actuary provides on the funded status or funding with respect to the wind-up, in full or in part, of a pension plan.

3310  General

.01 The actuary’s advice with respect to a pension plan that is being wound-up, in full or in part, should take account of the circumstances affecting the work. [Effective February 1, 2018]

.02 The actuary should take account of subsequent events up to the cut-off date. [Effective December 31, 2010]

.03 The pension plan’s assets should be valued at liquidation value. [Effective December 31, 2010]

Scope

.04 This section is not intended to prescribe the manner in which:

- The pension plan’s assets would be allocated between jurisdictions in the case of wind-up of a pension plan covering members in several jurisdictions;
- Benefit entitlements would be determined;
- Contributions to a pension benefits guarantee fund would be determined;
- Funding obligations would be determined; or
- The pension plan’s assets would be allocated between the employer and the members or between members themselves.

.05 Rather, those issues would be determined in accordance with the law or the plan provisions, or an entity empowered thereunder to make that determination. It may be appropriate, however, to use the results of the valuation to address one or more of those issues, or to disclose their resolution in the report.

Circumstances affecting the work

.06 For the purposes of section 3300, the circumstances affecting the work would include:

- Whether the actuary’s advice relates to the funded status or the funding of the pension plan, or a combination thereof;
- The terms of the appropriate engagement under which the work is being performed; and
- The application of the law to the work.
Standards of Practice

Cut-off date

.07 The cut-off date would be the date up to which subsequent events would be recognized in the valuation.

Partial wind-up

.08 A partial wind-up occurs when a subset of the members terminates membership in circumstances that require wind-up with respect to those members. Such wind-up does not apply to the continuing members, although it may be necessary, for legal or other reasons, also to value the benefits of the continuing members.

.09 The law regarding partial wind-ups varies by jurisdiction. As a result, the application of law can cause a partial wind-up to range from an insignificant change in the pension plan to something similar to a full wind-up.

.10 The standards for a partial wind-up are the same as the standards for a full wind-up. Their application may be easier, however, when the partial wind-up applies to relatively few members. For example:

- The standard of materiality for determination of benefit entitlements may be less rigorous for continuing members than for those to whom the partial wind-up applies; or
- The standard of materiality for reporting wind-up expenses may be less rigorous.

3320 Assumptions

.01 The actuary should select assumptions that:

- Are either best estimate assumptions or are best estimate assumptions modified to incorporate margins for adverse deviations to the extent, if any, required by law or by the terms of an appropriate engagement;
- Are selected as at the cut-off date; and
- Reflect the expected method of benefit settlement. [Effective February 1, 2018]

.02 Unless it is expected that expenses will not be paid from the pension plan’s assets, the actuary should select an explicit assumption regarding the expenses of wind-up and either offset the resulting expense provision against the pension plan’s assets or add the resulting expense provision to the pension plan’s liabilities. [Effective December 31, 2010]
3330 Reporting: External User Report

.01 If a previous external user report was prepared with respect to the wind-up, the actuary should describe and quantify the gains and losses between the prior calculation date and the calculation date. [Effective December 30, 2012]

.02 An external user report should:

- Include the wind-up date, the calculation date, the cut-off date, and the report date;
- Describe the events precipitating the wind-up, of which the actuary is aware, that affect the terms of the wind-up, the benefit entitlements, or the valuation results;
- Describe the sources of membership data, plan provisions, and the pension plan’s assets, and the dates at which they were compiled;
- Describe the membership data, including any assumptions made about missing membership data;
- Describe the tests applied to determine the sufficiency and reliability of the membership data and plan asset data for purposes of the work;
- Subject to any applicable privacy legislation:
  - Include the detailed individual membership data; or
  - Include an offer to provide detailed individual membership data on request to the employer, the plan administrator, or the regulator;
- Describe the liquidation value of the assets and a summary of the assets by major category;
- Describe the pension plan’s provisions, including an identification of
  - Any benefits that have been insured;
  - Any amendments made since any previous external user report with respect to the plan which affect benefit entitlements; and
  - Any subsequent events or post-wind-up contingencies, of which the actuary is aware, which affect benefit entitlements;
- Report the explicit assumption regarding the expenses of wind-up or justify the expectation that expenses will not be paid from the pension plan’s assets;
• Report the funded status at the calculation date;

• Disclose subsequent events of which the actuary is aware, whether or not the events are taken into account in the work and, if there are no subsequent events of which the actuary is aware, include a statement to that effect;

• State that the funded status at settlement may differ from that contained in the report unless the report includes the funded status at the time of final settlement;

• State whether an updated report will be required in the future;

• If the actuary relies upon direction concerning unclear or contentious issues,
  ▪ Describe each such issue;
  ▪ Describe the direction relied upon or, where appropriate, a summary thereof; and
  ▪ Identify the person providing such direction and the basis of authority of such person;

• Describe any post-wind-up contingencies that may affect the distribution of the pension plan’s assets;

• Describe whether a recalculation of the value of benefit entitlements is required at settlement;

• Where a member has a choice that the member has not yet made between receiving a commuted value and a deferred or immediate pension, describe the assumptions made regarding such choice;

• If applicable, describe the method to allocate the pension plan’s assets among classes of members and the method to distribute surplus;

• Describe the actuary’s role in calculating commuted values, the standards for their calculation, and an opinion on whether their calculation is in accordance with accepted actuarial practice in Canada; and

• Describe the sensitivity of the valuation results to the pension plan’s investment policy and to market conditions between the report date and the settlement date. [Effective March 31, 2015]
.03 An external user report should provide the following four statements of opinion, all in the same section of the report and in the following order:

- A statement regarding membership data, which should usually be, “In my opinion, the membership data on which the valuation is based are sufficient and reliable for the purpose of the valuation.”;
- A statement regarding assumptions, which should usually be, “In my opinion, the assumptions are appropriate for the purpose(s) of the valuation(s).”;
- A statement regarding methods, which should usually be, “In my opinion, the methods employed in the valuation are appropriate for the purpose(s) of the valuation(s).”; and
- A statement regarding conformity, which should be, “This report has been prepared, and my opinions given, in accordance with accepted actuarial practice in Canada.” [Effective December 30, 2012]

.04 The external user report should be sufficiently detailed to enable another actuary to assess the reasonableness of the valuation. [Effective December 30, 2012]

Dates

.05 The wind-up date of the pension plan would be determined by the regulator, the plan administrator or the plan sponsor based on the plan provisions and the law.

.06 The calculation date of the funded status would usually be the wind-up date.

.07 For a particular member:

- The date of calculation of benefit entitlement would depend on the circumstances of the wind-up, the terms of the pension plan, and the law, and may be the date of termination of employment, the date of termination of membership, the wind-up date, or another date; and
- The settlement date would be the date of settlement of the member’s benefit entitlement.
Nature of wind-ups

.08 The purpose of a wind-up valuation may be to determine, or to provide, the basis for determining:

- The funded status of the pension plan;
- The total value of the benefit entitlements of all members prior to taking account of the funded status of the pension plan;
- Any required additional funding;
- The amounts and methods of settlement of benefit entitlements, including any adjustment required due to a wind-up deficit; or
- The amount and method of distribution of a wind-up surplus.

.09 A wind-up may be complex and may take a long time. Delays may require a series of reports by the actuary. Since the funded status of the pension plan at the final settlement date may affect whether benefit entitlements can be settled in full, the reflection of subsequent events in each report would be critical.

.10 For example, between the wind-up date and the settlement date:

- The wind-up liabilities may fluctuate if there are fluctuations in interest rates and annuity prices;
- The pension plan’s assets may fluctuate depending upon the manner in which they are invested; and
- The surplus may fluctuate if the pension plan’s assets and liabilities are not matched.

.11 The actuary would usually report the value of the benefit entitlements of all members and the funded status of the pension plan. That report would be filed with the regulator for approval. After that approval, the plan administrator would settle the benefit entitlements.

.12 The actuary may prepare, or may be required to prepare, a final report after settlement of all benefit entitlements. Such report, if any, would document the distribution of the pension plan’s assets by describing those entitlements and their settlement.

Membership data

.13 The membership data are the responsibility of the plan administrator. The actuary would, however, report on the sufficiency and reliability of the membership data, specifically including the commuted values used in the valuation whether or not the plan administrator was the calculator thereof.
The finality of wind-up would call for the actuary to obtain precise membership data. The actuary may, if the circumstances dictate, include contingency reserves in the wind-up valuation with respect to missing members if the actuary believes that additional members still have benefit entitlements under the pension plan but their membership information is missing.

The reported membership data would include details of the amounts and terms of payment of each member’s benefits.

Assumptions

The selected assumptions would:

- In respect of benefit entitlements that are assumed to be settled by purchase of annuities, reflect single premium annuity rates;
- In respect of benefit entitlements that are assumed to be settled by lump sum transfer, reflect the standards in section 3500 respecting commuted values; and
- In respect of benefit entitlements that are assumed to be settled in some other manner, reflect the manner in which such benefits would be settled.

If future benefits depend on continued employment (e.g., the pension plan is terminating but employment is not), the actuary would consider reflecting contingencies such as future salary increases and termination of employment.

If the pension plan provides special early retirement allowances that may be reduced if the members have employment income following their actual or assumed early retirement dates, then the wind-up valuation would require assumptions regarding the likelihood and the amounts of the members’ future employment income. To extrapolate the pension plan’s historical experience as a going concern would not necessarily be appropriate in selecting those assumptions.

Wind-up expenses usually include, but are not limited to:

- Fees related to the actuarial wind-up report;
- Fees imposed by a regulator;
- Legal fees;
- Administration expenses; and
- Custodial and investment management expenses.
.20 The actuary would either net wind-up expenses against the pension plan’s assets or add the assumed wind-up expenses to the pension plan’s liabilities in calculating the ratio of assets to liabilities as a measure of financial security of the benefit entitlements, unless the expectation is that expenses will not be paid from the pension plan’s assets. However, an exception may be made for future custodial and investment management expenses, which may be netted against future investment return in the treatment of subsequent events.

Use of another person’s work

.21 Some aspects of the wind-up may be unclear to the actuary or contentious. Examples are:

- Interpretation of the law;
- The determination of the wind-up date;
- The members, former members or recently terminated members to be included in the wind-up;
- Whether or not to assume salary increases in determining benefit entitlements;
- Eligibility for plant closure benefits and permanent lay-off benefits;
- Eligibility for benefits payable only with the consent of the employer or plan administrator;
- The liquidation value of the pension plan’s assets;
- The method to allocate the pension plan’s assets among members;
- The allocation of surplus between the employer and the members; and
- Whether or not wind-up expenses are to be paid from the pension plan’s assets.

.22 To decide those aspects, the actuary may rely upon direction from another person with the necessary knowledge, such as legal counsel or the employer, or the necessary authority, such as a regulator or the plan administrator. The actuary would consider any issues of confidentiality or privilege that may arise.

Post-wind-up contingencies

.23 Post-wind-up contingencies may affect benefit entitlements. Examples are:

- Member election of optional forms of benefits;
- Member election of retirement date;
- Salary increases; and
- Change in marital status.
Subsequent events

.24 In contrast with a going concern valuation, in a wind-up valuation all subsequent events, ideally, would be reflected. This ensures that the funded status is presented as fairly as possible as of the report date. However, it would be impossible to recognize subsequent events right up to the report date. Accordingly, the actuary would select a cut-off date that is close to the report date.

.25 The actuary would ascertain that no subsequent events have occurred between the cut-off date and the report date that would change the funded status significantly, otherwise the actuary would select a later cut-off date. For clarity, a subsequent event may be material yet not be so significant as to require selection of a later cut-off date.

.26 It may be appropriate to have more than one cut-off date. For example, the actuary may select one cut-off date for the active membership data and another cut-off date for the inactive membership data.

.27 Common subsequent events are:

- Contributions;
- Expenses paid from the pension plan’s assets;
- Actual investment return on the pension plan’s assets;
- Change in annuity purchase rates;
- Change in assumptions for the calculation of commuted values;
- Corrections to the membership data;
- Deaths of members; and
- Crystallization of post-wind-up contingencies.

.28 One method for taking account of subsequent events is to determine the value of benefits as of the cut-off date and then discount such value back to the calculation date at an interest rate equal to the rate of investment return, net of investment expenses, earned on the pension plan’s assets between the calculation date and the cut-off date. The pension plan’s assets would be determined at the calculation date, but adjusted for the subsequent events (such as contributions and non-investment expenses) that affect the pension plan’s assets.

.29 There may be situations where, due to legal or practical considerations, subsequent events are not recognized, at least in a preliminary report and the cut-off date for such a report would be the calculation date. In such reports, the effect of subsequent events may be disclosed and quantified in an approximate manner. Where the effect of subsequent events is provided in a later report, it may be practical, in that report, to use a calculation date corresponding to the cut-off date.
Statements of opinion

.30 Where different statements of opinion apply in respect of different purposes of the valuation, the above requirements may be modified, but would be followed to the extent practicable.
3400   Financial Reporting of Pension Costs

.01 This section 3400 applies to advice that an actuary provides with respect to financial reporting of a pension plan’s costs and obligations in the employer’s or the pension plan’s financial statements, where the calculations and advice are provided in accordance with an applicable financial reporting standard.

3410   General

.01 For financial reporting purposes, the actuary should use methods and assumptions for the value of assets and pension benefit obligations that are appropriate to the basis of financial reporting in the employer’s or pension plan’s financial statements, as applicable, and that are consistent with the terms of an appropriate engagement and the circumstances affecting the work. [Effective May 1, 2019]

Circumstances affecting the work

.01.1 For the purposes of section 3400, the circumstances affecting the work would include

- The terms of the appropriate engagement under which the work is being performed; and
- The application of the law to the work.

.02 The actuary would reflect the financial reporting standards specified by the terms of the appropriate engagement. Where financial reporting standards require methods and assumptions to be established by the preparers of the financial statements, the actuary would use the methods and assumptions specified by the preparers of the financial statements.

Plan provisions

.02.1 The actuary would determine the plan provisions with sufficient accuracy for the purposes of the valuation. Sources of information on plan provisions include, where relevant

- Current plan documents;
- Administrative practices;
- Cost-sharing arrangements; and
- Communication between the plan sponsor or plan administrator and the plan members or collective bargaining agent.

.02.2 The actuary would consider all benefits in accordance with the terms of the appropriate engagement that are to be payable under the pension plan and would include provision for all such benefits expected to be paid under the plan.
Anticipated amendment or deferred recognition of a pending amendment

.02.3 The actuary’s advice on a pension plan may reflect an expected amendment to the plan if the amendment is definitive or virtually definitive, as appropriate, based on the applicable financial reporting standard.

.02.4 The effective date of the amendment is the date at which the amended benefits take effect, as opposed to the date when the amendment becomes either definitive or virtually definitive.

.02.5 If an actuary is aware of an expected amendment to the pension plan, but does not reflect the amendment in the work, then the actuary would report the event in accordance with the requirements for the disclosure of subsequent events.

Data

.02.6 In identifying the data need, the actuary would bear in mind the pertinent benefits (i.e., those applicable during retirement, disability, or following termination of employment).

.02.7 The actuary may use data, including membership data, with an effective date different from the calculation date. In extrapolating data or results, the actuary would consider actual benefit payments and other relevant events between the effective date of the data and the calculation date. The actuary would not normally extrapolate membership data more than three years from the effective date of the membership data.

Assumptions

.03 The assumptions that the actuary uses would be best estimate assumptions, unless otherwise specified in the relevant financial reporting standards or as otherwise selected by the preparers of the financial statements.

.04 Repealed

Benefit commitments

.05 The actuary would include in the valuation of pension benefit obligations the effect of a commitment to provide benefits beyond the terms of the plan to the extent stipulated by the preparers of the financial statements.

Expenses

.05.1 The actuary’s advice on a pension plan would take account of expenses, including whether or not they are expected to be paid from the pension plan’s assets, if any.

Extrapolations

.05.2 The actuary may extrapolate results of an earlier valuation using appropriate extrapolation techniques. The actuary would not normally extrapolate valuation results more than four years from the effective date of the membership data.
3420  Reporting: External User Report

.01 An external user report should:

- Include the calculation date and the report date;
- Describe the sources of membership data, plan provisions, and the pension plan’s assets, and the dates at which they were compiled;
- Describe the membership data and any limitations thereof, and any assumptions made about missing or incomplete membership data;
- Describe the tests applied to determine the sufficiency and reliability of the membership data and plan asset data for purposes of the work;
- Describe the market value of assets and a summary of the assets by major category;
- Describe the pension plan’s provisions;
- Describe any material accounting policies relevant to the work;
- Describe any commitment to provide benefits beyond the terms of the plan reflected in the valuation of pension obligations;
- Report the funded status at the calculation date and the applicable service cost;
- Disclose any pending but definitive or virtually definitive amendment of which the actuary is aware, and whether or not such amendment has been included in determining the funded status and the service cost;
- Disclose subsequent events of which the actuary is aware, whether or not the events are taken into account in the work, and, if there are no subsequent events of which the actuary is aware, include a statement to that effect;
- Describe any contingent benefits provided under the pension plan and the extent to which such contingent benefits are included or excluded in determining the funded status and the service cost;
- Describe any benefits that are not contingent benefits and that have been excluded in determining the funded status and the service cost;
- Describe the method and period selected in connection with any amortizations;
• If the valuation is an extrapolation of an earlier valuation, then describe the method and any assumptions for, and the period of, the extrapolation; and

• State whether or not the valuation and/or extrapolation conforms with the actuary’s understanding of the financial reporting standards specified by the terms of an appropriate engagement. [Effective May 1, 2019]

.02 An external user report should provide the following four statements of opinion, all in the same section of the report and in the following order:

• A statement regarding membership data, which should usually be, “In my opinion, the membership data on which the valuation is based are sufficient and reliable for the purpose of the valuation.”;

• A statement regarding assumptions which should usually be, “In my opinion, the assumptions are appropriate for purposes of the valuation.”;

• A statement regarding calculations, which should usually be, “In my opinion, the calculations have been made in accordance with my understanding of the requirements of [name financial reporting standard]”; and

• A statement regarding conformity, which should be, “This report has been prepared, and my opinions given, in accordance with accepted actuarial practice in Canada.” [Effective March 31, 2015]

.03 An external user report should be sufficiently detailed to enable another actuary to assess the reasonableness of the valuation. [Effective December 30, 2012]

Membership data

.04 Any assumptions and methods used in respect of insufficient or unreliable membership data would be described.

.05 Reference to report on funding

The descriptions required in the external user report may be incorporated by reference to an external user report on funding.
3500 Pension Commuted Values

3510 Scope

.01 The standards in this section 3500 apply to an actuary’s advice on the computation of commuted values, including commuted values to be paid from a pension plan that is registered under an Act when the method of settlement is a lump sum payment in lieu of an immediate or deferred pension resulting from death or individual termination of plan membership except for the specific circumstances that are described below in paragraph 3510.03. In particular, the standards in this section 3500 apply:

- In a jurisdiction whether or not there is legislation in that jurisdiction that specifically provides for portability of pension benefit credits;
- Regardless of limits imposed by the Income Tax Act (Canada) on amounts that may be transferred to other tax-sheltered retirement plans; and
- Under a reciprocal pension agreement between plan sponsors where the result of the reciprocal agreement is either to establish a pension amount determined on a defined contribution basis or to establish an account balance under a defined contribution provision of a plan, whether the account balance is to be converted immediately or subsequently into a pension.

.02 The standards in this section 3500 also apply to the determination of a lump sum payment from the pension plan in lieu of an immediate or deferred pension to which a plan member’s former spouse is entitled after a division of the member’s pension on marital breakdown.

.03 The standards in this section 3500 do not apply:

- Under a reciprocal pension agreement between plan sponsors where the result of the reciprocal agreement is to provide defined pension benefits for the plan member;
- To the determination of commuted values of pensions and deferred pensions payable from pension arrangements that are not registered under an Act;
- To the conversion of defined pension benefits to a defined contribution arrangement where there is no termination of active employment;
- To the determination of commuted values of pensions that have commenced payment and where commutation is at the discretion of the member, except as explicitly required under paragraphs 3510.02 or 3560.01; or
- When calculating the capitalized value of pension benefits for actuarial evidence purposes, pursuant to part 4000, where such value does not relate to a commuted value payable from a registered pension plan.
For the purposes of this section 3500, “Act” means a pension benefits standards act of a province or the federal government of Canada or the Income Tax Act (Canada).

Since Retirement Compensation Arrangements (RCAs) are not required to be registered under the Income Tax Act (Canada), this section 3500 applies to commuted values payable from an RCA only if the RCA is registered under a pension benefits standards act of a province or the federal government of Canada.

3520 Method

The commuted value should be independent of the funded status of the pension plan at the valuation date. [Effective April 1, 2009]

The actuary should establish the period for which the commuted value applies before recomputation is required, taking into account the requirements of applicable legislation and the plan rules. Commuted values paid after the end of such period should be recomputed on the basis of a new valuation date. [Effective April 1, 2009]

The commuted value should be adjusted for a reasonable rate of interest, taking into account the requirements of applicable legislation, between the valuation date and the first of the month in which the payment is made. [Effective April 1, 2009]

The commuted value should reflect the plan member’s full benefit entitlement as a deferred or immediate pensioner, as may be applicable, determined under the terms of the pension plan. In the case of a deferred pensioner, the commuted value should include the value of the death benefit that would have applied before commencement of the deferred pension. [Effective April 1, 2009]

The actuary should not calculate a commuted value using methods or assumptions that produce a commuted value smaller than the value computed in accordance with this section 3500. [Effective April 1, 2009]

The valuation date means the date as of which a value is being computed. Generally, this would be the date upon which the plan member becomes entitled to an immediate or deferred pension resulting from death or individual termination of plan membership, or as of such other date as may be determined either by legislation, by the plan rules, or by a plan administrator who is empowered to do so, on which the right to receive a commuted value becomes effective.
.07 In the event that recomputation is required in accordance with these standards, the actuary would establish a new valuation date. The actuary would make calculations at the new valuation date in accordance with the standards in effect on the new valuation date.

**Conditions attached to payment**

.08 Applicable legislation or the plan provisions may attach conditions to the payment of a portion of the commuted value when the plan is less than fully funded on a plan termination basis.

**Benefit entitlement**

.09 Where, at the valuation date, a plan member has the right as a deferred or immediate pensioner, as may be applicable, to optional forms of pension or optional commencement dates, and where such right is contingent on an action that is within the member’s control and where it is reasonable to assume that the member will act so as to maximize the value of the benefit, the option that has the greatest value would be used in the determination of the commuted value. For example, where a member has terminated employment and, upon application, is eligible for a particular benefit that has a value, it is reasonable to assume that, upon acquiring expert advice, the member will apply for the benefit.

.10 However, where such right is contingent upon an action that is within the member’s control and where it is not reasonable to assume that the member will act so as to maximize the value of the benefit, an appropriate allowance would be made for the likelihood and timing of such action. For example, where a member is continuing in employment and is entitled to an unreduced pension that commences upon termination of employment, it may not be reasonable to assume that the member will immediately terminate employment in order to maximize the value of the benefit. In determining the likelihood and timing of such action, the actuary may use group data, and the actuary would be prepared to justify the allowance that has been made.

.11 The commuted value determined by the actuary using these assumptions made in accordance with the preceding paragraphs 3520.09 and 3520.10 may prove to have recognized certain potential entitlements that are never realized, or may prove to have disregarded certain entitlements that ultimately provide value.

**Alternative methods and assumptions**

.12 The actuary may calculate a commuted value on methods and assumptions that differ from those prescribed in these standards only if:

- The resulting value is larger; and
- Such value is required by the plan terms or applicable legislation, or by a plan administrator who is empowered to specify the basis on which commuted values are to be determined.
3530  Demographic Assumptions

.01 Except for situations specifically noted below, the actuary should assume:
  • Separate mortality rates for male and female members; and
  • Mortality rates in accordance with a mortality table promulgated from time to time by the Actuarial Standards Board for the purpose of these calculations. [Effective February 1, 2014]

.02 No adjustment should be made to reflect the health or smoker status of the member. [Effective February 1, 2014]

.03 The current age of the plan member should be used when valuing an immediate pension. [Effective February 1, 2014]

.04 If the plan provides a contingent benefit only to the person who is the plan member’s spouse at the date of termination of membership, the actual age of the spouse, if any, should be used in the computation. If this information cannot be obtained, an appropriate proportion married and age difference between the plan member and spouse should be assumed. [Effective February 1, 2018]

.05 Where the plan provides a contingent benefit to a plan member’s spouse and a change in the member’s marital status after the valuation date is relevant to the determination of the commuted value, the actuary should make an appropriate assumption concerning the likelihood of there being an eligible spouse, and the age of that spouse, at the time of death. [Effective February 1, 2014]

.06 When valuing deferred pensions, including deferred pensions for a plan member who may also be entitled to an immediate pension, the normal retirement age should be used, except in the situation where the terminated plan member has the right to elect an earlier commencement date and the consequent early retirement pension exceeds the amount that is of actuarial equivalent value to the pension payable at normal retirement age. The retirement age should be determined in a manner consistent with paragraph 3520.09. [Effective February 1, 2018]

.07 The demographic assumptions would be the same for all types of immediate and deferred pensions.
Mortality

.08 The actuary would calculate commuted values that do not vary according to the sex of the plan member where the actuary is required to do so by applicable legislation or by the provisions of the plan or by the plan administrator if the administrator is so empowered by the provisions of the plan. In this case, the actuary would adopt a blended mortality approach by either developing a mortality table based on a combination of male and female mortality rates, or computing the commuted value as a weighted average of the commuted value based on male mortality rates and that based on female mortality rates. The relative proportions of males versus females would be appropriate for the particular plan.

.09 If the requirement that commuted values do not vary according to the sex of the plan member is legislated and applies only to benefits earned after a particular date or only to a subgroup of plan members, the actuary may extend the use of a blended mortality approach to commuted values of benefits earned prior to such date or to commuted values of benefits of all members.

3540 Economic Assumptions

.01 The actuary should select economic assumptions that vary depending on whether the pension is fully indexed, partially indexed or non-indexed. [Effective April 1, 2009]

.02 If the valuation date is on or before January 31, 2011, the actuary should select economic assumptions that depend on the reported rates for the applicable CANSIM series for the second calendar month preceding the month in which the valuation date falls. If the valuation date is on or after February 1, 2011, the actuary should select economic assumptions that depend on the reported rates for the applicable CANSIM series for the calendar month immediately preceding the month in which the valuation date falls. [Effective April 1, 2009]

.03 The actuary should calculate two interest rates, one applicable to the first 10 years after the valuation date and the second applicable to all years thereafter. [Effective April 1, 2009]

.04 The commuted value of a fully or partially indexed pension should be at least equal to the commuted value applicable to a non-indexed pension in the same amount and having similar characteristics. [Effective April 1, 2009]
The actuary should determine from the CANSIM series the following three factors.

<table>
<thead>
<tr>
<th>CANSIM Series</th>
<th>Description</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>V122542</td>
<td>Seven-year Government of Canada benchmark bond yield, annualized (final Wednesday of month)</td>
<td>$i_7$</td>
</tr>
<tr>
<td>V122544</td>
<td>Long-term Government of Canada benchmark bond yield, annualized (final Wednesday of month)</td>
<td>$i_L$</td>
</tr>
<tr>
<td>V122553</td>
<td>Long-term real-return Government of Canada bond yield, annualized (final Wednesday of month)</td>
<td>$r_L$</td>
</tr>
</tbody>
</table>

Note that the factors determined above are not the reported CANSIM series, but the annualized value of the reported figure. [Effective April 1, 2009]

The actuary should also determine a fourth factor, calculated as:

$$r_7 = r_L \times \frac{i_7}{i_L} \quad \text{[Effective April 1, 2009]}$$

The actuary should determine the interest rates from the following:

<table>
<thead>
<tr>
<th></th>
<th>Non-Indexed</th>
<th>Indexed</th>
</tr>
</thead>
<tbody>
<tr>
<td>First 10 Years</td>
<td>$i_{1-10} = i_7 + 0.90%$</td>
<td>$r_{1-10} = r_7 + 0.90%$</td>
</tr>
<tr>
<td>After 10 Years</td>
<td>$i_{10+} = i_L + 0.5 \times (i_L - i_7) + 0.90%$</td>
<td>$r_{10+} = r_L + 0.5 \times (r_L - r_7) + 0.90%$</td>
</tr>
</tbody>
</table>

[Effective April 1, 2009]

The actuary should calculate the commuted value of a non-indexed pension using a two-tier interest rate of:

$i_{1-10}$ for the first 10 years and $i_{10+}$ thereafter. [Effective April 1, 2009]

The actuary should calculate the commuted value of a pension that is fully indexed to increases in the Consumer Price Index using a two-tier interest rate of:

$r_{1-10}$ for the first 10 years and $r_{10+}$ thereafter. [Effective April 1, 2009]

The UP-94 Table and Projection Scale AA were published in the Transactions of the Society of Actuaries, Volume XLVII (1995).
.10  For pensions that are partially indexed to increases in the Consumer Price Index, the actuary should determine the implied rates of increase in the Consumer Price Index in the first 10 years and thereafter that make the above assumptions for non-indexed and fully indexed pensions internally consistent. The actuary should then determine the rates of pension escalation that are produced by applying to those implied rates of increase in the Consumer Price Index the partial indexing formula of the plan. The actuary should determine the adjusted interest rates applicable to partially indexed pensions by appropriately reducing on a geometric basis the non-indexed rates of interest to reflect the rates of pension escalation. [Effective April 1, 2009]

.11  Where increases in pensions are related to increases in the average wage index, the actuary should assume that the average wage index will increase at rates that are one percentage point higher than the implied rates of increase in the Consumer Price Index. [Effective April 1, 2009]

.12  A pension that is indexed according to an excess interest approach involves increases that are linked to the excess of formula A over formula B, where A is some proportion of the rate of return on the pension fund or on a particular class of assets, and B is a base rate or some proportion of the rate of return on another asset class. In determining the interest rates under formula A and formula B, the actuary should use the interest rate applicable to a non-indexed pension as a proxy for the rate of return on the pension fund or on any particular asset class for which the rate of return is expected to be equal to or greater than the non-indexed interest rates determined in accordance with paragraph 3540.07. [Effective February 1, 2018]

.13  Prior to calculating the commuted value, the actuary should round the rates of interest determined in accordance with this subsection 3540 to the nearest multiple of 0.10%. The actuary should round only the interest rates to be used in the calculation of the commuted value. The actuary should not round any rates of interest, increase or escalation used in calculations prior to the final step of the determination. [Effective February 1, 2018]

---

Pension index frequency

.14  For an indexed pension, the actuary would apply the indexed interest rates as determined above without adjustment only if the frequency of indexing is equal to the payment frequency. Reasonable approximations may be used to calculate an adjustment that takes into account the specific circumstances of the situation regarding payment frequency, indexing frequency, and time and amount of the first increase.
Pension indexed on an excess interest formula

.15 If the pension is indexed on an excess interest formula and the particular asset class is one for which the rate of return is expected to be less than the non-indexed interest rates determined in accordance with paragraph 3540.07, the actuary would appropriately reduce the rate of interest to reflect the actuary’s expectation of the difference between the non-indexed interest rates determined in accordance with paragraph 3540.07 and the rate of return on the particular asset class. In determining the expected rate of return on a particular asset class for this purpose, the actuary would be guided by the current economic environment as well as long-term historical experience.

Other modifications

.16 Where benefit adjustments are based on one of the above approaches but are either modified by applying a maximum or minimum annual increase, with or without carry forward of excesses or deficiencies to later years, or modified by prohibiting a decrease in a year where the application of the formula would otherwise cause a decrease in pension, the actuary would adjust the interest rates otherwise applicable, based on the likelihood of the modification causing a material change in the pension payable in any year. In determining such likelihood, the actuary would be guided by the current economic environment as well as long-term historical experience. The actuary would be prepared to justify any such adjustment or lack of adjustment to the interest rates.

.17 Where increases in benefits are not determined by reference to increases in the Consumer Price Index, the actuary would ensure that the commuted value is not inconsistent with the values of non-indexed pensions and fully indexed pensions.

Alternative calculation method

.18 For pensions that are either fully or partially indexed, rather than using the implicit approach described above, the commuted value may be determined explicitly by indexing each expected payment based on the indexing rate that makes the assumptions for non-indexed and fully indexed pensions, prior to rounding under paragraph 3540.13, internally consistent.
3550 Disclosure

.01 When communicating the amount of the commuted value of a member’s pension, the actuary should provide:

- A description of the benefit entitlements involved;
- A description of the actuarial assumptions used in determining the commuted value and the rate of interest to be credited between the valuation date and the date of payment;
- A statement of the period for which the commuted value applies before recomputation is required;
- When the payment of a portion of the commuted value is subject to a condition based on the funded status of the plan, the additional contribution required for the payment of the full commuted value to be made or the recommended schedule for payment of the balance of the commuted value, if applicable; and
- A statement as to whether the commuted value has been computed in accordance with these standards. [Effective February 1, 2018]

.02 Where the commuted value has not been determined in accordance with these standards, the actuary should clearly state that the calculation is not in compliance with these standards and disclose all areas of noncompliance and the reasons for the noncompliance. [Effective April 1, 2009]

.03 When communicating to the plan administrator an actuarial basis to be used in determining commuted values, the actuary should provide a statement that the actuarial basis is in accordance with these standards. [Effective February 1, 2018]
Disclosure of plan values which differ from these standards

.04 In a situation where the use of commuted values (called plan values in this subsection 3550) that are different from those computed in accordance with this section 3500, is required by the plan terms or applicable legislation, or by a plan administrator who is empowered to specify the basis on which commuted values are to be determined, the following disclosure requirements are applicable:

- If the plan values are lower, the actuary should disclose that the commuted values so calculated are in accordance with the plan or the applicable legislation but not in accordance with the standards; or
- If the plan values are higher, the actuary should disclose that the commuted values so calculated are in accordance with the plan or the applicable legislation and the standards. [Effective February 1, 2018]

.05 Where the actuary is required to calculate commuted values that do not vary according to the sex of the plan member, and where that requirement applies only to benefits earned after a particular date or only to a subgroup of plan members, the actuary should describe the extent to which the actuary’s blended mortality approach has been extended to benefits earned before the particular date or to benefits of all members. [Effective April 1, 2009]

.06 Where the actuary uses assumptions or methods described in these standards to calculate a commuted value in a situation where these standards does not apply, the actuary should not state or imply that the commuted value has been computed in accordance with these standards. [Effective February 1, 2018]

3560 Reduced Life Expectancy

.01 The standards in this subsection 3560 applies to an actuary’s advice on the computation of commuted values, from a registered pension plan, where the right to receive the lump sum is based on subsection 51.1 of the regulations to the Ontario Pension Benefits Act. These standards may also be applicable in other directly comparable situations.

.02 These standards do not apply where the right to receive a lump sum is not conditional upon medical certification, under legislation or plan provisions, even if the former member is known to be terminally ill.

.03 All standards set out in preceding subsections of section 3500 apply, except as superseded by the following recommendations.

.04 The commuted value should be calculated as of the date of the medical certificate specifying that the former member has life expectancy less than two years, even if other conditions for payment of the benefit (such as spousal consent) are not met until a later date. [Effective April 1, 2009]
.05 The commuted value should be adjusted for interest and benefits paid to the date of payment. [Effective April 1, 2009]

.06 The computation should not be adjusted to reflect the actual death or change in health of the former member after the valuation date. However, if a former pension plan member becomes eligible for immediate commencement of a pension after the date of the medical certificate and prior to payment of the benefit, this eligibility should be reflected in the calculation. [Effective April 1, 2009]

.07 If the former member is entitled to a commuted value transfer based on plan provisions or legislation that is not conditional on reduced life expectancy, the amount payable should be the greater of the amount calculated in accordance with this subsection 3560 and the amount computed in accordance with subsections 3520 through 3540 without regard to shortened life expectancy. [Effective April 1, 2009]

**Benefit Entitlement**

.08 The commuted value would reflect the plan member’s full benefit entitlement as a deferred or immediate pensioner, as may be applicable, determined under the terms of the pension plan.

There are three possible cases:

(a) a former member with deferred pension entitlement, not eligible for immediate commencement of pension.

In this case, the commuted value would reflect the present value of the death benefits that would be payable in respect of the former member. For this purpose, the value of the death benefit would be calculated as of the valuation date, assuming the former member died as of the valuation date.

(b) a former member with deferred pension entitlement, eligible for immediate commencement of pension.

In this case, the lump sum value would be the greater of the amount determined as in (a) above and a value determined as if the member had retired at the date of valuation and elected the most favourable combination of the highest surviving spouse pension permitted by the plan (if there is an eligible spouse) and the longest guaranteed period available under the plan. This value would be determined as for pensioners in (c) below.

(c) a former member in receipt of pension.

In this case, the commuted value would reflect the present value of pension payments for a period certain of four months from the valuation date, any additional guaranteed payments and any survivor benefits potentially payable.
Disclosure

.09  When communicating the amount of the commuted value of a member’s pension, the actuary would also provide a description of the survival period assumption.

4100 Scope

.00 Part 1000 applies to work within the scope of this part 4000.

.01 The standards in part 4000 apply to actuarial evidence work.

.02 With respect to actuarial evidence work:
   • An expert is an actuary who is qualified by knowledge, skill, experience, training, or education to render an opinion or otherwise testify concerning the matter at hand; and
   • An expert opinion is a conclusion drawn from actuarial knowledge and experience or from the application of one or more actuarial methods to a body of data.

.03 An expert opinion may be provided in a written report, oral or written testimony, or both.

.04 The provision of an expert opinion which is actuarial evidence work and which involves a practice area such as insurance or pensions is work in both that practice area and the actuarial evidence practice area. The actuary would refer to the standards applicable to that practice area, in addition to the standards in part 4000.

Examples

.05 Examples of actuarial evidence work are:
   • Determination of the capitalized value of pecuniary losses arising as a result of an event such as personal injury, death, or wrongful dismissal from employment;
   • Determination of capitalized values of pensions in marriage breakdown proceedings;
   • Expert opinions given in litigation arising from work completed in respect of a pension plan or an insurance business;
   • Work as an expert advisor to a mediating official, such as a judge;
   • Determination of effective rates of interest in cases of alleged charging of criminal interest rates; and
   • Provision of an expert opinion with respect to another actuary’s work that is being challenged or in cases of alleged professional negligence.
.06 Work in a practice area, such as insurance or pensions, may be performed in an adversarial environment but not involve an anticipated expert opinion for a dispute resolution proceeding. Such work would not normally be considered to be actuarial evidence work. Examples of such work, where the standards in part 4000 are not applicable, are:

- Pension plan valuations or costings related to union negotiations, or actuarial assistance with the merger of pension plans or the valuation of a pension plan in connection with the sale of a business; and
- Actuarial assistance with the valuation of an insurer, the merger of insurers, or the acquisition of an insurer.

Fact evidence

.07 The standards in part 4000 do not apply to the work of an actuary who is providing only fact evidence, and not an expert opinion. For example, an actuary testifying in his or her own defense in a proceeding related to professional negligence would normally be providing fact evidence, and not an expert opinion. As another example, an actuary may be providing evidence in a dispute resolution proceeding regarding his or her involvement in work performed in a practice area such as insurance or pensions. If the circumstances were not adversarial and there was no anticipation of a dispute resolution proceeding at the time the work was performed, the actuary’s evidence in the dispute resolution proceeding would normally be fact evidence and not an expert opinion. The standards in part 4000 would apply, however, if the actuary’s role includes providing an expert opinion in a dispute resolution proceeding, where such opinion is expected or required to be independent.

Litigation advice

.08 The terms of an appropriate engagement may require that the actuary provide only litigation advice, other than an expert opinion that is expected or required to be independent, such as assisting counsel or a client in identifying and analyzing legal or actuarial issues, advising in connection with relevant case law, and preparing for cross-examination of opposing witnesses. In such cases, provided that the actuary makes it clear that the work product does not represent an expert opinion that is actuarial evidence work, the standards in part 4000 would not apply.

.09 The terms of an appropriate engagement may require that the actuary provide both litigation advice that is not actuarial evidence work and also an expert opinion. If work related to the expert opinion meets the definition of actuarial evidence work, then the standards in part 4000 would apply to that aspect of the engagement.
Additional guidance

.10 Repealed
4200 General

4210 Circumstances affecting the work

.01 When performing actuarial evidence work, the actuary should take into account the circumstances affecting the work. [Effective February 1, 2018]

.02 The circumstances affecting the work would include:

- Relevant legislative or regulatory provisions;
- Rules of civil procedure and rules of court in the relevant jurisdictions;
- Other rules that may be applicable to the dispute resolution proceeding;
- Established legal principles relevant to the work; and
- Terms of an appropriate engagement under which the work is being performed.

.03 Relevant legislative or regulatory provisions may include:

- Provisions relating to allowable pecuniary damages under automobile insurance legislation or regulations;
- Provisions related to division of assets under a marital property act or regulations; and
- Provisions relating to pensions, benefits, insurance, or workers’ compensation.

.04 Rules of civil procedure and rules of court, as well as other rules that may be applicable to the dispute resolution proceeding, may include:

- Mandated assumptions;
- Required content and format of reports;
- Role of experts; and
- Duties and obligations of experts.

.05 Established legal principles relevant to the work may address:

- Issues relevant to the actuary’s engagement; and
- Role and obligations of experts.

.06 The terms of an appropriate engagement would define the role of the actuary and the purpose, context, and scope of the work. An engagement for actuarial evidence work would not be appropriate if it would impair the ability of the actuary to perform independent and objective work.
.07 Significant terms of an appropriate engagement may stipulate one or more of:

- Assumptions to be used in the actuary’s work;
- Methods to be used in the actuary’s work; and
- Various scenarios to be considered by the actuary.

.08 An engagement may be appropriate if its terms require that the actuary assist his or her client or counsel with challenging the application or a particular interpretation of existing law, regulation, court practice, or established legal principles relevant to the work. Nothing in part 4000 is intended to prevent the actuary from assisting with a challenge of the application or a particular interpretation of existing law, regulation, court practice, or established legal principles relevant to the work, even if the result of such challenge of the application or a particular interpretation would otherwise, in the opinion of the actuary, be inconsistent with accepted actuarial practice.

**4220 Financial interest of the actuary**

.01 The amount of the actuary’s compensation should not be related to the outcome of the matter (e.g., dispute resolution proceeding) in connection with which the work is done. [Effective December 31, 2013]

.02 For example, contingency fees that depend on the outcome of the dispute resolution proceeding would not be appropriate.

**4230 Role as expert**

.01 The actuary’s actuarial evidence work should be independent and objective. [Effective December 31, 2013]

.02 The actuary’s role as an expert should be to assist the court or other entity in the dispute resolution proceeding in its search for truth and justice, and the actuary should not be an advocate for one side of the matter in dispute. [Effective December 31, 2013]

.03 Where the terms of the engagement require that the actuary provide both litigation advice that is not actuarial evidence work and also an expert opinion that is actuarial evidence work, the litigation advice role should not influence the independence and objectivity of such expert opinion. [Effective December 31, 2013]
.04 Where the actuary is providing both litigation advice that is not actuarial evidence work and an expert opinion that is actuarial evidence work, the actuary would have a clear understanding of the differences between the two roles included in the engagement. The actuary would clearly identify in any work product which component of the engagement is involved, and would ensure that the litigation advice role does not impair his or her ability to perform the actuarial evidence work.

4240 Testimony

.01 The actuary’s testimony should be independent, objective, and responsive. [Effective December 31, 2013]

.02 Where the terms of the engagement require that the actuary provide both litigation advice that is not actuarial evidence work and also an expert opinion that is actuarial evidence work, the actuary should be aware that full disclosure of all work and work products with respect to both roles within the engagement may be required in any testimony. [Effective December 31, 2013]

.03 In the course of providing testimony in the dispute resolution proceeding, the actuary should:

- Present a balanced view of the factors surrounding the actuarial aspects of the questions put to him or her;
- Answer all the questions that are asked on the basis of his or her own best assessment of all the relevant factors;
- Apply best efforts to ensure that the evidence is clear and complete, that the information the actuary is providing will not be misunderstood or misinterpreted, and that the audience will be able to utilize it correctly; and
- Indicate when a particular issue or question falls outside his or her expertise. [Effective December 31, 2013]

.04 The actuary should respond truthfully and fully to questions posed in the course of providing testimony, but the actuary need not volunteer information which is beyond the scope of the question posed. [Effective December 31, 2013]

.05 Testimony is the actuary’s communication presented in the capacity of an expert witness in any dispute resolution proceeding where the actuary is examined or cross-examined. Such testimony may be oral or written, direct or responsive, formal or informal.

.06 When responding to a direct question relating to any error or shortcoming the actuary perceives in the report of another actuary or expert witness, the actuary would respond truthfully and fully, notwithstanding paragraph 4710.08.
4250 Capitalized Values

.01 The actuary should calculate the capitalized value of future amounts payable in respect of an individual utilizing the actuarial present value method. [Effective December 31, 2013]

.02 Actuarial evidence work frequently deals with the determination of the capitalized value of amounts for purposes of a dispute resolution proceeding. These amounts are often payable in respect of an individual and sometimes in respect of a group of individuals. Such calculations must often be performed within a framework established by law, regulation, and/or legal precedent.

.03 Payment of the capitalized value is an alternative to payment of defined amounts to which an individual is entitled. Often the courts and others have recourse to require payment of a capitalized value when payment of the defined amounts comprising that value is not practical or not desired.

.04 Calculation of the capitalized value is within the domain of actuarial practice.

.05 The actuary would not calculate the capitalized value of future amounts that are subject to any contingent event as the present value of an annuity certain. For example, when utilizing the actuarial present value method in respect of a life annuity, the capitalized value of each life annuity payment is weighted by the probability of survival to the date of that payment. Under this method, the present value of possible overcompensation in an individual circumstance is balanced by the present value of possible undercompensation.
4300 Actuarial Evidence Calculations, Other than Capitalized Value of Pension Plan Benefits for a Marriage Breakdown and Criminal Rate of Interest

4310 Scope

.01 The standards in section 4300 apply to an actuary’s advice when performing actuarial evidence calculations, other than for the capitalized value of pension plan benefits for a marriage breakdown and for a criminal rate of interest.

4320 Assumptions and methods

.01 The assumptions and methods selected by the actuary should be appropriate in the aggregate, taking into account the purpose of the work and the parts of the standards that are applicable to the actuary’s work. [Effective December 31, 2013]

.02 The assumptions selected by the actuary should be best estimate assumptions, unless it is appropriate to incorporate margins for adverse deviations in accordance with the circumstances affecting the work. [Effective February 1, 2018]

.03 The actuary should ensure that any assumptions stipulated by the terms of the engagement are plausible. [Effective December 31, 2013]

.04 The assumptions and methods used by the actuary should take account of the circumstances affecting the work, including applicable law, regulation, court practice, and established legal principles relevant to the work. [Effective February 1, 2018]

.05 The assumptions and methods selected by the actuary should not be influenced by the party to the dispute resolution proceeding that has retained the actuary. [Effective December 31, 2013]

.06 Examples of the circumstances affecting the work where it would be appropriate to incorporate a margin for adverse deviations in an assumption include, but are not limited to:

- The assumption or the requirement for a margin for adverse deviations is mandated by law, regulation, court practice, or established legal principles relevant to the work; and
- The actuary’s work relates to a practice area such as insurance or pensions, and the standards for that practice area require or permit the inclusion of a margin for adverse deviations for such work.
.07 Notwithstanding paragraph 4320.03, the terms of an appropriate engagement may stipulate assumptions that are not considered plausible by the actuary or methods that are not considered appropriate by the actuary. In such case, if the actuary performs the work in accordance with the terms of the engagement, the actuary would report the deviation from accepted actuarial practice in Canada.

.08 The terms of the engagement may require that the actuary complete calculations for related items, such as one calculation for the capitalized value of a pecuniary loss and another calculation for the income tax gross-up. The underlying assumptions would be consistent for the calculation of these related items. In this example, the actuary would utilize the same underlying assumptions, such as the same real rate of interest, the same rate of price inflation, and the same mortality assumption, for both the calculation of the capitalized value of the loss and the calculation of the income tax gross-up.

.09 Where there are insufficient data to support a particular assumption regarding a contingency incorporated in the actuary’s work, the actuary may present a range of results.

### 4330 Contingencies

- **.01** The actuary should consider incorporating any contingency where, in the actuary’s opinion, there are adequate legal, theoretical, or empirical grounds to justify this. The actuary should disclose the omission from the work of any contingencies he or she considers material. [Effective December 31, 2013]

- **.02** If the actuary gives advice on the effect of a specific contingency, that advice should be based on an assessment of that contingency, both alone and in combination with other factors, using appropriate actuarial methods. [Effective December 31, 2013]

- **.03** Where the actuary has prepared results under more than one scenario, the actuary’s report would show the results of the actuarial calculations separately for each scenario and identify which contingencies have been incorporated in each scenario. For example, the results of the actuarial calculations under one scenario may include precise recognition of only net investment return and mortality. The results taking into account any other provision for contingencies would be prepared under another scenario and would be reported separately.

- **.04** Recognition of a contingency may create a positive or negative effect on a calculation.

### 4340 Application of law

- **.01** In a situation where law, regulation, court practice, or established legal principles relevant to the work mandates that a method or assumption be adopted in an actuarial evidence calculation, a broad interpretation of accepted actuarial practice in Canada is appropriate, so that in most such situations the law, regulation, court practice, or established legal principles relevant to the work would be considered to be within the range of accepted actuarial practice in Canada.
.02  Repealed

.03  Where an assumption is mandated by law, regulation, court practice, or established legal principles relevant to the work, such assumption may be outside of the range of assumptions that the actuary considers to be reasonable.
4400 Capitalized Value of Amounts Other than Pension Plan Benefits for a Marriage Breakdown

4410 Scope

.01 The standards in section 4400 apply to an actuary's advice when calculating the capitalized value of amounts other than pension plan benefits for a marriage breakdown. A capitalized value relates to amounts payable at various times, each amount subject to various contingencies related to the individual or to the individual’s dependants. Examples of situations where capitalized values may be calculated are:

<table>
<thead>
<tr>
<th>Event</th>
<th>Capitalized Value of:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disability</td>
<td>individual’s loss of earnings, loss of household services, and/or cost of extraordinary expenses attributable to the disability.</td>
</tr>
<tr>
<td>Death</td>
<td>dependant’s loss of financial support and/or loss of household services.</td>
</tr>
<tr>
<td>Wrongful dismissal</td>
<td>individual’s loss of earnings, pension benefits, and/or employer-sponsored benefits other than pensions.</td>
</tr>
<tr>
<td>Marriage breakdown</td>
<td>individual’s support obligations.</td>
</tr>
</tbody>
</table>

4420 Assumptions and methods

Past loss

.01 In some cases, the capitalized value is the present value of amounts payable both before and after the date at which the capitalized value is established. For example, in an accident caused by negligence, litigation of the damages may result in the capitalized value becoming payable several years after the accident. Then the damages consist of those in respect of both the period before and the period after the date at which the capitalized value is established, called “past losses” and “future losses”, respectively.

Income tax

.02 Subject to the terms of the engagement, the actuary may include an appropriate allowance in the capitalized value calculation for the expected effect of income tax, taking account of applicable law, regulation, court practice, and established legal principles relevant to the work. The actuary’s report would deal with income tax in an internally consistent way, and the report would fully disclose the assumptions and methods utilized.
Investment expenses

.03 Subject to the terms of the engagement, the actuary may include an appropriate allowance in the capitalized value calculation for any expenses expected with respect to the future investment, management, or administration of any settlement amount, taking account of applicable law, regulation, court practice, and established legal principles relevant to the work. The actuary’s report would deal with such investment expenses in an internally consistent way, and the report would fully disclose the assumptions and methods utilized.
**Standards of Practice**

**4500 Capitalized Value of Pension Plan Benefits for a Marriage Breakdown**

**4510 Scope**

.01 The standards in this section 4500 apply to an actuary’s advice when the capitalized value of a pension plan’s benefits is needed for calculating the value of family property at the breakdown of the marriage of a plan member.

.02 For the purposes of this section 4500, “plan” means “pension plan” and is broadly defined, including not only a plan that is registered under the federal Income Tax Act but also an unregistered plan, such as a retirement compensation arrangement and an unfunded pension plan.

.03 The standards in this section 4500 do not apply when the purpose of the calculation is to calculate an amount, in respect of a pension benefit, to be paid:

- By the plan to the plan member or beneficiary as a result of the plan member’s death or termination of membership; or
- By a party other than the plan in connection with litigation other than in respect of a marriage breakdown.

.04 The standards in this section 4500 may provide useful guidance for similar calculations for other deferred compensation arrangements, such as a partnership retirement buy-out agreement, a sick leave buy-out plan, and a retirement lump sum allowance, but they do not provide useful guidance for current compensation arrangements such as group life and disability insurance.

.05 The standards in this section 4500 do not apply when applicable legislation mandates a different basis for the calculation of the value of a pension for family property purposes at the breakdown of the marriage of a plan member.

**4520 Method**

.01 The benefits to be valued are the plan’s benefits in respect of the member (including survivor benefits vested in the member’s spouse) at the calculation date or calculation dates. [Effective January 1, 2004]

.02 The value of the member’s benefits is the capitalized value of the benefits to be valued, but assuming that the member has no spouse. The value of the survivor benefits vested in the member’s spouse is the excess, if any, of the capitalized value of the benefits to be valued over the value of the member’s benefits. [Effective January 1, 2004]
**Standards of Practice**

**Principle**

.03 The capitalized value would conform to the intent of applicable family law. The capitalized value may, thus, differ from the corresponding transfer value from a registered pension plan. Transfer values typically include only unconditional rights, whereas property under family law typically includes both vested and contingent rights. Thus, such contingent rights as early retirement rights, bridging benefits, and ad hoc inflation adjustments are property to be considered in a calculation for marriage breakdown purposes.

.04 The standards in this section will often produce more than one result, by taking account of alternative possibilities for:

- Pension commencement age;
- Future increases in accrued benefits before and after retirement;
- Allocation of value earned before marriage;
- Inclusion or exclusion of non-vested benefits; or
- Special circumstances, such as buy-back or transfer of benefits.

.05 If the actuary has reason to believe that the plan’s financial position is so weak that payment of the capitalized benefits is doubtful, then the actuary would so report, making clear that allowance for this factor could significantly reduce the present values calculated, given that such present values have been calculated assuming that the plan would meet its obligations. In making that assessment, the actuary would take into account any benefits payable under provincial pension guarantee legislation. The actuary would take into account further the extent to which plan benefits are provided through a retirement compensation arrangement and/or an unfunded pension plan.

.06 The terms of the actuary’s engagement may determine some or all of:

- The relevant law or jurisdiction;
- The calculation date or calculation dates;
- Retirement age, but only if established as a matter of fact pursuant to an agreement of the parties or a determination by the court; and
- Inclusion or exclusion of the effect of income taxes.

**Benefits to be valued**

.07 The benefits to be valued would include all of the plan’s contractual benefits, including pre- and post-retirement death benefits, and any contractual inflation protection and non-contractual inflation protection.

.08 The benefits to be valued would exclude spousal survivorship benefits, except to the extent that these may have vested upon retirement prior to the calculation date.
.09 The form of plan benefits that would be valued would be the most favourable of any optional form available to the member with no spouse. For example, a 15-year guaranteed pension option would have a greater value than a five-year guaranteed pension option for a member with impaired mortality. However, if the applicable law disregards a particular optional form of plan benefit, then the actuary may omit that option in calculating the capitalized value.

.10 The benefits may include or exclude any non-vested benefits. Non-vested benefits may be included in the values, or may be illustrated separately, and would be valued without discount for the possibility of future forfeiture. Separately from the illustrated values, the report may contain comments including suggestions for recognizing the contingent nature of non-vested benefits. The references in this paragraph to inclusion of values of non-vested benefits apply in jurisdictions where the inclusion of such values depends on the plan provisions applicable to a deferred vested member. In other jurisdictions, the inclusion of such values depends on the extent to which continued employment is assumed.

.11 The capitalized values would include ancillary benefits that are provided by the plan as of the calculation date and are expected to become available to the member after the calculation date if the plan member continues as an active member of the plan, but are not available to the member as of the calculation date, such as unreduced early retirement benefits.

.12 The actuary would disclose whether or not the benefits valued include benefits that will be provided by the plan after the calculation date and that are expected to become available to the member after the calculation date if the plan member continues as an active member of the plan, but are not available to the member as of the calculation date, for example:

- A future increase in benefits as a result of a collective bargaining agreement; or
- A future increase in benefits as a result of an adopted plan amendment.

.13 The benefits referred to in paragraph 4520.11 are those payable by the plan as a going concern, and not those payable on plan wind-up, if different, unless the plan has been fully wound up or partially wound up with respect to the plan member.

.14 Where various legal interpretations for a specific question appear possible, the actuary would obtain clarification of such unclear matters from the instructing lawyer or from another authoritative source. If that is not possible, the actuary would advise that various interpretations exist, and would report the effects of these interpretations or report values that, in the actuary’s opinion, are most consistent with accepted actuarial practice.
Calculation date

.15 The calculation date may be single or multiple, depending on the circumstances and applicable law. The possibilities include:

- The date of separation;
- The date of marriage or commencement of cohabitation;
- The date of trial; and
- The report date.

.16 If the use of an alternative calculation date, close to the calculation date, would significantly affect the capitalized value, then the actuary would so report. Examples are:

- The date at which the member becomes eligible for early retirement with unreduced benefits; and
- The date at which the plan is amended to enhance its benefits.

Applicable standards

.17 The applicable standards are those in effect at the calculation date. If there are two or more calculation dates, however, and if the standards applicable to one differ from the standards applicable to another, then the actuary would use the same standards for all calculation dates. The choice of standards would be governed by the latest of the calculation dates, except that the choice would be governed by the base calculation when the actuary selects an alternative calculation date, close to the calculation date, in accordance with the previous paragraph.

Future service

.18 If the member’s employment terminated before the calculation date and was not reinstated at the report date, then the actuary would include nothing in the capitalized value on account of assumed service after the calculation date, even if reinstatement is possible after the report date. The actuary may, however, report a useful alternative calculation that assumes reinstatement.

.19 If the member’s employment terminated between the calculation date and the report date and was not reinstated at the report date, then the actuary may, with disclosure, exclude from the capitalized value any non-vested benefits forfeited by the termination of employment.

Effect on capitalized value of minimum benefits

.20 In calculating the capitalized value, the actuary would take account of any minimum benefit related to member contributions, for example:

- The so-called “50% minimum employer contribution rule”; and
- A minimum benefit equal to the member’s contributions accumulated with interest.

.21 The minimum benefit would not necessarily be limited only to the value determined on a termination of employment assumption. The capitalized value would incorporate the relevant minimum benefit rule according to the event.
Effect on capitalized value of salary increases after the calculation date

.22 If the pension is an earnings-related benefit, then the possibilities are:

• The capitalized value takes account of all the member’s salary increases—
general increases, promotional increases, and seniority increases—after the
calculation date;

• The capitalized value takes account of the member’s salary increases that result
from general (as opposed to promotional and seniority) salary increases after the
calculation date. A rationale for this possibility is that the member’s spouse has
no entitlement to the effect of promotions or seniority increases that the
member earns after the calculation date;

• The capitalized value does not take account of the member’s salary increases
after the calculation date. A rationale for this possibility is that the member’s
spouse has no entitlement to the effect of salary increases, which depend on the
member’s continued employment after the calculation date.

.23 The assumed salary increases after the calculation date would be consistent with the prescribed
economic assumptions, except that salary increases revealed by subsequent events would be
substituted for the corresponding assumed increases.

Effect on capitalized value of non-contractual indexing of pensions and other benefit
adjustments

.24 In calculating the capitalized value, the actuary would assume continuance of the plan’s
established practice or current policy, if any, for non-contractual indexing for inflation of
pensions after pension commencement age and of vested deferred pensions before pension
commencement age, unless there is explicit reason not so to assume. The actuary would report:

• The established practice or current policy; and

• The indexation assumption.

.25 If that assumption is doubtful, then the actuary would also report the numerical effect on the
capitalized value of helpful alternative assumptions.

.26 In the case of a final or best average earnings plan, there would be no allowance made for
indexing of vested deferred pensions before pension commencement age in the period for
which salary increases are projected after the calculation date.
Effect on capitalized value of income tax

.27 Income tax may be taken into account in the calculation. If it is to be taken into account, then the actuary would do so by calculating the average income tax rate based upon the member’s anticipated retirement income computed in “current” dollars, including accrued and projected future pension income, Canada Pension Plan, Old Age Security, and other anticipated income, and continuance of the tax environment at the report date or the calculation date; i.e., assuming continuance of the existing tax rates, brackets, surtaxes, and clawbacks, applied to the projected income on retirement expressed in “current” dollars. The actuary would disclose which date was used and if the tax environment is as at the report date, would disclose the use of any tax provisions that have not yet been enacted.

.28 The actuary may report useful alternative calculations that take income tax into account.

4530 Assumptions

.01 The actuary should select all assumptions, except those depending upon interpretation of applicable law. [Effective January 1, 2004]

Mortality rates

.02 The actuary should assume mortality rates in accordance with a mortality table promulgated from time to time by the Actuarial Standards Board for the purpose of these calculations, modified, if appropriate, to reflect the member’s or the member’s spouse’s impaired health, if medically determinable. [Effective January 1, 2012]

.03 Tobacco use (or lack of tobacco use) would not, in itself, be sufficient reason to modify the mortality rates identified above.

.04 Use of unisex mortality rates would not be appropriate except that it may be appropriate in situations where the plan member has terminated employment and has elected, or has the option to elect, a transfer value that was or would be calculated under a unisex basis.

Retirement age

.05 If the retirement age is a matter of fact (i.e., one agreed by the parties or determined by the court), then the actuary would report the selection of the assumed retirement age as such.

.06 The retirement of the member before the report date does not necessarily preclude assumption of a different retirement age.
.07 Unless paragraph 4530.05 applies, the actuary would usually assume and report the results for a range of useful retirement ages, based on data at the calculation date, which would include:

- The earliest age at which the member is entitled to a pension whose amount is not reduced on account of early retirement, assuming that the member’s service ceases at the calculation date;
- The earliest age at which the member is entitled to a pension whose amount is not reduced on account of early retirement, assuming that the member continues in service either to that age or to an earlier age after the calculation date;
- If there is an upper limit to the number of years of credited service, the earliest age at which the member has attained, or will attain, that upper limit and becomes entitled to a pension whose amount is not reduced on account of early retirement; and
- The normal retirement age.

Economic assumptions

.08 The actuary should select economic assumptions that depend on the reported rates for the applicable CANSIM series for the calendar month immediately preceding the month in which the calculation date falls. [Effective January 1, 2012]

.09 The actuary should determine from the CANSIM series the following four factors:

<table>
<thead>
<tr>
<th>CANSIM Series</th>
<th>Description</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>V122487</td>
<td>average long (&gt;10 yrs) Government of Canada bond yields</td>
<td></td>
</tr>
<tr>
<td></td>
<td>(final Wednesday of month)</td>
<td>$G_L$</td>
</tr>
<tr>
<td>V122544</td>
<td>long-term Government of Canada benchmark bond yield,</td>
<td>$b_L$</td>
</tr>
<tr>
<td></td>
<td>annualized (final Wednesday of month)</td>
<td></td>
</tr>
<tr>
<td>V122553</td>
<td>long-term Government of Canada real return bond yield,</td>
<td>$r_L$</td>
</tr>
<tr>
<td></td>
<td>annualized (final Wednesday of month)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$(1 + b_L)/(1 + r_L) - 1 break-even inflation rate</td>
<td>BEIR</td>
</tr>
</tbody>
</table>

Note that the factors determined above do not reflect the reported CANSIM series, but the annualized value of the reported figure. [Effective January 1, 2012]
Inflation and indexing

.10 The actuary should calculate the projected benefit obligation for a pension that is fully indexed to increases in the Consumer Price Index using an assumed inflation rate of EI. For pensions that are partially indexed to increases in the Consumer Price Index, the actuary should derive inflation rates in a like manner by applying to the stipulated inflation rates the partial indexing formula of the plan. [Effective January 1, 2012]

.11 The actuary should determine the assumed rate of inflation EI as:
   - First 20 years  \( EI_{0-20} = \beta EI \)
   - After 20 years  \( EI_{20+} = 2.25\% \)

EI should be rounded to the nearest multiple of 0.01%. [Effective January 1, 2012]

.12 Where increases in pensions are related to increases in the average wage index, the actuary should assume that the average wage index will increase at rates that are one percentage point higher than EI. [Effective January 1, 2012]

.13 The capitalized value of a fully- or partially-indexed pension should be at least equal to the capitalized value applicable to a non-indexed pension in the same amount and having similar characteristics. [Effective January 1, 2012]

.14 Where the plan so provides, the indexing in any of the above arrangements may be modified by:
   - Applying a maximum or minimum annual increase, with or without carry forward of excesses or deficiencies to later years; or
   - Prohibiting a decrease in a year where the application of the formula would otherwise cause a decrease.

The actuary would then adjust the expected inflation rate for a year to reflect the probability and extent of modification for that year.

.15 If the pension is indexed using an “excess investment return” approach, the expected indexation rate would be determined using the “floor rate” and the interest rates determined in accordance with paragraph 4530.18 to produce an expected indexation rate consistent with excess interest situations.

.16 For a pension in a plan that has a policy or a history of indexing on an ad hoc basis, the actuary would determine an indexation rate consistent with the indexing policy or history.
Interest rates

.17 The actuary should calculate two interest rates, one applicable to the first 20 years following the calculation date, and the second one applicable to all years thereafter. [Effective January 1, 2012]

.18 The actuary should determine the interest rates as:
- First 20 years \( i_{0-20} = g_L + 0.50\% \)
- After 20 years \( i_{20+} = 5.50\% \)

Prior to calculating the capitalized value, the actuary should round the rates of interest determined in accordance with this paragraph to the nearest multiple of 0.1%. [Effective January 1, 2012]

.19 The actuary should calculate the capitalized value of a pension using a two-tier interest rate of:
- \( i_{0-20} \) for the first 20 years; and
- \( i_{20+} \) thereafter. [Effective January 1, 2012]

Assumptions selected by client

.20 The actuary would obtain instructions from the client with respect to assumptions dependent upon the interpretation of applicable law.

.21 The actuary would report his or her reliance on an assumption selected by the client.

4540 Reporting: external user report

.01 Here is model text if the actuary reports without reservation with regard to marriage breakdown:

I have determined the capitalized value of the pension benefits and prepared this report in accordance with accepted actuarial practice in Canada, for purposes of settlement of a division of pension benefits resulting from marriage breakdown under the [Family Law Act] of [province]. In my opinion, the capitalized values are appropriate for this purpose.

Respectfully submitted,

[actuary]

Fellow, Canadian Institute of Actuaries
4600 Calculation of Criminal Rate of Interest

4610 Scope

.01 The standards in section 4600 apply to an actuary’s advice when determining whether the interest rate for a particular agreement or arrangement is a “criminal rate”.

.02 The Criminal Code of Canada defines “criminal rate” as meaning an effective annual rate of interest calculated in accordance with generally accepted actuarial practices and principles that exceeds 60 percent on the credit advanced under an agreement or arrangement.

4620 Data

.01 The actuary should ascertain or make assumptions regarding the quantum and timing of all amounts actually or deemed to be advanced as well as all amounts actually or deemed to be repaid either as principal or as “interest” as defined in the Criminal Code. [Effective December 31, 2013]

.02 The actuary should report all data used in the calculation, and their sources. [Effective February 1, 2018]

.03 If data are not clear from the initial terms of the engagement, the actuary would obtain clarification from his or her client (for example, whether or not a particular item falls within the statutory definition of “interest,” or the timing of a particular payment that could be made on various alternate dates).

4630 Method

.01 The actuary should calculate and report the effective rate of interest compounded annually, “i”, such that the following equality is established:

\[
\sum_{r=1}^{m} A_r \times (1+i)^{t_r} = \sum_{s=1}^{n} B_s \times (1+i)^{t_s}
\]

where

- m is the total number of payments advanced by the lender to the borrower;
- n is the total number of payments repaid by the borrower to the lender;
- \(A_r\) is the amount of the \(r^{th}\) payment advanced by the lender;
- \(B_s\) is the amount of the \(s^{th}\) payment repaid by the borrower, consisting of principal, “interest” as defined, or a combination of both;
• \( t_r \) is the period measured in years (including fractional parts of a year) between the time that the \( r^{th} \) payment is advanced by the lender to the borrower and the time on which the final repayment is made by the borrower to the lender; and

• \( t_s \) is the period measured in years (including fractional parts of a year) between the time that the \( s^{th} \) payment is repaid by the borrower to the lender and the time on which the final payment is made by the borrower to the lender. [Effective December 31, 2013]

.02 If the calculation produces only one result, then the actuary would report that result. If the calculation produces more than one result, then the actuary would report only those that are positive and real, or zero.

.03 The formula in paragraph 4630.01 applies in most, but not all, situations.
4700 Reporting

4710 External user report

.01 For work pursuant to part 4000, any external user report that is prepared should:

- Identify the person for whom the report was prepared and, if that person is acting on behalf of a party to the dispute, that party to the dispute;
- State the effective date of the report and the effective date of any actuarial opinions and calculations in the report;
- Describe any terms of the appropriate engagement that are material to the actuary’s work, including the role of the actuary, the scope and purpose of the work, any limitations or constraints on the work and any stipulated assumptions or methods;
- Where the actuary is aware of circumstances where the independence of his or her expert opinion may reasonably be questioned, disclose such circumstances;
- Disclose the results of the work;
- Describe the data, methods, and assumptions used for the work, including the terms and the amounts of the payments relevant to any calculations, for each of the scenarios presented in the report;
- Identify the assumptions and methods that are constrained by law, regulation, court practice, or established legal principles relevant to the work;
- Identify the differences between scenarios where the results of multiple scenarios are presented;
- Identify any margins for adverse deviations that are included, except where the assumption or method is mandated by law, regulation, court practice, or established legal principles relevant to the work, and the rationale for inclusion of any identified margins for adverse deviations;
- Describe every contingency that has been taken into account, and state that there may be other contingencies that could have a positive or negative effect that have not been taken into account;
- Disclose the extent of the actuary’s reliance on others;
- List the sources of information on which the actuary has relied; and
- Include any other information required in accordance with the rules of civil procedure, the rules of law, or other rules that may be applicable for the relevant jurisdiction. [Effective February 1, 2018]
.01.1 Notwithstanding paragraph 1710.01, the actuary is not required to provide an opinion on assumptions which are stipulated by the terms of engagement provided such assumptions are plausible in accordance with paragraph 4320.03. [Effective February 1, 2018]

.01.2 Notwithstanding paragraph 1710.01, the actuary is not required to provide an opinion on assumptions or methods described in paragraph 4340.01 which are within the range of accepted actuarial practice pursuant to paragraph 4340.01. [Effective February 1, 2018]

.02 The actuary’s external user report should be sufficiently detailed to enable another actuary to assess the reasonableness of the results. [Effective December 31, 2013]

.03 The actuary would prepare any draft reports and other documentation, taking into account the potential disclosure of such documents that may be required as part of the dispute resolution proceedings.

.04 Where the actuary reports the results of a capitalized value calculation without reservation, the disclosure wording that may be used is:

I have determined the capitalized value of those aspects of the pecuniary damages described herein and prepared this report in accordance with accepted actuarial practice in Canada. It is my opinion that the assumptions and methods for which I have taken responsibility are appropriate in the circumstances of this case and for the purpose of this report.

Respectfully submitted,

[actuary]
Fellow, Canadian Institute of Actuaries

Reporting with reservation

.05 Reporting with reservation or stating that the reporting requirements have not been followed would not excuse an actuary from these reporting standards.

.06 Notwithstanding paragraph 4340.01, the circumstances affecting the work may result in deviation from accepted actuarial practice in Canada. For example, the terms of the engagement may require that the actuary use an assumption that is outside of the range that the actuary considers plausible, or that the actuary use a method that the actuary considers is not appropriate, or that the actuary assist counsel with challenging a specific interpretation of the law. In such case, the actuary would disclose such deviation in the report.

New information

.07 Notwithstanding paragraph 1420.01, where an event occurs, such as the availability of new information, after the actuary has completed his or her report, the actuary would consider the potential effect of such event on his or her work, and would advise his or her client on a timely basis, if appropriate and subject to the terms of the engagement.
Disclosure of other expert’s report

.08 The external user report need not disclose any error or shortcoming that the actuary identifies in the report of another actuary or other expert witness.

4720 Internal user report

.01 Unless an internal user report conforms to the recommendations for an external user report, an internal user report should state that it is not to be given to an external user. [Effective December 31, 2013]

.02 For the purpose of determining whether or not the work is in accordance with accepted actuarial practice, an internal user report continues to be an internal user report even if, in breach of the statement required by paragraph 4720.01, it is given to an external user or utilized in the dispute resolution proceeding.

5100 Scope

.01 Part 1000 applies to work within the scope of this part 5000.

.02 The standards in this part apply as follows:

- Section 5200 applies to an actuary's work on the valuation of benefits liabilities of a public personal injury compensation plan for the purpose of its financial statements; and

- Section 5300 applies to an actuary's work on the valuation of benefits liabilities of a public personal injury compensation plan for the purpose of providing input into its funding arrangements.

.03 The standards in this part do not apply to an actuary's work for an employer on the valuation of benefits liabilities and other related items in respect of its employees who are covered by a self-insured element of a public personal injury compensation plan, where such work is covered by the Practice-Specific Standards for Post-Employment Benefit Plans. Nevertheless, the standards in this part may provide useful guidance for such work.

.04 The standards in this part may also provide useful guidance for other work of an actuary for a public personal injury compensation plan, such as work on the costing of benefits or policy changes, the development of assessment rates or premiums, or work on experience-rating programs.
5200 Valuation for Financial Reporting Purposes

.01 This section 5200 applies to work and advice an actuary provides with respect to financial reporting for a public personal injury compensation plan’s benefits liabilities and costs.

5210 Circumstances affecting the work

.01 The actuary’s work on the valuation of the benefits liabilities or other items for the purpose of the financial statements of a public personal injury compensation plan should take into account the circumstances affecting the work. [Effective December 15, 2019]

.02 For the purposes of section 5200, the circumstances affecting the work would include

- Terms of the relevant statute and regulations;
- Relevant accounting standards and policies;
- Relevant policies and practices of the public personal injury compensation plan; and
- Terms of an appropriate engagement under which the work is being performed.

.03 The terms of an appropriate engagement would define the role of the actuary and the purpose of the work. The work of the actuary may be limited to the valuation of the benefits liabilities, or the work may also include advice on its financial position, its financial condition, and any other actuarial item required under the terms of an appropriate engagement.

.04 The terms of an appropriate engagement may specify applicable policies of the public personal injury compensation plan relevant to the work of the actuary. These policies may include an accounting policy, operational policies and practices, and an investment policy.

.05 Significant terms of an appropriate engagement may stipulate one or more of

- Use of a specified asset value or method of asset valuation;
- The treatment of self-insured employers;
- The conditions considered in the liability for potential future occupational disease claims; and
- Depending on the circumstances affecting the work, treatment of definitive amendments and other pending changes.
The purpose of the work may influence one or more of

- The assumptions chosen for the valuation, including the discount rate;
- The methods used in the valuation; and
- The provision for adverse deviations included in the valuation, if any.

For valuations for financial reporting purposes, the actuary would consider the plan’s accounting standards and policies.

**5220 Data**

Where sufficient, reliable, and relevant data are not available for the valuation of a specific benefit, the actuary should make appropriate assumptions or introduce appropriate methods to compensate for any perceived deficiencies in the data. [Effective February 1, 2018]

The actuary would attempt to rectify insufficient or unreliable data by obtaining corrected data. If corrected data is not available, the actuary would consider making assumptions or introducing methods to compensate for the perceived deficiencies in the data, where appropriate.

The plan’s historical experience data may not be directly relevant for the liability valuation in various circumstances. For example,

- The relevant statute may have been amended to provide a new or revised benefit;
- An applicable policy of the public personal injury compensation plan may have been revised recently;
- The public personal injury compensation plan’s claim adjudication practices or administration practices may have changed recently;
- A recent appeal decision may be expected to have a material effect on future benefit payments; or
- Economic conditions or health care practices in the relevant jurisdiction may have changed, which may be expected to have a material effect on benefits.

Where the data are not sufficiently relevant to expected future experience for a specific benefit, the actuary would consider adjusting the data and historic claim settlement patterns to make them more representative of expected experience going forward.
### 5230 Methods

.01 The actuary should value the benefits liabilities assuming that the public personal injury compensation plan continues indefinitely as a going concern entity. [Effective February 1, 2018]

.02 The value of the benefits liabilities is the value, by the actuarial present value method, of cash flows after the calculation date with respect to

- All claims incurred before that date, whether reported or not; and
- Workplace exposures that have occurred prior to that date. The workplace exposures should include those which may potentially lead to occupational disease claims, in accordance with the policy of the plan for recognizing such claims. [Effective December 15, 2019]

.03 The cash flows after the calculation date on account of all claims and exposures incurred before that date should include all expenses expected to be incurred after the calculation date which are related to those claims and exposures, including relevant administration expenses. [Effective December 15, 2019]

.04 The actuary’s work should take into account the benefits, relevant policies and administration practices of the public personal injury compensation plan as of the calculation date, and should take into account any definitive or virtually definitive amendment to these items that is expected to have a material effect on benefits, unless the circumstances affecting the work require otherwise. [Effective December 15, 2019]

.05 The benefits liabilities should include an amount in respect of benefits for employees of a self-insured employer, unless the exclusion of such benefits is in accordance with the circumstances affecting the work. [Effective February 1, 2018]

### Occupational disease

.06 For the purpose of this part, occupational disease refers to diseases or conditions arising from the cumulative effects of long-term exposure to repetitive activities or environmental hazards in the workplace. Latency refers to the period from exposure to a causative factor to the manifestation of the occupational disease.
The actuary would include in the benefits liabilities an appropriate allowance for occupational disease claims expected to arise after the calculation date as a result of exposures incurred in the workplace prior to the calculation date. This allowance would be in respect of occupational diseases with a long latency period as recognized by the public personal injury compensation plan, by legislation, by regulation, or by appeal, regardless of the plan’s approach to funding such claims.

5240 Assumptions

.01 The actuary should set assumptions that reflect the expectation that the public personal injury compensation plan will continue indefinitely as a going concern entity, but may make adjustment for short-term considerations, where appropriate. [Effective February 1, 2018]

.02 The actuary should select either best estimate assumptions or best estimate assumptions modified to incorporate margins for adverse deviations to the extent, if any, required by law or by the circumstances affecting the work, and should provide the rationale for the decision made with respect to margins. [Effective December 15, 2019]

.03 Where a public personal injury compensation plan has an established practice of providing ad hoc increases to benefits, or a periodic update to rates or tables used in the administration of the plan, the actuary should recognize such established practice when valuing the benefits liabilities by assuming the continuation of such practice, unless a policy decision to discontinue such established practice has been taken by the plan. [Effective December 15, 2019]

5250 Economic assumptions

.01 The economic assumptions chosen for the valuation would depend on the purpose of the valuation. For valuations for financial reporting purposes, the assumptions would be consistent with the plan’s accounting standards and policies.

.02 The economic assumptions that are needed would depend on the nature of the benefits that are being valued, and may vary by year. Generally, the needed economic assumptions would include a discount rate and various inflation rate assumptions such as general inflation, wage inflation, and health care inflation.
.03 The economic assumptions chosen for the valuation would be internally consistent. In particular, the chosen assumptions would generally be appropriate for a similar time horizon. For example, a long-term investment rate of return assumption would generally not be combined with an inflation assumption based on short-term expectations. Similarly, the valuation would generally not mix assumptions based on current market prices (e.g., market-implied inflation expectation) with those not based on current prices.

.04 When determining a best estimate assumption for the expected rate of investment return, the actuary would take into account the expected investment return on the assets of the public personal injury compensation plan at the calculation date and the expected investment policy after that date.

.05 In establishing the assumption for the expected rate of investment return, the actuary would assume that there would be no additional returns achieved, net of investment expenses, from an active investment management strategy compared to a passive investment management strategy except to the extent that the actuary has reason to believe, based on relevant supporting data, that such additional returns will be consistently and reliably earned over the long term.

.06 The expected investment expenses would depend on the investment policy of the plan, the types of investments held and projected to be held in the future, and the nature of investment operations.

.07 The actuary may adopt an assumption for the expected rate of investment income that varies depending on the part of the public personal injury compensation plan being valued and the assets backing the liabilities in that part.

.08 The economic assumptions need not be a flat rate but may vary from period to period.

5260 Non-economic assumptions

.01 When setting non-economic assumptions, the actuary would reflect all material contingencies.

.02 The actuary would recognize the effect of varying experience and settlement patterns that result from definitive or virtually definitive revisions to the plan’s benefits or claims practices and would consider the relevance of historical claims experience.
When setting the assumptions for wage loss, disability, pension, and other benefits, the actuary would take into account all applicable material contingencies, including the possibility of recoveries, relapses, mortality improvements, changing benefit levels, and the intermittence of income replacement and rehabilitation benefits throughout the lifetime of claimants. Further, the actuary would consider the potential effect on future benefit payments of factors such as changing economic conditions, employment levels, the claimant’s occupation, and industry and seasonal variations.

5270 Margins for adverse deviations

.01 The actuary should not include a margin for adverse deviations when the circumstances affecting the work require a best estimate calculation. [Effective December 15, 2019]

.02 The actuary should include margins for adverse deviations when the circumstances affecting the work require such margins. A non-zero margin should be sufficient, without being excessive, and should have the effect of increasing the benefits liabilities or reducing the reported value of the offsetting assets, the computation of which falls within the scope of the work of the actuary. In addition, the provision resulting from the application of all margins for adverse deviations should be appropriate in the aggregate. [Effective February 1, 2018]

.03 If the actuary is required by legislation, regulation, accounting standards, or the accounting policy of the plan to use a margin for adverse deviations that is outside the range that the actuary considers appropriate, the actuary may use such an imposed assumption, but the actuary should disclose that the margin is outside of the appropriate range and disclose the reason for using such margin. [Effective December 15, 2019]
The actuary’s decision with respect to margins for adverse deviations may reflect considerations such as:

- Accounting policy of the public personal injury compensation plan;
- Underlying adaptability of the plan to changes in financial position;
- Legislative requirements regarding margins;
- Intergenerational equity among employers and other groups;
- Level of uncertainty inherent in the assumptions;
- Level of reliability or credibility of the data or historical information upon which the assumptions are based;
- Asset/liability mismatch risk;
- Propensity for ad hoc changes to be made to plan conditions; and
- Legislative or other restrictions on the ability to mitigate past losses.

Examples of situations where the circumstances affecting the work might require a best estimate calculation include:

- Legislation governing the plan may require a best estimate calculation;
- The relevant accounting standards or the accounting policy of the plan may require the use of best estimate assumptions; or
- The plan’s financial reporting may recognize the monopoly nature of the plan and place a high priority on equity among generations, employers and other groups.

5280  Gain and loss analysis

The actuary should conduct a gain and loss analysis, including a comparison of actual and expected experience for the period between the prior calculation date and the current calculation date. [Effective February 1, 2018]

The actuary should also conduct a reconciliation of the surplus or deficit position of the plan, provided that such reconciliation is in accordance with the terms of the engagement. [Effective February 1, 2018]
.03 The actuary’s analysis would include all material gains and losses. At a minimum, the actuary’s gain and loss analysis would consider the impact of any significant changes to the assumptions or methods used, any significant changes to the benefits or policies of the plan, legislative changes, investment returns on the plan’s assets different from the assumed basis (if reconciling the surplus or deficit position of the plan), and any other areas where the difference between actual and expected experience is significant.

.04 The actuary would report a change in assumption if the current assumption differs nominally from the corresponding prior assumption, unless the change in the nominal amount results from the application of the same calculation method. For example, if certain rates used in the valuation are based on historical claims experience and calculated using the same averaging formula, the difference in assumed rates between the calculation date and the prior calculation date would not normally be considered as a change in assumptions. Nevertheless, the actuary may choose to disclose the effect of the updated rate assumption on the valuation results.

5290 Sensitivity testing

.01 The actuary should perform sensitivity testing of adverse scenarios, to illustrate and aid the understanding of the effect of adverse changes to assumptions. [Effective February 1, 2018]

.02 The adverse scenarios that the actuary tests should include at least

- A decrease of 100 basis points in the gross discount rate used for the valuation; and
- An increase of 100 basis points in the assumed general rate of inflation while maintaining the gross discount rate at the value used in the underlying valuation. [Effective December 15, 2019]

.03 The actuary should consider other scenarios that, in the actuary’s judgment, represent plausible material risks to which the plan may be exposed, and provide sensitivity testing of those scenarios where appropriate given the circumstances affecting the work. [Effective December 15, 2019]

.04 When selecting the assumptions and scenarios for sensitivity testing, the actuary would consider the circumstances affecting the work, and would select those assumptions that have a material impact on the benefits liabilities. The actuary may consider testing integrated sensitivity scenarios, for example, the effect of a deep and prolonged recession.
The actuary may also perform sensitivity testing of favourable scenarios.

**5295 Reporting**

.01 For work pursuant to section 5200, the actuary should prepare a report in accordance with the circumstances affecting the work. [Effective December 15, 2019]

.02 An external user report on work pursuant to section 5200 should:

- State the calculation date and the prior calculation date;
- Identify the legislation or other authority under which the work is completed;
- Describe any significant terms of the appropriate engagement that are material to the actuary’s work, including the purpose of the work;
- Describe the sources of data, benefit provisions, and policies used in the work, and any limitations thereon;
- Summarize the data used for the valuation, the data tests conducted to assess the accuracy and completeness of the data used in the work, issues regarding insufficient or unreliable data, and any assumptions and methods used in respect of insufficient or unreliable data;
- Describe the plan’s benefits, significant policies, and relevant administration practices, including the identification of any amendments made since the prior calculation date, and the effect of such amendment on the benefits liabilities;
- Describe any pending definitive or virtually definitive amendment, policy change, or change to administration practice, confirm whether or not such amendment or change has been reflected in the benefits liabilities, and identify the effect of such amendment or change on the benefits liabilities;
- Identify any significant changes to the relevant statute, strategic direction, or management policy, or any significant appeal decision that changes management policy or practice, since the prior calculation date and the consequent effect on the benefits liabilities;
- Describe the assumptions and methods used to calculate the benefit liabilities;
- Summarize the benefits liabilities;
• Disclose any imposed margins that the actuary has used in accordance with paragraph 5270.03 that, in the opinion of the actuary, are outside of the appropriate range;

• Report the aggregate provision for adverse deviations included in the benefits liabilities or state that there is no provision for adverse deviations where that is the case;

• Describe the treatment of benefits liabilities for self-insured employers;

• Disclose subsequent events of which the actuary is aware, whether or not the events are taken into account in the work, or, if there are no significant events of which the actuary is aware, include a statement to that effect;

• Describe and quantify the gains and losses between the prior calculation date and the current calculation date, and provide an analysis and explanation of the significant gain and loss items; and

• Describe the treatment of the liabilities for occupational disease claims.

[Effective December 15, 2019]

.03 If the report does not include the results of the sensitivity testing that was completed, the actuary should prepare a separate report for the management of the public personal injury compensation plan that does include such sensitivity testing results.

[Effective February 1, 2018]
.04 An external user report for work pursuant to section 5200 should provide the following
five statements of opinion, all in the same section of the report and in the following order:

- A statement regarding data, which would usually be, “In my opinion, the
data on which the valuation is based are sufficient and reliable for the
purpose of the valuation.”;

- A statement regarding assumptions, which would usually be, “In my
opinion, the assumptions are appropriate for the purpose of the
valuation.”;

- A statement regarding methods, which would usually be, “In my opinion,
the methods employed in the valuation are appropriate for the purpose of
the valuation.”;

- A statement regarding appropriateness, which would usually be, “In my
opinion, the amount of the benefits liabilities makes appropriate provision
for all personal injury compensation obligations and the financial
statements fairly present the results of the valuation.”; and

- A statement regarding conformation, which should be, “This report has
been prepared, and my opinions given, in accordance with accepted
actuarial practice in Canada.” [Effective December 15, 2019]

.05 An external user report should be sufficiently detailed to enable another actuary to
examine the reasonableness of the valuation. [Effective December 15, 2019]

.06 The circumstances affecting the work may result in a deviation from accepted actuarial
practice in Canada. For example, the applicable legislation or the terms of the
engagement may require that the actuary use a margin for adverse deviations that is
outside the range that the actuary considers appropriate, or require that the actuary
exclude the benefits liabilities in respect of certain occupational disease claims. In such
case, the actuary would disclose such deviation in the report.
The descriptions required in an external user report may be satisfied by reference to another report where appropriate. For instance, the liability estimate for potential future occupational disease claims or future administrative expenses may be based on a previous study of the plan’s experience that is updated periodically. The details underlying these estimates could be incorporated by referencing the last study on which they are based rather than incorporating that material directly into the valuation report. Similarly, a report prepared for one purpose (e.g., funding) may reference material in a report prepared for another purpose (e.g., financial reporting) where appropriate.

An internal user report may appropriately abbreviate the reporting requirements for an external user report. The degree of abbreviation would take into consideration the circumstances affecting the work and the intended audience.
5300 Valuation for Funding Purposes

.01 This section 5300 applies to the work and advice an actuary provides with respect to the financial position, financial condition, and funding of a public personal injury compensation plan.

5310 Circumstances affecting the work

.01 The actuary’s work on the valuation of the benefits liabilities or other items for the purpose of providing input into its funding arrangements should take into account the circumstances affecting the work. [Effective December 15, 2019]

.02 For the purposes of section 5300, the circumstances affecting the work would include

- Terms of the relevant statute and regulations;
- Relevant policies and practices of the public personal injury compensation plan; and
- Terms of an appropriate engagement under which the work is being performed.

.03 The terms of an appropriate engagement would define the role of the actuary and the purpose of the work. The work of the actuary may be limited to the valuation of the benefits liabilities, or the work may also include advice on the funding of the public personal injury compensation plan, its financial position, its financial condition, and any other actuarial item required under the terms of an appropriate engagement.

.04 The terms of an appropriate engagement may specify applicable policies of the public personal injury compensation plan relevant to the work of the actuary. These policies may include a funding policy, operational policies and practices, and an investment policy.

.05 Significant terms of an appropriate engagement may stipulate one or more of

- Use of a specified asset value or method of asset valuation;
- The treatment of self-insured employers;
- The conditions considered in the liability for potential future occupational disease claims; and
- Depending on the circumstances affecting the work, treatment of definitive amendments and other pending changes.
.06 Objectives of funding specified by the terms of an appropriate engagement may include, but are not limited to, a specific funding target, the security of benefits, a principle of equity among various groups of employers or various groups of individuals or among generations, or a funding approach for occupational disease claims.

.07 The purpose of the work may influence one or more of
- The assumptions chosen for the valuation, including the discount rate;
- The methods used in the valuation; and
- The provision for adverse deviations included in the valuation, if any.

.08 For valuations for funding purposes, the actuary would consider the plan’s funding and investment policies.

.09 For the purposes of section 5300:
- New injury costs refers to the actuarial present value of benefits payable by the plan in respect of all new injuries incurred in a period, whether reported or not.
- Required revenue is an estimate of the amount necessary to fund the plan including new injury costs, plan administrative expenses, and any revenue adjustment required by the plan’s funding policy to respond to its financial position.

.10 A funding valuation may be completed to determine the following:
- The plan’s financial position under the funding valuation basis;
- An estimate of new injury costs for periods following the calculation date;
- An estimate of required revenue for periods following the calculation date; and
- The sufficiency of proposed premium or assessment rates.

5320 Data

.01 Where sufficient, reliable, and relevant data are not available for the valuation of a specific benefit, the actuary should make appropriate assumptions or introduce appropriate methods to compensate for any perceived deficiencies in the data. [Effective February 1, 2018]
The actuary would attempt to rectify insufficient or unreliable data by obtaining corrected data. If corrected data is not available, the actuary would consider making assumptions or introducing methods to compensate for the perceived deficiencies in the data, where appropriate.

The plan’s historical experience data may not be directly relevant for the liability valuation in various circumstances. For example,
