Those distinctions aside, it is clear from Table 2 that the largest asset class for the property/casualty industry in 2018 was bonds, which represented 49% of the industry’s total assets, followed by common stocks, which represented 19% of the industry’s total assets. These statistics have remained relatively consistent over the years. While most actuaries will not need to have a deep understanding of each of the asset classes on the balance sheet, it is worthwhile to know a few relevant details on the largest classes to have a fundamental understanding of the balance sheet.

Bonds (Line 1)

Bonds are securities that pay one or more future interest payments according to a fixed schedule. The face value of a bond refers to the amount that is to be paid in the final single payment at the maturity of a bond. When an insurance company purchases a bond, the current value of that bond is recorded as the actual cost, including brokerage and other fees. This purchase price may be more or less than the face value of the bond.

To the extent that the purchase price is higher (or lower) than the face value of the bond, a bond premium (or discount) is recorded as a part of the recorded amount. Over the life of the bond, that bond premium or bond discount will be amortized according to a constant yield approach. The reason for this amortization is that when the bond ultimately matures, the amortized value will be equal to the face value, eliminating a lump sum gain or loss at the maturity of the bond.

After the purchase, statutory accounting indicates that bonds be recorded at one of the following bases:

- Amortized cost
- The lower of amortized cost or fair value

The designation that the NAIC’s Security Valuation Office (SVO) assigns to the bond determines the applicability of the two bases above. The six possible designations are NAIC 1
through NAIC 6, which range from the “highest quality” bonds to “bonds in or near default,” respectively. Bonds with the two highest designations (NAIC 1 and 2) are carried at amortized cost, while bonds with designations of NAIC 3 (“medium quality”) and below are carried at the lower of amortized cost or fair value. The amount at which a bond is recorded, following these criteria, is referred to as the adjusted carrying value.

Schedule D of the Annual Statement provides details on the specific bonds that are held by an insurance company, including the following:

- Type of issuer (e.g., federal, state or corporate)
- Maturity (e.g., one year, one year to five years)
- NAIC Class (Class 1 through Class 6)

Based on the industry aggregate Annual Statement as of December 31, 2018, insurance companies’ bond portfolios were made up of approximately 44% industrial bonds, 24% special revenue bonds, and 17% U.S. government bonds. By maturity, just over half of bonds held were 5 years to maturity or less, with the majority of the remainder having maturities between 5 and 10 years. Furthermore, approximately 80% of bonds held by insurers were in the NAIC Class 1.

Given that bonds are the largest asset class for property/casualty insurers, an actuary or other user of the financial statements who is reviewing the financial health of an insurance company may benefit from reviewing the detail in Schedule D.

Stocks (Lines 2.1 and 2.2)

As shown in Table 2, approximately 19% of insurers’ assets were in common or preferred stock. Stocks are securities that represent an ownership share in a company. Those ownership shares are subordinate to bondholders and creditors. Common stock ownership confers voting privileges and may pay a dividend, though the dividend is not guaranteed. Preferred stock does not confer voting privileges but usually provides a guarantee on dividends to be paid, and usually has preference to common stock in the event of liquidation.

At purchase, stocks are valued at cost plus any brokerage or related fees. After purchase, publicly traded stocks are recorded at fair value, which is based on the market price that is readily available to the public and which can generally be determined from external pricing services. If a stock is not publicly traded or a price is not available, the NAIC’s SVO will determine a fair value. Preferred stocks are assigned similar NAIC designations as bonds with six rating levels, which dictate whether they are valued at cost, amortized cost or fair value based on the NAIC designation.

An actuary or other user of the financial statements who is evaluating the financial health of an insurance company should take note of a property and investigate further if an insurance
company has a relatively larger portion of their assets in stocks, compared to the overall industry.

Real Estate (Line 4)

Three classes of real estate are presented separately on the Assets page of the Annual Statement:

- Properties occupied by the company
- Properties held for the production of income
- Properties held for sale

These classes are relatively self-explanatory, though one detail to be aware of is that if a company and its affiliates occupy less than 50% of a property, it is classified as either a property held for production of income or a property held for sale (as opposed to a property occupied by the company). Properties in the first two categories are generally recorded at depreciated cost, while properties that are held for sale are recorded at the lower of depreciated cost (i.e., carrying amount) or fair value less encumbrances and estimated costs to sell the property.

Details of a company’s real estate transactions and holdings are presented in Schedule A of the Annual Statement.

Cash, Cash Equivalents and Short-Term Investments (Line 5)

This asset class generally includes assets that are immediately convertible to cash. As of December 31, 2018, these assets represented nearly 5% of insurers’ total assets, and approximately two-thirds of these assets were in short-term investments.

Cash equivalents must have an original maturity of less than three months, and short-term investments must have an original maturity of one year or less. In the Annual Statement, details on cash are provided in Schedule E-1, cash equivalents are described in Schedule E-2, and short-term investments are found in Schedule DA. Further, a reconciliation is made in the Cash Flow statement showing cash, cash equivalents and short-term investments at the beginning of the year, adjusted for net cash (inflows minus outflows from operations, investments, financing and miscellaneous sources) during the year. The result is the amount of cash, cash equivalents and short-term investments at the end of the year, which is shown in line 5 of the Assets page.

Uncollected and Deferred Premiums and Agents’ Balances (Lines 15.1 and 15.2)

These two asset classes represent premiums that have been written but have not yet been received. Although the names of the asset classes refer to “agents’ balances” (or balances due from policies sold by insurance agents, as intermediaries between the insurance company
and the policyholder, both asset classes may also include uncollected premiums for policies sold directly to policyholders.

Uncollected premiums and agents’ balances include premiums due on or before the financial statement date, while deferred premiums and agents’ balances include premiums due after the financial statement date. Both classes include installment premiums that meet those timing criteria as well.

Premiums that are more than 90 days past due from an agent or a direct policyholder are considered nonadmitted assets. Furthermore, an insurer may determine that agents’ balances that are 90 days or more overdue are unlikely to be collected (or “impaired”). In this event, the insurer should write-off the uncollectable balance.

These two classes together represented nearly 10% of the industry assets as of December 31, 2018, highlighting that collectability of these assets is relevant to a company’s financial health and a measure of the efficiency of its collections’ department. An actuary or other user of the financial statements who is reviewing the financial health of an insurer may consider the overall magnitude of a company’s uncollected and deferred agents’ balances and the percentage of agents’ balances that are nonadmitted. Either one of these metrics could be benchmarked to the overall industry; a company having a significantly higher portion of its assets in these two classes relative to the industry would warrant further analysis to understand the impact to liquidity.

Amounts Recoverable from Reinsurers (Line 16.1)

This asset class reflects amounts that are expected to be recovered from a reinsurer on losses and LAE that have been paid by the company, but do not include expected reinsurance recoveries for loss and LAE reserves. The reason that expected recoveries for loss and LAE reserves are not included is that loss and LAE are already reflected net of reinsurance on the balance sheet. Additional detail on expected recoveries for both paid amounts and reserves are included in Schedule F, which will be discussed in detail in Chapter 14, Schedule F. The detail included in Schedule F allows an actuary or other user of the financial statements to assess the quality and collectability of the reinsurance recoverables.

Net Deferred Tax Assets (Line 18.2)

Deferred tax assets (DTAs) represent expected future tax benefits related to amounts previously recorded in the statutory financial statements and not expected to be reflected in the tax return as of the reporting date. They are referred to as “net” DTAs because they are recorded net of any deferred tax liabilities (DTLs) that exist. Two common sources of DTAs relevant to the actuary are the following:

- The difference in tax accounting and statutory accounting for loss reserves
- The carryforward of net operating losses from previous years
The first source of DTAs is particularly relevant to actuaries. For tax reporting purposes, loss reserves are discounted when determining taxable income. This means that an insurance company is not able to deduct from taxable income the full amount of losses that are incurred during a year. Therefore, assuming loss reserves are growing, a company’s income on a tax basis is higher than the company’s pre-tax income on a statutory basis in the current year. In the future, as this discounting unwinds, the insurer will get a tax deduction, which will not be recorded in statutory financial statements because it was already recorded in the year the reserves were established. The value of this future deduction (21% of the deduction) represents the DTAs. This asset can be particularly significant for growing companies.

The second source of DTAs of relevance to the actuary (carryforward of net operating losses) occurs when an insurance company has net operating losses in one financial year and expects those losses to offset taxable income in the future, thereby reducing future tax liability.

For any DTA, an insurer can only record the portion of the asset that is expected to be realized, based on available evidence. Furthermore, the insurer must perform an admissibility test to determine the amount of a DTA that can be considered as an admitted asset.

As shown in Table 2, DTAs were one of the largest components of nonadmitted assets reported at December 31, 2018, representing $7 billion of the total $54.1 billion in nonadmitted assets, or 13%.

Receivables from Parent, Subsidiary and Affiliates (Line 23)

Many insurance companies are members of a national or international insurance group or may be affiliated with other insurance companies that are owned by the same ultimate parent company. These affiliates often share services or resources, such as internal support staff or third-party vendor agreements. In these cases, receivable balances for these services or resources exist between the parties.

As shown in Table 2, these receivables accounted for about 1% of assets held by the industry at December 31, 2018. If an individual company had a significantly larger portion of their assets in the form of receivables, a user of those financial statements may consider investigating further, as those receivables may not be as liquid or available as other asset types. More specifically, the user could attempt to ascertain the specific source of the receivables and the proportion of the receivables that are paid on time.

Other Nonadmitted Assets

In addition to the examples of nonadmitted assets already mentioned (agents’ balances more than 90 days overdue and net DTAs that are do not meet the statutory admissibility test), there are other sources of nonadmitted assets. Several common examples include:
• Amounts held of specific types of bonds, stocks, mortgage loans or real estate that are in excess of limitations that exist in specific states
• Electronic data processing equipment and operating system software in excess of specified limits (i.e., percentage of adjusted capital and surplus)
• Nonoperating system software
• Furniture, fixtures, equipment and leasehold improvements
• Balances due from a broker when a security has been sold but the proceeds have not been received that are still outstanding more than 15 days after settlement
• Funds held or deposited with reinsured companies that exceed the associated liabilities or are held by an insolvent reinsured company
• 10% of deductibles recoverable on high deductible insurance policies in excess of collateral specifically held and identifiable on a per policy basis

As previously noted, nonadmitted assets only represented about 3% of the total industry assets at December 31, 2018. However, due to their importance when measuring solvency, an actuary should be familiar with the sources of nonadmitted assets. If an actuary or other user of the financial statements observes that an insurer has a larger proportion of nonadmitted assets than the industry average, it may be worthwhile to investigate further to understand the source of those nonadmitted assets because they could be indicative of a problem with the business.

LIABILITIES AND SURPLUS

A liability is an obligation that the company must fulfill, based on past events or transactions, which will require the use of the company's resources. Under the literal definition of solvency, a company must have assets that are at least equal to its liabilities to remain solvent.

To be prudent and to comply with RBC requirements (see Chapter 19, Risk-Based Capital), most insurance companies have admitted assets that significantly exceed their liabilities. The amount of this excess of admitted assets over liabilities is generally referred to as surplus. Surplus can be viewed as the equity in the business or as the source of protection to the policyholders. These three amounts follow the relationship shown below:

\[
\text{Admitted Assets} = \text{Liabilities} + \text{Surplus}
\]

Or, equivalently,

\[
\text{Admitted Assets} - \text{Liabilities} = \text{Surplus}
\]

Because the combination of liabilities and surplus are equal to assets, liabilities and surplus are presented on the same page (page 3) of the Annual Statement. The assets reflected in the

14 Aligns with IASA Chapter 5.
relationship above include only admitted assets because Statutory Accounting Principles (SAP) do not allow insurers to take credit for nonadmitted assets in surplus.

A breakdown of the industry liabilities and surplus amounts (page 3 of the Annual Statement) by significant account is provided in Table 3 as of December 31, 2018.\(^\text{15}\)

### TABLE 3

| Liabilities, Surplus and Other Funds: Total U.S. Property/Casualty Insurance Industry | U.S. 2018 Statutory Financials, NAIC Format (USD in 000s) |
|---|---|---|
| Line | Description | Liabilities | % of Total |
| 1. | Losses | 547,217,016 | 27% |
| 2. | Reinsurance payable on paid loss and loss adjustment expenses | 29,393,074 | 1% |
| 3. | Loss adjustment expenses | 114,072,279 | 6% |
| 5. | Other expenses (excluding taxes, licenses and fees) | 8,191,309 | 0% |
| 9. | Unearned premiums | 275,398,145 | 14% |
| 12. | Ceded reinsurance premiums payable | 59,593,117 | 3% |
| 13. | Funds held under reinsurance treaties | 31,513,557 | 2% |
| 16. | Provision for reinsurance | 2,745,410 | 0% |
| 25. | Aggregate write-in for liabilities | 77,254,001 | 4% |
| | Other liabilities | 122,643,849 | 6% |
| 28. | Subtotal, liabilities | 1,268,021,758 | 65% |
| 29. | Aggregate write-ins for special surplus funds | 83,179,182 | 4% |
| 30. | Common capital stock | 3,982,853 | 0% |
| 34. | Gross paid in and contributed surplus | 197,134,014 | 10% |
| 35. | Unassigned funds | 459,882,311 | 23% |
| | Other surplus and capital | 12,743,455 | 1% |
| 37. | Subtotal, surplus as regards policyholders | 756,921,815 | 37% |
| 38. | Total | 2,024,943,573 | 100% |

First, note that the total amount of liabilities and surplus shown in Table 3 ($2.025 trillion) is exactly equal to the amount of net admitted assets that were shown in Table 2. This relationship must be true given the fundamental equation of Admitted Assets = Liabilities + Surplus.

The next observation that can be made is that the insurance industry’s admitted assets equal 1.6 times its liabilities as of December 31, 2018. On the surface, this suggests that the industry as a whole had sufficient assets to be able to sustain a sizeable increase in liabilities (or reduction in asset values) while still maintaining solvency, due to the current positive difference of assets relative to liabilities.

\(^{15}\) Accessed via a sector-specific information and research firm in the financial information marketplace.
However, this may not be true at the individual company level, and there are also other risks that could affect surplus that are not reflected in either the recorded assets, admitted assets or liabilities (such as catastrophe risk or liquidity risk). An actuary can benchmark a company’s ratio of liabilities to surplus against the current industry average. Further investigation may be warranted if the ratio is significantly higher than that of the industry. A review of the company’s RBC would be the next logical step.

We can also measure each of the underlying accounts in relation to total liabilities or surplus. Together, loss and LAE reserves (lines 1 and 3) have historically been the largest liability item on a property/casualty insurance company’s balance sheet. As of December 31, 2018, this item represented over 50% of total industry liabilities. This speaks to the importance of property/casualty actuaries to the financial reporting process because they are often the most suited to evaluate and establish those liabilities. The next largest liability class is unearned premium reserves, which made up approximately 22% of the industry liabilities as of December 31, 2018. Given actuaries’ involvement in pricing products, actuaries certainly play a role in this premium account. To the extent the unearned premium is not adequate to cover expected future losses, LAE and maintenance expenses, additional liabilities need to be recorded. Actuaries often play a key role in that analysis.

A brief description of each of the key liabilities and surplus classes is provided below.

Loss and Loss Adjustment Expense Reserves (Lines 1 and 3)

The required basis for loss and LAE reserves under SAP is defined by Statement of Statutory Accounting Principles (SSAP) 55, Unpaid Claims, Losses, and Loss Adjustment Expenses. SSAP 55 states that the recorded liabilities for loss and LAE reserves, for each line of business and for all lines of business in the aggregate, should be based on “management’s best estimate” (note that this term is not explicitly defined in the accounting guidance). Further, SSAP 55 requires that management consider the variability in the estimate of these liabilities. The standard states that management’s best estimate may consider a range of estimates; in the rare instances when no point within the range is considered to be a better estimate than other points within the range, the midpoint of the range should be used.

Note that SSAP 55 refers to management’s best estimate and not the actuary’s best estimate or central estimate. However, management will often rely on an actuary’s estimate, in whole or in part, in establishing their own best estimate to be recorded on the balance sheet. Whether or not management relies on an actuary in establishing the recorded reserves, the NAIC Model Law for Property and Casualty Actuarial Opinions (MDL-745) requires that a

---

Statement of Actuarial Opinion be provided that attests to the adequacy of the recorded liabilities (see Chapter 16. Statement of Actuarial Opinion).

Significant detail on the loss and LAE reserves is included in Schedule P of the Annual Statement. Schedule P provides loss and LAE reserves both gross and net, and also breaks down the total reserves by line of business and accident year. Further detail on the data in Schedule P and the potential uses of that data are described in Chapter 15. Schedule P. There are also relevant references to loss and LAE reserves in the Notes to Financial Statements within the Annual Statement (see Chapter 10. Notes to Financial Statements).

Because loss and LAE reserves are often the largest most variable liability on an insurer's balance sheet, they are of critical importance to the financial health of an insurance company.

Reinsurance Payable on Losses and Loss Adjustment Expenses (Line 2)

Reinsurance payable on losses and LAE includes liabilities related to assumed reinsurance contracts and is for loss and LAE that have already been paid by the reinsured. A detailed breakdown of this amount by type of reinsurer (e.g., affiliated, authorized and unauthorized as well as U.S. and non-U.S.) is provided in Schedule F, Part 1, column 6. Liabilities under assumed reinsurance contracts for loss and LAE that are reserved by the reinsured, but not paid, are included in lines 1 and 3 of the Liabilities, Surplus and Other Funds page (loss and LAE reserves).

Other Expenses (Excluding Taxes, Licenses and Fees) (Line 5)

In general, an insurance company’s expenses can be separated into two broad categories: LAE and underwriting and investment expenses. Further divisions can be made within each category. The underwriting and investment expense category can be further divided into the following subcategories:

- Commission and brokerage expenses
- Taxes, licenses and fees
- General and administrative expenses
- Investment expenses

The other expenses liability item on the balance sheet generally represents incurred but not yet paid expenses from the third and fourth categories listed above. Additional detail on these expenses can be found in the Underwriting and Investment Exhibit (U&IE), Part 3, Expenses, where the unpaid expenses are shown on line 26. Although this exhibit does not provide the breakdown of the unpaid expenses by expense category, the total incurred expenses during the calendar year for these other expenses are included on lines 3 through 18.

An additional observation from U&IE, Part 3 is that each category of other underwriting expenses is split between column 1 (Loss Adjustment Expenses), column 2 (Other
Underwriting Expenses) and column 3 (Investment Expenses). This is based on an allocation that is performed by the company, and that allocation determines whether unpaid amounts in these categories appear on the balance sheet as LAE reserves or as other expenses liabilities. Additional discussion regarding other expenses is provided in Chapter 8. The Statutory Income Statement: Income and Changes to Surplus. Further detail regarding the allocation of expenses by category is also provided in the following chapter (Chapter 18. Insurance Expense Exhibit).

Unearned Premiums (Line 9)

Unearned premium represents a liability related to the unexpired portion of all policies in force. For any individual in-force policy, the total amount of written premium can be separated into earned and unearned portions. In the simplest and most common case, this split is made by the number of coverage days in the total policy period that are expired or unexpired, respectively. This approach is referred to as the daily pro rata method and is the standard method used for lines such as automobile insurance, homeowners, general liability or property.

Another approach that is sometimes used is called the monthly pro rata method. This method assumes that policies are written evenly over the course of the month. Based on that assumption, 1/24 of the premium written in a given month is expected to earn in that month. Subsequent to that, 1/12 is expected to be earned in the next 11 months, and the remaining 1/24 is earned in the thirteenth month. This abbreviated method allows for a calculation of the earned premium in each month with less data and calculations.

Some specific types of coverage require different approaches to calculating earned premium (e.g., title insurance, financial guaranty and ocean marine).

The unearned premium reserve serves the important purpose of recognizing revenue over the time period the policy is in force. Unearned premium reserves represent an insurer’s obligation to provide future coverage and the potential obligation to refund the unexpired portion of the premium to a policyholder, in the event that a policy is cancelled.

While this accrual of unearned premium and the subsequent earning of that premium may appear to be an attempt to match revenues with expenses, this is not the case. Statutory accounting requires that expenses related to the acquisition of an insurance policy be realized as an expense at the time of acquisition. Despite that, the full amount of the written premium is still recorded as an unearned premium reserve at the inception of the policy. This departure from the matching principle that is commonly followed in accounting regimes exists to allow for a more conservative solvency-focused presentation because it results in lower policyholders’ surplus, which is consistent with the objective of SAP.
Additional detail of the composition of the unearned premium recorded on page 3 (Liabilities, Surplus and Other Funds) of the Annual Statement can be found on page 7, which is part of the U&IE. Page 7 (U&IE Part 1) shows the breakdown of the total unearned premium into the following four categories:

- Amount unearned (running one year or less from date of policy)
- Amount unearned (running more than one year from date of policy)
- Earned but unbilled premiums
- Reserve for rate credits and retrospective adjustments based on experience

The first two categories above are relatively self-explanatory and separate the unearned premium related to policies with effective periods that are one year or less and policies with effective periods that are longer than one year. The third category, earned but unbilled (EBUB) premiums, includes estimated adjustments that will occur to the premium on audit-type policies where the actual amount of premium depends on some exposure measure, such as payroll, and is unknown until the end of the policy period. EBUB premiums are only recorded if they are reasonably estimable in the aggregate. The fourth category represents the expected adjustments that will occur on retrospectively rated policies, where the premium is variable based on the loss experience on the policy.

In addition, SAP and GAAP require an insurer to establish a separate premium liability, referred to as a premium deficiency reserve, if the unearned premium reserve for a portion of the business is not sufficient to cover the expected corresponding losses, expenses and other costs. An actuary in either a reserving or pricing role should be aware of the criteria that dictate when a premium deficiency reserve is required so they can advise management accordingly. Different criteria apply for short-duration and long-duration contracts. Additional discussion of premium deficiency reserves is included in Chapter 10, Notes to Financial Statements and Chapter 22, U.S. GAAP, including Additional SEC Reporting.

Ceded Reinsurance Premiums Payable (Line 12)

Ceded reinsurance premiums payable represent premiums that are owed to reinsurers for ceded reinsurance. This liability is recorded net of any commission retained to cover expenses that were incurred in issuing the reinsured policies. This line item does not include ceded reinsurance that are owed to the reinsurer or other funds that are being held as a deposit by the ceding company as collateral for payment of the reinsurer’s obligations under specific terms of the reinsurance treaty, which is reflected in the next item, “Funds Held Under Reinsurance Treaties,” discussed below.

Funds Held Under Reinsurance Treaties (Line 13)

These liabilities relate to funds that are held by a ceding company as collateral from a reinsurer. The funds provide security to the ceding company that the reinsurer will pay losses
as they come due. This is particularly common in the case of unauthorized reinsurers (companies not authorized or licensed to do business in the ceding company’s state of domicile) because it allows the ceding company to avoid a statutory accounting penalty on the recoverables from the unauthorized reinsurer. This penalty is described in SSAP 62R, which states that a recoverable from an unauthorized reinsurer that is not sufficiently collateralized is a nonadmitted asset. As noted above, this category also included ceded reinsurance premiums that were payable but were held according the terms of the reinsurance agreement.

Provision for Reinsurance (Line 16)

Although the magnitude of this liability category is not large for most insurers, it is worth mentioning because it is unique to statutory accounting. The provision for reinsurance is a statutory liability established for reinsurance recoverables that may not be collectable. The change in this provision is recorded directly to surplus. This penalty applies to all reinsurers that are slow to pay or that are disputing amounts owed to the ceding company and unauthorized reinsurers that do not meet the collateral requirements of the ceding company’s domiciliary state. The actual details of the calculation of the provision for reinsurance are shown in Schedule F, Part 3 (Chapter 14. Schedule F) provides the details underlying this calculation).

Note that the net loss reserves, net unearned premium and the amounts recoverable from reinsurers for paid losses on page 2 of the Annual Statement are net of reinsurance but are stated without regard for the provision for reinsurance. The provision for reinsurance appears on page 3 and is a direct reduction to surplus and does not affect a company’s admitted assets or income. This direct reduction to surplus and other direct reductions to surplus will be discussed in Chapter 8. The Statutory Income Statement: Income and Changes to Surplus.

Common Capital Stock (Line 30)

Common capital stock is a surplus account that is equal to the par value of the common stock issued and outstanding. This account only applies to stock insurance companies and does not exist for mutual insurance companies. Par value is an amount set by the issuer of a stock (the insurer, in this case) when the stock is initially offered that serves as a minimum value for which the stock can be sold in that initial offering. Par value has no relation to the market value of a stock and is often set at a low amount, so this common capital stock is not a material item for most insurers (it is only included here to allow for a complete explanation). Certain state regulators have specific requirements for how the par value of shares is established. A separate, similar account is maintained for preferred stock.
Gross Paid in and Contributed Surplus (Line 34)

This account represents amounts received through the sale of stock in excess of the par value for each share. This account also exists only for stock insurers. As shown Table 3, gross paid in and contributed surplus makes up 26% of the industry surplus, and it is much larger than the common capital stock account.

Unassigned Funds (Line 35)

Unassigned funds primarily represents surplus that has been accumulated over time through retained earnings of the business. For mutual companies, all surplus will generally be reflected in the unassigned funds account because none of those funds were received due to the sale of stock. However, there are some cases in which mutual insurance companies have changed their capital structure through the creation of a mutual holding company. In those situations, the insurance companies issue stock to the holding company and will have common capital stock and gross paid in and contributed surplus accounts. Unassigned funds represented 61% of the industry surplus as of December 31, 2018.

SUMMARY

This chapter has explained the basic structure of the statutory balance sheet and has introduced some of the more significant and relevant accounts. An actuary’s involvement is often primarily focused on the loss and LAE reserves, which are the largest liability on the balance sheet, but it is also important for an actuary to understand the bigger picture of an insurer’s balance sheet in order to better assess the overall financial health of an insurance company.

In Chapter 13, Overview of Schedules and Their Purpose, we will discuss other schedules in the Annual Statement that provide details beyond what we have touched upon here. We will also discuss how that additional detail can be used with the contents of the balance sheet to assess the financial health of an insurance company.
CHAPTER 8. THE STATUTORY INCOME STATEMENT: INCOME AND CHANGES TO SURPLUS

While the balance sheet is of key importance to regulators and the focal point of statutory accounting, the income statement is of equal importance to the ongoing viability of an insurance company. The income statement illustrates the revenue, expenses and net income of an insurance company.

The income statement is presented on the top portion of the Statement of Income on page 4 of the Annual Statement and provides the three sources of income, before federal and foreign income taxes and dividends to policyholders, separately: underwriting income, investment income and other income.

A sample of the statutory income statement for the industry as of December 31, 2018, is presented in Table 4.

17 Accessed via a sector-specific information and research firm in the financial information marketplace.
As shown in Table 4, the net income for the industry during 2018 was $60.8 billion. The subtotals for each source of income show that the industry experienced gains in underwriting, investment income and other income during 2018. Each of the three sources of income is discussed further below.

**UNDERWRITING INCOME**

Underwriting income is the most familiar and relevant source of income to most actuaries. Underwriting income is calculated as earned premium minus loss and loss adjustment expense (LAE), other underwriting expenses incurred, any aggregate write-ins for underwriting deductions and net income of protected cells (not shown). We note that aggregate write-ins and net income of protected cells are generally immaterial if not 0.

Actuaries are typically involved in estimating incurred losses and LAE and possibly in the calculation of earned premium, so these terms should already be familiar. On the income statement, each of the amounts labeled incurred presented also include the ultimate amount of those liabilities that occurred in the current year, and any changes in the ultimate amount of the liabilities that occurred in previous years (as shown in the formula below).

\[
\text{Income statement incurred} = \text{Current period ultimate} + \text{Change in prior period ultimate}
\]

where,

\[
\text{Change in prior period ultimate} = (\text{total all periods ultimate at end of period} - \text{total all periods ultimate at beginning of period}) - \text{current period ultimate}
\]

Actuaries may be less familiar with the item labeled “other underwriting expenses incurred.” Further discussion on this other underwriting expense category is provided below.

**Other Underwriting Expenses Incurred (Line 4)**

We already encountered other underwriting expenses briefly during our discussion of the liability for “Other Expenses (Excluding Taxes, Licenses and Fees)” in Chapter 7, *Statutory Balance Sheet: A Measure of Solvency*. The “Other Expenses” account represents all other expenses that were incurred but not paid at the end of the fiscal year, while this line on the income statement represents the total amount of other expenses incurred during the course of the year, whether or not they have already been paid.

As shown in Table 4, the amount of the other underwriting expenses that were incurred by the industry in 2018 was $167.7 billion, which is about 28% of net premiums earned in 2018. The magnitude of these other underwriting expenses highlights the importance of other

---

18 Aligns with IASA Chapter 8.
underwriting expenses to the profitability of the industry and the importance of ensuring that they are accurately reflected in the financial statements.

Expense accounting requires that expenses be allocated in three ways:

1. NAIC operating expense classifications, which represent various types of expenses, some of which have sub-types. These 24 types are listed in the rows Underwriting and Investment Exhibit (U&IE), Part 3. Examples of these expense classifications are “commission and brokerage,” “salary and related Items,” and “taxes, licenses and fees.” It is suggested that the reader review the U&IE, Part 3, now to see the full list of classifications.

2. Expense categories, which are broader groupings of expenses that align with the different operational functions of an insurance company. There are three of these broad categories: LAE, other underwriting expenses and investment expenses. These categories are presented in the columns of the U&IE, Part 3.

3. Line of business, of which there are 33, some of which have sub-lines. These lines of business are listed in the U&IE, Part 2A. The lines of business used for expense reporting are similar to those lines of business used in Schedule P, but not the same.

Each time an insurance company has an expense, the appropriate expense classification needs to be determined and an allocation must be made by line of business and expense category. In some cases, the entire amount of the expense can be specifically identified with one expense classification, within one expense category and for one line of business (for instance, a commission paid on a policy within a specific line of business); however, this is often not the case, such as the salary of an employee who oversees several products and functions. In those instances, an allocation of that expense must be made. Some expenses may require several allocation steps.

When an allocation is required, it will be performed based on information that is relevant to that expense. Examples of potential allocation bases are policy counts, which may be appropriate in the case of policy administration expenses; employee headcount, which may be reasonable for supervisors’ salaries; or other measures of business or employee activity.

An example of a complex expense allocation would be one related to the rent that is paid for a home office that serves as a center for all operating functions. The allocation process could take place as follows:

- This expense can be specifically identified as the “rent and rent items” expense classification and therefore assigned fully to that classification.

- Because the home office is used for all company functions, its expenses would need to be allocated between all three categories: LAE, other underwriting expenses and...
investment expenses. One possible approach to this is to allocate the rent to those three categories by headcount of personnel associated with each function.

- The home office is also the base for all lines of business, so the expenses may be allocated to each line of business by premium volume. This allocation to line of business could differ by expense category.

The result of the first two of these allocations can be observed in the U&IE, Part 3, and the line of business allocation is reflected in the Insurance Expense Exhibit, Part 2, which will be discussed in more detail in Chapter 18, Insurance Expense Exhibit.

Guidance for allocation of expenses is provided in the NAIC Annual Statement Instructions, and also in Statement of Statutory Accounting Principles (SSAP) 70, Allocation of Expenses. These are the sources of the uniform classifications and categories that are described above, as well as additional allocation rules. In general, the guidance indicates that specific identification of expenses is preferable to allocation but that when allocation is required, it should be apportioned based on pertinent factors or ratios such as premium, number of claims or headcount. The decision to allocate and the factors or ratios that are used when allocation is required will require judgment on the part of a company.

While the topic of expense accounting and specifically other underwriting expenses may seem of questionable relevance to an actuary, it is important to have a basic awareness and knowledge of the topic. The reason for this is twofold.

First, the overall level of company expenses will directly affect the pricing (or the adequacy of pricing) of its insurance products. A company with lower expenses relative to its competitors has the potential to be more competitive and or more profitable. Actuaries can contribute by participating in the planning and control of expenses.

Second, if the relative allocation of expenses across functions and products is not accurate, it can lead to subsidies between products that may obscure the true profitability of those products and lead to inefficient allocation of resources or even anti-selection. An actuary who understands expense allocation can prevent or minimize such subsidies and their consequences by striving to allocate expenses as accurately as possible.

The expense allocation process described above and presented in the U&IE is the driver of the other underwriting expense account on the income statement, as well as other references to expenses elsewhere in the Annual Statement.
INVESTMENT INCOME

Investment income is an important source of income to insurance companies and a unique aspect of an insurer’s business relative to other industries. The importance of investment income was already highlighted by the summary of the industry income statement. There we saw that in 2018 the insurance industry’s positive net income was nearly entirely attributable to investment income, with limited contribution from underwriting and other income.

Because there is a delay (significant in some cases) between the time insurers receive premiums and the payment of claims, they have an opportunity to earn investment income on those funds. This makes consideration of investment income fundamental to the pricing of insurance products, which is not the case for most other industries.

The investment income item on the income statement consists of the following:

- Net investment income earned
- Net realized capital gain (loss)

Net investment income earned is primarily related to interest and dividends received on investment assets held over the course of the year. Net investment income earned does not include changes to the prices of invested assets that are sold (those are included in net realized capital gain described below). Furthermore, it is recorded on an accrual basis, meaning that it is reflected in the year in which it is earned and not necessarily the year in which the actual cash related to the income is received. The amount of this income is shown net of investment expenses and other costs, but gross of federal income taxes, on the income statement.

Net realized capital gain (loss) generally results from the sale of investments for more or less than original cost, adjusted for the amortization of premiums or accretion of discounts (amortized cost). Realized losses also result from impairment adjustments. Certain investments (primarily common stock) are recorded at fair value. The changes in the value of these investments (unrealized gains (losses)) are not included as income and instead reflected as direct adjustments to surplus. These direct adjustments to surplus are necessary because these items do not flow through net income for the current period, but the surplus must still be adjusted to maintain the admitted assets equal liabilities plus surplus relationship.

In 2018, industry net investment income earned was $57 billion, and the net realized capital gain was $10.7 billion. Detail of both the net investment income and the net realized capital gain (loss) amounts that are shown in the income statement is provided on page 12 of the Annual Statement, which includes the Exhibit of Net Investment Income and the Exhibit of Capital Gains (Losses). These exhibits provide the detail of both sources of income by asset class. The Exhibit of Net Investment Income also differentiates between the amount of income

---

19 Aligns with IASA Chapter 9.
collected and the amount of income earned in the year and describes the deductions for investment expenses and other costs. The Exhibit of Capital Gains (Losses) shows the split of the gains (losses) between those gains (losses) that were realized on the sale or maturity of an asset and those that were due to impairments (labeled “other realized adjustments”).

The details underlying these two exhibits are provided in Schedules A, B, D, DA and DB of the Annual Statement, which describe the assets held in each asset class as of the evaluation date of the financial statement and the assets that were sold, redeemed or disposed of during the current year.

While property/casualty actuaries are not typically involved in the investment reporting and valuation, they should have a basic understanding of these items due to their significance to product pricing and overall insurer operating results. For that reason, a discussion of the statutory reporting and valuation guidelines for each major asset class is included below. More detail will be provided on bonds and stocks because they represent the vast majority of assets held, but several other asset classes will also be discussed briefly.

Bonds

Bonds represent a majority of the assets held by insurance companies. On the Exhibit of Net Investment Income and the Exhibit of Capital Gains (Losses), bonds are reported in four categories: U.S. government bonds, bonds exempt from U.S. tax, other bonds (unaffiliated) and bonds of affiliates. The underlying detail is primarily provided in Schedule D, Part 1 (Long-Term Bonds Owned) and Schedule D, Part 4 (Long-Term Bonds Sold, Redeemed or Disposed of). Bonds that mature in one year or less are reported in Schedule DA, Part 1 (Short-Term Investments Owned).

The net investment income earned from bonds, as shown in the Exhibit of Net Investment Income, is based on the following four amounts:

1. Interest received during the year (Schedule D, Part 1, column 20 and Part 4, column 20).
2. Interest due and accrued (Schedule D, Part 1, columns 19 and 20).
3. Current year’s (amortization)/accretion (Schedule D, Part 1, column 13 and Part 4, column 12).
4. Interest paid for accrued interest on dividends (Schedule D, Part 3, column 9).

The first of the four items, interest received during the year, represents all coupon payments that were received on bonds held during the year. This includes coupon payment on bonds owned at the end of the year and on bonds that were owned at the beginning of the year but sold, redeemed or disposed of during the year. This is presented on the basis of when the actual interest coupon was actually received, so an adjustment is required to convert it to an accrual basis. This adjustment is made by adding the change in the interest due and accrued
The explanation of the third item above, current year’s (amortization)/accretion, requires us to revisit basic bond valuation. Recall that when a bond is purchased, the actual purchase price is usually different from the face value due to the difference between the coupon rate on the bond and the market interest rates at the time of purchase. To provide the buyer with an effective interest rate equal to the current market interest rate, the bond is sold at either a discount or a premium to the face value. For financial reporting purposes, that discount or premium is then realized as either positive (in the case of a discount) or negative (in the case of a premium) interest income over the life of the bond. This is referred to as either the amortization of the premium or the accretion of the discount and is reported for each bond in Schedule D, Parts 1 and 4.

The following example illustrates the accounting for a bond purchased at a discount. Assume a five-year bond with face value of $100 is purchased for $90. The purchase price is less than the face value because the coupon rate on the bond is less than the current market interest rate. This difference between the face value and purchase price is referred to as a discount, and the amount of the discount is set such that the effective yield on the bond will equal the current market interest rates at the time of purchase. The $10 discount is realized over the remaining five-year duration of the bond as investment income in addition to the actual coupon payments, such that the effective yield in each period also matches the market interest rate at the time of purchase.

The same example can be reversed for bonds that are purchased at premium (when the coupon rate exceeds the market interest rate), and that premium is amortized as negative investment income over the life of the bond to achieve an overall investment income equal to the market interest rate at the time of purchase.

The fourth and final item above, interest paid on accrued interest and dividends, is related to coupon payments that are received on bonds acquired during the year. When a bond is acquired between coupon payments, the buyer of the bond (in this case the insurance company) is required to pay the seller of the bond the portion of the coupon payment that was earned while they owned the bond. This amount is presented on Schedule D, Part 3 (Long-Term Bonds and Stocks Acquired During Current Year), column 9 (Paid for Accrued Interest and Dividends).

Each of these three items (interest received, accrual/amortization of discount/premium, interest due and accrued, and payments for accrued interest on purchases) is reflected in the investment income collected and earned columns in the Exhibit of Net Investment Income.

The other aspect of investment income related to bonds, net realized capital gains (losses), comprises the following components:
FINANCIAL REPORTING THROUGH THE LENS OF A PROPERTY/CASUALTY ACTUARY

Part III. SAP in the U.S.: Fundamental Aspects of the Annual Statement

- Realized gain (loss) on sale or maturity (Schedule D, Part 4, column 16)
- Foreign exchange gain (loss) on disposal (Schedule D, Part 4, column 17)
- Other than temporary impairments recognized (Schedule D, Part 1, column 14 and Part 4, column 13)

Before we discuss these items in more detail, we will first review the basic statutory accounting concepts for bonds. When a bond is purchased, it is recorded at actual cost, including brokerage and other fees. This amount is recorded as the “actual cost” in Schedule D, Part 1, column 7 and Schedule D, Part 4, column 7. In each statutory Annual Statement after the purchase of the bond, the bond is recorded at “adjusted carrying value,” which is based on one of two amounts:

- Amortized cost
- The lower of amortized cost or fair value

Amortized cost represents the actual cost of the bond adjusted for the amortization of any premium or discount from the face amount (as described in the paragraphs above). Fair value generally refers to the value that an asset could be sold for in the open market.

For bonds that are designated as National Association of Insurance Commissioners (NAIC) 1 and 2 and carried at amortized cost, the adjusted carrying value of the bond is updated each year to reflect the amortization of premium or the accretion of discount. As a result, the adjusted carrying value of the bond will converge with the par value as a bond matures. For bonds that are designated as NAIC 3 through 6, the value of the bond is shown as the lesser of fair value or amortized cost. All of this information is summarized on Schedule D, Part 1, including the NAIC designation, actual cost, fair value, par value and book/adjusted carrying value.

To the extent the adjusted carrying value of a bond is adjusted to fair value, the adjustment is considered an unrealized loss and is reflected in Schedule D, Part 1, column 12. Once the bond is sold, the difference between the consideration received and the adjusted carrying value is considered a realized gain or loss and is recorded in Schedule D, Part 4, column 18. Many bonds held by insurance companies are designated as NAIC 1 or 2 and held to maturity, so there is never any capital gain or loss over the life of the bond.

Bonds denominated in a foreign currency will also be affected by changes in foreign exchange rates over time. These changes are reflected in the adjusted carrying value but are unrealized until the bond is sold, redeemed or otherwise disposed of. The change in the unrealized amount of this foreign exchange gain or loss is found on Schedule D, Part 1, column 15, and the amount of foreign exchange gain or loss that is realized upon disposal is found on Schedule D, Part 4, column 17.
The sum of the realized gain or loss on disposal and the foreign exchange gain or loss on disposal equals the total gain or loss on disposal, which is shown on Schedule D, Part 4, column 19.

One important exception to the reporting and valuation rule described above relates to the third source of the net realized capital gains and losses, which is referred to as “other than temporary impairments recognized.” In general, an impairment occurs when it is deemed probable that the insurer will not collect all amounts due according to the contractual terms of a debt security at the date of acquisition. Whether or not impairment is temporary is a subjective judgment of the company. Impairments can occur on bonds with any NAIC designation, and they result in the realized capital losses even though a bond has not been sold, redeemed or disposed.

The total realized capital gain or loss for a year is calculated in the Exhibit of Capital Gains (Losses). Column 1 represents the “Realized Gain (Loss) On Sales or Maturity,” which is calculated in Schedule D, Part 4, and shown in column 18 of that exhibit. Column 2 is labeled “Other Realized Adjustments” and includes the foreign exchange gain (loss) on disposal and other than temporary impairments recognized in the first year.

Stocks

Like bonds, investment income from stocks comprises investment income earned and realized capital gains.

Preferred stocks and common stocks are reported on separate lines on the Exhibit of Net Investment Income and the Exhibit of Capital Gains (Losses), and they have separate supporting schedules, Schedule D, Part 2, Section 1 and Section 2, respectively. Disposals of preferred and common stocks are reflected in Schedule D, Part 4.

Investment income for stocks is simply the amount of dividends received during the year plus the change in the accrual for dividends declared but unpaid (dividends are accrued on the ex-dividend date). These dividends are included in Schedule D, Part 2-Section 2, column 11 for stocks owned at year end and in Schedule D, Parts 4 and 5, column 20 for stocks sold during the year.

When either common stocks or preferred stocks are purchased, the actual cost plus any commissions or taxes becomes the initial carrying value. Subsequently, the valuation of preferred stocks and common stocks differ, so each is discussed separately.

Common stocks of unaffiliated companies listed on the major U.S. exchanges (NYSE and NASDAQ) are recorded at fair value. Changes to fair value after purchase are recorded as unrealized valuation increases (decreases) in Schedule D, Part 2, Section 2, column 13. When a stock (common or preferred) is disposed of, the difference between the consideration
received and the original cost is recorded as a realized gain (loss) on disposal and a foreign exchange gain (loss) on disposal (if applicable) in Schedule D, Part 4, columns 17 and 18.

The rules governing the accounting for investments in subsidiaries, controlled and affiliated entities are complex and beyond the scope of this publication. A brief description of the accounting for investments in insurance company affiliates is discussed in the RBC chapter of this publication (see Chapter 19. Risk-Based Capital), where accounting background is needed on the accounting for determination of the asset risk charge.

The valuation of preferred stock of unaffiliated entities is dictated by the form of the instrument and the designation assigned by the NAIC Securities Valuation Office. The two common forms of preferred stock are redeemable and perpetual (i.e., non-redeemable) preferred stock. Redeemable preferred stock, also known as callable preferred stock, is preferred stock that is redeemable at the option of the issuer at a specified maturity date or after a specific period of notice, for a preset price. Perpetual preferred stock is preferred stock with no maturity date that cannot be redeemed by the issuer. For redeemable preferred stock, the highest two designation categories are recorded at the original purchase price (i.e., cost) plus brokerage and other related fees, with any discount or premium amortized over the life of the redeemable preferred stock; for perpetual preferred stock, the highest two designation categories are recorded at fair value; for redeemable and perpetual preferred stock, the lower four designation categories are recorded at the lower of cost, amortized cost or fair value.

As with fair value changes, market value changes to common and preferred stock after purchase are also shown in Schedule D, Part 2, Section 2, column 13 as unrealized valuation increases (decreases). Again, when a stock is disposed of, the difference between the consideration received and the original cost is recorded in Schedule D, Part 4, columns 17 and 18 as a realized gain (loss) on disposal and a foreign exchange gain (loss) on disposal (if applicable).

Both common stocks and preferred stocks are subject to impairment charges if there is a decline in fair value that is deemed to be “other than temporary” by the company. This determination must be made by the company based on available information (e.g., published reports, bankruptcy notifications). When impairment is made, it is recorded in Schedule D, Part 2, Section 1, column 17 and Schedule D, Part 2, Section 2, column 14 (as well as Part 4 for stocks that are disposed of during the year). Impairments made in a given year are included in the “Other Realized Adjustments” of the Exhibit of Capital Gains.

Each component of investment income from stocks is included in the Exhibit of Net Investment Income (page 12). Dividends received plus the change in dividends declared but unpaid are shown in the Exhibit of Net Investment income. In the Exhibit of Capital Gains (Losses), the realized gain or loss on disposal is shown in column 1, and the realized foreign
exchange gain (loss) on disposal and other than temporary impairments are shown in column 2.

Cash, Cash Equivalents and Short-Term Investments

This class includes assets that are immediately convertible to cash and have an original maturity of one year or less. Short-term investments are reported in Schedule DA, Part 1, cash is reported in Schedule E, Part 1, and cash equivalents are reported in Schedule E, Part 2.

The short-term investments presented in Schedule DA, Part 1 are composed of bonds or other securities with a maturity of one year or less (at acquisition) and follow the same reporting and valuation rules as long-term bonds. When a short-term bond or other investment is purchased, the security is recorded at cost and the premium or discount (if any) is amortized or accreted until maturity. Other than temporary impairments are also possible, though they are less common given the short duration of these investments.

The reporting and valuation of cash and cash equivalents is similar but relatively simpler than short-term investments, as evidenced by the fewer columns that are included in Schedule E, Parts 1 and 2 relative to Schedule DA.

Derivatives

Derivatives are financial contracts between two parties for which the value depends on the performance of other assets or variables. While derivatives are not a major asset class for most property/casualty insurance companies, they are becoming more common, and they are of heightened importance due to the financial crisis that occurred in the late 2000s. During the financial crisis, one large insurance group nearly collapsed due to derivatives that had been sold by one of its units.

A list of outstanding derivatives owned, sold ("written"), and terminated during the year is provided in Schedule DB. Companies that are not involved in any open derivatives may omit Schedule DB.

Schedule DB provides the number of contracts for each derivative and the notional amount, which represents the number of units of the underlying asset that are involved. The original trade date and the maturity or expiration date are also provided. The two prices listed are the transaction price, which is the price that the company agreed to buy or sell at, and the reporting date price, which is the current price.

One common reason a company may buy or sell derivatives is to hedge, or offset, the exposure they have to changes in price for an underlying asset or variable, such as an interest rate. For this reason, Schedule DB includes information on the item that is hedged with each derivative position and on the type of risk being hedged.
If a derivative position is held for hedging purposes and a company can demonstrate that the hedge has sufficiently reduced the risk related to the specific underlying asset or assets (known as a “highly effective” hedge), then that derivative may qualify for hedge accounting. Under hedge accounting, the derivative is accounted for in the same way as the asset that is hedged, which allows for any changes in the value of the hedged asset and the derivative to offset (or be unrecorded in cases where the hedged item is recorded at amortized cost). For instance, if an interest rate swap is held to specifically hedge the value of a bond portfolio and that interest rate swap qualifies as a highly effective hedge (i.e., effectively neutralizes any changes in the value of the bond portfolio), then that interest rate swap can be accounted for on an amortized cost basis.

If a derivative no longer qualifies for hedge accounting (i.e., is no longer highly effective), then the mark-to-market accounting method should be used, and any changes in the fair value of the derivative should be recorded as unrealized gains (losses) directly to surplus in the current period. The accounting for derivatives used in income-generation transactions depends on the nature of the transaction and the accounting for the covering asset or underlying interest.

Schedule E is also related to derivatives and lists the counterparty exposure for all derivatives that are open at year-end. Counterparty is the person or institution on the other side of a transaction. This is important because it provides information to the regulators and any other users of the financial statements regarding any concentration of exposure to a specific counterparty. If the exposure to a counterparty becomes large enough that it is material relative to the surplus of a company, it should be considered as a potential warning sign.

Derivative accounting is very complex and beyond the scope of this publication. More detail regarding derivative accounting can be found in SSAP 86, Derivatives.

Other Sources of Investment Income

Although we have covered the largest and most common sources of investment income, there are other sources. For additional information on those other sources, or for additional detail regarding any of the sources discussed here, refer to the corresponding statutory accounting guidance.

Investment Guidelines

As discussed, there is a variety of investment asset classes available to insurers, and there is a wide range of specific assets within each class. When purchasing a bond, an insurer needs to make decisions on the type of issuer (e.g., government, corporate, asset-backed), industry, quality, maturity and country. Each company will make these decisions based on a set of investment guidelines, which are governed by state investment laws applicable to insurers. Each state has established investment laws, which provide guidance and limits regarding the
allowable investments for insurers domiciled in their jurisdiction. Although the NAIC has established model laws governing various aspects of insurers’ operations (including investments), the laws adopted by individual states may vary from those model laws. For purposes of this discussion, we will focus on the NAIC Model Investment Law.\(^{20}\) The NAIC Model Investment Law allows for two alternative types of investment guidelines, which are referred to as Defined Limits and Prudent Person.

The Defined Limit system of investment guidelines follows a rule-based approach and prescribes specific quantitative limits for the invested assets that a company may hold. Examples of some of the prescribed limits include the following:

- 5% limit of admitted assets with any single issuer (exceptions for government bonds)
- 1% limit of admitted assets with any single issuer with a designation of NAIC 3
- 0.5% limit of admitted assets with any single issuer with a designation of NAIC 4 or lower
- 20% limit of admitted assets in all securities designated NAIC 3 or lower
- 10% limit of admitted assets in all securities designated NAIC 4 or lower
- 5% limit of admitted assets in all securities designated NAIC 5 or lower
- 1% limit of admitted assets in all securities designated NAIC 6
- 25% limit of admitted assets or 100% of surplus in all common stocks

The Prudent Person system of investment guidelines follows a principles-based approach and requires an insurance company to develop its own investment guidelines. If a company chooses to use the Prudent Person approach, it should develop the investment guidelines with the protection of the policyholder in mind, and it should consider the specific investment expertise and resources available.

Measuring Investment Performance

Although investment income is a critical aspect of an insurer’s profitability, it can be difficult to measure investment performance and make comparisons between insurance companies. Several factors to consider are the size of the asset base of a company, the level of risk inherent in a company’s investment portfolio and the impact of taxes on a company’s investment income. Each of these considerations will be discussed below.

It may be tempting to compare the amount of investment income from one company to another or to create the ratio of investment income to written or earned premium. Neither of these approaches is an accurate measure of investment performance because they ignore the size of a company’s invested assets. All things being equal, a company with 10 times the invested assets of another company would also be expected to generate 10 times the

investment income. For that reason, one metric to consider is the ratio of the investment income for the year to the average invested assets.

That ratio will provide a basic comparison between two companies and how much investment income they are generating relative to their invested assets. However, this ratio does not consider the inherent risk to the assets that are being held. If one company has a significantly higher percentage of its assets in common stocks or lower-rated bonds, it would be expected to achieve a higher investment return during a good year, but the level of risk is significantly higher. While there may not be a single ratio or metric that measures this inherent level of risk, it is at least possible to qualitatively compare the types of assets held by two companies to see if there are significant differences.

Measurement and comparison of investment performance is also difficult due to taxes. As discussed earlier in this chapter, net investment income earned is presented on the income statement before the effects of federal income taxes. On the other hand, net realized capital gain (loss) is presented after capital gains tax. Two companies that had the same net investment income earned may be subject to different taxation. The full implications of the impact of taxes on investment income are beyond the scope of this publication, but a user of the financial statements should be aware of this potential difference and seek input from a tax professional as needed.

OTHER INCOME

As shown in the summary of the industry income statement, the other income category is relatively small compared to the other two categories. For that reason, only a few of the significant sources of other income will be discussed below. Although they are not technically considered to be part of other income, dividends to policyholders and federal and foreign income taxes are also discussed below because they are part of the consideration of net income.

Net Gain (Loss) from Agents’ or Premium Balances Charged Off (Line 12)

In Chapter 7. Statutory Balance Sheet: A Measure of Solvency, we discussed the assets related to uncollected and deferred agents’ balances. If a company determines that a portion of those balances will not be collected, those balances should be charged off as a loss and are recorded as an expense under this category in other income. Conversely, if an agents’ balance that was previously written off is recovered, that recovery would be included as a gain in this category. Losses can be used to offset gains that occur during the same period.

Finance and Service Charges not Included in Premiums (Line 13)

Insurers will often offer financing or payment plans to the insured that allow the insured to spread out premium payment over time. Typically, the insured will pay an additional flat service charge to pay through these financing or payment plans. Those service charges are
not recorded as a part of written or earned premium and are instead included in this category under other income.

Aggregate Write-ins for Miscellaneous Income (Line 14)

While the amounts included as miscellaneous write-ins are not usually material, several of the common entries are the following:

- Gain or Loss on Sale of Equipment: When furniture, equipment or automobiles are sold, the sale price may differ from the current depreciated cost. That difference may be recorded as either a gain or a loss under other income.

- Retroactive Reinsurance: An insurer may purchase reinsurance on existing liabilities, and the reinsurance premium paid may be more or less than the previously recorded value of the liabilities transferred. That gain or loss is recorded as other income.

- Gain or Loss on Foreign Exchange: When payments are made or received in a foreign currency, the ultimate settlement of the payment may be at a different exchange rate than the exchange rate at which the payment was originally recorded, and the resulting gain or loss is recorded as other income. This does not include changes in investment income due to foreign exchange, which were already discussed.

- Corporate Expense: Some insurers will record some corporate expenses that are not allocable to underwriting or investments, such as national advertising, to other expenses.

- Fines and Penalties of Regulatory Authorities: As per the Annual Statement Instructions, all fines and penalties imposed by regulatory authorities must be disclosed separately, regardless of materiality.

Dividends to Policyholders (Line 17)

The board of directors of a mutual insurance company may elect to pay a dividend to the policyholders. A dividend is effectively a return of a portion of the premium that was originally paid by the policyholder, and for a dividend to be paid, there are typically state requirements. When the decision is made to pay a dividend, it is considered to have been “declared,” and payment won’t actually be issued until a later date.

This item on the income statement includes dividends that were actually paid plus the change in accrued dividends.

Federal and Foreign Income Taxes Incurred (Line 19)

All foreign and federal income taxes that are incurred during the current year, including amounts related to prior years, are recorded on this line. This amount of income taxes
incurred represents an estimate of the current income taxes incurred during the reporting period and excludes any amounts that would be deferred to later years. Further detail on taxation appears in Chapter 26, Taxation in the U.S.
CHAPTER 9. CAPITAL AND SURPLUS ACCOUNT

In addition to various income items that have already been discussed, the Statement of Income within the Annual Statement also includes a section referred to as the “Capital and Surplus Account.” This section is important because it reflects certain changes in surplus that are not recorded in the income statement and it reconciles the beginning surplus to the ending surplus for the reporting period.

In its simplest form, the key components of the Capital and Surplus Account are listed in Table 5 as follows:

\[
\text{Current Year Surplus (line 39) =} \\
\quad \text{Prior Year Surplus (line 21)} \\
\quad + \quad \text{Current Year’s Net Income (line 22)} \\
\quad + \quad \text{Other Surplus Changes (lines 24 through 31)} \\
\quad + \quad \text{Additional Capital Contributions (lines 32 and 33)} \\
\quad + \quad \text{Stockholder Dividends (line 35)}^{21}
\]

Under Statutory Accounting Principles, certain transactions are recorded directly to surplus, so the Other Surplus Changes component includes a number of important subcomponents. Table 5 is an excerpt of the Capital and Surplus Account for the U.S. property/casualty insurance industry as of December 31, 2018.\(^{22}\)

---

\(^{21}\) Stockholder dividends represent a charge to surplus for amounts paid during the year plus the change in the amount of dividends declared but unpaid during the year. These amounts are shown as a negative number in line 35 of the Capital and Surplus Account and therefore added, as a negative number, to calculate current year surplus. Table 5 demonstrates this calculation.

\(^{22}\) Accessed via a sector-specific information and research firm in the financial information marketplace.
The first item of Table 5, surplus as of December 31 of prior year, is taken directly from the Capital and Surplus Account from the prior year. Net income comes from the Statement of Income. The remaining rows describe the direct adjustments to surplus. An explanation of some of the important adjustments is below.

Change in Unrealized Capital Gains (Losses) (Line 24)

We previously discussed the concept of realized and unrealized capital gains in the discussion of investments and investment income. Capital gains (losses) occur when the carrying value of an asset changes, but those capital gains (losses) are only realized when an asset is either disposed of or impaired.

Recall that in the investment income section of the Statement of Income, realized capital gains (losses) are recorded in income, but unrealized capital gains (losses) are not. Unrealized capital gains (losses) occur when the fair value of investments carried at fair value changes during the reporting period. Because these unrealized capital gains (losses) are reflected in the balance sheet but not in net income, an adjustment to surplus is required to maintain the Admitted Assets – Liabilities = Surplus relationship.

Because the current year’s surplus is being calculated with the prior year’s surplus as a starting point, the required adjustment is the change in net unrealized capital gains (losses)
relative to the prior year, not the absolute amount of unrealized capital gains for the current year. This amount can be found in column 4 of the Exhibit of Capital Gains (Losses).

Unrealized capital gains (losses) most frequently occur with respect to stock holdings that are held at fair value because any change in the fair value from year to year affects capital gains (losses). Bonds may also produce unrealized capital gains, but this would typically only occur when a bond is designated as National Association of Insurance Commissioners (NAIC) 3 or lower and is therefore recorded at fair value. Perpetual preferred stock and redeemable preferred stock that is designated in the four lowest NAIC categories could also produce unrealized gains since they also may be recorded at fair value.

Change in Net Unrealized Foreign Exchange Capital Gains (Losses) (Line 25)

This item is similar to the change in unrealized capital gains (losses), but it is specifically related to unrealized capital gains (losses) due to changes in the foreign exchange rate. When an asset is purchased in a foreign currency, any subsequent change in value due to changes in foreign exchange rates as long as that asset is held are considered to be unrealized capital gains (losses). This amount can be found in column 5 of the Exhibit of Capital Gains.

Change in Net Deferred Income Tax (Line 26)

Deferred tax assets (DTAs) and deferred tax liabilities (DTLs) were already discussed in the previous discussion of the balance sheet (Chapter 7, Statutory Balance Sheet: A Measure of Solvency). DTAs and DTLs can arise for a variety of reasons, but the most common are differences in statutory and tax accounting (such as in the discounting of loss reserves, unrealized gains/losses and unrealized foreign exchange gains/losses) and carryforward of previous operating losses to future tax years. DTAs are only considered admitted assets if a strict admissibility test is met. All surplus adjustments are recorded net of deferred taxes if there is a difference in the treatment of the item for statutory accounting and tax purposes. Similar to unrealized capital gains, net DTAs affect the balance sheet but do not flow through to income. As a result, a direct adjustment is required to surplus to maintain the equality of Admitted Assets - Liabilities = Surplus. The change in deferred taxes is determined before consideration of the nonadmitted portion because the change in nonadmitted DTAs is captured with all the other nonadmitted assets.

Change in Nonadmitted Assets (Line 27)

The concept of nonadmitted assets was introduced in the previous discussion of the balance sheet. Nonadmitted assets are assets that are not allowed to be considered part of surplus for the purpose of statutory accounting. This creates a violation of the Admitted Assets - Liabilities = Surplus relationship.

As with the previous items, the adjustment required is based on the change in nonadmitted assets relative to the prior year, not the current absolute amount. There is a specific exhibit in
the Annual Statement, the Exhibit of Nonadmitted Assets (page 13 of the 2018 Annual Statement), which calculates the change in nonadmitted assets relative to last year by asset class and in total. The total change in nonadmitted assets from that exhibit is the source for the amount used as the change in nonadmitted assets in the Capital and Surplus Account.

Change in Provision for Reinsurance (Line 28)

Like nonadmitted assets, the provision for reinsurance is a concept that reduces surplus and is unique to statutory accounting. While nonadmitted assets are essentially treated as assets that are excluded from surplus, the provision for reinsurance is treated as an additional liability on the balance sheet (though no real liability exists). The provision for reinsurance is included on the balance sheet, but it does not flow through to the Statement of Income, which is why a direct adjustment to surplus is required.

The Liabilities page of the balance sheet shows the current year and the prior year provision for reinsurance, so the change in the provision for reinsurance can be calculated from those amounts. The amount of the change in the provision for reinsurance is included in the Capital and Surplus Account.

Cumulative Effect of Changes in Accounting Principles (Line 31)

Sometimes a company must adopt changes in accounting principles, either due to new accounting guidance, or a change in accounting policy. When such a change occurs, a company must determine the cumulative effect of the change (as if the accounting principle had always been in place) as of the beginning of the reporting period the change is made. The cumulative effect of the change is recorded as a direct adjustment to surplus.

Although an entry for a cumulative effect of changes in accounting principles could be required for many reasons, here are two examples:

- Anticipated salvage and subrogation: Companies have the option to record unpaid losses net of anticipated salvage and subrogation. When a company elects to change the recording from gross of salvage and subrogation to net of salvage and subrogation, the cumulative effect of this change should be reported here.

- Tabular discounting: When companies record loss reserves for life pension reserves, they have the option to discount for interest and mortality according to a prescribed actuarial table and interest rate. This is referred to as tabular discounting. When a company makes a change in its use of tabular discounting, the cumulative impact of that change should be recorded here.
Capital Changes and Surplus Adjustments (Lines 32 and 33)

The lines for capital changes and surplus adjustments primarily describe inflows and outflows of capital from the new issuance of stock or return of capital, as well as transfers from surplus to capital when stock dividends are issued. When new stock is issued, the portion of the proceeds related to the par value of that stock is recorded as paid-in capital on line 32.1. The portion of the proceeds in excess of the par value is recorded as paid-in surplus on line 33.1.

Dividends to Stockholders (Line 35)

The board of directors of an insurance company may elect to pay a dividend to the stockholders, which serves as a return on the stockholders’ investment. Stockholder dividends may only be paid out of unassigned surplus, which is surplus that is not assigned to the par value or paid in value of stock, special surplus funds, surplus notes or treasury stock. There are also specific state requirements that must be met for a stockholder’s dividend to be paid.

The amount shown as dividends to stockholders equals the actual amount paid during the year plus the change in the amount of dividends declared but unpaid during the year.

SUMMARY

This section described the three sources of income on the Statement of Income (underwriting, investment and other) and discussed the Capital and Surplus Account within the Statement of Income, where total change in surplus is determined.

While actuaries are most familiar with the aspects relating to underwriting income, they should also be familiar with investment income, given the significance of investment income to the pricing and profitability of an insurer. Understanding the various items that affect the change in surplus is also important because this not only provides the link between the profitability and the solvency of a company (or the income statement and the balance sheet), but it also highlights several direct adjustments to surplus that may require input from an actuary.
CHAPTER 10. NOTES TO FINANCIAL STATEMENTS

We have now covered the numerical aspects of three of the primary financial statements: the balance sheet, income statement, and statement of capital and surplus. For some of the balances, Statutory Accounting Principles (SAP) requires additional qualitative or quantitative information in order to more fully portray the financial condition of an insurer. The Notes to Financial Statements include some of this additional qualitative and quantitative information.

This publication will focus on specific notes that often require direct involvement by actuaries and the notes that are potentially relevant to actuaries. The notes within each of those two categories are described below:

- Notes often requiring direct involvement by actuaries:
  - Reinsurance (23)
  - Change in incurred loss and loss adjustment expense (LAE) (25)
  - Premium deficiency reserves (30)
  - Discounting of liabilities for unpaid loss and LAE (32)
  - Asbestos/environmental reserves (33)

- Notes that are potentially relevant to actuaries:
  - Summary of significant accounting policies and going concern (1)
  - Events subsequent (22)
  - Intercompany pooling arrangements (26)
  - Structured settlements (27)
  - High deductibles (31)

The numbers listed next to each note above are the numbers corresponding to that note in the 2018 Notes to Financial Statements included in the Annual Statement Blank, which are the same as those in 2011. These numbers may change from year to year due to the addition or subtraction of the notes that are required, so these numbers will not be used in the rest of this discussion. Examples will be drawn from the 2018 Notes to Financial Statements for Fictitious Insurance Company (referred to as the 2018 Fictitious Notes). It is also suggested that the reader review an example of the Notes to Financial Statements from a current insurance company Annual Statement as they review this section.23

For each of the notes described, the following information will be provided:

- Information contained in the note
- Importance of the note to actuaries
- Example of information from the 2018 Fictitious Notes

23 The Notes to the Financial Statements are included only in individual company Annual Statements, not in group Annual Statements.
Readers seeking more detail on any notes listed above or on other notes to financial statements can refer to either the National Association of Insurance Commissioners (NAIC) Annual Statement Instructions or the paper Notes to the NAIC Property/Casualty Annual Statement by Sholom Feldblum and Ralph Blanchard (October 2010).

NOTES OFTEN REQUIRING DIRECT INVOLVEMENT BY ACTUARIES

These five notes typically require direct input from the actuaries at an insurance company, though in each case the management of the company is ultimately responsible (and in some cases the actuary may be a member of management). Because actuaries will likely be the primary source of input in these cases, readers should review these notes in detail and understand what information is needed to complete them.

Reinsurance

The loss and LAE reserve liabilities on the balance sheet and the underwriting income on the income statement are expressed net of reinsurance. Given that reinsurance can significantly lower the loss and LAE reserves on the balance sheet and affect the level of surplus, disclosures regarding the reinsurance in place are important to assessing the financial health of a company. Actuaries typically estimate the ceded reserves on reinsurance contracts and are therefore directly involved in the preparation of this note.

In particular, it is important to understand the potential credit risk associated with the assumed reinsurance recoverables (the risk that the reinsurer will not pay). This note provides information on specific liabilities for which the credit risk may be heightened, such as unsecured recoverables, recoverables in dispute and recoverables that have been deemed uncollectible.

In addition to the assessment of credit risk, there are also some specific accounting rules related to reinsurance that require additional disclosure. The note includes several of these matters, namely the commutation of ceded reinsurance, retroactive reinsurance, reinsurance accounted for as a deposit and run-off agreements.

There are nine sections of this note labeled A through I. A brief summary is provided on each of these sections:

- Unsecured Reinsurance Recoverables (Section A): The credit risk related to recoverables with a specific reinsurer is often mitigated by the reinsured having access to a letter of credit, trust agreement or funds withheld. This note discloses reinsurers for which no such security exists, but only in cases where the recoverable from that reinsurer exceeds 3% of the reporting entity’s (i.e., the reinsured’s) policyholder surplus. The mention of a reinsurer in this note is not necessarily a problem because those reinsurers may be highly rated and financially sound. The
amounts shown for each include paid losses billed but not yet collected, ceded reserves and ceded unearned premium.

- Reinsurance Recoverables in Dispute (Section B): Even when a recoverable is secured, it is possible for a reinsurer to dispute (or refuse to pay) a recoverable. A reinsurer may dispute either because they are unwilling to pay due to a disagreement on the coverage or amount or because they are unable to pay due to insolvency. A recoverable is considered to be in dispute once a formal written refusal to pay is received from the reinsurer. In addition to identifying a credit risk, recoverables in dispute might represent attempts by a financially troubled insurer to over-recover from reinsurers.

- Reinsurance Assumed and Ceded (Section C): Although unclear from the vague naming, this section includes information on ceding commissions to reinsurers related to the ceded unearned premium reserve. These ceding commissions received from reinsurers are treated as revenue by the insurer and therefore benefit the insurers’ surplus position. This section helps regulators to identify situations where an insurer may be abusing ceding commissions to artificially enhance its surplus position, and it provides information on ceding commissions that would need to be returned in the event of cancellation. Specific disclosure is also required for contingent ceding commissions.

- Uncollectible Reinsurance (Section D): If an insurer deems that it is unlikely to collect a specific reinsurance recoverable, it must write off that recoverable as uncollectible and treat it as an expense. This section of the note includes a description of any recoverables that were written off as uncollectible during the course of the year. The disclosures in this note may help an actuary or other user of the financial statements to assess provisions set aside for future uncollectible reinsurance, which is reflected in the Provision for Reinsurance derived in Schedule F.

- Commutation of Ceded Reinsurance (Section E): A commutation is a “transaction which results in the complete and final settlement and discharge of all, or the commuted portion thereof, present and future obligations between the parties arising out of a reinsurance agreement.”24 This note requires disclosure of any commutations that occurred during the year. This information is important to a user of the financial statements because a commutation may cause a distortion to the income statement and balance sheet because the commutation payment received from the reinsurer may be reflected as a negative paid loss and the net loss reserves may increase to reflect the elimination of the reinsurance.

24 SSAP 62R.
Retroactive Reinsurance (Section F): Retroactive reinsurance refers to reinsurance that is purchased for liabilities that occurred prior to the effective date of the reinsurance contract. Retroactive reinsurance must be accounted for differently than normal prospective reinsurance to avoid distortion of the balance sheet and income statement. Instead of reducing the net loss reserves, retroactive reinsurance reserves are recorded separately as a write-in item on the balance sheet with any gain recorded in the income statement and as a restricted special surplus amount. This section of the note includes disclosure of any retroactive reinsurance, including reserves transferred, consideration paid or received, paid losses reimbursed or recovered, special surplus generated, and other reinsurers involved in the transaction. This section allows a user of the financial statements to verify that retroactive reinsurance is being accurately accounted for and to understand its impact on the financial statements.

Reinsurance Accounted for as a Deposit (Section G): To be accounted for as reinsurance, a reinsurance contract must meet certain risk transfer criteria. When a reinsurance contract does not qualify for reinsurance accounting, it must be accounted for as a deposit. This means that it is directly accounted for as a deposit asset or liability (depending on if amounts are owed from or to, respectively, other parties under the contract), instead of flowing through underwriting income. If a company has any reinsurance contracts that are accounted for as deposits, a schedule showing the historical changes to the balance since inception of each contract is included.

Disclosures for the Transfer of Property and Casualty Run-off Agreements (Section H): Run-off agreements are reinsurance agreements intended to transfer the risks and benefits of a specific line of business or market segment that is no longer actively marketed by the transferring insurer to a third party. This third party is often another insurance or reinsurance company. If certain criteria are met, a run-off agreement can be accounted for differently than is typically required for retroactive reinsurance. If these criteria are met, the transferring entity records the consideration paid to the assuming entity as a paid loss. If the consideration paid by the transferring entity is less than the loss reserves transferred, the difference is recorded by the ceding entity as a decrease in losses incurred. As noted above, retroactive reinsurance that is not considered a run-off agreement is recorded as a separate item on the balance sheet with no reduction in incurred losses at the time of the transaction.

Certified Reinsurer Rating Downgraded or Status Subject to Revocation (Section I): A certified reinsurer is an assuming insurer that has been certified as a reinsurer in the domiciliary state of the ceding insurer and secures its obligations in accordance with the requirements of Appendix A-785, Credit for Reinsurance of the NAIC Accounting Practices and Procedures Manual. Certified reinsurers that have their ratings reduced
or their certified status revoked by the ceding company’s state of domicile may have to provide increased collateral. This footnote requires disclosure of the impact on any reporting period in which a certified reinsurer’s rating has been downgraded or its certified reinsurer status is subject to revocation and additional collateral has not been received as of the filing date.

In summary, this note is helpful to an actuary or other user of the financial statements because it identifies potential credit risks (Sections A, B, D and I) and identifies types of reinsurance that are subject to specific accounting treatment (Sections C, E, F, G and H). For the sections related to credit risk (A, B, D and I), the user of the financial statements may ask the following kinds of questions if material balances exist:

- **Section A (Unsecured Recoverables):** Why wasn’t security provided? Are there concerns of the financial health of either the reinsurer or the reinsured? Was there a catastrophe that led to a large amount of recoverables? Are all of these unsecured recoverables concentrated with one reinsurer?

- **Section B (Recoverables in Dispute):** What is the point of disagreement with the reinsurer? Is the amount in dispute material to either the reinsured or the reinsurer? Are there legal opinions available on the validity of each side’s claim?

- **Section D (Uncollectible Reinsurance):** What was the reason for the uncollectible reinsurance? Could other outstanding recoverables also be uncollectible in the future for the same or similar reasons? How long did it take the company to write off any uncollectible reinsurance that was disclosed?

- **Section I (Certified Reinsurer Rating Downgraded or Status Subject to Revocation):** What was the reason for the downgrade or revocation? Why wasn’t the additional collateral provided as of the filing date?

The disclosures in this note are of specific interest to an actuary who is opining on a company’s loss reserves because several of these items are referred to explicitly in the Statement of Actuarial Opinion (SAO).

A review of the 2018 Fictitious Notes indicates that Fictitious provided disclosures related to unsecured reinsurance, commissions and retroactive reinsurance. The other items were not applicable for the 2018 year.

**Change in Incurred Loss and Loss Adjustment Expense**

The total incurred loss and LAE for a year can be thought of in two categories: (1) loss and LAE that were incurred on liabilities occurring during the current accident year and (2) any changes in incurred loss and LAE from previous accident years. This note relates only to the
second of these two items. The content of this note should include the amount of the change (i.e., reserve strengthening or weakening) in liabilities for previous accident years, the segments or lines of business that led to that change, and the reason for the change.

The importance of this note to the financial health of an insurance company is two-fold. First, the existence of a material change in prior accident years’ incurred losses and LAE affects the current year’s underwriting income and could obscure the true underlying experience of the current in-force business. A company that achieved positive underwriting income solely as a result of decreases to prior years’ loss and LAE estimates may have profitability issues on their current business.

Second, recurring material changes in prior accident year incurred loss and LAE may be indicative of a bias or problem with a company’s reserving process. For instance, if a company consistently experiences significant decreases in their estimates of prior accident years’ losses, then there may be inherent conservatism to the company’s process for establishing loss and LAE reserves. Schedule P provides additional information that may assist in this assessment, and it will be discussed in more detail in Chapter 15, Schedule P.

Actuaries should be familiar with the required content of this note so that they are prepared to provide input to management. Also, when reviewing a company’s financial statements, actuaries may be in the best position to identify one of the two problems noted above. This note should be consistent with information included in a similar note to the annual Generally Accepted Accounting Principles financial statements and also to the one-year development column from Schedule P, Part 2 (with the exception of Adjusting & Other Loss Adjustment Expenses, which are included in this note but not in Schedule P, Part 2).

Finally, if the actuary is the Appointed Actuary for the company, the actuary may be called on to understand the difference in estimates underlying the loss reserves since the prior year’s estimates and comment on those changes in the Appointed Actuary’s Statement of Actuarial Opinion. For that reason, the actuary needs to be aware of the content of this note.

In the case of the 2018 Fictitious Notes, it is disclosed that the prior year-end total loss and LAE reserves developed favorably by $875,000, and several specific segments were cited as the major drivers of this favorable development. According to Fictitious’ income statement, the company’s net income in 2018 was $2.2 million. This tells the user of the financial statements that the favorable reserve development was a significant factor in the financial results of the company for the year. Chapter 12, Five-Year Historical Data Exhibit will provide guidance on how to assess whether this favorable development has been occurring consistently over time.
Premium Deficiency Reserves

Premium deficiency reserves must be recorded when the unearned premium of in-force business is not sufficient to cover the losses, LAE and maintenance expenses that will arise as that premium is earned. Companies have the option to consider investment income when performing this calculation. Also, before performing the calculation, the business should be grouped in a manner that is consistent with how it is marketed, serviced and measured.

Most insurance policies sold by insurance companies are priced with rates that are greater than the expected losses and expenses, especially after consideration of investment income. Furthermore, if there is a segment of the business that is underpriced, it may be a part of a larger grouping where the deficiency in that segment is offset by other more profitable segments. For these reasons, the premium deficiency reserve will be zero for a majority of companies. However, there are cases where a non-zero premium deficiency reserve exists due to regulatory, competitive or other conditions that led to inadequate rates.

When a non-zero premium deficiency reserve does exist, a company may record it as either a write-in liability or a part of the unearned premium reserve on the balance sheet. When it is recorded as a part of the total unearned premium reserve liability, the Notes to Financial Statements is the only way to identify whether a premium deficiency reserve exists and the amount of the reserve.

In the note relating to premium deficiency reserves, the company must disclose the amount of the premium deficiency reserve. The company also needs to disclose whether investment income was considered in the determination of the premium deficiency reserve (although this is often disclosed in the accounting policy note).

This note is relevant to users of the financial statements because the existence of a premium deficiency reserve is usually a clear indication that issues of rate adequacy exist for at least the affected segment. However, the absence of a non-zero premium deficiency reserve does not necessarily indicate that rates for all business segments are adequate, due to the ability to consider investment income and to group segments into broad categories.

As a result of actuaries’ involvement in the pricing and reserving of business, actuaries are in a position to provide input on whether a premium deficiency reserve is necessary and on the amount of the premium deficiency reserve. The analytical approach for this is beyond the scope of this publication, but there are other resources available that provide direction.

In the 2018 Fictitious Notes, the note on premium deficiency reserves indicates that at December 31, 2018, the company had liabilities of $0 related to premium deficiency reserves, and anticipated investment income was considered in that determination. If an insurer were to elect to change its consideration of investment income from one year to the next for the purposes of calculating the premium deficiency reserve, that change would likely
need to be disclosed, along with the amount of the impact, in the Note called “Accounting Changes and Correction of Errors.”

Discounting of Liabilities for Unpaid Loss and Loss Adjustment Expenses

This note indicates whether a company discounts loss reserves, and if so, it also describes the basis for calculating the amount of the discount. There are two types of discounting that need to be disclosed: tabular discounting and non-tabular discounting.

Tabular discounting applies specifically to outstanding annuity-type claims that pay pension benefits. These claims arise most commonly from workers’ compensation coverage but may also arise from other types of liability coverage. A tabular discount reflects mortality assumptions according to a specific life table and a defined interest rate. Both the life table and the interest rates may be specified by the state regulator. Not all insurance companies that have these eligible liabilities choose to utilize tabular discounts.

In the first part of this note, the company needs to indicate whether any liabilities are discounted using tabular discounting. If any tabular discounting is used, the company also needs to indicate the basis and assumptions used in calculating the tabular discount. For instance, in the 2018 Fictitious Notes, the company disclosed that tabular workers’ compensation case reserves were discounted under various state laws, reflected a discount rate of 3.5% or a rate prescribed by the state regulator, and were derived based on a defined set of U.S. life tables.

In the second part of this note, any non-tabular discounting needs to be disclosed and described. This should reconcile to the amount of the non-tabular discount that was disclosed in Schedule P, Part 1, columns 32 and 33. Non-tabular discounting is less common than tabular discounting and is typically only done in specific cases where a company has been permitted by its state regulator to discount a specific type of liability. Two lines of business most commonly used for non-tabular discounting are workers’ compensation and medical professional liability.

While tabular discounts are calculated for specific pension claims, non-tabular discounts are typically calculated on the aggregate amount of a specific segment of reserves by using a projected payment pattern and an assumed discount rate. If a company applies any non-tabular discounting, they must disclose that and describe the basis in this note. We can see from the 2018 Fictitious Notes that the company did not apply non-tabular discounting.

The note also requires a company to disclose whether any of the key assumptions used to discount loss reserves (whether for tabular or non-tabular discounting) have changed relative to the prior year.

It is important for actuaries and other users of the financial statement to be familiar with this note because different companies have different discounting policies, and those differences
must be considered to make a consistent comparison. Non-tabular discounts may be of particular interest because they usually exist due to a specific exception granted by the regulator, which may relate to the solvency of an insurer. Furthermore, an actuary that is opining on the loss reserves of a company must disclose and describe any discounting of loss reserves in the SAO.

Asbestos/Environmental Reserves

Asbestos and environmental liability reserves have developed adversely over the past several decades. Therefore, exposure to asbestos or environmental liabilities can represent a significant source of uncertainty in a company’s loss and LAE reserves. Furthermore, asbestos and environmental liabilities have consistently developed adversely over the past several decades. For these reasons, specific qualitative and quantitative disclosure is required regarding a company’s asbestos and environmental reserves.

This note requires a company to disclose whether it has identified a potential exposure to asbestos or environmental reserves. These disclosures specifically exclude exposures relating to policies that were issued specifically to cover asbestos and environmental exposure. If the company answers affirmatively for either asbestos or environmental exposures, it must disclose the lines of business affected, the nature of the exposures and the reserving methodology used to estimate the liability. In addition to those qualitative disclosures, the company must complete a table that provides the following information for each of the past five years:

- Beginning reserves (including case, bulk + IBNR Loss & LAE)
- Incurred loss and LAE
- Calendar year payments for losses and LAE
- Ending reserves (including case, bulk + IBNR Loss & LAE)

This information must be provided separately for asbestos and environmental reserves on a direct, assumed and net of reinsurance basis. The company must also disclose the amount of the reserves that relate to unreported claims (i.e., pure incurred but not reported (IBNR)).

This note is important to the users of the financial statements because it discloses the existence of asbestos and environmental exposure, the magnitude of that exposure and the recent development of that exposure. In cases where these liabilities are material relative to a company’s overall reserves and/or have consistently been developing adversely, it should serve as a potential warning sign to the financial health of the company.

Actuaries at insurance companies are often directly involved in the estimation, monitoring and reporting of asbestos and environmental reserves. In situations where the financial statements of a company are under financial review, actuaries may also be in the best position to evaluate the disclosures made here for potential impact on the financial health of the company.
In the 2018 Fictitious Notes, the company acknowledged exposure related to asbestos and environmental liabilities. The company then described its process for identifying, monitoring and estimating these exposures.

The excerpt below in Table 6 shows an example of the five-year history of the calendar year incurred and paid asbestos losses and LAE on a net of reinsurance basis for Fictitious. In this case, we see that the net asbestos liability as of December 31, 2018, was $3.28 million. We also see that there was adverse development in Fictitious’ asbestos reserves from 2015 through 2018, as evidenced by the incurred losses and LAE each year.

<td>$1,153,000</td>
<td>$459,000</td>
<td>$471,000</td>
<td>$382,000</td>
</tr>
<tr>
<td>d. Ending reserves (including Case, Bulk + IBNR Loss &amp; LAE)</td>
<td>$5,023,000</td>
<td>$3,919,000</td>
<td>$3,710,000</td>
<td>$3,426,000</td>
<td>$3,280,000</td>
</tr>
</tbody>
</table>

The excerpt below in Table 7 includes the information on the portion of these reserves that relates to unreported claims.

**TABLE 7**

<table>
<thead>
<tr>
<th>Ending Loss and LAE Reserves for Unreported Claims Included in Part A Above</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Direct basis</td>
</tr>
<tr>
<td>2. Assumed reinsurance basis</td>
</tr>
<tr>
<td>3. Net of ceded reinsurance basis</td>
</tr>
</tbody>
</table>

From Tables 6 and 7 we see that $2.78 million out of the total $3.28 million in asbestos reserves (85%) related to unreported claims. The majority of the liability that is related to unreported claims underscores the high level of uncertainty in these liabilities.

**NOTES THAT MAY BE POTENTIALLY RELEVANT TO ACTUARIES**

In addition to the five notes described above, there are several other notes that may be potentially relevant to actuaries. Actuaries should be familiar with these notes and their significance, and they may need to review them when they are evaluating the reserves for a company (particularly if they are the opining actuary).
Summary of Significant Accounting Policies and Going Concern

This note describes the accounting rules used to produce the Annual Statement, including:

- The source of the accounting rules (typically the NAIC Accounting Practices and Procedures Manual)
- Any exceptions that were made in applying those rules and the basis for those exceptions, such as an exception that made with specific state approval
- Additional detail on the company’s significant accounting policies

Where exceptions are made to the rules in the NAIC Accounting Practices and Procedures Manual, they must be either prescribed or permitted by the domiciliary state. “Prescribed” refers to practices that are required by state law, and “permitted” refers to approval by the state regulator.

An actuary who is evaluating the reserves of a company will want to review this note to identify prescribed or permitted practices or other accounting policies that relate to loss reserves. Any unexpected deviations described in this note should be evaluated for their impact on the reserves and general financial health of the insurance company.

The following provides an excerpt of this note as provided in the 2018 Annual Statement for Fictitious:

1. SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES AND GOING CONCERN

A. Fictitious Insurance Company prepares its statutory financial statements in conformity with accounting practices prescribed or permitted by the state of Florida. The state of Florida requires that insurance companies domiciled in Florida prepare their statutory basis financial statements in accordance with the National Association of Insurance Commissioners (NAIC) Accounting Practices and Procedures Manual, subject to any deviations prescribed or permitted by the Florida Insurance Commissioner. The impact of any permitted accounting practices on policyholder surplus of the Company is not material.

As shown in this excerpt, the company prepared its statutory financial statements in conformity with the practices prescribed or permitted by the State of Florida and with the NAIC Accounting Practices and Procedures Manual, subject to deviations prescribed or permitted by the Florida Insurance Commissioner. Further, the note indicates that the impact of any permitted practices on policyholder surplus was not material.

Events Subsequent

Subsequent events are broadly defined as events that occur between the date of the financial statements (for instance, December 31) and the date that the financial statements are issued
(for instance, March 1). Within the broad category of subsequent events, there are also two specific types that should be defined:

- **Type 1 (Recognized Subsequent Events)** subsequent events provide “additional evidence with respect to conditions that existed as of the date of the Balance Sheet.” An example of this type of information would be if updated information was received on a large claim on January 15, when that claim had already been reported and known of prior to December 31, and the company deemed that insufficient IBNR was carried to cover the additional needed reserve.

- **Type 2 (Nonrecognized Subsequent Events)** subsequent events provide “evidence with respect to conditions that did not exist at the time of the Balance Sheet.” An example of a Type 2 subsequent event would be if a new large claim occurred on January 15 and was not previously known.

Type 1 subsequent events should already be reflected in the recorded amounts of the financial statements because the financial statements should reflect all information that is known up until the day that the financial statements are issued relating to the conditions that existed as of the accounting date. Disclosure is not needed unless it is “necessary to keep the financial statements from being misleading.” For example, if the booked reserves could not be adjusted in time to incorporate the revised reserve amount necessary to reflect the Type 1 event, this note would disclose the amount by which the reserves need to be adjusted. Note that changes that are made to reserves due to their normal continual review are not considered Type 1 events.

Type 2 subsequent events are not already, and should not be, reflected in the financial statement. However, they should be described in this note if they “may have a material effect on the financial condition of the company.” The guidance says “may have,” which means that even if a company has determined that the impact is not material, it should still be disclosed as long as it “may have” a material impact. Type 2 subsequent event disclosure, of course, requires use of management’s judgment.

An actuary or other user of the financial statement may consider reviewing this note to verify whether there are any material subsequent events that are not reflected in the financial statements. This is of specific importance to an actuary that is opining on a company’s loss reserves because the opining actuary will need to determine whether a subsequent event is material to the estimate of the loss reserves and whether that subsequent event should be considered.

Review of the 2018 Fictitious Notes indicates that no subsequent events were disclosed.
Intercompany Pooling Arrangements

Intercompany pooling is a common arrangement among companies in a group in which each of the participants fully cedes all of its business to the pool leader, and then each participant assumes back a specific percentage of the total.

In these situations, it is important for a regulator or any other user of the financial statements to understand the pooling arrangement to assess the solvency of the group as a whole. This note discloses the existence of the pooling arrangement and also describes the cessions and assumptions that occur. Typically, this includes identification of each company in the group, the lead company and the pooling percentages for each participant.

In cases where pooling exists, it will affect the various aspects of the Annual Statement in different ways. Some examples include the following:

- The Underwriting and Investment Exhibit will show direct business written by each company and the amounts ceded to the lead company in the pool and the portion of the pool assumed specifically by affiliates.
- Schedule F will show the cessions to the lead company as ceded reinsurance in Part 3 and the assumed business in Part 1.
- Schedule P will show only the pool member’s share of the pooled results.

The 2018 Fictitious Notes indicate that this company did not participate in any intercompany pooling.

Structured Settlements

A structured settlement refers to a situation where an insurance company settles a claim by purchasing an annuity on behalf of a claimant. This is most commonly observed on workers’ compensation or general liability claims, and the annuity is usually purchased from a life insurance company.

When the annuity is purchased (and the claimant is the payee), it is recorded as a paid loss by the original insurance company, and the claim is considered to be closed. However, if the life insurance company providing the annuity was ever to become insolvent, it is possible that the original insurer could still be liable for the remaining portion of the annuity payments.

The purpose of this note is to disclose the total amount of structured settlement payments for which an insurer could be held liable. Furthermore, if the amount of these remaining payments from a single life insurance company exceeds 1% of surplus, specific disclosure of the amount and the company from which the structured settlement was purchased is required.
This note is relevant to users of the financial statements because it describes a potential liability, or credit risk, that is not reflected on the balance sheet. The identification of life insurers that provide coverage for remaining payments exceeding 1% of surplus allows for further review of their financial condition to identify any significant issues.

Review of this note in the 2018 Fictitious Notes indicates that in total the company purchased structured settlements with a statement value of $4.3 million.

High Deductibles

High-deductible policies are commercial insurance policies that have a significant deductible, such as $250,000, giving the insured a substantial retention on each claim. Under these high-deductible policies, the insurer pays the full amount of the claim and then seeks reimbursement from the insured for the portion within the deductible. These types of policies are most commonly seen in workers’ compensation but also may be used for liability business. Similar to the situation with structured settlements, these policies can present a credit risk to the insurer that is not apparent in the financial statements. For unpaid claims, the portion of the unpaid amount within the deductible is not included within the insurance company’s booked loss reserve in the Annual Statement. The treatment for both paid and unpaid deductible losses creates a credit risk for the insurer due to the possibility that the insured will not reimburse them for the deductible portion of the loss.

This note requires disclosure of the following:

- The amount of reserve credit (i.e., the amount of case reserves established for the deductible portion of a loss) recorded by the company for unpaid claims.
- The amount of billed but not yet collected deductible reimbursements for paid claims.

To understand the potential impact of this credit risk, an actuary or other user of the financial statements who is reviewing the financial health of a company can consider the total amount of credit risk relative to the total unpaid claims and to the company’s surplus.

As noted in the Notes to Financial Statements for Fictitious, Fictitious does not issue any policies with high deductible plans.

SUMMARY

Notes to financial statements provide additional qualitative and quantitative disclosure to support the numerical information provided in the statutory financial statements. The Notes provide additional detail to assist the user of the financial statement in understanding the numerical exhibits and provide a source of publicly available information on off-balance sheet items.
CHAPTER 11. GENERAL INTERROGATORIES

In the previous chapter we discussed the Notes to Financial Statements. These notes provide additional information at the end of the financial statements in the interest of full disclosure of a company’s financial condition. The notes address accounting policy and provide explanatory data and supplemental information to the financial statements. They assist the reader in interpreting some of the more complex items within a company’s financial statements by expanding upon and adding clarity to specific items contained in the balance sheet and income statement. In contrast, the General Interrogatories are a series of questions within the statutory Annual Statement to which the insurance company is required to respond. The questions are divided into two parts:

- Part 1, Common Interrogatories, provides general questions applicable to life, health and property/casualty insurers.
- Part 2 provides questions that are specific to the type of insurance company (e.g., life, health or property/casualty). In the Property/Casualty Annual Statement, this section is Property & Casualty Interrogatories.

Similar to the Notes to Financial Statements, the responses provided in the General Interrogatories provide additional clarity to the reader of the Annual Statement but also serve to identify additional areas that warrant closer review by regulatory officials.

COMMON INTERROGATORIES

Part 1 contains the following subheadings: General, Board of Directors, Financial, Investment and Other. The purpose of each section is to give the reader an understanding of the company’s operations, business practices, and the types of internal and external controls in place.

General

The General subsection asks questions pertaining to the following topics:

- Holding company relationships
- Latest regulatory financial examinations
- Excessive sales commission levels
- Merger activity
- Suspension of licenses
- Foreign control
- Exemptions from required regulations
- Whether senior management is subject to a code of ethics
Answers to these questions provide the reader with additional information about the company and its discipline in following the “rules.” For example, if a company has suspended licenses or does not comply with recommendations from the latest financial examinations, there may be a lack of internal discipline, and this company would therefore be looked at with further scrutiny by external parties. Likewise, further inquiry may be appropriate if a company reports excessive commission levels, as this might be a sign that the company is conceding on commission to maintain business or achieve growth.

The General subsection also provides the name and address of the independent certified public accountant (CPA) or accounting firm (the auditor) conducting the annual audit and the appointed actuary.

While important to peruse all the interrogatories, knowledge of the auditor, appointed actuary and latest financial exam(s) are of particular relevance to the property/casualty actuary.

Audit firm: The CPA opines as to whether the insurance company’s financial statements are free of material misstatement and prepared in accordance with the accounting principles used. The audit firm is responsible for reconciling figures contained in a company's financial statements to detailed underlying balances and confirming amounts due to or from third parties.

It is important for the actuary to be aware of any misstatements in the financial statements or errors in the underlying data relied upon. Further, in accordance with National Association of Insurance Commissioners (NAIC) data testing requirements, a company’s independent accountant and appointed actuary are required to communicate so the accountant can determine which data relied upon by the actuary should be subject to audit testing procedures.

Actuary: The name, address and affiliation of the appointed actuary are provided in the General Interrogatories. The appointed actuary is the actuary explicitly appointed by the insurance company's board of directors, or equivalent body, to opine on the loss and loss adjustment expense (LAE) reserves reported in the company's Annual Statement. It is important for the user of the Annual Statement to know who the appointed actuary is; questions pertaining to the Statement of Actuarial Opinion should be addressed to the appointed actuary.

Latest financial examination: The General Interrogatories also provide information regarding the latest financial examination performed by state regulatory officials. The interrogatories include:

- The date of the latest financial exam

---

The date through which financial statements were evaluated
The release date of the examiner’s report
The name of the department performing the exam
Whether the insurance company has complied with all adjustments and recommendations from the examination report

Regulatory examination reports are generally available to the public through the state insurance department in which the exam was performed. The examination report will provide the state’s findings with respect to the adequacy of the company’s loss and LAE reserves.

Board of Directors

The Board of Directors subsection of the Common Interrogatories focuses on the board’s role in overseeing the company’s operations. In particular, it includes questions regarding the board’s approval of the purchase or sale of investments and whether the company has a process in place to notify the board of conflicts of interest within the company’s senior management. The company is also asked whether permanent records of board proceedings are retained; this enables tracking and monitoring of the board’s oversight role.

Financial

While it is generally assumed that the Annual Statement is prepared in conformity with Statutory Accounting Principles (SAP), the first question within the Financial subsection asks if the statement was prepared using another basis (e.g., Generally Accepted Accounting Principles). The basis of accounting is important for users of the statement and should probably be read first when opening an Annual Statement. If it is assumed that the Annual Statement is prepared in conformity with SAP, but it is prepared using a different accounting basis, then the user may misinterpret individual figures and ultimately a company’s financial position.

The questions within the remainder of the Financial subsection pertain to loans made to senior leadership and other stakeholders of the company, assets that the company was obliged to transfer to another party that were not reported as a liability in the statement, assessments other than those to a guaranty fund or guaranty association, and amounts due from affiliates. The purpose is to understand if the company has financial obligations that have not previously been reported in the Annual Statement and/or if the company is providing financial support or a lifeline to stakeholders or affiliates.

Investment

The Investment subsection has the most questions within the General Interrogatories (more than 30). They cover control over assets and investment decisions, security lending programs and associated collateral, hedging programs, mandatorily convertible preferred stocks or
bonds, and compliance with the Purposes and Procedures Manual of the NAIC Securities Valuation Office, among other topics. Here again, the questions pertain to the level of control the company has over its operations and compliance with the rules.

Other

The Other subsection captures information about payments made to trade associations, service organizations, statistical or rating bureaus, attorneys or others in connection with legislative or regulatory matters. Examples of such organizations include the Insurance Services Office and A.M. Best Company. The company is required to list the names of organizations where payment exceeded 25% of the subtotal so that the reader can get an idea of the amount of influence or reliance that the company has on a particular organization, bureau or legislative matter.

PROPERTY & CASUALTY INTERROGATORIES

Part 2 of the General Interrogatories is specific to property/casualty insurers and provides more details about the company’s exposures that are not readily determinable based on the quantitative information contained in the schedules and exhibits within the Annual Statement. Many of these questions focus on specific exposures that are not generally dealt with by the property/casualty actuary on a daily basis, such as those pertaining to Medicare supplement insurance, health lines of business or health savings accounts. However, other questions are of major interest to actuaries. For example, certain questions center on the company’s exposure to catastrophic events and excessive loss, the process by which probable maximum loss is determined and the level of reinsurance protection afforded to protect the company’s net results against catastrophic losses. These questions (requests) include the following:

- “What provision has this reporting entity made to protect itself from an excessive loss in the event of a catastrophe under a workers’ compensation contract issued without limit of loss?” 26
- “Describe the method used to estimate this reporting entity’s probable maximum insurance loss, and identify the type of insured exposures comprising that probable maximum loss, the locations of concentrations of those exposures and the external sources (such as consulting firms or computer software models), if any, used in the estimation process.” 27
- “What provision has this reporting entity made (such as a catastrophic reinsurance program) to protect itself from an excessive loss arising from the types and

---

27 Ibid., General Interrogatory 6.2 (Part 2 Property & Casualty Interrogatories).
concentrations of insured exposures comprising its probable maximum property insurance loss?” 28
• “Does the reporting entity carry catastrophe reinsurance protection for at least one reinstatement, in an amount sufficient to cover its estimated probable maximum loss attributable to a single loss event or occurrence?” 29
• “If no, describe any arrangements or mechanisms employed by the reporting entity to supplement its catastrophe reinsurance program or to hedge its exposure to unreinsured catastrophic loss.” 30

Although the General Interrogatories are not included for Fictitious Insurance Company, the aforementioned questions would be of particular interest to users of Fictitious’ Annual Statement in light of the company’s catastrophic loss experience in 2018. Review of answers to the above questions in conjunction with the information provided in Schedules F and P about Fictitious’ reinsurers and ceded loss ratios would assist the user in evaluating the adequacy of Fictitious’ reinsurance protection relative to its catastrophe exposures. Other questions within the Property & Casualty Interrogatories that are of interest include those pertaining to the use of finite reinsurance. Finite reinsurance was a hot topic in the property/casualty insurance industry in 2005 when several large insurance companies were fined by the Securities and Exchange Commission for accounting for finite reinsurance deals in a way to bolster their financial position.

In its simplest form, finite reinsurance does not transfer underwriting risk; rather it is a play on interest. Assume an insurance company knows it will have to pay a fixed amount in losses, say $10 million, in two years. Under a finite reinsurance deal, the insurance company could take the present value of $10 million and give it to a reinsurance company as “premium,” in exchange for an agreement that the reinsurer pay the $10 million in losses two years from now. The amount the reinsurer will have to pay is fixed ($10 million), and the time the reinsurer will have to pay the losses is fixed (two years); there is no underwriting or timing risk involved in the transaction.

Using a simplified example, assuming a 5% rate of interest, if the insurance company were to account for this contract as reinsurance, its balance sheet would show a reduction of approximately $9 million in cash for premium paid (the present value of $10 million at 5% interest per year for two years) in return for a corresponding reduction of $10 million in loss reserves, resulting in a net increase to surplus of approximately $1 million. However, since there is no underwriting or timing risk, this is more akin to a deposit, such as one with a bank, and this is how such contracts must be accounted for. There is no surplus relief as a result of this contract; the insurer still has to pay $10 million in two years.

28 Ibid., General Interrogatory 6.3 (Part 2 Property & Casualty Interrogatories).
29 Ibid., General Interrogatory 6.4 (Part 2 Property & Casualty Interrogatories).
30 Ibid., General Interrogatory 6.5 (Part 2 Property & Casualty Interrogatories).
Several high-profile insurance companies engaged in finite reinsurance arrangements in the early 2000s to boost their financial results through improper accounting. This behavior prompted the NAIC to adopt additional disclosure requirements, including an expansion of the Property & Casualty Interrogatories. One such interrogatory requires insurers to answer affirmatively if they ceded reinsurance that:

1. Resulted in underwriting gain (or loss) of more than 5% of prior year surplus or ceded premiums or loss and LAE reserves of more than 5% of surplus.
2. Was accounted for as reinsurance rather than as a deposit.
3. Had one or more of the following features (“or other features that would have similar results”):
   a. Duration of at least two years and is non-cancelable during the term.
   b. Limited cancellation provisions such that the ceding company is required to enter into a new contract with the same reinsurer or its affiliate.
   c. Aggregate stop loss coverage.
   d. The right by either party to commute, unless triggered by a downgrade in the credit rating of the other party.
   e. The ability to report or pay losses less frequently than quarterly.
   f. Delayed timing of reimbursement to the ceding company.

A following interrogatory requires insurers to answer affirmatively if they have entered any ceded reinsurance contracts where ceded premium is 50% or more than the insurer’s gross written premium, or 25% or more of the ceded written premium is retroceded to the insurer. Reinsurance ceded to entities other than captives under the insurer’s control or approved pooling arrangements is excluded from this interrogatory.

If either interrogatory is answered affirmatively by the insurance company, the insurer is required to file the Reinsurance Summary Supplemental Filing to the Annual Statement. This filing is due on March 1. Within this filing the insurer is required to disclose:

1. The financial impact on the balance sheet and statement of income if such contracts were excluded (i.e., the restatement of assets, liabilities, surplus and net income gross of the reinsurance contract(s)).
2. A summary of the applicable terms of the contract(s) that triggered the affirmative response.
3. The reasons management entered into the contract, including the expected financial gain.

---

33 Ibid., General Interrogatory 9.2 (Part 2 Property & Casualty Interrogatories).
34 2018 NAIC Annual Statement Instructions Property/Casualty, page 440.
The intent of these additional interrogatories and the supplemental filing is to identify those contracts that may be accounted for improperly and therefore warrant further review by regulatory officials. Knowledge of such contracts is relevant to the actuary as the accounting treatment may impact the actuary’s evaluation of unpaid claims. If a ceded contract is accounted for as reinsurance, it will serve to reduce the unpaid claim liabilities; if accounted for as a deposit, it will not.

Examples of other items addressed within the Property & Casualty Interrogatories that tend to be a focus of the actuary include:

- Whether there are specific limiting provisions within reinsurance contracts, guaranteed policies and retrospectively rated policies, as these features may affect the actuary’s evaluation of unpaid claims.\(^{35}\)
- Any releases of liability under reinsured policies, such that the company could reassume liability and potentially have its surplus position weakened as a result.\(^{36}\)
- Exposure to warranty business, whereby the adequacy of the unearned premium reserve would be the focus of attention as the contract terms, and therefore exposure, tends to continue beyond 12 months.\(^{37}\)

\(^{35}\) 2018 Property/Casualty Annual Statement, General Interrogatory 7.1 (Part 2 Property & Casualty Interrogatories).

CHAPTER 12. FIVE-YEAR HISTORICAL DATA EXHIBIT

OVERVIEW

Most other exhibits and schedules within the Annual Statement provide only one or two years of financial data for a company. The Five-Year Historical Data exhibit is valuable because it provides a summarization of key financial figures and statistics from historical Annual Statements going back five years: the current and prior four. Key line items from the balance sheet and income statement are included. Also included are operating ratios and ratios showing one- and two-year development in loss reserves relative to policyholders’ surplus. This compilation facilitates the identification of trends when evaluating the health of a property/casualty insurance company.

Following is a brief overview of content that actuaries tend to focus on within this exhibit, with illustrations using data from Fictitious’ 2018 Annual Statement where deemed relevant.

WRITTEN PREMIUM

The first page of the Five-Year Historical Data exhibit begins with the insurance company’s revenue. For an insurance company, revenue is in the form of written premium. Gross and net written premium information is provided. Gross and net amounts are summarized into the following five lines of business categories:

1. Liability
2. Property
3. Property and liability combined
4. All other
5. Non-proportional reinsurance

A sixth line contains the totals.

This information shows how the company’s premium volume, use of reinsurance and business mix have changed over time. Things to look out for when assessing the health of an insurance company include rapid growth or decline in revenue, increases or decreases in the use of reinsurance protection, and changes in business mix toward riskier or unprofitable lines. Observations such as these would prompt additional inquiry through review of other schedules, exhibits and notes within the Annual Statement and a meeting with company management. For example, if a company significantly increased its use of ceded reinsurance, we would want to understand the quality of the reinsurance. The Notes to Financial Statements and Schedule F provide additional information on the company’s reinsurers.

Total gross and net written premium figures from Fictitious’ Five-Year Historical Data exhibit are displayed in Table 8.
Fictitious experienced an approximate 5% decline in gross writings in 2016 and 2017. This could have been attributed to many things, including a decrease in concentration in a certain line of business or risk class, the continued softening of the market observed over this time period or a decrease in the amount of coverage purchased. Gross written premiums increased by 2% in 2018, which again could have been a function of the economy or insurance prices starting to rebound or both.

Over the same period, net written premium volume was relatively flat and even slightly positive. Calculation of the net-to-gross ratio shows that the company’s net retention had been growing since 2014, from 80% in 2014 to 93% in 2018. This means that the company was ceding fewer premium dollars to its reinsurers. This could have been attributed to either a decision by the company to retain more business or a softening in reinsurance prices over the period or both. Observations such as these would warrant further inquiry of company management to fully understand the cause for changes in the company’s direct, assumed and ceded business volume.

Table 9 shows the gross written premium figures by line of business segment as reported by Fictitious, below which the corresponding distribution of gross written premium by segment is shown.

For Fictitious, the lines of business flowing into the segments identified in Table 9 are as follows:

1. Liability lines: workers’ compensation, other liability and automobile liability
2. Property lines: fire and auto physical damage
3. Property and liability lines: homeowners and commercial multiple peril
4. All other lines: fidelity

Fictitious does not write any non-proportional reinsurance (line 5).

Over the five-year period ending in 2018, Fictitious’ writings declined in the liability lines (line 1) and grew in the property and liability lines (line 3). Writings in the straight property lines (line 2) remained consistent over the period.

Property lines tend to be short-tailed in nature; property claims are reported and paid relatively quickly when compared to liability claims. Shifts from liability to property lines would tend to result in a reduction in uncertainty surrounding the company’s loss and loss adjustment expense (LAE) reserves. However, shifts to the property lines increase uncertainty due to the exposure to catastrophe loss.

A similar analysis can be performed on Fictitious’ net written premium data.

---

38 Written premium by line of business is shown in Part 1B, Premiums Written, of the U&IE.
STATEMENT OF INCOME

The Five-Year Historical Data exhibit also provides summarized information from the Statement of Income that is useful in identifying components of changes in a company’s net income (e.g., whether attributed to underwriting or investments or other income). Table 10 shows this data for Fictitious.

| Increase/(decrease) year-over-year                      | (2,776,000) | 1,035,000 | (692,000) | (1,620,000) | |
| Percentage increase/(decrease) year-over-year           | -56%       | 26%       | -15%      | -26%      | |

We see that Fictitious’ net income was been positive in each of the years 2014 through 2018, with growth achieved in 2017 over 2016 after two years of decline. The $1 million (+26%) growth observed in 2017 was predominantly attributed to improvements in the financial markets and a reduction in taxes. Investment gains improved in 2017.

Despite relatively strong return on investments in 2018, Fictitious experienced a 56% decline in net income in 2018 over 2017 due to a net underwriting loss of $2 million. Given what we know about the company’s shift toward property lines over the period 2014 through 2018, and consequential increase in exposure to catastrophe losses, we can hypothesize that the underwriting loss in 2018 was due to the high frequency of catastrophe events during the year. Investigation of other statements and exhibits within Fictitious’ Annual Statement can help us validate our theory.

As discussed in Chapter 8. The Statutory Income Statement: Income and Changes to Surplus, the Statement of Income on page 4 of the Annual Statement provides the components of net underwriting gain (loss), net investment income gain (loss) and other income, and each component can be further investigated through various supporting schedules. For example, as displayed in the Statement of Income for Fictitious, the net underwriting loss of $2 million was primarily driven by an increase in losses incurred during 2018 ($17 million in 2018 versus $13 million in 2017, per line 2 of the Statement of Income).

We can drill down further by looking at the one-year development line (Development in estimated losses and loss expenses incurred prior to current year) within the five-year exhibit.
to see whether this increase was attributed to prior-year development or current-year incurred losses.

### TABLE 11

| Data from Fictitious Insurance Company 2018 Five-Year Historical Data (USD in 000s) |
|----------------------------------|------------------|------------------|------------------|------------------|
| (875) | (1,354) | (1,618) | (1,959) | (918) |

As displayed in the one-year development line, loss and defense and cost containment (DCC) development in 2018 on prior accident years was negative $875,000.\(^{39}\) This means that the company experienced favorable development in 2018 on the prior years in the aggregate. As a result, the underwriting loss in 2018 must have been due to current (2018) accident year incurrences, providing further evidence that catastrophes were the cause. A review of accident year 2018 loss and DCC experience per Schedule P can confirm this.

Turning to Schedule P, Part 2, Summary, we see that accident year 2018 incurred loss and DCC was $19 million, approximately $3 million higher than it had been in the company’s 10-year history. Later in Schedule P, the line of business detail shows that the company experienced higher incurred loss and DCC on the homeowners/farmowners line (roughly $4 million on accident year 2018 versus $2.5 million on accident year 2017). This further suggests that Fictitious, like the rest of the insurance industry, was adversely impacted by the natural catastrophes in 2018. However, Fictitious appeared to have been relatively unscathed by the 2017 catastrophes. A review of Fictitious’ mix of business by and within affected state(s) and discussions with management might help explain why Fictitious was not as impacted as the rest of the industry by catastrophes in 2017.

With respect to investment gains in 2017, a line-by-line comparison of the Exhibit of Net Investment Income within the company’s current-year and prior-year Annual Statements can provide further details on changes in the company’s investment income, as can a line-by-line comparison of changes in amounts by asset class within the Exhibit of Capital Gains (Losses). While these two exhibits are not included in the Annual Statement excerpts provided for Fictitious, a study of the changes in net investment income can be made by reviewing these exhibits for one of the (real) insurance companies on the CAS Exam 6 U.S. Syllabus.

\(^{39}\) We acknowledge that Schedule P, Part 2, Summary, provides both loss and DCC, while we are focusing on the change in incurred losses only. However, as shown in the Statement of Income, loss adjustment expenses have not changed significantly in dollar terms. We therefore feel this comparison is reasonable for illustration purposes.
Absent these exhibits for Fictitious, we expect that the growth in investment income in 2017 was most likely due to a rebound in the financial markets post crisis.

As displayed in the Five-Year Historical Data exhibit for Fictitious, the decline in taxes in 2018 is directionally consistent with what one would expect with a decline in income. We also expect the decline in taxes in 2018 to be in part attributed to the Tax Cuts and Jobs Act of 2017 ("TCJA"), which became effective beginning tax year 2018 and changed key federal tax rules. The changes most significant to property/casualty insurance carriers were related to the corporate tax rate, the loss reserve discounting rules, and the base erosion and anti-abuse tax. Further details on the impact of TCJA on property/casualty insurers are provided in Chapter 26.

However, the decrease in taxes between 2016 and 2017 by approximately $0.5 million (from $1,489,000 to $963,000) is somewhat counterintuitive. Generally, one would expect to pay more taxes the higher the income. While not included in the Annual Statement excerpts provided for Fictitious, the note in the financial statements titled “Income Taxes” (number 9 in the Notes to Financial Statements of the 2018 Annual Statement) can be helpful in explaining movements in taxes from year to year, such as that which occurred for Fictitious. This note provides details on deferred tax assets and losses and shows what taxes would have been if a straight 35% statutory tax rate was used. It also provides the reasons for differences between the total recorded income tax and taxes at the statutory rate, which might in turn explain higher or lower taxes paid in a particular year.

BALANCE SHEET

The balance sheet section of the Five-Year Historical Data exhibit contains summarized information that is useful in identifying components of changes in surplus (e.g., whether attributed to changes in assets or certain liability items) over time.

Only two major asset categories are provided: (1) total admitted assets and (2) premiums and considerations. However, the distribution of assets by class is provided further along in the exhibit (percentage distribution of cash, cash equivalents and invested assets). For trend analysis, the distribution of assets by class is more useful than the actual dollar amounts. When analyzing the health of a property/casualty insurer, things to look out for include large holdings in risky asset classes or changes in mix to riskier classes. However, the user would also look to the company’s use of hedging vehicles to mitigate increased holdings in riskier investments, such as derivative instruments (see Chapter 8. The Statutory Income Statement: Income and Changes to Surplus).

The remaining lines within the balance sheet section of the exhibit are summarized items from the Liabilities, Surplus and Other Funds page. Of most relevance to the property/casualty actuary is the level of loss and LAE reserves, unearned premiums, and surplus relative to the actuary’s knowledge of the underlying business and the changes therein.
A review of Fictitious’ data shows no significant changes in these items other than a dip in surplus in 2015 (6% decrease from 2014) and 2017 (12% decrease from 2016). The capital and surplus account within the Statement of Income shows that the large decrease in 2017 was attributed to sizeable dividends paid to stockholders during the year (approximately $10 million). This can also be seen in the Capital and Surplus Account section of the Five-Year Historical Data exhibit. This section provides two sources of the change in surplus: that due to unrealized capital gains (losses) and that resulting from dividends paid by the company to its stockholders.

RISK-BASED CAPITAL

We will discuss Risk-Based Capital (RBC) in detail in Chapter 19, Risk-Based Capital. It is a solvency framework developed by the National Association of Insurance Commissioners from which an amount of regulatory capital is determined formulaically based on the application of specified factors to an insurance company’s recorded admitted assets and liabilities as of year-end. The calculated amount of regulatory capital, or RBC, is compared to the total adjusted capital recorded by the insurance company at year-end to determine the level, if any, of company or regulatory action required from a solvency perspective.

The components of the RBC ratio are provided in the Five-Year Historical Data exhibit but not the RBC ratios themselves. However, the user can calculate the RBC ratios from the information provided in the Five-Year Historical Data exhibit. Table 12 provides the figures shown in lines 28 and 29 of Fictitious Insurance Company’s 2018 Five-Year Historical Data, below which we show the RBC ratios that we calculated from lines 28 and 29.

</tr>
</tbody>
</table>

Table 98 of this publication provides the various levels of company and/or regulatory action in response to a company’s calculated RBC ratios. For Fictitious, the percentage of adjusted capital to authorized control level (ACL) RBC ranged between 518% to 611% over the five-year period 2014 through 2018, which is 2.6 to 3.1 times the first level requiring action (company action level, which is equal to 200% of ACL). This means that Fictitious’ capital in 2018 could have been reduced by $20 million before any action was required under the RBC.
requirements. This was computed by taking the total capital in line 28 and subtracting from it the upper bound of the range of the first action level of RBC requirements (i.e., 200%).

In establishing a materiality standard for Statement of Actuarial Opinion purposes, some actuaries look at the impact on surplus from a change in RBC levels. In these circumstances, an increase in reserves by an amount that would cause the company (or regulator) to take action under RBC is thought to be material. This is discussed further in Chapter 16, *Statement of Actuarial Opinion*.

**OPERATING PERCENTAGES**

Operating percentages provide the distribution of earned premium into its components of loss, LAE, other underwriting expenses and the profit (loss) from underwriting (net underwriting gain (loss)) that remains. For Fictitious, the ratios were reasonably consistent over the five-year period with the exception of 2018. The high loss ratio in 2018 relative to prior years highlights the spike in losses in 2018 and resulting loss from underwriting.

Spikes or changes in other underwriting expenses directly impact profitability and would be investigated further as to whether such costs were necessary and/or indicative of costs to be incurred by the company in the future.

**ONE- AND TWO-YEAR LOSS DEVELOPMENT**

Actuaries, in particular those that work in the reserving area, pay considerable attention to the last four lines of the Five-Year Historical Data exhibit (lines 73 through 76 of 2018 Five-Year Historical Data exhibit), as this information shows how the company’s prior-year loss and DCC reserves have developed over one- and two-year time horizons.

We already presented the one-year development line (line 73) when interpreting the cause of the underwriting loss incurred by the company in 2018. The subsequent line (line 74) shows the relationship of one-year loss and DCC development to the company’s surplus as recorded in the prior year’s balance sheet. The purpose is to show the impact of adverse or favorable reserve development on policyholders’ surplus. That is, it shows the percentage of surplus that would have been absorbed (enhanced) as a result of adverse (favorable) loss development.

In a perfect world, development would be nil. However, loss reserves represent estimates made by a company’s management based on information available as of a certain point in time. It is expected that actual loss emergence will differ from expected, and company management will revise its estimates each year as additional information becomes available. As a result, it’s not often that $0 is observed in the one-year (or two-year) development line.

---

40 $19.920 million = $31.024 million - (2 * $5.552 million).
The issue here is not that a company experiences development in its loss reserves, but rather how big the development is and its significance to surplus.

Stakeholders tend to be concerned when large positive numbers are shown in the development lines as this means that the prior-year reserves were deficient. The question is whether the increase is attributed to an anomaly or if it is symptomatic of a trend of under-reserving. Further investigation could be made within the Annual Statement by reading the Notes to Financial Statements, specifically the note on changes in incurred loss and LAE, and looking at Schedule P, Part 2, which may show that the adverse development is coming from a particular year or line of business. Oftentimes, such development is also discussed in public reports by and on behalf of the company (e.g., Form 10-K for public companies or the AMB Credit Report for the company published by A.M. Best). However, nothing supplants discussion with company management.

Table 13 provides both the one-year development line and the relationship of one-year development to prior-year surplus (line 74) for Fictitious.

<table>

</tr>
</tbody>
</table>

During 2018, Fictitious’ booked net ultimate loss and DCC reserve estimates on accident years 2017 and prior developed favorably by $0.9 million (line 73). This means that, with the benefit of one year’s hindsight, the net loss and DCC reserves recorded by the company as of December 31, 2017, were overstated by $0.9 million. That overstatement represented 3% of the company’s surplus as of December 31, 2017 (line 74).

Going back a year, with the benefit of one year’s hindsight, recorded net loss and DCC reserves as of December 31, 2016, were overstated by $1.4 million, or 4% of surplus.

We can continue going back and observe development in years 2014 through 2016 on prior-year reserves. For Fictitious, the result was consistent over the five-year period; recorded loss and DCC reserves (or ultimate loss and DCC estimates) developed favorably in the
following year. This implies that the company was relatively conservative in establishing its reserve estimates.

While stakeholders and regulators of insurance companies tend to be more concerned when development is adverse, large favorable development also raises an issue with certain parties. For example, the Internal Revenue Service pays close attention to favorable emergence as overstatements in reserves reduce the amount of taxable income. Additionally, investors would be concerned that the company is accumulating funds that could be better invested elsewhere, thereby suppressing the investor’s rate of return.

The two-year development lines show similar information as contained in the one-year lines, with the exception that development over a two-year period is provided. For example, Fictitious’ recorded net loss and DCC reserves as of year-end 2016 developed favorably by $2.6 million in 2017 and 2018. This represents 7.3% of surplus recorded at the end of 2016.

<td>(7.3)</td>
</tr>
</tbody>
</table>

This information enables the actuary to see whether the development tends to be isolated to the first year of development or continues to the next. In Fictitious’ case, the favorable development continued through year two. For example, one-year development on year-end 2016 reserves developed by $1.4 million in 2017 (line 73) and then another $1.2 million in 2018 (per line 75, computed by taking $2.6 million and subtracting the one-year development of $1.4 million).
CHAPTER 13. OVERVIEW OF SCHEDULES AND THEIR PURPOSE

OVERVIEW

Schedules A through E

The first eight schedules (Schedules A through E) of the Annual Statement provide further transparency of the company’s assets, as displayed in the balance sheet of the statutory financial statements. The purpose of these schedules is to assist stakeholders and regulators in identifying and analyzing risks inherent in those assets, changes in those assets and differences in their valuation.

The following outlines the contents of Schedules A through E:
<table>
<thead>

</tbody>
</table>

There is considerable information within each schedule, including a description of each asset, its value and the basis for valuation. We do not intend to provide all the details of each asset...
As discussed previously, most property/casualty actuaries will not need to have a deep understanding of all of the asset classes on the balance sheet. Therefore, we only provide a brief description of each schedule and show how the reader can source the items listed in the asset side of the balance sheet (page 2 of the Annual Statement) to these schedules.

While we will present each of Schedules A through E in order of presentation in the Annual Statement, keep in mind the distribution of admitted assets by class for the property/casualty industry as a whole, as was provided in Chapter 7, Statutory Balance Sheet: A Measure of Solvency. Table 16 provides a comparison of the distribution for the industry to that of Fictitious Insurance Company as of December 31, 2018.

</tbody>
</table>

Note: Contract loans are loans on contracts issued by the insurance company. They typically pertain to life insurance contracts. There is no schedule within the Annual Statement that pertains to or provides additional disclosure about contract loans.

The assets detailed in Schedules A through C and E make up a relatively small portion of the total admitted assets of the property/casualty insurance industry at year-end 2018 (less than 15%). This relationship has remained relatively consistent over the years. Property/casualty insurers tend to invest in relatively short-term, fixed assets of low risk given their need to be able to pay claims emanating from short-term contracts (as opposed to long-term life insurance contracts). As a result, the largest holding of a property/casualty insurer tends to

---

41 The distribution of assets by class within this table is based on admitted assets. Schedules A through E provide supporting detail for total assets, including amounts that become nonadmitted in column 2 of the asset side of the statutory balance sheet.
be in bonds, followed by common stocks. Therefore, Schedule D tends to be the most populated of the asset schedules within the Annual Statement.

In assessing the financial health of an insurance company, it is important to understand differences in the distribution of assets by class relative to the industry. In particular, large concentrations in riskier asset classes would warrant additional scrutiny. The information contained in Schedules A through E and in the notes and interrogatories within the Annual Statement will provide some level of quantitative and qualitative detail to aid in the assessment. However, enhanced understanding will come through inquiries of management as to its investment policy, including any hedging strategies that have been implemented to mitigate investments in higher-risk asset classes.

Schedules F and P

Property/casualty actuaries tend to spend more time focusing on page 3 (Liabilities) of the balance sheet than on page 2 (Assets). Therefore, of all the schedules within the Annual Statement, property/casualty actuaries tend to spend the most time with Schedules F and P, in particular Schedule P. Schedule F pertains to reinsurance accounting, and Schedule P pertains to loss and loss adjustment expense reserves. We will devote much of our attention to these Annual Statement schedules in separate chapters for each (Chapter 14. Schedule F and Chapter 15. Schedule P).

Schedules T and Y

The remaining two schedules, Schedule T and Schedule Y, will be discussed at the end of this chapter. These schedules provide details on the insurance company’s premium writings by state and organizational structure, respectively.

SCHEDULE A

Schedule A provides information on real estate directly owned by the insurance company. Schedule A, Part 1 provides a detailed listing of all real estate owned by the company as of December 31 of the current year, while Parts 2 and 3 provide a detailed listing of real estate acquired and disposed during the year, respectively.

Schedule A, Part 1, column 9, Book/Adjusted Carrying Value Less Encumbrances, is the source of the information provided in line 4 of the asset side of the balance sheet. Amounts are provided for each property that the reporting entity owns, grouped in the same three parts as shown in line 4 of page 2:

- 4.1 Properties occupied by the company
- 4.2 Properties held for the production of income
- 4.3 Properties held for sale
All figures are shown less the amount of any encumbrances, which include items such as a lien on the company’s property or outstanding principal balance of a mortgaged property.

Consistent with the rest of the property/casualty insurance industry (1%), real estate was a small asset class for Fictitious in 2018, representing less than 4% of its total assets. Although small, actuaries will look at the level of an insurance company’s investment in long-term assets and associated cash flows relative to the cash outflows of its liabilities. For example, a property/casualty insurer writing short-tailed lines of business (e.g., homeowners) will require relatively liquid and continual flows from its assets to pay its claims. A large proportion of this company’s assets in real estate holdings, or other longer-term assets that do not have constant outflows, might raise questions about liquidity of the company’s assets. This is particularly true during unstable economic times when the real estate market is at a low and the seller may not be able to dispose of the investment let alone get the expected value.

Schedule A, Part 3 shows what the reporting entity was able to sell real estate investments for over the past year, relative to the value of the investment as shown in the entity’s prior-year statement.

SCHEDULE B

Schedule B provides information on mortgage loans owned by the insurance company that are secured by real estate. These are instances where the insurance company has issued a mortgage loan to another party.

Schedule B is organized in the same three parts as Schedule A. Part 1 provides a detailed listing of all mortgage loans owned by the company as of December 31 of the current year, while Parts 2 and 3 provide a detailed listing of mortgage loans acquired and disposed during the year, respectively. Part 3 includes mortgage loans transferred or repaid during the year.

Part 1 is the source of the information provided in line 3 of the asset side of the balance sheet. Line 3 of the asset side of the balance sheet is broken up into two parts:

3.1 First liens
3.2 Other than first liens

The source of the figures provided in line 3 is column 8, book value/recorded investment excluding accrued interest, of Schedule B, Part 1. The figures in column 8 reconcile to the amounts in lines 3.1 and 3.2 on the asset side of the balance sheet. However, it is not evident from Schedule B as to which loans are first liens.

Part 1 provides a detailed listing of mortgage loans owned by the company in the following groupings:

- Mortgages in good standing, which are those loans where the terms are being met by borrowers.
Restructured mortgages, which are those loans where the terms have been restructured in 1986 or subsequent due to delinquency.
Mortgages with interest more than 90 days due and not in the process of foreclosure.
Mortgages in the process of foreclosure.

Issuing mortgages is not a core business strategy of a property/casualty insurance company. Further, mortgage loans are relatively illiquid assets. Therefore, insurers don’t have large holdings in Schedule B assets. However, for those insurance companies that do invest in mortgage loans, the groupings provided in Schedule B provide the reader with a sense of the risk associated with the company’s mortgage loan investments. For example, investments in mortgages in the process of foreclosure are riskier than those in good standing.

Only 0.2% of Fictitious’ assets were invested in mortgage loans on real estate as of December 31, 2018, as compared to 0.3% for the industry.

SCHEDULE BA

Schedule BA provides information on other long-term invested assets owned by the insurance company. These are assets not included in any of the other invested asset schedules, such as real estate that is not owned directly by the insurance company and therefore excluded from Schedule A. Other examples of BA assets include investments in joint ventures, partnership interests and surplus debentures.

Schedule BA, Part 1 provides a detailed listing of other long-term invested assets owned by the company as of December 31 of the current year, while Parts 2 and 3 provide a detailed listing of other long-term invested assets acquired and disposed during the year, respectively. Part 3 includes other long-term invested assets transferred or repaid during the year.

The total in column 12, book/adjusted carrying value less encumbrances, of Schedule BA, Part 1, is the source of the figure provided in line 8 of the asset side of the balance sheet.

As with real estate investments, actuaries will look at the level of cash flows from a company’s long-term invested assets relative to the duration of its liabilities for liquidity purposes.

As displayed in Table 17, Fictitious had only 5% of its assets invested in Schedule BA assets at year-end 2018. Schedule BA assets are included within the other investments line. Other investments also include receivables for securities, securities lending reinvested collateral assets and aggregate write-ins for invested assets.

SCHEDULE D

Schedule D provides information on bonds and stocks owned by the insurance company. It is broken into six parts, 1 through 6. The amounts shown on the assets side of the balance sheet for bonds and stocks comes from the book/adjusted carrying value column, within Schedule D, Parts 1 and 2.

Part 1

Part 1 provides a detailed listing of the long-term bonds and certificates of deposit (CDs) owned by the insurance company as of December 31 of the current year. The term “long-term” is intended to exclude bonds and CDs with maturity or repurchase dates one year or less from the date acquired and cash equivalents with maturities of three months or less. Bonds that are not long term are reported in other schedules. Bonds with maturities of one year or less are reported in Schedule DA. CDs with maturities of one year or less are reported in Schedule E, Part 1. Cash equivalents are reported in Schedule E, Part 2. Schedules DA and E are discussed in subsequent sections of this chapter.

The source of the balance sheet figure for bonds is the total in column 11 (Book/Adjusted Carrying Value) of Schedule D, Part 1.

In Part 1, bonds are separated into the following categories:

- U.S. governments
- All other governments
- U.S. states, territories and possessions (direct and guaranteed)
- U.S. political subdivisions of states, territories and possessions (direct and guaranteed)
- U.S. special revenue and special assessment obligations and all non-guaranteed obligations of agencies and authorities of governments and their political subdivisions
- Industrial and miscellaneous (unaffiliated)
- Hybrid securities
- Parent, subsidiaries and affiliates
Within each of the aforementioned categories, there are issuer obligations, residential mortgage-backed securities (MBS), commercial MBS, and other loan-back and structured securities, with subtotals for each.

In addition to book/adjusted carrying value, the columns within Part 1 enable the user to obtain an understanding of fluctuations in value over the past year and time to maturity of each bond. As noted, users of the Annual Statement consider time to maturity, and therefore liquidity, relative to liability duration.

Part 2 provides a detailed listing of the stocks owned by the insurance company as of December 31 of the current year. Preferred stocks are in Section 1 of Schedule D, Part 2, and Common stocks are in Section 2.

Schedule D, Part 2 is the source of the information provided within line 2 of the asset side of the balance sheet titled “Stocks (Schedule D).”

The source of the balance sheet figure for preferred stocks is the total in column 8, Book/Adjusted Carrying Value, of Schedule D, Part 2, Section 1, whereas the source for common stocks is the total in column 6, Book/Adjusted Carrying Value, of Schedule D, Part 2, Section 2.

In Part 2, Section 1 of Schedule D, preferred stocks are separated into the following categories:

- Industrial and miscellaneous (unaffiliated)
- Parent, subsidiaries and affiliates

Part 2, Section 2 has the additional categories for common stocks of:

- Mutual funds
- Money market mutual funds

Parts 3 through 6

Part 3 provides a detailed listing of long-term bonds and stocks acquired during the current year and still owned by the company as of December 31 of the current year. Those acquired and disposed of during the current year are only provided in subtotal in Part 3, with the details reported in Part 5.

Part 4 provides a detailed listing of long-term bonds and stocks that were owned as of the beginning of the current year and disposed of during the year through sale, redemption or
other means. Those acquired and sold during the current year are provided in detail in Part 5, with only subtotals in Part 4.

Part 6 provides a detailed listing of preferred and common stocks in affiliated companies. This is particularly relevant in the calculation of the $R_0$ charge in the RBC calculation, as we will see in Chapter 19. Risk-Based Capital.

SCHEDULE DA

Schedule DA provides information on short-term investments owned by the insurance company. According to the 2018 National Association of Insurance Commissioners (NAIC) Annual Statement Instructions Property/Casualty, this schedule is to “include all investments whose maturities (or repurchase dates under repurchase agreement) at the time of acquisition were one year or less except those defined as cash or cash equivalents in accordance with Statement of Statutory Accounting Principles No. 2R, Cash, Cash Equivalents, Drafts, and Short-term Investments.”

Schedule DA, Part 1 provides a detailed listing of short-term investments by the company as of December 31 of the current year. This is the source of the information provided within line 5 of the asset side of the balance sheet.

Short-term investments can include the following asset classes:

- Bonds
- Mortgage loans and other short-term invested assets for parent, subsidiaries and affiliates
- Mortgage loans
- Exempt money market mutual funds
- Class one money market mutual funds
- Other short-term invested assets

Fictitious had less than 1% of its assets invested in short-term investments in 2018.

SCHEDULE DB

Schedule DB provides information on derivative instruments owned by the insurance company. It is broken into four parts, A through D. Part A provides the company’s positions in options, caps, floors, collars, swaps and forwards. Part B provides the company’s positions in futures contracts. Part C provides the company’s positions in replication (synthetic asset) transactions. And in Part D, the company reports counterparty exposure for derivative

---

42 2018 NAIC Annual Statement Instructions Property/Casualty, page 367.
instruments open December 31 of the current year. Counterparty exposure is the exposure to credit risk.

Parts A and B are further broken into two sections. Section 1 provides open positions during the year, and Section 2 provides positions terminated during the year.

Schedule DB, Parts A and B are the source of the information provided within line 7 of the asset side of the balance sheet, Derivatives (Schedule DB).

While property/casualty insurance companies do not invest much in the derivatives market, derivatives are used to hedge the mismatch between the timing and payment of assets and liabilities. A company investing in a greater proportion of risky assets than the industry (say a higher proportion in common stocks than bonds), could be expected by its stakeholders to have a hedging strategy in place to mitigate those risks.

As displayed on line 7 of the asset side of its balance sheet, Fictitious did not use derivatives in its investment strategy in 2018.

SCHEDULE DL

Schedule DL provides information on securities lending collateral assets. Schedule DL is a fairly new schedule in the Annual Statement, added in 2010 as a result of the financial crisis in 2008.

Securities lending received a lot of publicity during the financial crisis of September 2008. Securities lending involves a company lending securities that it does not actively trade to another party for a fee. The borrower will generally sell the borrowed security, in anticipation of repurchasing it at a lower price before returning it to the lender. The difference between the sale price and repurchase price is profit to the borrower.

The borrower is required to post collateral with the lender. This collateral may in turn be invested by the lender; however, the lender needs to have the collateral available for return when the borrower decides to return the borrowed security. These arrangements tend to be for less than a year, and the borrower generally can return the security on relatively short notice. Therefore, a prudent investment strategy would call for investment of the collateral by the lender in short-term, low-risk, liquid markets. Investment in long-term, riskier securities is one of the causes of the financial crisis in 2008.

According to an article by the NAIC and The Center for Insurance Policy and Research, American International Group (AIG) was involved in securities lending whereby securities owned were loaned in exchange for fee and cash collateral. During the period 2005 through

---

44 Ibid.
2007, investments of the collateral were made in long-term subprime residential MBS, which subsequently experienced significant declines in market value. When the borrowers came back to AIG to exchange the borrowed securities for the cash collateral they had provided, AIG was experiencing liquidity constraints. The demand for cash from securities lending counterparties put further constraints on AIG, resulting in regulators and the U.S. government stepping in to help alleviate the liquidity issue and reduce strains on AIG’s capital.

While securities lending was not the main cause of the financial crisis in 2008, one of the many lessons learned was the lack of transparency in the securities lending market. Schedule DL was created to provide further transparency by providing detailed information on the collateral assets that are reinvested by the insurance company, including the fair value and book value and the date the agreements mature. As the length of the agreement term increases, so does the risk to the insurance company. If borrowers in the company’s securities lending program were to return the borrowed securities and request their collateral back with short notice, the company may have difficulty meeting the cash (collateral) demand.\(^{45}\)

Schedule DL, Part 1 contains those collateral assets that are not included in other investment schedules within the Annual Statement (e.g., Schedule A, B, BA, D, DA and E). Part 2 contains those that are reported in the other asset schedules. Therefore, Part 1 is the source of the information provided in line 10 of the asset side of the balance sheet.

The total in column 6, Book/Adjusted Carrying Value, of Schedule DL, Part 1, is the source of line 10 of the asset side of the balance sheet.

As displayed in Table 18, Fictitious had an immaterial securities lending program relative to total assets and policyholders’ surplus at year-end 2018. As a result, sudden demand to return collateral to a borrower would not have had a significant impact on Fictitious’ balance sheet.

#### Table 18

\(^{45}\) Regulators became aware of this strategy as a result of the financial examination process, which occurs only once every three to five years.
SCHEDULE E

Schedule E provides information on the insurance company’s cash and cash equivalents.

Schedule E, Part 1 provides:

- A detailed listing of cash on deposit with banks, trust companies, and savings and loan and building and loan associations
- Totals for cash held in the company’s offices
- CDs maturing one year or less (long-term CDs are reporting in Schedule D)

Part 2 provides a detailed listing of investments in what are referred to as cash equivalents and are therefore maturing within three months or less.

Part 3 provides a detailed listing of special deposits, which include assets reported in the various asset schedules within the Annual Statement but are segregated for a special purpose, such as bail bonds, workers’ compensation, property and casualty insurance, collateral and escrow.

Column 6, Balance, of Schedule E, Part 1, is the source of the cash amount included in line 5 of the asset side of the balance sheet. Column 6, book/adjusted carrying value of Schedule E, Part 2, is the source of the amount of cash equivalents, which are also included in line 5.

Table 19 shows that Fictitious had less than 1% of its assets in cash and cash equivalents at year-end 2018.

<tr>
<td>Percentage of total assets (Row 5 / Row 28)</td>
</tr>
</tbody>
</table>

SCHEDULE T

Schedule T has two parts:

1. Exhibit of Premiums Written
2. Interstate Compact — Exhibit of Premiums Written
Each part is arranged showing its content by U.S. state (50); the District of Columbia; five U.S. territories (American Samoa, Guam, Puerto Rico, U.S. Virgin Islands and Northern Mariana Islands); Canada; and a line for aggregate other alien territories.46

The following provides a general description of the content of each part and their use(s).

Exhibit of Premiums Written

The purpose of this schedule is to apportion premiums, losses and other items amongst the states or territories in which the company writes business.

The first column shows the “active status” of the company for each state/territory. Active status is denoted by:

- L: Licensed insurance carrier or domiciled Risk Retention Group (RRG)
- R: Registered — non-domiciled RRGs
- Q: Qualified or accredited reinsurer
- E: Eligible — reporting entities eligible or approved to write surplus lines in the state
- N: None of the above — not allowed to write business in the state

The total line of this column shows the number of states/territories that the company is licensed in.

Direct losses, premiums and other information are required to be allocated by state/territory regardless of the active status reported. The information requested includes:

- Written premiums
- Earned premiums
- Policyholder dividends
- Paid losses
- Incurred Losses
- Unpaid losses
- Finance and service charges
- Direct premiums written for federal purchasing groups

The complicated part of completing this schedule is figuring out how to allocate the foregoing items by state/territory. The NAIC Annual Statement Instructions Property/Casualty looks for the premiums to be reported “based on the physical location of the insured risk (except

46 According to the glossary in the textbook Property-Casualty Insurance Accounting issued by Insurance Accounting & Systems Association, Inc., Eighth Edition (2003), First Addendum (2006), an alien insurance company is defined as “An insurer or reinsurer domiciled outside the U.S. but conducting an insurance or reinsurance business in the U.S.”
individual and group health insurance).” Losses are to be reported to the states where the associated premium is allocated.

For example, an insurer writes workers’ compensation insurance for an organization that has employees located across the country. The foregoing items need to be allocated to each state/territory based on primary workplace of each employee. Table 20 shows additional examples of the basis for allocating premiums and losses by state/territory, according to the NAIC instructions.

**TABLE 20**

<table>
<thead>
<tr>
<th>Line of Business</th>
<th>Basis for Allocation by State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property lines, such as fire, homeowners, boiler and machinery</td>
<td>Location of property</td>
</tr>
<tr>
<td>Marine coverages, where property is in transit</td>
<td>Beginning state location</td>
</tr>
<tr>
<td>Automobile lines</td>
<td>Location of principal garage of each automobile</td>
</tr>
<tr>
<td>Liability lines (other than auto) where premium determined per location</td>
<td>Location of principal office of operation</td>
</tr>
</tbody>
</table>

Companies are required to describe the basis for the allocation in the footnote of Schedule T.

Schedule T is useful to actuaries in several instances, such as the following:

- **Actuaries use this schedule to learn where the company writes its business to further research and consider the insurance laws of those states. This is particularly important for workers’ compensation insurers where estimates of unpaid claims depend on each state’s laws.**

- **Actuaries also look to this schedule over a series of historical Annual Statements to see if the company has changed geographic concentration or is growing in a particular state. In addition to regulatory differences by state, changes in geographic mix have an impact on the exposures. For example, for a company writing in California or among fault lines, consideration should be made of the company’s exposure to earthquakes.**

- **For a company where industry loss development factors are used in reserving, actuaries may look to this schedule for a distribution of losses by state to determine weights to apply to industry factors by state.**

In addition, as we shall see in **Chapter 18. Insurance Expense Exhibit**, the totals in Schedule T are used as a means of reconciling items contained in the Insurance Expense Exhibit.

---

There is another part to Schedule T that is less well-known to property/casualty actuaries: Interstate Compact — Exhibit of Premiums Written and Allocated by States and Territories. Part 2 only pertains to property/casualty insurers that also write life insurance, annuities, disability income and long-term care insurance products. The purpose of Part 2 is for regulators to monitor writings in these products for consumer protection purposes.

SCHEDULE Y

Schedule Y, Information Concerning Activities of Insurer Members of a Holding Company Group, has two parts:

1. Organizational chart
2. Summary of insurer’s transactions with any affiliates

The following provides a brief description of the content and purpose of each.

Part 1 — Organizational Chart

Part 1 is required for those companies that file a registration statement under the Insurance Holding Company System Regulatory Act of the company’s domiciliary state.48

This part provides exactly what its name says, an organizational chart. In simplest terms, it is similar to a family tree, showing a pictorial representation of where the company lies within an organization and its relationship to the other members of the organization.

We often hear the phrases “sister company,” “parent company” and “holding company,” but until you see the schematic, it can be difficult to understand where a company fits within an organization. Knowing this and the company’s purpose relative to its affiliates is important. For example, the company may have an affiliated managing general agent or other agency that produces its business, or it may have an affiliated claims administrative organization. Consideration of the affiliate’s underwriting philosophy and/or claims handling practices is significant in estimating unpaid claims and establishing reserves for the company’s liabilities, including those for adjusting expenses.

Sometimes this part is provided in list form as opposed to an actual chart due to the number of companies involved.

---

48 Ibid., page 247.
Part 1A —Detail of Insurance Holding Company System

This part must be completed by members of a holding company system. The purpose is to provide information about the relationship between the reporting entity and any parent, subsidiary(ies) and/or affiliate(s). The relationship is identified in Part 1A as either:

- Upstream direct parent (UDP)
- Upstream indirect parent (UIP)
- Downstream subsidiary (DS)
- Insurance affiliate (IA)
- Non-insurance affiliate (NIA)
- Other, which requires an explanation of the relationship in the footnotes to this part (OTH)

Additionally, the controlling entity in the relationship is provided, along with the type of control that the entity has over the other:

- Control through ownership
- Control at the board of directors level
- Control through management
- Control by acting as the attorney-in-fact
- Controlling influence
- Other

If the reporting entity is a member of a holding company system, the reporting entity must include the above items for each parent, subsidiary or affiliate of the reporting entity whose names are listed in column 8 of Schedule Y.

According to the NAIC 2018 Annual Statement Instructions Property/Casualty, which references the Insurance Holding Company System Regulatory Act, “Control shall be presumed to exist if any person, directly or indirectly, owns, controls, holds with the power to vote, or holds proxies representing, ten percent (10%) or more of the voting securities by another person.”

As we shall see in Chapter 19. Risk-Based Capital, this information is particularly useful in determining the RBC $R_0$ charge for investments in insurance affiliates.

Part 2 —Summary of Insurer’s Transactions With Any Affiliates

Schedule Y, Part 2, provides a listing of transactions among members of the holding company system where an insurance affiliate was a party to the transaction. Examples include:

---

49 Ibid., page 249.
• Shareholder dividends
• Capital infusions
• Purchases/sales of loans or real estate
• Management agreements and service contracts
• Income (disbursements) incurred under reinsurance contracts and reinsurance recoverable (only those transactions that took place during the reporting period are included)

The purpose of this part of Schedule Y is to assist regulators in monitoring monetary flows in and out of insurance company affiliates. This schedule is the same for all members of an insurance holding company system. Therefore, the totals all balance to zero, as an outflow from one company is offset by the inflow to another.
CHAPTER 14. SCHEDULE F

OVERVIEW

As noted in the previous Chapter 13, Overview of Schedules and Their Purpose, Schedule F and Schedule P are two of the Annual Statement schedules that property/casualty actuaries tend to use most. In this chapter we will focus on the content of Schedule F; Chapter 15 focuses on the content of Schedule P.

Schedule F provides details underlying an insurance company’s reinsurance transactions on prospective contracts\(^{50}\) that meet the conditions for reinsurance accounting as defined in SSAP No. 62R. It includes the names of the counterparties to the transactions and the premium, loss and expense amounts that emanate from those transactions as of December 31 of the reporting year. This information is important to actuaries for several reasons:

- Loss and loss adjustment expense (LAE) reserves recorded by an insurance company include business assumed by the company. Knowledge of the source and amount of assumed reinsurance provides valuable information to an actuary in assessing the reasonableness of the gross and net loss and LAE reserve balances. Schedule F, Part 1 provides a listing of assumed premiums and losses by ceding company.

- Loss and LAE reserves recorded on an insurance company’s statutory balance sheet are net of reinsurance. Considerable focus is placed on the collectability of that reinsurance by users of the Annual Statement, particularly regulators. In fact, the NAIC Instructions to the Statement of Actuarial Opinion require the Appointed Actuary to provide relevant comment paragraphs to address reinsurance. According to the NAIC Instructions, “Before commenting on reinsurance collectability, the actuary should solicit information from management on any actual collectability problems, review ratings given to reinsurers by a recognized rating service, and examine Schedule F for the current year for indications of regulatory action or reinsurance recoverable on paid losses over 90 days past due.”\(^{51}\)

Schedule F, Part 3 provides the name of each of the company’s reinsurers, a listing of liability amounts ceded to each reinsurer and the amount of collateral held by the insurance company in support of those liabilities. Using this information, research can be done on the financial ratings of the reinsurers to evidence the credit quality of the

\(^{50}\) According to paragraph 22 of SSAP No. 62R, Property and Casualty Reinsurance, “Prospective reinsurance is defined as reinsurance in which a reinsurer agrees to reimburse a ceding entity for losses that may be incurred as a result of future insurable events covered under contracts subject to the reinsurance.”

\(^{51}\) 2018 NAIC Annual Statement Instructions Property/Casualty, page 13.
reinsurer and assess the risk that the ceding company would not able to collect the balances due from that reinsurer.

Schedule F, Part 3 also provides the aging of ceded reinsurance. An assessment can be made of the company’s exposure to collectability issues in light of the reinsurer’s payment history and the amount of collateral the company holds in support of its reinsured balances.

• The Statement of Actuarial Opinion also requires the Appointed Actuary to comment on and disclose the amount of net reserves for the insurance company’s participation in underwriting pools and associations. Schedule F, Part 1 provides a source for this information. In fact, regulators expect there to be a reconciliation of the amount disclosed in the Statement of Actuarial Opinion to Schedule F.52

Schedule F also provides the derivation of the provision for reinsurance, which is included as a liability on the statutory balance sheet (page 3, line 16 of the 2018 Annual Statement). While Statutory Accounting Principles (SAP) requires insurance companies to record loss and LAE reserves net of reinsurance, SAP also presumes that a portion of that reinsurance is not collectible. The provision for reinsurance provides “a minimum reserve for uncollectible reinsurance with an additional reserve required if an entity’s experience indicates that a higher amount should be provided. The minimum reserve Provision for Reinsurance is recorded as a liability, and the change between years is recorded as a gain or loss directly to unassigned funds (surplus). Any reserve over the minimum amount shall be recorded on the statement of income by reversing the accounts previously utilized to establish the reinsurance recoverable.”53

This minimum reserve is computed in Schedule F, Part 3. It reflects the conservative nature of statutory accounting since the entire provision may ultimately be collected.

Schedule F - Part 3 also provides the data used in the calculation of the credit risk charge for reinsurance recoverables required by the NAIC Risk-Based Capital (RBC) formula.

Finally, Schedule F also provides a view of the reporting entity’s balance sheet on a gross of reinsurance basis. Ceded reinsurance is a valuable means for insurance companies to mitigate insurance risk. Schedule F, Part 6 enables the user to observe the amount of protection afforded to the company’s balance sheet through the use of reinsurance.

53 SSAP No. 62R, paragraph 64.
Note that retroactive reinsurance does not flow through Schedule F. Ceding companies record loss and LAE reserves gross of retroactive reinsurance and assuming companies exclude the retroactive reinsurance from loss and LAE reserves. The same is true for Schedule P; retroactive reinsurance does not flow through Schedule P.

STRUCTURAL ORGANIZATION OF SCHEDULE F

Schedule F is arranged in the following six parts:

- Part 1 Assumed Reinsurance as of December 31, Current Year ($000 Omitted)
- Part 2 Premium Portfolio Reinsurance Effected or (Canceled) during Current Year
- Part 3 Ceded Reinsurance as of December 31, Current Year ($000 Omitted)
- Part 4 Issuing or Confirming Banks for Letters of Credit from Schedule F, Part 3 ($000 Omitted)
- Part 5 Interrogatories for Schedule F, Part 3 ($000 Omitted)
- Part 6 Restatement of Balance Sheet to Identify Net Credit for Reinsurance

Parts 1 and 3 provide details underlying the reinsurance items on a company's balance sheet. One asset item and four liability items on an insurance company's balance sheet come directly from Schedule F.

The asset item is “amounts recoverable from reinsurers” (Assets, page 2, line 16.1). It includes amounts the insurance company has already paid in loss and LAE to its claimants that are recoverable from its reinsurers. The first of the liability items provide this balance from the reinsurer’s (i.e., the company in this case, as an assumed reinsurer) perspective (Liabilities, Surplus and Other Funds, page 3, line 2).

The other three liability items that come directly from Schedule F include ceded reinsurance premiums payable, net of ceding commissions, (Liabilities, Surplus and Other Funds, page 3, line 12), funds held by the company under reinsurance treaties (Liabilities, Surplus and Other Funds, page 3, line 13), and the provision for reinsurance (Liabilities, Surplus and Other Funds, page 3, line 16). In addition, the parenthetical reference to unearned premiums for ceded reinsurance in line 9 of page 3 also comes from Schedule F, Part 3 (column 13, total).

---

54 According to paragraph 22 of SSAP No. 62R, “Retroactive reinsurance is defined as reinsurance in which a reinsurer agrees to reimburse a ceding entity for liabilities incurred as a result of past insurable events covered under contracts subject to the reinsurance.” Note that there are exceptions for property/casualty run-off agreements whereby the entire risk for a line of business or segment (e.g., asbestos liabilities) is retroactively transferred by a ceding company to a reinsurer. We will not get into the specifics in this publication, but note that the accounting for this type of contract can be found in paragraphs 81-84 of SSAP No. 62R.

55 SSAP No. 62R, paragraph 29.
Schedule F, Part 3 is used to derive the provision for reinsurance. Effective with the 2018 Annual Statement, numerous individual parts used to derive the provision for reinsurance were consolidated into a single new Part 3 within Schedule F. This “eliminates duplication, promotes consistency of the reported ceded transactions, provides for greater automation, and reduces filing errors.”\(^{56}\)

The following illustrates how the amounts in the balance sheet map to those in Schedule F using the 2018 Annual Statement for Fictitious Insurance Company\(^ {57}\):

While relevant, Parts 2 and 4 through 6 tend to get less attention by actuaries. As the name suggests, Schedule F, Part 2 provides the user with a detailed listing of all portfolio reinsurance transactions entered into or canceled during the current year.

\(^ {57}\) In gaining an understanding of the interplay between the Financial Statements and various Schedules within the Annual Statement, it is important to remember that the amounts in Schedule F, Parts 1 and 3 are displayed in thousands of U.S. dollars, whereas amounts on the balance sheet, as well as in Schedule F, Part 6, are in whole dollars.
Schedule F, Part 4 provides a listing of issuing or conforming banks for letters of credit as collateral reported in Schedule F, Part 3, column 22.

Schedule F, Part 5 provides interrogatories for Schedule F, Part 3. The interrogatories include two tables with more detailed information. The first identifies the five largest commission rates included in the cedant’s reinsurance treaties for those contracts where ceded premium is in excess of $50,000\(^{58}\). The second table identifies the five largest reinsurance recoverables reported in column 15 and associated ceded premiums, as well as an indicator as to whether the reinsurer is affiliated with the reporting entity.

Schedule F, Part 6 provides a summarized form of the balance sheet with adjustments to restate it on a gross of ceded reinsurance basis. The assets are adjusted to remove any expected recoverables from the company’s reinsurer, while the liabilities are restated to remove any anticipated recoveries or payables.

Given the limited level of focus on Parts 2 and 4 through 6 by property/casualty actuaries, we will provide only a brief description of their contents and use. We will devote the majority of this chapter on the contents of the other parts of Schedule F, including the calculation of the provision for reinsurance in Part 3.

**SCHEDULE F — PART 1: ASSUMED REINSURANCE AS OF DECEMBER 31, CURRENT YEAR ($000 OMITTED)**

**Overview**

Part 1 provides the total amount of the insurance company's assumed reinsurance balances by reinsured. It enables the user to obtain an additional understanding of the amounts at stake and risks associated with an insurance company’s assumed reinsurance transactions as of the current year.

With Part 1, each reinsured is separated into the following groups or categories, with subtotals at the end of each category and group:

- Affiliated Insurers:
  - U.S. Intercompany Pooling
  - U.S. Non-Pool - Captive
  - U.S. Non-Pool - Other
  - Other (Non-U.S.) - Captive
  - Other (Non-U.S.) - Other
- Other U.S. Unaffiliated Insurers
- Pools and Associations:
  - Mandatory Pools, Associations or Other Similar Facilities

---

\(^{58}\) According to the NAIC Annual Statement Instructions, the five largest should exclude mandatory pools and joint underwriting associations.
Voluntary Pools, Associations or Other Similar Facilities
- Other Non-U.S. Insurers

Knowledge of the group or category the reinsured is in, as well as the name of the reinsured, provides the user of the Annual Statement with further insight as to the risk associated with the assumed transaction.\textsuperscript{59} For example, the reporting entity may have less control over and knowledge of the risks assumed from an unaffiliated non-U.S. insurer than it would of risks assumed from a U.S. affiliate.

In terms of its structure, the first four columns of Part 1 provide the ID number, NAIC company code, name of the reinsured and the reinsured’s domiciliary jurisdiction. The ID number is one of the following, as appropriate:

- Federal Employer Identification Number (FEIN)
- Alien Insurer Identification Number (AIIN)
- Certified Reinsurer Identification Number (CRIN)
- Pool/Association Identification Number

The remaining 11 columns provide the dollar amounts pertaining to the assumed reinsurance transactions, including premiums, loss and LAE liabilities, contingent commissions, and the type of collateral required by the ceding company to secure balances owed to it by the reporting entity.

Premiums

The amount of written premium assumed by the insurance company from the reinsurer during the year is shown in column 5. The totals in column 5 ($000 omitted) will reconcile to the sum of the totals in columns 2 (reinsurance assumed from affiliates) and 3 (reinsurance assumed from non-affiliates) in Part 1B of the Underwriting and Investment Exhibit (shown in whole dollars).

Assumed premiums receivable, less commissions payable, are shown in column 10. The amount of commissions payable does not include contingent commissions, which are shown in column 9 and discussed below. The amount considered in column 10 is for fixed commissions. For example, if the reporting entity wrote a reinsurance contract for premium of $500,000 with a fixed ceding commission of 25% all of which was unpaid at the end of the year, the figure in column 10 would be the $500,000 of assumed premium receivable less $125,000 of commissions payable, for a total of $375,000.

\textsuperscript{59} Reinsurance assumed from pools and associations is generally reported by the name of the pool or association. As a result, it is difficult to gain insight about the underlying risks of the pool(s) and/or association(s) that the insurer participates in from Schedule F alone.
The total in column 10 ($000 omitted) is included as a part of agent’s balances in line 15 (premiums and considerations) of page 2. As we will see later, this is considered in the profit calculation in the IEE.

Unearned premium on assumed business is provided in column 11. This is a liability to the insurance company and is included within line 9 of page 3, entitled unearned premiums, as well as the unearned premium reserves contained in Parts 1 and 1A of the Underwriting and Investment Exhibit. The unearned premium reserves on page 3 and in the Underwriting and Investment Exhibit are net of reinsurance. As such, the assumed unearned premium reserves listed in column 11 of Schedule F, Part 1 make up only one piece of these net amounts.

The amount in column 11 ($000 omitted) should reconcile directly to item (1) within the “Reinsurance” note of the “Notes to Financial Statements” titled “Reinsurance Assumed and Ceded” (shown in whole dollars; Notes 23C of Fictitious’ 2018 Annual Statement).

Loss and LAE liabilities

Known liabilities owed by the reporting entity (i.e., the insurance company) to the reinsured (i.e., ceding company) as of December 31 of the current year are displayed in columns 6 and 7, with column 8 being the sum of the two.

- Column 6 (reinsurance recoverable on paid losses and LAE) represents losses and LAE that the ceding company has already paid but for which the insurance company has yet to pay to the reinsured.
- Column 7 (reinsurance recoverable on known case losses and LAE) represents the amount of losses and LAE reported by the ceding company as case reserves for which the reporting entity has included in its direct plus assumed case reserves stated on Schedule P, Part 1 and its net loss and LAE reserves stated on page 3 of the balance sheet.\(^\text{60}\)

The above information is valuable to the actuary in assessing the reasonableness of unpaid claims. The actuary can reconcile the case reserves relied upon in the actuarial analysis to Schedule F, Part 3 and determine where the ceded loss reserves are coming from. However, Part 1 does not provide assumed IBNR. While a ceding company may report IBNR figures to its reinsurer, the reinsurer is responsible for estimating and recording assumed IBNR.

As shown in Table 21, the total in column 6 (reinsurance recoverable on paid losses and LAE; $000 omitted) reconciles to the amount on page 3, line 2 (reinsurance payable on paid losses and LAE, displayed in whole dollars). However, the total in column 7 ($000 omitted) does not reconcile directly to any exhibits or schedules within the Annual Statement. Known case reserves for losses are a part of the reported losses included in column 2 of the Underwriting

\(^{60}\) This is only true for those companies that do not participate in intercompany pooling. A discussion of the treatment of intercompany pooling in Schedule P is provided in Chapter 15. Schedule P of this publication.
and Investment Exhibit, Part 2A; however, LAE would need to be added to this balance to reconcile to the amount in Schedule F, Part 1, column 7.

Contingent commissions

Column 9 provides a listing of contingent commissions payable. Reinsurers pay ceding companies a commission for the premium income generated under the reinsurance contract. Contingent commissions payable represent profit commissions generated from assumed reinsurance contracts that have yet to be paid as they are “contingent” on the profitability of the underlying reinsurance arrangement. The total amount listed in column 9 ($000 omitted) is included within the amount on page 3, line 4, entitled Commissions payable, contingent commissions and other similar charges. The amount in column 9 ($000 omitted) should reconcile to item (2) within the “Reinsurance” note of the “Notes to Financial Statements” titled “Reinsurance Assumed and Ceded” (Note 23C of the 2018 Annual Statement), which provides the amount of additional or return commission contingent upon loss experience or other forms of profit-sharing arrangement as a result of existing contracts (shown in whole dollars).

Let’s go back to the example we used in our explanation of column 10 (assumed premiums receivable), but this time, let’s assume that the 25% ceding commission is on a one-to-one sliding scale basis instead of being fixed. The 25% ceding commission assumes a 75% loss ratio. If the loss ratio is worse than expected and ends up being 80% then the ceding commission drops to 20%. If the loss ratio turns out to be better than expected and is 65% for example, then the ceding commission increases by 10 points to 35%.

The amount of assumed premium receivable in column 10 would be $500,000, and the contingent commissions payable in column 9 would be $125,000, which is the amount of expected commission at the onset of the contract. Let’s fast-forward to the end of the following year and assume that the $500,000 in premium was paid by the ceding company (reinsured) to the reporting entity (reinsurer), and the $125,000 in ceding commission was paid by the reporting entity to the ceding company. However, based on actual loss experience to date, the reporting entity now knows that the loss ratio is 65% as opposed to the 75% originally expected. This means that the reporting entity will owe the ceding company 10 more points of commission, or $50,000. The $50,000 would be shown in column 9 as a positive number and is a liability to the reporting entity. Of course, since the $500,000 in premium has already been received by the reporting entity, the amount shown in column 10 would be $0.

Security

The remaining columns of Schedule F, Part 1 (columns 12 through 15) provide forms of security that ceding companies often require of their reinsurers to avoid credit risk or an insolvency problem with the reinsurer.
Funds held
Funds held by or deposited with reinsured companies (column 12) represent an asset to the reinsurance company and a liability to the ceding company. It represents a provision within a reinsurance contract under which a portion of the premium due to the reinsurer is withheld by the ceding company to pay claims. There is usually a limit to the funds-held balance; however, it is replenished as (or when) it is absorbed.

Not only do the funds held reduce credit risk, but they also serve to reduce the administrative burden of the reinsured having to go to the reinsurance company to collect each time it makes a loss payment. This provision is often beneficial to the reinsurer as the funds withheld are credited for interest, the rate of which is determined in the contract. Given the benefit, this is one provision that is considered in the evaluation of whether a reinsurance contract transfers underwriting risk.

Letters of credit
The dollar amount underlying any letters of credit that the reporting entity is required to post to benefit the reinsured is shown in column 13. Letters of credit are issued by a bank in favor of the reinsured in the event that the reinsurer is unable to meet its obligations. Reinsureds tend to favor this form of credit because it is not part of the estate of an insolvent reinsurer and therefore not tied up or subject to degradation in bankruptcy or liquidation proceedings. However, letters of credit can be very costly to the reinsurer. First, banks charge the reinsurer a fee, and this fee can be very high in uncertain economic times, as experienced during 2008 and several years thereafter. Second, letters of credit serve as a reduction to the reinsurer’s line of credit with a bank and therefore reduce the amount of collateralization available on its debt obligations.

Amount of assets pledged or collateral held in trust
Broadly speaking, these are amounts not otherwise included within the funds-held provision. Unlike the other two types of security (funds held and letters of credit), these assets or collateral amounts are under the control of the reinsurer.

As we will see in Schedule F, Part 3, the funds-held provision and letters of credit serve to reduce a ceding company’s provision for reinsurance.

Schedule F — Part 1 for Fictitious Insurance Company
Because Fictitious Insurance Company does not have any assumed reinsurance, these balances are $0 within Fictitious’ 2018 Annual Statement. However, a reconciliation of these balances could be made within the Annual Statement for another company on the Exam 6 U.S. Syllabus.
Overview

Part 2 provides a detailed listing of portfolio reinsurance transactions effected or canceled during the current year. Portfolio reinsurance is the transfer of policies in force or liabilities remaining on a block of the insurance company’s business. Companies tend to enter into these arrangements when they:

- Want to discontinue writing a certain business
- Would like to get the risk or uncertainty associated with the liabilities off of their books
- Need surplus relief, which can come in the form of the discounted premium

However, these transactions come at a price, as the reinsurer will require a risk premium; the benefit of these contracts must be weighed with the cost.

Schedule F - Part 2 for Fictitious Insurance Company

Fictitious Insurance Company neither effected nor canceled any portfolio reinsurance during 2018.

Overview

Part 3 is one of the most referenced parts within Schedule F. Part 3 provides a comprehensive listing of the company’s ceded reinsurance balances by reinsurer. It shows the dollar amounts relating to ceded reinsurance contracts, which enable the user to identify amounts recoverable from each of the company’s reinsurers and assess credit risk.

Each reinsurer in Part 3 is separated into the same groups and categories as Part 1, with the addition of protected cells.\(^{61}\) However, these groups and categories are provided separately for authorized reinsurers, unauthorized reinsurers and certified reinsurers,\(^{62}\) with subtotals

---

\(^{61}\) A protected cell company is one that is organized for the creation of separate cells, each having its own assets and liabilities, but also having access to a part of the company’s overall capital. The liability to each cell is limited such that creditors to one cell cannot look to another cell or the company as a whole for assets. Only certain jurisdictions currently have insurance legislation pertaining to protected cell companies.

\(^{62}\) An authorized reinsurer is one that is licensed or approved to transact insurance business in a jurisdiction; an unauthorized reinsurer is not. A certified reinsurer is an assuming insurer that has been certified as a reinsurer in the domiciliary state of the ceding insurer and secures its obligations in accordance with the requirements of Appendix A-785, Credit for Reinsurance, of the NAIC Accounting Practices and Procedures Manual.
for each. As we shall see, the categorization of authorized, unauthorized and certified is used in the calculation of the provision for reinsurance, which culminates in column 78.

Schedule F, Part 3, is separated into 5 “sections”:

- The first 20 columns detail the ceded reinsurance balances
- Columns 21 through 36 calculate credit risk on ceded reinsurance
- Columns 37 through 53 provide the aging of ceded reinsurance
- Columns 54 through 69 provide the calculation of the Provision for Reinsurance for Certified Reinsurance
- Columns 70 through 78 provide the Total Provision for Reinsurance (authorized, unauthorized and total)

Ceded Reinsurance Balances (the first 20 columns of Part 3)

Similar to Part 1, Part 3 starts off with a listing of the ID Number, NAIC Company Code, name of each of the Company’s reinsurers (reinsured in Part 1), and the domiciliary jurisdiction of each reinsurer (reinsured in Part 1).

Special Code

Column 5 of Schedule F, Part 3, is used to identify reinsurance relationships of heightened importance to regulators or those where special considerations are made in the calculation of the provision for unauthorized reinsurance. A specifically defined number code is indicated in the applicable row for situations outlined below.

Special Code “2” - Cessions of 75% or more of subject premium

By definition, an insurance company is a risk-bearing entity. When an insurance company decides to cede most, if not all, of the risk under a contract, regulators need to understand why an insurer writes business and then cedes a large portion of it to another insurer. Column 5 identifies, through an indicator of the number 2 in the relevant row, each individual reinsurance contract whereby 75% or more of the subject direct written premiums are ceded. The purpose of column 5 is to identify situations where the reporting entity may be acting as a fronting carrier for another company (the reinsurer) in a particular state where the reinsurer is not licensed to transact business. Regulatory concern is that the reinsurer is using the fronting company to avoid regulatory oversight.

We often see this in the case of workers’ compensation insurance due to the strict licensing requirements. For example, Insurer A may wish to write workers’ compensation for a retail organization with locations along the west coast of the U.S. However, Insurer A may not be licensed to write workers’ compensation insurance in California. Insurer A may turn to Insurer B, which is licensed in California, to write the
policy on Insurer A’s behalf. In turn, Insurer B would cede 100% of the exposure to Insurer A. Insurer B would require a fronting fee to provide this service to Insurer A.

Certain reinsurance transactions are exempt from this requirement, as they are not fronting arrangements and their purpose is not to avoid regulatory oversight. These transactions include:

- Intercompany cessions with affiliates, as these are used to share risks across related companies
- Cessions to a group, association, pool or organization of insurers that underwrite jointly and are subject to examination by any state regulatory authority or that operate pursuant to any state or federal statutory or administrative authorization, such as a workers’ compensation or auto assigned risk pool
- Those where the gross annual premium ceded is less than 5% of policyholder surplus, as these transactions are deemed immaterial and may represent situations where an insurance company is exiting a line of business as opposed to a fronting arrangement
- Cessions to captive insurance companies, which are regulated in their domiciliary state (captive insurance companies are used by parent companies (non-insurance) to keep commercial insurance costs down)

Special Code “3” – Counterparty Reporting Exception for Asbestos and Pollution Contracts under SSAP No. 62R – Property Casualty Reinsurance

Special Code “3” identifies those reinsurers that have been aggregated into one line in Schedule F in accordance with the counterparty reporting exception for asbestos and pollution contracts under SSAP No. 62R paragraphs 66 through 68. This exception allows the Provision for Reinsurance to be reduced by reflecting that amounts have been recovered by the reporting entity under duplicate coverage provided by the retroactive contract, and that inuring balances from the original contract(s) are payable by the retroactive counterparty, if applicable. In order for this exception to be employed, the agreement must comply with paragraphs 66.a. through 66.e. and the reporting entity must obtain prior approval by its domiciliary regulator.

If this exception is employed, the reporting entity must complete the Supplemental Schedule for Reinsurance Counterparty Reporting Exception – Asbestos and Pollution Contracts.

Note that this exception only applies to the calculation of the Provision for Reinsurance and how these contracts are presented in Schedule F. It does not change the treatment of retroactive reinsurance accounting.
Special Code “4” – Incurred but not Reported Losses on Contracts in Force Prior to July 1, 1984 that are Exempt from the Statutory Provision for Unauthorized Reinsurance

IBNR losses on contracts in force prior to July 1, 1984 and not subsequently renewed are exempt from the statutory provision for unauthorized reinsurance. These contracts are identified by a 4 in this column with details of amounts provided in Part 2, Question 17, of the General Interrogatories to enable the reader to assess significance.

Many of the columns in the first section (the first 20 columns) of Schedule F, Part 3, are mirror images (albeit with different column numbers) to the corresponding contents of Part 1 for assumed reinsurance and pertain to premiums ceded, reinsurance recoverable, reinsurance payable and funds held by the reporting entity. In our discussion of the remaining columns of Part 3, we provide parenthetical references to amounts in Schedule F of Fictitious Insurance Company’s 2018 Annual Statement where applicable.

Premiums ceded

The amount of written premium that is ceded to each of the company’s reinsurers during the year is shown in column 6. The total amount in column 6 ($1,882; $000 omitted) should reconcile to the total of columns 4 plus 5 in Part 1B of the Underwriting and Investment Exhibit (shown in whole dollars).

Reinsurance recoverable

Columns 7 and 8 provide recoverables on paid losses and LAE ($426; $000 omitted). These are booked as an asset on the insurance company’s balance sheet ($426,000 on page 2, line 16.1) because the company is awaiting receipt of a recovery from its reinsurer on payments that the insurance company already made to the claimant.

Columns 9 through 12 provide recoverable on unpaid loss and LAE. The totals of column 9 ($5,343; $000 omitted) will reconcile to the Underwriting and Investment, Part 2A, column 3 (shown in whole dollars). The totals of column 11 ($4,038; $000 omitted) will reconcile to the Underwriting and Investment, Part 2A, column 7 (shown in whole dollars).

For companies that do not participate in intercompany pooling, Schedule F, Part 3, columns 9 through 12 are equal to the amount of ceded reserves that are netted against the gross loss and LAE reserves, which result in the net loss and loss adjustment expense reserves shown on page 3 of the balance sheet in rows 1 plus 3. Columns 9 through 12 should also reconcile to the sum of the totals in columns 14, 16, 18, 20 and 22 of Schedule P, Part 1 – Summary as follows:
The totals in Schedule F, Part 3, columns 9 and 11 ($5,343 and $4,038) should reconcile directly to the total amounts in Schedule P, Part 1, columns 14 and 16 ($5,343 and $4,038), respectively.63

Similarly, Schedule F, Part 3, column 10 ($258) should reconcile to Schedule P – Part 1, column 18 ($258), since the NAIC Annual Statement Instructions require column 10 of Schedule F, Part 3 to exclude Adjusting and Other expenses.

The total in Schedule F, Part 3, column 12 ($503) should reconcile to the sum of the totals in columns 20 and 22 of Schedule P, Part 1 ($503).64

Even if the company does participate in intercompany pooling, the recoverables on known case and IBNR loss reserves should match columns 3 (reported losses recoverable from authorized, unauthorized and certified reinsurers) and 7 (IBNR losses on reinsurance ceded) of the Underwriting and investment Exhibit Part 2A.

Note that Part 3 provides IBNR reserves, as these are amounts determined and recorded by the reporting entity. Recall that Part 1 does not provide IBNR. Part 1 provides case reserve amounts reported by the assuming company from the ceding company. While the ceding company may report IBNR to the assuming company, it is the assuming company’s responsibility to book what it believes to be its best estimate.

Column 13 represents the amount of unearned premium that will be ceded to an insurance company’s reinsurers ($920; $000 omitted). This should equal to the parenthetical amount on page 3, line 9 of the balance sheet ($920,000), which provides the reduction to gross unearned premium for the amount ceded. This is a contra liability to the ceding company. It should also reconcile directly to the amount in item (1) within the “Reinsurance” note of the Notes to Financial Statements titled “Reinsurance Assumed and Ceded” (shown in whole dollars; Note 23C of the 2018 Annual Statement).

Column 14 is similar to Schedule F, Part 1, column 9 (contingent commissions payable), but column 14 is from the view point of the reporting entity as a ceding company (reinsured) as opposed to the reporting entity as the reinsurer. Schedule F, Part 3, column 14 represents the amount of contingent commissions receivable from the reporting entity’s reinsurers. The amount in column 14 ($11; $000 omitted) should reconcile to item (2) within the “Reinsurance” note of the Notes to Financial Statements titled “Reinsurance Assumed and Ceded” (shown in whole dollars; Note 23C of the 2018 Annual Statement), which provides the amount of additional or return commission contingent upon loss experience or other forms of profit-sharing arrangement under the reporting entity’s existing reinsurance contracts. In the case of Fictitious, this amount is positive, which means that Fictitious expects to receive

63 Any differences are due to rounding within the Annual Statement for Fictitious Insurance Company.
64 ibid.
additional commission from the companies it cedes business to (specifically Good Reinsurer and Slightly Overdue Reinsurer) as a result of favorable loss experience. However, the amount can also be negative, which would mean that the reinsurer’s experience has been worse than anticipated under the contract and the reporting entity is expected to return some of the commission already received.

Column 15 provides a sum of reinsurance recoverables, whether on paid (an asset) or unpaid losses (a reduction to liabilities), a reduction to unearned premiums, or contingent commissions receivable. Column 16 identifies amounts in dispute that are included in column 15. Amounts in dispute are those for which the reinsurer has disputed amounts due through formal written notification, arbitration or litigation.

Reinsurance payable

Columns 17 and 18 provide other amounts payable by the insurance company to the reinsurer. All other commissions receivable that are not included in column 14 are netted with ceded balances payable in column 17. Column 17 ($440; $000 omitted) should reconcile to page 3, line 12, “Ceded reinsurance premiums payable (net of ceding commissions) ($440,000). Amounts in column 18 ($0) represent miscellaneous liabilities owed to the reinsurer under the ceded contracts, excluding funds held by the company under the terms of the contracts with its reinsurers. Funds held are provided for separately in column 20.

Column 19 ($11,061; $000 omitted) represents the net amount recoverable from reinsurers and is equal to column 15 reduced by columns 17 and 18.

Funds held

Column 20 provides the liability for funds held by company under reinsurance treaties ($170; $000 omitted) and reconciles to page 3, line 13 ($170,000). This provision is the mirror image of that reported by the reinsurer in a transaction, as described in Part 1. It is used by the reporting entity to protect balances due from the reinsurer under the terms of the reinsurance contract. As we will see in the remainder of Schedule F, Part 3, the liability for funds held enables the insurance company to mitigate its liability for unauthorized, certified and overdue authorized reinsurance.

Credit Risk on Ceded Reinsurance (columns 21 through 36)

This section of Part 3 is new in 2018. The information reported in this section is not only used in the calculation of the provision for reinsurance, but it is also used in the calculation of the credit risk charge for reinsurance recoverables for RBC purposes. The calculation is performed on reinsurance balances receivable on reinsurance ceded to non-affiliated companies. Cessions to state mandated residual market mechanisms, the National Council on Compensation Insurance, Federal Insurance Programs (e.g., National Flood Insurance
Program), and U.S. parents, subsidiaries and affiliates are exempt from this charge and therefore excluded from the calculation.

The amount of the credit risk charge is dependent upon whether the reinsurance recoverables are collateralized or not and the financial strength of the reinsurers. Therefore, the credit risk charge is calculated separately for collateralized and uncollateralized recoverables in columns 35 and 36, respectively.

The financial strength of the reinsurers is determined based on the current rating received from an approved rating agency as outlined in the table below taken from the 2018 NAIC Annual Statement Instructions.

The calculation of credit risk for RBC purposes is offset by the liability that has been established for purposes of the reinsurance penalty (Provision for Reinsurance) in the Annual Statement (Page 3, Line 16). Therefore, before application of the credit risk charge, the reinsurance recoverables in column 15 are reduced by the Schedule F penalty provided in column 27 (equal to the Provision for Reinsurance in column 78) to produce column 28, the total amount recoverable from reinsurers less any applicable reinsurance penalty. Column 28 is multiplied by 120% to stress the recoverable in column 29. The total of reinsurance payable and funds held (total of columns 17 plus 18 plus 20, but not in excess of the stressed recoverable in column 29) are applied as offsets to arrive at the stressed net recoverable in column 31. Based on the Reinsurer Designation Equivalent in column 34, the credit risk charge on uncollateralized recoverables (provided in Table 24) is applied to the stressed net recoverable net of collateral offsets provided in column 33 to arrive at the credit risk on uncollateralized recoverables in column 36. Credit risk on collateralized recoverables in column 35 is determined by applying the credit risk charge on collateralized recoverables (provided in Table 23) to total collateral in column 32 (columns 21 plus 22 plus 24, not in excess of the stressed net recoverable in column 31).

Note for purposes of calculating the reinsurance credit risk charge, reinsurance recoverables are reduced by IBNR for reinsurers with Special Code “4” indicated in column 5. Recall, Special Code “4” designates those reinsurers with IBNR loses on contracts in force prior to July 1, 1984 that are exempt from the Provision for Reinsurance.

Aging of Ceded Reinsurance (columns 37 through 53)

Columns 37 through 53 of Part 3 comprise the section on the “Aging of Ceded Reinsurance”. This section provides a breakdown by age of the paid loss and LAE amounts recoverable from the insurance company’s reinsurers that are shown in columns 7 (reinsurance recoverable on paid loss) and 8 (reinsurance recoverable on paid LAE) of Schedule F, Part 3.

Paid loss and LAE recoverables are provided in the following age categories:

- Current (column 37)
- 1 to 29 days (column 38)
- 30 to 90 days (column 39)
- 91 to 120 days (column 40)
- Over 120 days (column 41)
The total amount of paid loss and LAE recoverable that is overdue (columns 38 through 41) is provided in column 42. The total amount of paid loss and LAE recoverable that is due (current in column 37 plus overdue in column 42) is provided in column 43. The amount in column 43 ($426 in total; $000 omitted) reconciles to the amount in column 7 (recoverable on paid loss) plus column 8 (recoverable on paid LAE) in Schedule F, Part 3 ($426 + $0 = $426 in total; $000 omitted) and Page 2, line 16.1 (amounts recoverable from reinsurers; $426,000) of the Annual Statement. As stated previously, paid loss and LAE recoverables are assets of the reporting entity.

According to the NAIC Annual Statement Instructions, the age of the recoverable is based on the following:

- The terms of the reinsurance contract as to when claims are to be paid by the reinsurer, if specified
- The terms of the reinsurance contract as to when claims are to be reported by the insurance company to the reinsurer, if specified
  Or
- The date when the amount recoverable exceeds $50,000 for a particular reinsurer and is entered in the insurance company’s financial accounts as a paid recoverable

If the amount recoverable is less than $50,000, and the aforementioned paid/reported dates are not specified in the contract, then the recoverable is reported in column 37 as currently due.

Note that recoverables from mandatory pools and associations are reported in column 37 as currently due.

Columns 49 through 50 provide percentages of the overdue balances to total amounts due. Column 49 provides the percentage overdue relative to the total due (column 42 divided by column 43), column 50 provides the percentage overdue greater than 90 days and not in dispute (column 47 divided by columns 46 plus 48), and column 51 provides the percentage overdue greater than 120 days to the total due (column 41 divided by column 43). These percentages are used in the calculation of the provision for reinsurance.

Provision for Reinsurance for Certified Reinsurance (columns 54 through 69)

In 2012, the NAIC added a third facet to the “authorized” and “unauthorized” categorization of reinsurers in Schedule F, called “certified.” This resulted in the addition of a new Part 6 to Schedule F, shifting the former Parts 6 through 8 to Parts 7 through 9, respectively. In 2018, numerous individual parts used to derive the provision for reinsurance were consolidated into a single new Part 3 within Schedule F, with columns 54 through 69 being specific to certified reinsurers.
Certified reinsurers are non-U.S. reinsurers domiciled in a jurisdiction designated by the NAIC as a Qualified Jurisdiction (i.e., Bermuda, France, Germany, Ireland, Japan, Switzerland and the United Kingdom) that would have been categorized as unauthorized prior to 2012, but have applied for and attained certification from the reporting entity’s domiciliary state as a certified reinsurer. A non-U.S. reinsurer that is not certified is required to post 100% collateral for its U.S. claims. Once a reinsurer is certified, it is allowed to provide a reduced amount of collateral for its U.S. claims. In attaining certification, consideration is made for the reinsurer’s jurisdiction, financial position, amount of capital and surplus, regulatory history, financial strength rating(s) from recognized rating agency(ies), among other factors. Once certified, the reinsurer is given a rating that ranges from 1 to 6, called the Certified Reinsurer Rating. A reinsurer with a rating of 1 is considered most secure from a financial strength perspective; a reinsurer with a rating of 6 is considered vulnerable.

The rating defines the amount of collateral that the reinsurer is required to post with the reporting entity. The more secure the certified reinsurer, the less collateral required. For example, a reinsurer with a rating of 1 is not required to post any collateral; a reinsurer with a rating of 6 is required to post 100% of total recoverable due to the reporting entity in collateral. The rating and collateral are used in the calculation of the provision for reinsurance in column 77 of Schedule F, Part 3.

The obvious benefits of this new “certified” category are twofold: (1) the reporting entity does not get “penalized” as much as an unauthorized reinsurer in the provision for reinsurance, and (2) the reinsurer does not have to post as much security with the ceding company.

The provision for certified reinsurance comprises two parts, one coming from column 64 and the other from column 69. Column 64 provides the provision for reinsurance ceded to certified reinsurers due to collateral deficiency. This provision is equal to total recoverables from certified reinsurers offset by any corresponding payables (from Schedule F, Part 3, column 19) in excess of the amount of credit permitted for recoverables based on the Certified Reinsurer Rating (column 63). The amount of credit permitted is based on the amount of collateral actually posted by the reinsurer relative to the amount of collateral required based on its Certified Reinsurer Rating. For example, if a certified reinsurer has a rating of 6, then the reinsurer is required to post 100% of the recoverable in collateral. However, if the reinsurer only posts 75% of the total collateral required, then the reporting entity would record a provision for reinsurance in Section 1 equal to 25% of the recoverable.

---

65 The list can be found at this link: https://content.naic.org/sites/default/files/inline-files/committees_e_reinsurance_qualified_jurisdictions_list_1.pdf, and the designation was initially effective on January 1, 2015.
66 A rating of Secure-2 requires 10%; Secure-3 requires 20%; Secure-4 requires 50%; and Secure-5 requires 75%.
The 25% represents the deficiency in collateral; 75% represents the amount of credit permitted.

Column 69 of Part 3 provides the provision for overdue reinsurance ceded to certified reinsurers. As with authorized and unauthorized reinsurers, overdue reinsurance ceded is defined as recoverable on paid losses and LAE more than 90 days overdue per columns 40 and 41.

As we will see, the provision for overdue certified reinsurers is calculated similarly to the provision for authorized reinsurance, in that the provision is greater for slow payers (i.e., those certified reinsurers where the percent of recoverables on paid losses and LAE more than 90 days overdue is 20% or more), than non-slow payers. In the case of slow payers, instead of 20% of the recoverables on paid losses and LAE, the maximum amount of the recoverables on paid losses and LAE and the net unsecured recoverable for which credit is allowed is considered. In either case, the provision is not to exceed the amount of credit allowed for net recoverables per column 63.

Total Provision for Reinsurance (columns 70 through 78)

As explained in the “Overview” section of this chapter, the provision for reinsurance is a minimum reserve that is calculated under SAP to reflect an estimate of recoveries under the reporting entity’s reinsurance contract(s) that it will not be able to collect. The provision is provided in column 78 and is the sum of the following three main elements:

1. Provision for authorized reinsurance in column 75, which emanates from overdue balances.
2. Provision for unauthorized reinsurance in column 76, which comprises two components, the sum of columns 71 and 72:
   - Column 71 provides the provision due to collateral deficiency.
   - Column 72 provides the provision due to overdue balances.
3. Provision for certified reinsurers in column 77, which similarly comprises two components, the sum of columns 64 and 69:
   - Column 64 provides the provision due to collateral deficiency.
   - Column 69 provides the provision due to overdue balances.

For Fictitious, the components of the provision for reinsurance are as follows:
TABLE 25

<table>
<thead>
<tr>
<th>Column</th>
<th>Provision for Reinsurance (USD in 000)</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>75</td>
<td>1. Provision for Authorized Reinsurance</td>
<td>46</td>
</tr>
<tr>
<td>76</td>
<td>2. Provision for Unauthorized Reinsurance</td>
<td>224</td>
</tr>
<tr>
<td>77</td>
<td>3. Provision for Certified Reinsurance</td>
<td>13</td>
</tr>
<tr>
<td>78</td>
<td>Total Provision for Reinsurance</td>
<td>283</td>
</tr>
</tbody>
</table>

Details underlying the computation of each of these three elements is provided below.

1. Provision for Amounts Ceded to Authorized Reinsurers in column 75

An authorized reinsurer is one that is either licensed or accredited in the ceding insurance company’s state of domicile or domiciled in a state that employs standards regarding credit for reinsurance substantially similar to those of the ceding insurance company’s state of domicile and is therefore regulated in the U.S. and subject to minimum capital and surplus requirements. As a result, there is less concern about the reinsurer’s ability to pay unless the reinsurer is late in making payments or has disputed the ceded balance. Therefore, for authorized reinsurers, the provision for reinsurance emanates from overdue balances, including amounts in dispute.

For purposes of calculating the provision for overdue authorized reinsurance, “overdue” reinsurance is defined as the amount of paid loss and LAE recoverable over 90 days past due for reasons other than dispute between the insurance company and the reinsurer.

The provision for authorized reinsurance is equal to the sum of column 73 and 74. The provision that emanates from column 73 comprises overdue authorized reinsurance that represents less than 20% of the total recoverable on paid loss and LAE (plus amounts received by the insurance company from that reinsurer in the prior 90 days). For these reinsurers, most of the payments are less than three months late. This of course is not as great of a concern from a collectability standpoint as is the situation where the majority of the amount overdue from a reinsurer is greater than 90 days (i.e., the provision for “slow payers” derived in column 74); the likelihood of the reinsurer reimbursing the insurance company is less as time goes on.

The provision for overdue authorized reinsurance in column 73 is calculated as (1) 20% of the amount of reinsurance recoverable on paid losses and LAE more than 90 days overdue, plus (2) 20% of amounts in dispute excluded from the recoverable on paid losses and LAE more than 90 days overdue for those authorized reinsurers where the amount overdue represents less than 20% of the total. This is equal to 20% of the amount reported in column 47 plus 20% of the amount reported in column 45.
For Fictitious Insurance Company, “Good Reinsurer” and “Slightly Overdue Reinsurer” are the only authorized reinsurers for which loss and LAE payments are overdue in 2018 and for which the overdue amount represents less than 20% of the total recoverable on paid, as indicated by a “YES” in column 52.

Column 74 provides the provision for what Sholom Feldblum refers to as “slow-paying” authorized reinsurers (i.e., authorized reinsurers where the amount of paid loss and LAE recoverable more than 90 days overdue represents greater than or equal to 20% of the total recoverable on paid losses and LAE). Column 74 is calculated as 20% of the maximum of (1) reinsurance recoverable on all items less funds held and collateral in column 26 and (2) the amount recoverable on paid losses and LAE greater than 90 days past due in columns 40 and 41.

Similar to column 73, the provision for overdue authorized reinsurers in column 74 considers reinsurance recoverables on paid loss and LAE greater than 90 days overdue. However, column 74 also considers all recoverables from the reinsurer, less allowable offsets. We note that the reinsurance recoverables would include amounts in dispute. In column 74, the greater of all items recoverable less offsets, and paid recoverables more than 90 days due, is used in the calculation of the provision. In other words, slow payers are penalized in the calculation of the provision for authorized reinsurance.

As indicated in column 52 by a “NO”, Fictitious has two slow-paying reinsurers: “Overdue Reinsurer” and “Foreign Authorized.”

The following table details the first step in the calculation of the provision of authorized reinsurance for Fictitious Insurance Company, the determination of whether amounts overdue are less than 20% of total recoverables on paid losses and LAE in column 52.

</tbody>
</table>

2. Provision for unauthorized reinsurance in column 76

The provision for unauthorized reinsurance requires that the insurance company establish a liability to protect against the inability to collect on amounts due from a reinsurer not authorized or certified by the domiciliary state of the insurance company. The liability emanates from two sources:
• Collateral deficiency (column 26), which is defined as the total amount of reinsurance recoverables, including amounts in dispute, offset by funds held, payables and collateral (i.e., the unsecured recoverable in column 26); and
• Overdue balances (i.e., 20% of column 47) and amounts in dispute (20% of column 16)

To put it another way, the liability is equal to total recoverable from unauthorized reinsurers, reduced for allowable offsets only to the extent that there are no amounts in dispute or more than 90 days due (and not in dispute). Otherwise, the allowable offsets are reduced by 20% of amounts due from late payers and 20% of amounts recoverable that are in dispute. Late payers and those that dispute coverage are more likely not to pay than those unauthorized reinsurers that have a history of paying on time and where no amounts are currently in dispute. For each reinsurer, the liability is capped at the total amount of reinsurance recoverable from that reinsurer.

The Appointed Actuary comments on the collectability of reinsurance in the Statement of Actuarial Opinion. However, a large provision for reinsurance would not always mean there is a collectability issue. Just because a reinsurer is not authorized (or certified) to transact business in the company’s domiciliary state doesn’t mean that the reinsurer is not viable and will not pay claims owed under the terms of the reinsurance contract.

The following provides the calculation of the Provision for Unauthorized Reinsurers included in Schedule F, Part 3, column 76 of the 2018 Annual Statement for Fictitious Insurance Company.
### TABLE 27

3. **Provision for certified reinsurers in column 77**

As discussed earlier in this chapter, the provision for certified reinsurance is calculated in a separate, dedicated section of Part 3, in columns 54 through 69, and emanates from two sources:

- **Collateral deficiency (column 64)**, which is defined as the total amount of reinsurance recoverables, including amounts in dispute, net of reinsurance payables and the amount of credit allowed (column 19 minus column 63); and
- **Overdue balances (column 69)** which is calculated as the greater of 20% of recoverables on paid losses and LAE, including amounts in dispute (i.e., 20% of column 47 and 20% of column 45). For “slow payers”, the provision is modified to be at least equal to 20% of the net unsecured recoverable for which credit is allowed (column 68 = 20% * column 67 = 20% * (column 63 minus column 66)). In either case, the
provision should not exceed the amount of credit allowed for net recoverables in column 63.

The following provides the calculation of the Provision for Certified Reinsurers included in Schedule F, Part 3, column 77 of the 2018 Annual Statement for Fictitious Insurance Company.

SCHEDULE F — PART 4: ISSUING OR CONFIRMING BANKS FOR LETTERS OF CREDIT FROM SCHEDULE F, PART 3 ($000 OMITTED)

Schedule F, Part 4 is for information purposes. It provides a listing of the issuing or confirming banks for letters of credit as collateral reported in Schedule F, Part 3, column 22. Confirming banks are those that provide a guarantee on a letter of credit such that the confirming bank will pay if the original bank issuing the letter of credit bank does not.

There are 5 columns in Part 4:

Column (1): provides the issuing or confirming bank reference number.

Column (2): identifies by a “1”, “2” or “3” whether single, syndicated or multiple letters of credit, respectively, are provided as collateral. Syndicated letters of credit are those where one bank acts as an agent for a group of banks issuing the letter of credit.

Column (3): provides the American Bankers Association (ABA) Routing Number for the letter of credit issuing or confirming bank.

Column (4): provides the name of the issuing or confirming bank.

Column (5): provides the amount of the letter of credit, the sum of which should equal the total of Schedule F, Part 3, column 22.

SCHEDULE F — PART 5: INTERROGATORIES FOR SCHEDULE F, PART 3 ($000 OMITTED)

Schedule F, Part 5 provides interrogatories for Schedule F, Part 3. The interrogatories include two tables with more detailed information. These two tables are particularly relevant from a regulatory perspective.

The first table identifies the five largest commission rates included in the cedant’s reinsurance treaties for those contracts where ceded premium is in excess of $50,000.\(^{68}\) The top five provisional commission rates are considered in conjunction with column 14 (contingent

---

\(^{68}\) According to the NAIC Annual Statement Instructions, the five largest should exclude mandatory pools and joint underwriting associations.
commissions receivable) and the aforementioned Note to the Financial Statements on reinsurance assumed and ceded. The purpose is to identify companies that may be using reinsurance as a means to conceal high operating leverage. As we shall see in Appendix I of this publication, one purpose of the NAIC’s Insurance Regulatory Information System (IRIS) ratios is to identify companies that may be taking on more business and more risk than they can handle relative to their surplus. Specifically, IRIS Ratio 2 provides the ratio of net written premium to policyholders’ surplus. Unusual values triggering regulatory attention are those in excess of 300% on a net basis. The 300% ratio on a net basis corresponds to the age-old generally accepted benchmark that insurers remain within the 3-to-1 range in terms of writings relative to surplus.

Companies growing rapidly may use reinsurance as a means to reduce pressure on its surplus. This is known as “surplus relief.” All else being equal, an increase in the amount of ceded premiums will reduce the amount of net premiums and reduce the premium to surplus ratio (IRIS Ratio 2). This is perfectly legitimate; the purpose of reinsurance is to spread and manage insurance risk.

For example, consider a company that has $150 million of direct written premium and surplus of $25 million. The premium-to-surplus ratio is 600% well above the 300% benchmark. Let’s say this company decides to purchase a 30% quota share reinsurance contract with a fixed ceding commission of 35% The company’s net written premium would be:

\[
\text{Direct written premium} \times (1 - \text{ceding percentage})
\]

\[
= \$150 \text{ million} \times (1 - 0.30)
\]

\[
= \$105 \text{ million}.
\]

At the onset of the contract, the company’s surplus would grow by the amount of ceding commission:

\[
\text{Direct written premium} \times \text{ceding percentage} \times \text{ceding commission}
\]

\[
= \$150 \text{ million} \times 30\% \times 35\%
\]

\[
= \$15.75 \text{ million}
\]

The resulting surplus would be $40.75 million ($25 million current surplus plus $15.75 million in ceding commission). The purchase of this contract would reduce the company’s premium-to-surplus ratio below the 300% “usual” value benchmark, from 600% to 258%.

However, consider the situation where the commission is instead offered on sliding scale basis such that a one-point increase in loss ratio from 65% would result in a one-point decrease in the 35% commission rate. The premium-to-surplus ratio at the onset of this contract would be the same as that under the situation where the commission rate is fixed (258%). However, if the actual loss ratio turns out to be 80% then the company will have to return $6.75 million of the original $15.75 million in ceding commission. Instead of receiving 35% of ceded
premium in commission, the company (reinsured) will end up getting only 20%. If a 20% fixed commission rate was considered at the onset, the premium-to-surplus ratio would have been 309%, triggering an unusual value for IRIS Ratio 2.

Schedule F, Part 5 and the reinsurance Note to the Financial Statements identify reinsurance contracts with high provisional commission rates so that the regulator may investigate these contracts and determine if they are being used to mask high operating leverage.

We note that IRIS Ratio 4 (surplus aid to policyholders surplus) is another statistic that can identify companies that rely heavily on reinsurance for surplus relief. As explained in Appendix I of this publication, IRIS Ratio 4 provides the ratio of surplus aid to policyholders surplus. Surplus aid is the amount of surplus enhancement in the current year attributed to ceding commission (both fixed and contingent) that has been taken into income on ceded unearned premium. Ratios of surplus aid to policyholders surplus in excess of 15% are considered unusual and trigger regulatory scrutiny.

In either of our examples (with the 35% ceding commission being either fixed or provisional), IRIS Ratio 4 would be computed as 39% at the onset of the contract, well in excess of the 15% benchmark.\(^6^9\) This further illustrates the company’s heavy use of reinsurance as surplus relief, masking considerable growth and uncertainty in results.

The second table in Part 5 identifies the five largest reinsurance recoverables reported in column 15 and associated ceded premiums, as well as an indicator as to whether the reinsurer is affiliated with the reporting entity. This table enables the regulator to assess concentration of reinsurance credit risk.

SCHEDULE F —PART 6: RESTATEMENT OF BALANCE SHEET TO IDENTIFY NET CREDIT FOR REINSURANCE

Part 6 of Schedule F provides a summarized form of the balance sheet with adjustments to restate it on a gross of ceded reinsurance basis. That is, Part 6 provides a snapshot of the balance sheet as if the company had no reinsurance protection.

Part 6 is one page and displays the assets followed by the liabilities. Both the assets and liabilities are in a condensed format for ease of presentation and computation. There are three columns, providing balances for each of the following asset and liability line items:

<table>
<thead>
<tr>
<th>Column 1:</th>
<th>As Reported (Net of Ceded)</th>
</tr>
</thead>
<tbody>
<tr>
<td>This provides the amounts included on page 2 of the Annual Statement, which are net of reinsurance.</td>
<td></td>
</tr>
</tbody>
</table>

| Column 2: | Restatement Adjustments |

\(^6^9\) IRIS Ratio 4 is computed as the unearned premium reserve of $45 million multiplied by the 35% ceding commission and divided by policyholders surplus of $40.75 million.
This provides the adjustments necessary to put the net amounts in column 1 on a gross of reinsurance basis in column 3.

Column 3: Restated (Gross of Ceded)
This is equal to the sum of columns 1 and 2 and shows the corresponding asset and liability figures on a gross of reinsurance basis.

Adjustments to assets

The asset side of the balance sheet is generally easier to adjust because there are fewer items that require adjustment. This is because certain items relate to direct or assumed business only, and/or certain items are not impacted by the amounts associated with a company’s ceded reinsurance transactions. In general, no adjustment is made to the following asset items within Part 9:

- Cash and invested assets (line 1 of Schedule F, Part 6; line 12 of page 2), as these represent balances that the company has on hand or invested, regardless of its ceded reinsurance.
- Premiums and considerations (line 2 of Schedule F, Part 6; line 15 of page 2), as these represent uncollected or deferred balances relating to direct written premiums.
- Funds held by or deposited with reinsured companies (line 4 of Schedule F, Part 9; line 16.2 of page 2), as these represent balances for business assumed by the company, not ceded.
- Other assets (line 5 of Schedule F, Part 6; representing the balance of page 2 not separately identified), as these represent balances that would not change regardless of ceded reinsurance balances, such as title plants, furniture and electronic data equipment.
- Protected cell assets (line 7 of Schedule F, Part 6; line 27 of page 2), as these are not related to ceded reinsurance.

The only two lines that are affected by the reinsurance adjustments are line 3, reinsurance recoverable on loss and loss adjustment expense payment, and line 6, net amount recoverable from reinsurers. The adjustment in line 3 is simply a reversal of the amount of reinsurance recoverable on loss and LAE such that the balance gross of reinsurance ceded is $0 for this asset. The adjustment for line 6 is a balancing item such that the total adjustments on the liabilities side of the balance sheet equal those on the asset side.

Adjustments to liabilities

With respect to the Liability side of the balance sheet, no adjustment is typically made to the following line items in Part 6:
Taxes, expense, and other obligations (line 10 of Schedule F, Part 9; lines 4 through 8 of page 3), as these are generally applied to direct writings

Advance premium (line 12 of Schedule F, Part 6; line 10 of page 3), as this represents balances that the company has received in advance on its direct writings

Dividends declared and unpaid (line 13 of Schedule F, Part 6; line 11.1 and 11.2 of page 3), as dividends are not affected by the ceded reinsurance balances

Amounts withheld or retained by company for account of others (line 16 of Schedule F, Part 6; line 14 of page 3), as these balances are not related to ceded reinsurance

Other liabilities (line 18 of Schedule F, Part 6; representing the balance of the liabilities on page 3 not separately identified), as these are unrelated to ceded reinsurance

Adjustments are made for the following lines:

Line 9: Losses and LAE (lines 1 through 3 of page 3) These balances are stated net on a company’s statutory balance sheet. The adjustment puts the balances on a gross of reinsurance basis. For companies that are not involved in intercompany pooling arrangements, the adjustment equals the ceded case and IBNR figures from Schedule P, Part 1, Summary, total, columns 14, 16, 18, 20 and 22.

Line 11: Unearned premiums (line 9 of page 3) These balances are stated net on a company’s statutory balance sheet. The adjustment puts the balances on a gross of reinsurance basis. The source of the ceded unearned premium reserve is Schedule F, Part 3, column 13, multiplied by 1,000. The ceded balance is also provided within the parenthetical reference on the Liabilities, Surplus and Other Funds page of the Annual Statement (page 3) on line 9.

Line 14: Ceded reinsurance premiums payable (line 12 of page 3) If ceded reinsurance is ignored, as is the purpose of Part 6, then the company will not have any ceded reinsurance premiums payable. The adjustment reverses the amount in column 1.

Line 15: Funds held by company under reinsurance treaties (line 13 of page 3) Similarly, if there are no ceded reinsurance treaties, then the company won’t have any funds held related to these treaties. The adjustment reverses the amount in column 1.

Line 17: Provision for reinsurance (line 16 of page 3) This is the Schedule F “penalty,” as computed in Schedule F, Part 3. If the company is assumed to have no reinsurance protection in Part 6, then there
will be no provision for reinsurance. The adjustment reverses the amount in column 1.

Surplus

Surplus remains unadjusted in Part 6, as such, the adjustment amount is shown as “XXX” in column 2 and the amount in column 3 equals that in column 1.

Totals

The totals shown in column 1, line 22 of Part 6, balance to the totals shown on line 38 of page 3 of the Annual Statement. The total is equal to the difference between the total assets and total liabilities of the company. This calculation follows through to column 3, with the new total being on gross of reinsurance basis.

The following provides Schedule F, Part 6 for Fictitious Insurance Company.
As displayed above, the asset items are adjusted in column 2 for:

- Reinsurance recoverable on loss and LAE payments in line 3, totaling $426,000
- The net amount recoverable from reinsurers in line 6, totaling $10,595,000
The amount in line 6, column 2, is simply a reversal of the balance shown in column 1, and therefore the asset side of the balance sheet. The amount in line 6 is computed as the “plug,” such that the total adjustment to the assets in line 8 equals the total adjustment to the liabilities in line 19.

The liability items are adjusted in column 2 for:

- Loss and LAE in line 9, totaling $10,142,000
- Unearned premiums in line 11, totaling $920,000
- Ceded reinsurance premiums payable in line 14, totaling $440,000
- Funds held by company under reinsurance treaties in line 15, totaling $170,000
- Provision for reinsurance in line 17, totaling $283,000

The amount in line 9, column 2, is equal to the amount of ceded loss and LAE reserves per Schedule P, Part 1, Summary, of Fictitious’ 2018 Annual Statement (sum of the totals in columns 14, 16, 18, 20 and 22).\(^\text{70}\)

For companies that do not participate in intercompany pooling, line 9 is equal to the ceded reserve loss and LAE reserve balance in Schedule P, Part 1, Summary. However, for those that operate in an intercompany pooling arrangement, we note that Schedule P is prepared net of pooling on both a gross and net of external reinsurance basis, whereas Schedule F considers all assumed and ceded reinsurance, including intercompany pooling. As such, it makes it difficult to have full visibility into the loss and LAE reserve balances shown in column 2 of Schedule F, Part 6 for companies participating in intercompany pooling.

The amount in line 11, column 2 is equal to the amount of gross unearned premium reserves that are ceded, as displayed in the total line of Schedule F, Part 3, column 13, multiplied by 1,000.

The amounts in column 2 for lines 14, 15, and 17 represent a reversal of the amount in column 1.

As displayed above, there is no adjustment to surplus; therefore, the amount in column 1 equals that in column 3 ($31,024,000).

\(^\text{70}\) Schedule P is prepared net of intercompany pooling on both a gross and net of external reinsurance basis, whereas Schedule F considers all assumed and ceded reinsurance, including intercompany pooling. As such, it makes it difficult to have full visibility into the loss and LAE reserve balances shown in column 2 of Schedule F, Part 6 for companies participating in intercompany pooling arrangements.
SUMMARY

As we have seen, Schedule F is not only important to actuaries in assessing net loss and LAE reserves, but it is also an important tool to the many users of the Annual Statement in solvency monitoring because it:

- Identifies the amount of gross losses that emanate from the reporting entity’s assumed reinsurance transactions;
- Provides an estimate of the significance of the reporting entity’s assumed and ceded reinsurance transactions to its surplus;
- Enables further inquiry into the financial strength of the reporting entity’s reinsurees and reinsurers;
- Quantifies “credit risk” related to reinsurance recoverables for purposes of the NAIC’s RBC formula; and
- Identifies the reporting entity’s reinsurers that may require further scrutiny because they are either slow at paying claims or are not regulated.

Yet, Schedule F is only one of many tools used to monitor solvency by regulators. As we have stressed throughout this publication, no one tool can be used blindly.

Further, while Schedule F is valuable, it has received some criticism as to how well it meets the regulatory objectives of monitoring solvency for the protection of policyholders. The following are a few of those criticisms:

- The provision for reinsurance is strictly formulaic, potentially masking the true estimate of uncollectible reinsurance that would be determined by company management based on their knowledge of the reinsurers and terms of each contract.
- There is no statistical, historical or actuarial basis for the formula, and its application may not adequately represent an insurer’s exposure to collectability risk.
- Unauthorized reinsurance may provide more and/or higher-quality reinsurance at a lower price than a competing authorized reinsurer.
- Slow payers who are financially strong eventually pay, whereas a reinsurer that is current in its payments may not be able to withstand a stress scenario to its financials.
- The numerous calculations and detail involved in determining the provision for reinsurance can lead to a false level of precision such that the true issue of collectability risk is overlooked.
- The costs associated with collateral requirements may be passed down to the primary policy, thereby costing the policyholder more for insurance.
- The provisions within Schedule F can limit competition to the U.S. market as a result of the penalty that the European reinsurers bring given that they are unauthorized.

Schedule F does not directly tell us anything about the reinsurer’s solvency, which is really the source of collectability risk.
CHAPTER 15. SCHEDULE P

OVERVIEW

Schedule P is probably the most important schedule within the Annual Statement to property/casualty actuaries. Schedule P provides details underlying the recorded loss and loss adjustment expense (LAE) reserves on the reporting entity’s statutory balance sheet, including 10 years of the company’s historical loss and defense and cost containment (DCC) experience (i.e., net paid, case outstanding and incurred loss and DCC triangles). Because the Annual Statement is a public document, Schedule P tends to be a means for outside parties to evaluate the adequacy of recorded reserves, absent loss and LAE data provided directly by the company. And even when detailed data is provided by the company, oftentimes outside parties look to Schedule P for purposes of providing a check on the reasonableness of the recorded balances. However, there are cautions to using this information, and we have presented several within this chapter.

Schedule P has numerous other uses in addition to providing support for the recorded loss and LAE reserves. For example, Schedule P:

- Supports and provides necessary disclosures for the Statement of Actuarial Opinion, including:
  - Direct plus assumed and net loss and expense reserves
  - The amount of anticipated salvage and subrogation (S&S) that the reporting entity takes credit for in its reserves
  - The amount of tabular and non-tabular discount that the reporting entity takes credit for in its reserves
- Shows how loss reserves have developed over time and enables the reader to decipher whether development is attributed to a specific year or line of business
- Shows the split between a company’s reserves for known claims and those actuarially determined (i.e., IBNR reserves)
- Provides historical claim count data to facilitate review of trends in claim frequency and severity, as well as changes in claims handling and reserving
- Provides information necessary to compute the loss sensitive discount in the RBC calculation

We will discuss some of these additional uses within this chapter.

ORGANIZATIONAL STRUCTURE

There are seven parts to Schedule P plus interrogatories, as described below.

Part 1 summarizes a company’s loss and LAE experience as of December 31 of the current year. It displays a company’s loss and LAE reserves, after adjustment for tabular discount if
applicable, and then separately shows the reserves net of all discounts (both tabular and non-tabular). These are the loss and LAE reserves that are recorded on a company’s statutory balance sheet (page 3 of the Annual Statement).

For those companies that participate in intercompany pooling, Part 1 displays the pooling percentage.

Part 2 provides a historical display of a company’s net ultimate loss and DCC estimates. This enables the user to see how the company’s ultimate loss and DCC estimates have developed over time. In a perfect world, the company’s ultimate estimate of the cost of incurred claims would remain the same at each evaluation point. However, these are estimates, and therefore have the potential to develop upward or downward as the claims mature. The information provided in Part 2 feeds into the one-year development test in the Five-Year Data Exhibit and is also used in computing the NAIC Insurance Regulatory Information System (IRIS) ratios 11, 12 and 13.

Part 3 shows a historical array of the company’s net paid loss and DCC experience as of each of the past 10 years. Actuaries can use this information to project unpaid claims using methods such as the paid loss development technique.

The difference between Part 2 (ultimates) and Part 3 (paids) provides a historical array of the company’s net loss and DCC reserves as of each of the past 10 years. These amounts are provided before tabular discount.

Part 4 displays a company’s recorded net IBNR for loss and DCC before tabular discount. The difference between Parts 2 and 4 provides a historical array of the company’s net reported loss and DCC experience as of each of the past 10 years. This information can be used by actuaries to project unpaid claims using methods such as the case incurred loss development technique.

Part 5 provides a historical array of claim counts as of each of the past 10 years, including claims closed with payment, open claims and reported claims.

Part 6 displays the earning of premium over time, separately on a direct plus assumed and ceded basis. Like the information provided in Parts 2 through 4, the earned premium data is provided in a triangular format enabling the monitoring of premium adjustments over time.

Part 7 provides loss and premium data on loss sensitive contracts, separately for primary and reinsurance contracts, for those lines of business where such contracts are written.

All dollar amounts presented in Schedule P are in thousands (i.e., 000 omitted).

Within the remaining sections of this chapter, we will provide an overview of each part of Schedule P, focusing on those of most relevance to the property/casualty actuary. We will then get into details of those parts, providing relevant examples from the 2018 Schedule P for Fictitious Insurance Company.
SCHEDULE P —PART 1

Part 1 is shown in summary format for all lines of business combined, followed by separate schedules (Parts 1A through 1T) in the same format as Part 1 – Summary, but by Schedule P line of business. The data in Part 1 is provided on a direct plus assumed (gross) and ceded basis and includes premiums earned, paid loss and LAE, case outstanding loss and DCC reserves, and IBNR for loss and LAE. Additionally, incurred loss and LAE ratios are displayed on a gross, ceded and net of reinsurance basis.

One item that is not included in Schedule P is the segregation of gross data into its direct and assumed components. Oftentimes actuaries look for this information separately in performing analyses of unpaid claims; however, it is not provided in Schedule P. As noted in Chapter 14, Schedule F, certain of this information can be provided in Schedule F, Part 1, including assumed case reserves.

Line of Business Segmentation in Part 1

Parts 1A through 1T provide the same information as in Part 1 – Summary, except separately by line of business. The line of business segmentations are as follows:

- A – Homeowners/Farmowners
- B – Private Passenger Auto Liability/Medical
- C – Commercial Auto Liability/Medical
- D – Workers’ Compensation
- E – Commercial Multiple Peril
- F – Section 1 – Medical Professional Liability – Occurrence
- F – Section 2 – Medical Professional Liability – Claims-Made
- G – Special Liability (Ocean Marine, Aircraft (All Perils), Boiler & Machinery)
- H – Section 1 – Other Liability – Occurrence
- H – Section 2 – Other Liability – Claims-Made
- I – Special Property (Fire, Allied Lines, Inland Marine, Earthquake, Burglary & Theft)
- J – Auto Physical Damage
- K – Fidelity/Surety
- L – Other (Including Credit, Accident and Health)
- M – International
- N – Reinsurance – Nonproportional Assumed Property
- O – Reinsurance – Nonproportional Assumed Liability

---

72 Business reported as an aggregate write-in for other lines of business in the State Page is included here (either as occurrence or claims-made, depending on the coverage written).

73 Property includes fire, allied, ocean marine, inland marine, earthquake, group, credit and other A&H, auto physical damage, boiler and machinery, burglary and theft and international property.

74 Liability includes farmowners, homeowners and commercial multiperil; medical professional liability workers’ compensation; other liability; products liability; auto liability; aircraft (all peril); and international liability.
The definitions of these lines correspond to those on the Exhibit of Premiums and Losses (Statutory Page 14), with the exception of the three nonproportional reinsurance assumed lines (Parts N, O and P), which are not included in Statutory Page 14, as it provides information on a direct basis only. Nonproportional reinsurance assumed is generally excess of loss reinsurance, whereas proportional is generally a form of quota share reinsurance. Proportional reinsurance is included within its respective line(s) of business segments. For example, premiums and losses associated with assumed commercial property reinsurance under a quota share contract would be included within Schedule P, Part 1I, whereas the same risk assumed on an excess of loss basis would be included within Schedule P, Part 1N.

Only two accident years and a “prior years” row are shown for the following lines due to the limited amount of loss development beyond two years:

- I – Special Property (Fire, Allied Lines, Inland Marine, Earthquake, Burglary & Theft)
- J – Auto Physical Damage
- K – Fidelity/Surety
- L – Other (Including Credit, Accident and Health)
- S – Financial Guaranty/Mortgage Guaranty
- T – Warranty

That is, claims for the aforementioned lines of business are expected to be reported and paid within a relatively short period of time after the occurrence of a claim. Consider the Special Property line of business. If a commercial property is damaged due to fire, the insured will report the claim rather quickly to get the building repaired or rebuilt in order to continue operations. Payments may continue to the insured while the commercial property is being repaired due to business interruption; however, the insured will generally be back in business within the year in which the loss occurred. As a result, losses will develop for 12 to 24 months after the beginning of the accident year (January 1) in which the loss occurred, but typically the claim will be closed by the end of 24 months.

To illustrate the “bucketing” of claims, consider a complete fire loss to a paper mill on December 19, 2018. Assume the building is rebuilt and the insured is back in business on September 4, 2019. This claim would be recorded as an accident year 2018 claim, with loss

---

75 Financial includes financial guaranty, fidelity, surety, credit, and international financial.
76 There is no Part Q.
payments extending into the second year of development (24-month period) until the claim is closed on September 4.

Despite only two years being shown in the Schedule P line of business parts, all 10 years are included in Schedule P – Part 1 – Summary. Therefore, the insurer is required to retain data for these lines in a similar 10-year format as all other lines of business in Schedule P.

Many have argued that the two-year reporting convention is not necessarily appropriate for the aforementioned lines of business due to the tail on lines such as Fidelity/Surety. These opponents would vote for including all 10 years, as is shown for the other Schedule P lines, arguing further that all 10 years are already produced for purposes of forming the summaries in Schedule P.

**Yearly Reporting Convention**

Part 1 provides information related to earned premiums and cumulative loss and LAE data at the current evaluation date (i.e., December 31 of the current year) for the last 10 years in which premiums are earned and losses incurred. Earned premiums are shown by calendar year, and once they are entered in Schedule P, they do not change for retrospective premium adjustments or other adjustments. Losses are shown by:

- Accident year for occurrence policies
- Report year for claims-made policies
- Policy year for tail policies
- Discovery year for fidelity and surety policies

Accident year is defined as the calendar year in which accidents occur and/or losses are incurred. For example, a claim with a date of loss of November 13, 2018, would be a 2018 accident year claim. This reporting convention is used for occurrence-basis policies, where the trigger of coverage is the occurrence of a loss. With occurrence policies, a claim can be reported at any time after the loss occurs, subject to statutes of limitation, as long as the loss occurs during the policy term. For example, an injury that occurred 15 years ago can be reported to the insurer today, and any coverage for that injury would be provided by the terms and conditions of the policy that was in effect 15 years ago.

Report year represents the calendar year in which losses are reported. This is typically used for claims-made policies, as the trigger of coverage is the reporting of a claim or incident to the insurance carrier. In their most basic format, claims-made policies cover claims that are first made during the policy term. As a result, if a claim occurs during the policy period but is not reported by the insured during the policy term, the claim is not covered by the insurance company under the terms and conditions of the policy that was in force at the time the claim occurred. This significantly reduces the uncertainty for the insurance carrier, both for pricing and reserving, since the policy that is in effect at the time the claim is made will be the policy
providing the coverage for the claim, regardless of how long ago the incident took place (provided there is no retroactive date on the policy).

A claims-made policy may have a retroactive date that is before the effective date of the policy, the same as the effective date of the policy or it may have no retroactive date. The retroactive date is the date on or after which the incident must occur in order for it to be covered under the claims-made policy. An incident that occurs before the retroactive date will not be covered by the claims-made policy even if it is first reported during the policy period.

These types of policies are generally issued for medical malpractice, other liability, or products liability coverages because claims covered by these types of policies tend to have a long latency period. It becomes very difficult for insurance companies to project the claim frequency as well as the severity of claims and therefore difficult to price and reserve for an occurrence that will result in the reporting of a claim many years in the future.

To illustrate the concept of claims-made coverage and the concept of report year, assume a young surgeon purchases a medical malpractice policy on a claims-made basis for the term beginning July 1, 2018, and expiring on June 30, 2019. Assume that the surgeon performs a procedure on his patient on October 21, 2018, and complications arise during the surgery. If the surgeon reports the incident to his insurance carrier before June 30, 2019, and subsequently the surgeon is sued and a claim materializes, he will be covered under his policy in effect from July 1, 2018, through June 30, 2019. This would be a 2018 report year claim for Schedule P reporting purposes. If the surgeon does not report the incident because the patient did not become aware of the complications until a year later, and the claimant decides to sue the physician on August 22, 2019, the surgeon reports this claim to his carrier on August 23, 2019. He would not be covered by the policy in effect from July 1, 2018, through June 30, 2019, as the claim was not reported during the policy term. If the surgeon renewed the claims made policy, the renewal policy that is in effect from July 1, 2019, through June 30, 2020, would be the policy that covers the claim.

In general, the people or companies that purchase claims-made policies do not like to leave themselves exposed to the risk of being uninsured, despite the cost savings of a claims-made policy as compared to an occurrence policy. As a result, they generally purchase something called an extended reporting period or “tail coverage.” Tail coverage extends the reporting period of a claims-made policy for an additional period of time, which may be one to five years or an unlimited period of time past the expiration of the claims-made policy. A claims-made policy plus an unlimited extended reporting period essentially turns the claims-made policy into an occurrence policy. To illustrate using our previous example, let’s assume that the surgeon does not renew his claims-made policy and therefore purchases unlimited tail coverage on July 1, 2019, when the policy expires. This means that any accident or loss that occurred as a result of error by the surgeon during the period July 1, 2018, through June 30, 2019, would be a covered claim by the insurance company that issued the claims-made
policy regardless of when in the future the surgeon first reports the claim. Without the tail coverage, the surgeon would have no coverage for claims that he learns about on or after July 1, 2019.

Premiums and losses associated with tail policies are included in Schedule P with their associated line on an occurrence basis.

Discovery year is generally used for fidelity and surety policies, as it is difficult to determine the actual date the “loss” occurs. As the name suggests, discovery year represents the calendar year in which a loss or damage is discovered.

For simplicity, and because it is most common, we will use the term accident year in the remainder of our discussion of Schedule P, unless explicitly stated otherwise.

Note that there is also a prior years row in Schedule P, which accumulates loss and expense information into one row within each of the schedules. The prior years row shows paid (received) activity during the current year (i.e., calendar year activity) and ending reserves as of the evaluation date of the Statement. Within this chapter we provide examples of how to calculate the prior years row; it is a bit trickier than this brief explanation suggests.

Loss Adjustment Expenses

Losses are provided separately from LAE, which is separated into two components: DCC expenses and Adjusting and Other (A&O) expenses. DCC generally includes defense, litigation and medical cost containment expenses, whether internal or external, and A&O includes all expenses associated with adjusting and recording policy claims, other than those included with DCC.\(^7\) The following table summarizes the types of expenses by category.

\(^7\) Per the Official NAIC Annual Statement Instructions for 2018, DCC are defined as “those that are correlated with the loss amounts,” and A&O are defined as “those expenses that are correlated with claim counts or general loss adjusting expenses.”

</tbody>
</table>

The NAIC Instructions to the Annual Statement indicate that DCC should be assigned to accident year in accordance with the associated losses, while for A&O, “in any justifiable way, ...[t]he preferred way is to apportion these expenses in proportion to the number of claims reported, closed, or outstanding each year.” The following table illustrates this using Fictitious’ commercial automobile liability line of business as an example. Fictitious allocates its unpaid A&O for commercial automobile liability by applying the distribution of outstanding claim counts by accident year to total unpaid A&O.

78 2018 NAIC Annual Statement Instructions Property/Casualty, page 226.
Disclosure of the methodology used to allocate A&O by year is required in the interrogatories to Schedule P.

LAE wasn't always segregated between DCC and A&O. Prior to 1988, LAE were stated as either allocated LAE (ALAE) and unallocated LAE (ULAE) in the Annual Statement. ALAE is defined as claim expenses that can be specifically assigned to a particular claim, and ULAE as those that cannot. ULAE is generally associated with the cost of administering claims. The terms ALAE and ULAE are still used in practice. In fact, for reserving purposes many companies perform actuarial analyses on an ALAE/ULAE basis.

Salvage and Subrogation

Most insurance policies require the insured to transfer the right to S&S recovery upon payment of a covered claim to an insured. Salvage is typically received by insurance companies in the case of automobile claims, when the vehicle incurs physical damage that is beyond repair. Here the insurance company can sell usable parts of the vehicle, such as tires, hubcaps and engine parts, to companies that salvage damaged vehicles.

Subrogation is typically received in the case of liability policies. For example, an insurance carrier paying a claimant for liability associated with a product manufactured by an insured, may in turn attempt to recover part or all of the amount paid to the claimant from the company that made a part used in manufacturing the product.

</table>
The paid loss figures provided in columns 4 (direct and assumed loss payments) and 5 (ceded loss payments) are net of S&S received, and the unpaid losses provided in columns 13 through 16 are net of anticipated S&S, if the company reduces its reserves for anticipated S&S. We typically find that when companies take credit for anticipated S&S, they do so in the “bulk and IBNR”\(^{79}\) amounts as opposed to the “case basis” reserves. It is difficult enough to estimate reserves for known claims, let alone the amount that will be recovered for salvage and/or subrogation on those claims.

For statutory reporting purposes, insurance companies can take credit for S&S received, as well as that anticipated in its loss reserves. This means that companies can reduce their reserves by estimates of recoveries that they expect to receive in the future.

The S&S figures displayed in columns 10 (received) and 23 (anticipated) are for informational purposes only. As displayed in the formula for total net paid loss and LAE in column 11, S&S received in column 10 is not subtracted from the paid loss and LAE amounts in columns 4 through 9, as they are already reduced by the S&S received. The following illustrates the calculation on total net paid loss and LAE using data from the total line from Schedule P, Part 1 – Summary of the 2018 Annual Statement for Fictitious Insurance Company.

<table>
<thead>
<tr>
<th>TABLE 33</th>

</tr>
<tr>
<td></td>
</tr>
<tr>
<td>11</td>
</tr>
</tbody>
</table>

The S&S received figure in column 10 of Schedule P, Part 1 – Summary ($5,283 in total; 000 omitted) does not enter the above calculation, as the loss payments shown in columns 4 and 5 have already been reduced by this amount. The amount shown in column 11 is net of the S&S received amount shown in column 10.

The same goes for the total net loss and LAE unpaid in column 24; anticipated S&S in column 23 is not subtracted from the case and IBNR figures in columns 13 through 22, as it is already displayed net of anticipated S&S (if the company anticipates S&S in its recorded reserves).

\(^{79}\) Hereafter we will refer to “bulk and IBNR” simply as “IBNR.”
The following provides a similar illustration using total unpaid amounts from Fictitious’ 2018 Schedule P, Part 1 – Summary.

Column 23, which provides anticipated S&S ($1,363 in total; 000 omitted), is not included in the above calculation as the amounts in loss columns are provided on a net basis.

Composition of Loss and LAE Reserve Figures Provided in Schedule P, Part 1

The case and IBNR reserves provided in Part 1 are net of tabular discounting and gross of non-tabular discounting, up until columns 32 and 33. The amount of non-tabular discount is shown separately for loss and LAE in columns 32 and 33, respectively. For Fictitious, the amounts shown in columns 32 and 33 are zero because the Company does not discount non-tabular reserves. This is confirmed in part B of the Note to Financial Statements titled “Discounting of Liabilities for Unpaid Losses or Unpaid Loss Adjustment Expenses” (Note 32B in the 2018 Annual Statement).

The reserves shown on the Balance Sheet are provided in columns 35 and 36 for loss and LAE, respectively. These figures are on a net of reinsurance basis, and net of all discounting.

---

Tabular reserves are defined on page 159 of the 2018 NAIC Annual Statement Instructions to Note 32 of the Financial Statements as “indemnity reserves that are calculated using discounts determined with reference to actuarial tables that incorporate interest and contingencies such as mortality, remarriage, inflation, or recovery from disability applied to a reasonably determinable payment stream. This definition shall not include medical loss reserves or any loss adjustment expense reserves.”
if applicable. The sum of columns 35 and 36 will reconcile to the amount shown in column 24 reduced by the amount of discount shown in columns 32 and 33.

As we shall see in Part IV. Statutory Filings to Accompany the Annual Statement of this publication, Schedule P, Part 1 - Summary provides the source of the recorded reserve amounts that the Appointed Actuary opines upon in the Statement of Actuarial Opinion on behalf of the insurance company. The Appointed Actuary opines on the loss and LAE reserve amounts provided in columns 35 and 36, respectively, on a net of reinsurance basis, and columns 13 plus 15 and columns 17 plus 19 plus 21, respectively, on a gross of reinsurance basis. For Fictitious Insurance Company, the amounts shown in Exhibit A to the 2018 Statement of Actuarial Opinion, on which the Appointed Actuary has provided his opinion, are as follows.
TABLE 35b

</tbody>
</table>

The figures shown in Schedule P are net of intercompany pooling. As suggested by the “XXX” in column 34, Fictitious does not participate in any intercompany pooling arrangements. This can be confirmed by a reading of the Notes to the Financial Statements titled “Intercompany Pooling Arrangements” (Note 26 in the 2018 Annual Statement) for an insurance company. We will discuss the effect of intercompany pooling on Schedule P reporting in a separate section at the end of this chapter.

Incurred loss and LAE

The other items of interest in Schedule P, Part 1 are the total losses and loss expense incurred columns (26 through 28) and resulting loss and LAE ratios columns (29 through 31). The loss ratio columns are useful in assessing historical performance of the business separately on a direct and assumed, ceded and net basis. For companies with non-proportional reinsurance, the loss ratios will differ on a direct and net basis, and one can get a sense if the company is paying relatively more for the reinsurance than the direct risk. Using Fictitious as an example, we see that its incurred loss and LAE ratios differ on a direct plus assumed, ceded and net of reinsurance basis.
TABLE 36

</tr>
</tbody>
</table>

Since 2014, the Company’s ceded loss and expense ratios have been lower than its direct plus assumed ratios, thereby resulting in higher net loss ratios.

We should note that the amounts shown as “incurred” in columns 26 through 31 are on an “ultimate incurred” basis. This is an important definitional distinction from “case incurred,” and people often get the two confused, so we will walk through the definitions here.

The following equations are different ways of presenting ultimate incurreds:

Ultimate incurred loss

\[
\text{Ultimate incurred loss} = \text{Paid loss} + \text{case outstanding loss} + \text{IBNR loss}
\]

\[
\text{Ultimate incurred loss} = \text{Reported loss} + \text{IBNR loss}
\]

\[
\text{Ultimate incurred loss} = \text{Paid loss} + \text{unpaid loss}
\]

Paid losses represent those amounts paid by the insurance carrier. Case outstanding losses represent the reserve for known claims, which is generally established by the company’s claims administrators/adjusters. IBNR represents the reserve for claims Incurred But Not Reported. IBNR includes a provision for:

- Development on known claims (“case development”)
- Pure IBNR, or those claims that are incurred but not yet reported to the insurance carriers
- Reopened claims
Case development is intended to cover upward and downward movements in the reserves established by the adjusters as additional information becomes available about the claim. For example, an adjuster may establish an initial reserve for a workers’ compensation claim based on the initial injury reports from the employer or claimant’s doctor. However, subsequent medical examinations may uncover that the injury is worse than originally expected, resulting in additional cost and the need for an increase in the case reserve estimate to reserve the claim to its ultimate value.

Reported loss is equal to the amount of paid plus case outstanding; it represents the dollar value of loss known to the insurance company. The term “case incurred” is synonymous with “reported” and represents the reported value of known cases.

Unpaid loss (or loss reserve) equals the amount of case outstanding plus IBNR reserves. It represents the remaining amount expected to be paid on claims incurred by the insurance company.

Actuaries often derive an ultimate loss estimate using triangular projection methods. The amount unpaid (or loss reserve) can be derived using the above formulas by subtracting paid losses from the ultimate estimate. Similarly, IBNR can be determined by subtracting reported losses from the ultimate estimate.

Data used in actuarial projections can be derived from the information contained in Parts 2 through 4 of Schedule P, as will be discussed later in this chapter under the heading “Actuarial Projections” within the section “SCHEDULE P – PARTS 2 THROUGH 4.”

Claim Count Information in Part 1

Certain line of business subparts of Part 1 also provide claim count information that is not included in Part 1 – Summary because such information is not captured for all lines. Column 12 provides the number of claims reported, direct plus assumed. However, this column only applies to certain lines and may be left blank for others, including the Summary. The applicable lines are:

- Homeowners/Farmowners
- Private Passenger Auto Liability/Medical
- Commercial Auto Liability/Medical
- Workers’ Compensation
- Commercial Multiple Peril
- Medical Professional Liability
- Other Liability
- Auto Physical Damage
- Products Liability
- Warranty
Further, column 25 provides the number of claims outstanding, direct plus assumed. This column is completed for all lines except the nonproportional reinsurance assumed lines (Parts N, O and P) and therefore the Summary.

For those lines, including the Summary, where claim count information is not included, the corresponding columns are filled in with “XXX.”

Claim count data can be used to explore changes in ultimate loss and LAE or reserve levels or to identify changes in claims settlement or reserving philosophy. We will provide more details in our discussion of Schedule P, Part 5; however, for now we will show the meaningful relationships that can be derived from Schedule P, Part 1 for Fictitious’ Homeowners/Farmowners lines of business (Part 1A).

First, it is generally assumed that net claim counts are equal to direct and assumed counts, unless 100% of the business is ceded. The theory is that a direct claim results in a net claim, even if the value of the net claim is $0. Therefore, all ratios that we show below, both on a gross and net of reinsurance basis, are in relation to direct plus assumed counts.

Data from Schedule P, Part 1 can be used to calculate reported claim frequency, which is the relationship of reported claim counts as of December 31, 2018, to earned premium.
### TABLE 37

</table>

Table 37 can help us identify trends in claim frequency over the accident years. It is not a complete picture because claim counts are on a reported basis, as opposed to ultimate. However, for a short-tailed line of business such as homeowners, where losses are generally reported within the year in which they are incurred (i.e., accident year), it is not a bad approximation. Reported claim frequency appears to have increased in 2018 relative to both gross and net earned premiums (e.g., frequency in 2018 of 0.094 per $000 of gross earned premium versus 2017 of 0.076). This is most likely due to the high frequency of weather-related and catastrophe claims incurred by the Company during 2018.

We note that the interpretation of frequency trends using earned premium can be misleading due to the effect of rate changes. In our example, the increasing trend in Fictitious’ claim frequency relative to earned premium may be partly attributed to soft market conditions in addition to the number of catastrophe claims. Viewing claim frequency in terms of exposures (e.g., house years for homeowners) would provide a clearer comparison and enhance the ability to understand observed trends. Regardless, when investigating trends in claim frequency, consideration should be made for changes over time in a company’s mix of business (e.g., by types of exposures, geography), policy limits, reinsurance attachment points and limits, as well as the way the company counts its claims.
We can also compute the average value of reported claims by year, with each year evaluated as of December 31, 2018, using Schedule P, Part 1 data, as shown below.

</table>

We see that there hasn't been much of a trend in the average cost per reported claim since 2015, until we get to 2018. The relatively flat trend from 2015 through 2017 is most likely due to economic factors during the time period and general flattening of costs associated with the repair and rebuilding of damaged properties. Similar to the increase in frequency in 2018, the increase in claim costs is primarily attributed to an increase in the size of claims due to the catastrophic events of 2018.

Here again, the comparison does not provide a complete picture because we are comparing accident year data at different levels of maturity rather than evaluating the reported loss and claims counts at their ultimate values. As we shall see, comparisons at the ultimate level can be made by developing loss and DCC data provided in Parts 2 through 4 and claim count data provided in Part 5.

Finally, we can also show the average cost of open claims as of December 31, 2018, using Part 1 data, as provided in the Table 39:
### TABLE 39

</tbody>
</table>

What we see in Table 39 is that the case outstanding reserve values and number of open claims generally decrease with maturity (ignoring the prior years row, which is a compilation of all prior years into one line). This makes sense, as eventually all claims will be closed and the outstanding reserves will be $0.\(^{81}\) We also see that the average case reserves increase in maturity to a certain point, at which they decrease (ignoring the prior years row). This suggests that the claims that remain open after 24 months (accident year 2017 in this case) tend to be the larger dollar-valued claims. Put another way, the claims that cost the least tend to be the easiest to administer and close, while the more costly claims take longer to settle and pay out. This makes sense and is generally the case with property/casualty lines of business. As time goes on, the average case reserve for homeowners claims tends to decrease as the payments decline to closure.

The average case reserve values are lower on accident year 2018 relative to the immediately prior periods. There are still small to midsized claims, in addition to the large dollar-value claims, that remain open on the current accident year. These low-value claims suppress the average.

---

\(^{81}\) Sometimes we will see a very high severity in a mature accident year, relative to the surrounding years and the general decreasing trend with maturity. This will happen when there’s one or a small number of large dollar-valued claims outstanding.
Parts 2 through 4 provide a historical array of incurred, paid and IBNR loss and DCC, respectively. The data is provided on a net of reinsurance and net of S&S (as applicable) basis.

Similar to Part 1 – Summary, the information in the Summary of Parts 2 through 4 is provided for each of the past 10 years in which losses were incurred using the aforementioned definitions depending on the type of policies (e.g., occurrence, claims-made, tail, or fidelity and surety). The data is evaluated as of December 31 for each of the last 10 years.

Details are provided by line of business in the same breakdowns as in Part 1, with 10 accident years shown for all lines except for those lines previously mentioned (e.g., Special Property, Auto Physical Damage).

Discounting

Parts 2 through 4 of Schedule P are gross of all discounting. Therefore, the reserve amounts shown in Parts 2 through 4 will not reconcile to those provided in Part 1 for companies that discount nontabular reserves. The amount of discount is reported in the Notes to Financial Statements, which enables reconciliation between Part 1 and Parts 2 through 4.

We can illustrate this using Schedule P, Parts 1, 2 and 3, Summary for Fictitious. As displayed in Table 40b, the difference between the total net loss and DCC reserve reported in Schedule P, Part 1 and the amount indicated by subtracting the figures in column 10 of Parts 2 and 3 provides the $1.365 million of reduction for tabular discount taken in Schedule P, Part 1.

</tbody>
</table>

The amount of tabular discount included in Schedule P, Part 1 should reconcile to the amount disclosed in the Note titled “Discounting of Liabilities for Unpaid Losses or Unpaid Loss Adjustment Expenses” (Note 32 of the 2018 Annual Statement).
Actuarial Projections

The format of Parts 2 through 4 is conducive for loss development projection methods used by actuaries to assess a company’s reserve adequacy. However, actuaries tend to view the data in a slightly different format than that presented in Parts 2 through 4. Shifting all of the cells to the left so that each accident year starts with figures in column 1 transforms the data into standard triangular format used in the loss development (or “chain ladder”) method. The paid loss triangle comes directly from Schedule P, Part 3, and the case incurred loss triangle can be derived by subtracting the IBNR in Part 4 from the incurreds in Part 2. The following provides the calculation of the net case incurred (reported) triangle for Fictitious Insurance Company.

**Cautions When Using Schedule P to Assess Reserve Adequacy**

Age-to-age loss development factors can be computed from the above triangles and projections of ultimate loss and DCC made. However, we note several issues that we have observed in practice with blindly using Schedule P data to assess the adequacy of an insurance company's reserves:

- While there are Instructions to the Annual Statement and third-party companies provide software to assist insurers in preparing their Schedule P, certain allocations and presentations are left up to interpretation of the person completing Schedule P.

- Internal pooling or reinsurance agreements may have an impact on the data set, and that impact may not be readily apparent from Schedule P. For example, we have seen pooling and reinsurance arrangements on a calendar year basis, as opposed to accident or policy year, which distorts Schedule P since it is on a net (or after pool) basis.
Schedule P contains experience from a company’s participation in voluntary and involuntary pools and/or associations. Many underwriting pools report IBNR reserves as case reserves, thereby distorting analytics and projections that use case base reserves. Further, a company’s level of participation in the pool may have changed over time.

Schedule P only contains data for the last 10 accident years. Most casualty lines have experienced loss development significantly longer than 10 years. Tail development factors have to be estimated using other (external) sources, thereby increasing the uncertainty of the projections.

Commutations of reinsurance agreements can also distort an analysis of loss development using Schedule P. Commutations represent an agreement between a reinsurer and the reinsured to release all obligations under a reinsurance contract. Typically, the reinsurer will pay a lump sum to the reinsured to extinguish all future liabilities. The reinsurer’s case and IBNR reserves for the assumed contract will drop to $0 upon paying the lump sum, while the ceding company’s net reserves should increase since the ceding company can no longer take credit for the reinsurance and “reassumes” the liability.

The data triangles in Parts 2 through 4 include DCC expenses, potentially masking trends in the loss or DCC components that may impact reserve needs.

Analytics of the data, including a review of loss ratios, claim closure rates from Part 5 data, and average severities from data contained in Parts 2 through 5 can provide observations regarding trends. However, the underlying cause for these trends, and determination of their impact on future claim payments, can only be obtained through discussion with company management, including interviews with management in the pricing, underwriting and claims departments of the insurance company. Care should be taken in the interpretation of these trends absent these discussions.

This list is not intended to be all-inclusive, but rather illustrate that care should be taken when drawing conclusions about a company’s recorded reserves using Schedule P data alone.

As with any unpaid claim analysis, consideration should be made for changes in the company’s business, including but not limited to retentions, claims settlement and reserving, business mix, and underlying exposures. One of the Schedule P Interrogatories helps to address this. Interrogatory 7 asks for further explanation regarding “any especially significant events, coverage, retention or accounting changes that have occurred that must be considered” in using Schedule P data to assess reserve adequacy.
Hindsight Tests from Part 2

Part 2 represents ultimate incurred loss and DCC by accident year, recorded by the company at the end of each of the last 10 years. Part 2 is particularly useful as it shows how the company’s estimates of ultimate loss and DCC have fared over the past year and past two years, as displayed in columns 11 and 12, respectively. The figures in column 11 provide the change in ultimates over the past year (column 10 minus column 9) for all accident years prior to the current accident year. Column 12 provides the change in ultimates over the past two years (column 10 minus column 8) for all but the most recent two accident years.

The totals of the figures in columns 11 and 12 of Part 2 - Summary reconcile directly to the current calendar year figures in column 1, lines 73 and 75 respectively, of the Five-Year Historical Data exhibit within the Annual Statement. This is illustrated below for Fictitious Insurance Company using the 2018 Annual Statement:

<table>

While the absolute dollar amount of development is useful, it is valuable to view loss development in relation to prior year reserves from which the development has emerged, as well as on prior year surplus. For Fictitious, the $0.875 million of favorable development represents less than 1.8% of prior year reserves totaling $49.445 million. This means that, with perfect hindsight, company management would have established reserves at $48.570 million ($49.445 million minus $0.875 million).

In Part IV, Statutory Fillings to Accompany the Annual Statement of this publication, we discuss loss development as a ratio to surplus in further detail. This is a measure used by the NAIC IRIS. For now, we will simply state that the $0.875 million of favorable development represents less than 2.8% of policyholders’ surplus as of December 31, 2017, totaling $31.608 million per column 2, line 37 of page 3 of the company’s 2018 Annual Statement.

A benefit of Part 2 is that it provides further insight into the observed development. The development across all accident years may be negligible in aggregate; however, there may be large increases or decreases in certain accident years or lines of business that warrant further investigation.

As displayed above, Fictitious Insurance Company experienced favorable development in 2018, totaling $0.875 million on prior accident years. We see that the favorable development on accident years 2009 through 2016 was somewhat offset by adverse development on the prior accident years and the current accident year. This is where the actuary becomes a detective to uncover the cause of the development.

- First, when we see adverse development in the prior accident years, we might first look to the longer-tailed casualty lines as the culprit. Schedule P, Parts 2A through 2T

---

82 The net loss and DCC reserve of $49.4 million as of December 31, 2017, was computed by subtracting column 9 in Schedule P, Part 2 – Summary from column 9 in Schedule P, Part 3 – Summary (i.e., ultimate incurred minus paid = unpaid). This was done to put the reserve amount on the same basis as the development amount, both of which are undiscounted.
provide net incurred loss and DCC development for each of the Schedule P lines of business.

- Second, when we see adverse development on the “all prior” years, and then a consistent trend of favorable development, we question the difference between the exposures in the prior accident years versus those in the subsequent accident years. Generally speaking, if the exposures underlying the prior years were consistent with those in subsequent accident years, we would expect the adverse development to flow through to the current years as well.

Once we identify the line of business, we could look to other areas of the Annual Statement for guidance. For example, we can turn to the Notes to the Financial Statements, in particular “Changes in Incurred Losses and Loss Adjustment Expenses” (Note 25 of the 2018 Annual Statement) for further details. This Note provides management’s explanation for development during the year. This may lead to review of additional notes, such as the note titled “Asbestos/Environmental Reserves.” Oftentimes when we see adverse development isolated to the prior years row, we look to see if it stems from asbestos and environmental (A&E) claims activity.⁸³

While the line of business details in Parts 2A through 2T and Notes to the Financials provide further insight into the source of loss development, they do not substitute the value of a conversation with management of the insurance company. Management can provide further color around the causes of development that pure numbers and notes cannot.

Prior Years Row

The calculation of the prior years row in Schedule P, Parts 2 through 4 can be a bit cumbersome and confusing. The easiest way to explain the calculation is to start backwards, providing the source of the prior years row for Schedule P, Part 4, and then work our way to the details underlying the computation of Part 3, and then Part 2.

Prior Years Row – Part 4

The prior row in Part 4 is the most straightforward. It is simply the amount recorded by the company for bulk and IBNR reserves for all accident years prior to the most recent 10. This amount is determined by the company’s management and recorded in Part 4, as are the amounts for all subsequent accident years.

One can reconcile the prior year balances at each evaluation date (i.e., across the columns) to Schedule P, Part 1 of the current and prior year Annual Statements. Specifically, the amount in column 15 (direct and assumed bulk + IBNR loss) minus 16 (ceded bulk + IBNR loss) plus 19

⁸³ There is considerable uncertainty around the reserving for these types of claims due to the length of time between exposure to manifestation of disease that gives rise to a claim. As such, the industry has experienced considerable adverse development on reserves established for these claims over the years.
(direct and assumed bulk + IBNR DCC) minus 20 (ceded bulk + IBNR DCC) of Schedule P, Part 1, should equal the last number in column 10 of the prior row in Part 4 after adjusting for any tabular discount. The following provides the calculation for Fictitious for 2018.

**TABLE 44a**

Prior Years Row – Part 3

As discussed previously, Part 3 provides cumulative paid loss and DCC for the latest 10 accident years, evaluated as of the end of each of those years. The prior row for Part 3 also provides cumulative paid data; however, it does not start with the cumulative payments from the first year that the company wrote business. Rather, it shows the payments that have occurred on loss and DCC reserves as of the earliest evaluation date in the table, for all prior accident years. Only payments made subsequent to the establishment of reserves as of the earliest evaluation date in the table are shown. The 2018 Annual Statement for Fictitious shows the prior row for Part 3 as the following.

---

84 The amount of tabular discount shown in the table is derived from the data in Fictitious’ Schedule P by taking the bulk and IBNR in the prior years row from Part 4 minus the corresponding amount in Part 1.

</tbody>
</table>

The amount of $9,061 in column 2 represents net amounts paid in 2010 on net loss and DCC reserves established by the Company as of December 31, 2009. The amount shown in column 3 of $13,830 represents net amounts paid since year-end 2009 on net loss and LAE reserves as of December 31, 2009, for all prior accident years. This continues all the way until 2018, where the amount of $30,210 represents net amounts paid since year-end 2002 (through year-end 2018) on net loss and DCC reserves as of December 31, 2009, for all prior accident years.

Only loss and DCC payments on reserves evaluated as of the earliest evaluation date (December 31, 2009, in our example) are shown in the prior row. As a result, the balance in the first column is always zero.

The calculation of the prior row in Part 3 is done by computing the incremental payments subsequent to the earliest evaluation date (2009 in our example) for both the prior and first subsequent accident year from the previous year’s Schedule P, Part 3 (2017 in our example). The following provides this calculation using Part 3 from the 2017 Schedule P for Fictitious.
### TABLE 46

Data from 2017 Annual Statement for Fictitious Insurance Company, Schedule P — Part 3 — Summary
Cumulative Paid Net Losses and Defense and Cost Containment Expenses Reported at Year-End (000 omitted)

<table>
<thead>
<tr>
<th>Years in Which Losses Were Incurred</th>

<td>14,424</td>
<td>14,714</td>
<td>14,908</td>
<td>15,124</td>
</tr>
</tbody>
</table>

As displayed above, the starting point for the calculation is the first two rows (prior and 2008) of Part 3 of the Fictitious 2017 Annual Statement. To calculate the prior years row for Part 3 of Fictitious’ 2018 Annual Statement, the difference between amounts in each column and the amounts in column 2 (2009) is computed. The prior and subsequent accident year (2008) payments are then added together to produce the new prior row for Part 3 of the Company’s 2018 Schedule P.

For example, cumulative net paid loss and DCC for column 2 (2010) are calculated as:

\[
14,960 - 8,238 + 10,637 - 8,297 = 6,722 + 2,340 = 9,061^{85}
\]

---

As displayed above, the starting point for the calculation is the first two rows (prior and 2008) of Part 3 of the Fictitious 2017 Annual Statement. To calculate the prior years row for Part 3 of Fictitious’ 2018 Annual Statement, the difference between amounts in each column and the amounts in column 2 (2009) is computed. The prior and subsequent accident year (2008) payments are then added together to produce the new prior row for Part 3 of the Company’s 2018 Schedule P.

For example, cumulative net paid loss and DCC for column 2 (2010) are calculated as:

\[
14,960 - 8,238 + 10,637 - 8,297 = 6,722 + 2,340 = 9,061^{85}
\]

---

85 Minor differences due to rounding.
As another example, the cumulative net paid loss and DCC for column 10 (2017) are calculated as:

\[30,519 - 8,238 + 15,124 - 8,297 = 22,281 + 6,827 = 29,108\] \(^{86}\)

Prior Years Row – Part 2

As discussed previously, Part 2 provides cumulative ultimate incurred loss and DCC for the latest 10 accident years, evaluated as of the end of each of those years. The prior row for Part 2 also provides cumulative incurred data; however, it does not start with the cumulative incurreds from the first year that the company wrote business. Rather, it starts with the net loss and DCC reserves recorded by the Company as of the earliest evaluation date in the table and includes this amount in column 1 of Schedule P, Part 2. For example, using Schedule P, Parts 2 through 4, Summary, of the 2017 and 2018 Annual Statements for Fictitious Insurance Company, we see that column 1 of the prior row in the 2011 Schedule P, Part 2, is equal to the sum of the following amounts in column 2 (labeled “2009”) from the 2017 Annual Statement (USD in 000s).

<table>
<thead>
<tr>
<th>TABLE 47</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data from 2017 Annual Statement</strong></td>
</tr>
<tr>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>2018 Annual Statement</th>
<th><strong>2009</strong></th>
<th><strong>Source</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule P – Part 2 – Summary, Prior Years row</td>
<td>35,994</td>
<td>Line 1</td>
</tr>
</tbody>
</table>

\(^{86}\) Minor differences due to rounding.
As displayed above, the amount in column 1 of the prior row in 2018 Schedule P, Part 2, Summary is $35,994.87

Then, amounts in columns 2 and subsequent are equal to the ending reserves (case plus bulk plus IBNR reserves) as of each corresponding year-end, plus the paid from the corresponding prior row in Schedule P, Part 3. This is shown below for Fictitious:

| TABLE 48 |
| Data from 2018 Annual Statement for Fictitious Insurance Company, Schedule P — Parts 2 through 4 — Summary |

<table>
<thead>
<tr>
<th>Prior Years Row, Net Loss &amp; DCC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Years in Which Losses Were Incurred</td>
</tr>
<tr>
<td>Prior Paid from Part 3</td>
</tr>
<tr>
<td>Prior Case Outstanding from Part 2 — Part 3 — Part 4</td>
</tr>
<tr>
<td>Prior Bulk + IBNR from Part 4</td>
</tr>
<tr>
<td>Total Prior Unpaid (Case + Bulk + IBNR)</td>
</tr>
<tr>
<td>Prior Incurred Loss = Paid + Unpaid</td>
</tr>
</tbody>
</table>

As displayed above, the case outstanding plus bulk plus IBNR reserves in the prior rows, derived from Parts 2 through 4, are summed and then added to the corresponding cumulative paid since 2010. This produces the “incurred” on all prior accident years, as shown in Schedule P, Part 2.

All the examples above are provided for the Summary of Schedule P, Parts 2 through 4, with the calculation being the same for all of the lines of business in Parts 2A through 2T.

87 Minor differences due to rounding.
Prior Years Row – Fictitious 2017 Annual Statement

For completion, and so that a reconciliation can be made of the amounts shown in Table 48 for 2017, the following provides the prior years and 2008 rows from Schedule P, Parts 2 and 4 from Fictitious’ 2017 Annual Statement.

As a reminder, Part 3 from Fictitious’ 2017 Annual Statement is shown in Table 46.

**Claim Counts**

Part 3 also provides the number of claims closed with and without loss payment in columns 11 and 12, respectively. These figures are provided only for those lines where this information is provided in Part 5 (see below); these figures are not shown in the Summary.

**SCHEDULE P — PART 5**

Part 5 is provided in the following three sections, which are provided by accident year as of the last 10 year-end evaluations on a direct plus assumed basis:

- **Section 1**: Cumulative number of claims closed with loss payment
- **Section 2**: Number of claims outstanding
- **Section 3**: Cumulative number of claims reported
Part 5 is provided for the following lines of business:

A - Homeowners/Farmowners  
B - Private Passenger Auto Liability/Medical  
C - Commercial Auto Liability/Medical  
D - Workers’ Compensation  
E - Commercial Multiple Peril  
F - Section A - Medical Professional Liability - Occurrence  
F - Section B - Medical Professional Liability - Claims-Made  
H - Section A - Other Liability - Occurrence  
H - Section B - Other Liability - Claims-Made  
R - Section A - Products Liability - Occurrence  
R - Section B - Products Liability - Claims-Made  
T - Warranty  

No summary is provided for Part 5.

As noted, claim counts can assist the user in identifying trends or changes in the way claims are settled and reserved. However, caution should be made in relying solely on the analytics without discussion with company management, ideally management within the claims department of the insurance company. There is inconsistency in the way that companies record and report claim counts, and sole reliance on the data without confirmation with management can be misleading. One known inconsistency is that some companies record claims on a per-claim basis and others on a per-claimant basis. As we shall see later in this chapter, the Interrogatories of Schedule P require that companies disclose the method for recording claim counts.

Actuaries can derive many statistics from the data contained in Part 5. In the following paragraphs we discuss the most common claim count statistics used by actuaries, as well as other uses of Part 5.

Claim Closure Rates

These represent the ratio of closed claims to total reported claims. The ratio can be computed as all closed claims, or only those claims closed with payment, divided by reported claims. This relationship, in particular when viewed in the current accident year in comparison to prior accident years during the first 12 months of a development, helps to identify any changes in the rate at which claims are settled (closed).

---

88 The line of business section headings change from 1 and 2 to A and B in Part 5, due to the naming of Sections 1 through 3 herein.
89 Business reported as an aggregate write-in for other lines of business in the State Page is included here (either as occurrence or claims-made, depending on the coverage written).
We often hear claims adjusters say, “The best claim is a closed claim,” the reason being that the longer a claim stays open, the greater the likelihood it will develop adversely and cost the insurer more money. A closed claim significantly reduces that potential, in most cases to zero.\(^9\) Closed claims also benefit the insured by allowing the insured to receive medical treatment, repair damaged property and recover from the loss. Claims departments look for ways to increase claim settlement rates to achieve this mutual benefit.

Despite the benefits of such improvements, they can have an adverse effect on the projection of unpaid claims if not explicitly taken into consideration. Take for example the situation where a company has implemented a new strategy to increase claim settlement rates in the current year. This will result in higher than average claim payments being made in the current year and will cause the paid loss development factors at the latest evaluation date (i.e., last diagonal) to be higher than in prior evaluation dates along the diagonals. Giving weight to this higher factor in the application of loss development factors to paid losses (that are themselves higher than normal) will result in the over-projecting of ultimate losses and therefore the overestimate of unpaids.

Similarly, a claims department may also experience a reduction in claim settlement rates for numerous reasons, such as reductions in staffing levels, growth in a book without a commensurate increase in claim staff, or influx of claims resulting from the occurrence of a catastrophe, among others. A reduction in claim settlement rates could result in underestimating unpaid claims because the last diagonal of loss development factors and current evaluation of paid losses are suppressed relative to prior years.

A review of claim closure rates will help to identify these trends, thereby enabling the actuary to consider the impact on the analysis of unpaid claims.

Table 50 shows the triangle of claim closure rates for Fictitious’ homeowners line of business.

---

\(^9\) There is always the chance that a claim could reopen.

</table>

The above was computed by taking total reported counts in Section 3 of Part 5A and subtracting the open counts in Section 2 to compute a triangle of closed counts. We then took the resulting closed count triangle and divided by the reported count triangle in Section 3.

Depending on the line of business, generally, only the first two to three columns are relevant to the actuary, as claim adjusters tend to have the biggest impact on claim settlement in the first couple of years of development. After that, it is often difficult to have a widespread effect on the open claims. For a short-tailed line of business such as homeowners, actuaries will tend to focus on the first 12 months in the above triangle. The following provides a graphic depiction of the first 12 months of settlement rates.
From the chart we see a slight uptick in the claim settlement rates since 2016. While the change is relatively benign, it would be important to talk to Fictitious’ management to see if there are any internal or external changes that might impact the rate at which homeowners claims are being settled. Additionally, it would be interesting to inquire as to the changes that occurred in 2011 and 2012, as there appears to have been a large drop in the rate at which claims were being closed. If, for example, there was an uptick in weather-related claims during 2012, it may be that Fictitious’ claims department had some difficulties keeping pace with the large number of claims reported during 2012.

Closed With Pay (CWP) Ratios

These represent the ratio of CWP claims to total closed claims. Companies may experience changes in the rate that claims are closed without payment. It is important for the actuary to understand the implications of changes in CWP rates on the unpaid claim analysis. While an increasing trend in CWP rates is generally a good sign, it may result in increases in reopened claims in the future or have other effects that are not easily discernible in the loss data.

Table 52 provides the ratio of claims closed without payment to total closed claims for Fictitious. While we can show the ratio of CWPs as well, which is simply one minus the ratios shown within Table 52, we thought the ratios of closed without pay more clearly highlights some changes in the Company’s experience.

</table>

As displayed above, there appears to have been a drop in claims closed without pay between the 2011 and 2013 accident years from around the 15% level at 12 months of development to about the 8% level for accident years 2013 through 2017 at 12 months. There seems to be a further decline in accident year 2018, although to a much lesser degree. Inquiries would have to be made of company management to understand the cause for these trends and ascertain the impact on future loss and LAE development.

Claim Frequency

The rate of claim frequency can be determined using Schedule P data by dividing claim counts in Part 5 by earned premiums in Part 1. This can be useful in identifying changes in the rate claims are closed and reported relative to the exposure. However, we note that the exposure here is influenced by rate changes. Therefore, similar to loss ratios, these rates can go up or down depending on pricing changes. Schedule P does not provide the raw exposure base (e.g., home years for homeowners, car years for auto, payroll or employee count for workers’ compensation). As a result, one cannot identify pure loss cost trends using this data without making manual adjustments for changes in rate.

Average Claim Severities

In addition to providing statistics based solely on counts, the actuary can also analyze severities using the loss data from Parts 2 through 4 and the count data in Part 5. The actuary can analyze the following:
average closed claim severities, which are computed as the ratio of net paid loss and DCC to direct plus assumed claims closed with payment (or total closed claim counts). The numerator in the equation comes from Schedule P, Part 3, and the denominator comes from Schedule P, Part 5, Section 1 (or Section 3 minus Section 2 for total closed claim counts).

- Average case outstanding severities, which are computed as the ratio of net case outstanding loss and DCC to direct plus assumed open counts. The numerator in the equation comes from Schedule P, Part 2 minus Part 3 minus Part 4, and the denominator comes from Schedule P, Part 5, Section 2.

- Average reported claim severities, which are computed as the ratio of net reported loss and DCC to direct plus assumed reported counts. The numerator in the equation comes from Schedule P, Part 2 minus Part 4, and the denominator comes from Schedule P, Part 5, Section 3.

The above enables the actuary to identify trends in the cost of insurance claims. Such trends may be inflationary, a result of law changes, attributed to one-time catastrophic claims, due to changes in deductibles or retentions, or caused by internal factors, among others.

As with claim counts, actuaries generally look for changes in the first few years of development, as these changes tend to have the biggest impact on reserve levels.

A review of average case reserves is particularly useful to the reserving actuary. Changes in case reserve levels may be a sign that the company has strengthened or weakened its case reserves. For example, if we were to compute a triangle of average case outstanding severities and observe a decrease along the last diagonal relative to the prior diagonal, then that may be a sign that the company has weakened its case reserves. Of course, this observation would warrant discussion with the company’s claims department. However, assuming there was a weakening in case reserves, use of the reported loss development method to project unpaid loss, without adjustment to reflect the weakening, may understate the reserve need.

To be more specific, loss development methods assume that the past is predictive of the future. When a company weakens reserves, the reported losses are at a lower level than they had been at the past. Therefore, application of prior average loss development factors to current, lower loss amounts, will tend to understate the ultimate loss estimate and therefore the reserve need. The effect is similar to what happens to development methods using paid

---

91 The last diagonal represents average case outstanding reserves corresponding to the accident years in the left most column, as of the current evaluation date, which is December 31, 2018 for Fictitious. The prior diagonal is one year prior to the current evaluation (i.e., December 31, 2017 for Fictitious).
loss data when there has been a change in the rate claims are being closed. A decrease in claim settlement rates (i.e., “slowdown”) along the last diagonal will result in an understatement of the reserve need absent adjustment to the paid loss triangle or paid loss development methods. The opposite can happen when there has been a strengthening in case reserves or a speed-up in claim settlement. While not the topic of this publication, there are loss reserving methods that explicitly adjust for changes in case reserve adequacy and claim closure rates, such as those described in the Berquist-Sherman paper.92

Table 53 provides the average case outstanding reserves for Fictitious’ homeowners line of business:

</table>
Looking down the column at the first 12 months, we see a significant increase in case reserve between 2012 and 2013. This is a bit more obvious graphically. The following provides the change in average case reserves, from one accident year to the next, going down the 12-month development column.

A large spike is seen in 2013. The approximate 56% increase was computed by taking the average case outstanding severity for accident year 2013 of $14,571 and dividing by the average for accident year 2012 of $9,360 to obtain the year-over-year change of 1.56 (+56%).

Despite the large increase in 2013 and subsequent sharp decline in 2015, the year-over-year trend rates in the first 12 months of development appear to have been on a slight decline from 8% to 4% between 2016 and 2018.

As previously mentioned, the value of these analytics is to identify trends and generate discussion with management so that the actuary can appropriately consider them in the analysis of unpaid claims.

Reasonableness Tests

In addition to the raw trends, actuaries also use Part 5 data to provide checks on the reasonableness of unpaid claim estimates. For example, actuaries can compute the following statistics and compare the results to see if the trends across the accident years are in alignment with what they expect:
• Average claim frequency —the ratio of the ultimate claim count estimate by accident year to the corresponding earned premium

• Average ultimate severity —the ratio of the ultimate loss and DCC estimate by accident year to the corresponding estimate of ultimate claim counts

• Average unpaid claim severity —the ratio of the unpaid loss and DCC estimate by accident year to the corresponding estimate of unpaid claims

The above can be computed using direct plus assumed loss and DCC estimates in addition to the net estimates.

Uses of Part 5 in Estimating Unpaid Claims

Before turning to Part 6, we should add that actuaries also use Part 5 for purposes of projecting ultimate loss and DCC estimates. These methods are referred to as “counts and averages” methods. Projections are made by developing average paid and reported loss severities to ultimate and applying them to estimates of ultimate claim counts using closed and reported claims count development methods. These methods can be valuable when adjusting for observed trends in each of their specific components.

SCHEDULE P —PART 6

Part 6 provides cumulative premiums earned as of December 31 for each of the last 10 calendar years. The first year of report includes premiums earned in the calendar year. Moving left to right, subsequent years show premiums earned after positive or negative adjustments from premium audits, retrospectively rated policies, lags in reporting or accounting for premiums, among others. Part 6 provides the information needed to develop earned premium to its ultimate amount using methods similar to those used to develop ultimate loss and DCC (i.e., using traditional, triangular development methods). Part 6 is provided for the following lines of business, as these lines tend to be the ones subject to the aforementioned adjustments:

C – Commercial Auto Liability/Medical
D – Workers’ Compensation
E – Commercial Multiple Peril
H – Section A – Other Liability – Occurrence
H – Section B – Other Liability – Claims-Made
M - International

93 Business reported as an aggregate write-in for other lines of business in the State Page is included here (either as occurrence or claims-made, depending on the coverage written).
The premium displayed in Part 1 of Schedule P is that which is earned during each specified calendar year; it is not updated for subsequent adjustments to the specified exposure year premium. It is equal to the left-most diagonal in Part 6 plus adjustments that come through during the specified calendar year to premiums on prior exposure years. Adjustments made after the first year of report are included in the appropriate column of Part 6.

Workers’ compensation provides a good example of a line that is subject to premium adjustment. At inception, the premium charged for a workers’ compensation policy is determined by applying a rate to an estimate of the payroll (exposure) for the policy term. At the end of the year, or shortly thereafter, the actual payroll is known. The insurance carrier, however, has determined its premium earnings on the basis of the estimated premium. As a result, the premium figure will change from its initial amount, and this change is recorded in Part 6.

Additionally, the exposure base used to determine the premium can be subject to audit by the insurance carrier. For example, an insurance company can verify that payroll amounts used in determining an insured’s workers compensation premium, or revenue figures used in computing an insured’s general liability premium, are accurate and complete. Differences uncovered through these audits will emerge as premium development in Part 6.

The one area where we tend to see the most development on earned premium is retrospectively rated insurance policies. Under these policies, the insured is charged a base premium that is adjusted over time based on the insured’s loss experience based on a formula. The formula incorporates tax multipliers and expense factors and typically imposes a minimum and maximum premium amount.

Insurance companies record the claim experience associated with retrospectively rated insurance policies within Schedule P, and the loss reserve estimates typically include a provision for these claims. Without adjustment for the additional premium income expected under these policies, a company’s surplus would be understated. This adjustment comes in as

---

94 Property includes fire, allied, ocean marine, inland marine, earthquake, group, credit and other A&H, auto physical damage, boiler and machinery, burglary and theft and international property.

95 Liability includes farmowners, homeowners and commercial multiperil; medical professional liability workers’ compensation; other liability; products liability; auto liability; aircraft (all peril); and international liability.

96 Financial includes financial guaranty, fidelity, surety, credit and international financial.
an asset on line 15.3 of page 2 of the Annual Statement titled “Accrued Retrospective premium.”

Estimates of future premium can be determined by developing the earned premiums in Part 6 using development methods. However, as with reliance on the rest of Schedule P for projection purposes, exclusive reliance on Part 6 should not be made without having a good understanding of its contents.

SCHEDULE P —PART 7

Part 7 is optional and completed only by those companies using the loss sensitive adjustment in the RBC calculation. It provides premium and loss information on loss sensitive contracts. It is broken into two parts: A for Primary Contracts (i.e., direct written business) and B for Reinsurance Contracts (i.e., assumed business). Parts A and B each have the same five sections:

- Section 1 provides net loss and LAE unpaid and net written premium on loss sensitive contracts, relative to all contracts written by the company, for each Schedule P line of business in total.
- Section 2 provides incurred loss and DCC reported at year-end on loss sensitive contracts in the same format as Schedule P, Part 2.
- Section 3 provides loss and DCC IBNR at year-end on loss sensitive contracts in the same format as Schedule P, Part 4.
- Section 4 provides net earned premiums reported at year-end on loss sensitive contracts in the same format as Schedule P, Part 6.
- Section 5 provides net reserves for premium adjustments and accrued retrospective premiums for each of the last 10 years in which the policies were issued, evaluated at each of the last 10 years.

The information provided in Part 7 is on a policy year basis.

As noted, the primary use of this exhibit is for RBC purposes. The Reserve RBC and Written Premium RBC are adjusted to reflect the fact that loss experience under loss sensitive contracts is shared in whole or in part with the insured. As such, the risk of adverse loss development is also shared with the insured. The insurance company receives a discount to its RBC reserve charge to reflect this reduction in risk. This discount is computed separately by line of business. Columns 3 and 6 of Schedules A and B provide the percentage of loss and LAE reserves and written premiums by line of business for loss sensitive contracts. Column 3 provides the distribution of reserves, and column 6 provides the distribution of net written premium.

Examples of how this information is used in computing RBC are contained in Part IV. Statutory Filings to Accompany the Annual Statement of this publication.
SCHEDULE P INTERROGATORIES

The Schedule P Interrogatories are a series of seven questions that the insurance company is required to answer to provide further insight into the information reported in Schedule P. We will briefly discuss those interrogatories that are most widely referred to by property/casualty actuaries.

Question 1 pertains to extended reporting endorsements (EREs) arising from death, disability or retirement (DDR). EREs essentially turn a medical professional liability claims-made policy into an occurrence policy upon the policyholder’s death, disability or retirement. In the 1990s, DDR endorsements were issued for free and known as “free tail coverage” as a marketing effort by medical insurers to attract physicians. Many such DDR extended reporting period endorsements are still offered for free.

Question 1 has six parts, the first of which pertains to whether the company issues such endorsements for free or at a reduced rate. The remaining five parts serve to identify where and how the company reports the DDR reserve: as unearned premium or loss reserve, claims-made or occurrence, etc. The main point is to make sure these policies have been reserved for somewhere in the company’s financial statements, either as losses or unearned premium.

Question 2 asks whether LAE are reported as DCC and A&O as per the definitional change effective January 1, 1998. This is relevant to the actuary or other user who may be relying on Schedule P data to perform reserve adequacy tests.

Question 4 requires disclosure on whether the company’s recorded loss and LAE reserves are net of non-tabular discount and reminds the preparer of the Annual Statement that:

- Disclosure of non-tabular discount must be included in the Notes to Financial Statements.
- Discounting is only allowed if the company has permission from its state insurance regulator.
- Schedule P must be prepared gross of non-tabular discounts, with the amount of discount reported in Schedule P - Part 1, Columns 32 and 33.
- Support for the amount of discount must be available for regulatory review upon request.

In question 6, the company is required to indicate whether the company reports claim counts on a per-claim or per-claimant basis in Schedule P. This, along with whether the reporting convention has changed over time, is relevant in interpreting trends in claim frequency and severity. It is also relevant when assessing reserve adequacy using counts and averages (frequency and severity) methods.

Question 7 is the most important and aligns most directly with the use of Schedule P. It asks if there are any changes or if there is anything special that the user should be aware of if the
user decides to rely on the data provided in Schedule P to assess the adequacy of the recorded loss and LAE reserves. If the answer is yes, disclosure of such is required.

INTERCOMPANY POOLING AND SCHEDULE P

It is important to know that intercompany pooling differs from intercompany reinsurance.

According to SSAP No. 63, “Intercompany pooling arrangements involve establishment of a conventional quota share reinsurance agreement under which all of the pooled business is ceded to the lead entity and then retroceded back to the pool participants in accordance with their stipulated shares.”

Under intercompany pooling, business underwritten by affiliated insurance companies is consolidated by the “lead” company and the premiums, losses and related expenses are shared based on a fixed and predetermined percentage per the agreement.

Intercompany reinsurance refers to a transaction whereby one company (the reinsurer) agrees to indemnify the other (the ceding company) against all or part of the loss that the latter may sustain under the policies that it has issued. Intercompany reinsurance is accounted for in the same way as third-party reinsurance, subject of course to statutory accounting rules. Very broadly, cessions to affiliated reinsurers under straight reinsurance agreements serve to reduce gross premiums, losses and related expenses.

The treatment of intercompany pooling in Schedule P is different from that of a typical reinsurance agreement. Gross losses are combined or “pooled” and then shared based on the pooling percentage of each member company, regardless of the policy issuing entity. Net losses are treated in the same manner in that they are first pooled and then shared based on each company’s pooling percentage. Very simply, assume Companies A, B and C participate in intercompany pooling, with 60%, 20% and 20% participation, respectively. If each company has $100 of loss reserves on a direct basis and cedes $30 to outside reinsurers, the recorded reserves in Schedule P of Companies A, B and C would be $180, $60 and $60 on a gross of reinsurance basis and $126, $42 and $42 on a net of reinsurance basis, respectively. That is, the pooled gross ($300) and net amounts ($210) are shared based on each company’s participation rates. This is summarized in Table 55.

---

While Schedule P for companies that operate under an intercompany pooling arrangement is prepared on a pooled basis, as exemplified above, other schedules and exhibits within the Annual Statement treat intercompany pooling as if it is a typical reinsurance arrangement. Therefore, using the above example, if Company A were the lead in the intercompany pool, then Company A would have $100 in direct loss reserves, plus $70 assumed from each of Companies B and C, for a total of $240 in gross reserves. The $70 in assumed loss reserves from each non-lead company is after cessions to outside reinsurance.

For each non-lead company, the amount of gross loss reserves is $100 in direct reserves plus the amount assumed after the lead company cedes through the intercompany reinsurance relationship. The amount of business in the intercompany pool is $300 of direct loss reserves minus $90 (=$30*3) of ceded business, for a total of $210 net reserves. The $210 pooled net loss reserve is shared 60%, 20%, 20%, so each non-lead gets $42. Thus, the total gross loss reserves for each non-lead is $100 in direct plus $42 of intercompany pooled loss reserves for a total of $142. These amounts are summarized in Table 56.

### TABLE 56

<table>
<thead>
<tr>
<th>Company A (Lead)</th>
<th>Company B (Non-Lead)</th>
<th>Company C (Non-Lead)</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Gross</td>
<td>240</td>
<td>142</td>
<td>142</td>
</tr>
<tr>
<td>Total Net</td>
<td>126</td>
<td>42</td>
<td>42</td>
</tr>
</tbody>
</table>

Notice that on a net basis, the amounts are the same in all of the exhibits and schedules within the Annual Statement. However, on a gross basis, exhibits and schedules other than Schedule P essentially double count the cessions to intercompany pooling, whereas Schedule P nets them out.

The fact that Schedule F does not show IBNR on an assumed basis, the double counting effect of pooling, as well as the fact that some companies have other intercompany reinsurance relationships outside the intercompany pooling relationship, complicates the reconciliation.
between Schedules within the Annual Statement to Schedule P. This is the main reason we have not used Fictitious in our examples.

We used loss reserves in our example. However, it is important to note that pooling percentages apply to the premium, loss, expense and claim count data within Schedule P. Therefore, all figures provided in Part 1 and the triangles provided in Parts 2 through 7 are provided after intercompany pooling. If one wanted to determine total premium, loss, expense and/or claim count data for the pool in aggregate, all one would need to do is divide the figures in Schedule P for a pool member by its intercompany pooling percentage in Schedule P, Part 1, column 34.

Intercompany pooling percentages can change over time, based on a particular group's business strategy. Schedule P is generally restated retroactively when there is a change in intercompany pooling.

Ignoring differences in underwriting expense structure, underwriting income for members of an intercompany pool is shared based on their respective pooling percentage. Each company will likely have its own underwriting expense structure, as well as structure for investment and other income, therefore policyholders’ surplus will differ by company and may not align with the companies’ particular pooling percentages. However, pooling percentages are generally determined with consideration of the level of policyholders’ surplus at the legal entity level; in general, the larger the surplus, the greater the share.

As with reinsurance, companies use intercompany pooling for surplus relief. Under intercompany reinsurance, an individual company provides the relief. Under intercompany pooling, the members of the pool utilize the capital and surplus of all the companies, rather than each individual company.

Actuaries often think of intercompany pooling as advantageous over intercompany reinsurance, given that the unpaid claim analysis for both gross and net reserves can be calculated on pooled (combined) basis, as opposed to having to perform separate analyses of gross reserves for each entity. However, many companies use intercompany reinsurance as opposed to intercompany pooling.

In general, intercompany pooling should be easier to administer than having to maintain separate intercompany reinsurance agreements between affiliates. Over time, one table of pooling percentages can be updated as things change, therefore intercompany pooling can be more flexible. Intercompany pooling also makes it easier for a rating agency to review the financial condition of a group and assign a single rating. The group can then market its rating across all member underwriting companies. We expect that intercompany pooling would also facilitate regulatory review at a group level versus each individual company.
PART IV. STATUTORY FILINGS TO ACCOMPANY THE ANNUAL STATEMENT

INTRODUCTION TO PART IV

Insurance companies are required to file numerous documents with state insurance regulators each year, either included within or supplemental to the Property/Casualty Annual Statement. These annual filings include those listed in the Official NAIC Annual Statement Instructions Property/Casualty, such as the Statement of Actuarial Opinion (SAO), Actuarial Opinion Summary Supplement (AOS), Supplemental Compensation Exhibit, Insurance Expense Exhibit (IEE), Supplemental Investment Risks Interrogatories, Financial Guaranty Insurance Exhibit and others such as the National Association of Insurance Commissioners (NAIC) Insurance Regulatory Information System (IRIS) ratio and Risk-Based Capital (RBC) calculation. Many of these filings serve as a means for regulators to obtain a relatively quick view of an insurance company’s financial health, thereby enabling regulators to prioritize those insurance companies requiring immediate attention.

This section addresses the filings that tend to be used the most by property/casualty actuaries, namely:

- SAO
- AOS
- IEE
- RBC
- IRIS

We will discuss the purpose and important aspects of each filing. Many of these filings are addressed in considerable detail in other publications, and the NAIC has issued instructions, manuals and/or software applications that provide the preparer of these filings with authoritative guidance. This section is not intended to replace those readings or provide instructions on how to prepare those filings. Rather, we will limit our discussion to the purpose of each and a general overview of how they are prepared.

---

98 2018 NAIC Annual Statement Instructions Property/Casualty, pages i-v.
CHAPTER 16. STATEMENT OF ACTUARIAL OPINION

OVERVIEW

The Statement of Actuarial Opinion (SAO) provides the opinion of a qualified actuary on the reasonableness of the loss and loss adjustment expense (LAE) reserves recorded by a property/casualty insurance company as of December 31 each year. It is filed with the Annual Statement, either included or attached to page 1 of the Annual Statement. The SAO must be prepared by a qualified actuary, as defined by the National Association of Insurance Commissioners (NAIC), who is appointed by the company’s board and then referred to as the appointed actuary.

Certain companies may qualify for an exemption from the SAO requirement. Possible exemptions include the following:

- Size of the insurer (less than $1 million of total gross written premiums during a calendar year and less than $1 million of total gross loss and LAE reserves at year-end)
- Insurers under supervision or conservatorship
- Nature of business written
- Insurers under financial hardship (if the cost of the SAO is greater than either 1% of surplus or 3% of gross written premiums during the calendar year within which the exemption is requested)

Simply meeting one of the above criteria does not provide automatic exemption. To qualify, the insurer has to file for exemption with its domiciliary commissioner. It is at the discretion of the domiciliary commissioner to decide whether to exempt a company from the SAO requirement.

The main purposes of the SAO are the following:

---

99 A qualified actuary is defined by the NAIC as "a person who meets the basic education, experience and continuing education requirements of the Specific Qualification Standard for Statements of Actuarial Opinion, NAIC Property and Casualty Annual Statement, as set forth in the Qualification Standards for Actuaries Issuing Statements of Actuarial Opinion in the United States, promulgated by the American Academy of Actuaries, and is either: (i) A member in good standing of the Casualty Actuarial Society, or (ii) A member in good standing of the American Academy of Actuaries who has been approved as qualified for signing casualty loss reserve opinions by the Casualty Practice Council of the American Academy of Actuaries" 2011 NAIC Annual Statement Instructions Property/Casualty, page 9.

100 The 2011 NAIC Annual Statement Instructions Property/Casualty go on further by saying that the requirements of the company’s domiciliary state may permit individuals to issue the SAO despite not meeting the definition of qualified actuary per the NAIC. In these instances, a letter from the state must be attached to the SAO indicating that the individual meets the state’s requirement to issue SAOs. Throughout this text we will use the terms "qualified actuary" and "appointed actuary" to encompass these individuals.
Part IV. Statutory Filings to Accompany the Annual Statement

- Provide the appointed actuary's opinion on the reserves specified within the scope of the SAO.
- Inform the reader, in particular regulators, of significant risk factors and/or uncertainties with respect to those reserves.
- Advise whether those risks and uncertainties are reasonably expected to lead to material adverse deviation in the reserves.

There is considerable guidance for the actuary in issuing the SAO. Every appointed actuary should read and be familiar with the most current versions of the following:

- Qualification Standards, as set forth by the American Academy of Actuaries (AAA)
- NAIC Instructions for the SAO
- AAA Committee on Property and Liability Financial Reporting (COPLFR) Practice Note on Statements of Actuarial Opinion on Property and Casualty Loss Reserves (COPLFR P/C Practice Note)
- NAIC Regulatory Guidance On Property and Casualty Statutory Statements of Actuarial Opinion Prepared by the NAIC’s Casualty Actuarial and Statistical (C) Task Force
- Actuarial Standards of Practice (ASOP), including but not limited to:
  - ASOP No. 20. Discounting of Property/Casualty Unpaid Claim Estimates (September 2011)
  - ASOP No. 23. Data Quality
  - ASOP No. 36. Statement of Actuarial Opinion Regarding Property/Casualty Loss and LAE Reserves
  - ASOP No. 41. Actuarial Communications
  - ASOP No. 43. Property/Casualty Unpaid Claim Estimates
- Applicable state laws, in particular with respect to reserve requirements, SAO requirements, discounting, etc. (the Property/Casualty Loss Reserve Law Manual published annually by the AAA provides a compilation of this material) Applicable laws and regulations supersede any applicable ASOPs.
- SSAP No. 55, Unpaid Claims, Losses and Loss Adjustment Expenses
- SSAP No. 62R, Property and Casualty Reinsurance
- SSAP No. 65, Property and Casualty Contracts

The SAO is organized into four required sections:

1. Identification
2. Scope
3. Opinion
4. Relevant comments

---

101 This is updated annually and typically included as an appendix to COPLFR P/C Practice Note.
102 Applicable laws and regulations supersede any applicable ASOPs.
Each section must be included and clearly identified within the SAO.

The SAO also contains two exhibits, A and B. Exhibit A provides the recorded amounts associated with the items identified in the scope section, generally on a direct plus assumed and net basis. Exhibit B provides relevant disclosure items with respect to the net reserves identified in the scope section, as identified in the relevant comments section. For example, loss and LAE reserves for asbestos are disclosed in Exhibit B on a net of reinsurance basis. There is no separate exhibit within the SAO showing asbestos reserves on a gross of reinsurance basis. Differences between the net and gross (direct plus assumed) amounts reported in Exhibit B may be discussed in the relevant comments section.

While there are other publications on the CAS Exam 6 U.S. Syllabus of Basic Education that cover the SAO, there is not a “real” SAO on the Syllabus to bring the instructions to life for the student. As a result, we have created a SAO for Fictitious Insurance Company to illustrate the application of the SAO instructions in practice. Fictitious’ SAO was issued by an imaginary actuary named Mr. William H. Smith, who is a consulting actuary with the make-believe firm, WS Actuarial Consulting. Smith’s opinion is included in of this publication and should be read side-by-side with this chapter.

The Fictitious SAO is the author’s interpretation of the NAIC instructions as they might apply to Fictitious. It should not be taken as authoritative guidance on format or content of the SAO.

The following provides a summarized view of each of the four sections of the SAO and how Fictitious’ appointed actuary responded to each required section in his 2018 SAO for the company.

IDENTIFICATION

The identification section of the SAO provides the actuary’s name and credentials, the actuary’s qualifications for issuing the SAO, the actuary’s relationship to the company, and the date the actuary was appointed by the company’s board of directors (or its equivalent) to issue the opinion. This section typically includes a statement identifying the intended purposes and users of the opinion, consistent with ASOP 36 requirements.

For Fictitious, the 2018 SAO was issued by Mr. William H. Smith, who is a Fellow of the Casualty Actuarial Society and Member, American Academy of Actuaries, and is associated with the firm of WS Actuarial Consulting. He was appointed by the company’s board of directors on September 7, 2018. At the time of issuance of his opinion (February 24, 2019), Smith met the qualification standards to issue SAOs.

The intended purpose of Smith’s opinion was to satisfy the requirements of the NAIC. The intended users were the company’s management, the directors of its board and state regulatory officials.
SCOPE

The scope section identifies the reserve items upon which the actuary is giving an opinion as well as the accounting basis for those reserves. The reserve items include:

- Loss and LAE reserves
- Retroactive reinsurance assumed reserves
- Unearned premium reserves for Property and Casualty (“P&C”) Long-Duration Contracts
- Unearned premium reserves for extended reporting endorsements, such as those included in Schedule P Interrogatory No. 1 of the company’s Annual Statement
- Other reserve items for which the actuary is providing an opinion

The scope also identifies the “review date,” which is defined in ASOP 36 as “the date (subsequent to the valuation date) through which material information known to the actuary is included in forming the reserve opinion.” If no such date is explicitly disclosed, it is likely to be assumed by the reader of the opinion that the review date is the date the opinion is signed.

It also contains a statement regarding who provided the data relied upon by the actuary in forming the opinion and that either the actuary performed a reconciliation of that data, or reviewed a reconciliation prepared by the company, to Schedule P of the company’s Annual Statement.

If the company participates in intercompany pooling, the actuary may wish to disclose this and the basis for reconciling data used in the actuary’s analysis to Schedule P.

Further, regulatory guidance suggests that the scope section for each pooled company provide information about the pooling arrangement, including the intercompany pooling percentage for the company.

There are special requirements for opinions on non-lead companies operating under an intercompany pooling arrangement in which the lead company retains 100% of the pooled reserves. We refer the reader to the NAIC opinion instructions and COPLFR Practice Note for further guidance.

---

103 P&C Long Duration Contracts are defined on page 10 of the NAIC SAO Instructions as “contracts (excluding financial guaranty contracts, mortgage guaranty contracts and surety contracts) that fulfill both of the following conditions: (1) the contract term is greater than or equal to 13 months; and (2) the insurer can neither cancel the contract nor increase the premium during the contract term. These contracts are subject to the three tests of SSAP No. 65-Property and Casualty Contracts of the NAIC Accounting Practices and Procedures Manual.”

The reserve items on which Smith opined for Fictitious are presented in Exhibit A of his 2018 SAO. As displayed on Exhibit A, Smith opined on net loss and LAE reserves in lines 1 and 2, totaling $51,557,000 as of December 31, 2018. The amounts in lines 1 and 2 of Exhibit A reconcile to lines 1 and 3, respectively, of the Liabilities, Surplus and Other Funds page of the 2018 Annual Statements.

Smith also opined on total direct plus assumed (or gross) loss and LAE reserves of $61,699,000, as shown in lines 3 and 4. The amounts in lines 3 and 4 reconcile to Schedule P, Part 1, Summary, columns 13 plus 15, and columns 17, 19 and 21, respectively.

As disclosed in the Notes to Financial Statements (see Chapter 10. Notes to Financial Statements) and displayed in Exhibit A of the SAO, Fictitious did not have any retroactive reinsurance assumed as of December 31, 2018. Nor were there any other loss reserve items on which Smith expressed an opinion.

Smith disclosed his “review date” as January 28, 2019. This means that information received through January 28, 2019, was relevant to his analysis of unpaid claims and his opinion on the company’s loss and LAE reserves. Information after that date, to the time he signed the opinion on February 24, 2019 (see the signature line of the opinion), was not relied on by Smith in forming his opinion.

The scope section also provides a statement from Smith that he reconciled the data that he relied upon for purposes of forming his opinion to Schedule P, Part 1, of Fictitious’ 2018 Annual Statement.

OPINION

The opinion section provides exactly what the name says, the actuary’s opinion with respect to the reserves identified in the scope section. The actuary has five options in terms of the type of opinion, as outlined in ASOP 36. These are:

1. Reasonable: if the recorded reserve lies within the actuary’s range of reasonable unpaid claim estimates
2. Inadequate or deficient: if the recorded reserves are below what the actuary deems to be reasonable
3. Excessive or redundant: if the recorded reserves are above what the actuary deems to be reasonable
4. Qualified: if the actuary is unable to issue an opinion on certain items and those items are believed to be material
5. No opinion: if the actuary is unable to conclude on the reasonableness of the recorded reserves

Ibid., page 9.
Note that in accordance with ASOP 36, the actuary should disclose the minimum amount that he or she deems reasonable when issuing an inadequate or deficient opinion. Similarly, the actuary should disclose the maximum amount deemed to be reasonable when issuing an excessive or redundant opinion.

The actuary is also required to state whether the recorded reserves identified in the scope section meet the requirements of the insurance laws of the state the company is domiciled in and are computed in accordance with actuarial standards.

Additionally, if use was made of the work of another actuary, such as for pools and associations, for a subsidiary, or for special lines of business, in forming the SAO, the other actuary must be identified by name and affiliation within the opinion section. The appointed actuary cannot simply rely on another actuary’s opinion. The appointed actuary needs to perform enough analysis on the other actuary’s work to issue an unqualified opinion on the total reserve amounts listed in Exhibit A. A situation where the actuary may make use of another’s work is for reserves assumed by the company for its participation in underwriting pools and associations. ASOP No. 36 provides the relevant guidance, and the COPLFR P/C Practice Note provides good examples of how to handle this situation in practice.

The 2018 SAO for Fictitious states the following:

“In my opinion, the amounts carried in Exhibit A on account of the items identified:

- Make a reasonable provision for all unpaid losses and loss adjustment expenses, gross and net as to reinsurance ceded, under the terms of the Company’s contracts and agreements
- Are computed in accordance with accepted standards and principles
- Meet the requirements of the insurance laws of Florida”

Note that Smith opined on the loss and LAE reserves in Exhibit A, items 1 through 6. These reserves include “Retroactive Reinsurance Reserve Assumed,” which in the case of Fictitious totaled $0.

Unless otherwise disclosed, the Appointed Actuary will generally opine on the loss and LAE reserves including the amount of retroactive reinsurance assumed, despite the fact that the amount of retroactive reinsurance is not accounted for within lines 1 and 3 of page 3 of the Annual Statement under SAP. This treatment is in accordance with the NAIC instructions.

---

106 Ibid., page 10.
108 See Appendix I of this publication for the Statement of Actuarial Opinion for Fictitious Insurance Company.
Retroactive reinsurance assumed is a liability, and regulators look for assurance that this balance is reasonable.

The reserves for retroactive reinsurance ceded are not separately listed on Exhibit A and are therefore not explicitly opined on by the actuary. The absence of this reserve from Exhibit A is not because regulators don’t care about the reasonableness of the balance. Rather, the reserve for retroactive reinsurance ceded is already included as a component of the gross loss and LAE reserves, which are opined on by the actuary. An overstatement or understatement of retroactive reinsurance ceded would impact gross and ceded reserves equally and have no impact on the net reserve balance.

RELEVANT COMMENTS

The relevant comments section provides commentary and disclosures relative to the reserves opined on to assist the reader in understanding the context and composition of those reserves. Commentary is required on the following items:

- The actuary’s materiality standard for purposes of addressing the risk of material adverse deviation
- Significant risks and uncertainties that could result in material adverse deviation
- The significance of items listed in Exhibit B, including:
  - Anticipated net salvage and subrogation
  - Nontabular discounting
  - Tabular discounting
  - Net reserves for the company’s share of voluntary and involuntary pools and associations
  - Net reserves for asbestos and environmental liabilities
  - Claims-made extended loss and LAE reserve reported as unearned premium and as loss reserves
- Retroactive or financial reinsurance
- Uncollectible reinsurance
- The results of IRIS ratios 11, 12 and 13 and explanation for exceptional values
- Changes in methods and assumptions from those employed in the most recent prior opinion that are deemed to have a material effect on the recorded reserve or actuary’s unpaid claim estimate
- Unearned premium reserves for P&C Long Duration Contracts
- Net reserves for Accident and Health (“A&H”) Long Duration Contracts that the company carries on the Liabilities, Surplus and Other Funds page as Losses, Loss

109 Recall from Chapter 10. Notes to Financial Statements, a company’s gross reserves are not reduced for retroactive reinsurance ceded. Rather, retroactive reinsurance ceded is recorded separately as a write-in item on the balance sheet.
FINANCIAL REPORTING THROUGH THE LENS OF A PROPERTY/CASUALTY ACTUARY

Part IV. Statutory Filings to Accompany the Annual Statement

Adjustment Expenses, Unearned Premium or other Write-In items (e.g., Premium Deficiency Reserves, Contract Reserves, or AG 51 Reserves)\(^{110}\)

With respect to the risk of material adverse deviation, the NAIC Instructions require the appointed actuary to make an explicit statement as to whether or not he/she believes there are significant risks and/or uncertainties that could result in material adverse deviation.

Smith addresses the above items within the 2018 SAO for Fictitious, as applicable. We will not discuss each item but rather provide further details on some to assist in reading this section of the opinion.

MATERIALITY STANDARD

There are numerous ways an actuary can establish his or her materiality standards, and examples are provided in the COPLFR Practice Note. Common methods are based on a percentage of reserves, surplus and movements in Risk-Based Capital (RBC) levels, among others. Materiality standards such as 10% of loss and LAE reserves or anywhere from 10% to 20% of surplus are commonly used. However, some actuaries establish materiality standards using a set dollar amount based on the actuary's particular knowledge of the company's operations. As an extreme example, for a company operating with limited surplus and/or under regulatory intervention, a deviation in loss and LAE reserves greater than $0 might be considered material.

Regardless, there is no “one size fits all” in terms of formulaic materiality standards. The standard is based on the actuary's personal opinion as to what he or she considers material in relation to the company's reserves and surplus.

Smith considered a deviation in net loss and LAE reserves of more than:

1. 10% of net loss and LAE reserves, which he calculated as:

   \[
   10\% \text{ of } $51.557 \text{ million } = $5.156 \text{ million}
   \]

2. 20% of policyholders' surplus, which he calculated as:

\(^{110}\) “A&H Long Duration Contracts are defined on page 10 of the NAIC SAO Instructions as “contracts in which the contract term is greater than or equal to 13 months and contract reserves are required. See Schedule H instructions for a description of categories of contract reserves, as well as policy features that give rise to contract reserves. Two specific examples of contracts that typically require contract reserves are long-term care and disability income insurance.” According to page 15 of the NAIC SAO Instructions, “Actuarial Guideline LI—The Application of Asset Adequacy Testing to Long-Term Care Insurance Reserves (AG 51) in the NAIC Accounting Practices and Procedures Manual requires a company to perform a stand-alone asset adequacy analysis for its in force long-term care (LTC) contracts with more than 10,000 in force lives as of the valuation date. The Actuarial Report and workpapers summarizing the results, assumptions and testing procedures for the asset adequacy testing of LTC business must be in compliance with AG 51 requirements.”
20% of $31.024 million = $6.205 million

Or

3. The reduction in surplus that would result in additional action per the NAIC RBC formula, which he calculated as the difference between the following:

- The company's total adjusted capital of $31.024 million,\(^{111}\) which produces an RBC ratio of 555% based on authorized control level (ACL) RBC of $5.588 million per the Five-Year Historical Data exhibit
- Adjusted capital at the next RBC level of $11.176 million, which is equal to two times ACL

The difference between $31.024 million and $11.176 million is $19.848 million.

For purposes of establishing his materiality standard, Smith selects the smallest of the three balances, which in this case happens to be 10% of net loss and LAE reserves ($5.156 million).

MAJOR RISK FACTORS

Once materiality is defined, the actuary determines whether there are significant risks or uncertainties that could result in material adverse deviation in the company’s loss and LAE reserve. According to the NAIC instructions to the SAO, “If such risk exists, the actuary should include an explanatory paragraph to describe the major factors, combination of factors, or particular conditions underlying the risks and uncertainties that the actuary reasonably believes could result in material adverse deviation.”\(^{112}\) Examples of risk factors are provided in the COPLFR Practice Note.

Note that the actuary is not expected to list all risks that the company is exposed. Rather, only those major risk factors that could result in the reserves developing adversely by an amount that is material relative to the actuary’s materiality standard. To illustrate, Smith identifies and provides details about major risk factors that materially affect the variability of the reserves held by Fictitious Insurance Company. The major risk factors identified are mass tort claims; so-called “Chinese drywall” claims; cumulative injury losses; claims from large deductible workers’ compensation policies; and claims related to catastrophic weather events, including wildfires, tornadoes and hurricanes. The uncertainty associated with these types of claims adds to the variability in the company’s recorded reserves.

\(^{111}\) Differences from above due to immaterial rounding errors that may occur in the Annual Statement.

\(^{112}\) 2018 NAIC Annual Statement Instructions Property/Casualty, page 13.
RISK OF MATERIAL ADVERSE DEVIATION

The actuary is required to make a clear statement within the SAO as to whether or not there are significant risks or uncertainties that could result in material adverse deviation. That determination is based on the major risk factors identified by the actuary, the actuary’s professional opinion of the variability inherent in the unpaid claim estimates and the actuary’s materiality standard.

In the case of Fictitious, Smith concludes that there are significant risks that could result in the net reserve amount deviating adversely from that recorded by the company by a material amount. This conclusion was determined in part quantitatively, by comparing the distance between the company’s net recorded loss and LAE reserve and the high end of Smith’s range to his materiality standard.

As shown in the Smith’s Actuarial Opinion Summary for the company, he has developed a range of reasonable unpaid loss and LAE claim estimates on a net of reinsurance basis of $43 million to $57 million with a point estimate of $50 million. The distance between the company’s recorded reserve of $51.556 million and the high end of Smith’s range is $5.443 million. Smith’s materiality standard is $5.156 million, which is less than the distance between the high end of his range and the recorded reserve. This means that a deviation of $5.156 million is reasonably expected by Smith, as it lies within his range relative to the recorded balance. The compilation of these figures is shown in Table 57.

<table>
<thead>
<tr>
<th>WS Actuarial Consulting</th>
<th>Fictitious Carried</th>
<th>Carried + Materiality Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserve estimates</td>
<td>Low 43,000</td>
<td>Point 50,000</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Fictitious 51,557</td>
</tr>
</tbody>
</table>

Stated differently, Smith reasonably expects that the company’s carried reserve could deviate by an amount equal to the materiality standard since the carried reserve plus the materiality standard lies within his range of reasonable unpaid claim estimates. The results of his quantitative analysis, coupled with his knowledge of the significant risks and uncertainties inherent in the company’s reserves, lead Smith to conclude that there are significant risks and uncertainties that could result in material adverse deviation in the recorded reserves.

It is important to note that there is no requirement for an actuary to provide a range. Even when a range is provided, the actuary may believe there are significant risks and uncertainties that could result in material adverse deviation despite the results of the calculation described above. In other words, there may be qualitative reasons for concluding there are significant risks that could result in material adverse deviation absent quantitative reasons. For example, a company might have a significant portion of its gross loss and LAE reserves ceded.
to a reinsurer of relatively weak financial strength. In this case, the carried net reserve plus materiality standard might exceed the high end of the actuary’s range (assuming all reinsurance was considered valid and collectible in determining the range). However, the risk that the company may not be able to recover a portion of its gross reserves due to the financial strength of one of its reinsurers may be considered significant by the actuary, and lead him/her to conclude the carried net reserves could deviate adversely by a material amount. Therefore, both qualitative and quantitative considerations should be considered in determining whether there are significant risks that could result in material adverse deviation.

REMAINING RELEVANT COMMENTS

The remaining relevant comments in Smith’s opinion speak to the disclosure items in Exhibit B, addressing the fact that the company anticipates salvage and subrogation in its reserves totaling $1.363 million and discounts its reserves for certain workers’ compensation and other liability claims on a tabular basis, the amount of which totals $1.365 million.

According to Smith, the company does not have claims-made extended reporting endorsement loss and expense reserves, participate in any underwriting pools or associations or write either P&C or A&H Long Duration Contracts.

As noted, retroactive and financial reinsurance is addressed in the relevant comments section. The liability for the one retroactive reinsurance assumed contract that the company has been deemed immaterial by Smith.

Finally, Smith has disclosed in his opinion that IRIS ratios 11, 12 and 13 did not produce unusual values for the company. We have confirmed this statement in our recalculation of Fictitious’ IRIS ratios in Appendix I of this publication.

SIGNATURE OF THE APPOINTED ACTUARY

The SAO closes with an affirmative statement that an actuarial report supporting the SAO will be provided to the company and retained for a period of seven years at its administrative offices and will be made available for regulatory examination, if requested.

The SAO is signed and dated by the actuary for delivery along with the Annual Statement by March 1 of the year following the Annual Statement date (December 31). Note that some states require an original signature on each signed opinion, as opposed to a photocopy. The signature line includes the actuary’s address (both postal and email).

Smith signed the opinion on February 24, 2019.

NOTEWORTHY CHANGES TO THE NAIC SAO INSTRUCTIONS IN 2019

While this text contemplates the NAIC SAO Instructions for 2018, there were significant changes to the NAIC SAO Instructions for 2019 pertaining to the requirements for an actuary
to be qualified to sign property/casualty SAOs. In particular, the NAIC set the definition of a “Qualified Actuary” as “a person who:

(i) Meets the basic education, experience and continuing education requirements of Specific Qualifications Standard for Statements of Actuarial Opinion, NAIC Property and Casualty Annual Statement, as set forth in the Qualification Standards for Actuaries Issuing Statements of Actuarial Opinion in the United States (U.S. Qualification Standards), promulgated by the American Academy of Actuaries (Academy), and

(ii) has obtained and maintains an Accepted Actuarial Designation; and

(iii) is a member of a professional actuarial association that requires adherence to the same Code of Professional Conduct promulgated by the Academy, requires adherence to the U.S. Qualification Standards, and participates in the Actuarial Board for Counseling and Discipline when its members are practicing in the U.S.

An exception to parts (i) and (ii) of this definition would be an actuary evaluated by the Academy’s Casualty Practice Council and determined to be a Qualified Actuary for particular lines of business and business activities.”

The NAIC has defined the term “Accepted Actuarial Designation as “an actuarial designation accepted as meeting or exceeding the NAIC’s Minimum Property/Casualty (P/C) Actuarial Educational Standards for a P/C Appointed Actuary (published on the NAIC website). The following actuarial designations, with any noted conditions, are accepted as meeting or exceeding basic education minimum standards:

(i) Fellow of the CAS (FCAS) – Condition: basic education must include Exam 6 – Regulation and Financial Reporting (United States);

(ii) Associate of the CAS (ACAS) – Conditions: basic education must include Exam 6 – Regulation and Financial Reporting (United States) and Exam 7 – Estimation of Policy Liabilities, Insurance Company Valuation, and Enterprise Risk Management;

(iii) Fellow of the SOA (FSA) – Conditions: basic education must include completion of the general insurance track, including the following optional exams: the United States’ version of the Financial and Regulatory Environment Exam and the Advanced Topics in General Insurance Exam.”

The 2019 NAIC SAO Instructions include a table of allowable exam substitutions for (i), (ii) and (iii) in the definition of “Accepted Actuarial Designation” given that exams have changed over time.

113 2019 NAIC Annual Statement Instructions Property/Casualty, page 10.
114 Ibid.
Part IV. Statutory Filings to Accompany the Annual Statement

In accordance with these changes, Exhibit B, Item 3 of the SAO (the Appointed Actuary’s designation) has been modified to provide the Appointed Actuary’s Accepted Actuarial Designation and the NAIC now requires the Appointed Actuary to provide qualification documentation to company’s Board of Directors, including a description of how the Appointed Actuary meets the definition of Qualified Actuary and his or her experience relevant to the subject of the SAO.

We refer the reader to the 2019 NAIC SAO Instructions, AOWG Regulatory Guidance and COPLFR Practice Note for further details on these changes and new requirements for the Appointed Actuary.
CHAPTER 17. ACTUARIAL OPINION SUMMARY SUPPLEMENT

OVERVIEW

The Actuarial Opinion Summary Supplement (AOS) is required to be filed by the company with its domiciliary state by March 15 of the year following the Annual Statement date (December 31). This is a confidential document containing the appointed actuary’s range of unpaid claim estimates and/or point estimate, as calculated by the actuary, in comparison to the company’s recorded reserves on a net and gross of reinsurance basis. Due to its confidential nature, it is filed separately from the public Annual Statement document, which is due on March 1.

Non-domiciliary states that provide evidence of the ability to preserve the confidential nature of the document may request a copy.

The AOS also provides a statement regarding whether the company has experienced one-year adverse development in excess of 5% of surplus in three or more of the past five years. The amount of adverse development is computed in Schedule P, Part 2, Summary, and is also provided in the one-year development line of the Five-Year Historical Data exhibit within the Annual Statement. If the company has experienced adverse development in excess of 5% of surplus in three or more of the past five years, an explanatory paragraph is required so that the regulator can determine what additional review, if any, is required.

Prior to 2011, the actuary had the choice of providing his or her range, point estimate, or both, regardless of whether the actuary calculated both. In 2011, the instructions changed, requiring the actuary to include the point estimate and range, if both are calculated. If only one is calculated, the actuary would need only to provide one.

Because the AOS document is confidential, it is not available for public review, unlike the Statement of Actuarial Opinion (SAO). As a result, the student will not be able to find the AOS for the companies listed on the Casualty Actuarial Society Syllabus of Basic Education. However, we created an AOS for Fictitious Insurance Company, which is provided in Appendix I of this publication and should be read side by side with this chapter of the publication.

Like the SAO, the AOS is signed and dated by the actuary. In the case of Fictitious, this is Mr. William H. Smith. As we see in items A and B, Smith has produced a range and point estimate in his independent analysis of unpaid claims supporting the SAO. Items A and B include his range and point estimate on a net and gross of reinsurance basis, as displayed in Table 58.
TABLE 58

<table>
<thead>
<tr>
<th></th>
<th>Net Reserves (USD in 000s)</th>
<th>Gross Reserves (USD in 000s)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Low</td>
<td>Point</td>
</tr>
<tr>
<td>A. Actuary’s range of reserve estimates</td>
<td>43,000</td>
<td>57,000</td>
</tr>
<tr>
<td>B. Actuary’s point estimate</td>
<td>50,000</td>
<td></td>
</tr>
</tbody>
</table>

Item C provides the company’s carried loss and loss adjustment expense (LAE) reserves on which the actuary has based his opinion. Item D highlights the company’s position within the actuary’s range by showing the difference between the carried loss and LAE reserves and the actuary’s range and point estimate. In Table 59 we see that Fictitious’ recorded reserves lie above Smith’s point estimate.

TABLE 59

<table>
<thead>
<tr>
<th></th>
<th>Net Reserves (USD in 000s)</th>
<th>Gross Reserves (USD in 000s)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Low</td>
<td>Point</td>

</tr>
<tr>
<td>D. Difference between Company carried and Actuary’s estimate (C. - A. and C. – B., if applicable)</td>
<td>8,557</td>
<td>1,557</td>
</tr>
</tbody>
</table>

It is not surprising that Fictitious’ recorded reserves lie within the high end of the actuary’s range given that the Fictitious’ recorded loss and LAE reserves have developed favorably over time. This favorable development is seen in the one-year development line of the Five-Year Historical Data exhibit within Fictitious’ 2018 Annual Statement. At the risk of being repetitious (see Table 13), we show the one-year development line again in Table 60.

<td>(5.6)</td>
<td>(2.6)</td>
</tr>
</tbody>
</table>

While the AOS only displays the company’s current position within the actuary’s range, the AOS Instructions require that the actuary state whether the company has experienced one-
year adverse development in excess of 5% of surplus in three or more of the past five years. This and an explanation are provided in Item E of the AOS. The information contained in Item E enables the regulator to obtain an understanding of why the company’s recorded reserves continue to show adverse development over time. The concern, of course, is whether the company is consistently understating reserves and therefore overstating surplus. Depending on the result, the information provided in Item E could trigger additional regulatory review in assessing the company’s financial health. As shown in Table 60, Fictitious’ loss and LAE reserves have developed favorably in each of the past five years. As a result, Smith has responded with the following in Item E of his AOS:

E. The Company has not had 1-year adverse development in excess of 5% of surplus in at least three of the last five calendar years, as measured by Schedule P, Part 2 Summary, and disclosed in the Five-Year Historical Data, on line 74, of the Company’s December 31, 2018 statutory-basis Annual Statement.

In those cases where there has been adverse development in excess of 5% of surplus in three or more of the last five years, we have seen explanations in Item E vary from providing vague detail to very specific reasons for the changes. The more detail that can be provided as to the root cause, the easier time the regulator will have in his or her review.

To illustrate we have provided sample wording in the 2018 AOS of a fictional company that experienced one-year development in excess of 5% of surplus during 2015 through 2017:

The company had one-year adverse development in excess of 5% of statutory surplus in three of the past five years. The exceptional values occurred in years 2015 through 2017. The exceptional values resulted from a strengthening in loss reserves made by management to reflect unexpected trends in asbestos and environmental claims on excess liability policies written by the company from 1968 to 1986.

These trends include increased likelihood of exposure to higher-layer policies as a result of greater than expected emergence of reported claims on underlying policies, and efforts by insureds to expand coverage periods and expose additional policies.

It should be noted that in 2018 the company entered into a retroactive reinsurance agreement whereby 100% of this run-off business is ceded to an unaffiliated reinsurance company. Going forward, this reinsurance agreement will mitigate the impact of adverse development of loss reserves on the company’s statutory surplus.
The regulator reading the above will determine whether additional steps are necessary to understand the cause of the adverse development and impact on the company’s financial health. While the regulator may gain comfort that the company’s balance sheet is protected against future adverse development because of the new reinsurance agreement, we expect that the regulator would want to understand the potential impact of such development on the financial health of the company’s unaffiliated reinsurer.
CHAPTER 18. INSURANCE EXPENSE EXHIBIT

OVERVIEW

As discussed in Chapter 4, Primary Financial Statements, the Statement of Income within the Annual Statement provides a view of an insurance company’s profitability over the past year on a net of reinsurance basis, but only on an aggregate level for all lines of business combined. The Insurance Expense Exhibit (IEE) enables a deeper review of an insurance company’s profitability by showing the components of statutory profit (loss) by line of business on a direct and net of reinsurance basis.

The IEE is required to be filed by April 1 of the year following the Annual Statement date (December 31). It contains three parts plus interrogatories. Part I provides an allocation of the other underwriting expense category within Part 3, Expenses, of the Underwriting and Investment Exhibit (U&IE) of the Annual Statement. Parts II and III allocate pretax profit by line of business, on a net and direct written basis, respectively. All dollars are shown in thousands within the IEE, either by rounding or truncating.

The uses of the IEE are numerous. The following provides some examples:

- Regulators use the IEE as a means for monitoring financial health. Changes or historical trends in an insurance company’s profitability at the line of business level may put a strain on the company’s surplus in total, thereby threatening solvency.

- Regulators also use the IEE as a means to monitor rate adequacy. Inadequate rates also threaten an insurance company’s financial health. Conversely, excessive rates are also a concern to the regulator as they are unfair to the consumer.

- Stakeholders in general use the IEE as a means to identify those lines of business that have performed profitably and those that have not in order to make informed business decisions, such as where to deploy capital and/or where the company should grow.

- An investor might look at the IEE in light of the company’s future growth plans to make decisions as to how much to invest in the company. Growth into unprofitable lines might lead the investor to reduce his or her level of investment in the company.

- Actuaries use the IEE as a publicly available source of premium, loss and expense data for benchmarking company performance by line of business.

As we shall see, there are cautions to using the IEE as described above, and we have presented several within this chapter.

Throughout our discussion of the IEE, we will continue to use Fictitious Insurance Company in our examples.
PART I — ALLOCATION TO EXPENSE GROUPS

The National Association of Insurance Commissioners (NAIC) instructions to the Property/Casualty Annual Statement provide directions for classifying expenses to the 22 operating expense categories provided in Part 3, Expenses, of the U&IE within the Annual Statement. The instructions provide uniformity in classification of expenses among property/casualty insurance companies.

The 22 operating expense categories are as follows, by line number per the U&IE, Part 3, Expenses:

1. Claims adjustment services
2. Commission and brokerage
3. Allowances to managers and agents
4. Advertising
5. Boards, bureaus and associations
6. Surveys and underwriting reports
7. Audit of assureds’ records
8. Salary and related items
9. Employee relations and welfare
10. Insurance
11. Directors’ fees
12. Travel and travel items
13. Rent and rent items
14. Equipment
15. Cost or depreciation of Electronic Data Processing (EDP) equipment and software
16. Printing and stationery
17. Postage, telephone and telegraph, exchange and expenses
18. Legal and auditing
19. Taxes, licenses and fees
20. Real estate expenses
21. Real estate taxes
22. Miscellaneous

Amounts for the above operating expenses are each allocated into the following three categories (column headings) within the U&IE:

1. Loss Adjustment Expenses
2. Other Underwriting Expenses
3. Investment Expenses

Part 1 of the IEE further allocates other underwriting expenses into the following three components (column headings):
Part IV. Statutory Filings to Accompany the Annual Statement

1. Acquisition, Field Supervision and Collection Expenses
2. General Expenses
3. Taxes, Licenses and Fees

The allocation of other underwriting expenses from the U&IE, Part 3, Expenses, into Part I of the IEE is as follows:

- All commission and brokerage expenses from line 2 of U&IE, Part 3 should be allocated to acquisition, field supervision and collection expenses in column 2 of Part I of the IEE.
- All taxes, licenses and fees from line 20 of U&IE, Part 3 should be allocated to taxes, licenses and fees in column 4 of Part I of the IEE.
- The remaining operating expenses from lines 3 through 18 of the IEE can be allocated to acquisition, field supervision and collection expenses in column 2 or general expenses in column 3 of Part I of the IEE, as applicable.

Part 1 of the IEE looks like Part 3, Expenses, of the U&IE within the Annual Statement, except:

1. There are three columns under the other underwriting expenses heading, rather than one in total.
2. The operating expense classification line items end with line 25, total expenses incurred, and therefore do not include amounts unpaid, amounts relating to uninsured plans or total expenses paid (lines 26 through 30 of U&IE, Part 3).
3. Amounts are reported in thousands of dollars in the IEE rather than in whole dollars as in the U&IE.

The totals in column 4 of the U&IE, Part 3, line 25 should equal the totals in column 6 of Part I of the IEE multiplied by 1,000.

Table 61 provides the other underwriting expenses column from Part 3, Expenses, of the U&IE from Fictitious’ 2018 Annual Statement, with the allocation to acquisition, field supervision and collection expenses, general expenses, and taxes licenses and fees, as in Part I of the company’s 2018 IEE.

PART II — ALLOCATION TO LINES OF BUSINESS NET OF REINSURANCE

Part II provides the components of total profit (loss) on a pretax basis, net of reinsurance, and additional information needed to calculate net profit (loss) for the line of business segments used in the U&IE of the Annual Statement. The line of business segments differ slightly from the U&IE in the following ways:

- **Allied lines** are broken down into further components in the IEE as:
  - 2.1 Allied lines
  - 2.2 Multiple peril crop
  - 2.3 Federal flood

- **Commercial multiple peril** is broken down into further components in the IEE as:
  - 5.1 Commercial multiple peril (non-liability portion)
  - 5.2 Commercial multiple peril (liability portion)

- **Medical professional liability occurrence and claims-made lines** are combined in the IEE into line 11, as are the corresponding product liability lines into line 18.

- **Auto physical damage** is broken down into further segments in the IEE as:
  - 21.1 Private passenger auto physical damage
  - 21.2 Commercial auto physical damage

- **Reinsurance lines 31 through 33** are summed in the IEE.

Line 35 of the IEE provides the totals for all lines of business in lines 1 through 34.

Similar to the U&IE, the line of business segments are displayed in the first column of the IEE, with the components of profit (loss) and additional items in the remaining columns, providing the amounts (or percentages) for each line of business. These components and additional items are as follows:

- **Net premiums written**
- **Net premiums earned**
- **Dividends to policyholders**
- **Incurred:**
  - **Loss**
  - **Defense and cost containment (DCC)**
  - **Adjusting and other (A&O) expenses**
- **Unpaid:**
  - **Loss**
  - **DCC**
  - **A&O expenses**
Unearned premium reserves
Agents' balances
Other underwriting expenses:
  • Commission and brokerage expenses incurred
  • Taxes, licenses and fees incurred
  • Other acquisitions, field supervision and collection expenses incurred
  • General expenses incurred
Other income less other expenses
Pre-tax profit or loss excluding all investment gain
Investment gain on funds attributable to insurance transactions
Profit or loss excluding investment gain attributable to capital and surplus
Investment gain attributable to capital and surplus

The above items are organized in two columns: the first containing the dollar amount and the second providing the ratio of the dollar amount to premiums earned. There are 42 columns: 21 provide dollar amounts (odd-numbered columns) and 21 provide percentages to earned premium (even-numbered columns).

Total profit (loss) is calculated using the same components as in the Statement of Income, with the exception that the IEE is on a pretax basis. Most of the aforementioned components used to compute pretax profit (loss) either reconcile directly to exhibits within the Annual Statement, or are reasonably straightforward for companies to compute. However, the calculation of investment gain is not straightforward, as the allocation of investment gain by line of business is not intuitive.

We will discuss the computation of each component (odd-numbered columns), reconciling to Annual Statement exhibits, and provide example(s) as to how to calculate investment gain. We will not address the even-numbered columns, other than to say that they represent the ratio of the dollar amount to net earned premium, on a line-by-line basis.

There are numerous ways to estimate profit by line of business; the approach used by the NAIC for the IEE is only one of them. The NAIC approach is a retrospective one. It allocates total profit that has emerged rather than providing an estimate of future profit, as is used in pricing insurance policies.

Further, the allocation of surplus by line of business does not consider how much surplus is needed to support the line, as is the intention in pricing insurance policies and capital

---

115 According to page 419 of the 2018 NAIC Annual Statement Instructions Property/Casualty, "In instances where the reporting entity cannot allocate amounts to lines of business by direct and accurate allocation, the methods of allocation stated in the Uniform Classification of Expenses found in the Appendix of the NAIC Annual Statement Instructions must be used. Where the instructions do not define means of allocation, a reasonable method of allocation must be applied and disclosed in Interrogatory 4."
modeling. Rather, as we shall see, the entire amount of surplus is allocated by line based on the level of the company’s reserves (loss and unearned premium) and earned premium, which do not necessarily measure the inherent risk of a particular line of business. Good examples are catastrophe-exposed short-tailed lines, such as homeowners. In non-catastrophe years, the reserves for these lines may be relatively small because claims are reported and paid out relatively quickly when compared to longer-tailed casualty lines. However, as the property/casualty insurance industry observed in 2018, this short-tailed line of business is exposed to considerable risk. We shall see this in our examples for Fictitious. Therefore, caution should be made when reviewing and placing reliance on the results of the IEE calculations of surplus and profit by line of business for pricing or capital allocation purposes.

Dividends to policyholders in column 5 reconcile in total to the amount in the Statement of Income of the Annual Statement, line 17. The allocation by line of business is based on the policies eligible and receiving dividends or on a company’s formulaic determination if the line of business per the policy does not correspond directly to a line of business in the Annual Statement.116

Loss adjustment expense (LAE), provided separately for DCC and A&O expenses incurred and unpaid, in columns 9, 11, 15 and 17 of the IEE, cannot be found within the Annual Statement for the line of business breakdowns required in the IEE. However, insurance companies track expenses by line of business and therefore know which expenses are allocated to which lines. In total, the LAE incurred amounts in columns 9 plus 11 reconcile to the Statement of Income, line 3, column 1 (current year) and Part 3 of the U&IE, line 25, column 1. The LAE unpaid

amounts reconcile to page 3 of the Annual Statement, line 3, column 1 (current year) and Part 2A of the U&IE, line 35, column 9.

Like policyholder dividends, insurance companies know which lines agents’ balances stem from and therefore can allocate the amounts directly in column 21. The amounts should agree to balances included within lines 15.1 plus 15.2, column 3 of the Assets page of the Annual Statement.

Other underwriting expenses in columns 23, 25, 27 and 29 reconcile directly to Part I of the IEE.

Other income less other expenses in column 31 of the IEE reconciles in total to line 15 minus line 5 of the Statement of Income. Line 15 of the Statement of Income provides total other income incurred, and line 5 provides aggregate write-ins for underwriting deductions. The allocation by line is performed directly by accumulating the sources of other income and underwriting deductions on specific policies and mapping the income/deductions by policy to the Annual Statement lines of business.

Calculation of Pretax Profit or Loss Excluding All Investment Gain (Column 33)

Column 33 provides pretax profit (loss) excluding all investment gains and is calculated from the information contained in the previous columns of Part II of the IEE as follows:

\[
\text{Pretax profit (loss) excluding all investment gains} =
\]
\[
\text{Premiums earned (column 3) - Dividends to policyholders (column 5) - Incurred loss (column 7) - DCC expenses incurred (column 9) - A&O expenses incurred (column 11) - Commission and brokerage expenses incurred (column 23) - Taxes, licenses and fees incurred (column 25) - Other acquisitions, field supervision and collection expenses incurred (column 27) - General expenses incurred (column 29) + Other income less other expenses (column 31).}
\]

Simply put, pretax profit equals inflows of earned revenue minus outflows of incurred expenses.

The total amount in column 33 reconciles to line 18 (net income after dividends to policyholders, after capital gains tax and before all other federal and foreign income taxes) minus line 11 (net investment gain (loss)) of the Statement of Income.

Table 63 demonstrates the calculation of column 33 of Part II of the IEE in total and shows the reconciliation to the Statement of Income within the Annual Statement for Fictitious in
2018. Recall that figures in the IEE are provided in thousands; any differences from the Statement of Income are due to rounding errors.

</table>

As displayed in Table 63, Fictitious operated at a pretax loss (before any gains or losses from investments) of $2.1 million in 2018, most of which was due to underwriting (underwriting loss totaled $2.1 million as per line 8 of the Statement of Income). Net incurred loss and LAE during 2018 was $4.4 million higher than that incurred in 2017, with less than $1 million more in net earned premium. As previously explained, this was due to the high frequency of catastrophe losses incurred by Fictitious in 2018, compared to a relatively benign catastrophe year for Fictitious in 2017.

Of the $2.1 million pretax loss (before investment gain), $1.2 million stems from the homeowners of business. Homeowners is the largest line of business written by the company in terms of net written premium volume ($4.6 million per column 1 of the IEE, Part II). Further, the homeowners line was hit hardest by the catastrophe losses in 2018. Given its significance to the 2018 results, we will use homeowners as the line of business example for computing total profit or loss for Fictitious.

The remaining columns, columns 35 through 41, are determined formulaically and are the crux of Part II of the IEE.

Overview of the Calculation of Total Profit or Loss (Column 41)

Column 41 provides total profit (loss) on a pretax basis to an insurance company for each line of business. It is computed by taking pretax profit (loss) before any investment gain and adding investment gains.
Column 41 of the IEE is equal to net income as calculated in the Statement of Income within the Annual Statement, except all amounts in the IEE are gross of taxes. Column 41 reconciles to line 18 (net income after dividends to policyholders, after capital gains tax and before all other federal and foreign income taxes) plus the amount of capital gains tax provided in line 10 (Net realized capital gains (losses) less capital gains tax) of the Statement of Income. Capital gains taxes are added back to the calculation simply because total profit is shown on a pretax basis.

Table 64 demonstrates the calculation of column 41 of Part II of the IEE in total and shows the reconciliation to the Statement of Income within the Annual Statement for Fictitious in 2018.

</table>

As displayed in Table 64, net investment gain (loss) ($4.4 million) more than offset the Fictitious’ underwriting loss in 2018.

The same formula is used to calculate total profit or loss (column 41) for each line of business. The tricky part, of course, is how to allocate the net investment gain (loss) by line of business and between funds attributable to insurance transactions versus those attributable to capital and surplus. The following provides an overview of the allocation procedure, with details in the subsequent sections.

The first step of the calculation is to determine the ratio of net investment gain (loss) to total investable assets then apply that ratio to investable assets by line of business. This calculation provides net investment gain (loss) by line. The ratio of net investment gain (loss) to total investable assets is called the net investment gain ratio.

The second step is to apply the net investment gain ratio to funds attributable to insurance transactions by line of business. This calculation provides investment gain on funds attributable to insurance transactions in column 35.

Investment gain attributable to capital and surplus in column 39 is computed as the difference between net investment gain (loss) and investment gain on funds attributable to insurance transactions in column 35. Formulaically, for each line of business,
Investment gain attributable to capital and surplus (column 39) =

\[
\text{Net investment gain (loss)}^{117} - \text{Investment gain on funds attributable to insurance transactions (column 35)}.
\]

As indicated, both of the inputs in the calculation of investment gain attributable to capital and surplus (column 39) are determined by applying the ratio of net investment gain (loss) to total investable assets for all lines of business to the applicable investable funds (either in total or attributable to insurance transactions) associated with the particular line of business.

Net Investment Gain Ratio

The net investment gain ratio is the ratio of net investment gain (loss) to total investable assets. Total investable assets equal the sum of net loss and LAE reserves, net unearned premium reserves, ceded reinsurance payable and policyholders’ surplus, minus agents’ balances. These amounts are intended to be a proxy for investable assets as they are amounts that are available for investment by the insurance company. Agents’ balances are subtracted in the formula because they are not investable assets.

In the calculation of total investable assets, the mean of the aforementioned amounts are used (i.e., average of the prior year and current year) because investment income during the year is earned on reserves and surplus throughout the year, rather than a fixed point in time.

Formulaically, the net investment gain ratio is calculated as follows, for all lines of business in total:

\[
\text{Net investment gain ratio} = \frac{\text{Net investment gain (loss)}}{\text{Total investable assets}}
\]

where,

Total investable assets =

\[
\text{Mean net loss and LAE reserves} + \text{Mean net unearned premium reserves} + \text{Mean ceded reinsurance premiums payable} + \text{Mean policyholders’ surplus} - \text{Mean agents’ balances}.
\]

\(^{117}\) The calculation of net investment gain (loss) is provided in subsequent paragraphs below.

\(^{118}\) Going back to basics, admitted assets minus liabilities equals surplus. Or equivalently, admitted assets equals liabilities plus surplus. Reserves and ceded reinsurance payables are liabilities that the insurance carrier must hold. As with surplus, the company can invest the assets backing these liabilities. They are therefore used in the calculation to represent investable assets.
Table 65 demonstrates the calculation of the net investment gain ratio based on 2018 Annual Statement data for Fictitious.

**TABLE 65**

</table>

As displayed above, the 2018 investment gain ratio for Fictitious was 5%. This means the company earned 5% on its “investable assets” during 2018.

Net Investment Gain (Loss) by Line of Business

Net investment gain (loss) by line of business is determined as the investment gain ratio multiplied by total investable assets for that line of business.
Net investment gain (loss) for a particular line of business =

\[
\text{Net investment gain ratio (for all lines)} \times \text{Total investable assets for the line of business}
\]

where,

Total investable assets for the line of business =

\[
\text{Mean net loss and LAE reserves for the line of business} + \text{Mean net unearned premium reserves for the line of business} + \text{Mean ceded reinsurance premiums payable for the line of business} + \text{Mean policyholders' surplus for the line of business} - \text{Mean agents' balances for the line of business}.
\]

Table 66 demonstrates the calculation of the net investment gain for the homeowners line of business based on 2018 Annual Statement and IEE data for Fictitious.

</tbody>
</table>

As displayed in Table 66, $232,000 of the company’s total $4.4 million in net investment gain during 2018 was allocated to the homeowners line using the NAIC’s approach.

The net loss and LAE reserves, unearned premium reserves and agents’ balances by line of business used in the above calculation come from columns 13, 15, 17, 19 and 21 of the IEE,
current year and prior year, respectively. Ceded reinsurance premiums payable by line and policyholders’ surplus by line, are calculated separately.

Ceded Reinsurance Premiums Payable by Line of Business

Ceded reinsurance premiums payable are allocated to line of business based on the distribution of ceded written premiums by line. Formulaically, the calculation is as follows:

\[
\text{Ceded reinsurance premiums payable for the line of business} = \frac{\text{Ceded written premiums for the line of business}}{\text{Total ceded written premiums}} \times \text{Total ceded reinsurance premiums payable.}
\]

Table 67 demonstrates the calculation of Fictitious’ ceded reinsurance premiums payable for homeowners.

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>

The mean ceded reinsurance payable for homeowners that was used in the calculation of Fictitious’ total investable assets for homeowners was $12 (dollars in thousands).

Policyholders’ Surplus by Line of Business

The NAIC allocates surplus to line of business in proportion to the sum of net loss and LAE reserves, net unearned premium reserves and net earned premium. The mean values are used in the calculation of the balance sheet figures (reserves), while the current-year value is used for the income statement figure (net earned premium).
The first step in the calculation is to compute the ratio of mean policyholders’ surplus to the sum of mean net loss and LAE reserves, mean net unearned premium reserves and current year net earned premiums, in total for all lines combined. This ratio is called the surplus ratio.

\[
\text{Surplus ratio} = \frac{\text{Mean policyholders’ surplus in total}}{\text{Mean net loss and LAE reserves in total}} + \frac{\text{Mean net unearned premium reserves in total}}{\text{Current year net earned premium in total}}.
\]

Table 68 demonstrates the calculation of the 2018 surplus ratio for Fictitious.

</tr>
</tbody>
</table>

The surplus ratio for Fictitious was 35.1% in 2018.

The surplus ratio is then applied to the applicable mean balance sheet amounts and the income statement amount (earned premium) for the current year for the particular line of business to determine the amount of surplus allocated to that line.

\[
\text{Surplus allocated to line of business} = \text{Mean surplus ratio (for all lines) multiplied by} \\
\text{[Mean net loss and LAE reserves for the line of business} \\
\text{+ Mean net unearned premium reserves for the line of business} \\
\text{+ Current year net earned premium for the line of business].}
\]
Table 69 shows the application of the surplus ratio in determining the amount of surplus allocated to Fictitious’ homeowners line of business.

</tbody>
</table>

As displayed in Table 69, $2.9 million of the Fictitious’ total $31 million in policyholders’ surplus at year-end 2018 was allocated to the homeowners line using the NAIC’s allocation approach. Stated differently, less than 10% of the company’s policyholders’ surplus was allocated to homeowners using the IEE allocation. This exemplifies the caution noted earlier in relying on this method for prospective pricing or even retrospective evaluation of profitability. Given the catastrophe risk inherent in this line of business, which is quite evident based on 2018 experience, one might expect more than 10% of the surplus to be allocated to this line. To provide some perspective, in 2018 we saw that homeowners contributed more than 50% of the company’s underwriting loss. If the IEE allocation is used in pricing for Fictitious, the rates will be inadequate and could eventually result in the insolvency of Fictitious.

Investment Gain by Line of Business Attributable to Insurance Transactions

Investment gain attributable to insurance transactions is allocated to line of business by applying the net investment gain ratio to funds attributable to insurance transactions for the particular line. Funds attributable to insurance transactions for a particular line are equal to the sum of mean net loss and LAE reserves, mean net unearned premium reserves and mean ceded reinsurance premiums payable for that line, reduced by agents’ balances and the portion of prepaid expenses in the unearned premium reserves.
Funds attributable to insurance transactions for the line of business =

- Mean net loss and LAE reserves for the line of business
- Mean net unearned premium reserves for the line of business
- Mean ceded reinsurance premiums payable for the line of business
- Mean agents’ balances for the line of business
- Prepaid expenses in the unearned premium reserves.

The elements that go into the calculation of funds attributable to insurance transactions differ from total investable funds in two ways. First, mean policyholders’ surplus is not included in the calculation of funds attributable to insurance transactions. This is because here the focus is on funds attributed to insurance transactions and not to capital and surplus. Second, prepaid expenses in the unearned premium reserves are not included in the calculation because they are not an investable asset; they have already been expensed. These expenses were not explicitly removed in the calculation of total investable funds because they are already out of policyholders’ surplus, which is a component of the calculation.

Table 70 provides the calculation of investment gain attributable to insurance transactions for Fictitious’ homeowners line.

As displayed in Table 70, $53,000 of the company's total $232,000 in net investment gain on the homeowners line was attributed to gains on insurance transactions using the NAIC approach.

**Prepaid Expense Ratio**

The ratio that is used to determine the amount of unearned premium reserves representing prepaid expenses is calculated for each line of business separately. It is the ratio of net acquisition expenses to net written premiums (column 1). Net acquisition expenses are calculated as the sum of commissions and brokerage expenses incurred (column 23); taxes, licenses and fees incurred (column 25); other acquisition, field supervisions and collection expenses incurred (column 27); and half of the general expenses incurred (50% of column 29).
The prepaid expense ratio for homeowners is calculated for Fictitious in Table 71.

The prepaid expense ratio for Fictitious was 29% in 2018.

**Investment Gain by Line of Business Attributable to Capital and Surplus**

The difference between net investment gain (loss) and the amount of investment gain attributed to insurance transactions is the amount of investment gain attributable to capital and surplus. Table 72 provides this calculation for Fictitious.

**TABLE 72**

Total profit or loss

Finally, column 41 provides total profit (loss) by line of business. Table 73 demonstrates the calculation of total profit in 2018 for Fictitious’ homeowners line. First, we will provide the calculation of pretax profit excluding all investment gain for homeowners, as shown in column 33. Then we will add the components of net investment gain in columns 35 and 39 to compute total profit in column 41.

Pretax profit excluding all investment gain is first computed for Fictitious’ homeowners line of business as follows in Table 73.

</tr>
</tbody>
</table>

As displayed in Table 73, the NAIC allocation formula shows that Fictitious experienced a pretax loss of $1.2 million on its homeowners book in 2018, nearly all of which came from underwriting (since other income is $1).

The calculation of column 41 of Part II of the IEE shows that investment gains only offset $232,000 of the $1.2 million underwriting loss, such that homeowners showed an overall loss, after investment gain, of $1.0 million.

Out of the total $2.3 million in pretax profit for all lines earned by Fictitious in 2018, $(1.0) million was allocated to homeowners based on the NAIC calculation. This represents -23% of net earned premium in 2018. A review of column 41 of IEE shows that Fictitious also experienced pretax losses in the other liability, automobile physical damage and fidelity lines. Profits were earned in other lines to absorb the losses in these lines of business, the largest of which was achieved in workers’ compensation ($3.3 million). This is why companies diversify insurance risks across property/casualty lines of business; the intent is that any losses would be offset by gains.

PART III — ALLOCATION TO LINES OF BUSINESS DIRECT

Part III provides the components of direct profit (loss) on a pretax basis, excluding investment gain. Investment gain is not considered because investment income is earned on the actual assets held by the company, which are net of reinsurance.

Different from Part II, the components used to compute profit (loss) in Part III are not readily available from the Annual Statement as presented. Unless assigned with the task of completing the IEE for their employer, most students will not use the information contained in Part III of the IEE. This publication is not intended to be an instruction manual for completing the IEE. As a result, we will only provide a brief discussion of the computation of each component, reconciling to Annual Statement exhibits when possible.

Columns 1 through 32

As with Part II, the even columns of Part III of the IEE provide the percent of the corresponding amounts in the odd-numbered columns to earned premium, in this case on a direct basis.

Direct premiums written in column 1 reconcile to Part 1B, Premiums Written, column 1, of the U&IE. Direct premiums written also reconcile to column 1 of the Exhibit of Premiums and Losses (Statutory Page 14 Data) by line and in total to Schedule T, column 2, line 59.
Part IV. Statutory Filings to Accompany the Annual Statement

Direct premiums earned in column 3 reconcile to column 2 of the Exhibit of Premiums and Losses (Statutory Page 14 Data) by line, for all states plus any alien business, and in total to Schedule T, column 3, line 59.

Dividends to policyholders in column 5 should agree to line 17 of the Statement of Income, excluding dividends associated with business assumed and ceded.

Incurred loss in column 7 reconciles to column 6 of the Exhibit of Premiums and Losses (Statutory Page 14 Data) by line, for all states plus any alien business, and in total to Schedule T, column 6, line 59.

DCC expenses incurred and unpaid in columns 9 and 15, respectively, reconcile to columns 9 and 10, of the Exhibit of Premiums and Losses (Statutory Page 14 Data) by line, for all states plus any alien business. Incurred expenses also reconcile in total to the U&IE, Part 3, Expenses, line 1.1 of column 1.

A&O expenses incurred and unpaid in columns 11 and 17, respectively, cannot be tied directly to amounts presented in the Annual Statement. The NAIC instructions state, “IEE Part III, columns 9, 11, 15 and 17 must agree with IEE Part II, columns 9, 11, 15 and 17, respectively, excluding expenses relating to reinsurance assumed and ceded.” An insurance company knows which expenses are allocated to which lines and can therefore complete these columns.

Unpaid losses in column 13 reconcile to column 7 of the Exhibit of Premiums and Losses (Statutory Page 14 Data) by line, for all states plus any alien business, and in total to Schedule T, column 7, line 59.

Unearned premium reserves in column 19 reconcile to column 4 of the Exhibit of Premiums and Losses (Statutory Page 14 Data) by line, for all states plus any alien business.

Agents’ balances in column 21 stem from policies written; therefore, companies know the applicable line of business. The amounts should agree to balances included within lines 15.1 plus 15.2, column 3 of the Assets page, excluding balances relating to reinsurance.

Other underwriting expenses in columns 23, 25, 27 and 29 cannot be found in the line of business breakdown of Part III. However, they should reconcile in total to the corresponding amounts in Part I of the IEE excluding amounts relating to reinsurance assumed or ceded. In fact, commissions and brokerage incurred on a direct basis in column 23 should reconcile in total to the sum of the amounts in line 2.1 plus 2.4 of IEE Part I, column 2.

Other income less other expense in column 31 also does not reconcile directly to amounts in the Annual Statement. However, the NAIC instructions note that it should agree in total to

---

119 2018 NAIC Annual Statement Instructions Property/Casualty, page 422.
FINANCIAL REPORTING THROUGH THE LENS OF A PROPERTY/CASUALTY ACTUARY

Part IV. Statutory Filings to Accompany the Annual Statement

amounts in line 15 minus line 5 of the Statement of Income that apply to direct business only (i.e., “excluding expenses related to reinsurance assumed or ceded”).

Calculation of Pretax Profit or Loss Excluding All Investment Gain (Column 33)

Column 33 provides pretax profit (loss) excluding all investment gains and is calculated from the information contained in the previous columns of Part III of the IEE, using the same formulaic approach as in Part II. Specifically,

Pretax profit or loss excluding all investment gains =

   Premiums earned (column 3)
   - Dividends to policyholders (column 5)
   - Incurred loss (column 7)
   - DCC expenses incurred (column 9)
   - A&O expenses incurred (column 11)
   - Commission and brokerage expenses incurred (column 23)
   - Taxes, licenses and fees incurred (column 25)
   - Other acquisitions, field supervision and collection expenses incurred (column 27)
   - General expenses incurred (column 29)
   + Other income less other expenses (column 31).

INTERROGATORIES

The interrogatories to the IEE are actually shown before the Parts I through III. The interrogatories provide explanatory notes on the information contained in Parts I through III, the most important of which is Interrogatory 4, which provides information on the process by which the allocations of expenses and profit are made. Specifically, question 4 asks:

4. The information provided in the Insurance Expense Exhibit will be used by many persons to estimate the allocation of expenses and profit to the various lines of business.
   4.1 Are there any items requiring special comment or explanation?
   4.2 Are items allocated to line of business in Parts II and III using methods not defined in the instructions?
   4.3 If yes, explain.

Questions 4.1 and 4.2 each require “yes” or “no” responses. If the company answers “yes” to either question, the company is required to provide an explanation, so the user can consider differences in the company’s process relative to what is stated in the instructions.

CHAPTER 19. RISK-BASED CAPITAL

OVERVIEW

The Risk-Based Capital (RBC) system was developed by the National Association of Insurance Commissioners (NAIC) and has been used since 1994 to provide a means for the early detection of insurance company insolvency. It was implemented for property/casualty companies in part in response to reports issued by the federal government in the late 1980s and early 1990s questioning the ability of state governments to regulate insurance companies. These reports emerged in the wake of four of the largest property/casualty insurance company insolvencies in the history of the U.S. insurance industry: Mission Insurance Company, Transit Casualty Company, Integrity Insurance Company and Anglo-American Insurance Company.

The implementation of the RBC system was a significant advancement in solvency monitoring by state governments and has also served as the foundation for many other capital models that followed, including those currently used by rating agencies.

There are two main components to the RBC system:

1. RBC formula: The RBC formula results in a minimum level of required capital determined (the authorized control level benchmark, or ACL) formulaically using an approach that is standard to all insurance companies in a particular industry group (e.g., property/casualty, life and health). The minimum level of required capital is intended to reflect the capital needed to support the risks faced by insurance companies. The company's actual recorded capital and surplus is compared to the minimum required capital to produce the RBC ratio. The RBC ratio is compared to a range of values that define the levels of company and regulatory action.

2. RBC for Insurers Model Act: The RBC Model Act, as adopted in the laws and regulations of each state, provides the state insurance regulator with authority to take specific action when a company's RBC ratio falls below certain thresholds.

The RBC system is applied to property/casualty, life and health insurance companies. Certain entities are exempt from the RBC system, including title insurance companies, monoline

---

123 The company's actual recorded capital and surplus is adjusted to reflect certain items that will be introduced later in this chapter.

124 NAIC RBC for Insurers Model Act (Model #312).
financial guaranty insurance companies and monoline mortgage guaranty insurance companies. Other exemptions may apply based on individual state laws and regulations.

This publication will focus on the RBC system as it applies to property/casualty insurance companies. The formulas differ for property/casualty, life and health insurance companies, reflecting differing risk factors for each.

Insurance companies are required to file their RBC report with the NAIC by March 1 based on information evaluated as of the prior year-end (December 31). An insurance company’s RBC report provides its RBC formula calculations and management discussion and analysis of the RBC results. The RBC report is confidential; therefore, details of the calculation are not available to the public. However, the summarized results of the RBC formula calculations are shown in the Five-Year Historical Data exhibit of the Annual Statement, which is in the public domain. The disclosure shows the overall result of the authorized control level risk-based capital calculation together with the company’s total adjusted capital, which can be compared to determine the RBC ratio.

RBC FORMULA

Overview

The RBC formula is computed by applying a set of factors to asset, reserve, recoverable and premium items reported in an insurance company’s Annual Statement. The size of the factor depends on the level of risk associated with each item; the greater the risk, the greater the factor. The application of the factors to the associated Annual Statement items results in what are commonly referred to as “risk charges.”

The formula is not a comprehensive measure of every risk for an insurance company; rather it only considers those risks that are material to an insurance company. Further, risks associated with a company’s business plans and strategy, management, internal controls, systems, reserve adequacy and ability to access capital are not considered as these risks are difficult to quantify.

The general structure of the RBC formula has remained intact since it was first implemented in 1994, although the risk charges have been subject to periodic revisions since that time. In recent years, additional risk categories have been introduced to the formula to reflect evolving practices around the management and quantification of risk in the insurance industry. The RBC formula was developed based on its predecessor, the life RBC formula, which the NAIC implemented a year earlier in 1993.

---

125 It should be noted that the NAIC is currently in the process of testing and implementing a proposed risk-based mortgage guaranty capital model, see: [http://www.naic.org/cmte_e_mortgage_guaranty_insurance_wg.htm](http://www.naic.org/cmte_e_mortgage_guaranty_insurance_wg.htm)

126 RBC for stand-alone health insurers was not implemented until 1998.
Risk Categories

The current property/casualty RBC formula includes eight risk categories, with most denoted by the letter “R” with an indicator subscript to identify the particular risk:

- **R₀** Subsidiary Insurance Companies and Miscellaneous Other Amounts
- **R₁** Asset Risk – Fixed Income
- **R₂** Asset Risk – Equity
- **R₃** Asset Risk – Credit
- **R₄** Underwriting Risk – Reserves
- **R₅** Underwriting Risk – Net Written Premium
- **R_{cat}** Catastrophe Risk
- **Operational Risk**\(^{127}\)

Broadly speaking, the major categories of risk captured by the property/casualty RBC formula are similar to those within the life and health formulas, focusing mainly on the risks associated with the company’s investments and other recoverable-based assets (“asset risk”), as well as risks associated with the issuance of insurance policies (“underwriting risk”). Visually, the formulas differ by the use of the letter “R” denoting the risks for property-casualty, while the letter “C” is used for the life formula and “H” for the health formula.

Asset risk is a much smaller portion of the property/casualty total risk charge compared to the life industry. This is because life insurance policies tend to be purchased as investment vehicles, whereas property/casualty products are purchased to protect the consumer from financial loss. As a result, property/casualty companies tend to invest in short-term, liquid investments (which are generally considered to be lower risk) due to the relatively shorter duration of liabilities.

As of December 31, 2018, the life insurance industry held more than 17 times the amount of recorded surplus in admitted assets whereas property/casualty insurers held less than three times the amount of surplus in admitted assets\(^{128}\).

**Subsidiary Insurance Companies and Miscellaneous Other Amounts**

The R₀ charge considers the risks associated with investments in affiliated entities as well as miscellaneous off-balance sheet and other items.

\(^{127}\) Operational Risk is added as a final step in the calculation, after applying the covariance adjustment between other risk types, and does not have a corresponding “R” indicator.

\(^{128}\) S&P Global Market Intelligence, based on YE2018 Annual Statement data.
Affiliated investments fall into two broad categories: insurance affiliates that are subject to RBC and affiliates that are not subject to RBC. The latter group includes insurance affiliates that are not subject to RBC, such as title insurers, monoline financial guaranty insurers, and monoline mortgage guaranty insurers, all of which are currently exempt from the RBC system.

R₀ contains the risk charges associated with affiliated insurers subject to RBC (whether property/casualty, life or health), along with alien insurance affiliates.¹²⁹ All other affiliates are subject to R₂ charges.

The miscellaneous off-balance sheet and other items component includes non-controlled assets, guarantees for affiliates, contingent liabilities and deferred tax assets admitted under statutory-basis accounting.

Asset Risk

Within the property/casualty RBC formula, there are three categories of asset risk:

- R₁: Asset risk — Fixed income
- R₂: Asset risk — Equity
- R₃: Asset risk — Credit

R₁ and R₂ are risks associated with admitted invested assets (other than those already captured in R₀), which are shown on lines 1 through 11, column 3, on the asset side of the statutory balance sheet on page 2 of the Annual Statement. The R₁ charge considers changes in interest rates and potential default of fixed income investments (e.g., cash, bonds, mortgage loans). The R₂ charge considers changes in asset valuations for non-fixed income investments (e.g., stocks, real estate).

As of December 31, 2018, bonds represented approximately 51% of the admitted assets of the property/casualty insurance industry, with the next largest investment category dropping to 20% represented by holdings of common (19%) and preferred (<1%) stocks, and 5% in cash.¹³⁰

R₃ considers the credit risk associated with receivables on the balance sheet, which include items listed on lines 14 and subsequent on the asset side of the statutory balance sheet, as well as risk associated with reinsurance recoverables. Additionally, if a company has written

---

¹²⁹ According to the Glossary of Terms in the textbook Property-Casualty Insurance Accounting issued by Insurance Accounting & Systems Association, Inc., 8th ed. (2003), First Addendum (2006), an alien insurance company is defined as “An insurer or reinsurer domiciled outside the U.S. but conducting an insurance or reinsurance business in the U.S.”

¹³⁰ S&P Global Market Intelligence, based on YE2018 Annual Statement data
5% or more of its premiums in accident & health lines in the last three years, it is also subject to a Health Credit Risk charge.

Underwriting Risk

There are two categories of underwriting risk in the property/casualty RBC formula:

\[ R_4 \] Underwriting risk — Reserves
\[ R_5 \] Underwriting risk — Net written premium

The reserve risk charge (\( R_4 \)) is concerned with past business while the premium risk charge (\( R_5 \)) is concerned with future business. Reserve risk is the risk that the company’s recorded loss and loss adjustment expense (LAE) reserves will develop adversely, under the assumption that the current reserve balance is adequate. Written premium risk considers the risk that the company’s business in the following year will be unprofitable.

According to the NAIC RBC instructions, “Underwriting risk is the largest portion of the risk-based capital charge for most property/casualty insurance companies and makes up approximately 55 percent of the aggregate industry risk-based capital prior to the covariance adjustment.”\(^{131}\) This contrasts with life insurance companies, where the predominant portion of the RBC charge is asset risk.

Property/casualty insurance companies tend to concentrate in short-term, relatively fixed and liquid investment categories given the short duration of most property/casualty insurance products sold and the need to have funds readily available to pay claims. The smaller volume and relatively short-term nature of the assets for property/casualty insurance companies significantly limits the asset risk relative to the size of underwriting risk, as compared to life insurance companies.

Catastrophe Risk

The catastrophe risk charge (\( R_{\text{cat}} \)) was added to the RBC formula in 2017 after more than a decade of development.\(^{132}\) It covers risks associated with earthquake and hurricane events and considers modeled losses at the worst year in 100. Projected losses can be calculated using one of the approved commercially available catastrophe models (e.g., AIR, RMS, EQECAT). Beginning in 2019, companies will also be able to use their own internally developed catastrophe model, upon obtaining written permission by their domestic (where model output is used for a single entity) or lead state (where model output is used for the whole group) insurance regulator.

\(^{131}\) NAIC, RBC Property & Casualty 2018 Forecasting & Instructions, page 20.
\(^{132}\) Catastrophe Risk was included as part of RBC filings on an informational only basis only from 2013-16 as part of the development phase.
The catastrophe risk charge applies on a net of reinsurance basis, with a corresponding contingent credit risk charge for certain categories of reinsurers.

**Covariance Adjustment**

Risk charges $R_0$ through $R_{cat}$ are aggregated in the RBC formula to calculate the overall RBC requirement, before the consideration of operational risk, as follows:\footnote{Note that under certain circumstances, discussed later, half of the reinsurance component of $R_3$ is moved into $R_4$ for the purpose of the covariance adjustment calculation.}

$$
R_0 + \sqrt{R_1^2 + R_2^2 + R_3^2 + R_4^2 + R_5^2 + R_{cat}^2} = \text{Total RBC After Covariance Before Basic Operational Risk}
$$

The square root calculation within the RBC formula is commonly referred to as the “covariance adjustment.” Rather than summing up the individual risk charges ($R_1$ through $R_{cat}$), it is assumed that the individual risk charge categories are independent of one another. That is, the formula reflects diversification among these risk categories, thereby assuming that the aggregate risk is less than the sum of risk of the independent components. For example, the formula assumes that the risk of default on an insurance company’s invested assets (e.g., bonds, stocks) is independent of the performance of its loss reserves. Taking the square root of the sum of the squares for $R_1$ through $R_{cat}$ increases the dependency of the larger risks in the calculation and decreases the significance of the smaller risk categories in the overall aggregate RBC requirement.

$R_0$ is kept outside of the covariance adjustment because the risk for investments in insurance company subsidiaries is believed to be directly correlated with the combination of the risks specific to the reporting entity (i.e., the other risk charges $R_1$ through $R_{cat}$). Therefore, the risk for investments in insurance company subsidiaries is additive to the aggregate of the investment and underwriting risks of the reporting entity for which RBC is being calculated. In other words, RBC should not depend on the organizational structure of the insurance company and investments in insurance company subsidiaries that are subject to RBC do not provide a diversification benefit.

The covariance calculation is applied similarly in the life and health RBC formulas, keeping $C_0$ and $H_0$ outside of the square root like $R_0$.

**Basic Operational Risk**

Introduced in 2018,\footnote{The operational risk charge was formally introduced in 2017, but applied a 0% risk charge that year} the basic operational risk charge considers the risk of financial loss resulting from operational events, such as the inadequacy or failure of internal systems,
personnel, procedures or controls, as well as external events. This includes legal risk but excludes reputational risk arising from strategic decisions. The risk charge accounts for operational risks that are not deemed to be already reflected in the existing risk categories.

The basic operational risk charge uses a percentage of RBC or “add-on” approach that applies a risk factor to the Total RBC After Covariance Before Basic Operational Risk amount described above. The operational risk charge will be reduced by the sum of offset amounts reported by direct Life RBC filing insurance subsidiaries adjusted for the percentage of ownership in the direct life insurance subsidiaries (but not to produce a charge that is less than zero).

Components of the Charges

Within subsequent sections of this chapter, we will walk through the components of each charge that goes into the RBC formula, deliberately leaving out certain information that would be necessary to fully prepare and issue the RBC report for a company. We will reference the requirements of the RBC formula as it stands for year-end 2018 submissions, noting in a few places modifications that are expected in the 2019 version of the RBC formula.

The NAIC issues instructions on how to prepare the RBC calculation, including an instructional forecasting spreadsheet containing an example of the necessary formulas. Additionally, RBC software is available from Annual Statement software vendors and is used by insurance companies for filing with state regulatory authorities. This publication is only intended to provide an overview of the RBC formula and is not intended to supplant the NAIC RBC instructions or electronic filing requirements.

Before we delve into the details, let us provide some perspective on the relevance of each risk category to the overall formula. Table 75 provides a summarization of figures provided by the NAIC in its presentation of 2018 RBC results for the property/casualty insurance industry.135

Asset Risk – Equity (R₂) and Underwriting Risk – Reserves (R₄) represented the largest risk charges within the RBC formula for the property/casualty insurance industry in 2018, with $119 billion and $115 billion respectively.

Despite representing approximately half of the invested assets of the property/casualty insurance industry in 2018 (see Table 2), the asset risk charge for fixed income investments is the smallest component of the RBC charge for the industry. This is because property/casualty insurers tend to invest in relatively safe, high-credit quality bonds.

On the other hand, the asset risk charge for equity brings the highest charge, reflecting the increased risk associated with these investments over fixed income. The NAIC’s report on 2018 RBC results shows that the equity risk component has been growing in significance relative to other risk charges over the past decade, becoming the largest risk component for the first time in 2017. This reflects a period where common stocks have increased from 12% of property/casualty insurers’ total admitted assets in 2008 to 19% in 2018.

Table 76 shows the impact of the Covariance Adjustment. Applying the sum-of-squares approach to the R₁ through R₅ charges reduces the combined total of these risk charges by approximately 50% reflecting independence between each of the risk types.

Recall that the covariance adjustment increases the dependency of the larger risks and decreases the significance of the smaller risk categories in the overall aggregate RBC requirement. As displayed in the Table 76, squaring each of charges R₁ through R₉ and summing the results shows the increased significance of the two largest risk categories (R₂ and R₄), which now contribute 76% to the total on a squared basis, up from 61% based on a simple sum. The other risk categories have similarly seen their contribution shrink.

**THE RBC CHARGE FOR SUBSIDIARY INSURANCE COMPANIES AND MISCELLANEOUS OTHER AMOUNTS (R₀)**

The R₀ charge considers the risks associated with investments in subsidiary insurance companies as well as miscellaneous off-balance sheet and other items.

Subsidiary and affiliated insurance companies are only considered within R₀ if they are U.S. domiciled entities subject to RBC, or if they are alien insurers (i.e., foreign to the U.S.). Recall that certain insurance companies are not subject to RBC, such as title insurers, monoline mortgage guaranty insurers and monoline financial guaranty insurers. All other affiliated entities, including U.S. insurance subsidiaries not subject to RBC, are considered within the Asset Risk — Equity (R₂) module.

**Selected definitions**

Term definitions will become important as we walk through the risk charges for affiliated entities. Statutory Accounting Principles (SAP), specifically Statement of Statutory Accounting Principles (SSAP) No. 97, Investments in Subsidiary, Controlled and Affiliated Entities, define the following terms:
Parent  "An entity that directly or indirectly owns and controls the reporting entity."\textsuperscript{136}

Subsidiary  "An entity that is, directly or indirectly, owned and controlled by the reporting entity."\textsuperscript{137}

Affiliate  "An entity that is within the holding company system or a party that, directly or indirectly, through one or more intermediaries, controls, is controlled by, or is under common control with the reporting entity. An affiliate includes a parent or subsidiary and may also include partnerships, joint ventures, and limited liability companies."\textsuperscript{138}

Control  "The possession, directly or indirectly, of the power to direct or cause the direction of the management and policies of the investee, whether through the (a) ownership of voting securities, (b) by contract other than a commercial contract for goods or non-management services, (c) by common management, or (d) otherwise. Control shall be presumed to exist if a reporting entity and its affiliates directly or indirectly, own, control, hold with the power to vote, or hold proxies representing 10\% or more of the voting interests of the entity."\textsuperscript{139}

SSAP No. 97 further states that control is measured at the holding company level. For example, the 10\% benchmark would apply to a group consisting of two affiliates where one affiliate owns 7\% of a company and the other affiliate owns 4\% of that same company. Each member of the group has control over the company as the sum of their ownership percentages exceeds 10\%.

Investments in SCA entities  An insurance company’s investment in subsidiaries, controlled and affiliated entities (SCAs), are admitted assets to the extent they conform to the requirements of SSAP No. 97.

Insurance Affiliates Subject to RBC

For U.S. insurers subject to RBC, including those subject to the life or health RBC requirements, the total $R_0$ charge for a particular subsidiary is limited to the RBC of the subsidiary, across all common stocks and preferred stocks, adjusted by the reporting entity’s \textsuperscript{136} SSAP No. 97, Investments in Subsidiary, Controlled and Affiliated Entities, “Definitions” section.
\textsuperscript{137} Ibid.
\textsuperscript{138} Ibid.
\textsuperscript{139} Ibid.
ownership (pro rata) share in the subsidiary. The theory is that, through ownership, the reporting entity is subject to the same risks as its subsidiary.

According to the NAIC’s 2018 written instructions for RBC, the relevant RBC measure from the subsidiary or affiliate is defined as:

- For a P/C and Health subsidiary RBC filings:
  - Total RBC After Covariance Before Basic Operational Risk

- For a Life subsidiary RBC filing, the sum of:
  - Total RBC After Covariance Before Basic Operational Risk
  - Primary Security shortfalls for all cessions covered by Actuarial Guideline XLVIII, multiplied by two

Ownership of Common Stock

The RBC charge for investments of an insurance company subsidiary depends on the accounting method used by the reporting entity to report the investment. For investments in insurance affiliates recorded on the equity method, and for which unamortized admitted goodwill is zero or non-existent (i.e., no adjustment to the book/carrying value of the investment), the R0 charge for ownership of common stock in the insurance affiliate subject to RBC is equal to the minimum of the following:

- The total RBC of the affiliate multiplied by the percentage of ownership in the common stock
- The book/adjusted carrying value of the common stock (greater than 0) as recorded by the reporting entity

For all other insurance affiliates, the R0 charge for ownership of common stock in these affiliates is made up of two components:

1. An R0 component, which is equal to the minimum of the following:
   a. The total RBC of the affiliate multiplied by the percentage of ownership in the common stock; or

---

140 NAIC RBC Property & Casualty 2018 Forecasting & Instructions, page 1.
141 According to SAP (SSAP No. 97), admitted investments in insurance company SCAs are recorded on the reporting entity’s balance sheet using one of two methods: the market valuation approach or equity method. Under the market valuation approach, investments in insurance company SCAs are based on the market value of the SCA, adjusted for the reporting entity’s ownership percentage. Market value is equivalent to fair value. Under the equity method, investments in insurance company SCAs are recorded based on the reporting entity’s proportionate share of audited statutory equity of the SCA’s balance sheet, adjusted for any unamortized goodwill. Under this method, the reporting entity records the initial investment at cost then essentially adjusts the value over time based on the reporting entity’s share in the company’s income (loss). At any point in time, the recorded amount is called the “carrying value.”
b. The statutory surplus of the affiliate multiplied by the percentage of ownership of the total common stock.

2. An $R_2$ component, which is equal to one of the following (limited to a minimum of zero):
   a. The amount of the book/carrying value that exceeds the value from the $R_0$ component (above), when the total RBC of the affiliate multiplied by the percentage of ownership in the common stock is greater than the book/carrying value; otherwise
   b. The maximum of the following:
      i. The excess of the book/adjusted carrying value over the pro rata statutory surplus value for the affiliate multiplied by 22.5% or
      ii. The amount that RBC of the affiliate multiplied by the percentage of ownership in the common stock exceeds the value obtained in the $R_0$ component (above).

Recall that RBC calculations are not in the public domain. Attempts to recalculate an insurance company’s RBC often make a simplifying assumption that the $R_0$ charge for ownership in common stock of an SCA is equal to the SCA’s RBC (adjusted for ownership).

Ownership of Preferred Stock

The reporting entity’s $R_0$ charge for investments in preferred stock of insurance subsidiaries depends on whether the subsidiary has excess RBC. Excess RBC is defined as the amount of RBC of the affiliate that exceeds the total value of the outstanding common stock. If the excess RBC is greater than zero, the RBC charge for ownership in preferred stock is the minimum of the following:

- The pro rata share of the excess RBC
- The book/adjusted carrying value of the preferred stock (greater than zero) as recorded by the reporting entity

The pro rata share is equal to the percentage of the affiliate’s total outstanding preferred stock value that is owned by the company. To determine the value of total outstanding common stock or total outstanding preferred stock, divide the book/adjusted carrying value of the investment by the percentage of ownership.

If the excess RBC is less than or equal to zero, then the RBC charge for the company’s ownership in the preferred stock of its affiliate is zero.

Occasionally, a company might own preferred stock in an affiliate subject to RBC but no common stock. When this occurs, the company must determine if there is any excess by calculating the notional value of the total outstanding value of the affiliate’s common stock.
and/or preferred stock using one of the accepted methods from the Purposes and Procedures Manual of the NAIC Investment Analysis Office.

Alien Insurance Affiliates

Alien insurance companies are entities that are incorporated under the laws of a country outside the U.S., therefore these entities are not themselves subject to RBC. The reporting entity’s RBC charge for investments in directly owned alien affiliates is equal to the Annual Statement carrying value of the company’s interest in the affiliate multiplied by a factor of 0.500. For indirectly owned alien affiliates, this amount is further adjusted to reflect the reporting entity’s ownership on the holding company.

Off-balance Sheet and Other Items

Off-balance sheet and other items include amounts that are either restricted or not recorded by the insurance company in its statutory financial statements yet still represent assets and/or potential liabilities of the insurance company and therefore expose the company to risk. Off-balance sheet and other items are disclosed in the Notes to Financial Statements and General Interrogatories of the Annual Statement. The following represents the categories of such items included in the R\textsubscript{0} charge:

1. Non-controlled assets: This category of assets includes the following:
   - Collateral loaned to others from securities lending programs
   - Assets that are reported on the company’s balance sheet but for which the company does not have exclusive control over, thereby exposing the company to increased investment risk
   - Assets sold or transferred that are subject to a put option, thereby enabling the purchaser to sell the assets back to the insurance company

2. Guarantees for the benefit of affiliates: These are guarantees that may expose the company’s assets to contingent liability exposure. An example would be a guarantee made by a company to pay an outstanding loan held by an affiliate with a third party in the event that the affiliate was unable to meet its obligation to that third party.

3. Contingent liabilities: This includes amounts for which the insurance company may be held responsible but for which the amount cannot be determined and therefore is not entered on the balance sheet. An example includes structured settlements for which the insurance company purchases an annuity from a life insurance company to make structured payments to claimants in order to close out a claim. The insurance carrier would close the claim since it paid the life insurer to make the claim payments on its behalf. However, if the life insurance company fails to pay, the insurance company would still be ultimately responsible for settling the liability. This is a contingent liability to the insurance company.
4. Deferred tax assets: This comprises admitted adjusted gross deferred tax assets (DTAs) as described in SSAP No. 101, paragraphs 11a and 11b. The source for the DTA amounts to use in the calculation is found in the Annual Statement, Notes to the Financial Statements, Note 9, Part A, Section 2.

For almost all of the items listed above, a 1.0% factor is applied to all off-balance sheet amounts for purposes of inclusion in the $R_0$ charge. The one exception is for conforming securities lending programs, which are those programs that have specified elements that lower the associated risk,\(^\text{142}\) where a reduced charge of 0.2% is applied.

Additionally, the charge associated with deferred tax assets can be reduced to 0.5% when the insurance company either filed its own separate Federal income tax return or was included in a consolidated Federal income tax of which the common parent is an insurance company.

THE RBC CHARGE FOR ASSET RISK ASSOCIATED WITH FIXED INCOME INVESTMENTS ($R_1$)

$R_1$ includes the charge for interest rate and default risk associated with fixed income investments in the following categories:

1. Bonds
2. Off-balance sheet collateral and Schedule DL, Part 1, Assets
3. Other long term assets, including mortgage loans, low income housing tax credits and working capital finance investments
4. Miscellaneous assets, including cash, cash equivalents, other short-term investments and non-admitted collateral loans
5. Replication (synthetic asset) transactions and mandatorily convertible securities

Typically, the charge relating to bonds overwhelmingly dominates this risk category for property/casualty insurers. In general, the charge for each of these investment types is based on a factor determined by the NAIC multiplied by the book/adjusted carrying value of the investment.

In addition to the charge for the aforementioned types of fixed income investment categories, there are two charges reflecting the level of diversification in the entity’s fixed income portfolio. The first is the bond size factor, and the second is the asset concentration factor.

\(^{142}\) According to the NAIC RBC Property & Casualty 2018 Forecasting & Instructions, page 16, conforming securities lending programs are those comprising all of the following: (1) a written plan approved by the company’s board of directors describing the company’s securities lending program and ways it can invest collateral; (2) written procedures that the company must follow to monitor and control the risks of the program; (3) a binding agreement between the insurance company and the borrowers of the insurer’s securities; and (4) collateral in the form of investments that are allowable by the company’s domiciliary state (e.g., cash, cash equivalents, federally guaranteed investments).
The fewer the bond holdings and greater the concentration in individual issuers or borrowers, the greater the associated charge.

A brief discussion of each charge is provided below, with examples to illustrate their calculation as deemed appropriate.

Bonds and the Bond Size Factor

The RBC charge for unaffiliated bond investments is equal to the book/adjusted carrying value of the bond multiplied by a factor, where the factors vary based on the bond class. The factors are as shown in Table 77.

<table>
<thead>
<tr>
<th>NAIC bond class</th>
<th>RBC factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class 01 — Highest credit quality</td>
<td></td>
</tr>
<tr>
<td>- U.S. government, guaranteed by U.S. government</td>
<td>0.000</td>
</tr>
<tr>
<td>- U.S. government, not backed by full faith and credit of U.S. government</td>
<td>0.003</td>
</tr>
<tr>
<td>- All other</td>
<td>0.003</td>
</tr>
<tr>
<td>Class 02 — High credit quality</td>
<td>0.010</td>
</tr>
<tr>
<td>Class 03 — Medium credit quality</td>
<td>0.020</td>
</tr>
<tr>
<td>Class 04 — Low credit quality</td>
<td>0.045</td>
</tr>
<tr>
<td>Class 05 — Lowest credit quality</td>
<td>0.100</td>
</tr>
<tr>
<td>Class 06 — In or near default</td>
<td>0.300</td>
</tr>
</tbody>
</table>

As displayed in Table 77, the RBC factors increase with the amount of perceived credit risk, starting with 0.000 for U.S. government bonds that are backed by the full faith and credit of the government and therefore have almost no default risk, all the way to a factor of 0.300 for bonds issued by companies that are in or near default. According to the NAIC RBC instructions, the bond factors are determined “based on cash flow modeling using historically adjusted default rates for each bond category.” The instructions further explain: “For each of 2,000 trials, annual economic conditions were generated for the 10-year modeling period. Each bond of a 400-bond portfolio was annually tested for default (based on a “roll of the dice”) where the default probability varies by NAIC designation category and that year’s economic environment.”

In addition to the charge for each class of bond, there is a separate charge to reflect the level of diversification called the bond size factor. According to the NAIC RBC instructions, “The size factor reflects additional modeling for different size portfolios that shows the risk increases as the number of bond issuers decreases. Because most insurers’ bond portfolios are considerably smaller than the portfolio used to develop the model bond risk, the basic bond factors understate the true default risk of these assets. The bond size factor adjusts the

---

143 NAIC, RBC Property & Casualty 2018 Forecasting & Instructions, page 7.
The bond size factor, which measures the degree of diversification in the investment portfolio, is computed as the weighted average number of issuers in a portfolio subject to the adjustment, with the weights prescribed by the NAIC depending on the number of issuers. Table 78 displays the formula, including the NAIC weights.

**TABLE 78**

<table>
<thead>
<tr>
<th>Bond Size Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
<tr>
<td><strong># of bond issuers</strong></td>
</tr>
<tr>
<td>(1)</td>
</tr>
<tr>
<td>First 50</td>

<tr>
<td>Next 50</td>
</tr>
<tr>
<td>Next 300</td>
</tr>
<tr>
<td>More than 400</td>
</tr>
<tr>
<td><strong>Total</strong></td>
</tr>
</tbody>
</table>

The bond size factor is equal to the total in column 3 divided by the total in column 1 in Table 79, minus 1. For example, if a reporting entity invests in 500 bonds, the bond size factor would be 0.2. The calculation of this factor is provided in Table 79 as the sum of the weighted number of issuers in column 3 of 580 divided by the total number of issuers in column 1 of 500, minus 1.

**TABLE 79**

<table>
<thead>
<tr>
<th>Example of Bond Size Factor</th>

</tr>
<tr>
<td>Next 300</td>
</tr>
<tr>
<td>More than 400</td>
</tr>
<tr>
<td><strong>Total</strong></td>
</tr>
</tbody>
</table>

The bond size factor is applied to the RBC calculated for bonds subject to adjustment. As displayed in Table 79, the weights decrease with the number of issuers. Therefore, the more

---

144 Ibid.
issuers, the lower the factor applied in the RBC calculation and the lower the additional RBC amount required. For a reporting entity investing in fewer than 50 bonds, the factor is 1.5 times the RBC required for the bonds (=2.5 - 1); for an entity investing in 1,000 bonds, the factor is 0.03.\(^{145}\)

The bond size factor is calibrated such that the break-even point where the factor equals 1.0 is set at 1,300 bonds. Portfolios containing 1,300 or more bonds will receive a discount to their RBC charge for bonds.

Bonds that are subject to the bond size factor include unaffiliated bonds in classes 02 through 06, plus non-U.S. government bonds in class 01.

Off-balance Sheet Collateral and Schedule DL, Part 1, Assets

The RBC charge for off-balance sheet collateral and Schedule DL assets considers the risk associated with securities lending programs. Recall the discussion of securities lending programs in Chapter 13, Overview of Schedules and Their Purpose. The risk associated with these programs is that the reporting entity will lose money on the reinvestment of collateral posted by the borrower. Collateral held by the reporting entity in conjunction with securities lending programs is reported one of three ways in the Annual Statement:

1. In investment schedules that correspond to the invested collateral (e.g., Schedule A, B, BA, D, DA and E), which roll up into the balance sheet
2. In Schedule DL, Part 1, of the Annual Statement, which rolls into line 10 of the asset side of the balance sheet
3. Off-balance sheet, due to not being recorded in the financial statements

The R\(_1\) charge considered herein includes a provision for these assets as included in items 2 and 3 above. The charge is equal to the book/adjusted carrying value multiplied by a factor, where the factor is equal to that for the particular asset class. For example, the same factors by class applicable to bonds are also used in this calculation.

Other long term assets – Mortgage loans

The RBC charge for mortgage loans for property/casualty insurers is computed as the book/adjusted carrying value of the loans multiplied by a factor of 0.050. This is based upon the factors developed by the Life RBC formula, which ranged from 3% to 20%.

Other long term assets – Working Capital Finance Investments

The booked/adjusted carrying value of working capital finance investments can be found in the Notes to Financial Statements, lines 5M(01a) and 5M(01b) in column 3, of the Annual

\(^{145}\) 0.03 = \(\frac{[(50*2.5) + (50*1.3) + (300*1.0) + (600*0.9)]}{(1,000)} - 1.0\)
Statement. Those in line 5M(01a) – NAIC Designation 1 - get a risk charge of 0.0038, while those in 5M(01b) – NAIC Designation 2 – have a factor of 0.0125.

Low Income Housing Tax Credits (LIHTC)

There are five categories of LIHTC investments listed below, which must be reported in accordance with Statement of Statutory Accounting Principles (SSAP) No. 93, Low Income Housing Tax Credit Property Investments:

- Federal guaranteed
- Federal non-guaranteed
- State guaranteed
- State non-guaranteed
- All other

The associated NAIC factor used to calculate the RBC charge varies by category.

In order to be classified as a federal guaranteed LIHTC investment, it must have an all-inclusive guarantee from an ARO\textsuperscript{146}-rated entity which guarantees the yield on the investment. The RBC charge for a federal guaranteed LIHTC investment is equal to the book/adjusted carrying value times 0.0014.

To be classified as a federal non-guaranteed LIHTC investment, it must include the following risk mitigation factors:

a) A level of leverage below 50% For an LIHTC fund, the level of leverage is measured at the fund level; and

b) A tax credit guarantee agreement from a general partner or managing member, requiring the general partner or managing member to reimburse investors for any shortfalls in tax credits due to errors of compliance. For an LIHTC fund, a tax credit guarantee is required from the developers of the lower-tier LIHTC properties to the upper-tier partnership.

The RBC charge for a federal non-guaranteed LIHTC investment is equal to the book/adjusted carrying value times 0.0260.

To be classified as a state guaranteed LIHTC investment, it must minimally meet the federal requirements for guaranteed LIHTC investments. The RBC charge for a state guaranteed LIHTC investment is equal to the book/adjusted carrying value times 0.0014.

\textsuperscript{146} NAIC’s Acceptable Rating Organizations
To be classified as a state non-guaranteed LIHTC investment, it must minimally meet the federal requirements for non-guaranteed LIHTC investments. The RBC charge for a state non-guaranteed LIHTC investment is equal to the book/adjusted carrying value times 0.0260.

All other federal and state LIHTC investments that do not meet the requirements of the above categories will be classified in the All Other LIHTC investments category. The RBC charge for all other LIHTC investments is equal to the book/adjusted carrying value times 0.1500.

Miscellaneous Assets

The RBC charge for miscellaneous assets is computed as a factor times the book/adjusted carrying value for those assets that are in excess of amounts considered elsewhere in the RBC formula, if any. The RBC charges for each investment are as follows (not less than zero):

- 0.003 times the book value of cash, net cash equivalents and other short-term investments
  - The NAIC recognize that there is a small risk related to the possible insolvency of the bank where cash deposits are held. The 0.3% factor, equivalent to an unaffiliated NAIC 01 bond, reflects the short-term nature of this risk.

- 0.050 times admitted collateral loans and write-ins
  - These are generally a small proportion of total portfolio value. A factor of 5.0% is consistent with other RBC formulas studied by the NAIC working group.

Replication (Synthetic Asset) Transactions and Mandatory Convertible Securities

Assets included within this category are defined in the NAIC RBC instructions as follows:

“A replication (synthetic asset) transaction is a derivative transaction entered into in conjunction with other investments in order to reproduce the investment characteristics of otherwise permissible investments...

A mandatory convertible security is defined as a type of convertible bond that has a required conversion or redemption feature. Either on or before a contractual conversion date, the holder must convert the mandatory convertible security into the underlying common stock. Mandatory convertible securities are subject to special reporting instructions and are therefore not assigned NAIC designations or Unit Prices by the SVO. The balance sheet amount for mandatory convertible securities shall be reported at the lower of amortized cost or fair value during the period prior to conversion...Upon conversion, these securities will be subject to the accounting guidance of the SSAP that reflects their revised characteristics.”

147 NAIC, RBC Property & Casualty 2018 Forecasting & Instructions, page 10.
To expand upon the discussion about derivatives in Chapter 8. The Statutory Income Statement: Income and Changes to Surplus and Chapter 13. Overview of Schedules and their Purpose, insurance companies use derivative transactions for one of three reasons:

1. Hedge or mitigate risk
2. Generate income
3. Replicate an asset that cannot be purchased in the cash market because it is either too expensive or unavailable

As stated previously, derivative holdings by property/casualty insurers are small relative to those held by life insurance companies. This somewhat explains the low-risk charge for this category.

Replication (synthetic asset) transactions are commonly referred to as “RSATs” and are reported in Schedule DB of the Annual Statement. An RSAT is a package of a derivative(s) and a cash instrument(s). The cash instrument is generally a bond.

The RBC charge for RSATs is equal to the RBC factor applicable for the asset the RSAT is replicating, multiplied by the statement value of the transaction from Schedule DB. Credit is given for the RBC charge already applied to the cash instrument. For example, if the cash instrument is a bond, then the cash component of the RSAT is recorded as a bond on the company’s balance sheet and has already received a risk charge based on its bond characterization. The RBC for RSATs is adjusted to remove the RBC previously calculated for the subject bond.

A mandatory convertible security is reported in the Annual Statement schedule that corresponds to the security pre-conversion. For example, assume an insurer holds a bond that is mandatorily convertible into a fixed number of shares of common stock within three years. The bond will be reported in the company’s balance sheet and will therefore receive an RBC charge based on its NAIC bond class. However, the insurer is not only exposed to risks associated with the bond, but also the risk associated with the common stock that it will convert to sometime over the next three years, since the bond’s principal will be used to purchase the shares. The RBC charge for mandatory convertible securities adjusts the RBC charge upward if the security that results from conversion is more risky. Since unaffiliated common stocks have a RBC charge of 0.15, and bonds have a charge between 0.00 and 0.30, depending on class, the RBC charge will be adjusted upward by the maximum of the difference between the RBC charge for the stock and bond, and zero. This is similar to the application of the RBC charge for RSATs; the RBC charge for mandatory convertible securities is equal to

---

the RBC charge for the converted security, reduced by the RBC charge for the original security.

Half of the charge for RSATs and mandatory convertible securities is applied to $R_1$, with the remaining half applied to $R_2$. This assumes that half of the securities in the calculation are fixed income and half are equity.

Asset Concentration Factor

The asset concentration factor doubles the RBC charge for the 10 largest issuers that the insurance company is exposed to. The purpose of this charge is to reflect the increased risk associated with large concentrations in single issuers.

The 10 largest issuers are determined by first summing the insurer’s total investment (book/adjusted carrying value) across all investments (fixed income plus equity) for each issuer. The total amounts for each issuer are then sorted from largest to smallest to determine the top 10. The RBC charge for each fixed income and equity asset is computed for the 10 largest issuers. The resulting RBC charge for fixed income is included as the asset concentration RBC charge within $R_1$; the resulting RBC charge for equity is included as the asset concentration RBC charge within $R_2$.\(^{149}\) The RBC charge is limited to a maximum of 0.300 for each fixed income and/or equity investment.

However, not all assets are subject to the asset concentration factor, as certain assets are deemed to be of low risk or have already received the maximum charge of 0.300. The assets excluded from the additional charge are also excluded in determining the 10 largest issuers.

Fixed income assets that are subject to the asset concentration factor include the following:

- Bonds in classes 02 through 05\(^ {150}\)
- Collateral loans
- Mortgage loans
- Working Capital Finance Investments - NAIC 02
- Low Income Housing Tax Credits

$R_2$ assets that are subject to the asset concentration factor include the following:

- Unaffiliated preferred stocks and hybrid securities in classes 02 through 05
- Hybrid securities in classes 02 through 05
- Unaffiliated common stock
- Investment in real estate

\(^{149}\) The asset concentration factor can be computed as the weighted average of the total asset concentration RBC charge with the total subject assets.

\(^{150}\) Unaffiliated bonds in class 01 are excluded because they are deemed to be of low risk; unaffiliated bonds in class 06 are excluded because they already receive the maximum charge of 0.300.
The following provides a simplified example to illustrate the calculation of the asset concentration factor.

Assume that the fixed income and equity investments made by an insurance company that are subject to the asset concentration factor are limited to 15 issuers and investments in these issuers are limited to the assets listed in the Table 80 below. The following provides the total adjusted book/carrying value of these investments sorted from highest to lowest value by issuer\(^{151}\).

Only the first ten of these issuers (Aspill Drug through Dakota Energy) are considered in the calculation of the asset concentration factor. The asset concentration charge is computed by

\(^{151}\) Note, for simplicity, only certain assets were included in the example.
multiplying the RBC charge for each asset class by the associated RBC factor for that class. For simplicity, assume that each of the bond investments is class 02 and each of the preferred stock investments is class 03. Table 81 provides the calculation of the asset concentration RBC charge within $R_1$ and $R_2$.

The asset concentration RBC charge for fixed income investments within $R_1$ is $94,900 and the asset concentration RBC charge for equity within $R_2$ is $217,500, resulting in a total asset concentration RBC charge of $312,400.
R₁ for Fictitious

To further illustrate the RBC charges, we used the Annual Statement for Fictitious Insurance Company to build a full example of the NAIC RBC calculations.¹⁵² Because Schedule D is not included in the Annual Statement for Fictitious, we had to make assumptions in preparing the calculation, such as the distribution of fixed assets by RBC class. Table 82 provides the R₁ portion of the RBC calculation for Fictitious.

¹⁵² Note that Fictitious Insurance Company does not have any affiliated entities or miscellaneous off-balance sheet amounts. Therefore, the R₀ charge is zero for Fictitious.
THE RBC CHARGE FOR ASSET RISK ASSOCIATED WITH EQUITY INVESTMENTS ($R_2$)

$R_2$ includes the charge for risk associated with equity investments in the following:

1. Affiliated investments
2. Unaffiliated stocks
3. Real estate
4. Schedule BA assets
5. Miscellaneous assets, including receivables for securities, aggregate write-ins for invested assets and derivatives
6. Replication (synthetic asset) transactions and mandatory convertible securities

Typically, investments in unaffiliated stocks and Schedule BA assets, as well as the asset concentration RBC charge, represent most of the risk charge within $R_2$ for property/casualty insurers.

As discussed for $R_0$, there is an RBC charge for the ownership of common stock in insurance affiliates which includes an $R_2$ component - this gets rolled up with the unaffiliated stocks component of the RBC formula. Additionally, for $R_1$, half of the RBC charge for replication transactions and mandatorily convertible securities listed above as item 6 is applied to $R_2$.

Similarly, there is the additional charge for asset concentration in the 10 largest issuers for each type of equity investment. The calculation is performed as described within the previous section of this chapter covering the Asset Risk - Fixed Income ($R_1$) component.

We will continue by providing a brief discussion of the charges for the different types of equity investments (items 1 through 6).

Affiliated investments

The following list includes the different categories of affiliated investments included in $R_2$, which can be described generally as affiliated entities not subject to RBC (other than alien affiliates):

- Investment affiliates
- Holding companies
- Upstream affiliates (parent)
- Property & Casualty insurance affiliates not subject to RBC
- Life insurance affiliates not subject to RBC
- Health insurance affiliates not subject to RBC
- Other affiliates
The $R_2$ charge for investments in insurance affiliates not subject to RBC is calculated by multiplying a factor by the book/adjusted carrying value of the common and preferred stock of those affiliates.

**Investment Affiliates**

According to the NAIC RBC Instructions, “An investment affiliate is an affiliate that exists only to invest the funds of the parent company. The term investment affiliate is strictly defined in the annual statement instructions as any affiliate, other than a holding company, engaged or organized primarily to engage in the ownership and management of investments for the insurer, not including any broker-dealer or a money management fund managing funds other than those of the parent company.”

In other words, the RBC charge for an investment affiliate is essentially the same as it would be if the reporting entity held the assets directly. For example, if the reporting entity owned a subsidiary that managed $1 billion of its investments in common stock, then the RBC charge for that entity would be computed based on the $1 billion common stock portfolio. If the charge for these investments would have been $10 million if the reporting entity owned the stock directly, then the charge for the investment affiliate would also be $10 million. If the entity only owned 60% of the investment affiliate, then the RBC charge would be $6 million (= 0.6 * $10 million).

The RBC charge for an investment in an investment affiliate is 0.225 times the carrying value of the common and preferred stock.

**Holding Companies**

For investment in a holding company, the RBC charge is 0.225 times the holding company value in excess of the carrying value (i.e., holding company value minus carrying value) for indirectly owned insurance affiliates.

Let’s use an example to illustrate this calculation. In this example, we will use another fictional company named Reporting Entity Insurance Company (REIC).

Assume REIC purchased 100% of the shares in a holding company called HC Company in 2018. Also assume that HC Company has the following assets on its December 31, 2018, balance sheet, as illustrated in Table 83.
TABLE 83

<table>
<thead>
<tr>
<th>Type of asset</th>
<th>Assets 12/31/2018</th>
<th>Distribution by asset type</th>
</tr>
</thead>
<tbody>
<tr>
<td>U.S. Sub Life Insurance Company</td>
<td>5,000,000</td>
<td>10%</td>
</tr>
<tr>
<td>U.S. Sub Property/Casualty Insurance Company</td>
<td>15,000,000</td>
<td>30%</td>
</tr>
<tr>
<td>UK Sub Property/Casualty Insurance Company</td>

<td>8,000,000</td>
<td>16%</td>
</tr>
<tr>
<td>Preferred Stock</td>
<td>12,000,000</td>
<td>24%</td>
</tr>
<tr>
<td>Total assets</td>
<td>50,000,000</td>
<td>100%</td>
</tr>
</tbody>
</table>

U.S. Sub Life Insurance Company, U.S. Sub Property/Casualty Insurance Company and UK Sub Property/Casualty Insurance Company are directly owned by HC Company and indirectly owned by REIC as a result of REIC’s ownership of HC.

Recall that book/adjusted carrying value is used in computing the \( R_0 \) charge. The carrying value of an indirectly owned insurance subsidiary will depend on the carrying value of the holding company and percentage of the holding company carrying value that the subsidiary represents. Let’s continue our example to illustrate.

Assume that REIC carried HC Company on its Annual Statement at year-end 2018 at a value of $55 million, which is equal to the market value of the shares. Of this amount, 10% or $5.5 million, would represent the carrying value of U.S. Sub Life Insurance Company for purposes of determining the \( R_0 \) charge in REIC’s RBC calculation. Similarly, $16.5 million (= 0.3 * $55 million) would be the carrying value for U.S. Sub Property/Casualty Insurance Company, and $11 million is the value for the alien insurer, UK Sub Property/Casualty Insurance Company.

If REIC had only purchased, for example, 66% of the shares of HC Company, each carrying value would be adjusted by REIC’s ownership interest of 66%. The corresponding values would be $3.63 million, $10.89 million and $7.26 million for the three subsidiaries of HC Company, respectively.

Now back to our discussion of the \( R_2 \) charge for investments in holding companies. The RBC charge is 0.225 times the holding company value in excess of the carrying value of indirectly owned insurance affiliates calculated in \( R_0 \). In our example, this would be 0.225 times $22 million, where $22 million is derived as in Table 84.

</tbody>
</table>

Upstream Affiliates (i.e., Parent Company)

For bond investments in a parent company, the RBC charge is 0.225 times the carrying value of the common and preferred stock of the parent, regardless of whether the parent is subject to RBC.

Property & Casualty Insurance Affiliates

For P/C insurance affiliates that are not subject to RBC, including title insurers, monoline financial guaranty insurers, and monoline mortgage guaranty insurers, the RBC charge is 0.225 times the book/adjusted carrying value of the common and preferred stock.

Life Insurance Affiliates

For Life insurance affiliates that are not subject to RBC, the RBC charge is 0.225 times the book/adjusted carrying value of the common stock and preferred stock.

Health Insurance Affiliates

For Health insurance affiliates that are not subject to RBC, the RBC charge is 0.225 times the book/adjusted carrying value of the common stock and preferred stock.

Other Affiliates

Non-insurance and insurance affiliates not included elsewhere in this chapter are classified as Other Affiliates. The RBC charge for investments in Other Affiliate is 0.225 times the carrying value of the common and preferred stock.

Unaffiliated Stocks

The RBC charge for unaffiliated preferred stocks and hybrid investments is equal to the book/adjusted carrying value of the asset multiplied by a factor, where the factors vary based on the NAIC class. The classes for preferred stocks and hybrid securities are the same as those for bonds, as are the RBC factors, with the exception that there are no federal government guaranteed preferred stocks.
TABLE 85

<table>
<thead>
<tr>
<th>NAIC class for preferred stocks and hybrid securities</th>
<th>RBC factor</th>
</tr>
</thead>

</tr>
<tr>
<td>Class 05 — Lowest credit quality</td>
<td>0.100</td>
</tr>
<tr>
<td>Class 06 — In or near default</td>
<td>0.300</td>
</tr>
</tbody>
</table>

The RBC charge for unaffiliated common stocks is computed separately for non-government money market funds and other admitted unaffiliated common stocks. The computation applies a specific factor to the book/adjusted carrying value. The RBC factor for non-government money market funds of 0.003 is equal to that for cash because these investments are considered to be of the same risk level. The factor applied to other common stocks is 0.150.

Real Estate, Schedule BA and Miscellaneous Assets

In general, the RBC charge for real estate investments, other long-term invested assets (as per Schedule BA) and miscellaneous assets are computed as a factor times the book/adjusted carrying value for those assets. The RBC charges for each investment are as follows:

- 0.100 times the book value of real estate (Annual Statement Schedule A assets)
  - According to the NAIC RBC Instructions, encumbrances have been included in the real estate base since the value of the property subject to loss would include encumbrances\(^\text{154}\)
- 0.200 times the book value for other long-term invested assets (Annual Statement Schedule BA assets) other than collateral loans
- 0.050 times the book value for aggregate write-ins for invested assets and derivatives
- 0.025 times the book value for receivables for securities

R\(_2\) for Fictitious

Table 86 shows the calculation of R\(_2\) for Fictitious Insurance Company. As with the calculation of R\(_1\) for Fictitious, we had to make several assumptions because only excerpts of Fictitious’ Annual Statement are included with this publication. One such assumption that is relevant to the calculation of R\(_2\) is the distribution of stock by RBC class.

</tbody>
</table>

THE RBC CHARGE FOR CREDIT RISK (R₃)

Credit risk reflects counterparty (the entity owing the insurance company money) credit exposure for receivables, including those relating to reinsurance. It contemplates the risk that the counterparty will default (or not pay in whole or in part) and the risk associated with estimating the amounts recorded for counterparty receivables.

R₃ is the charge for credit risk associated with the following:

1. Reinsurance recoverable (reinsurance RBC)
2. Non-invested assets

155 Note the RBC charge is greater than or equal to 0 as in the case of Aggregate Write-ins (W/I) for Invested Assets in Table 86.
3. Health credit risk

The largest component of $R_3$ in the industry is the risk associated with uncollectible reinsurance (due both to reinsurers being unable and unwilling to pay). While there is a charge for health credit risk, it is historically zero for most property/casualty companies across the industry.

Reinsurance recoverables

The $R_3$ charge for reinsurance recoverables reflects the risk that reinsurers cannot or will not pay amounts the reporting entity expects to receive under the terms of its reinsurance contracts.

Over the years there has been considerable focus in the property/casualty industry on reinsurance. For one, uncollectible reinsurance was deemed partly to blame for the failure of Mission Insurance Company and Transit Casualty Company,\(^{156}\) which helped set RBC in motion for the property/casualty industry. Furthermore, throughout the years, reinsurance has been used in certain situations inappropriately to enhance a company’s financial position or hide poor financial results.\(^ {157}\)

From its inception, the RBC formula applied a simple 10% loading to all eligible reinsurance recoverables. Despite the relatively low impact that $R_3$ has on the industry as a whole, the charge has been subject to criticism from insurance carriers, who have argued that the charge does not differentiate between high and low rated reinsurers, or give credit for those recoverables that are backed by collateral.

From 2018,\(^ {158}\) a new formula was introduced to address these concerns. This new formula is performed at the transaction level and those results are then summed to determine the charge. It applies differentiated risk charges to each reinsurer counterparty based on their credit quality, as indicated by a rating from an approved rating agency, as well as whether or not the recoverables are collateralized.

The charge is calculated within columns 28 through 36 of Schedule F, Part 3, of the Annual Statement. Details of this part of the calculation are described in Chapter 14 covering Schedule F (section titled “Credit Risk on Ceded Reinsurance (columns 21 through 36)”).

\(^{158}\) Earlier versions of the new formula for the reinsurance recoverables component of $R_3$ were included for informational purposes only in the RBC filings in 2016 and 2017 while it was under development.
RBC formula uses the total row of the results shown in columns 35 and 36 as inputs to the $R_3$ risk charge.

Overall, the implementation of this new formula has reduced the level of RBC for reinsurance recoverables by almost a half across the industry.\textsuperscript{159}

The RBC charge for reinsurance recoverable is split 50%/50% between $R_3$ and $R_4$ in circumstances where the reserve RBC charge (see discussion below) exceeds the sum of the credit risk RBC charge for non-invested assets plus one-half of the RBC charge for reinsurance recoverables. Otherwise, the full amount of the reinsurance recoverable RBC charge is included in $R_3$. The concept of moving half of the reinsurance recoverable RBC amount to $R_4$ is to recognize there is some dependency between deterioration in reserves and an increase in exposure to reinsurance credit risk. The limitation on splitting the charge based on the size of the reserve RBC charge is put in place so the insurance company cannot diversify away a portion of its credit risk in situations where the company has limited net reserves.

Non-invested assets

$R_3$ includes the charge for risk associated with credit exposure resulting from the following non-invested assets listed on the balance sheet:

1. Investment income due and accrued
2. Guaranty funds receivable or on deposit
3. Recoverable from parent, subsidiaries and affiliates
4. Amounts receivable relating to uninsured Accident and Health plans
5. Aggregate write-in for other than invested assets

The RBC charge for these assets is the net admitted value included in column 3 of the asset side of the balance sheet (page 2 of the Annual Statement), each multiplied by a factor of 0.050, with the exception of investment income due and accrued, which receives a factor of 0.010. The factor for investment income due and accrued is equal to the RBC factor applied to unaffiliated class 02 bonds because most of the investment income due and accrued comes from bonds, which are typically the largest holding for a property/casualty insurance company. The receivable assets are generally short-term balances generated in the normal course of doing business. The capital charges for these assets are lower than other long-term recoverables.

Health credit risk

Finally, $R_3$ also includes a charge for health credit risk for those reporting entities writing 5% or more in accident and health premiums in any of the last three years. This charge considers

\textsuperscript{159} NAIC, Summary: Aggregate P/C RBC Results By Year, 2018, http://www.naic.org/documents/research_stats_rbc_results_pc.pdf
the risk associated with transferring health risks (morbidity and mortality) to health care organizations through fixed prepaid amounts (i.e., capitated payments).\textsuperscript{160} There is a risk of non-payment in these situations (similar to traditional reinsurance recoverables). Therefore, a charge is applied to reflect the credit risk associated with the portion of capitated payments over and above the security held by the reporting entity for these organizations.

Given that this charge is generally zero for most companies in the property/casualty industry, we will not go into details of the calculation of this charge.

THE RBC CHARGE FOR RESERVE RISK ($R_4$)

$R_4$ is very often the largest of the RBC charges for property/casualty insurers. Reserve risk contemplates the risk that a reporting entity’s loss and LAE reserves will develop adversely. This charge is calculated separately by line of business using Schedule P data for the last 10 years.

$R_4$ is the charge for reserve risk associated with the following:

1. Unpaid loss and LAE (reserve RBC)
2. Excessive premium growth
3. Reinsurance recoverable (reinsurance RBC)
4. Accident and Health (A&H) claim reserves (health RBC)

Within the following sections we provide a discussion of each of these categories, with considerable focus on the reserve RBC since this represents the dominant component of the $R_4$ charge.

Reserve RBC

Reserve RBC is determined by applying a set of factors (called company RBC percent) to the company’s net loss and LAE reserves before non-tabular discount. Nominal (undiscounted) reserves are used because consideration for investment income is made by applying the same set of discount factors to all property/casualty insurance companies (called the adjustment for investment income). The use of a common method for considering investment income puts all property/casualty companies on an equivalent basis rather than having differences due to discount rates and payout patterns.

The calculation is performed separately by line of business using the same lines of business as used in Schedule P of the Annual Statement, with the exception that certain lines of business are combined. The occurrence and claims-made categories are combined for other liability and product liability, and reinsurance property and financial lines are combined.

Once the calculation of the base loss and LAE reserve RBC is performed for each line of business, two adjustments are made: one for loss sensitive (e.g., retrospectively rated) contracts and the other for loss concentration. Similar to the asset concentration factor in $R_1$ and $R_2$, the loss concentration factor considers diversification in the RBC calculation. Both adjustments result in reductions to the reserve RBC.

We will discuss each component of the calculation, providing examples where applicable.

Base loss and LAE reserve RBC by line of business

The base loss and LAE reserve RBC by line of business is computed as follows:
Equation 1: Base Loss and LAE Reserve RBC

\[
\text{Base Loss and LAE Reserve RBC} = \left( \left( \text{Company RBC} \% + 1 \right) \times \text{Adjustment for investment income} \right) - 1
\times \left( \text{Net loss and LAE reserve} + \text{Other discounts not in the reserves} \right)
\]

The net loss and LAE reserves used in this calculation are provided in Schedule P, Part 1, column 24, for each line of business. As previously noted, these are gross of non-tabular discount, but net of tabular discount.

Company RBC percentage

The company RBC percentage is the crux of the reserve risk charge. According to the NAIC RBC instructions, “These factors are designed to provide a surplus cushion against adverse reserve development.”

For each line of business, the company RBC percentage is determined based on a 50% weighting applied to the straight industry reserve RBC percent and 50% applied to the industry reserve RBC percent adjusted for the company’s own experience.

- Industry reserve RBC percent

The industry reserve RBC percent is a set of factors provided by the NAIC and is the same for all property/casualty insurance companies. There is one factor for each Schedule P line of business. According to the NAIC RBC instructions, these percentages “are based on detailed analysis of historical reserve development patterns found in Parts 2 and 3 of Schedule P for each major line of business.” They have been determined in the past by computing the ratio of net incurred loss and defense and cost containment (DCC) development during a particular period from Schedule P, Part 2, to the net loss and DCC reserves as of the earlier period (calculated by subtracting the figures in Schedule P, Part 3 from those in Part 2). The industry percent factor is selected based on the average for all companies within the property/casualty insurance industry, by line of business.

The industry RBC percent factors are not always updated annually, but rather on an as-needed basis. In fact, the factors in the original RBC model remained for well over 10 years. The only interim change was made to reflect the change in the format of Schedule P, such as when medical malpractice was split into its claims made and occurrence components.

---

\[161\text{ NAIC, RBC Property & Casualty 2018 Forecasting & Instructions, page 21.}\]

\[162\text{ Ibid.}\]
The NAIC developed the original factors in 1993 based on an actuarial analysis using data evaluated as of 1991 and prior.\textsuperscript{163} This analysis computed the aforementioned ratios of incurred loss and DCC to prior period reserves over each evaluation period provided in Schedule P, Parts 2 and 3 of the 1991 Annual Statement. Nine ratios were computed, the first of which provided development on accident years 1982 and prior over the period December 31, 1982 through December 31, 1991, as a ratio to loss and DCC reserves as of December 31, 1982. The remaining eight ratios were computed measuring development to December 31, 1991, for periods beginning December 31, 1983 through December 31, 1990. The nine ratios were calculated for each line of business by company. An average was computed over all companies for each evaluation period. The industry RBC percent factor for each line of business was set equal to the largest ratio over all of the evaluation dates. This is commonly referred to as the “worst-case year” ratio. The belief is that development of this magnitude could occur in the future because it occurred in the past.\textsuperscript{164}

The original factors remained until 2008, when the NAIC adopted changes recommended by the American Academy of Actuaries P/C Risk-Based Capital Committee (Committee) in a report titled An Update to P/C Risk-Based Capital Underwriting Factors: September 2007 Report to the National Association of Insurance Commissioners P/C Risk-Based Capital Working Group. In this study, the Committee recognized that the insurance industry had been through many changes since the original factors were developed, namely changes in the underwriting cycle resulting in shifts in reserve redundancies/deficiencies. Furthermore, despite the formulaic approach of the worst-case year, the Committee found that the original factors could not be easily replicated and varied considerably relative to expectations as to the level of adverse development inherent in a particular line of business. The Committee therefore recommended developing a revised approach that would meet the following criteria:

1. Simple to apply and understand;
2. Responsive to actual history and underlying risk;
3. Easily reproducible by future practitioners;
4. Statistically relevant;

The revised approach differed from the original approach in four significant ways:

1. The historical data was filtered and screened to remove companies with insufficient or unusual data points. Examples include companies with less than 10 years of experience and/or companies with negative paid, reserve and/or incurred loss and DCC in any one accident year.

2. Rather than selecting the ratio from the worst-case year over the average of all companies, the 87.5 percentile of all data points was used. “The 87.5 percentile was selected because it represents a conservative view of the risk in each line but is also broadly consistent with the existing factors.”

3. A floor was set such that the indicated industry reserve RBC percent factor resulted in a minimum charge of 5% after adjustment for investment income.

4. The indicated industry reserve RBC percent factors were capped to limit the change in the base loss and LAE reserve RBC. The Committee recommended a cap of 35%.

For example, the indicated industry reserve RBC factor for private passenger automobile liability that was produced using the revised methodology before capping was 0.128, and the change in the investment income adjustment factor was 0.927. Using Equation 1 (assuming a net loss and LAE reserve balance of $1.00), the implied base loss and LAE reserve RBC is 0.046. As displayed below, this represented a change of -70.5% from the original industry reserve RBC factor of 0.254 with adjustment for investment income of 0.921:

**Indicated base loss and LAE reserve RBC based on 2007 methodology before capping:**

\[
= \left[ (0.128 + 1) \times 0.927 \right] - 1 \times 1.00 \\
= 0.046
\]

**Original base loss and LAE reserve RBC:**

\[
= \left[ (0.254 + 1) \times 0.921 \right] - 1 \times 1.00 \\
= 0.155
\]

**Change in base loss and LAE reserve RBC from original to revised (2007) methodology:**

---

167 Ibid, pages 6 and 7.
= 0.046 / 0.155 - 1
= -70.5%

Capped at 35%, the revised methodology produced an industry reserve RBC percent factor of 0.187, which was calculated as follows:

= \[((-0.350 +1) \times 0.155 +1) / 0.927] - 1
= 0.187

To summarize, the industry RBC reserve factor indicated from the revised 2007 methodology was 0.128 before capping and 0.187 after the 35% cap. The 35% cap reduced the impact of the change in methodology from the original factor of 0.254.\(^\text{168}\)

The NAIC adopted the factors in 2008 using the revised methodology and indications of the September 2007 report, however with a cap at 15% instead of 35%. The revised factors were applied to RBC calculations for the 2008 reporting year. To continue with the previous example, capping at 15% resulted in an industry RBC reserve percent factor of 0.221, which was calculated as follows:

= \[((-0.150 +1) \times 0.155 +1) / 0.927] - 1
= 0.221\(^\text{169}\)

Subsequent changes to the industry reserve RBC percent factors were also made and adopted in 2009 and 2010. The 2009 update applied a 15% cap to the factors adopted in 2008. That is, 2008 factors were substituted in for the “original” factors in the previous calculations, for purposes of capping the impact from the effects of the 2007 revised methodology. This revision was adopted in 2009 and applied to the 2009 reporting year.\(^\text{170}\)

Two changes were made in 2010. First, in March 2010, the American Academy of Actuaries P/C Risk-Based Capital Working Group updated the 2007 methodology but with 2008 data. As with the 2007 study, the factors were capped to cause no more than a 15% change to the current factors (2009 updated factors), and the minimum charge was set at 5%.\(^\text{171}\) Second, in June 2010, the March 2010 study was updated

\(^{168}\) Ibid, Appendix II, Exhibit I – III.
\(^{169}\) American Academy of Actuaries, Update to P/C Risk-Based Capital Underwriting Factors Presented to National Association of Insurance Commissioners P/C Risk-Based Capital Working Group, March 2008.
\(^{171}\) American Academy of Actuaries, 2010 Update to P/C Risk-Based Capital Underwriting Factors Presented to the National Association of Insurance Commissioners’ Property Risk-Based Capital Working Group, March 2010.
using a 5% cap instead of 15%. The 2010 study capped at 5% was adopted and applied to the 2010 reporting year.

The 2017 RBC formula had a further update to the industry RBC reserve factors, the first since 2010. This update was based on changes recommended by the American Academy of Actuaries P/C Risk-Based Capital Committee in a report titled 2016 Update to Property and Casualty Risk-Based Capital Underwriting Factors. This report proposed a new calibration based on data from Annual Statements 1997-2014 and calculates the 87.5 percentile subject to the following filtering:

- Survivorship – Include data points where, for a particular company and line of business there is no net earned premium in the latest accident year(s).
- Line of business size – Exclude data points where, for a particular line of business, net earned premiums are less than the 15th percentile for that accident year or reserve year.
- Pooling – Combine data points from intercompany pool participants into a single pool-wide data point.
- Minor Lines – Exclude data points where the net earned premium for the line of business represents a small portion of the company’s total net earned premium.
- Years of line of business with net earned premium >0 – Exclude data points where, for a particular company and line of business, there is less than five years of net earned premium.
- Maturity – Remove the least mature data points.
- Anomalous values – Exclude data points with anomalous values, i.e., negative loss ratios, negative initial reserves and reserve runoff ratios over/under 500%/-500%

In 2017, the NAIC’s Property and Casualty Risk-Based Capital (E) Working Group updated the industry RBC reserve factors in the 2017 RBC formula to the 10% capped level, representing scenario #1 in the report. The factors were due to be re-evaluated again and expected to reach the fully proposed values in the following four years.

In 2018, the NAIC’s Property and Casualty Risk-Based Capital (E) Working Group further revised the factors to be included in the 2019 RBC formula by adopting the 35% capped factors (scenario #3) for commercial insurance, medical professional liability and all other lines, while adopting the uncapped factors (scenario #4) for personal and reinsurance lines.

Company “development factor”

The reporting entity’s own loss experience is considered by adjusting the industry reserve RBC percent by the company “development factor” by line of business. This development factor is calculated as the ratio of the sum of incurred loss and DCC from nine prior accident years evaluated as of the current year to the sum of the initial evaluations of those incurred amounts. The current incurred loss and DCC values come from Schedule P, Part 2, column 10, with the initial values coming from the first incurred value shown for each accident year. The initial values lie along the diagonal. This development factor measures how the initial estimates of ultimate loss and DCC have developed based on what the company currently knows. The factor is capped at 400% to limit the impact of anomalous, one-time results.

The reporting entity may not rely on its own experience in determining the company RBC percentage if:

1. Either the initial or current values shown in Schedule P, Part 2, are negative for any year.
2. The current value is zero for any year.
3. The sum of the initial values is zero across all years.

Adjustment for investment income

With the exception of workers’ compensation tabular reserves, and instances where a company has explicitly requested and received permission from state regulatory authorities to discount non-tabular reserves, insurance companies are required to record loss and LAE reserves on an undiscounted basis under statutory accounting. This creates an inherent margin in surplus. For purposes of determining required capital under the RBC calculation, the reserves are adjusted to remove this margin.\(^\text{174}\)

Similar to the industry reserve RBC percent, the investment income factors are provided by the NAIC. According to the NAIC RBC instructions, “This discount factor assumes a 5 percent interest rate. For lines of business other than workers’ compensation and the excess reinsurance lines, the payment pattern is determined using an IRS type methodology applied to industry-wide Schedule P data by line of business; otherwise, a curve has been fit to the data to estimate the average payout over time. The discount factor for workers’ compensation is adjusted to reflect the tabular portion of the reserves that is already discounted.”\(^\text{175}\) Tabular discounting is typically permitted only on the indemnity portion of

workers’ compensation reserves and not to the medical component due to the relatively fast payment of medical expenses.

Similar to the industry reserve RBC percent, the investment income adjustment factors were updated in September 2007 from their original values. An approach similar to the original methodology was followed but applied to updated data through 2005.\footnote{\textit{American Academy of Actuaries, An Update to P/C Risk-Based Capital Underwriting Factors: September 2007 Report to the National Association of Insurance Commissioners P/C Risk-Based Capital Working Group}, page 5.}

### Other discounts not included in the reserves

The adjustment for investment income is applied to reflect non-tabular discount. It is applied to loss and LAE reserves on a net of reinsurance basis, net of tabular discount, but before any non-tabular discount, as provided in column 24 of Schedule P, Part 1. If for some reason the amounts included in column 24 are net of non-tabular discount, the amount of the non-tabular discount would need to be added back to the reserves before applying the adjustment for investment income.

These amounts are generally equal to zero; the amount of non-tabular discount is included in columns 32 and 33 of Schedule P, Part 1.

### Adjustment for loss-sensitive business

Prior to summing the reserve risk charge over all lines of business written by the reporting company, an adjustment is made to reflect loss-sensitive business.

The loss sensitive adjustment provides a discount for business that is written by the insurance company on contracts for which the premium is determined based on the insured’s loss experience (i.e., retrospectively rated contracts). The loss experience is shared in whole or in part with the insured. Therefore, the risk of adverse loss development is also shared with the insured. The insurer needs less surplus to survive this risk of adverse loss development than it does if none of the policies were written on a loss sensitive basis, thereby resulting in a discount to the company’s RBC reserve charge to reflect this reduction in risk. This discount is computed separately by line of business.

The following provides the application of the loss-sensitive adjustment:

**Equation 2:** Loss and LAE RBC after discount

\[
\text{Loss and LAE RBC after discount} = \text{Equation 1} - \text{Loss-sensitive discount} = \text{Base Loss and LAE Reserve RBC} - \text{Loss-sensitive discount}
\]

Where the loss-sensitive discount

\[
\text{Loss-sensitive discount} = \text{Loss-sensitive discount factor} \times \text{Base loss and LAE RBC (from Equation 1).}
\]
The loss-sensitive discount factor is 30% for net loss and expense reserves associated with direct loss-sensitive contracts and 15% for net loss and expense reserves associated with assumed loss-sensitive contracts. The difference stems from the potential offset associated with reinsurance contracts for commissions that are loss sensitive as well. Oftentimes such business is written with sliding scale commissions whereby the commission the ceding company receives from the reinsurer is dependent upon the loss ratio on the business; the lower the loss ratio, the higher the commission paid by the reinsurer to the ceding company, subject of course to specified limits. For example, the reinsurer may receive additional premium from the reinsured as losses emerge but in turn have to pay additional commission due to a reduction in loss ratio. As with direct loss-sensitive contracts, the risk of adverse loss development on assumed contracts is reduced; however, it is not reduced by as much due to the potential offset from ceding commissions.

The portion of net loss and expense reserves attributed to direct and assumed loss-sensitive contracts is found in column 3 of Schedule P, Parts 7A and 7B, respectively.

Adjustment for loss concentration

The loss concentration adjustment is applied to the sum of the RBC reserve charges for all lines of business and reflects diversification across the lines. The theory underlying this discount is that the reserves for each line of business written by an insurance company would not be expected to develop adversely or favorably at the same time, assuming such development is random.

The final net loss and LAE RBC charge is computed as follows:

Equation 3: Net loss and LAE RBC

\[
\text{Net loss and LAE RBC} = \frac{\text{Total loss and LAE RBC after discount for all RBC lines} \times 1,000}{\text{Net loss and LAE for the largest line}} \times 0.300 + 0.700
\]

Where the loss concentration factor

\[
\frac{\text{Net loss and LAE for the largest line}}{\text{Net loss and LAE for all lines combined}} \times 0.300 + 0.700
\]

The loss concentration factor is determined by taking the percentage of total net loss and LAE reserves for the largest line of business to the total net loss and LAE for all RBC lines combined, multiplying this percentage by 0.300 and then adding the result to 0.700.\(^\text{177}\)

Because all adverse loss development may not always be a random fluctuation in losses, such as when the company increases loss reserves to improve its earnings position, adverse

\(^{177}\) For clarity, largest line is determined based on the Schedule P line of business having the highest amount of net loss and LAE reserves as of the filing date. Note, despite being separate lines of business within Schedule P, claims-made and occurrence business are combined for purposes of this calculation for other liability and product liability.
development across lines may not be totally independent. This formula recognizes that there may be some interdependence between lines of business.

A monoline writer would not receive any discount, as the calculation would be $1.000 \times 0.300 + 0.700$, which produces a loss concentration factor of $1.000$. However, a company writing $60\%$ of its business in its largest line would receive a discount to its reserve risk charge of $12\%$ or a loss concentration factor of $0.880 (= 0.600 \times 0.300 + 0.700)$.

Illustration of reserve RBC calculation

The following provides an illustration of the reserve RBC calculation for REIC. Assume REIC writes only four lines of business: homeowners/farmowners (HO/FO), private passenger automobile liability (PPAL), workers’ compensation (WC) and other liability (OL). The source of the company’s own data is Schedule P, which is provided in thousands of U.S. dollars.
As displayed in Table 88, the reserve RBC included in the R₄ charge for REIC is $6,948,010. The main driver of the reserve RBC is the company RBC percentage for loss and LAE reserve risk. This percentage is higher than the industry RBC percent in line 3 because REIC’s ultimate estimates tend to develop adversely, as evidenced by the ratios of company development to industry development in excess of 1.000 in line 8 above.

Table 89 provides another example of the detailed R₄ calculation for the commercial automobile liability (CAL) line of business for Fictitious Insurance Company. This calculation
uses the financial statements and Schedule P line detail found in other examples within this publication.

**Excessive premium growth**

The estimation of unpaid loss and LAE reserves is subject to greater uncertainty for companies that are growing rapidly. The reasons are twofold. First, an insurance company does not have as much insight into new business as it does into risks that are currently on the books. Second, the estimation of unpaid claims is more difficult for a growing company rather than a company in a steady state. Consider a company that decides to grow its writings by 20% over the course of a year. As a company grows throughout the year, the average writings are more heavily skewed toward the second half of the policy year. Without explicit consideration for this shift, traditional actuarial projection techniques will not adequately capture the lag in loss emergence and therefore will understate the reserve need. However, the difficulty is in determining how exactly to consider this shift.

In the RBC calculation, excessive growth is defined as a three-year average growth rate in gross written premiums that is in excess of 10%. A growth rate of 10% is deemed to be a normal annual increase in premium volume. The growth rate for any single year is capped at 40%. The excess percentage (excess of 10%) is called the RBC average growth rate factor.

\[
\text{Average growth rate factor} = \text{Maximum (average gross premium growth over three years, 0.10)} - 0.10
\]

For purposes of this calculation, gross written premiums are equal to direct written premiums from line 35 of column 1 of the Underwriting and Investment Exhibit (U&IE), plus assumed premiums from non-affiliates in column 3. To perform this calculation, Part 1 of the U&IE is
required for each of the past four years. The calculation is performed using as many years as possible, but no more than four; if the company only has one year of experience, only one year is used. However, if the company is a start-up, a growth rate of 40% is used. If a company has no gross written premium in the current year, it is assumed not to be growing, and a growth rate of zero is used.

This calculation is performed on a group basis, for those companies that are part of a group. Therefore, each member of the group will have the same RBC average growth rate factor. The group basis is used to neither punish nor reward individual legal entities that might be growing due to a realignment of business from one company within the group to another. In this case, the growth is not attributed to new business but rather a transfer or risks from one company to the other.

In addition, business acquired or divested as a “shell” is included in the calculation of the growth rate only to the extent that the liabilities are retained by the reporting entity. Servicing carriers for assigned risk pools can also exclude the written premiums associated with the involuntary pool, as the insurer has little or no control over the assignment of such risk.

The RBC average growth rate factor is multiplied by 0.450 of the net loss and LAE reserves as per the total line in Schedule P, Part 1, Summary, column 24.

Excessive premium growth charge for loss and LAE reserves =

\[ \text{RBC average growth rate factor} \times 0.450 \times \text{net loss and LAE reserves} \]

The 0.450 has remained unchanged since the original RBC formula for property/casualty insurers was implemented. It was determined by a member of the American Academy of Actuaries RBC Task Force (Mr. Allan Kaufman) after studying the average development in net loss and LAE reserves experienced by companies that experienced growth in excess of 10% relative to development observed by the remainder of the industry.\(^\text{178}\) The 0.450 is already adjusted for discount using a factor of 0.900, which was what Kaufman approximated to be the average discount factor for all lines of business.\(^\text{179}\)

Reinsurance RBC

Recall from our discussion of the R\(_3\) charge that reinsurance RBC represents the minimum amount of capital included in the RBC formula that would be needed to survive the risk of reinsurer default.

\(^{179}\) Ibid.
The reinsurance RBC within $R_4$ is equal to the other half of the reinsurance recoverable amount computed in $R_3$ unless the reserve RBC is less than the RBC for non-invested assets plus one-half of the RBC for reinsurance recoverables. If this is the case, the entire reinsurance RBC charge is included in $R_3$ and the reinsurance RBC within $R_4$ is zero. The reserve RBC limitation was put in place so the insurance company cannot diversify away a portion of its credit risk in situations where the company has limited net reserves.

Health RBC

In addition to the charge for property/casualty lines of business, a separate health RBC calculation is required for those property/casualty insurers that have written 5% or more in accident and health premiums in any of the past three years. We will not go into the details of this formula but note that the health RBC calculation is based on the RBC formula for life insurance.

$R_4$ for Fictitious

Table 90 provides the $R_4$ calculation for Fictitious.

Half of Reinsurance RBC 273,500

Total R4 Charge — Underwriting Risk — Reserves 9,273,342

---

We have assumed that the percentage of Fictitious' net loss and expense reserves that emanates from loss-sensitive contracts written on a direct basis is: 1.10% for commercial automobile liability, 12.3% for workers' compensation, 0.5% for other liability, and 0% for all other lines and for loss-sensitive contracts written on an assumed basis.
THE RBC CHARGE FOR WRITTEN PREMIUM RISK ($R_5$)

The $R_5$ charge considers underwriting risk associated with the following:

1. Net written premium (written premium RBC)
2. Excessive premium growth
3. Health premium (health premium RBC)
4. Health stabilization

For a typical company, almost all of the $R_5$ charge will come from the written premium RBC component.

The following provides a brief discussion of each of the first two categories of the $R_5$ risk charge. As previously noted in the discussion on $R_4$, we will not go into details for health insurance categories because the charges for health premium RBC and health stabilization are generally immaterial to the property/casualty industry.

Written premium RBC

Written premium risk contemplates the risk that future business written by the company will be unprofitable. Ideally, the charge for this risk should be based on business written in the following year, but since that is an unknown quantity, business written during the current year is used as a proxy. Similar to the reserve RBC, the written premium RBC is computed by applying a set of factors, varying by line of business, to the net of reinsurance premiums written by the company during the current year. The calculation is done on the same lines of business as the reserve RBC with a different set of factors used in the calculation.

As with the reserve RBC, once the calculation of the base net written premium RBC is calculated for each line of business, two reductions are made: one for loss-sensitive business and the other for premium concentration (as opposed to loss concentration in $R_4$). Premium concentration reflects diversification in writing business across different lines of business.

Because the mechanics generally follow those used in the reserve RBC charge, we will only discuss differences in the calculation for written premium RBC.

Base net written premium RBC by line of business

The base net written premium RBC by line of business is computed as follows:

Equation 4: Base net written premium RBC

\[
= \text{Net written premium for the current calendar year} \\
* \left[ \text{Company RBC loss and LAE ratio} \times \text{Adjustment for investment income} + \text{Underwriting expense ratio} - 1.000 \right]
\]
The net written premiums for each line of business are provided in column 6 of Part 1B of the U&IE within the Annual Statement. Aggregate write-ins for other lines of business are included within the other liability line of business.

**Company RBC loss and LAE ratio**

Similar to how the company RBC percentage is the key driver in the reserve RBC calculation, the company RBC loss and LAE ratio forms the crux of the written premium risk charge. For each line of business, the company RBC loss and LAE ratio is determined based on a 50% weighting applied to the straight industry RBC loss and LAE ratio and 50% applied to the industry RBC loss and LAE ratio adjusted for the company’s own experience. The industry RBC loss and LAE ratio is given by the NAIC and is the same for all property/casualty insurance companies.

As with the industry reserve RBC percent, the industry RBC loss and LAE ratios did not change from their original value until 2008, when the NAIC adopted changes that were recommended by the American Academy of Actuaries P/C Risk-Based Capital Committee.\(^{181}\)

The original industry RBC loss and LAE ratios were based on the “worst-case” accident year ratio by line of business that resulted from taking a simple average over all companies. Company loss and LAE ratios by accident year were taken from what is currently column 31 of Schedule P, Part 1. The revised methodology recommended by the Committee instead uses the 87.5 percentile of all data points. Consistent with the industry reserve RBC percent factor, a floor was set such that the indicated industry RBC loss and LAE ratio resulted in a minimum charge of 5% after adjustment for investment income. In addition, the indicated industry RBC loss and LAE ratios were capped to limit the change in the base loss and LAE reserve RBC. The data was also filtered and screened to remove anomalous values (e.g., companies having less than an average of $500,000 in earned premium or a loss ratio of 0% for any one year). Further, loss ratios were capped at 300%.\(^{182}\)

As discussed in the reserve RBC section above, the 2017 RBC formula saw another update to the industry RBC loss and LAE ratio factors, the first since 2010. This update was based on changes recommended by the American Academy of Actuaries P/C Risk-Based Capital Committee in a report titled 2016 update to Property and Casualty Risk-Based Capital Underwriting Factors.\(^{183}\) The recommendations from this study are the same for written premium RBC as those discussed above for reserve RBC. As with the industry RBC reserve factors, the NAIC adopted the industry RBC loss and LAE ratio factors capped at 10% in the

---

181 Note, however, changes were made to reflect structural changes to Schedule P over the time period, such as the separation of medical malpractice into its occurrence and claims-made components.
FINANCIAL REPORTING THROUGH THE LENS OF A PROPERTY/CASUALTY ACTUARY

Part IV. Statutory Filings to Accompany the Annual Statement

2017 formula, with further revisions to the 2019 formula to use the factors capped at 35% for all lines of business other than personal and reinsurance lines which are uncapped.

The reporting entity's own experience is considered by adjusting the industry loss and LAE ratios by the ratio of the company average loss and LAE ratio to the industry average loss and LAE ratio. The company average loss and LAE ratio is a straight average over the past 10 accident years of the net loss and LAE ratios provided in Schedule P, Part 1, column 31. Loss and LAE ratios for any accident year in excess of 300% are capped at that value in consideration of anomalous, one-time results.

Note that the reporting entity may not rely on its own experience in determining the company RBC loss and LAE ratio if:

1. The loss and LAE ratio for any accident year is zero or negative.
2. The net earned premium for any accident year is zero or negative.
3. More than two years’ net earned premiums are less than 20% of the average over all years for each line (otherwise the company must exclude the one or two specific years that fail and take a straight average from the remaining years).

Adjustment for investment income

The investment income factors are provided by the NAIC and calculated using the same assumptions as in the reserve RBC, with the exception that discounted years differ because written premium is discounted as opposed to reserves.

Underwriting expense ratio

This is the company's own underwriting expense ratio for the current year capped at 400% with a floor of zero. It is equal to the ratio of other underwriting expenses incurred in the current year per line 4 of the income statement, divided by total net written premium for the current year from Part 1B, column 6 of the U&IE.

\[
\text{Underwriting expense ratio} = \frac{\text{Other underwriting expenses}}{\text{Net written premium}}
\]

Adjustment for loss-sensitive business

Prior to summing the written premium RBC over all lines of business written by the reporting company, an adjustment is made to reflect loss-sensitive business. The following provides the application of the loss-sensitive adjustment:

Equation 5: Net written premium RBC after discount

\[
\text{Equation 4} - \text{Loss-sensitive discount}
\]
Similar to the reserve RBC, a 30% discount is applied to the portion of the net written premium RBC charge that is attributed to direct loss-sensitive contracts, and a 15% discount is applied to the base net written premium RBC charge for assumed contracts. The portion of net written premium attributed to direct and assumed loss sensitive contracts is found in column 6 of Schedule P, Parts 7A and 7B, respectively.

**Adjustment for premium concentration**

The final written premium RBC charge is computed as follows:

**Equation 6:** Net written premium RBC charge

\[
\text{Net written premium RBC charge} = \text{Equation 5} \\
\quad \times \text{Premium concentration factor} \\
\quad = \text{Total net written premium RBC after discount} \\
\quad \times \text{Premium concentration factor}
\]

The premium concentration factor is determined by taking the percentage of total net written premiums that the largest line of business represents, multiplying this percentage by 0.300 and then adding the result to 0.700. As with the loss concentration factor, a monoline writer would not receive any discount, as the calculation would be \(1.000 \times 0.300 + 0.700\), which produces a premium concentration factor of 1.000. However, a company writing 60% of its business in its largest line would receive a discount to its net written premium RBC charge of 12% or a premium concentration factor of 0.880 (\(= 0.600 \times 0.300 + 0.700\)).

**Illustration of written premium RBC calculation**

Table 91 shows the written premium RBC calculation for REIC used in our illustration of Reserve RBC. The source of the company’s net written premium data is Part 1B of the U&E, which is provided in U.S. dollars.

<td></td>
</tr>
<tr>
<td>(16)</td>
<td>3,790,109</td>
<td>= (13) * (15)</td>
<td></td>
</tr>
</tbody>
</table>

As displayed in Table 91, the written premium RBC that is included in the Rs charge for REIC is $3,790,109. The company average loss and LAE ratio for the past 10 years (line 2) is better than the industry average loss and LAE ratio (line 1) for the personal lines (HO/FO and
PPAL) and worse for the commercial lines (WC and OL). Thus, the company loss and LAE ratio in line 9 is lower than the industry ratio in line 3 for the personal lines and higher for the commercial lines. In fact, the ratio is substantially higher for OL given the poor average loss ratio over the past 10 years, which is causing a higher overall written premium RBC for OL than the other three lines of business, despite the fact that the premium writings are the lowest for OL.

Table 92 provides another example of the $R_5$ calculation for CAL for Fictitious.

Excessive premium growth

The RBC average growth rate factor is calculated the same as that for reserve risk. However, the factor differs in its application. In the case of $R_5$, the excessive premium growth charge is applied to net written premium rather than reserves and multiplied by 0.225, rather than 0.450. The net written premium is obtained from the total line in Part 1B, column 6, of the U&IE. The factor of 0.225 was determined by Kaufman based on a study of the loss ratio for companies experiencing growth in excess of 10% versus all companies in the industry. As with the 0.450 factor, the factor applied to net written premium of 0.225 has been adjusted for discounting by 0.900.

THE RBC CHARGE FOR CATASTROPHE RISK (Rcat)

The Rcat risk charge considers catastrophe risk associated with earthquakes and hurricanes. This risk applies on a net of reinsurance basis with a corresponding contingent credit risk charge for certain categories of reinsurers.

The insurance company may use the modeled losses from any one of the NAIC-approved commercially available third party vendor catastrophe models, or any combination of losses

184 We have assumed that the percentage of Fictitious’ net written premium that emanates from loss-sensitive contracts written on a direct basis is: 0.8% for commercial automobile liability, 5.5% for workers’ compensation, 0.3% for other liability, and 0% for all other lines and for loss-sensitive contracts written on an assumed basis.
from two or more of the models, using the insurer’s own insured property exposure information as inputs to the model. For the 2018 RBC formula, approved vendor models are available from AIR, EQECAT, RMS, ARA HurLoss Model (hurricane only) and the Florida Public Model (hurricane only). For the 2019 RBC formula, companies will also be able to use their own internally developed catastrophe model or those that are the result of adjustments made by the insurer to vendor models to represent their own view of catastrophe risk, upon applying for and obtaining written permission by their domestic (where model output is used for a single entity) or lead state (where model output is used for the whole group) insurance regulator.

The company must provide modeled loss scenarios for the worst year in 50, 100, 250 and 500; however, only the worst year in 100 will be used in calculating the catastrophe risk charge. Insurers are expected to use the same exposure data, modeling, and assumptions that they use in their own internal catastrophe risk management process, rather than a prescribed set of modeling assumptions. While it is preferred that the projected modeled losses are reported on an Aggregate Exceedance Probability (AEP) basis, companies are permitted to report on an Occurrence Exceedance Probability (OEP) basis if that is consistent with the company’s internal risk management process.

For both earthquakes and hurricanes, a risk charge factor of 1.000 is applied to the net of reinsurance losses (excluding any loss adjustment expenses) at the worst year in 100 level. Additionally, a factor of 0.048 is applied to the modeled losses ceded under any reinsurance contract associated with this level of net loss to capture the contingent credit risk associated with the potential default of reinsurers in this scenario. Recoveries from certain categories of reinsurers are exempt from this charge, namely U.S. affiliates and mandatory pools (whether authorized, unauthorized or certified).

The total \( R_{\text{cat}} \) catastrophe risk charge is calculated using the “sum of squares” approach, which assumes the two risks are independent, using the following formula:

\[
R_{\text{cat}} = \sqrt{(\text{Total earthquake risk})^2 + (\text{Total hurricane risk})^2}
\]

Exemption Interrogatory

Insurers may qualify for an exemption from filing either or both of the components of the catastrophe risk charge if they meet certain criteria, upon completion of an interrogatory.

For both earthquake and hurricane exemptions, the company must indicate under which criteria below it is claiming an exemption:

1. The company has not entered into a reinsurance agreement covering earthquake / hurricane exposure with a non-affiliate or a non-U.S. affiliate, and either
FINANCIAL REPORTING THROUGH THE LENS OF A PROPERTY/CASUALTY ACTUARY

Part IV. Statutory Filings to Accompany the Annual Statement

a. The company participates in an inter-company pooling arrangement with 0% participation, leaving no net exposure for earthquake / hurricane risks; or
b. The company cedes 100% of its earthquake / hurricane exposures to its U.S. affiliate(s), leaving no net exposure for earthquake / hurricane risks

2. The company’s ratio of Insured Value – Property to surplus as regards policyholders is less than 50%

3. The company has written Insured Value – Property that includes earthquake / hurricane coverage in the Catastrophe-Prone Areas representing less than 10% of its surplus as regards policyholders

The NAIC RBC Instructions include the following definitions related to the catastrophe risk exemptions:

- **Insured-Value Property**: Includes aggregate policy limits for structures and contents for policies written and assumed in the following annual statements lines – Fire, Allied Lines, Earthquake, Farmowners, Homeowners, and Commercial Multi-Peril.

- **Catastrophe-Prone Areas in the U.S.:**
  - **Earthquake risks**: Includes any of the following states or commonwealths: Alaska, Hawaii, Washington, Oregon, California, Idaho, Nevada, Utah, Arizona, Montana, Wyoming, Colorado, New Mexico, Puerto Rico, and geographic areas in the following states that are in the New Madrid Seismic Zone – Missouri, Arkansas, Mississippi, Tennessee, Illinois, and Kentucky.
  - **Hurricane risks**: Includes Hawaii, District of Columbia, and states and commonwealths bordering on the Atlantic Ocean, and/or Gulf of Mexico including Puerto Rico.

For the earthquake exemption, if a company qualifies for exemption under criteria 3, the company must provide details about how the “geographic areas in the New Madrid Seismic Zone” were determined, with the following additional questions:

a. What resource was used to define the New Madrid Seismic Zone?
b. Was exposure determined based on zip codes or countries in the zone, was it based on all of the earthquake exposure in the identified states, or was another methodology used? Describe any other methodology used.

THE RBC CHARGE FOR BASIC OPERATIONAL RISK

The basic operational risk charge considers the risk of financial loss resulting from operational events that have not already been reflected in existing risk charges. This includes the inadequacy or failure of internal systems, personnel, procedures, or controls, and external events. Additionally, this accounts for legal risk, excluding reputational risk from strategic decisions.
The operational risk charge uses a percentage or “add-on” charge of 3.00% applied to the Total RBC After Covariance Before Basic Operational Risk. The operational risk charge is further reduced by the sum of offset amounts reported by directly owned life insurance company subsidiaries that prepare and file the Life RBC calculation, adjusted for the percentage of ownership in the directly owned life insurance company subsidiaries (but not to produce a charge that is less than zero).

Table 97 illustrates the final calculation of NAIC RBC, including basic operational risk, for Fictitious.

RBC MODEL ACT

Each state’s statutes define a minimum amount of capital that a company must have to obtain a license in that state. These amounts vary by state and by lines of business but are usually relatively low, from $1 million to $5 million. These minimum capital amounts do not account for the characteristics and risk level of individual insurance companies.

The purpose of RBC is to help regulators identify insurers that are in financial trouble and that need regulatory attention. Therefore, the RBC requirements attempt to individualize the minimum capital requirement for each insurer. RBC is not a target-level of capital that insurers should hold; rather, it computes a minimum level of capital adequacy that a company must have to operate.

The RBC requirement is a dollar amount calculated from the NAIC RBC formula. The RBC that results from the formula (Total RBC After Covariance including Basic Operational Risk) is compared to a company’s Total Adjusted Capital. Total Adjusted Capital is equal to the company’s policyholders’ surplus from page 3 of the Annual Statement that is reduced by:
1. The amount of non-tabular discount from Schedule P, Part 1, Summary, columns 32 and 33.

Additionally, a property/casualty insurer that owns a life insurance company subsidiary adjusts its surplus for the same amounts as the life subsidiary does for RBC purposes, namely by adding back the asset valuation reserve and 50% of the dividend liability to surplus. All such affiliate amounts are adjusted by the company’s percentage of ownership.

The “RBC ratio” is the name used in the insurance industry to describe the ratio of Total Adjusted Capital to Authorized Control Level (ACL). While discretionary, ACL is the point at which the insurance commissioner is authorized to take control over the company under the RBC Model Act. ACL is equal to 50% of the Total RBC After Covariance including Basic Operational Risk.

\[
\text{RBC ratio} = \frac{\text{Total Adjusted Capital}}{\text{ACL}} = \frac{\text{Total Adjusted Capital}}{(\text{Total RBC After Covariance including Basic Operational Risk} \times 0.500)}
\]

Regulatory action is permitted when total adjusted capital is within 50 percentage points of the ACL (i.e., when the RBC ratio is 150% or less). This is called the regulatory action level.

Table 98 summarizes the level of regulatory control relative to the percentage of total adjusted capital to both the RBC and ACL benchmarks:
As noted earlier, the detailed calculations of a company's risk charges are not available to the public. However, two metrics of RBC are disclosed in the Five-Year Historical Data exhibit of the Annual Statement: Total Adjusted Capital and the ACL. A company's RBC ratio can be calculated by dividing the Total Adjusted Capital by the ACL from the company's Five-Year Historical Data. Table 99 provides the RBC ratios for Fictitious from its 2018 Five-Year Historical Data exhibit.
As displayed in Table 99, the company’s RBC ratios have been well over 300 points above the Company Action Level, the first action level within the RBC framework, which ranges from 150% to 200% of ACL. Note how the 2018 ACL amount of $5,588,000 is 50% of the Total RBC After Covariance including Basic Operational Risk shown in Table 97.\textsuperscript{186}

As shown in the Actuarial Opinion Summary in the Appendix of this publication, Fictitious Insurance Company’s range of reasonable reserve estimates is $43 million to $57 million with an actuarial central estimate of $50 million and carried reserves of $51.557 million. If the high end of the range was to materialize, total adjusted capital would decrease by $5.443 million ($57 million - $51.557 million). At $25.581 million, the total adjusted capital would still be well above the company action level of $11.450 million (by $14.131 million). Some Appointed Actuaries look to the impact on capital resulting from a movement in reserves relative to the high end of the actuarial range for purposes of selecting a materiality standard (see Chapter 16. Statement of Actuarial Opinion) in their Statement of Actuarial Opinion.\textsuperscript{187}

According to the NAIC 2018 RBC instructions, 98.5% of property/casualty insurance companies usually fall within RBC levels that require no regulatory action (i.e., having Total Adjusted Capital in excess of 200% of ACL).\textsuperscript{187} However, just because a company’s RBC results do not require regulatory attention, it does not necessarily mean that the company is strong financially. RBC is intended to be one of a number of tools used by regulators to evaluate financial solvency and therefore should not be used in isolation.

TREND TEST

Companies with RBC ratios exceeding 200% are not necessarily free from regulatory attention. Companies with an RBC ratio of between 200% and 300% are subject to the trend test. The trend test serves as an early warning to state insurance regulators of companies that may be on a path to reporting an RBC ratio below 200%, thereby triggering the company action level. The trend test looks to see whether companies with an RBC ratio of between 200% and 300% also have a current year combined ratio that exceeds 120%.

\textsuperscript{186} Note that the Authorized Control Level RBC of $5,587,565 is rounded to $5,588,000 in Table 12 and Table 99 for simplicity.

\textsuperscript{187} NAIC, RBC Property & Casualty 2018 Forecasting & Instructions, page 48.
meeting the trend test criteria are required to comply with the company action level requirements despite having an RBC ratio in excess of 200%.

The combined ratio is calculated as the sum of:

1. Loss and LAE ratio
2. Dividend ratio
3. Expense ratio

The loss and LAE ratio is calculated as calendar year net incurred loss and LAE divided by net earned premium from the Statement of Income. The dividend ratio is equal to policyholders’ dividends divided by net earned premium from the Statement of Income. The expense ratio is equal to other underwriting expenses incurred plus aggregate write-ins for underwriting deductions from the Statement of Income divided by net written premiums from the Underwriting & Investment Exhibit.

THE FUTURE OF RBC

Since its inception, the RBC model has continued to evolve and this chapter has captured the details of the calculation at a point in time. In particular, over the past decade the RBC formula has had substantial development as a consequence of the comprehensive review of the solvency framework in the U.S. performed as part of the NAIC’s Solvency Modernization Initiative. Such changes included the addition of new catastrophe risk and operational risk charges as well as enhancements made to various existing risk categories, such as investments in affiliates and reinsurance credit risk.

In the future the principles behind the RBC calculation are unlikely to change substantially, although we are likely to see continued enhancements to the calculation to reflect evolving practices in the measurement and management of risk.

One initiative currently undertaken by the NAIC is the development of a Group Capital Calculation that will provide regulators with another regulatory tool to understand the level of risk across an entire insurance group, i.e., aggregating across all of its operations, to complement the RBC requirements that are applicable at the legal entity level.

The RBC calculation is likely to also remain a key component of an insurance company’s annual Own Risk and Solvency Assessment (“ORSA”). First introduced in 2015, the ORSA is an internal process undertaken by an insurer to assess the adequacy of its risk management and current and prospective solvency positions under normal and severe stress scenarios.
CHAPTER 20. IRIS RATIOS

OVERVIEW

National Association of Insurance Commissioners (NAIC) Insurance Regulatory Information System (IRIS) has been used since 1972 to help insurance regulators evaluate the financial condition of insurance companies. More than 5,000 companies file their financial statements with the NAIC each year. IRIS is applied to property/casualty, life/accident and health, and fraternal insurance organizations.

IRIS is known by practicing property/casualty actuaries as being a series of 13 tests of financial ratios relative to benchmarks (i.e., ranges of “unusual values”). These are called IRIS ratios. However, the IRIS ratios are only one component of IRIS. IRIS includes other tools and databases of financial information that are used by state insurance regulators to monitor the financial health of insurance companies.

The instructions for computing IRIS ratios are currently included as part of the CAS Exam 6 U.S. Syllabus of Basic Education. As a result, we will not go into details of the calculations here but rather will provide a brief overview of the IRIS ratios. In Appendix I of this publication, we walk through the calculation and purpose of each of the 13 IRIS ratios, provide possible explanations for unusual values, and show the results of the IRIS ratio calculations for Fictitious Insurance Company using data from the 2018 Annual Statement.

IRIS RATIOS

The IRIS ratios are grouped into four categories:

- Overall ratios
- Profitability ratios
- Liquidity ratios
- Reserve ratios

Many of the ratios are computed in terms of policyholder surplus, with the intent of providing an early warning of companies in financial distress. The results of each of these ratios are not reviewed in isolation. When reviewing the results of ratios and investigating unusual values, mitigating or augmenting circumstances brought to light through other ratios and information are considered.

---

188 Per the description of the publication *Ratio Results for the IRIS* on the NAIC and The Center for Insurance Policy and Research, NAIC Store, Financial Regulation Publication on IRIS, [http://www.naic.org/store_pub_fin Receivership.htm#iris_results](http://www.naic.org/store_pub_fin_receivership.htm#iris_results).
The reserve ratios are probably the most important ratios to the property/casualty actuary and where the actuary places most attention, as these ratios are specifically commented on by the appointed actuary in the Statement of Actuarial Opinion (SAO).

There are three reserve ratios:

- **IRIS ratio 11**: One-year reserve development to policyholders’ surplus
- **IRIS ratio 12**: Two-year reserve development to policyholders’ surplus
- **IRIS ratio 13**: Estimated current reserve deficiency to policyholders’ surplus

These three ratios focus on the development of an insurance company’s net loss and LAE reserves for purposes of understanding reserve adequacy. IRIS ratio 11 is the same one-year development test as provided in the Five-Year Historical Data exhibit within the Annual Statement. It measures development in the company’s net loss and LAE reserves over the past year, whether adverse or favorable, relative to prior year surplus. Essentially, this test looks to see how much surplus would have been absorbed or enhanced in the prior year as a result of adverse or favorable development in the corresponding net loss and LAE reserves. Adverse development is shown as an increase to reserves and therefore a positive number. Results of IRIS ratio 11 equal to or greater than 20% are considered unusual.

IRIS ratio 12 is the same two-year development test as provided in the Five-Year Historical Data exhibit within the Annual Statement. It measures development in the company’s net loss and LAE reserves over the past two years, relative to surplus at the end of the second prior year. Like ratio 11, results of IRIS ratio 12 equal to or greater than 20% are considered unusual.

IRIS ratio 13 is a hindsight test. It looks at a company’s net outstanding loss and LAE reserves at the immediate prior two years relative to calendar year earned premium for those years and adds to the reserves development that has emerged over that period (one-year development for the immediate prior year; two-year development for the year prior to that). The test then applies the average of the resulting two “adjusted” loss ratios to earned premium for the recent year to determine what the outstanding loss reserve should be. A calculated deficiency in recorded loss and LAE reserves of 25% or more is deemed to be unusual.

The purpose of this test is to identify companies that may not have gotten their reserves “right” in the past. The expectation inherent in this test is if companies have had adverse development in the past, they will probably have adverse development in the future. Regulators want to see if companies who have had such adverse development have corrected for it in their current estimates.
INTERPRETING THE RESULTS OF THE SYSTEM

The IRIS results are used to prioritize insurers requiring further analysis through examination by the state insurance regulatory system. An unusual value does not necessarily mean that the insurer is financially impaired. The NAIC IRIS Ratios Manual states, “No state can rely on the tools’ results as the state’s only form of surveillance.”189

189 Ibid., page 2.
INTRODUCTION TO PART V

In Part IV. Statutory Filings to Accompany the Annual Statement we presented details underlying several filings either included within or supplemental to the statutory Annual Statement. These and other tools, including on-site financial examinations and Financial Analysis Solvency Tools (FAST, of which the IRIS System is a part), provide a means for the regulator to monitor the financial health of an insurance company. Many of these tools are confidential. However, certain results can be derived from publicly available information, such as the result of RBC, which is included within the Five-Year Historical Data exhibit in the Annual Statement.

The monitoring performed by regulators is risk-focused and intended to identify financially troubled companies well before they are impaired. Regulators use the tools collectively to evaluate financial health and prioritize those insurers requiring additional scrutiny and analysis.

While policyholders and investors place heavy reliance on state insurance regulators in monitoring the health of property/casualty insurance companies, they themselves have access to the publicly available tools, such as quarterly and Annual Statement filings, the Statement of Actuarial Opinion, and Securities and Exchange Commission filings (for publicly traded companies). Also, to assess financial health, they rely on ratings and analyses performed by credit rating agencies, such as A.M. Best, Moody’s, Standard & Poor’s and Fitch. Each of these rating agencies uses internally developed capital adequacy models to perform qualitative and quantitative financial strength assessments and establish a company’s rating.

In this section we provide a summary of the tools used by regulators and stakeholders in monitoring an insurance company’s financial health and briefly explain how these tools are used in practice.
CHAPTER 21. MEASUREMENT TOOLS

Before we discuss what the tools mentioned in the introduction do, it is important to disclose what they don’t do.

First, each measurement tool provides one piece of evidence and should not be taken as the only evidence of a healthy or troubled insurance company. For example, an insurance company may have “usual” values for each of its Insurance Regulatory Information System (IRIS) ratios, but something about the company’s exposures or a pending regulatory decision may result in a risk of material adverse deviation in the company’s reserves, and such risk could be material to the company surplus. The risk of material adverse deviation would be discussed in the Statement of Actuarial Opinion (SAO) by the appointed actuary, and in reading that disclosure, the regulator would determine the necessary steps for further investigation. In this example, neither the results of the IRIS ratios nor the SAO should be considered alone; other information should be incorporated into an evaluation of an insurance company’s health.

Second, these tools don’t supplant the audit of an insurance company. In fact, the audited financial statements are themselves a tool used by the stakeholders and regulators of an insurance company. Further, these tools will not ensure that the data used as input into the tools is accurate and complete, nor will they provide any insight as to whether the company’s management has good internal management, systems and controls in place. However, weaknesses in company management, systems and/or controls eventually leach into the output from the tools.

Finally, these tools will not identify fraud, which can be difficult to uncover.

WAYS IN WHICH THESE TOOLS ARE USED TO MEASURE FINANCIAL HEALTH

When viewed together, these tools can provide valuable insight into the financial health of a property/casualty insurance company. The information gathered from one tool may not in itself be an indicator but may prompt additional investigation, either through the evaluation of other tools or inquiry of company management.

Further, the results from a single year may not immediately suggest financial impairment; however, a review of these results over several years may identify a trend in that direction. When reviewed together and across multiple years, these tools can be used to provide an early warning of companies that are of higher risk for financial impairment.
Annual and quarterly financial statements and schedules

Insurance companies are required to file financial statements every quarter. To summarize what we learned in preceding chapters, substantial detail is contained in the annual filing (i.e., as of December 31), including qualitative information in the form of detailed notes to financial statements and interrogatories. These statements are filed under Statutory Accounting Principles. As discussed, statutory accounting focuses on protecting the policyholder and therefore is known as maintaining more of a conservative stance relative to Generally Accepted Accounting Principles. Assets and liabilities tend to be measured on a basis that includes some cushion in the event of financial impairment.

There are two perspectives of financial health measured by the statutory financial statement: balance sheet strength and earnings potential. In terms of balance sheet strength, regulators are concerned with an insurance company’s claim-paying ability and therefore focus on areas that could impair solvency. Two such areas are loss and loss adjustment expense (LAE) reserve and unearned premium reserve adequacy. Loss and LAE reserves make up the largest item on the liability side of an insurance company’s balance sheet, representing one-third of total Liabilities, Surplus and Other Funds at year-end 2018 for the U.S. property/casualty insurance industry. Coupled with unearned premium reserves, these liabilities represent nearly half of the total 2018 Liabilities, Surplus and Other Funds for all U.S. property/casualty insurers in aggregate.

The Five-Year Historical Data exhibit provides a historical view of how an insurance company’s losses have developed over time. Additionally, the Notes to Financial Statements provide management discussion of changes in incurred loss and LAE. Data from Schedule P, Parts 2 through 4 can also be used to perform independent tests of a company’s reserve adequacy.

Because loss reserves are stated on a net of reinsurance basis on the balance sheet, reinsurance collectability is also an area of risk relative to the statutory financial statements. The provision for reinsurance is established on the liability side of the balance sheet to offset some of this risk by excluding a portion of reinsurance recoverables from unauthorized and overdue authorized reinsurers. Despite the establishment of the provision for reinsurance, reserve credit risk still exists. The Notes to Financial Statements are a means to identify reinsurance that is unsecured, uncollectible or in dispute. And Schedule F, Part 3 can be used to identify the company’s reinsurers so that additional review of the reinsurers’ financial strength can be performed. For example, the credit rating of each reinsurer can be determined from recognized rating agencies, such as those mentioned later in this chapter.

Accident-year loss and LAE ratios from Schedule P, Part 1 provide insight into the adequacy of claim reserves and unearned premium reserves. For example, property/casualty actuaries look at current accident year incurred loss and LAE ratios by line of business relative to prior year ratios adjusted for rate change and trend. Deviations from anticipated trends are
typically investigated to assess adequacy of loss and LAE ratios on the current accident years. To illustrate, for a line of business experiencing loss trend of +5% and rate change of -3% on premiums earned in 2019 over 2018, one might initially expect the accident year 2019 loss and LAE ratio to be approximately 8% higher (\(\frac{1.05}{0.97} - 1\)) than that for 2018. That is, if the accident year 2018 loss and LAE ratio was 60%, one would expect the accident year 2019 ratio to be 65% (60% * 1.08). If the loss and LAE recorded in Schedule P, Part 1, for accident year 2019 was 55% one might question the rationale behind an improvement in loss ratio, when deterioration was expected.

Additionally, deficiencies in loss and LAE reserves or current accident-year loss and LAE ratios in excess of 100% lead to further investigation of whether the unearned premium is adequate to cover losses that will emerge as premium is earned. In performing such an investigation, consideration is often made for investment income.

In terms of the asset side of the balance sheet, property/casualty insurance companies tend to invest in short-duration, relatively liquid fixed-income investments. Nearly 50% of the assets held by U.S. property/casualty insurers at year-end 2018 were in bonds. However, the financial crisis in 2008 taught us that even conservative investment strategies can pose a risk to insurance companies. Changes in asset values and yields on invested assets are monitored to assess this risk.

Further, investment in asset classes where the level of risk exceeds industry norms stimulates investigation of the hedging strategies a company has in place to mitigate risk.

While a company's balance sheet may appear financially solid, future earnings can be impaired by a company's underwriting, pricing and investment strategy. Although the Annual Statement schedules and exhibits may not be able to uncover a weakening in earning strength on their surface, trends in financial ratios and other analysis of year-over-year changes in income statement line items can provide an early warning. Examples of such trends include:

- Rapid and substantial growth in written premium and the timing of such growth relative to the underwriting cycle: In soft markets it is difficult to achieve significant growth without concessions on price or commission levels. The Five-Year Historical Data provides historical premium volume on a gross and net basis to assist in measurement of a company’s growth.

- Increases in underwriting (or other) expense ratios: This may also be a sign that an insurer is conceding commission to grow or maintain business. Increases in commissions or other expenses mean that there is less premium available to pay losses. The income statement and Part 3 of the Underwriting and Investment Exhibit (U&IE) and the Insurance Expense Exhibit (IEE) are sources of this data.
• Deteriorating loss ratios: Historical loss ratios can be observed on a calendar-year basis in the Five-Year Historical Data or by accident year and line of business in Schedule P. Deterioration in loss ratios implies that pricing is not keeping pace with the underlying risk being underwritten. Further investigation into a company’s price monitoring practices relative to peer benchmarks and ability to increase rates would be warranted.

• Increased exposure to catastrophic or large events: A review of writings by state in Schedule T and writings by line of business per the U&IE can help to identify catastrophe exposure. A company with premium concentration in Florida homeowners business suggests that the company may have increased exposure to hurricane risk. Further, a review of Part 2 of the general interrogatories provides information regarding a company’s probable maximum loss and provisions in place to protect the company against such loss, such as a catastrophic reinsurance program.

• Losses on investments, change in mix of invested assets by class and/or declining yields on investment assets: Such trends may suggest a change in a company’s investment strategy or lack of control in the strategy.

• Increases in the provision for reinsurance: Changes in the provision for reinsurance, as displayed in the capital and surplus account of the income statement, can be a sign of increased credit risk.

Quarterly statements provide more limited information than what is included in the annual filing. However, the primary financial statements remain in the same general format (i.e., Assets page; Liabilities, Surplus and Other Funds; Statement of Income; Cash Flow; and Notes to Financial Statements), as do many of the schedules. The evaluation date is the quarter-end and comparisons are made to the prior year-end. From the perspective of a property/casualty actuary, the biggest difference is that quarterly statement does not include Schedule P. Schedule P is replaced with a schedule titled “Part 3,” which shows loss and LAE reserve development during the quarter for the latest three accident years and all years prior, for all lines of business in the aggregate. While this schedule provides a gauge of retrospective reserve strength during the current year, it does not provide all of the line of business detail that is provided annually in Schedule P.

There is a wealth of information contained in the annual and quarterly statements. But because more than 5,000 companies file their statements, state regulators of insurance companies may not have the resources available to analyze these filings in detail for every company domiciled or licensed to write business in their state. Rather, regulators rely on the other tools coupled with the financial statements and schedules to prioritize those companies of greatest risk of financial impairment.
IRIS

As discussed in Chapter 20, IRIS Ratios, IRIS is one tool used by regulators. The IRIS ratios focus on balance sheet strength and the earnings quality through measures that assess growth, profitability, liquidity, and reserve development/adequacy.

Although the IRIS ratio results are not widely available to the public, they can be calculated directly from an insurance company's Annual Statement. We have done so for Fictitious in Appendix I of this publication.

While there is no direct link to regulatory intervention based on the results of these ratios, the results of the IRIS values are considered by regulators in conjunction with other solvency monitoring tools, such as Risk-Based Capital (RBC), to prioritize those insurance companies requiring immediate regulatory attention.

RBC

RBC is another tool that considers balance sheet strength and future earnings. Balance sheet risk is considered in the asset risk charges ($R_0$ through $R_3$), while profitability of future writings is contemplated through the underwriting risk charges ($R_4$ and $R_5$) and the catastrophe risk charge ($R_{CAT}$).

The calculations underlying an insurance company’s RBC are confidential and cumbersome to perform without using the spreadsheet provided with the NAIC instructions. However, the results of the RBC formula are provided in the Five-Year Historical Data exhibit within the Annual Statement. Stakeholders are able to review overall results and monitor changes over time.

RBC considers the risks and relative size of an insurance company in computing a required level of capital, whereas under IRIS, no adjustments are made to reflect what would be “usual” for an individual insurance company. Unlike IRIS, there is a direct link to regulatory intervention based on a comparison of the RBC level of required capital to the company's total adjusted capital. The NAIC RBC Model Act provides regulators with the authority to take control of a property/casualty insurance company if the company's RBC ratio falls below 100% of the ACL.

RBC isn’t a fail-safe test for financial impairment. While certain of the RBC factors consider a company’s own experience, the majority of the factors used to determine the level of required capital are based on industry-wide factors developed by the NAIC. As a result, while a company’s RBC ratios may not require any specific action by the company management or regulatory authorities, this doesn’t mean that the company is safe from future impairment.

The trend test is one way that the RBC results are used to identify companies that may become financially impaired. The purpose of the trend test is to identify companies likely to
fall in the company action level RBC in the coming year and require those companies to take action before that happens. The trigger for application of company action within the trend test is having an RBC ratio within 100 points of the company action level RBC, coupled with a current-year combined ratio of more than 120%.

SAO

The SAO provides assurance of a qualified actuary that the company’s loss and LAE reserves are reasonable on a gross and net of reinsurance basis. It is not an opinion on the solvency of an insurance company but an opinion on the adequacy of what is typically the largest item on an insurance company’s balance sheet. Significant deviations in this balance may have a material impact on a company’s solvency. Therefore, the actuary will provide commentary of any significant uncertainties or risks that could result in a material adverse deviation in the company’s recorded reserves.

A determination by the appointed actuary that the reserves are anything other than “reasonable” and relevant comments that indicate there is are significant risks and/or uncertainties that could result in material adverse deviation are two triggers of additional scrutiny by regulatory authorities.

One thing the SAO does not tell the reader is the company’s reserve position within the appointed actuary’s range, if the appointed actuary calculates a range. A company that is exposed to significant risks and uncertainties, with reserves lying at the lower bound of the actuary’s range, would be subject to greater concern than a company exposed to the same level of risk with reserves in the high end of the appointed actuary’s range. There is no document available for public review, which includes rating agencies, that contains the appointed actuary’s range. The appointed actuary’s range is contained in the Actuarial Opinion Summary (AOS), SAO documentation report, and usually found in the work papers of the company’s external auditors.

As noted previously, the AOS is a confidential document, for regulators only. The actuarial report contains the range; however, these reports contain restrictions on distribution and use, due to their confidential nature, and therefore are not widely distributed. Similarly, while audit work papers may be subpoenaed for cause, they are not publicly available.

AOS

The AOS is valuable in providing the regulator with context as to the company’s reserve adequacy by providing the company’s position relative to the appointed actuary’s point estimate or range, if calculated, on a net and gross of reinsurance basis. It also provides details that explain to the regulator the cause for adverse development in the company’s reserves over the past five years, where such development has exceeded 5% of surplus in
three of those years. The AOS is also a confidential document that is only shared with the insurance company's state regulator.

Credit Rating Agencies

Stakeholders also rely on financial strength ratings (FSRs) issued by credit rating agencies (CRAs) in the evaluation of financial health. FSRs represent a CRA’s evaluation of an insurance company’s ability to meet ongoing obligations to its policyholders. This is in contrast to debt/issuer credit ratings, which are also provided by CRAs. Debt/issuer ratings represent the CRA’s evaluation of a company’s ability to meet debt obligations. Debt/issuer credit ratings are provided on the creditworthiness of the entity as a whole or on individual debt instruments.

Of the CRAs that rate insurance companies, A.M. Best is the only one that focuses exclusively on the insurance industry, providing FSRs and debt/issuer ratings. A.M. Best rates thousands of insurance entities across the globe. Other CRAs, such as Standard & Poor’s (S&P), Moody’s and Fitch serve a wide range of industries (ranging from aerospace to utilities, financial institutions and the public sector) and are prevalent in the area of debt/issuer ratings.

Ratings are based on qualitative and quantitative analysis of a company’s financial statements and organization. Each CRA uses its own criteria. Qualitative factors can include corporate governance, product development, composition of capital structure, asset quality, investment strategy, reserve adequacy, claims management, contingent assets and liabilities, and the level of reinsurance dependency. Quantitative analysis includes running a company’s financial data through capital adequacy models. Each CRA has its own internally developed model that computes required capital levels. Similar to RBC, the required capital levels are computed and compared to an insurer’s capital to produce a ratio that translates to letter ratings. Examples of CRA models include Best’s Capital Adequacy Ratio and S&P’s Capital Adequacy Ratio.

The higher the rating, the greater the ability the company is deemed to have to meet its ongoing insurance obligations. The ability to meet ongoing insurance obligations generally diminishes as ratings decrease. For example, A.M. Best’s FSR scale includes 7 rating symbols from A+ (superior) to D (poor), with rating notches applicable to symbols A+ through C (weak) to reflect a gradation of financial strength denoted by an additional “+” or “-“. With the rating notches there are a total of 13 FSR designations. There are also 4 non-rating designations of E (in conservation or rehabilitation), F (in liquidation), S (rating suspended) and NR (not rated).\(^{190}\) Regardless, the CRAs provide no guarantee that the insurance company will be able to meet its obligations.

FSR ratings are generally established annually, with ongoing monitoring performed by the CRA analyst throughout the year to evaluate the impact of developments on a company’s rating. Ongoing monitoring includes review of the following:

- Statutory financial statement filings
- Interim management reports and other information provided by the insurer to the rating agency
- Significant public announcements, including earnings releases/calls, made by the entity

A rating action or review can be considered at any time that A.M. Best becomes aware of significant development in the insurer’s operations.

The following provides examples of the uses of FSRs by stakeholders of insurance companies:

- Individual and corporate policyholders want to make sure the insurance company will be there when needed to pay claims. They therefore look to the FSR as an indicator in their insurance buying decisions, weighing the company’s rating against the cost of insurance.
- Many boards of directors of corporate policyholders require that their organization’s insurance purchases are made with highly rated insurance companies. After the financial crisis, many large corporations required insurance companies to include cancellation endorsements to allow the insured to cancel without penalty if the carrier was downgraded below a certain level(s) by recognized CRAs.
- Insurance companies will also look at FSRs of reinsurers in making reinsurance buying decisions.
- Investors look at FSRs in their decision to invest in an insurance company, weighing risk relative to the company’s rating with expected return.

HOW THESE TOOLS HAVE FARED — INDICATORS OF INSURANCE COMPANY INSOLVENCIES OVER THE PAST 40 YEARS

The measurement tools discussed in this publication are designed to assist in predicting or preventing all insurance company failures, but it is impossible for a tool to work in all circumstances. The intent, however, is that they identify the vast majority before it’s too late.

Over the years, studies have been performed to detect the cause of insurance company failure and therefore sharpen the tools that are available to monitor solvency. The American Academy of Actuaries (AAA) has issued three such studies that, collectively, have examined property/casualty insurance company insolvencies over a 40-year period, from 1969 through 2009. The following contains the results of these studies and common themes observed in insolvent companies prior to their demise.
The AAA Property/Casualty Financial Soundness/Risk Management Committee (the FSRM) published a report in September 2010 titled Property/Casualty Insurance Company Insolvencies. This report revisited the issue of insurance company solvencies, which was examined in two previous studies in the 1990s by AAA, one based on property/casualty insurance company insolvencies over the period 1969 to 1987 and the other from 1988 to 1990. The AAA’s research included submitting a questionnaire to insurance regulators on the causes of the insurance company failures over that time period. In each period, “under-reserving” and “mismanagement” were the first and second most frequently cited cause of insurance company insolvencies.

Given that the adequacy of loss reserves was historically cited as the primary cause of insolvency in the prior two studies, the 2010 report focused on the performance and characteristics of companies having the largest reserve deficiencies. Additionally, the FSRM studied five years’ worth of historical financial data for 36 property/casualty insurance companies that became insolvent over the period 2005 to 2009 for commonalities. The 2010 report concluded the following:

- Insolvency is caused by a combination of factors. “Under-reserving” is a factor in the insolvency of property/casualty insurance companies but “is not the leading cause of insolvency.”\(^{191}\)

- Size, experience and diversification matters. “The majority of the companies was small, relatively new, and/or was concentrated in one line of business and/or state.”\(^{192}\)

- Good management and governance is essential. “The review of financial data for many of the companies showed evidence of poor management and decision-making, including little or no reinsurance, inadequate reinsurance for the amount of risk, very rapid premium growth, significant adverse development, inadequate pricing, and potentially serious data problems.”\(^{193}\)

The report also studied the SAO as an indicator of financial impairment over the immediate five years prior to insolvency. The FSRM concluded that the SAO alone is not a backstop for insurance company insolvencies, but it “can help identify those companies and/or categories of companies that could be in trouble.”\(^{194}\) Where opinions were available, the FSRM observed the following:

- Only one SAO was qualified, and the remaining were “reasonable” reserve opinions.

---

\(^{192}\) Ibid., page 16.

\(^{193}\) Ibid.

\(^{194}\) Ibid., page 18.
Nearly 50% of the SAOs concluded that a risk of material adverse deviation existed in the company’s loss and LAE reserves, 37% concluded that such a risk did not exist, and the remainder of the SAOs either did not comment on the risk of material adverse deviation or it wasn’t clear if the appointed actuary deemed a risk of material adverse deviation existed.

- When stated, materiality standards were generally based on a percentage of surplus (between 5% and 20%).

We note that the NAIC Actuarial Opinion Instructions and Actuarial Standards of Practice issued by the Actuarial Standards Board have continued to include enhancements on disclosure requirements within the SAO since the period studied.

The commonalities identified in the above studies provide us with areas of focus when evaluating the tools used to measure financial health. The key message is that financial impairment is caused by a variety of factors, and the measurement tools discussed in this publication, when considered in unison, can help detect companies at risk for financial impairment.
PART VI. DIFFERENCES FROM STATUTORY TO OTHER FINANCIAL/REGULATORY REPORTING FRAMEWORKS IN THE U.S.

INTRODUCTION TO PART VI

As discussed in Part III. SAP in the U.S.: Fundamental Aspects of the Annual Statement, U.S. Statutory Accounting Principles (SAP) focuses on the solvency of insurance companies. However, other frameworks exist for solvency, general purpose financial reporting, and taxation. In this section we will examine these other frameworks, beginning with general purpose financial reporting.

The framework in the U.S. for general purpose financial reporting is U.S. Generally Accepted Accounting Principles (GAAP). We will focus on the key differences between U.S. SAP and U.S. GAAP. We will also study the importance of accounting for business combinations and consider calculations that involve actuaries in fair valuing the balance sheet in accordance with the requirements of U.S. GAAP. We will provide an overview of the emergence of International Financial Reporting Standards as a general purpose financial reporting framework. We will also provide a brief overview of the European regulatory framework known as Solvency II. Finally, we will discuss financial reporting for tax purposes.
OVERVIEW

U.S. Generally Accepted Accounting Principles (GAAP) for public companies is, by statute, determined by the Securities and Exchange Commission (SEC). The SEC has effectively delegated this responsibility since its inception to the private sector. Currently, the SEC looks to the Financial Accounting Standards Board (FASB) as the organization for establishing standards of financial accounting. In 2009, the FASB codified U.S. GAAP by publishing its Accounting Standards Codification (ASC). The ASC replaced several sources of authoritative U.S. GAAP literature from various standard setters. These sources included:

1. FASB
   a. Statements (FAS)
   b. Interpretations (FIN)
   c. Technical Bulletins (FTB)
   d. Staff Positions (FSP)
   e. Staff Implementation Guides (Q&A)
   f. Statement No. 138 Examples.
2. Emerging Issues Task Force (EITF)
   a. Abstracts
   b. Topic D.
3. Derivative Implementation Group (DIG) Issues
4. Accounting Principles Board (APB) Opinions
5. Accounting Research Bulletins (ARB)
6. Accounting Interpretations (AIN)
7. American Institute of Certified Public Accountants (AICPA)
   a. Statements of Position (SOP)
   b. Audit and Accounting Guides (AAG) — only for incremental accounting guidance
   c. Practice Bulletins (PB)
   d. Technical Inquiry Service (TIS) — only for Software Revenue Recognition

References to the newly codified standards usually start with the letters ASC followed by a series of numbers. Insurance specific guidance can be found in Section 944. For example, the definition of the measurement approach to unpaid claims estimates under U.S. GAAP can be found at ASC-944-40-30-1. It states: “The liability for unpaid claims shall be based on the estimated ultimate cost of settling the claims (including the effects of inflation and other

\[195\] Aligns with IASA Chapter 14.
\[196\] Aligns with IASA Chapter 15.
Historically, U.S. GAAP formed the foundation of U.S. Statutory Accounting Principles (SAP). From this foundation, U.S. SAP evolved over time (on a state by state basis), incorporating many modifications and exceptions to U.S. GAAP in the interest of establishing a more conservative accounting framework with a focus on solvency. In the 1990s, the National Association of Insurance Commissioners (NAIC) undertook a project (Codification) to consolidate the myriad state-based rules and exceptions to U.S. GAAP into a cohesive set of accounting principles. included in the NAIC Accounting Practices and Procedures Manual. SAP still remains the prerogative of each individual state; however, Codification provides a consistent and comprehensive framework of accounting and reporting guidance for each state insurance department to consider. As new pronouncements are made under U.S. GAAP, they are reviewed by the NAIC’s Statutory Accounting Principles Working Group, which decides whether to adopt, reject or modify it for NAIC SAP. In turn, each state may accept what the NAIC has produced or adopt deviations or develop exceptions to the guidance that would apply to insurance entities domiciled in that state.

The fundamental difference between U.S. SAP and U.S. GAAP is driven by the intended user. U.S. SAP is intended for use by state insurance regulators and is thus focused on an insurance company’s ability to pay claims, emphasizing the adequacy of surplus in the balance sheet. This is generally viewed as conservative-leaning philosophy to provide an element of margin if the regulator would need one day to step in to settle all current liabilities while not writing any new business. U.S. GAAP is primarily intended for use by investors and creditors and has historically been focused on the measurement of earnings emergence, through the income statement, over a specified reporting period. Given the objective of U.S. SAP, it is not surprising that it is viewed as a conservative basis of accounting in comparison to U.S. GAAP.

There are many differences between U.S. GAAP and U.S. SAP, but we will focus on those that actuaries need to be familiar with:

- Deferred acquisition costs (DAC)
- Premium deficiency reserves (PDR)
- Nonadmitted assets
- Deferred tax assets (DTAs)
- Invested assets
- Balance sheet presentation of reinsurance
- Ceded reinsurance — prospective and retroactive
- Structured settlements

---

Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S.

- Anticipated subrogation and salvage
- Discounting of loss reserves
- Goodwill under purchase accounting

DEFERRED ACQUISITION COSTS

DAC is an asset that is established under GAAP to defer the recognition of acquisition expenses to match the recognition of earned premium. Beginning in 2012, the deferral of acquisition costs is limited to those direct costs (i.e., those which would not have been incurred if the contract had not been entered into) related to the successful acquisition or renewal of a contract. In addition, certain direct marketing advertising costs can be deferred under very limited circumstances. All other expenses, either direct or indirect, must be expensed as incurred.

Certain companies are permitted to limit the capitalization (deferred expenditure) of DAC to those expenses they had been capitalizing prior to 2012 if they previously had not been capitalizing all expenses that met the definition of direct expenses related to the successful acquisition or renewal of insurance contracts. Capitalization of acquisition costs, through the establishment of a DAC asset, is not permitted under SAP. Therefore, all acquisition costs are expensed to current operations as incurred. This is keeping with the conservative philosophy of SAP.

Under SAP, if the ceding commission under a reinsurance agreement exceeds the anticipated acquisition cost of the business ceded, the ceding entity shall establish a liability, equal to the difference between the anticipated acquisition cost and the reinsurance commissions received, to be amortized over the effective period of the reinsurance agreement in proportion to the amount of coverage provided under the reinsurance contract. For example, when the commission rate of a company's direct business is 10% and the ceding commission rate charged for the business ceded is 20%, it is likely that after considering all other anticipated direct acquisition costs, the ceded commission is still higher than the direct acquisition cost of the business being ceded. While the recognition of a DAC asset is not permitted, and the corresponding direct acquisition costs should be expensed to current operations, in this example, a net liability must be recognized by the ceding entity, reported as a write-in liability item on the balance sheet rather than a gain to the current operations. This effectively defers the gain until such time as the premium is earned.
Under both GAAP and SAP, a PDR must be recognized with a charge to current operations when the unearned premium reserve (UPR) is insufficient to cover the anticipated losses, loss adjustment expenses, commissions and other acquisition costs, and maintenance costs associated with the unexpired exposure. When a company performs the premium deficiency analysis, insurance contracts should be grouped in a manner consistent with how policies are marketed, serviced and measured. A liability should be recognized for each policy grouping where a premium deficiency is indicated. Premium deficiency from one policy grouping cannot be offset by expected profits from any other grouping.

Under both GAAP and SAP, a company is allowed to include anticipated investment income in the premium deficiency analysis.

The major difference in the calculation of premium deficiency liability between GAAP and SAP is that under SAP, commissions and other acquisition costs should not be included to the extent that the related amounts have previously been expensed rather than established as an asset.

The table below, using three numerical examples, illustrates the difference in the calculation of premium deficiency liability between GAAP and SAP:

<table>

Balance Sheet Presentation of Deferred Acquisition Costs and Premium Deficiency Reserves

Under GAAP, DAC is established as an asset and is presented net of ceded DAC. If a PDR is calculated, it first lowers the recorded DAC asset; once the DAC asset is exhausted, a separate PDR liability should be established.

Under SAP, any premium deficiency is either included in the UPR balance or reported as a write-in liability item.

The table below illustrates the difference in the presentation of DAC and PDR between GAAP and SAP.
Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S.

NONADMITTED ASSETS

As discussed in Part III. SAP in the U.S.: Fundamental Aspects of the Annual Statement, SAP is focused on the ability of an insurance company to pay claims. To reflect that certain assets are not readily liquid, they are considered nonadmitted for purposes of determining the company’s statutory surplus. One such example is furniture, fixtures and equipment.

For other asset categories, matters are more complicated as they may be partly admitted and partly nonadmitted. One such asset category is DTAs.

DEFERRED TAX ASSETS

Under GAAP and SAP, deferred taxes are established for temporary differences in the accounting and tax treatment of all assets and liabilities. For example, discounting of loss reserves for tax purposes but not for accounting purposes leads to a deferred tax asset. This is because you pay tax based on income (revenue minus expenses) under the tax accounting basis. If liabilities incurred are discounted for tax purposes, this leads to higher income, which produces more tax for the taxing authorities. But the discount on incurred losses will unwind over time and create an expense that will reduce future taxable income. Some or all of this reduction to future taxable income is what is recorded as a DTA.

The primary difference between GAAP and SAP is in the treatment of DTAs. For GAAP, DTAs are fully recognized, and a valuation allowance is established if, based on the weight of evidence, it is more likely than not that the DTAs will not be realized. GAAP establishes a hierarchy of evidence to be considered. This is a subjective determination requiring management to use significant judgment. Under SAP, there is a strict admissibility test for all DTAs in addition to the establishment of a valuation allowance. This can lead to recognition of less DTAs in SAP basis financial statements. Since January 1, 2012, the admitted portion is calculated as the sum of the following three components: 198

---

198 This recent change is not reflected in the 2007 Feldblum taxation CAS Study Note.
1. Federal income taxes paid in prior years that can be recovered through loss carrybacks for existing temporary differences that reverse during a timeframe corresponding with IRS tax loss carryback provisions (not to exceed three years), including the amount established for tax loss contingencies related to those periods.

2. The amount of DTA expected to reverse during the forthcoming period (up to a maximum of three years), limited to a percentage of surplus. The period and percentage of surplus is determined based on the company’s ratio of total authorized capital (with some adjustments) to authorized control level (ACL) Risk-Based Capital (RBC). For example, the December 31 ratio is calculated based on the Authorized Control Level RBC for the current reporting period, which is in process of being filed with the company’s state of domicile. Different rules apply for non-RBC reporting entities such as mortgage guarantee insurers.

3. The amount of DTA after application of the first and second components that can be offset against existing DTLs. The character (i.e., ordinary vs capital) of the DTAs and DTLs must be taken into consideration. Ordinary DTAs can be admitted by offset with ordinary DTLs and/or capital DTLs; however, capital DTAs can only be admitted by offset with capital DTLs.

INVESTED ASSETS

Under SAP, investment-grade bonds and higher quality redeemable preferred stocks are held at cost or amortized cost while below-investment-grade bonds and lower quality redeemable preferred stocks are held at the lower of cost, amortized cost or fair value. All common stock and higher quality perpetual (i.e., non-redeemable) preferred stock are recorded at fair value. Lower quality non-redeemable preferred stock are held at the lower of cost or fair value. Changes in the carrying value of investments attributed to changes in fair value are recorded directly to surplus.

The accounting treatment of investment-grade bonds appears to be inconsistent with the conservative philosophy of SAP. In the case of increasing interest rates, the market value of older investment-grade bonds issued at a lower interest rate will decrease. Yet SAP allows for the asset to be carried at the higher amortized cost value. One possible explanation for this is that the difference is only temporary if the bond is held until maturity, as is typically done by most property/casualty insurers.

Effective December 31, 2017, SAP adopted a revised definition of bonds that identifies certain non-bond types of non-bond investments as SVO-identified investments that receive special statutory accounting treatment under the new guidance. These specifically identified investments shall be treated in the same way as those included in the revised definition of bonds.

199 Under the Federal Internal Revenue Code, for nonlife insurance entities, ordinary losses can be carried back two years, while capital losses can be carried back three years.
bonds. The new guidance also introduces the concept of systematic value for SVO-identified investments and allows a company to elect the use of a documented systematic approach to value its higher quality SVO-identified investments if certain conditions are met. SVO-identified investments for which the company has not made this election, or do not qualify for the use of systematic value, should be measured and reported at fair value. Net asset value (NAV) is allowed to be used as a practical expedient to fair value for these investments.

The table below summarizes the accounting treatment under SAP for investments in bonds, common stocks, preferred stocks and SVO-identified investments:

<table>

</table>

Under U.S. GAAP, financial instruments such as bonds and stocks are classified as Available-For-Sale (AFS), Held-To-Maturity (HTM) or trading securities. The acquiring entity classifies the financial instrument at the time of acquisition, and the appropriateness of the classification is reassessed at each reporting date. If a security is acquired with the intent of selling it within hours or days, the security is classified as trading. However, at acquisition an entity is not precluded from classifying a security as trading if it plans to hold it for a longer period. Trading securities include both debt and marketable equity securities. Trading securities are recorded at fair value with changes in fair value recorded in the income statement. Investments in debt securities are classified as HTM only if the reporting entity has the positive intent and ability to hold those securities to maturity. Equity securities cannot be classified as HTM because they do not have a stated maturity date. HTM debt securities are recorded at amortized cost. Investments in debt securities and equity securities that have readily determinable fair values not classified as either trading securities or HTM securities.

Per SSAP No. 26R, SVO-identified investments refer to certain Exchange Traded Funds and Bond Mutual Funds that shall be treated as if they were bonds under the new guidance. For these investments, net asset value (NAV) is allowed as a practical expedient to fair value. The use of a systematic value is an irrevocable election. SSAP No.26R is effective December 31, 2017, but these investments shall be reported at their systematic value, if elected, starting on January 1, 2018.
are classified as AFS securities. The AFS category is the default or residual security classification. AFS securities are recorded at fair value with changes in fair value reported in other comprehensive income (OCI), resulting in a direct change to the value of U.S. GAAP equity, rather than changes in their fair value flowing through the income statement. Most property/casualty companies’ financial instruments are classified and measured as AFS.

BALANCE SHEET PRESENTATION OF CEDED REINSURANCE

U.S. GAAP requires, due to limited rights to offset assets and liabilities, that liabilities be presented gross on the balance sheet with a separate asset for anticipated ceded reinsurance recoveries. SAP requires the balance sheet presentation of liabilities on page 3 of the Annual Statement to be presented net of ceded reinsurance. Schedule P provides additional detail on the gross liabilities.

Using the Fictitious Insurance Company as our example, we have created the table below illustrating how the balance sheet presentation differs between GAAP and SAP for the line items associated with ceded reinsurance. The table shows how the SAP-basis balances illustrated correspond to the specific line items on the annual statement of the Fictitious Insurance Company (see Appendix I).
The accounting for reinsurance depends on whether the reinsurance contract covers future or past insured events. The latter is called retroactive reinsurance and the former prospective reinsurance. The difference between SAP and U.S. GAAP for prospective reinsurance is limited to balance sheet presentation. Illustrated in Table 103 above.

Retroactive reinsurance, however, has a different measurement approach for SAP compared to U.S. GAAP. SAP requires that undiscounted ceded reserves be recorded as a negative write-in liability. This leaves Schedule P unchanged, i.e., gross of the retroactive reinsurance. Any gain to the ceding company (excess of the negative write-in liability over the consideration paid for the reinsurance) is treated as write-in gain in other income and restricted as special surplus until the actual paid reinsurance recovery is in excess of the consideration paid.
U.S. GAAP requires ceded reserves to be recorded as a reinsurance asset. Any gain is deferred, thereby resulting in no immediate income or surplus benefit. The deferred gain is amortized using the interest method if the timing of the payments under the reinsurance treaty are reasonably estimable. Otherwise the proportion of actual recoveries to total estimated recoveries (the recovery method) determines the amount of amortization.

STRUCTURED SETTLEMENTS

To settle certain liability claims, an insurance company may purchase an annuity from a life insurance company with the beneficiary being the original claimant. For the case where a full release is signed by the claimant upon agreement to settle for the future annuity payments, the GAAP and SAP treatments are the same. The purchase price of the annuity is recorded as a paid loss and the claim is closed.

In the situation where a full release is not provided to the insurance company by the claimant, the insurance company is still contingently liable. In this situation, U.S. GAAP treats the structured settlement like a reinsurance contract, thus retaining the loss reserve and establishing an equivalent reinsurance recoverable. The accounting under SAP is the same as for structured settlements where a release is obtained, but it requires that the insurance company disclose the amount of these contingent liabilities in the Notes to Financial Statements.

ANTICIPATED SALVAGE AND SUBROGATION

In Schedule P reserves can be stated either gross or net of anticipated salvage and subrogation. If the reserves are stated net, column 23 in Schedule P discloses the amount of anticipated salvage and subrogation. This election appears to be a residual effect of pre-codification standards where certain states required reserves to be stated gross of anticipated salvage and subrogation.

Under U.S. GAAP, estimated realizable salvage and subrogation is subtracted from the unpaid loss estimates.

DISCOUNTING OF LOSS RESERVES

Statement of Statutory Accounting Principles (SSAP) 65 indicates that except for certain workers compensation and long-term disability claims with fixed and reasonably determinable payments, property/casualty loss reserves cannot be discounted. For those reserves that are tabular based, SSAP 65 is silent on the permitted discount rate. Most state regulations are also silent, but typically 3.5%per annum is used. For non-tabular reserves SSAP 65 recommends that the discount rate should be determined in accordance with Actuarial Standard of Practice 20, but capped at the lesser of:
Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S.

1. If the company’s statutory invested assets are at least equal to the total of all policyholder reserves, the company’s net rate of return on statutory invested assets minus 1.5%; otherwise, the company’s average net portfolio yield rate minus 1.5%

2. The current yield to maturity on a U.S. Treasury debt instrument with a duration that is consistent to the payment of the claims

For U.S. GAAP, ASC 944-40-S30-1 refers to an SEC staff bulletin that indicates it is permissible to apply the same discount calculated under SAP for U.S. GAAP purposes. It also indicates that an alternative discount rate could be used as long as the alternative rate “is reasonable on the facts and circumstances applicable to the registrant at the time the claims are settled.” This SEC staff bulletin was prepared in response to an inquiry from a registrant asking if it was permissible to discount for U.S. GAAP purposes based on the company’s historical investment yield.

GOODWILL UNDER PURCHASE ACCOUNTING

Under SAP, a business combination is accounted for as either a statutory purchase or a statutory merger. Business combinations that create parent-subsidiary relationships are accounted for as a statutory purchase. Alternatively, transactions are accounted for as a statutory merger if equity of one entity is issued in exchange for equity of the second entity, with the equity in the second entity then canceled. Prospectively, only one entity exists. Under statutory purchase accounting, the assets and liabilities of the acquired entity are recorded at their historical carrying (i.e., book) values. Goodwill is calculated as the difference between the purchase price and the net book value of the acquired entity. Goodwill is limited in the aggregate to 10% of the acquiring entity’s capital and surplus (adjusted to exclude any net positive goodwill, electronic data processing equipment and operating system software, and net DTAs) for its most recently filed Annual Statement. Goodwill is amortized to unrealized capital gains and losses over the period in which the acquiring entity benefits economically, not to exceed 10 years.

Under U.S. GAAP, all business combinations are accounted for using purchase accounting, which requires all assets and liabilities of the acquired entity to be recorded at fair value (including all identifiable intangible assets). Goodwill represents the difference between the purchase price and the fair value of the net assets of the acquired entity. Goodwill is not amortized but is evaluated for possible impairment on a regular basis.

For example, Company XYZ acquired Company ABC (an insurance entity) on January 1, 2018. We assumed that the purchase price of Company ABC was $3 million, the fair value of Company ABC’s net assets was $2 million, and the statutory surplus amount of Company ABC was $1.5 million. On January 1, 2018, we calculated that under SAP the goodwill recorded should be $1.5 million, the difference between the purchase price and the statutory surplus of Company ABC, and that under GAAP the goodwill recorded should be $1 million, the
difference between the purchase price and the fair value of the net assets. On December 31, 2018, we calculated that under SAP the goodwill recorded should be reduced to $1.35 million after amortization (assuming the goodwill should be amortized over 10 years) and that under GAAP the goodwill recorded should remain at $1 million as no impairment was identified.

In the case of a negative goodwill, under SAP, it should be recorded as a contra-asset and be amortized to unrealized capital gains and losses over a period not to exceed 10 years; under GAAP, the negative goodwill should first offset the book value of the acquired non-current assets (plant, property, equipment, intangibles, and other non-current and non-monetary assets) and the residual negative goodwill recorded as a bargain purchase gain through the income statement.

Due to these different approaches in calculating goodwill, the initial amounts of goodwill under SAP and GAAP can be significantly different. Chapter 23. Fair Value Under Purchase GAAP will discuss further the concept of fair value in business combinations.

SEC REPORTING

Companies with publicly traded securities are required to file quarterly (Form 10-Q) and annual (Form 10-K) financial reports with the SEC. In addition, companies are required to file a Form 8-K on an ad hoc basis for material events as they occur. The triggering events requiring the filing of an 8-K include a change in the principal officers or directors of the company, a change in the company's certified accountant, and entering or terminating a material definitive agreement.

These filings provide investors with quantitative and qualitative information about a company's business and operations, allowing investors to make informed and timely decisions. The key contents by section of a 10-K include:

- Part I — Business description, risks factors, unresolved comments from SEC staff, properties, and legal proceedings
- Part II — Financial statements and supplementary data, selected financial data, management's discussion and analysis of financial condition and results of operations, and controls and procedures
- Part III — Directors and executive officers of the company, executive compensation, securities ownership by certain beneficial owners and management, certain relationships and related transactions, and the fees of the principal accountant
- Part IV — Reports, exhibits and schedules from 8-Ks filed during the reporting period.

The 10-Q is an abbreviated form of the 10-K.

SEC reporting requirements for all registrants are mainly outlined in two regulations.
1. Regulation S-X — Form and Content of Financial Statements
2. Regulation S-K — Integrated Disclosure Rules

Regulation S-X contains general instructions to all companies around the composition and presentation of financial statements. Specifically, article seven provides detailed rules around the form and content of financial statement data and schedules of insurance companies. Many of these requirements are also required under GAAP. In particular, article seven requires the insurance company to state in the Notes to Financial Statements the:

- Basis of assumptions, including interest rates, for determining discounted liabilities
- Deferred acquisition costs amortized in the period
- Statutory stockholders equity and net income or loss

In addition, Regulation S-X requires certain schedules to be included in each registrant’s 10-K form (their annual filing). These schedules include:

- Schedule III — Supplementary insurance information for each reporting segment, of which the following is required to be reported:
  - Deferred policy acquisition costs
  - Unpaid loss and loss expenses
  - Unearned premiums
  - Other policy claims payable
  - Premium revenue
  - Net investment income
  - Losses and loss expenses
  - Amortization of deferred policy acquisition costs
  - Other operating expenses
  - Premiums written
- Schedule IV — Reinsurance including amounts ceded and assumed
- Schedule VI — Supplemental information concerning property/casualty insurance operations that includes the same information as Schedule III in total across fiscal years for the current fiscal year and the two years prior

Following are examples of Schedules III (Table 104), IV (Table 105) and VI (Table 106) from a 2018 10-K filing for a company we are calling “Fictional Insurance Company”.

(2) Credited to the related asset account.
Regulation S-K contains the requirements for the nonfinancial statement portions of the 10-K filing. In conjunction with the Securities Act Industry Guides, Guide 6: Disclosures Concerning Unpaid Claims and Claim Adjustment Expenses of Property-Casualty Insurance Underwriters, the following items are required to be disclosed:

- A tabular analysis of changes in aggregate reserves for unpaid claims and claim adjustment expenses for each of the latest three one-year periods
- Method for estimating the effects of inflation, implicitly or explicitly
- A reconciliation between statutory and GAAP reserves for unpaid claims and claim adjustment expenses, including an explanation of the key differences
- The amount of discount embedded in the GAAP reserves for unpaid claims, including the pre-tax income effect of discount accrued and of discount amortized

The following in an example of the tabular analysis of changes in aggregate reserves.

Table 107 shows for each of the last three years the beginning reserve from the prior year-end, the provision for reserve development in the calendar year (ultimate incurred losses from accidents occurring in the current year plus change in ultimate incurred losses on accidents from prior fiscal periods), paid losses and the ending reserve. The beginning reserve plus the provision for reserve development minus paid losses equals the ending reserve. If the company makes an acquisition, this would be reflected in the beginning reserve balance.

Accounting Standards Update (ASU) 2015-09

In the early 2010s, the FASB explored a joint project with the International Accounting Standards Board (IASB) to update insurance accounting. Due to a lack of agreement between the Boards, the FASB decided instead to make targeted improvements to the current accounting under U.S. GAAP. Meanwhile the IASB went on to developing IFRS 17 (See Chapter 24).
The FASB initially proposed that short duration contract liabilities be discounted, to allow investors the ability to understand the present value of the liabilities, but with no adjustment for risk. Insurance companies and the analyst community provided feedback indicating that any discount would immediately be unwound by analysts, to be replaced with what they believe is the appropriate amount of discount. Instead the analysts requested additional disclosures be developed to allow them more insight to develop their own discount and to judge management’s ability to establish the appropriate reserve estimates over time.

The resulting guidance that was issued in ASU 2015-09 added several new disclosures to U.S. GAAP financial statements for short duration insurance contracts. The key elements of ASU 2015-09 are as follows:

- The reserve roll-forward table required annually by the SEC (see Table 107) was codified into U.S. GAAP and required quarterly for all U.S. GAAP financial statements rather than just annually for SEC public filers.
- Accident year triangles of paid and ultimate loss and ALAE for up to 10 years on a net of reinsurance basis. These triangles were required to be reconciled in another schedule to the carried reserves.
- Current reported claim frequencies and current net loss and ALAE IBNR by accident year on the same level of aggregation as the triangles.
- A description of the methodologies used to estimate the loss and ALAE IBNR.
- The average annual payout of ultimate incurred claims based on the paid triangles and current ultimate incurred loss and ALAE.
- In the aggregate, a description of any significant changes in the methodology used to estimate the IBNR or the reported claim frequencies.

These additional disclosures were required to be presented at a level such that “useful information is not obscured by either the inclusion of a large amount of insignificant detail or the aggregation of items that have significantly different characteristics.” The exceptions to this requirement were the quarterly roll-forwards and the description of significant changes in methodology, both of which are only required in the aggregate.

While there are similarities to the triangles in Schedule P for some of these disclosures, there are also important differences. Some of these differences include:

- These U.S. GAAP triangles require ALAE, not DCC. For example, this can drive significant differences if claims are handled by external adjustors, whose costs would fall under ALAE for U.S. GAAP as long as they can be allocated to a specific claim, but A&O expense for SAP.
Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S.

- The level of disclosure for the U.S. GAAP triangles is principle based, while SAP has defined lines of business.
- Schedule P, even when presented for a group, only contains business written through U.S. entities for an insurance group. The U.S. GAAP disclosures may require business written globally, which can lead to significant foreign currency exchange issues.
- Under U.S. GAAP, the IBNR and reported claim frequency are as of the financial reporting date, and not in triangle form. The former limits the ability for a user of the financial statements to obtain and use case incurred data. The latter, while meant to help the user understand the severities in the underlying business, ignores that incurred amounts for reported claims tend to develop after being reported and claims reported later tend to have higher severities. Therefore, care must be taken by users in interpreting these disclosures.

The American Academy of Actuaries published a white paper on the considerations in implementing ASU 2015-09 in December 2016. In developing the white paper, the authors consulted with the AICPA’s insurance expert panel and the SEC. Therefore, the reader is urged to read the white paper for further information.

CHAPTER 23. FAIR VALUE UNDER PURCHASE GAAP

When an entity agrees to buy another entity, under U.S. Generally Accepted Accounting Principles (GAAP) the purchaser is required to state at fair value the assets and liabilities of the purchased entity. This accounting for business combinations is often referred to as Purchase GAAP (P-GAAP). As part of the P-GAAP process, certain intangible assets are included that would not typically be recognized and measured under U.S. GAAP. After the fair value of the assets and liabilities is determined, the implied capital (fair value assets minus fair value liabilities) is compared to the purchase price. If the implied capital is less than the purchase price of the purchased entity, the difference is defined to be goodwill and an asset equivalent to that amount is established. If the implied capital is greater than the purchase price of the purchased entity, the difference is immediately recognized as an operating gain into income.

As actuaries we may become involved in the estimation of certain balance sheet items on a fair value basis. In particular we may be asked to estimate the fair value of loss and LAE reserves and to estimate the value of business in-force (VBIF).

FAIR VALUE OF LOSS AND LAE RESERVES

Fair value under U.S. GAAP is defined in Accounting Standards Codification (ASC) 820-10-05 as “the price at which an orderly transaction to sell the asset or to transfer the liability would take place between market participants at the measurement date under current market conditions.” Such a value could be obtained by a market quote if there were a deep and liquid market for insurance liabilities. As there is no such market, the approach is “mark-to-model,” which entails determining the market value through an estimation process rather than using an observable market price. Recent actuarial literature supports an approach to estimating fair value of insurance liabilities based on three components. These components are:

1. The expected value of the nominal future cash flows related to liabilities incurred, for loss and LAE, as of the date of the transaction.
2. The reduction in those cash flows for the time value of money at a risk-free rate plus an element for the illiquid nature of the liabilities. This discount rate is meant to reflect the characteristics of the underlying liabilities.
3. A risk adjustment to compensate an investor for bearing the risk associated with the liabilities. This is meant to reflect the expected net present value of profit that an investor would demand in return for the risk inherent within the liabilities.

We will separately consider each in our example below, basing the expected value of the cash flows on what we deem to be a reasonable estimate of unpaid claims as of the sale date and the associated future payout pattern (first component), and the current risk-free rate matched to the duration of those liabilities plus an adjustment for illiquidity (second
component). For the third component of fair value, the risk adjustment, we use what is commonly referred to as the “cost of capital approach.” This approach estimates the amount of capital required to support the reserves at each future evaluation date. The required return on a pretax basis in excess of the risk-free rate plus illiquidity adjustment is applied to this amount to calculate the value of the excess return expected by the investor in that future period. These values are in turn discounted to present value. The sum of the present value of excess returns from each future period is considered the risk margin.

The first component, expected nominal cash flows, can be derived from the current recorded reserve if management’s best estimate is indeed an expected value that has no obvious inherent bias. There are two common ways to establish the cash flows by line of business from the nominal reserves. The first is to use the payout pattern based on the loss reserve development that the actuary would have selected in the course of his or her review of the reasonableness of management’s recorded reserve. The second approach is to utilize the implied pattern based on the ratios of paid loss to ultimate loss by accident year. This latter approach may require more smoothing depending on the methods used in selecting ultimate losses and the stability, yet decreasing values, of incurred but not reported (IBNR) to case reserve ratios.

The second component is the amount of discount. Once the cash flows are estimated, the discounting calculation is fairly straightforward provided the rate is given. Given the third component is an explicit risk margin, the interest rate should reflect only the characteristics of the liability not related to the underlying risk in the outcomes for the purchasing entity. This is effectively the risk-free rate plus an element for the illiquidity of the liability, typically less than 100 basis points.

The risk-free rates are typically observed by referencing the U.S. Treasury Daily Yield Curve for the evaluation date of study, for liabilities settled in U.S. dollars. The liquidity/illiquidity premium (the terms “liquidity” and “illiquidity” are used interchangeably) is not readily available or typically understood. The need for an illiquidity premium is much easier to initially comprehend when considered from an asset perspective. Two assets with identical expected cash flows and no difference in the risk associated with those cash flows would be expected to be valued the same. But what if one was publicly listed and readily tradable, while the other is privately held? In this situation the ability to readily trade the asset would result in a lower discount rate being applied to the tradable asset’s future cash flows than that of the privately held asset. The difference in the discount rates is the illiquidity premium for the privately held asset.

From a liability perspective, many find it hard to fathom why a liability that is less liquid should be lower in value than a liability that is liquid. It is easier to understand by considering the asset transferred to support the liability by the seller. The less liquid the liability is, the greater the opportunity for the purchaser of the liability to utilize the asset for their own gain.
until the liability comes due. This opportunity cost results in a greater discount for the seller of the liability, i.e., a higher discount rate. How to derive the illiquidity premium is an active debate at the time of writing and beyond the scope of this study material.

The third and final component of the fair value of the loss reserves is the risk adjustment. The most logical approach to calculating a risk adjustment for an estimate that is meant to represent a market-based valuation is a cost of capital. The cost of capital approach is simply the present value of the future returns on capital that an investor would require for bearing the risk in the expected cash flows. The basic formula for the risk adjustment is:

\[
\text{Risk adjustment} = \left( R - i \right) \sum_{t=0}^{\infty} \frac{C_{t \rightarrow t+1}}{(1 + i)^{t+1}}
\]

Where:

- \( R \) = pretax required return on capital by the capital provider
- \( i \) = risk-free rate of return plus an illiquidity premium
- \( t \) = time
- \( C_{t \rightarrow t+1} \) = average capital carried over time \( t \) and \( t+1 \) to support the liability

The pretax required return can be approximated from the post-tax weighted average cost of capital that is typically produced by valuation experts performing the P-GAAP work on other intangible assets. The capital at any time \( t \) could be derived from using a suitable benchmark of the required capital for a hypothetical market participant based on Risk-Based Capital, S&P’s capital model or Best’s Capital Adequacy Ratio model.

As an example, we shall calculate the fair value of the loss and loss adjustment expense (LAE) reserves for the homeowners/farmowners line of business from Fictitious’ Annual Statement. In performing the calculation, we have assumed the following:

- The recorded reserve of $1.457 million is a mean estimate of the expected future cash flows, i.e., no margin is present in management’s best estimate.
- The appropriate payout pattern of the loss reserves, with some slight smoothing, can be derived from the ultimates in each accident year divided by the paid losses in each accident year\(^{201}\).
- The discount rates are the U.S. Treasury yield curve as of the valuation date plus an adjustment of 35 basis points for the illiquidity premium.
- The payments are made halfway through each future period.

\(^{201}\) Note the term “payout pattern” is used interchangeably by actuaries as either the ratio of paid losses to ultimate loss (“percent paid”) or the ratio of ultimate loss to paid loss (which is equivalent to a paid age-to-ultimate factor).
The required capital ratio is 20.1% of the unpaid claim estimates in each future period and is applied to the average amount outstanding over the period to estimate the required capital.

The cost of capital is 10%, which is reduced by the discount rate associated with the average duration of capital to derive the risk cost of capital of 9.7% (R-i) in the above formula.

The return on capital is paid at the end of each future period.

</table>

The resulting fair value for this line of business differs only slightly from the recorded reserve and is likely within the bounds of the level of accuracy for determining a reasonable reserve estimate. However, this is due to several factors, some of which are offsetting. The discount is minimal in this case due to the relatively short payout pattern of the line of business and the low level of interest rates on U.S. treasuries as of December 31, 2018.

The shorter payout pattern also affects how long you need to hold the capital. The less time the capital is held, the lower the future capital charges that can accumulate. In addition, in this case the line of business is not one that is associated with a large degree of reserve variability. Therefore, the required capital ratio is fairly small, which decreases the absolute return that a third party would demand to acquire the liability. Finally, working in the opposite
direction, there is the effect of discount rates on the risk margin. The low discount rates effectively increase the risk margin as the present value of the future returns on capital is higher.

In this example, you can see that the fair value of a liability can be affected by many moving pieces that can require an actuary to dig into the calculation to be able to explain differences between lines of business or between evaluation dates.

Not all believe that cost of capital is the right approach to producing a risk adjustment. Australian Prudential Regulation Authority requires reserves to be recorded at or about the 75th percentile of the discounted distribution of outcomes. In Canada, property/casualty actuaries judgmentally select the risk adjustment for loss reserves as a percentage value up to 20%. In addition, one could use a tail value at risk (T-VaR) approach. While the cost of capital can be calibrated to the pre-tax return investors require and the amounts of capital typically held for a risk, these other methods lack any calibration to the market. This makes it difficult to assert that the assumption of a certain confidence level, T-VaR or percentage load is required by a market participant in an arm’s-length transaction.

VALUE OF IN-FORCE

Under P-GAAP, the fair value of deferred acquisition costs (DAC) is zero, given its lack of ability to generate future cashflows. In its place an asset is established based on the VBIF. This is not, as some companies assume, equivalent to the DAC asset. The VBIF is affected by the relationship of discount to risk adjustment on the liabilities expected to be incurred in connection with the unearned premium reserves, the amount of acquisition costs that were covered by the premium but previously expensed, and the estimated profitability of the unearned premium reserves. A shortcut technique to calculating the VBIF is to state at fair value the liabilities expected to be incurred in connection with the unearned premium reserves and subtract them from the unearned premium to obtain the implied VBIF. The steps to obtain a fair value of these liabilities are identical to those in obtaining the fair value of the loss reserves but with some additional steps. The expected and unbiased loss ratio is required to estimate the nominal expected liabilities from the unearned premium, and the cash flows in the first year should include an amount for policy maintenance costs. Consideration should also be given to the additional risk, event risk, present during the coverage period which can be reflected with a higher capital charge during that period if using a cost of capital approach to estimate a risk adjustment.
CHAPTER 24. INTERNATIONAL FINANCIAL REPORTING STANDARDS

International Financial Reporting Standards (IFRS) is a single set of global financial reporting standards issued by the International Accounting Standards Board (IASB). It was developed in the public interest as a high-quality set of general purpose standards that will provide users across borders and industries with transparent and comparable information. That is, they provide the world’s integrated capital markets with a common language for financial reporting.

Most of the world’s major economies permit or require the use of IFRS. The European Union, Canada, Hong Kong, and Australia are among the economies that use IFRS. At the time of writing, the Securities and Exchange Commission (SEC) in the U.S. does not allow domestic issuers of financial statements the ability to file using IFRS rather than U.S. Generally Accepted Accounting Principles (GAAP), but it currently permits foreign issuers to do so without reconciliation to U.S. GAAP.

In 2005, the IASB realized it was unable to issue a new standard for insurance contracts before IFRS was due to be implemented in the European Union. Consequently, under time constraints, the IASB issued an interim standard known as IFRS 4. IFRS 4 allowed entities to use a wide variety of accounting practices for insurance contracts, reflecting national accounting requirements and variations within the respective requirements. For instance, companies were allowed to continue to use their local GAAP but with minimum rules around that practice. However, the standard did not adequately reflect the true underlying financial position or performance of the insurance contracts as the contracts:

- Are accounted for differently across jurisdictions as national accounting requirements were allowed to be adopted;
- Often cover difficult-to-measure long term and complex risks, with uncertain outcomes;
- Are not typically traded in the market;
- May include a significant investment or deposit component – the amount that the insurer is liable to pay the policyholder regardless of whether the insured event occurs.

To address the issues above, in May 2017, the IASB issued IFRS 17 which was initially set to be effective on or after January 1, 2021, superseding IFRS 4. However, in 2018, the IASB voted to defer its effective date to January 1, 2022.

IFRS 17 establishes principles for the recognition, measurement, presentation and disclosure of insurance contracts. The objective is to:

a) Improve comparability between insurers
FINANCIAL REPORTING THROUGH THE LENS OF A PROPERTY/CASUALTY ACTUARY

Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S.

- Harmonization of insurance practices across jurisdictions
- New accounting framework to replace the various accounting treatments

b) Improve quality of financial information
- Inclusion of useful information in the financial statements
- Increase transparency on insurers' profitability.

SCOPE

IFRS 17 applies to contracts that are insurance contracts issued, reinsurance contracts held, and investment contracts with discretionary participation features. Similar to IFRS 4, it does not apply to insurance contracts in which the company is the policyholder, with the exception that the contracts are reinsurance contracts.

The new standard retains the IFRS 4 definition of an insurance and reinsurance contract, which is “a contract under which one party (the insurer) accepts significant insurance risk from another party (the policyholder) by agreeing to compensate the policyholder if a specified uncertain future event (the insured event) adversely affects the policyholder.”

LEVEL OF AGGREGATION

IFRS 17 provides a consistent framework for accounting for all insurance contracts issued. A company applies the requirements of IFRS 17 to a group of insurance contracts rather than on a contract-by-contract basis. In grouping insurance contracts, a company is required to identify portfolios of contracts and divide each portfolio into:

a) A group of contracts that are onerous at initial recognition;

b) A group of contracts, at initial recognition, that have no significant possibility of becoming onerous subsequently; and

c) A group of remaining contracts

Contracts issued more than one year apart can’t be grouped into the same group.

MEASUREMENT MODEL

The standard introduced a new measurement model referred to as the General Model with the measurement objective of fulfillment value for insurance contracts. Two variants of the General Model were also defined by the standard, the Premium Allocation Approach (“PAA”) and the Variable Fee Approach (“VFA”).
General Model

The General Model is the default model in IFRS 17. Under this model, insurance contracts are to be reported on the balance sheet as the total of:

a) Fulfillment cash flows – the current estimate of amounts that the insurer expects to collect from premiums and pay out for claims, benefits and expenses, including an adjustment for the timing and risk of those cash flows; and

b) Contractual service margin ("CSM") – the expected profit for providing future insurance coverage (i.e., unearned profit).

The fulfillment cash flows consist of the present value of future cash flows and a provision for risk adjustment. The risk adjustment component represents compensation that an insurer requires for bearing the uncertainty about the amount and timing of the cash flows that arise as it fulfills the insurance contract.

Upon initial recognition, the CSM is defined as the net difference between the fulfillment cash inflows and outflows, floored by zero. The CSM cannot be negative. If it is negative upon inception, the expected losses are to be recognized in the income statement immediately. The purpose of recognizing a positive initial CSM is to report expected profitability arising from the contract over time, reflecting the service to be provided.

The standard requires companies to update the fulfillment cash flows at each reporting date, using current estimates that are consistent with relevant market information. For instance, companies are to use current discount rates to measure insurance contracts. Using current discount rates, as opposed to historical rates (i.e., discount rates during contract inception) or a mix of rates, will reflect the characteristics of the cash flows arising from the insurance contract liabilities in a consistent manner across all companies. As such, changes in insurance obligations due to economic factors, i.e., interest rates, will be reflected in the financial statements in a timely way.

Premium allocation approach

The PAA is a simplification of the General Model. It is an option that insurers can elect to implement if the model is expected to produce results that would not differ materially from the General Model and if it doesn’t contain any complex features. There is a safe harbor for contracts that have a coverage period of twelve months or less. Other contracts can be tested to allow them to use the PAA over the General Model.

The PAA splits the measurement of groups of insurance contracts into two pieces where needed, the liability for remaining coverage and the liability for incurred claims. The liability
for remaining coverage is approximately equal to the unearned premium less any premium receivable and deferred acquisition costs.

The liability for incurred claims is measured using the fulfilment cashflows from the General Model. No CSM is required for this portion of the liability as the coverage from the contract has expired for this portion of the liability.

Variable Fee Approach

The VFA is based on the General Model but with additional features to account for contracts with direct participating features.

Overall, IFRS 17 and its basis for conclusions published by the IASB total 240 pages. It covers in-depth topics such as what is considered an insurance contract and therefore needs to be accounted for under the standard, the boundaries of such contracts, more specifics around the building blocks (fulfilment cashflows and CSM), the option to lock-in discount rates to avoid income statement volatility from mismatched accounting of assets, recognition of revenue, and required disclosures.

At the time of writing of this text, significant amounts of accounting and actuarial literature have been published on how to implement this complex standard. No doubt much more will be written in the coming years as the implementation date is reached. Those interested in reading more should first look to International Actuarial Note 100 that will be published by the International Actuarial Association during 2020.
CHAPTER 25. SOLVENCY II

Solvency II is a principle-based insurance regulatory system governing how insurance companies are funded in the European Union. It links the required capital of insurance companies to their risk profile.

Solvency II came into effect on January 1, 2016. The new system is based on three pillars similar to those of Basel II. Those pillars are quantification, governance, and transparency.

PILLAR I — QUANTITATIVE CAPITAL REQUIREMENTS

Pillar I is focused on the quantitative aspect of Solvency II to obtain the solvency capital requirement (SCR) and minimum capital requirement (MCR). It also harmonized standards for the valuation of assets and liabilities. The measurement approach is summarized in the following diagram and is often referred to as the total balance sheet approach.
On the asset side of the balance sheet, non-insurance assets are recorded using the measurement approach under International Financial Reporting Standards (IFRS). Reinsurance assets are measured in the same way as insurance liabilities. On the liability side of the balance sheet, the technical provisions consist of the discounted best estimate of the liabilities and their associated risk margin. These are meant to represent the fair market value of the insurance liabilities, and although principles based, the approach to calculating them is fairly prescriptive. The best estimate of the liabilities is the expected value of the cash flows discounted using a risk-free rate; adjustments such as matching adjustment for illiquidity are available for long term liabilities. The risk-free discount rates are published by the European regulator on a monthly basis. The risk margin is calculated using a cost of capital method with the cost of capital above the risk-free rate (R-i from Chapter 23) equal to 6%.

Under Pillar 1 there are two capital requirements defined which are the Solvency Capital Requirement (SCR) and the Minimum Capital Requirement (MCR). The SCR and MCR are capital requirements that must be held in addition to the best estimate liabilities. SCR is the capital that should be held to ensure that the insurance company can meet its obligations to policyholders and beneficiaries with certain probability and should be set to a confidence level of 99.5% over a 12-month period i.e., a one-year 99.5% Value at Risk (VaR). A company whose capital falls below the SCR will be subject to regulatory intervention. If it falls even
FURTHER below the MCR, the company will lose its license and will not be permitted to operate. Critics have noted that the one-year 99.5% VaR is not an adequate measure for bearing the risk to ultimate settlement. Solvency II requires consideration of recapitalization based on adverse development in each future annual period, yet doesn’t assume you need to hold sufficient capital from inception to settlement without raising capital. Therefore, critics of Solvency II believe using one-year 99.5% VaR as the capital standard in the risk margin calculation does not provide a true fair market value.

The SCR can be calculated using the standard model, an approved internal model or a mix of both. To obtain approval for an internal model, the company has to demonstrate that the model is used in running the business, has been validated by an independent third party and is documented appropriately. The benefits of using an internal model are a model which is more appropriately tailored to the risk profile of the insurance company and the likely outcome of a lower SCR.

Any remaining amount between the assets minus the technical provisions and SCR is considered free surplus.

PILLAR II — SUPERVISORY ACTIVITIES

Pillar II provides insurance supervisors with the tools required to identify high-risk companies and the power to intervene. First, this pillar requires companies to have the governance structure in place to address the following key areas:
The functional areas, while each satisfying the conditions, should be allocated responsibility in a manner that avoids duplication. Each one is viewed as essential for an insurance business to operate effectively. Key responsibilities of each function include:

- **Internal audit**: Produce a report at least annually to the board of directors on any deficiencies of the internal controls and any shortcomings in compliance with internal policies and procedures. This function should have unrestricted access to information and staff.
- **Actuarial**: Ensure the reasonability of methods and assumptions used in calculating the technical provisions and providing a look-back analysis of best estimates against experience. Also, provide opinions on the overall underwriting policy and adequacy of reinsurance arrangements.
- **Risk management**: Monitoring the risk management function and maintaining an aggregated view. Ensure the integration of any internal model with the risk management function.
- **Compliance**: Ensure the internal control system is effective to comply with all applicable laws and regulation, promptly reporting any major compliance issues to the board of directors.

Pillar II also requires that companies complete an own risk self-assessment (ORSA). The ORSA has been defined by the European Insurance and Occupational Pensions Authority (EIOPA) as: “The entirety of the processes and procedures employed to identify, assess, monitor, manage, and report the short- and long-term risks a (re) insurance undertaking faces or may face and to determine the own funds necessary to ensure that the undertaking’s overall solvency needs are met at all times.”

An ORSA should contain at a minimum the following:

- The overall solvency needs, taking into account the specific risk profile, approved risk tolerance limits and the business strategy of the undertaking
- The compliance with the capital requirements and the requirements regarding technical provisions
- The extent to which the risk profile of the undertaking deviates significantly from the assumptions underlying the SCR, calculated with the standard formula or with its partial or full internal model

The ORSA results will periodically be reported to the supervisor who will use the results as input for their risk-based supervision and actions. The ORSA will also be the basis for the dialogue between the insurer and the supervisor regarding important decisions made by the insurer.
In the case of significant deviations from the risk profile, the ORSA will be the starting point of the supervisor’s process that could lead to a capital add-on (i.e., an increase in the SCR).

PILLAR III — TRANSPARENCY

Pillar III represents the disclosure and reporting of information about a company’s capital and regulatory position collected from Pillars I and II to the supervisors and the financial markets. Some items will be reported quarterly and others annually. The purpose of public disclosure of a company’s financial and solvency position is to increase market discipline because companies are aware that their risk-based decisions will be in the public and supervisory domains.

COMPARISON TO THE U.S. SOLVENCY REGIME

Solvency II was developed as a group wide solvency regime. The U.S. regime, being state-based, is focused on the regulation of individual statutory entities with capital “walled” off from other entities in the group. However, pressure stemming from the financial crisis in 2008 combined with closer coordination between international insurance regulators led to the NAIC’s Solvency Modernization Initiative (“SMI”).

The SMI developed a “Windows and Walls” approach, giving windows for state insurance regulators to look into group wide operations and the effect those operations might have on a statutory entity, while maintaining the walls at the statutory legal entity level. Those windows that developed out of the SMI were:

1. Communication between regulators – enhanced communications between the state insurance regulators within the group
2. Supervisory Colleges – formally incorporate supervisory colleges of international regulators into the NAIC review procedures
3. Access to and collection of information – enhanced access to upstream entities within a group structure including regulated and non-regulated entities
4. Enforcement measures – tools to protect policyholders if violations occur
5. Group capital assessments – group supervision requires a panoramic view of capital needs of the group to be effective
6. Accreditation – state insurance regulators involved in group supervision should be accredited through the NAIC

The regulatory tool developed to implement several of these windows was the U.S. Own Risk and Solvency Assessment (“ORSA”) requirement. The NAIC defines the ORSA as “an internal
assessment ... conducted by the insurer of the material and relevant risks identified by the insurer associated with an insurer’s current business plan and the sufficiency of capital resources to support those risks.”

The NAIC has stipulated two primary goals for the ORSA:

1. To foster an effective level of Enterprise Risk Management (ERM) at all insurance companies through which each insurance company identifies, assesses, monitors, prioritizes and reports on its material and relevant risks, using techniques that are appropriate to the nature, scale and complexity of the insurer’s risks, in a manner that is adequate to support risk and capital decisions

2. To provide a group-level perspective on risk and capital, as a supplement to the existing legal entity view

In order to meet these goals, an insurer that is a member of an insurance holding company system (as defined by state insurance law) and meets certain benchmarks for direct written and unaffiliated assumed premium is required to complete the ORSA process at least annually and create an ORSA Summary Report to be provided to its lead state commissioner and, upon request, to its domiciliary state commissioner. Additionally, the insurer must retain documentation and supporting risk management material to evidence the efficacy of its ORSA process, as these may be requested for review by the insurer’s state commissioner(s).

The ORSA process is intended to be just one element of an insurer’s overall ERM framework, in which the insurer assesses and summarizes the other elements of the framework, as well as linking these to the insurer’s overall organizational structure, business strategy and capital management/planning process. Accordingly, the NAIC expects that the depth and detail of the ORSA and the ORSA Summary Report should reflect the nature of the size and complexity of insurer and its ERM framework. To assist state commissioners in gaining a high-level understanding of an insurer’s ORSA, the NAIC has established three key areas that the ORSA Summary Report should cover:

Section 1: Description of the Insurer’s Risk Management Framework

This section provides a summary of the insurer’s ERM framework, covering how the insurer has integrated the following key principles into the organization: risk culture and governance; risk identification and prioritization process; risk appetite and tolerances/limits; risk management and controls; and risk reporting and communication. In summary, it brings together how the insurer identifies and categorizes its material risks and how it assesses, monitors and manages those risks against its established risk tolerances as it executes its business strategy.

Section 2: Insurer’s Assessment of Risk Exposure
This section provides a high-level summary of the current quantitative and/or qualitative assessments of the insurer’s risk exposure in both normal and stressed environments for each material risk category identified in Section 1. In addition to providing detailed descriptions and explanations of the risks identified by the insurer, the insurer describes the assessment methodology used and key assumptions made to evaluate the current risk level and how this compares to the relevant risk tolerances/limits for the risk under both normal and stressed conditions. For P&C insurers, relevant material risk categories typically include insurance risk (often divided into underwriting/premium risk, reserve risk and catastrophe risk), market risk, credit risk, liquidity risk, operational risk, and strategic risk.

Section 3: Group Assessment of Risk Capital and Prospective Solvency Assessment

This section provides a summary of the insurer’s process for assessing capital adequacy in relation to its risk profile and how this process is integrated into the insurer’s management and decision-making culture. For the Group Assessment of Risk Capital, the insurer describes its approach for assessing its group capital adequacy, including the basis of its definition of solvency, accounting/valuation basis, and the key methodologies, assumptions and considerations used in calculating available capital and risk capital required. For the Prospective Solvency Assessment, the insurer projects its future financial position, including its projected economic and regulatory capital to assess its ability to meet its internally defined risk appetite and its regulatory capital requirements based on the insurer’s multi-year (typically three to five years) business plan. The Prospective Solvency Assessment is also completed under both normal and stressed environments.

Further detail on the requirements for completing an ORSA process and the details that are expected to be covered within each section of an insurer’s ORSA Summary Report can be found in the NAIC’s Own Risk and Solvency Assessment (ORSA) Guidance Manual.

Depending on their role within an insurer, actuaries may become involved in the ORSA process in several ways.

Due to the significant role they play in establishing and executing the insurer’s ERM framework and policies, identifying and monitoring its key risks, and assisting senior leadership in overall risk and capital management, an actuary that serves as the insurer’s Chief Risk Officer and actuaries that are members of its ERM function typically have ownership of the overall drafting of the ORSA Summary Report, particularly where these elements are covered within Section 1. Additionally, actuaries within the ERM function are frequently involved with the estimation and monitoring of the insurer’s risk exposure in

relation to its risk tolerances for the material risks identified in Section 2, as well as the modelling of the group’s risk capital adequacy and prospective solvency assessment detailed in Section 3.

Actuaries working within an insurer’s pricing or reserving functions assist the ERM team in the risk identification and assessment/estimation process for the insurer’s material insurance risks and may contribute to drafting sections of the ORSA Summary Report related to their risk area.

The models utilized by the insurer to estimate its material risk exposures, group risk capital and prospective solvency position are typically validated by another qualified actuary that was not involved in their development, which sometimes results in the involvement of a third-party party actuarial consulting firm.

Finally, actuaries assisting in the regulatory examination and financial analysis review of an insurance company may review the ORSA Summary Report to better understand the material risks the insurer is facing, its current and projected capital adequacy, and the strength of the insurer’s risk management program.
Beyond the solvency and general-purpose financial reporting frameworks, taxation is another framework applicable to insurance companies. Taxation has many forms, including the direct taxation of the income of corporations. Generally, tax is imposed on net profits from business, net gains, and other income. The income subject to taxation is determined under accounting principles that are modified or replaced by tax law principles where a different basis is determined as necessary by the relevant taxing authorities. In the U.S., an insurance company is taxed based on its statutory income, but with adjustments provided by the Internal Revenue Code ("IRC") that will be described herein.

Understanding the impact of federal taxation is important for insurance contract pricing, insurance company valuation, capital models construction, and tax returns preparation. Additionally, when there are changes to the tax law, it is important to understand the changes that occurred and the potential impact. In 2017, the Tax Cuts and Jobs Act of 2017 ("TCJA"), which became effective beginning tax year 2018, changed key federal tax rules. The changes most significant to property/casualty insurance carriers were related to the corporate tax rate, the discounting rules, and the international tax system.

In this chapter, we will present a summary of how taxable income is derived for property/casualty insurance companies from their statutory accounts, including a review of the adjustment of loss reserves for discounting. We will also review the process for determining taxable income attributable to statutory underwriting income and to investment income. Statutory underwriting income consists of premium revenue (i.e., earned premiums) minus losses and expenses incurred.

**TAX BASIS EARNED PREMIUMS**

On a tax basis, earned premiums are adjusted for “revenue offset”. The need for the revenue offset stems from a lack of a deferred acquisition cost asset under statutory accounting. Assume that today a company wrote a policy effective January 1 of the following year for $100 but incurred $20 in acquisition costs. Under statutory accounting, the company would incur a $20 loss from establishing an unearned premium reserve of $100 and payment of $20 in acquisition costs. Rather than allowing property/casualty insurance companies to claim a tax credit on that “loss” under statutory accounting, the IRC has established a revenue offset convention, often referred to as the “20% haircut”. The revenue offset convention assumes that acquisition costs are 20% of net written premiums for all lines of property/casualty business and all types of insurers and requires that 20% of unearned premiums be currently included in earned premiums. In our example, the unearned premium reserve would be reduced by $20, resulting in the income effect from writing this contract as $0.
Statutory earned premium is calculated as net written premium minus the change in the unearned premium reserve. Under the revenue offset convention, tax basis earned premiums are net written premium minus 80% of the change in unearned premium reserves.

\[
\text{Tax Basis Earned Premium} = \text{Net Written Premium} - (0.8 \times \text{Change in Unearned Premium Reserve})
\]

This formula can be rearranged to provide:

\[
\text{Tax Basis Earned Premium} = \text{Statutory Earned Premium} + (0.2 \times \text{Change in Unearned Premium Reserve}).
\]

Where the change in Unearned Premium Reserve

\[
= \text{Unearned Premium Reserve at end of period} - \text{Unearned Premium Reserve at beginning of period}.
\]

TAX BASIS INCURRED LOSSES AND LOSS ADJUSTMENT EXPENSES

Statutory calendar-year incurred losses are paid losses plus the change in full value loss reserves:

\[
\text{Incurred losses} = \text{Paid losses} + \text{Change in full value loss reserves} = \text{Paid losses} + \text{Change in full value loss reserves} = \text{Paid losses} + \text{Change in full value loss reserves}.
\]

For long-tailed lines of business, without the time value of money considerations that are considered in the pricing of policies, the result may be an underwriting loss under this statutory definition of incurred losses. As we previously discussed, the IRC does not provide an insurance company with a tax credit for what appears to be a temporary loss when investment income can be made on the reserves held before the claims are paid. To avoid this, tax basis accounting is more aligned with economic reality by requiring the discounting of loss reserves, albeit with defined rules and the lack of a risk margin/adjustment.

Our next section will discuss the process of discounting for taxes in more detail. For now, it is sufficient to understand that:

\[
\text{Tax Basis Incurred Losses} = \text{Paid Losses} + \text{Change in Discounted Reserves} = \text{Statutory Incurred Losses} - \text{Change in Reserve Discount}.
\]
Loss adjustment expenses are treated in the IRC in the same manner as losses (i.e., estimated loss adjustment expense is subject to discounting). Other kinds of expense liabilities are addressed in a different paragraph in the IRC and may be subject to a different timing requirement.

INVESTMENT INCOME
Taxable investment income consists of income from bonds, mortgages, real estate and venture capital holdings, and realized capital gains. In addition, there are two key adjustments: proration of tax-exempt municipal bond interest and proration of dividends received deduction for stockholder dividends.

Tax-exempt municipal bonds produce tax-free income for most taxpayers. Similarly, the dividends received deduction (DRD) allows most corporate taxpayers to reduce taxable income by a portion of dividends received from other corporate taxpayers. Generally, earnings credited to the cash values of life insurance policies owned by corporate taxpayers are not recognized as current income. Insurance companies, however, are required under the IRC to include a portion of such tax-favored income and earnings in taxable income under a rule known as “proration”. For a property/casualty insurer, proration increases taxable income by reducing the deduction for losses incurred by a percentage of such tax favored income.

Previously, the proration rules required a property/casualty insurance company to reduce its losses incurred deduction by an amount equal to 15% of the sum of its tax-exempt income, DRD and any earnings credited to life insurance products owned.

The TCJA amended the proration rules in a manner that retains the prior law’s financial effect (i.e., a 15% reduction in the deduction from income taxed at a top marginal rate of 35%) while reflecting the reduction of the top corporate marginal rate from 35% to 21%. It does so by replacing the reduction percentage of 15% under previous law with a reduction percentage computed by dividing 5.25% (the “applicable percentage” referred to in the statute) by the top corporate tax rate of 21% which results in a reduction percentage of 25%. Should the top corporate tax rate change in future years, the proration rate will also change.

BASE EROSION AND ANTI-ABUSE TAX (BEAT)

Now that we have determined taxable income, we can establish the regular tax liability, which is 21% of taxable income, a decrease from 35% under the previous tax law. Yet that is not necessarily the end of the calculations; if a U.S. insurance company makes a payment to a related foreign company, it might be subject to the BEAT.
Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S.

In general, the BEAT calculations may apply when a domestic taxpayer, such as an insurance company that is domiciled in the U.S., obtains a “base erosion tax benefit” as a result of making a “base erosion payment” to a related foreign party. BEAT applies when the insurance company is part of a U.S. group of companies that has average gross receipts in the past three years equal to or in excess of $500M and if base erosion payments constitute 3% or more of the total deductions taken by the U.S. group on its current tax return.

The BEAT operates as a type of “minimum tax” that is added to the regular tax liability. It operates by ascertaining the “modified taxable income” of a U.S. taxpayer that has paid or incurred amounts to a foreign related party that provide deductions from regular taxable income or, in the case of reinsurance premiums to a foreign reinsurer, reduce gross income included in regular taxable income. Generally, modified taxable income is determined by adding back to regular taxable income the base erosion tax benefit caused by a base erosion payment. This minimum tax is equal to the excess of:

i. BEAT rate x modified taxable income over
ii. Regular tax liability

The BEAT rate in the 2018 tax year was 5% moving to 10% in tax years 2019 through 2025, and then subsequently to 12.5%. The modified taxable income includes the income subject to the regular tax rate plus all deductible or excludible payments made to a foreign affiliate (base erosion payments) for the year.

Accordingly, to determine the BEAT charge a corporation should perform the following steps:

1. Determine if subject to the BEAT
2. Determine taxable income and compute regular tax of its U.S. companies
3. Compute modified taxable income
4. Apply the BEAT tax rate to modified taxable income
5. Compare regular tax liability with the BEAT

As an example, assume there is a domestic insurance company that is part of a U.S. group that meets the minimum requirements for being subject to the BEAT. In the 2019 tax year, this U.S. subsidiary has $120 of gross written premium for coverage effective January 1 (and so no unearned premiums), $0 investment income, $0 losses incurred and $10 of general and administrative expenses. Additionally, the U.S. subsidiary paid reinsurance premiums of $70 to a related foreign insurance company.
TABLE 109

The U.S. subsidiary regular tax must first be determined:

- Taxable income = $120 gross written premium reduced by $70 of reinsurance premiums reduced by expenses of $10 = $40
- Regular tax = $40 * 21% = $8.40

Then the BEAT tax must be determined:

- Modified taxable income = $40 + $70 = $110
- BEAT tax = $110 * 10% = $11

As such, the additional tax due under the BEAT is $2.60 ($11 - $8.40).

It is noted, however, that payments to a foreign company that has elected to be taxed as a U.S. taxpayer under Section 953(d) are not subject to the BEAT.

DISCOUNTING LOSS RESERVES FOR TAXES

In the section within Chapter 22 titled “Deferred Tax Assets”, we discussed the reasons why statutory loss reserves are discounted in calculating taxable income. We shall now look in more detail at the method prescribed under the IRC for determining the discount required. The discounted loss reserves are calculated using three components:

1. The undiscounted loss reserves
2. The discount rate promulgated by the U.S. Treasury for that accident year
3. The payment pattern
Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S.

The first component is obtained from Schedule P, Part 1. Reserves in Schedule P, Part 1 are net of tabular discount but gross of non-tabular discount. Therefore, any tabular discount will need to be eliminated to gross-up the loss reserves from Schedule P, Part 1 to an undiscounted basis.

The discount rate will be determined by the U.S. Treasury for each accident year and is to be based on the corporate bond yield curve, effective for taxable years beginning after December 31, 2017. This is a change from the previous tax law, where the discount rate was determined for each accident year based on the 60-month average of the Federal midterm rates.

The payment pattern for each line of business is determined every five years by the IRS based on the paid loss development from industry aggregate Schedule P, Part 1 data. Under the TCJA, insurance companies cannot elect to use their own payment patterns.

Additionally, during the transition from the previous tax law to the TCJA in tax year 2018, unpaid losses and loss adjustment expenses for all accident years were discounted using the interest rate and loss payment patterns applicable to accident year 2018. The recognition of the adjustment (differences in taxable reserve estimates between the prior methodology and the new methodology at the same point in time) from the interest rate and payment pattern changes are evenly spread across eight tax years so that Companies are not burdened with the full change in the first year in taxable income from a change in the tax reserve. Below is an example of an implied eight year spread:

| Tax Year | Statutory Reserve | Tax Discount Factor* | Beginning of Year 2018 Net Change in Taxable Reserve** | 8 Year Spread of Net Change*** |
|----------|-------------------|----------------------|---------------------------------------------------------|
| 2017     | 51,557            | 0.9                  |                                                         |                           |
| 2018     |                    | 0.8                  | (5,156)                                                 | (644)                     |
| 2019     |                    |                      |                                                         | (644)                     |
| 2020     |                    |                      |                                                         | (644)                     |
| 2021     |                    |                      |                                                         | (644)                     |
| 2022     |                    |                      |                                                         | (644)                     |
| 2023     |                    |                      |                                                         | (644)                     |
| 2024     |                    |                      |                                                         | (644)                     |
| 2025     |                    |                      |                                                         | (644)                     |

* For example purposes, assume that 0.9 is the company implied tax discount factor under the prior law and 0.8 is the implied company tax discount factor under the current law

** $-5,156 = 51,557 * (0.8 - 0.9)$

*** $-644 = -5,156/8$
FINANCIAL REPORTING THROUGH THE LENS OF A PROPERTY/CASUALTY ACTUARY

Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S.

TCJA IMPACT

As discussed above, the TCJA had the following key changes affecting insurance companies:

- Decrease in the corporate tax rate
- Repeal in the election for use of company-specific payment patterns
- Change in the determination of the interest rate
- Addition of the Base Erosion and Anti-Abuse Tax (BEAT)

These changes will have varying impacts, with the biggest drivers being the primary exposures that are written, what payment patterns were used in the past, and whether or not the company utilizes an affiliated foreign entity for certain transactions (e.g., reinsurance).
PART VII. CANADIAN-SPECIFIC REPORTING

INTRODUCTION TO PART VII

This part provides an overview of insurance financial reporting in Canada and a description of the main participants who influence the reporting framework in Canada. The Canadian regulatory Annual Statement and certain key elements of particular importance to Canadian actuaries are discussed.
CHAPTER 27. OVERVIEW OF FINANCIAL REPORTING IN CANADA

OVERVIEW

Insurance regulators, the accounting profession, and the actuarial profession play a role in setting the framework for insurance financial reporting in Canada.

Insurance is regulated in Canada at the federal and provincial levels. As a result, insurance companies can choose to be registered federally (across Canada) or separately in each province where they conduct business. The majority of insurers are regulated federally under the jurisdiction of the Office of the Superintendent of Financial Institutions (OSFI).203 Registered204 insurers are required annually to file detailed financial statements with supporting exhibits and quarterly updates. In addition, since 1992 registered insurers have been required to appoint an actuary (“Appointed Actuary”) to value their policyholders’ liabilities and to report at least annually on the current and future financial condition of the insurer. Each province regulates its own policy forms and monitors market conduct; hence, an insurer must also be licensed by each province in which it writes business regardless of where it is registered.

OFFICE OF THE SUPERINTENDENT OF FINANCIAL INSTITUTIONS

OSFI is a federal agency established in 1987 under the Office of the Superintendent of Financial Institutions Act. OSFI’s mandate is to supervise all federally regulated financial institutions, monitor federally regulated pension plans and provide actuarial advice to the Government of Canada.

OSFI’s activities are structured to protect the rights and interests of depositors, policyholders, pension plan members, and creditors of financial institutions and in so doing to contribute to the public confidence in a safe and sound financial system. This is accomplished through supervision under a principles-based regulatory framework which is designed205 to identify key risks in certain institutions and intervene as appropriate and through regulation to enhance the financial system’s safety and soundness.

OSFI differs from the National Association of Insurance Commissioners (NAIC) in that OSFI covers all federally regulated financial institutions and not just insurance companies. OSFI has authority over the entities it regulates, whereas the NAIC is a coordinating body that works

204 A registered insurer in Canada is an insurer that is licensed to distribute insurance policies by either the federal regulator or a provincial regulator in Canada.
205 OSFI’s web site provides a table of guidelines such as the Minimum Capital Test which comprise the principles-based regulatory framework by which OSFI regulates insurers in Canada.
Part VII. Canadian-Specific Reporting

with state insurance regulators to provide support and coordination to the regulation of multistate insurers across the various states.

INTERNATIONAL FINANCIAL REPORTING STANDARDS (IFRS)

On January 1, 2013, the Chartered Professional Accountants of Canada (CPA Canada) was established by both the Canadian Institute of Chartered Accountants (CICA) and the Society of Management Accountants of Canada (CMA Canada) to support the Canadian provincial accounting bodies unifying under the CPA banner. Certified General Accountant (CGA-Canada) integrated with CPA Canada on October 1, 2014, completing the unification of Canada’s accounting profession at the national level.

In 2011, the Canadian Institute of Chartered Accountants (CICA) adopted all changes to IFRS standards issued by the International Accounting Standards Board (IASB) as part of the reporting framework for publicly accountable entities (PAE). Regulated insurance companies meet the definition of PAEs and therefore were required to adopt IFRS as of January 1, 2011 (with comparative information for 2010). Today, this still holds with the merge to CPA Canada.

IFRS 4 is the current standard that deals with accounting for insurance contracts. It allows for the continuation of valuation practices in existence at the adoption of IFRS that Canadian Generally Accepted Accounting Principles (CGAAP) provided for insurance contracts. Under CGAAP the policy liabilities can be recorded in accordance with accepted actuarial practice (AAP) in Canada, which means the recorded liabilities are discounted to reflect the time value of money and include a provision for adverse deviation. The accounting for foreign branches and domestic insurers is substantially the same, and their financial statements are prepared in accordance with IFRS. However, there are two key differences for foreign branches:

1. The assets of foreign branches are required to be under the control of either the Minister of Finance of Canada or the branches’ Chief Agent in Canada. The amount of assets under the control of the Minister of Finance is determined by risk based minimum capital requirements, further described in Chapter 29. Assets that are under the control of the Minister of Finance are to be placed in a trust.

2. There is no share capital account, as the entity is operating as a branch of its parent; therefore, there is a head office account instead.

The Canadian Institute of Actuaries (CIA) is the national organization of the Canadian actuarial profession.\textsuperscript{207} The CIA serves the public through the provision, by the profession, of actuarial services and advice of the highest quality.

AAP is the manner of performing work in Canada in accordance with the rules and the Standards of Practice (SOP) of the CIA. SOP is the responsibility of the Canadian Actuarial Standards Board,\textsuperscript{208} and approval of standards and changes to standards are made through a process that involves consultation with the actuarial profession and other interested parties. If AAP conflicts with the law, an actuary should comply with the law but report the conflict and, if practical, useful and appropriate under the terms of the engagement, report the result of applying AAP.

The SOP published by the CIA are binding on fellows, associates, and affiliates of the CIA for work in Canada and for members of bilateral organizations, as defined in the bylaws, when those members are practicing in Canada. The standards consist of recommendations and explanatory text. A recommendation is the highest order of guidance in the SOP. Unless there is evidence to the contrary, there is a presumption that a deviation from a recommendation is a deviation from AAP. Explanatory text, which consists of definitions, explanations, examples, and useful practices, support and expand upon the recommendations.

The SOP consist of general standards and practice-specific standards. The general standards apply to all areas of actuarial practice. Usually, the intent of the practice-specific standards is to narrow the range of practice considered acceptable under the general standards.

Actuaries practicing in Canada should be familiar with relevant educational notes and other designated educational material affecting their practice. Educational notes are not binding on an actuary; however, educational notes and other designated educational material describe but do not recommend practice in illustrative situations. A practice that the educational notes describe for a situation is not necessarily the only accepted practice for that situation and is not necessarily AAP for a different situation.

Differences between Statutory and Other Financial/Regulatory Reporting Frameworks in Canada

Canadian insurers are required to prepare their financial statements in accordance with IFRS, as issued by the IASB, since 2011. The Canadian Annual Returns were also modified to include the impacts of changes to IFRS. Upon the introduction of IFRS, the insurance contracts standard (IFRS 4) permitted insurers to apply CGAAP for their insurance contracts. With IFRS 4, there was little impact on the financial statements of Canadian property/casualty

\textsuperscript{6} Canadian Institute of Actuaries, \url{http://www.cia-ica.ca/}, 2018.

\textsuperscript{7} Actuarial Standards Board, “About the ASB – Terms of Reference,” \url{http://www.asb-cna.ca/}, September 27, 2017.
insurers, and as in the past, the statutory Annual Return was prepared on the same basis as the company's financial statements.

In May 2017, the IASB issued a new insurance contracts standard, IFRS 17, which is effective for annual accounting periods beginning on 1 January 2023. As companies were allowed to use a wide variety of accounting practices for insurance contracts under IFRS 4, it was difficult for investors and analysts to understand and compare results of insurers, especially from an international perspective. IFRS 17 is expected to improve the comparability of financial performance of insurance contracts between different entities. The standard applies to both life and property and casualty insurers and it requires insurers to divide insurance contracts into groups, and recognize groups of contracts as risk-adjusted present value of future cash flows, plus an amount representing the unearned profit in the group of contracts (named contractual service margin under IFRS 17). There is a simplified approach (premium allocation approach) that will apply to certain types of contracts, which is somewhat consistent with current Canadian practice, and it is expected that this simplified approach will be widely adopted by property and casualty insurers in Canada. The standard may have a significant effect on many insurers as their existing accounting policies are likely to differ from those required by the IFRS 17. Therefore, the costs involved in implementing IFRS 17 are expected to be substantial because of the need for significant systems development in order to capture the required information.

Statutory Accounting Principles (SAP) is the accounting framework under which all U.S. insurance companies are required to report for state regulatory purposes. There are many differences between SAP and IFRS, including the valuation of invested assets and the valuation of policy liabilities. These differences arise because in Canada there is a desire to achieve consistency with published financial statements and in the U.S. there is a focus on insurer solvency.
CHAPTER 28. CANADIAN ANNUAL RETURN

OVERVIEW

All insurers are required to file an Annual Return (or Canadian Annual Statement) based on International Financial Reporting Standards (IFRS) in each province where they are licensed and with the Office of the Superintendent of Financial Institutions (OSFI) if they are federally regulated. The Annual Returns are prescribed forms that are annually reviewed by the Canadian Council of Insurance Regulators. The full Annual Return is to be completed and filed annually within 60 days of year-end. In addition, there is a requirement to file interim returns on a quarterly basis within 45 days of the end of each quarter.

PREPARATION OF KEY SCHEDULES

The Canadian Annual Return is logically divided into a number of sections as follows:

- **General information**: This section contains information about the company, its officers, and directors and a summary of selected financial data for five years.

- **Consolidated financial statements**: This section shows the company’s balance sheet (assets, liabilities, and equity), statement of income; statement of retained earnings and reserves; statement of comprehensive income and accumulated comprehensive income; statement of cash flows; statement of changes in equity; and notes.

- **Statutory compliance**: This is the Minimum Capital Test (MCT) for domestic insurers or the Branch Adequacy of Assets Test (BAAT) for foreign insurers, including supporting exhibits, related to capital adequacy.

- **Investments**: This includes detailed information relating to the company’s invested assets.

- **Miscellaneous assets and liabilities**: This includes items such as other receivables and interests in joint ventures.

- **Premiums, claims, and adjustment expenses**: This section contains detailed information relating to unearned premiums, incurred losses, claims liabilities, and runoff of claims and adjustment expenses.

- **Provincial and territorial summaries**: This provides geographical premium and claims information.

- **Reinsurance ceded**: This includes information related to premiums and claims ceded.

- **Commissions and expenses**: This includes details relating to commissions and operating expenses.

- **Out of Canada exhibits**: This section provides detail relating to operations outside of Canada.
- Non-consolidated financial statements and exhibits: Financial statements and many of the exhibits are also provided on a non-consolidated basis.

The report of the appointed actuary must be submitted with the Annual Return. It is expected that the values reported in the financial statements for the items included in the opinion of the appointed actuary not differ materially from the values opined on by the appointed actuary.

**BALANCE SHEET**

*Appendix II* of this publication shows separately the assets and liabilities and equity elements of the balance sheet for the total of all Canadian property/casualty insurance companies as reported by the OSFI as at December 31, 2017. The Appointed Actuary should be familiar with all aspects of the Annual Return; however, the Appointed Actuary is opining on the policy liabilities and is thus expected to demonstrate a significant understanding of all elements of the policy liabilities (claims and policy liabilities in connection with unearned premiums).

The claims and premium liabilities are typically the largest liabilities on the balance sheet of an insurer and are reported through the following:

1. Claims liabilities:
   a. Direct unpaid claims and adjustment expenses
   b. Assumed unpaid claims and adjustment expenses
   c. Ceded unpaid claims and adjustment expenses
   d. Other amounts to recover
2. Premium liabilities:
   a. Gross unearned premiums
   b. Net unearned premiums
   c. Premium deficiency reserves
   d. Other net liabilities
   e. Deferred policy acquisition expenses
   f. Unearned commissions

Table 111 summarizes the balance sheet provided in *Appendix II* of this publication into key items from the perspective of the Appointed Actuary.

As illustrated, the unpaid claims and loss adjustment expense (LAE) and unearned premium liabilities are the most significant liabilities on the balance sheet. In Canada, the claims and premium liabilities are reported on the balance sheet on a gross basis. That is, the liabilities are reported gross of reinsurance, and an asset is recorded to reflect the amount of the liabilities expected to be recoverable from reinsurers, which, as illustrated above, is a significant asset on the balance sheet.

The liabilities in Canada are recorded in accordance with AAP, which requires that the liabilities be equal to the value discounted to reflect the time value of money plus a provision for adverse deviation (PfAD). A discount rate has to be selected to determine the present value of the liabilities. This discount rate is defined by the Canadian Institute of Actuaries as follows:

“The expected investment return rate for calculation of the present value of cash flow is that to be earned on the assets, taking into account reinsurance recoverables, that support the insurance contract liabilities. It depends on the assets owned at the calculation date, the allocation of those assets and related investment income among lines of business, the method of valuing assets and reporting investment income, the yield on assets acquired after the calculation date, the capital gains and losses on assets sold after the calculation date investment expenses, and losses from asset depreciation.”
The actuary need not verify the existence and ownership of the assets at the calculation date, but would consider their quality.”

This definition requires the Appointed Actuary to also understand the assets on the balance sheet, how they are valued and the insurer’s investment policy. Typically, a large proportion of invested assets are used to support insurance contract liabilities. Therefore, the Appointed Actuary should be able to estimate the expected investment return on those assets. The following chart, Table 112, illustrates a simple calculation of the market yield of a bond portfolio. The market yield and modified duration are calculated using readily available spreadsheet functions and the overall yield is calculated using the product of modified duration and market value as weights.

Total: 37,951,000.00 / 41,264,001.60

Market value duration weighted average yield: 3.72%
Estimated investment expense ratio: 0.25%
Indicated discount rate net of expenses: 3.47%

There are also other more complex methods employed for estimating the investment yield, such as using a discounted cash flow model where the discount rate is the rate at which the...
present value of claims cash flows equals the market value of the assets or where the discount rate is the internal rate of return for a group of assets whose cash flow matches claims payout.

INCOME STATEMENT

Appendix II of this publication shows the income statement for the total of all Canadian property/casualty insurance companies as reported by OSFI as at December 31, 2018. The income statement measures the financial performance of the insurer over the accounting period. The net income for the period is equal to revenues less expenses and income taxes. For an insurance company, revenues and expenses are separately identified for insurance underwriting operations, investment operations, and other operations (mainly from subsidiaries, or affiliated or ancillary operations).

In the Canadian Annual Return, insurance revenue consists of net premiums written, which is equal to direct written premiums plus assumed written premiums, less written premiums ceded to reinsurers.

The change (opening unearned premiums less ending unearned premiums) in net unearned premiums is added to net written premiums resulting in net premiums earned. The net premiums earned item is the net underwriting revenue that is attributable to the accounting period under consideration. Other underwriting-related revenues are added, such as service charges, to generate total underwriting revenue.

Premium deficiency adjustments are required if the Appointed Actuary determines that the net policy liabilities in connection with the net unearned premium are larger than the total of the net unearned premium plus unearned commission liabilities less the deferred policy acquisition expense asset as recorded by the company. Incurred claims, claims adjustment expenses, acquisition expenses, general expenses, and any premium deficiency adjustments must be deducted from total underwriting revenue to derive the underwriting income or loss for the period under consideration.

Gross incurred claims and adjustment expenses are equal to gross claims and adjustment expenses paid during the period plus the change in gross unpaid claims (ending unpaid claims minus opening unpaid claims) and adjustment expenses calculated in accordance with AAP over the period. The reinsurers’ share of claims and adjustment expenses is deducted from gross incurred claims and adjustment expenses to derive net claims and adjustment expenses. This calculation of net incurred claims and adjustment expenses is consistent with the same exposure period(s) as revenue, as defined above.

The categories of acquisition expenses shown in the income statement in the Canadian Annual Return are gross commissions, ceded commissions, taxes, and other acquisition expenses. For an insurer that distributes its products through the independent broker
network, commissions are typically the largest cost of acquiring the business. For those companies that have captive agents or that distribute their products directly to the consumer, the other acquisition expenses will be larger. The net commission expense is the gross (direct plus assumed) commission expense less any commission income received from ceding reinsurance—typically ceding commissions received on proportional reinsurance. The tax expense item is for taxes, other than income taxes, such as premium taxes, associated with writing insurance in Canada.

General expenses are items that do not relate directly to the acquisition of the business. This includes salaries, management fees, professional fees, occupancy costs, and information technology costs, among other items not directly related to the acquisition of the business.

Net investment income consists of investment income earned plus realized gains (losses), less investment expenses.

Underwriting income, net investment income, and other revenues and expenses are added to derive net income before income taxes and extraordinary items. Income taxes are separated into current income taxes and deferred income taxes.

Extraordinary items, net of income tax, are added to arrive at the net income or loss for the accounting period under consideration.

STATEMENT OF RETAINED EARNINGS

The statement of retained earnings illustrates the calculation of the retained earnings for the insurance company at the end of the reporting period. The retained earnings at the end of the reporting period are equal to the retained earnings at the beginning of the period plus the net income earned during the period less dividends and changes in reserves required plus any prior period adjustments.

RESERVES

This statement provides detail as to the reserves shown under the Equity section of the balance sheet. These reserves are appropriations of surplus for items such as earthquakes or nuclear events. These reserves have specific purposes and are required by OSFI in Canada.

STATEMENT OF COMPREHENSIVE INCOME AND ACCUMULATED COMPREHENSIVE INCOME

Total comprehensive income for the reporting period is equal to net income as reported on the statement of income (above) plus other comprehensive income (OCI). OCI comes from changes in unrealized gains (losses) on available-for-sale assets such as loans, bonds, and debentures and equities; derivatives designated as cash flow hedges; foreign currency translation; and share of OCI of subsidiaries, associates, and joint ventures. Items that are reclassified to earnings of gains (losses) are also included in OCI.
Accumulated other comprehensive income (AOCI) is the cumulative value of OCI or the total of unrealized gains on the above noted items that is included in the equity on the balance sheet.

STATEMENT OF CASH FLOWS

The statement of cash flows derives the value of cash and cash equivalents that are included as the cash item on the balance sheet at the end of the reporting period. Cash flow is derived from or used in operating activities, investing activities and financing activities. The cash flow during the year from these activities is added to the opening cash to derive the cash balance at the end of the year.

Operating activities relate to the operation of the business and include such items as:

- The net income generated during the year
- Changes in receivables
- Changes in unearned premiums and unpaid claims liabilities
- Recognized gains/losses in investments

The cash flow from investing activities is basically the net cash flow from the purchase of new investments and the proceeds from the sale of investments plus the amortization of premiums on investments.

The cash flow from financing activities is the net cash flow from increasing/repayment of borrowing plus the increase/redemption of shares less dividends to shareholders.

STATEMENT OF CHANGES IN EQUITY

This exhibit illustrates the change in equity across various classes of equity (e.g., share capital, retained earnings, accumulated other comprehensive income (“AOCI”) ) resulting from various transactions or events such as issue of share capital, total comprehensive income for the year, and dividends.

NOTES TO FINANCIAL STATEMENTS

The notes to financial statements are an integral part of the financial statements. The notes provide significant detail on such important items as the basis of presentation, the basis of measurement, significant accounting policies and detailed explanations relating to some of the key financial statement items.

IMPACT OF REINSURANCE, INCLUDING COMMUTATIONS

Insurance companies may purchase reinsurance to limit their risk to loss from certain events. There are many different forms of reinsurance contracts that insurers can enter into, allowing each insurer to manage risk and capital in accordance with its own objectives. These
reinsurance contracts can be used to protect against multi-claim, catastrophic events, individual large losses, and poor experience across a line of business, among other uses, and thereby act to reduce volatility in insurance results.

In the event that a registered insurer cedes business to a non-registered insurer, the registered insurer is required to secure adequate collateral from the non-registered insurer to receive full capital credit for the cession of this business. The collateral must be secured through a Reinsurance Security Agreement providing the adequate level of creditor protection to the ceding insurer. This aspect is further discussed in Chapter 29.

Treaty reinsurance is a contract that applies to all or a portion of an insurance company’s contracts covered under the term of the agreement, typically for a calendar year. These contracts generally are placed on an excess basis or on a proportional (quota-share) basis. In an excess treaty, the reinsurer responds to all claims during the treaty period excess of a specified threshold to a specified limit, e.g., automobile claims for $5 million excess of $5 million. In a proportional treaty, the reinsurer receives a set proportion of all premiums subject to the treaty, net of ceding commission, and in return pays the same proportion of all claims subject to the treaty. The ceding commission is paid by the reinsurer to the insurer in a proportional treaty to reimburse the insurer for policy acquisition expenses.

Facultative reinsurance differs from treaty reinsurance in that it relates to reinsurance against risks from certain policies written by an insurer. For example, an insurance company writes a very large commercial property exposure and wishes to limit its losses from this specific policy and hence purchases facultative reinsurance excess of its retained risk.

Reinsurance contracts impact the income statement and balance sheet of an insurance company. When an insurer purchases reinsurance, it pays a ceding premium, which reduces its earned premiums during the financial reporting period. It will also reduce its gross claims and adjustment expenses incurred by the reinsurer’s share of claims and adjusting expenses and reduce its commission expense for any ceding commissions received. All of these items are reflected on the income statement.

Similarly, on the balance sheet of the Canadian Annual Return, there are two main reinsurance assets: unpaid claims and adjustment expenses recoverable from reinsurers, and unearned premiums recoverable from reinsurers. These assets reflect the share of the corresponding liabilities recorded by the insurer, which are recoverable from reinsurers.\(^{210}\)

Table 113 charts a sample income statement and balance sheet for an insurance company prior to the application of reinsurance.

\(^{210}\) This differs from the U.S. Annual Statement, where liabilities are shown net of reinsurance.
Table 113 shows the impact of reinsurance on a company’s financial statements resulting from two simple reinsurance treaties: an excess of loss treaty and a proportional treaty. To simplify the example, we will ignore all impacts on investment income and income taxes, and, further, we will assume that the treaties run from January 1 to December 31.

For the excess of loss treaty example, it is assumed that the company will cede $20,000 in premiums and that it will recover $13,000 of losses from the reinsurer, of which $10,000 will be unpaid at the end of the year. The following chart illustrates the impact on the foregoing financial statements of such a treaty.

</tbody>
</table>

In the example above, the accounts impacted are highlighted, and it is assumed that ceded premiums and claims have flowed through cash.

In the proportional example, it is assumed that 15% of premiums and claims are ceded and that a ceding commission of 25% is paid to the insurer. It is also assumed that due to the large ceded premium that invested assets (bonds) would be reduced and that 100% of the claims are unpaid at the end of the year. Table 115 charts the impact on the foregoing financial statements of such a treaty.

Again, accounts impacted are highlighted.
COMMUTATION OF CLAIMS

Commuting a claim is a process in which one party is relieved of its obligations in respect of the claim in exchange for a cash payment. This can happen between insurers and individual claimants, with insurers under financial stress or between insurers and reinsurers. This section addresses the commutation of claims between insurers and reinsurers.

Reinsurance contracts may contain a commutation clause, which requires the insurer to relieve the reinsurer of its obligations in exchange for a cash payment. These clauses are typically more common in contracts that cover long-tail liabilities, and the purpose is generally to allow the reinsurer to settle its obligations within a finite period.

The primary motivation for a reinsurer to commute is to bring certainty to its results; however, there are other benefits to the reinsurer associated with commutation, including capital relief and savings in claims adjusting and administrative costs. From an insurer’s point of view, there can be a benefit from commutation if there is a concern in respect of the creditworthiness of the reinsurer — the receipt of cash extinguishes this risk. Insurers also will save administrative costs. Insurers, however, once they receive the cash payment will be subject to the risk of any future adverse loss experience in respect of the commuted liability and will have to hold capital for this risk.

Claims subject to commutation typically have expected cash flows that extend into the future. Therefore, the settlement of these claims requires that financial and non-financial considerations associated with the future cash flows be contemplated. Financial considerations can include items such as the amount and timing of cash flows, the discount rate to be used, cost inflation, the potential for volatility in cash flows and income tax. Non-financial considerations can include such items as regulatory involvement or legal court decisions of the claimant(s), current and future entitlements of the claimant(s), and unfavorable court decisions.

The commutation of a block of claims under a reinsurance agreement typically will involve the actuary for the insurer and the actuary for the reinsurer. Each actuary will be charged with estimating the present value of the future obligations. In estimating the present value of these obligations, the actuary must consider the following:

- The nominal or undiscounted value of future loss and LAE on reported and unreported claims
- The expected timing of the payout of the undiscounted loss and LAE
- Expected investment income on assets supporting these cash flows
- Income tax
- An appropriate risk load to provide for volatility

An example calculation of a commuted value of a portfolio is illustrated below.
TABLE 116

<table>
<thead>
<tr>
<th>TABLE 116 Estimate of Commuted Value of Claims December 31, 2018</th>

<tr>
<td>Commuted Value</td>
</tr>
</tbody>
</table>

The starting point in estimating the commuted value is to estimate the undiscounted value of the liabilities to be commuted and the expected payout of the liabilities. This can be completed using various actuarial approaches. In Table 116, these liabilities are discounted at a risk-free rate corresponding to the average duration of each expected payment to obtain an estimate of discounted liabilities.

The risk margin is estimated based on the cost of holding capital for claims liabilities. In this case, it is assumed that required capital is based on a regulatory approach. For purposes of
this example, it is assumed that a margin of 10% of the claim liabilities is required and that the company must hold target capital equal to 200% of required capital.

The cost of holding capital is equal to the risk cost of capital multiplied by the regulatory capital. The risk cost of capital can be calculated in various ways, such as by calculating a weighted average cost of capital less the risk-free rate. The total risk margin is the present value of the annual cost of capital amounts discounted at the risk-free rate. The commuted value is calculated as the sum of the discounted value of the liabilities plus the risk margin.

PREMIUM LIABILITIES

The policy liabilities of a property/casualty insurance company at a particular valuation date consist of claims liabilities and premium liabilities. Claims liabilities provide for events that have happened prior to the valuation date, whether reported or not. Premium liabilities provide for events that will occur after the valuation date on policies in force on the valuation date, i.e., premium liabilities are the liabilities associated with the unexpired portion of an insurance or reinsurance contract.

Net premium liabilities are not separately identified on an insurer’s balance sheet as a single item but rather are derived by considering the following items:

1. Net unearned premiums
2. Net loss and LAE costs (external and internal) after the valuation date on in-force policies
3. Expected excess of loss reinsurance costs after the valuation date on in-force policies
4. Costs of servicing the in-force policies
5. Provision for premium adjustments
6. Contingent commissions adjustments
7. Unearned reinsurance commissions
8. Deferred policy acquisition expenses (DPAE)
9. Premium deficiency

A property/casualty insurer typically records items 1, 6, 7, and 9 as liabilities on its balance sheet, item 8 is recorded as an asset on the balance sheet, and item 5 can be an asset or a liability. Items 2, 3, and 4 are not recorded on the insurer’s financial statements but are used by the Appointed Actuary in testing the adequacy of the recorded premium liabilities.

In testing the adequacy of premium liabilities, the Appointed Actuary is comparing an estimate of ultimate costs associated with the unexpired portion of the policy against premium liabilities recorded by the company. The elements of this calculation are discussed below (on a net of reinsurance basis as the gross basis is identical with the exception of the items relating to reinsurance ceded):

A. Unearned premiums: These are the company’s unearned premiums net of proportional reinsurance.
B. Excess of loss reinsurance costs: This is the expected costs of excess of loss reinsurance associated with unexpired policies. It is typically calculated by applying the subsequent year’s excess of loss reinsurance rates to the unearned premium.

C. Expected losses and external LAE: This is the expected losses (net of all reinsurance) for the unexpired portion of the policy. In Canada this is calculated on an AAP basis, i.e., discounted plus a PfAD. There are different ways to calculate this, such as reviewing historical loss and LAE ratios on an AAP basis and selecting an expected AAP loss ratio or by forecasting expected loss and LAE cash flows and then discounting these and adding a PfAD.

D. Expected internal LAE: This provides for the internal costs associated with settling these claims. This is typically calculated by reviewing historical ratios of paid internal LAE to paid losses.

E. Expected maintenance expenses: This is the cost of servicing these in-force policies, other than internal claims handling. This would provide for policy changes, customer inquiries, etc.

F. Contingent commissions: Many insurers have contingent commission arrangements with brokers, which pay additional commissions if certain volume and/or profit targets are met, and this provides for the anticipated cost of these.

G. Policy Liabilities in Connection with Unearned Premium: The total of items B to F in Table 117 below are all expenses associated with the unearned premium. The net liability recorded by the company would be the unearned premium plus unearned commissions less the deferred premium acquisition expense (DPAE) asset.

H. Equity in Unearned Premium Reserve: This is the amount by which the unearned premiums exceed the policy liabilities in connection with unearned premium.

I. Unearned commissions: These are ceding commissions from proportional reinsurance that are not yet earned by the company.

J. Maximum net DPAE: This is the maximum DPAE asset that the company may record given the expected costs and the liability already recorded. If the company, on a provisional basis, has a higher amount recorded, it must be adjusted downward to a level at or below the amount flowing from this calculation.

K. In the event that this amount is negative, the company must record a premium deficiency reserve, which is an additional liability to ensure that all future costs are provided for.
These elements are illustrated below in Table 117 on both gross and net of reinsurance bases.

**TABLE 117**

</tr>
</tbody>
</table>

A number of items above are included in the premium liability component of the actuarial opinion required by OSFI, as part of the Annual Return, as illustrated in Table 118. It is assumed in this case that the company booked $6.5 million as a DPAE asset, which is less than the $9 million calculated by the Appointed Actuary. Since the booked DPAE is less than the maximum DPAE calculated by the appointed actuary there is no need for a premium deficiency reserve.

CHAPTER 29. FINANCIAL HEALTH OF PROPERTY/CASUALTY INSURANCE COMPANIES IN CANADA

RISK-BASED CAPITAL ADEQUACY FRAMEWORK

The Minimum Capital Test (MCT) for federally regulated property/casualty insurance companies and the Branch Adequacy of Asset Test (BAAT) for foreign property/casualty companies operating in Canada on a branch basis (foreign branch) were introduced in 2003 by the Office of the Superintendent of Financial Institutions (OSFI). To simplify their use, effective January 1, 2012, the MCT/BAAT guidelines were consolidated into one document, the MCT guideline. Under this guideline the MCT/BAAT ratios are also subject to an independent audit.

The minimum and supervisory target capital standards set out in the MCT guideline published by OSFI provide the framework within which the Superintendent assesses whether a property/casualty company, or a foreign branch, maintains adequate capital. Property/casualty companies are required, at a minimum, to maintain an MCT ratio of 100% (minimum capital ratio). OSFI has also set a “supervisory target capital ratio” of 150% to trigger early intervention and provide time for a company to take action to improve its MCT ratio, if it falls below the supervisory target.

OSFI expects companies to establish their own “internal target capital ratio” to reflect their own risk appetite and profile. An adequate internal target capital ratio provides the company with capacity to withstand unexpected losses beyond those covered by the minimum capital ratio. Notwithstanding that a property/casualty company or a foreign branch may meet these standards, the Superintendent has the authority to direct the property/casualty company to increase its capital or the foreign branch to increase the margin of assets over liabilities in Canada.

Typically, the Appointed Actuary is involved with company management in setting its internal target capital ratio. In setting it, the Appointed Actuary should consider the following, among other items:

- **Nature of the company:** A stock company has the ability to raise capital and thus may wish to hold enough capital to ensure that it stays above the supervisory target capital ratio (150%) but not so much that it cannot generate its required return on capital. A mutual company cannot raise capital and thus will typically wish to operate at a higher ratio.

- **Size of the company:** A smaller company or monoline company may have more volatile results and thus wish to hold more capital to ensure that it stays above the supervisory target capital ratio under most circumstances.
Company’s reinsurance program: Reinsurance is a form of capital support in that it can act to reduce the volatility in loss experience. In addition, when reinsurance reduces the net claims liability, the capital required will also be reduced.

Investment philosophy: Certain investment approaches will require greater capital. That is, if a company does not match assets and liabilities or if a company holds a greater proportion of its investments in equities, more capital may be required.

Competitive forces: If competing companies can raise capital quickly, by issuing stocks for example, their internal target can be relatively lower as it would be easy to raise funds in an event that drains the capital.

In simple terms, the Minimum Capital Test ("MCT") compares capital available to capital required. Detailed guidelines are issued by and available from OSFI.

CAPITAL AVAILABLE

Capital available generally represents the company’s total equity adjusted for certain items. It is restricted to the following, subject to qualification requirements by OSFI:

- Category A: common equity including common shares, surplus, retained earnings, earthquake, nuclear and general reserves and Accumulated other comprehensive income (AOCI);
- Category B & C: instruments issued by the institution that meet certain criteria for the respective category.

Certain items are deducted from/adjusted within the total of capital available, such as:

- Interests in non-consolidated subsidiaries and associates, and joint ventures with more than a 10% ownership interest
- Loans to non-consolidated subsidiaries, associates, and joint ventures with more than a 10% ownership interest considered as capital
- Amounts due to/from unregistered reinsurers to the extent they are not covered by deposits or letters of credit held as security
- Self-insured retentions where no collateral has been received
- The earthquake premium reserve (EPR) not used as part of financial resources to cover earthquake risk exposure
- Deferred policy acquisition expenses associates with accident and sickness (A&S) business, other than those arising from commissions and premium taxes
- Accumulated other comprehensive income on cash flow hedges
- Accumulated impact of shadow accounting
- Goodwill and other intangible assets
- Deferred tax assets that are not eligible for the 10% capital factor
FINANCIAL REPORTING THROUGH THE LENS OF A PROPERTY/CASUALTY ACTUARY

Part VII. Canadian-Specific Reporting

- Cumulative gains and losses due to changes in own credit risk on fair values financial liabilities
- Defined benefit pension fund assets and liabilities
- Investments in treasury stock
- Reciprocal cross holdings in the common shares of insurance, banking, and financial entities
- Adjustment to owner-occupied property valuations
- Accumulated net after-tax revaluation losses in excess of gains accounted for using the revaluation model
- Other assets, as defined by OSFI, in excess of 1% of total assets

No capital factor is applied to items that are deducted from capital available.

CAPITAL REQUIRED

The total capital required is determined as the sum of capital required for insurance risk, market risk, credit risk, and operational risk, less diversification credit (divided by 1.5). See below for calculations of the capital requirements and the target level for each of these risk components. Further details on each component of capital required follow.

INSURANCE RISK

MARGINS FOR UNPAID CLAIM AND PREMIUM LIABILITY

Insurance risk is the risk arising from the potential for claims or payouts to be made to policyholders or beneficiaries. This risk arises from the present value of losses being higher than the amounts originally estimated. Factors are applied to net unpaid claims (less PfAD) and net premium liabilities (less PfAD). The factors for unpaid claims vary by class of insurance and reflect the potential for variability in the estimates of these amounts, e.g., a 15% factor is applied to personal property claims, and a 25% factor is applied to liability claims. The risk factors for premium liabilities also vary by class of insurance, e.g., property claims have a 20% factor, and Auto - Liability claims have a 15% factor. However, the accident and sickness line of insurance has margins for unearned premiums and unpaid claims to take into account possible abnormal negative variations in actual requirements.

RISK MITIGATION and RISK TRANSFER - REINSURANCE

The factor to be applied to unpaid claims and unearned premiums recoverable from registered non-associated reinsurers is treated as a combined weight under the MCT and is set at 2.5%. The factor to be applied to unearned premiums and unpaid claims ceded to unregistered reinsurers is 20%. The resulting margin can be reduced to zero by letters of credit and non-owned deposits held as security.
SELF RETENTION

Self-Insured Retention represents the portion of a loss that is retained by the policyholder. Credit may be taken with acceptable collateral such as letters of credit which are also subject to risk factors depending on the credit rating of the issuing organization.

CATASTROPHES

In Canada there is specific guidance on the amount of capital required for earthquake exposure and nuclear risk (if written). Components of capital are required for Earthquake Premium risk and Earthquake Reserves. These may be reduced based on specific financial resources. The financial resources may take the form of capital & surplus, earthquake premium reserve, reinsurance coverage and prior approved capital financing.

MARKET RISK INTEREST RATE RISK

Interest rate risk is the risk of loss from changes in interest rates impacting interest-rate-sensitive assets and liabilities. Interest rate risk arises due to the volatility and uncertainty of future interest rates. Assets and liabilities whose value depends on interest rates are impacted; generally, this includes fixed income assets and discounted policy liabilities. The interest rate risk margin is the difference between the change in the value of interest-rate-sensitive assets and the change in the value of interest-rate-sensitive liabilities arising from a change in interest rates plus the change in the value of allowable interest rate derivatives (only simple derivatives such as interest rate futures, forwards, and swaps may be included).

Interest-rate-sensitive assets include the following:

- Term deposits and other short-term securities (excluding cash)
- Bonds and debentures
- Commercial paper
- Loans
- Mortgages
- Mortgage-backed securities and asset-backed securities
- Preferred shares
- Interest rate derivatives held for other than hedging purposes

Assets held in mutual funds and segregated funds that are interest-rate sensitive are to be included in interest-rate-sensitive assets. All interest-rate-sensitive assets that are held by the insurer are to be included, not just those backing liabilities.
Net unpaid claims and adjustment expenses and net premium liabilities (as determined in accordance with AAP) are considered to be the interest-rate-sensitive liabilities.

The interest rate risk margin is calculated as \( A - B + C \) where:

A. Estimated change in the value of the interest-sensitive asset portfolio for an interest rate change of \( X\% \)
B. Estimated change in the value of the interest-sensitive liabilities for an interest rate change \( X\% \)
C. Estimated change in the value of the allowable interest rate derivatives for an interest rate change \( X\% \)

The same calculation is completed for an interest rate change of \(-X\%\). The interest rate risk margin is the greater of that resulting from a change of \(X\%\) or \(-X\%\).

The change in the value of the interest-rate-sensitive assets and liabilities depends on the duration of the relevant assets and liabilities. Modified duration or effective duration may be used to calculate duration; however, the selected method must be used for all interest-rate-sensitive assets and liabilities and must be used consistently from year to year. The portfolio duration is calculated as a weighted average of the duration of the individual assets or liabilities comprising the portfolio. The dollar duration is the change in the asset or liability dollar value for a given change in interest rates.

The estimated change in the value of the interest rate assets is therefore calculated as duration of the asset portfolio multiplied by fair value of the asset portfolio multiplied by \( X\% \) The estimated change in the value of the interest rate liabilities is therefore calculated as duration of the liabilities multiplied by fair value of the liabilities multiplied by \( X\% \) A simple example (ignoring the impact of interest rate derivatives) follows:

\[
\text{Asset duration} = 6 \text{ years} \\
\text{Fair value of asset portfolio} = 500 \text{ million} \\
X = 1.25\% \\
\text{Liability duration} = 3 \text{ years} \\
\text{Fair value of liabilities} = 350 \text{ million} \\
\text{Capital required} = 6 \times 500 \text{ million} \times 0.0125 - 3 \times 350 \text{ million} \times 0.0125 = 24.375 \text{ million}
\]
FOREIGN EXCHANGE RISK

The foreign exchange risk margin is 10% of the greater of either the aggregate net long positions or the aggregate net short positions in each currency, adjusted by any effective allowable foreign exchange rate hedges.

The net open positions for each currency is the sum of:

- The net spot position (all asset items less all liabilities denominated in the currency under consideration, including accrued interest and accrued expenses if they are subject to exchange rate fluctuations);
- The net forward position, valued at current spot market exchange rates or discounted using current interest rates and translated at current spot rates;
- Guarantees that will be called and are irrecoverable;
- Any fully hedged net future income/expenses not yet accrued;
- Other items representing a profit or loss in foreign currencies.

To reduce the amount of net exposure, a carve-out may be used by P&C insurer with a net open long position in a given currency. This carve-out is equal to a short position of up to 25% of the liabilities denominated in the corresponding currency, to a maximum of zero.

A simple example for calculating the foreign exchange risk is as follows:

If a P&C insurer has $200 of U.S. assets and $100 of U.S. liabilities,
Net spot position = 200 – 100 = $100
Carve-out = 25% * $100 = 25
Foreign exchange risk margin = 10% * MAX ((net spot position - carve-out), 0)
= 10% * MAX ((100 – 25), 0)
= 10% * 75
= 7.5

EQUITY, REAL ESTATE, AND OTHER MARKET RISK EXPOSURES

Equity risk is the risk of economic loss due to fluctuations in the value of equity securities. A 30% risk factor is applied to investments in common shares and joint ventures in which a company holds less than or equal to 10% ownership interest, and to the market value of equity futures, forwards, and swaps.

Real estate risk is the risk of loss due to changes in the value of a property or in real estate investment cash flows. The risk factor for owner-occupied properties is 10% and a 20% factor is applied to real estate held for investment purposes.
Other market risk exposures include those assets comprised in the “other assets” category, where a 10% risk factor applies.

CREDIT RISK

The risk of loss resulting from a counterparty’s potential inability to fully meet contractual obligations due to an insurer is defined as credit risk. This risk occurs anytime funds are extended, committed, or invested through actual or implied contractual agreements. Risk factors are as follows:

- Long-term obligations (term deposits, bonds, debentures, and loans) that are not eligible for a 0% risk factor have a risk factor between 0.25% and 18% depending on the rating and remaining term to maturity of the investment
- Short-term obligations (term to maturity less than 1 year) that are not eligible for a 0% risk factor have risk factors between 0.25% and 8% depending on the rating of the investment
- Risk factors for preferred shares are between 3% and 30% depending on the rating of the investment

STRUCTURED SETTLEMENTS, LETTERS OF CREDIT, DERIVATIVES, AND OTHER EXPOSURES

Capital required for structured settlements, letters of credit, derivatives, and other exposures are for counterparty risk not covered by the capital required for balance sheet assets. The capital required for these instruments is calculated as follows:

\[
\text{Capital required} = \text{The credit equivalent amount of the instrument less collateral or guarantees} \\
\times \text{Credit conversion factor (reflects the nature and maturity of the instrument)} \\
\times \text{Capital factor (to reflect counterparty default risk)}.
\]

The credit equivalent amount varies according to the type of instrument. The credit equivalent of a structured settlement is the current replacement cost of the settlement. For derivatives, it is the positive replacement cost plus an amount for potential future credit exposure.

OPERATIONAL RISK

Operational risk is the risk of loss arising from inadequate or failed internal processes, people and systems from external events. There are two risk drivers to determine the operational risk margin: capital required and premium volume. For the total capital required (before the
operational risk margin and diversification credit), an 8.5% risk factor is applied. The following risk factors apply to insurance premiums:

- 2.50% for all direct premiums and ceded premiums written arising from third party reinsurance
- 1.75% for assumed premiums written arising from third party reinsurance
- 0.75% for assumed and ceded premiums written arising from intra-group pooling arrangements

To account for the additional pressures on people and systems due to rapid growth, additional capital is required. Thus, a 2.50% risk factor is applied to the total amount of gross premiums written in the past 12 months above a 20% growth threshold compared to the gross premiums written for the same period in the previous year. Finally, to lessen the effect of the operational risk margin for companies that have high-volume/low-complexity business, a 30% cap is applied. This is calculated in relation to the total capital required before the operational risk margin and diversification credit.

**DIVERSIFICATION CREDIT**

A company is not likely to incur the maximum possible loss from each type of risk simultaneously since the losses arising across risk categories are not perfectly correlated. Therefore, a diversification credit can be applied so that the total capital for the credit, market, and insurance risk requirements is lower than the sum of the individual requirements for these risks.

The formula used to calculate the diversification credit is:

\[
Diversification\ credit = A + I - \sqrt{A^2 + I^2 + 2 \times R \times A \times I}
\]

- \(A\) = asset risk margin = capital required for credit risk + capital required for market risk (e.g., interest rate, foreign exchange, equity, real estate, and other market risks)
- \(I\) = insurance risk margin
- \(R\) = correlation factor between \(A\) and \(I\) = 50%

**MINIMUM CAPITAL TEST**

\(MCT = \frac{\text{Capital Available}}{\text{Capital Required}}\), where Capital Required =

\[
\frac{\text{Insurance risk margin} + \text{Market risk margin} + \text{Credit risk margin} + \text{Operational risk margin} - \text{Diversification credit}}{1.5}
\]
FOREIGN COMPANIES

Foreign companies operating in Canada on a branch basis are required to maintain an adequate margin of assets over liabilities in respect of their business in Canada. The BAAT provides a framework, similar to the MCT, by which the regulator assesses the adequacy of assets of the branch.

The BAAT is similar to the MCT in that it compares net assets available to margin required. The net assets available are equal to the excess of assets vested in Canada less total net liabilities. The margin required is the sum of amounts required for the same items as in the MCT, e.g., assets, policy liabilities, catastrophes, etc., less the diversification credit (as in the MCT), divided by 1.5.

DYNAMIC CAPITAL ADEQUACY TESTING

Under federal regulation, the Appointed Actuary must investigate the insurer’s financial condition. This is completed by way of Dynamic Capital Adequacy Testing (DCAT).

DCAT is a process of analyzing and projecting the trends of a company’s financial condition, given its current financial and operating circumstances, its recent past, and its intended business plan under a variety of future scenarios. It allows the Appointed Actuary to inform company management of the likely implications of the business plan on capital and to provide guidance on the significant risks to which the company is exposed.

The principal goal of this process is to help measure capital adequacy by arming the company with the best information on courses of events that may lead to capital depletion and the relative effectiveness of alternative corrective actions. Furthermore, knowing the sources of threat, the company can strengthen the monitoring systems where it is most vulnerable and thus provide information on a continuous and timely basis.

In accordance with AAP, the DCAT process must include a base scenario and several plausible adverse scenarios. The CIA provides guidance as to the risk categories that must be examined for possible threats to capital adequacy. For property and casualty insurers, some of these risk categories include claim frequency and severity, inflation, premium increases and decreases, investment, reinsurance, and policy liabilities. However, the risk categories enumerated by the CIA are not necessarily the only ones to be examined because the circumstances of the insurer may result in the need to examine other risk categories.

The DCAT process generally consists of the following:

1. Development of a base scenario, which is typically derived from the company’s business plan
2. Examination of the risk categories (mandatory or otherwise) to determine those that are relevant to the company circumstances
3. Stress-testing of the risk category in question for each relevant risk category
4. Selection of those scenarios requiring further analysis
5. Reporting on the results of the analysis

In the most general sense, solvency is the ability of an entity to honor its financial obligations. From the accounting viewpoint, solvency requires that assets equal or exceed liabilities and therefore that the total equity is non-negative. This is ascertained as of a specified date. Even though a balance sheet may show a corporate entity to be technically insolvent by this definition, legal insolvency is only determined through court or regulatory action to terminate the operations of that company. In contrast, the concept of capital adequacy envisioned by DCAT extends beyond the balance sheet at a specific date to the continued vitality of the organization.

Accordingly, in considering the solvency of insurance operations, the amount of and expected trends in surplus and other forms of available capital over the near future are of vital importance, especially in terms of risk profile of the company. It is necessary to consider the purposes of and needs for capital in relation to anticipated and possible events occurring after the statement date.

DCAT utilizes the regulatory formula for the capital adequacy standard. For insurers regulated under the Federal Insurance Companies Act or the Ontario Insurance Act, the minimum regulatory capital requirement for the purposes of the DCAT standard is based upon the MCT for a Canadian property/casualty insurer and the BAAT for a Canadian branch of a foreign property/casualty insurer. Should an insurer be subject to minimum capital requirements under other jurisdictions, the most restrictive requirement is used.

The company's financial condition is deemed satisfactory if, throughout the forecast period, it is able to meet all its future obligations under the base and all plausible adverse scenarios. In addition, under the base scenario, it must meet the target regulatory capital requirement. Otherwise the company's financial condition is deemed unsatisfactory.

DCAT analysis provides the Appointed Actuary with significant information about the financial condition of a company. The base scenario is in essence the business plan of the company throughout the forecast period. A review of the business plan should allow the Appointed Actuary to learn much about the company, including the following:

- Whether the company is growing or contracting through the forecast period and, if relevant, the level at which it is growing
- Whether the company is profitable throughout the period and whether the profits are sufficient to grow the capital base to support the growth of the company
- Planned changes in mix of business written by the company through the forecast period
- Planned changes to reinsurance programs, investment philosophies, expenses, etc.
Further, the adverse scenarios can reveal information about the risk management strategy employed by the company. For example, if a scenario that tests the impact of a change in interest rates has very little impact on the company, it is likely that the company has employed an asset/liability matching strategy to minimize the impact of this event. Adverse scenarios can also identify risks to which the company's financial condition is particularly sensitive, and the Appointed Actuary can work with management in developing mitigation strategies to manage these risks.

FINANCIAL CONDITION TESTING

Under federal regulation, the Appointed Actuary must investigate the insurer's financial condition. The financial condition of an entity refers to its prospective ability to meet its future obligations and is sometimes termed “future financial condition”. The investigation is completed by way of Financial Condition Testing (FCT). The Appointed Actuary can supplement FCT with the use of other means, such as the own risk solvency assessment (ORSA).

Financial condition testing examines the effect of selected adverse scenarios on the insurer's forecasted capital adequacy. FCT is a process of analyzing and projecting the trends of a company's financial condition, given its current financial and operating circumstances, its recent past, and its intended business plan under a variety of future scenarios. It allows the Appointed Actuary to inform company management of the likely implications of the business plan on capital and to provide guidance on the significant risks to which the company is exposed.

The purpose FCT is to identify plausible threats to satisfactory financial condition, actions that would lessen the likelihood of those threats, and actions that would mitigate a threat if it materialized. FCT is one of several stress-testing processes that would fit within the insurer's overall risk management process. The FCT process allows management to understand implications the business plan has on capital and provides awareness of the significant risks to which the insurer is exposed.

The FCT process generally consists of the following:

1. Development of a base scenario, which is typically derived from the company's business plan. The forecast period would be sufficiently long to be aligned with the risk emergence and the recognition of impacts and to capture the effect of management actions.
2. Development and analysis of the impact of adverse scenarios to determine those that are relevant to the company circumstances. The adverse scenarios may be single-risk or an integration thereof. Possible adverse scenarios include but not limited to risks associated with claims frequency and severity, policy liabilities, investment and reinsurance. They are categorized as solvency or going-concern. A solvency scenario is a plausible adverse scenario if it is credible and has a non-
trivial chance of occurring whereas a going-concern scenario is more likely to occur and less severe.

The approach used to determine adverse scenarios may be stochastic (based on statistical models), deterministic (based on judgement), or a combination of the two.

3. Identification and analysis of the effectiveness of corrective management actions to mitigate risks. Possible management actions include repricing products, reducing planned dividends and strengthening capital.

4. Reporting on the results of the analysis

5. An opinion by the Appointed Actuary. The financial condition is deemed satisfactory if throughout the forecast period, the following are met:
   - Under the solvency scenarios, the statement value of the insurer’s assets is greater than the statement value of its liabilities;
   - Under going concern scenarios, the insurer meets the regulatory minimum capital ratio; and
   - Under the base scenario, the insurer meets its internal target capital ratio as determined by the ORSA.

DCAT utilizes the regulatory formula for the capital adequacy standard. The report need not include any explanation on the development and/or validity of the regulatory capital formula used. In most cases it will suffice to disclose the following:

   - The applicable federal and/or provincial regulatory formula(s);
   - For insurers subject to target capital requirements under multiple jurisdictions, the rationale for using the selected formula; and
   - The target requirement used in the projections and the rationale.

FCT analysis provides the Appointed Actuary with significant information about the financial condition of a company. The base scenario is in essence the business plan of the company throughout the forecast period. A review of the business plan should allow the Appointed Actuary to learn much about the company, including the following:

   - Whether the company is growing or contracting through the forecast period and, if relevant, the level at which it is growing;
   - Whether the company is profitable throughout the period and whether the profits are sufficient to grow the capital base to support the growth of the company;
   - Planned changes in mix of business written by the company through the forecast period;
   - Planned changes to reinsurance programs, investment philosophies, expenses, etc.

Further, the adverse scenarios can reveal information about the risk management strategy employed by the company. For example, if a scenario that tests the impact of a change in interest rates has very little impact on the company, it is likely that the company has employed an asset/liability matching strategy to minimize the impact of this event. Adverse
scenarios can also identify risks to which the company's financial condition is particularly sensitive, and the Appointed Actuary can work with management in developing mitigation strategies to manage these risks.

INDUSTRY RESEARCH

Market-Security Analysis and Research, Inc.

Market-Security Analysis and Research, Inc. (MSA) is a Canadian analytical research firm that is focused on the Canadian insurance industry. While MSA is not a rating agency, it publishes many reports and also offers a software tool that allows for comprehensive analysis of company and industry results in significant detail over a number of years. Canadian insurers are also monitored by major rating agencies such as A.M. Best, Standard & Poor's, and Moody's.

Individual company reports are presented by way of a number of exhibits. The first exhibit (Exhibit 1) is titled “Key Company Information.” It presents key information about the company's type of license, ownership, and distribution category; identification of the appointed actuary and external auditor; and the name of the CEO or chief agent. There is additional information included in this exhibit for companies with publicly traded parents.

Key financial indicators are included in Exhibit 2. A number of regulatory tests and early warning indicators are included, such as:

- The MCT/BAAT ratio
- Profitability measures such as return on equity, return on revenue, return on assets after tax, and insurance return on net premium earned
- Liabilities as a percentage of liquid assets
- Net loss reserves to equity
- One-year loss development to equity
- Overall net leverage

The above measures are used by OSFI and other regulatory bodies as early warning solvency indicators. In its reports, MSA flags results that fall outside of OSFI's acceptable range. The MCT/BAAT ratios are OSFI's Risk-Based Capital adequacy assessment and are important measures of a company's financial position. If a company fails this test, it will likely be the subject of regulatory intervention. Often companies fail certain other ratios without being in distress; thus, the Appointed Actuary should consider results across all of the tests as a whole when making judgments about a company's financial position.

There are also supplementary ratios calculated to provide more summary-level information about the company, including:

- Investment yield (including realized capital gains)
- Change in net premium written
- Change in gross premium written
- Change in equity
- AOCI to equity
- Reinsurance recoverable to equity
- Net underwriting leverage ratio (ratio of net premiums written to equity)
- Two-year combined ratio
- Overall diversification score
PART VIII. THE FUTURE OF SAP

INTRODUCTION TO PART VIII

Regulation and financial reporting of insurance companies has evolved over time. The original FASB accounting standard for insurance entities (FAS 60) was discussed and developed in the 1970s and adopted in June 1982. The NAIC codified its statutory accounting principles, effective January 1, 2001. Today we see the implications of the work performed by the FASB and the IASB on insurance contracts accounting and the NAIC’s Solvency Modernization Initiative (SMI). So, what is driving change today and where are we heading?
In Part VI. Differences from Statutory to other Financial/Regulatory Reporting Frameworks in the U.S., we discussed the reasons behind the development of new accounting standards for insurance contracts by the Financial Accounting Standards Board (FASB) and the International Accounting Standards Board (IASB). The National Association of Insurance Commissioners’ (NAIC) Solvency Modernization Initiative was started in part because of pressure to conform to new and evolving international standards. In November 2008 at a G20 summit, during the global financial crisis, the G20 members agreed to undergo periodic peer reviews of their financial services regulatory regimes. This peer review process was developed by the International Monetary Fund and World Bank in response to the financial crisis in the late 1990s but had mainly been applied to developing countries. This peer review process is called the Financial Sector Assessment Program (FSAP).

The NAIC participated in the FSAP process during 2010 for the first time, and again in 2015. The assessment process benchmarked the U.S. insurance regulatory regime against the Insurance Core Principles (ICPs) developed and published by the International Association of Insurance Supervisors (IAIS). The results of the 2010 assessment were generally favorable but were based on the ICPs published in 2003. In October 2011, the IAIS published a revised set of ICPs, with amendments to certain of the ICPs published through November 2018. This revised set of ICPs were used to perform the 2015 FSAP review.

The 2015 FSAP concluded that while there were improvements since 2010, there remained difficulties in assessing the health of the U.S. insurance sector. In particular:

“Capital adequacy at legal entity level, measured by the regulators’ risk-based capital (RBC) requirements, has increased since the crisis, and the number of companies breaching regulatory levels has declined. However, capital adequacy ratios are hard to interpret due to valuation rules, regulatory arbitrage via captives, and lack of regulatory capital adequacy measures at group level.”

The report also noted that one area that still poses a challenge is ICP 14, Valuation. ICP 14 states the following:

“The context and purpose of the valuation of assets or liabilities of an insurer are key factors in determining the values that should be placed on them. This ICP considers the valuation requirements that should be met for the purpose of the solvency assessment of insurers within the context of IAIS risk-based solvency requirements that reflect a total balance sheet approach on an economic basis and address all reasonably foreseeable and relevant risks.”
ICP 14 also states that “an economic value should reflect the prospective valuation of the future cash flows of the asset or liability allowing for the riskiness of those cash flows and the time value of money.” Some may argue the current statutory valuation of property/casualty liabilities does not comply with this statement as it doesn’t reflect the time value of money, except in limited circumstance, nor the underlying risk. The 2015 FSAP found that the U.S. insurance regulatory regime only partially observed this ICP. It recommended:

“Allowing for conservatism explicitly in a margin over current estimate would increase transparency. The explicit decomposition of reserves into a current estimate and a margin over current estimate allows assessment of the overall conservatism for different lines of products. This would allow a recalibration of the valuation standard for products where reserves are overly conservative or not sufficient.”
In addition to the revised set of ICPs, the IAIS has been developing a Common Framework for the Supervision of Internationally Active Insurance Groups, commonly referred to as ComFrame. The final framework was published in November 2019.

U.S. regulators have expressed concerns about the valuation approach under ComFrame which requires a margin over the current estimate for valuation purposes, also known as a GAAP plus valuation approach. U.S. regulators have instead proposed allowing an aggregation approach based on current local requirements in determining the required amount of group capital. As a compromise there will be a five year monitoring period to assess GAAP plus valuation and its effect on the prescribed capital requirement versus the aggregated approach proposed by U.S. regulators.

The Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 created the Federal Insurance Office (FIO), which has several functions. The relevant functions are:

- To coordinate federal efforts and develop federal policy on prudential aspects of international insurance matters, including representing the U.S., as appropriate, in the IAIS and assisting the Treasury Secretary in negotiating covered agreements (bilateral or multilateral agreements entered into by the U.S. regarding prudential measures with respect to the business of insurance or reinsurance)
- To determine whether state insurance measures are preempted by covered agreements
- To consult with the states (including state insurance regulators) regarding insurance matters of national importance and prudential insurance matters of international importance

Effectively, this gives the FIO the power to act like a national regulator for purposes of negotiating the contents of ComFrame and its group capital requirement as it can preempt state law if the director of the FIO determines that the measure “results in less favorable treatment of a non-U.S. insurer domiciled in a foreign jurisdiction that is subject to a covered agreement than a U.S. insurer domiciled, licensed, or otherwise admitted in that State,” and state law “is inconsistent with a covered agreement.”

In addition to the FIO, Dodd-Frank gave the Federal government powers to regulate systemically important financial institutions (SIFI). What financial institutions are systemically important is determined by the Financial Stability Oversight Council, a body set up by Dodd-Frank to reduce the risk of any one company being “too big to fail.”
THE FUTURE

All the above activities by the NAIC, FASB, IASB, IAIS, and the FIO leave us with a very muddy picture of how insurance liabilities will be evaluated in the future. The common theme, though, is change, as each proposed framework differs from the current valuation of insurance liabilities today. Several scenarios could play out that would leave us with several different frameworks in place. Yet, any of these changes individually would have one common result: a greater need for actuaries to perform the additional calculations and explain the drivers of the results.
Accepted Actuarial Practice (AAP)
The manner of performing work in accordance with rules and standards of practice as promulgated by the relevant actuarial body, e.g., American Academy of Actuaries in the U.S. or the Canadian Institute of Actuaries in Canada.

Accident year
The calendar year in which the accident occurs and/or the loss is incurred.

Accumulated other comprehensive income (AOCI)
The cumulative value of other comprehensive income or the total of unrealized gains and losses on (i) available-for-sale assets such as loans, bonds and debentures and equities; (ii) derivatives designated as cash flow hedges; (iii) foreign currency translation; and (iv) share of other comprehensive income of subsidiaries, associates, and joint ventures. AOCI is included on the balance sheet of a Canadian insurance company in equity.

Actuarial Opinion Summary (AOS)
A confidential document containing the appointed actuary’s range of unpaid claim estimates and/or point estimate, as calculated by the appointed actuary, in comparison to the company’s recorded reserves on both a net and gross of reinsurance basis.

Actuarial Standards Board (ASB)
“The Actuarial Standards Board (ASB) establishes and improves standards of actuarial practice. These Actuarial Standards of Practice (ASOPs) identify what the actuary should consider, document, and disclose when performing an actuarial assignment. The ASB’s goal is to set standards for appropriate practice for the U.S.”

Actuarial Standards of Practice (ASOP)
“ASOPs are intended to provide actuaries with a framework for performing professional assignments and to offer guidance on relevant issues, recommended practices, documentation, and disclosure.”

Adjusting and other (A&O) expenses
One of the two components of loss adjustment expense, with defense and cost containment being the other. A&O generally include all expenses associated with the

---

adjusting and recording of insurance claims, other than those included with defense and cost containment expenses. According to the 2011 National Association of Insurance Commissioners Annual Statement Instructions Property/Casualty, A&O expenses are “those expenses that are correlated with claim counts or general loss adjusting expenses.”

Alien insurance company
A company doing business in the U.S. that is incorporated under the laws of a country outside the U.S.

Allocated loss adjustment expenses (ALAE)
Expenses that can be readily assigned to a specific claim, such as attorney fees.

A.M. Best Company
A global credit rating agency that serves the financial and health care service industries. In the insurance area, Best’s Credit Ratings cover property/casualty, life, annuity, reinsurance, captive, title and health insurance companies as well as health maintenance organizations. A.M. Best covers thousands of insurance entities across the globe.

American Academy of Actuaries Committee on Property and Liability Financial Reporting (COPLFR)
“This committee monitors activities regarding financial reporting related to property and liability risks, reviews proposals made by various organizations affecting the actuarial aspects of financial reporting and auditing issues related to property and liability risks, and evaluates property and liability insurance and self-insurance accounting issues.”

Amortized cost
“The cost of bonds less the amortization of premium, or plus the accumulated accrual of discount, from the date of purchase to the date of valuation.”

Annual Statement
A filing made annually by an insurance company to each state insurance department in which it writes business. The filing is prepared under Statutory Accounting Principles and includes the company’s financial statements and various supporting schedules and exhibits.

214 2018 NAIC Annual Statement Instructions Property/Casualty, page 225.
Glossary of Terms

Appointed actuary
“A qualified actuary appointed the Board of Directors, or its equivalent, or by a committee of the Board to render a statement of actuarial opinion. ‘Qualified Actuary’ is a person who is either:
i. A member in good standing of the Casualty Actuarial Society, or
ii. A member in good standing of the American Academy of Actuaries who has been approved as qualified for signing casualty loss reserve opinions by the Casualty Practice Council of the American Academy of Actuaries.”

Assets
Resources obtained or controlled by a company as a result of past events that have a probable future economic benefit to the company.

Authorized control level (ACL)
The level of Risk-Based Capital within which the state regulatory authority is authorized, but not required, to take control of an insurance company. This level is triggered when a company’s total adjusted capital is between 70% and 100% of the ACL benchmark.

Authorized reinsurer
A reinsurer that is licensed or approved to transact insurance business in a jurisdiction; an unauthorized reinsurer is not.

Balance sheet
The financial statement that presents all of a company’s assets and liabilities as of a specific point in time.

Branch Adequacy of Asset Test (BAAT)
Guideline for federally regulated property/casualty insurance companies published by the Office of the Superintendent of Financial Institutions that provides the framework within which the Superintendent assesses whether a property/casualty company, or a foreign branch, maintains adequate capital.

Canadian Institute of Actuaries (CIA)
The national organization of the Canadian actuarial profession.

Chartered Professional Accountants Canada (CPA Canada)  
“Chartered Professional Accountants of Canada (CPA Canada) is one of the largest national accounting organizations in the world and is a respected voice in the business, government, education and non-profit sectors.

CPA Canada is a progressive and forward-thinking organization whose members bring a convergence of shared values, diverse business skills and exceptional talents to the accounting field. Domestically, CPA Canada works cooperatively with the provincial and territorial CPA bodies who are charged with regulating the profession. Globally, it works together with the International Federation of Accountants and the Global Accounting Alliance to build a stronger accounting profession worldwide. As one of the world’s largest national accounting bodies, CPA Canada carries a strong influential voice and acts in the public interest.”

Cap  
“An agreement obligating the seller to make payments to the buyer, each payment under which is based on the amount, if any, that a reference price, level, performance or value of one or more Underlying Interests exceed a predetermined number, sometimes called the strike/cap rate or price.”

Carryforward of net operating losses  
An accounting practice used when an insurance company has net operating losses in one financial year and expects those losses to offset gains in the future, thereby reducing future tax liability.

Carrying value  
An initial cost of an investment adjusted over time based on the reporting entity’s share in the company’s income.

Case development  
Increases or decreases in the reserves for known claims as additional information becomes available.

Case incurred loss  
The reported value of a known claim equal to the sum of paid losses plus case outstanding losses.

219 2018 NAIC Annual Statement Instructions Property/Casualty, page 373.
Glossary of Terms

Case outstanding loss
The reserve for a known claim, or case reserve, generally established by the company’s claims administrator(s)/handler(s) based either on the facts of the particular claim or based on formula.

Case reserves
See definition for case outstanding loss

Cash flow statement
A statement that presents a company’s operations strictly from a cash perspective.

Ceded reinsurance premiums payable
Premiums that are owed to reinsurers relating to ceded reinsurance.

Ceding commission
A fee paid by the reinsurer to the insurance company (ceding company) for the reinsurance transaction. The fee is generally expected to reimburse the insurer for policy acquisition expenses.

Certified public accountant (CPA)
“Professional accountant who has passed the uniform CPA examination administered by the American Institute Of Certified Public Accountants, and has fulfilled the educational and work related experience requirements for certification.”

Claim frequency
The rate of claim occurrence, typically calculated as the ratio of claim counts to exposures.

Claim severity
The average cost of a claim, typically calculated as the ratio of losses to claim counts.

Claims-made policy
An insurance policy covering claims that arise on or after the policy retroactive date and are reported during the term of the policy. The retroactive date may be a date many years before the purchase of the policy. Therefore, a claims-made policy may cover claims made today that result from actions that occurred any time after the retroactive date.

Glossary of Terms

Collar
“An agreement to receive payments as the buyer of an Option, Cap or Floor and to make payments as the seller of a different Option, Cap or Floor.”

Common capital stock
A surplus account that is equal to the par value of common stocks that were issued.

Common stock
A type of stock holding that confers voting privileges and may pay a dividend, though the dividend is not guaranteed.

Commutation of ceded reinsurance
The agreement to fully settle all current and future liabilities associated with a reinsurance agreement for a set payment from the reinsurer.

Commuting a claim
A process in which one party is relieved of its obligations in respect of the claim in exchange for a cash payment.

Contingent commissions
Additional commissions paid by an insurance company to its broker if certain volume and/or profit targets are met.

Contingent liabilities
Amounts for which the insurance company may be held responsible but for which the balance is not currently determinable.

Credit risk
A risk that the counterparty will default (or not pay in whole or in part) and the estimation risk associated with amounts recorded for those receivables.

Defense and cost containment (DCC)
One of the two components of loss adjustment expense, with adjustment and other expense being the second. DCC generally includes defense, litigation and medical cost containment expenses, whether internal or external. According to the 2011 NAIC Annual Statement Instructions Property/Casualty, DCC expenses are “those that are correlated with the loss amounts.”

---

221 2018 NAIC Annual Statement Instructions Property/Casualty, page 373.
222 Ibid., page 225.
Deferred acquisition costs (DAC)
An asset that is established under U.S. Generally Accepted Accounting Principles to defer the recognition of acquisition expenses to match the recognition of revenue of insurance companies.

Deferred tax assets (DTAs)
Expected future tax benefits related to amounts previously recorded in the statutory financial statements and not expected to be reflected in the tax return as of the reporting date.

Derivatives
Financial contracts between two parties for which the value is dependent upon the performance of other assets or variables. Examples include options, warrants, caps, floors, collars, swaps, forwards and futures.

Discount rate
The term commonly used when referring to the rate at which the present value of cash flows are calculated.

Discovery year
A calendar year in which a loss or damage is discovered.

Dividends received deduction (DRD)
In the case of corporate stockholders, DRDs are certain allowances that are made to reduce tax on dividends to avoid triple taxation when the Company in turn dividends earnings to their investors.

Dynamic Capital Adequacy Testing (DCAT)
A process of analyzing and projecting the trends of a company’s financial condition given its current financial and operating circumstances, its recent past, and its intended business plan under a variety of future scenarios.

Earned but unbilled premiums
Estimated adjustments that will occur to the premium on policies where the actual amount of premium depends on an exposure measure (such as payroll) that is unknown until the end of the policy period.

Encumbrance
An impediment or claim on an asset made by a party that restricts the value of asset from complete use by the owner until the owner clears its obligation to the other party. An example is a lien on a property.
Glossary of Terms

Equity method
A method under which investments in insurance company subsidiary, controlled and affiliated entities (SCAs) are recorded based on the reporting entity’s proportionate share of audited statutory equity of the SCA’s balance sheet, adjusted for any unamortized goodwill.

Excess treaty reinsurance
A contract under which the reinsurer responds to claims during the treaty period excess of a specified threshold to a specified limit.

Exhibit of Capital Gains (Losses)
An Annual Statement exhibit that shows the split of the gains (losses) between those gains (losses) that were realized on the sale or maturity of an asset and those due to impairments.

Exhibit of Net Investment Income
An Annual Statement exhibit that differentiates between the amount of income collected and the amount of income earned in the year and describes the deductions for investment expenses and other costs.

Facultative reinsurance
A reinsurance contract that is negotiated separately for each insurance policy that is reinsured. Facultative reinsurance is purchased for individual risks that are not covered, or not adequately covered, by the insurer’s treaty reinsurance.

Fair value
The value at which an asset or liability could be bought or sold for in the open market.

Financial Accounting Standards Board (FASB)
A private organization providing authoritative accounting guidance for non-governmental entities. It has the responsibility of developing and establishing U.S. Generally Accepted Accounting Principles, with the Securities and Exchange Commission operating in an overall monitoring role over the application of the accounting standards by public companies.

Floor
“An agreement obligating the seller to make payments to the buyer, each payment under which is based on the amount, if any, that a predetermined number, sometimes
called the strike/floor rate or price exceeds a reference price, level, performance or value of one or more Underlying Interests.”  

Forward

“An agreement (other than a Future) to make or take delivery of, or effect a cash settlement based on, the actual or expected price, level, performance or value of one or more Underlying Interests.”

Future

“An agreement traded on an exchange, Board or Trade or contract market to make or take delivery of, or effect a cash settlement based on, the actual or expected price, level, performance or value of one or more Underlying Interests.”

General expenses

Insurance company operating and administrative expenses other than those that relate directly to the acquisition of the business or ongoing policy maintenance costs incurred by an insurance company.

General Interrogatories

A series of questions that the insurance company is required to respond to within its Annual Statement.

Generally Accepted Accounting Principles (GAAP)

An accounting framework that provides a consistent set of rules under which publicly traded and privately held companies report their financial transactions.

Goodwill

An intangible asset that results from the excess of the price paid for an acquired entity and its book value (for U.S. SAP) or fair value (for U.S. GAAP). It represents the value perceived by the buyer in the company for things like customer relationships or trade name, which are not physical or material assets but can be bought or sold due to their relevance to the company’s future profitability.

Governmental Accounting Standards Board (GASB)

“...the independent private-sector organization... that establishes accounting and financial reporting standards for U.S. state and local governments that follow generally accepted accounting principles (GAAP).”

223 2018 NAIC Annual Statement Instructions Property/Casualty, page 373.
224 Ibid., page 373.
225 Ibid., page 374.
Glossary of Terms

Income statement
A statement that describes a company's gain or loss in net income during a specific time period.

Incurred but not reported (IBNR)
The reserve for claims that have been incurred but not yet reported to the insurance company. IBNR includes a provision for development on known claims ("case development"), a provision purely for those claims that are incurred but not yet reported to the insurance carriers ("pure IBNR"), and reopened claims.

Insurance Expense Exhibit (IEE)
An Annual Statement exhibit that enables regulators to dive deeper into an insurance company's profitability by examining profitability by line of business on a direct and net of reinsurance basis.

Insurance Regulatory Information System (IRIS)
A collection of analytical solvency tools and databases designed to provide state insurance departments with an integrated approach to screening and analyzing the financial condition of insurers. IRIS is used to assist each state in prioritizing which companies need additional regulatory attention.

Insurance contract
A contract under which one party (the insurer) accepts significant insurance risk from another party (the policyholder) by agreeing to compensate the policyholder if a specified uncertain future event (the insured event) adversely affects the policyholder.

Insurance or underwriting risk
The risk of an insurance company associated with issuing insurance policies.

Intercompany pooling
A common arrangement among companies in a group in which each participant fully cedes all of its business to the lead insurance company of the pool, and then each participant assumes back a specific percentage of the total.

Interest rate risk
The risk of loss from changes in interest rates impacting interest-rate-sensitive assets and liabilities.
Glossary of Terms

Internal Revenue Service (IRS)
The U.S. government agency that is responsible for establishing tax laws and collecting taxes.

Internal Target Capital Ratio
The ratio determined by an insurance company intended to provide capacity to withstand unexpected losses beyond those covered by the minimum capital ratio. Canadian property and casualty companies are asked by the Office of the Superintendent of Financial Institutions to establish their own internal target capital ratio.

International Accounting Standards Board (IASB)
“The Board is an independent group of experts with an appropriate mix of recent practical experience in setting accounting standards, in preparing, auditing, or using financial reports, and in accounting education...Board members are responsible for the development and publication of IFRS Standards including the IFRS for SMEs Standard. The Board is also responsible for approving interpretations of IFRS Standards as developed by the IFRS Interpretations Committee (formerly IFRIC).”227

International Financial Reporting Standards (IFRS)
The accounting standards promulgated by the International Accounting Standards Board typically used for financial reporting by companies licensed in countries outside of the U.S.

Investment affiliate
An affiliate, other than a holding company, engaged or organized primarily to engage in the ownership and management of investments for the insurer. Investment affiliates exclude entities that manage funds of organizations other than the parent.

Letters of credit
Issued by a bank to guarantee that payment will be made by a borrower to the lender. In the case of reinsurance transactions, a letter of credit guarantees that the reinsurer will be able to meet its obligations to the reinsured. The bank typically charges for this guarantee as a percent of its value. The percentage rate generally rises during periods of uncertain economic times.

Liability
An obligation that the company must fulfill based on past events or transactions that will require the use of monetary resources.

Liquidity/Illiquidity premium
In a situation when the ability to readily trade the asset results in a lower discount rate being applied to the tradable asset’s future cash flows than that of the privately held asset, the difference in the discount rates is the liquidity/illiquidity premium for the privately held asset.

Loss adjustment expense (LAE)
Expenses associated with the handling of a claim from the time it is reported to the insurance company until the time it is closed. LAE includes allocated loss adjustment expenses (ALAE) and unallocated loss adjustment expenses (ULAE). The National Association of Insurance Commissioners currently uses the defense and cost containment (DCC) and adjusting and other (A&O) expenses to comprise the two forms of LAE. While LAE in total is equivalent under either the ALAE/ULAE or DCC/A&O definitions, it is the segregation of expenses between the two that differs. DCC generally includes defense, litigation and medical cost containment expenses, whether internal or external, and A&O includes all expenses associated with adjusting and recording policy claims, other than those included with DCC.

Mandatorily convertible security
A security that is required to be exchanged for another type of security at a specified price that differs from the market price at the time of conversion.

Market-Security Analysis & Research (MSA)
A Canadian analytical research firm that is focused on the Canadian insurance industry.

Market valuation approach
A valuation approach in which an investment by an insurance company in subsidiary, controlled and affiliated entities (SCAs) is based on the market value of the SCA, adjusted for the reporting entity’s ownership percentage.

Maximum net deferred policy acquisition expense (DPAE)
A ceiling to the amount of the DPAE asset that a property/casualty insurance company may record on its financial statements in Canada.

Minimum capital ratio
Minimum Capital Test (MCT) ratio of 100%
Minimum capital requirement (MCR)
The smallest level of capital at which a company would be permitted to operate in Canada per the Office of the Superintendent of Financial Institutions.

Minimum capital test (MCT)
Guideline for Federally Regulated Property and Casualty Insurance Companies published by the Office of the Superintendent of Financial Institutions that provides the framework within which the Superintendent assesses whether a property/casualty company, or a foreign branch, maintains adequate capital. MCT compares capital available to capital required.

Mortgage-backed security (MBS)
"Debt instrument secured by a mortgage or a pool of mortgages (but not conveying a right of ownership to the underlying mortgage). Unlike unsecured securities, they are considered 'investment grade,' and are paid out of the income generated by principle and interest payments on the underlying mortgage. It is a type of mortgage derivative."228 We note that there can be MBS securities designated by the NAIC at 3 through 6, which would be equivalent to a below investment grade designation for bonds.

National Association of Insurance Commissioners (NAIC)
Serves as an organization of state regulators that facilitates and coordinates governance of insurance companies across the U.S.

NAIC Model Investment Law
Allows for two alternative types of investment guidelines:

1. The defined limit system of investment guidelines follows a rule-based approach and prescribes specific quantitative limits for the invested assets that a company may hold.
2. The prudent person system of investment guidelines follows a principles-based approach and requires an insurance company to develop its own investment guidelines.

NAIC’s Securities Valuation Office (SVO)
“The National Association of Insurance Commissioners’ Securities Valuations Office (SVO), one of three groups within the Capital Markets & Investment Analysis Office, is responsible for the day-to-day credit quality assessment of securities owned by state regulated insurance companies. Insurance companies report ownership of securities

Glossary of Terms

Net income/Net loss
The difference between the amount of the revenues and expenses during the period. It is referred to as net income if it is positive and net loss if it is negative.

Net investment income earned
Interest and dividends received on investment assets held over the course of the year, net of investment expenses including any associated taxes.

Net realized capital gain (loss)
Income received related to changes in the value of investment assets that are held under U.S. SAP, net of any associated taxes.

Nonadmitted assets
Assets that are not recognized by state insurance departments in evaluating the solvency of an insurance company for statutory accounting purposes.

Notes to Financial Statements
Qualitative and quantitative disclosures made by a company to further explain the balances shown in its financial statements.

Off-balance sheet and other items
Amounts that are not recorded by the insurance company in its statutory financial statements yet still represent assets and/or potential liabilities of the insurance company and therefore expose the company to risk.

Office of the Superintendent of Financial Institutions (OSFI)
The organization that supervises all federally regulated financial institutions, monitors federally regulated pension plans and provides actuarial advice to the Government of Canada.

Option
“An agreement giving the buyer the right to buy or receive, sell or deliver, enter into, extend or terminate, or effect a cash settlement based on the actual or expected price, level, performance or value of one or more Underlying Interests.”

---

230 2018 NAIC Annual Statement Instructions Property/Casualty, page 373.
Other comprehensive income (OCI)
Changes in unrealized gains and losses on (i) available for sale assets such as loans, bonds and debentures and equities; (ii) derivatives designated as cash flow hedges; (iii) foreign currency translation; and (iv) share of OCI of subsidiaries, associates and joint ventures. OCI is required by U.S. GAAP and International Financial Reporting Standards.

Overdue authorized reinsurance
Reinsurance for which the amount of paid loss and loss adjustment expense recoverable is more than 90 days past due for reasons other than dispute between the insurance company and the reinsurer.

Own risk self-assessment (ORSA)
The entirety of the processes and procedures employed to identify, assess, monitor, manage and report the short- and long-term risks a (re) insurance undertaking faces or may face and to determine the own funds necessary to ensure that the undertaking’s overall solvency needs are met at all times.

Paid losses
Amounts paid by the insurance carrier for insured claims.

Par value
An amount set by the issuer of a stock when the stock is initially offered, which serves as a minimum value for which the stock can be sold in that initial offering.

Policyholder dividend
A return to the policyholder of a portion of the premium that was originally paid by the policyholder. There are typically state requirements that must be met for a company to pay dividends.

Preferred stock
A stock holding that does not confer voting privileges but usually provides a guarantee on dividends to be paid and usually has preference to common stock in the event of liquidation.

Premium deficiency reserve
A reserve that must be recorded when the unearned premium of in-force business is not sufficient to cover the losses, loss adjustment expense and other expenses that will arise when that premium is earned.
Glossary of Terms

Proportional treaty
A contract under which the reinsurer receives a set proportion of all premiums subject to the treaty, net of ceding commission, and in return pays the same proportion of all claims subject to the treaty.

Protected cell company
A company that comprises individual cells, each with its own assets, liabilities and equity, but that also has access to a part of the company's overall capital. The liability to each cell is limited such that creditors to one cell cannot look to another cell or the company as a whole for assets.

Provision for adverse deviation (PfAD)
A provision required in Canada for adverse deviation in a company's loss reserves determined by increasing the value of variables used in the reserve estimation process.

Provision for reinsurance
A penalty for reinsurance recoverables that may not be collectible. The amount of this provision is a reduction to surplus. This penalty applies to unauthorized reinsurers that do not provide full collateral, that are slow to pay or that have disputed amounts owed to the ceding company, as well as the authorized reinsurers that are slow to pay or that have disputed amounts that are owed to the ceding company.

Regulation S-X
The Securities and Exchange Commission's regulation that contains general instructions to all companies around the composition and presentation of financial statements.

Reinsurance contract
Oftentimes considered insurance for insurance companies, a contract under which one party (the insurer or reinsured) transfers risk to another party (the reinsurer) to protect the insurer (reinsured) from financial loss.

Replication (synthetic asset) transaction
A derivative transaction entered into in conjunction with other investments to reproduce the investment characteristics of otherwise permissible investments.

Report year
A calendar year in which losses are reported.
Reported loss
   Amount of paid plus case outstanding losses incurred by an insurance company. It represents the dollar value of loss known to the insurance company. Reported loss is synonymous with the term case incurred loss.

Reserve risk
   The risk that a reporting entity’s loss and loss adjustment expense reserves will develop adversely.

Retroactive date
   The date specified in a claims-made insurance policy that defines the first day on which incurred losses are covered under the policy.

Retroactive reinsurance
   Reinsurance that is purchased for liabilities that occurred in the past (i.e., prior to the effective date of the reinsurance policy).

Revenue offset
   A reduction in earned premium to account for a lack of deferred acquisition costs.

Review date
   The valuation date through which material information known to the actuary is included in forming the reserve opinion.

Risk-Based Capital (RBC)
   A solvency framework developed by the National Association of Insurance Commissioners from which an amount of capital is determined formulaically based on the application of specified factors to an insurance company’s admitted assets and liabilities recorded as of year-end. The calculated amount, or RBC, is compared to the total adjusted capital for the insurance company at year-end to determine the level, if any, of company or regulatory action required from a solvency perspective.

Risk-Based Capital ratio (RBC ratio)
   The ratio of total adjusted capital to the authorized control level benchmark computed under the National Association of Insurance Commissioners RBC framework.

Schedule A
   A schedule within an Annual Statement that provides information on real estate directly owned by the insurance company.
Schedule B
A schedule within an Annual Statement that provides information on mortgage loans owned by the insurance company that are backed by real estate.

Schedule BA
A schedule within an Annual Statement that provides information on other long-term invested assets owned by the insurance company. These are assets not included in any of the other invested asset schedules, such as real estate that is not owned directly by the insurance company and therefore excluded from Schedule A.

Schedule D
A schedule within an Annual Statement that provides information on bonds and stocks owned by the insurance company.

Schedule DA
A schedule within an Annual Statement that provides information on short-term investments owned by the insurance company. The schedule includes all investments whose maturities (or repurchase dates under repurchase agreement) at the time of acquisition were one year or less except those defined as cash or cash equivalents in accordance with SSAP No. 2R, Cash, Cash Equivalents, Drafts and Short-term Investments.

Schedule DB
A schedule within an Annual Statement that provides the number of contracts for each derivative and the notional amount, which represents the number of units of the underlying asset that are involved.

Schedule DL
A schedule within an Annual Statement that provides information on securities lending reinvested assets.

Schedule E
A schedule within an Annual Statement that provides information on the insurance company’s cash and cash equivalents.

Schedule F
A schedule within an Annual Statement that provides information on an insurance company’s assumed and ceded reinsurance transactions.
Glossary of Terms

Schedule P
A schedule within an Annual Statement that provides loss and loss expenses reserves gross and net and also breaks down the total reserves by line of business and accident year.

Schedule P interrogatories
A series of questions that the insurance company is required to answer to provide further insight into the information reported in Schedule P.

Schedule T
A schedule within an Annual Statement that provides an allocation of its contents by U.S. state (50) and the District of Columbia, as well as five U.S. territories (American Samoa, Guam, Puerto Rico, U.S. Virgin Islands and Northern Mariana Islands), Canada, and “aggregate other alien” territories.

Securities and Exchange Commission (SEC)
The authoritative body for establishing accounting and reporting standards for publicly traded companies in the U.S.

Solvency capital requirement (SCR)
An amount of capital required to limit the probability of ruin over the forthcoming year to 0.5%

Statement of Actuarial Opinion (SAO)
The opinion of a qualified actuary on the reasonableness of the loss and loss adjustment expense reserves recorded by a property/casualty insurance company as of December 31 each year.

Statement of cash flows
A statement that shows cash inflows and outflows from a company’s operations, investments, financing and other sources, the net value of which is included as the value of cash and cash equivalents (and short-term investments under U.S. SAP) that is shown on the balance sheet at the end of the reporting period.

Statement of Changes in Equity exhibit
A statement included within the financials of a Canadian insurance company illustrating the change in equity across the various classes of equity (e.g., share capital, retained earnings, available for sale financial assets) resulting from various transactions or events such as issue of share capital, total comprehensive income for the year, dividends, etc.
Statement of retained earnings
A statement included within the financials of a Canadian insurance company that provides the calculation of the retained earnings for the insurance company at the end of the reporting period.

Statutory Accounting Principles (SAP)
The accounting framework that all U.S. insurance companies are required to report under for state regulatory purposes: “accounting principles or practices prescribed or permitted by an insurer’s domiciliary state.”

Structured settlements
A situation where an insurance company settles a claim by purchasing an annuity on behalf of a claimant.

Surplus (policyholders’ surplus)
The difference between assets and liabilities is generally referred to as net worth, and, in the specific case of an insurance company under statutory accounting, it is referred to as surplus.

Surplus aid
An amount of enhancement to surplus in the current period as a result of ceding commission that has been taken into income on its ceded unearned premium.

Surplus ratio
A ratio of mean policyholders’ surplus to the sum of mean net loss and loss adjustment reserves, mean net unearned premium reserves and current year net earned premiums, in total for all lines combined.

Swap
“An agreement to exchange or net payments at one or more times based on the actual or expected price, level, performance or value of one or more Underlying Interests or upon the probability occurrence of a specified credit or other event.”

Tabular reserves
Indemnity reserves that are calculated using discounts determined with reference to actuarial tables that incorporate interest and contingencies such as mortality, remarriage, inflation or recovery from disability applied to a reasonably determinable payment stream. This definition does not include medical loss reserves or any LAE reserves.

---

232 2018 NAIC Annual Statement Instructions Property/Casualty, page 373.
Glossary of Terms

Tail coverage  
Coverage issued as an endorsement to a claims-made policy that covers claims incurred after the retroactive date but reported to the insurer subsequent to the claims-made policy expiration date.

Tax-basis earned premium  
Earned premium adjusted for a revenue offset.

Tax-basis incurred losses and expenses  
Statutory calendar-year incurred paid losses plus the change in discounted loss reserves.

Total comprehensive income  
Net income as reported by Canadian insurance companies on the Statement of Income plus other comprehensive income.

Treaty reinsurance  
A reinsurance contract that applies to all or a portion of an insurance company’s policies written during the term of the reinsurance agreement, typically a calendar year.

Unallocated loss adjustment expenses (ULAE)  
Expenses associated with the handling of claims that are not generally assigned to a particular claim, such as salaries for adjustors and utility costs.

Underwriting income  
Earned premium minus loss and LAE incurred and other underwriting expenses incurred.

Unearned commissions  
Ceding commissions from reinsurance that are not yet earned by the insurance company.

Unearned premiums  
The premium that corresponds to the time period remaining on an insurance policy prior to expiration.

Unpaid loss (or loss reserve)  
Amount of case outstanding plus incurred but not reported reserves. It represents the remaining amount expected to be paid on claims incurred by the insurance company.
Glossary of Terms

Value at risk
“Largest loss likely to be suffered on a portfolio position over a holding period (usually 1 to 10 days) with a given probability (confidence level). VAR is a measure of market risk, and is equal to one standard deviation of the distribution of possible returns on a portfolio of positions.”233

Warrant
“An agreement that gives the holder the right to purchase an underlying financial instrument at a given price and time or at a series of prices and times according to a schedule or warrant agreement.”234

Written premium risk
A risk that future business written by the company will be unprofitable.

Yield curve
“Graph used typically to show yields for different bond maturities and used for determining the best value in bonds and as an economic indicator. Positive (upward sloping) curve indicates an expanding economy whereas a flat or negative (downward sloping) curve indicates a slowing or contracting economy.”235

ANNUAL STATEMENT FOR THE YEAR 2018 OF THE FICTITIOUS INSURANCE COMPANY

Selected NOTES TO FINANCIAL STATEMENTS

1. Summary of Significant Accounting Policies and Going Concern

A. Accounting Policies

Fictitious Insurance Company prepares its statutory financial statements in conformity with accounting practices prescribed or permitted by the state of Florida. The state of Florida requires that insurance companies domiciled in Florida prepare their statutory basis financial statements in accordance with the National Association of Insurance Commissioners (NAIC) Accounting Practices and Procedures Manual, subject to any deviations prescribed or permitted by the Florida Insurance Commissioner. The impact of any permitted accounting practices on policyholder surplus of the Company is not material.

22. Events Subsequent

The company had no material subsequent events through February 15, 2019.

23. Reinsurance

A. Unsecured Reinsurance Recoverable

The company had one reinsurer whose aggregate recoverable for ceded losses, loss adjustment expenses and unearned premiums recoverable as of December 31, 2018 exceeded 3% of the Company’s Surplus. The company was Good Reinsurer, F.E.I.N. xxxxxx. Its net recoverable was $4,189,000 or 14% of Surplus. Good Reinsurer has always been current in its payments and is an A+ rated company by A.M. Best and is financially sound.

B. Reinsurance Recoverable in Dispute

The company has a few recoverable in dispute, but they are not material.

C. Reinsurance Assumed and Ceded

(1) The following table sets forth the maximum return premium and commission equity due the reinsurers or the Company if all of the Company’s ceded reinsurance was canceled as of December 31, 2018:

<table>
<thead>
<tr>
<th>Ceded Reinsurance</th>

<tr>
<td>Total $</td>
<td>920,000 $</td>
</tr>
<tr>
<td>Direct Unearned Premium Reserve: $12,610,000</td>
<td></td>
</tr>
</tbody>
</table>

(2) Accruals for contingent, sliding scale adjustment and other profit sharing commissions, net of reinsurance assumed and ceded, amounted to $188,000 at December 31, 2018:

| Direct Business | $200,000 |
| Reinsurance Assumed | 11,000 |
| Reinsurance Ceded | $189,000 |

D. Uncollectible Reinsurance

Not applicable.

E. Commutation of Ceded Reinsurance

Not applicable.

F. Retroactive Reinsurance

a. Reserves Transferred

(1) Initial Reserves $676,613

(2) Adjustments - Prior Years 261,792

(3) Adjustments - Current Year (5,791)

(4) Current Total $932,614

b. Consideration Paid or Received

(1) Initial Consideration $602,314

(2) Adjustments - Prior Years 72,120

(3) Adjustments - Current Year -

(4) Current Total $674,434
c. Paid Losses Reimbursed or Recovered

(1) Prior Years $755,052

(2) Current Year 25,485

(3) Current Total $780,537
d. Special Surplus from Retroactive Reinsurance

(1) Initial Surplus Gain or Loss $74,299

(2) Adjustments - Prior Years 189,673

(3) Adjustments - Current Year (5,791)

(4) Current Year Restricted Surplus 135,715

(5) Cumulative Total Transferred to Unassigned Surplus $122,270
e. All cedents and reinsurers included in the above transactions:

| Foreign Authorized | $34,000 | - | $ - |
25. Changes in Incurred Losses and Loss Adjustment Expenses

During the period from January 1, 2018 to December 31, 2018, the prior year-end total loss and loss adjustment expense reserves for The Company developed favorably by $875,000. This development was driven mainly by better than expected loss and DCC development in the other liability, workers compensation and homeowners segments. The deterioration in the commercial auto liability and commercial multi-peril segments offset some of this positive development.

Homeowners showed positive development in the 2017 accident year which was driven by better than expected loss development primarily related to catastrophe losses. The deterioration in Commercial Auto was driven by worse than expected severity for 2008 through 2017. Asbestos and Environmental reserves developed unfavorably and drove the large development for prior years.

26. Intercompany Pooling Arrangements

The Company does not participate in any intercompany pooling.

27. Structured Settlements

The Company has purchased annuities from XYZ Life Insurance Company, under which the claimant is the payee and the Company is the owner of the annuity contract, to fund structured settlements. The statement value of these annuities is $4,304,000. The annuities are treated as closed claims, but in the event that XYZ Life Insurance Company fails to make the required annuity payments, the Company would be required to make such payments as not covered by state guaranty associations.

30. Premium Deficiency Reserves

The Company has no premium deficiency reserves and investment income was considered in determining premium deficiency reserves.

31. High Deductibles

The Company does not issue any policies with high deductible plans.

32. Discounting of Liabilities for Unpaid Losses or Unpaid Loss Adjustment Expenses

For Workers Compensation, the Company discounts its reserves for unpaid losses on a tabular basis with a discount rate of 3.5% based on United States Life Tables. Reserves for other liability structured settlements are discounted at a rate of 4.5% and reflect the Individual Annuity Mortality table.

The amount of tabular discount reserves for Workers Compensation is $1,159,000 of which $495,000 is the discount on case reserves and $664,000 is the discount on IBNR.

The amount of tabular discount for Other Liability is $206,000 of which $21,000 is the discount on case reserves, $15,000 is the discount on IBNR and $170,000 is the discount on structure settlements. The total amount of discount for Workers Compensation and Other Liability is $1,365,000.

33. Asbestos/Environmental Reserves

A. Does the Company have on the books or has it ever written an insured for which you have identified potential for the existence of a liability due to asbestos losses?  
Yes (X)  No ( )

Exposures for asbestos and environmental losses arise from liability coverage written many years ago. The methods of determining estimates for reported and unreported losses and establishing resulting reserves and related reinsurance recoverables are periodically reviewed and updated. Conventional actuarial methods are not utilized to establish these reserves. Reserve methods used include an analysis of exposure and claim payment patterns and recent settlements, judicial associations.

Due to the uncertainties of legal issues such as coverage, potential liability etc. for these asbestos and environmental related claims the Company believes that these claims could result in a liability that materially differs from current reserves.

The following tables summarize the activity for these asbestos and environmental claims for the past five years.

1. Direct - Asbestos:

### ANNUAL STATEMENT FOR THE YEAR 2018 OF THE FICTITIOUS INSURANCE COMPANY

**Selected NOTES TO FINANCIAL STATEMENTS**

**D.** Does the Company have on the books, or has it ever written an insured for which you have identified a potential for the existence of a liability due to environmental losses? Yes (X) No ( ).

Exposure for environmental losses arises from liability coverage written many years ago. The exposures include bodily injury and property damage losses.

2018 STATEMENT OF ACTUARIAL OPINION FOR FICTITIOUS INSURANCE COMPANY

STATEMENT OF ACTUARIAL OPINION

Fictitious Insurance Company

IDENTIFICATION

I was appointed by the Board of Directors of Fictitious Insurance Company (“the Company”) on September 7, 2018, to provide this opinion for purposes of satisfying the requirements of the NAIC Annual Statement Instructions Property/Casualty. The intended users of this opinion are Company management, its Board of Directors and state insurance department regulators.

SCOPE

I have reviewed the December 31, 2018, loss and loss adjustment expense reserves recorded under U.S. Statutory Accounting Principles, listed in Exhibit A and included in the 2018 Statutory Annual Statement of the Company as filed with the respective state insurance departments. Those loss and loss adjustment expense reserves are the responsibility of the Company’s management; my responsibility is to express an opinion on those loss and loss adjustment expense reserves based on my review.

My review of the Company’s reserves included the use of such actuarial assumptions and methods and such tests of the actuarial calculations as I considered necessary in the circumstances and was conducted in accordance with standards and principles established by the Actuarial Standards Board. My review considered information provided to me through January 28, 2019.

The reserves listed in Exhibit A, where applicable, include provisions for disclosure items (disclosures 8 through 13) in Exhibit B.

In my review, I have relied on data and other relevant information, prepared by John J. Hoffman, Vice President and Controller of the Company. I evaluated that data for reasonableness and consistency. I also reconciled that data to Schedule P, Part 1 of the Company’s 2018 Annual Statement.

I have not reviewed the Company’s unearned premium reserves, nor have I performed any analysis to determine whether a premium deficiency reserve is needed to supplement the unearned premium reserves reported by the Company.
I have not reviewed any of the Company’s assets, nor have I formed any opinion as to their validity or value; the following opinion is based on the assumption that the Company’s December 31, 2018, statutory-basis reserves identified herein are funded by valid assets that have suitably scheduled maturities and/or adequate liquidity to meet cash flow requirements.

OPINION

In my opinion, the amounts carried in Exhibit A on account of the items identified:

- Make a reasonable provision for all unpaid losses and loss adjustment expenses, gross and net as to reinsurance ceded, under the terms of the Company’s contracts and agreements.

- Are computed in accordance with accepted standards and principles.

- Meet the requirements of the insurance laws of Florida.

RELEVANT COMMENTS

Materiality standard

In order to establish my materiality standard, for purposes of addressing the risk of material adverse deviation of the Company’s reserves for unpaid losses and loss adjustment expenses, I have considered the following amounts:

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10% of the Company’s net loss + loss adjustment expense reserves (10% of Exhibit A, Item 1. + Item 2.) at December 31, 2018</td>
<td>$5,155,700</td>
</tr>
<tr>
<td>2</td>
<td>20% of the Company’s surplus at December 31, 2018</td>
<td>$6,204,800</td>
</tr>
<tr>
<td>3</td>
<td>The difference between the Company’s surplus at December 31, 2018, and the company action level based on the NAIC’s Risk-Based Capital formula</td>
<td>$19,848,000</td>
</tr>
</tbody>
</table>

My materiality standard, for purposes of preparing the analysis in support of this Statement of Actuarial Opinion, was established at $5,155,700, which is the smallest of the foregoing amounts.

Risk of material adverse deviation

I have identified the major risk factors for this company as: mass tort claims; construction defect claims; so-called “Chinese drywall” claims; cumulative injury losses; claims from large deductible workers’ compensation policies; and claims related to catastrophic weather events.
In my analysis I have considered these risk factors and the implications of uncertainty in estimates of unpaid losses and loss adjustment expenses in determining my range of reasonable estimates. I also observed that the difference between the Company’s carried reserves for losses and loss adjustment expenses and the higher end of my range of reasonable unpaid claim estimates is greater than my materiality standard.

In light of the materiality considerations within this analysis, and after considering the potential risks and uncertainties that could bear on the Company’s reserve development, I concluded that there are significant risks and uncertainties that could result in material adverse deviation of the Company’s carried reserves for unpaid losses and loss adjustment expenses as of December 31, 2018.

These risk factors are described in more detail in the following paragraphs and in the report supporting this opinion.

Mass Torts

The Company has exposure to mass tort claims such as those involving asbestos and environmental impairment liability. The Company’s management has indicated that case-basis loss and allocated loss adjustment expense reserves for such claims are established as claims are reported. Additional reserves for such claims are established by the Company’s management to include the potential for future development of those claims and the reporting of latent claims. Estimation of ultimate liabilities for those types of claims is unusually difficult due to such outstanding issues as whether coverage exists, definition of an occurrence, determination of ultimate damages, and allocation of such damages to financially responsible parties. The Company’s net reserves for these mass tort claims totaling $3,739,000, which are included in the amounts listed in Exhibit A, are subject to greater inherent uncertainty than are estimates of the remainder of the Company’s loss and loss adjustment expense liabilities.

Other losses and/or risk factors subject to greater inherent uncertainty

Additionally, at December 31, 2018, the Company has characterized construction defect claims; so-called “Chinese drywall” claims; cumulative injury losses; claims from large deductible workers’ compensation policies; and claims related to catastrophic weather events, including wildfires tornadoes and hurricanes, as types of losses subject to greater inherent uncertainty than are estimates for the remainder of the Company’s loss and loss adjustment expense liabilities due to pending legal interpretation, coverage disputes, length of the expected settlement pattern and high excess attachment levels. The absence of other types of losses and risk factors from this paragraph does not imply that additional factors will not be identified in the future as having contributed to significant uncertainty in the Company’s estimates of unpaid losses and loss adjustment expenses.
Anticipated salvage and subrogation

The Company’s management has informed me that the reserves listed in Exhibit A provide for anticipated salvage and subrogation.

Discounting

Except for tabular discount for workers’ compensation and other liability, the Company’s management has informed me that it does not discount its reserves for unpaid losses and loss adjustment expenses.

Pools and associations

The company does not participate in any voluntary and involuntary underwriting pools or associations.

Retroactive or financial reinsurance

I have been informed by the Company’s management that it is not aware of any reinsurance contract that either has been or should have been accounted for as retroactive reinsurance or financial reinsurance.

Uncollectible reinsurance

I have been informed by the Company’s management that it is not aware of any significant uncollectible reinsurance. In my review, I have requested information from management on uncollectible reinsurance, reviewed the latest available financial ratings of reinsurers by a recognized rating service and reviewed Schedule F for indications of regulatory actions or reinsurance recoverables on paid losses over 90 days past due. The majority of the Company’s ceded loss reserves are with reinsurance companies rated A or better by A.M. Best Company. Past uncollectability levels and current amounts in dispute have been reviewed and found to be immaterial relative to surplus. Therefore, reinsurance collectability does not appear to be an issue. I express no opinion on the financial condition of the Company’s reinsurers.

IRIS Ratios

I have reviewed the Company’s calculations of the National Association of Insurance Commissioners’ Insurance Regulatory Information System (IRIS) tests that relate to the Company’s December 31, 2018, loss and loss adjustment expense reserves (Test 11, One-Year Reserve Development to Surplus; Test 12, Two-Year Reserve Development to Surplus; and Test 13, Estimated Current Reserve Deficiency to Surplus). No exceptional values were noted with respect to the Company’s December 31, 2018, loss and loss adjustment expense reserve tests.
Extended reporting endorsements

According to management, the Company has no exposure to medical professional liability extended reporting endorsements, such as those relating to death, disability or retirement.

P&C Long Duration Contracts

Excluding financial guaranty contracts, mortgage guaranty policies and surety contracts, the Company’s management has informed me that the Company does not write policies with coverage periods of 13 months or greater that are non-cancelable and not subject to premium increase.

Accident & Health (“A&H”) Long Duration Contracts

The Company’s management has informed me that the Company does not write A&H policies with contract terms of thirteen months and for which contract reserves are required.

*                    *                    *

An actuarial report supporting this actuarial opinion is to be provided to the Company to be retained for a period of seven years at its administrative offices and to be available for regulatory examination.

13.1 Losses $0

13.2 Loss Adjustment Expenses $0

13.3 Unearned Premium $0

13.4 Write-In (list separately, adding additional lines as needed, and identify (e.g., “Premium Deficiency Reserves”, “Contract Reserves other than Premium Deficiency Reserves” or “AG 51 Reserves”)) $0

14. Other items on which the Appointed Actuary is providing Relevant Comment (list separately) $0

* The reserves disclosed in item 11 above, should exclude amounts relating to contracts specifically written to cover asbestos and environmental exposures. Contracts specifically written to cover these exposures include Environmental Impairment Liability (post 1986), Asbestos Abatement, Pollution Legal Liability, Contractor’s Pollution Liability, Consultant’s Environmental Liability, and Pollution and Remediation Legal Liability.
2018 ACTUARIAL OPINION SUMMARY FOR FICTITIOUS INSURANCE COMPANY

ACTUARIAL OPINION SUMMARY

Fictitious Insurance Company

December 31, 2018

This Actuarial Opinion Summary has been prepared in conjunction with my role as Appointed Actuary for Fictitious Insurance Company (“the Company”), and in accordance with the NAIC’s Annual Statement Supplemental Filing Instructions. The information provided in this Actuarial Opinion Summary will be included in the actuarial report in support of my Statement of Actuarial Opinion, dated February 24, 2019, on the Company’s statutory-basis loss and loss adjustment expense reserves at December 31, 2018. That actuarial report is to be provided to the Company to be retained for a period of seven years at its administrative offices and to be available for regulatory examination.

E. The Company has not had one-year adverse development in excess of 5% of surplus in at least three of the last five calendar years, as measured by Schedule P, Part 2, Summary, and disclosed in the Five-Year Historical Data, on line 74, of the Company’s December 31, 2018 statutory-basis Annual Statement.

* * *

This Actuarial Opinion Summary was prepared solely for the Company for the purpose of filing with regulatory agencies and is not intended for any other purpose. Furthermore, it is my understanding that, consistent with the Annual Statement Supplemental Filing Instructions, the information provided in this
Actuarial Opinion Summary will be held confidential by those regulatory agencies and will not be made available for public inspection.

RESULTS OF IRIS RATIO TESTS FOR FICTITIOUS INSURANCE COMPANY

OVERVIEW

Within this section of the Appendix, we will walk through the calculation and purpose of the 13 IRIS Ratios, provide possible explanations for unusual values, and show the results of the IRIS Ratio calculations for Fictitious Insurance Company using the 2018 Annual Statement.

IRIS Ratios are grouped into four categories:

- Overall ratios
- Profitability ratios
- Liquidity ratios
- Reserve ratios

We will present the material separately by category.

It is important to note that the calculations provided herein are based on the 2017 edition of the National Association of Insurance Commissioners’ (NAIC) Insurance Regulatory Information System (IRIS) Ratios Manual. Further, the ranges of “unusual values” are as provided in the 2017 IRIS manual. The NAIC re-evaluates the reasonableness of the ranges periodically, in light of the current environment. For example, years ago the range of “usual” values for IRIS Ratio 6, Investment Yield, was between 5% and 10%. Compare that to the range in 2017 of 3% to 6.5%, which reflects the current economic environment. The current version of the IRIS manual needs to be followed when analyzing data.

OVERALL RATIOS

The overall ratios focus on the insurance company’s leverage, in terms of premium volume relative to surplus. There are four overall ratios:

- IRIS Ratio 1: Gross premiums written to policyholders’ surplus
- IRIS Ratio 2: Net premiums written to policyholders’ surplus
- IRIS Ratio 3: Change in net premiums written
- IRIS Ratio 4: Surplus aid to policyholders’ surplus

IRIS Ratios 1 and 2 provide written premium-to-surplus ratios on a gross and net of reinsurance basis, respectively. The denominator is the same in each of these ratios, with the numerator differing by the amount of ceded reinsurance premium written. The source of this data can be readily found in an insurance company’s Annual Statement, from either Part 1B of the Underwriting and Investment Exhibit (U&IE) and the balance sheet (page 3), or Five-Year Historical Data.

The purpose of IRIS Ratios 1 and 2 is to identify companies that may be taking on more business and more risk than they can handle relative to their surplus. Unusual values are
greater than or equal to 900% on a gross basis and 300% on a net basis. The 300% ratio on a net basis corresponds to the age-old generally accepted benchmark that insurers remain within the 3-to-1 range in terms of writings relative to surplus. This ratio is higher on a gross basis in consideration of reinsurance.

The following are examples of considerations that should be made when reviewing the results of these ratios:

- The difference between the gross and net IRIS Ratio results:
  - Wide disparity could signal heavy reliance on reinsurance or involvement in fronting arrangements. Further investigation on the quality, rating and collectability of the reinsurance should be made, as well as the level of collateral held, if any. This can be accomplished through a review of the note titled, “Reinsurance” (number 23 within the Notes to Financial Statement of the 2018 Annual Statement), Schedule F, and research on the financial ratings of the company’s reinsurers listed in Schedule F by a recognized rating service, such as A.M. Best.
  - This does not mean that a narrow difference between the gross and net IRIS Ratio results should not be investigated, as it could signal inadequate levels of reinsurance protection, in particular if the company is exposed to catastrophe risk. Part 2 of the General Interrogatories provides information on a company’s protection against excessive or catastrophic loss, although further inquiry would have to be made of the company for specific details.

- The amount of the gross premiums that stem from assumed business versus business directly written by the company:
  - Companies tend to have less control over business assumed from third parties. Those companies having a large portion of assumed business and IRIS Ratio 1 results nearing the unusual value benchmark should be subject to further investigation. This would include an understanding of the type of business assumed, attachment points, layers and limits of coverage, as well as the underwriting and price monitoring controls in place on the assumed book.

- The results relative to lines of business written:
  - Lower ratio results are preferred for companies writing long-tailed lines of business due to the uncertainty inherent in the ultimate payout of associated claims.

As displayed below, IRIS Ratios 1 and 2 can be calculated for Fictitious using data from the Five-Year Historical Data exhibit.
As displayed in the above table, the results of IRIS Ratio 1 for Fictitious, ranging from 82% to 96% over the period 2014 to 2018, were well within the benchmark imposed for unusual values (900%). Similarly, the results of IRIS Ratio 2, ranging from 71% to 86% over same period, were well within the 300% benchmark on a net basis.

IRIS Ratio 3 provides the change in net written premiums, current year over prior year, as a percentage of prior year net written premium. The source of this data can be readily found in an insurance company’s Annual Statement, from either Part 1B of the current year and prior year U&IEs, or Five-Year Historical Data.

The purpose of IRIS Ratio 3 is to identify companies that are growing or declining rapidly so that further investigation can be made as to the cause. Unusual values are outside of the -33% to +33% range.

The following are examples of considerations that should be made when reviewing the results of IRIS Ratio 3:

- Consistent or large increases in results:
  - Growth brings uncertainty in the types of risks written and the frequency and ultimate cost of claims. In certain markets, it is difficult to expand without conceding on pricing and underwriting standards. Further investigation as to the source of the company’s expansion and whether the company has been able to maintain adequate pricing and terms and conditions is warranted. In addition, a review of the results of other IRIS Ratios can serve to mitigate or augment the uncertainty. For example, a mitigating factor would be a low result for IRIS Ratios 1 and 2.

- Consistent or large decreases in results:
  - A decrease in writings also requires attention. A sharp reduction in writings may be a sign of financial stress.
Unstable results year over year:

- This may be a sign that the company does not have good controls on its underwriting or a solid business plan and therefore raises uncertainty with respect to the viability of the company in the long-term.

We can also calculate IRIS Ratio 3 from Fictitious’ Five-Year Historical Data exhibit.

| Data from Fictitious Insurance Company 2018 Five-Year Historical Data (USD) |
|-----------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|
|                             | 26,752,000      | 25,936,000      | 25,521,000      | 25,583,000      | 25,363,000      |

<table>
<thead>
<tr>
<th>Results of IRIS Ratio 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>IRIS Ratio 3 (= Line 12 current less prior year) / Line 12 prior year</td>
</tr>
</tbody>
</table>

As displayed in the above table, the results of IRIS Ratio 3 for Fictitious, ranging from 0% to 3% over the period 2014 through 2018, were well within the benchmark imposed for unusual values (outside the range -33% to +33%).

IRIS Ratio 4 provides the ratio of surplus aid to policyholder surplus. It is meant to identify companies that rely heavily on reinsurance as a means to enhance surplus. Insurance companies typically receive a ceding commission from their reinsurers for placing business with those reinsurers. Under statutory accounting, the treatment of ceding commissions is similar to the way that an insurance company treats policy acquisition costs, the “signs” are just different. While acquisition expenses are a direct charge to income and surplus as they are incurred, ceding commissions are recognized as a credit to income and surplus when they are incurred. Surplus aid represents the amount of enhancement to surplus in the current period as a result of ceding commission that has been taken into income on its ceded unearned premium. Formulaically,

\[
\text{Surplus aid} = \frac{\text{Estimated reinsurance commission rate} \times \text{Unearned premium on reinsurance ceded to non-affiliates}}{\text{Total written premiums ceded to reinsurers (affiliates and non-affiliates)}}
\]

where, 

\[
\text{Estimated reinsurance commission rate} = \frac{\text{Ceding commissions from reinsurance, including contingent commissions}}{\text{Total written premiums ceded to reinsurers (affiliates and non-affiliates)}}
\]
Ceding commissions from reinsurance for the current year are found in Part 3, Expenses of the U&I of the Annual Statement, column 2 (other underwriting expenses), line 2.3 (reinsurance ceded, excluding contingent) plus line 2.6 (contingent — reinsurance ceded).

Total written premiums ceded to reinsurers is found in Part 1B, Premiums Written of the U&I of the Annual Statement, column 4 (reinsurance ceded to affiliates) plus column 5 (reinsurance ceded to non-affiliates) totals.

Unearned premium on reinsurance ceded to non-affiliates is found in Schedule F, Part 3, reinsurance ceded of the Annual Statement, column 13 totals for the following three categories of unaffiliated reinsurers:

1. Authorized, unauthorized and certified other U.S. unaffiliated insurers
2. Authorized, unauthorized and certified mandatory and voluntary pools
3. Authorized, unauthorized and certified other non-U.S. insurers

IRIS Ratio 4 is the ratio of surplus aid, as calculated above, to policyholders’ surplus.

Unusual values are greater than or equal to 15% and may be a sign that policyholders’ surplus is inadequate. Therefore, when IRIS Ratio 4 produces values greater than 15% certain other IRIS Ratio tests dependent upon policyholders’ surplus are recalculated to remove surplus aid. These are:

IRIS Ratio 1: Gross premiums written to policyholders’ surplus
IRIS Ratio 2: Net premiums written to policyholders’ surplus
IRIS Ratio 7: Gross change in policyholders’ surplus
IRIS Ratio 10: Gross agents’ balances (in collection) to policyholders’ surplus
IRIS Ratio 13: Estimated current reserve deficiency to policyholders’ surplus

Further, when IRIS Ratio 4 produced unusual values, the company’s reinsurance treaties should be evaluated to assess the impact that cancellation could have on solvency.

The following provides the calculation of IRIS Ratio 4 for Fictitious.

Results of IRIS Ratio 4

IRIS Ratio 4 | 1.30% = (1) / (22)

As displayed in the above table, the result of IRIS Ratio 4 of 1.30% for Fictitious was well within the benchmark imposed for unusual values (greater than or equal to 15%).

PROFITABILITY RATIOS

The profitability ratios focus on the insurance company’s profitability from an operations, investment and surplus perspective. There are four profitability ratios:

IRIS Ratio 5: Two-year overall operating ratio
IRIS Ratio 6: Investment yield
IRIS Ratio 7: Gross change in policyholders’ surplus
IRIS Ratio 8: Change in adjusted policyholders’ surplus
IRIS Ratio 5 essentially provides a company's combined ratio over a two-year period, offset for investment income earned over that period. In IRIS Ratio 5, the combined ratio is calculated as loss and loss adjustment expense (LAE) incurred plus policyholder dividends incurred, divided by earned premium, plus other underwriting expenses less other income, divided by written premium. The investment income ratio is calculated as the ratio of investment income earned divided by earned premium.

Two-year operating ratio = Two-year combined ratio - Two-year investment income ratio
where,

Combined ratio =
\[
\frac{\text{Net loss and LAE} + \text{Dividends to policyholders incurred}}{\text{Net earned premium}} + \frac{\text{Other underwriting expenses} - \text{Other income incurred}}{\text{Net written premium}}
\]

Investment income ratio =
\[
\frac{\text{Investment income earned}}{\text{Net earned premium}}
\]

The source of this data can be readily found in an insurance company's Annual Statement, from the Statement of Income and Part 1B of the U&IE.

The purpose of IRIS Ratio 5 is to identify companies that are operating unprofitably. A two-year period is used in the calculation to smooth unusual fluctuations due to a "bad" loss or investment year. Unusual values are greater than or equal to 100% meaning that the company is operating at an underwriting loss, even after consideration of investment income.

When reviewing the result of this ratio, consideration should be made for the cause by looking at each of the components of the calculation. During the financial crisis, companies experienced a significant decline in investment income and therefore did not achieve as much of a benefit in the offset afforded in the calculation. Further, adverse development on prior accident years will have an impact on the combined ratio, but such development may not be reflective of profitability on the company's current operations or current reserving.

IRIS Ratio 5 is calculated for Fictitious in the following table.

### Results of IRIS Ratio 5

<table>
<thead>
<tr>
<th>IRIS Ratio 5</th>
<th>( 84% = (1) - (14) ) for two-year period</th>
</tr>
</thead>
</table>

*Also provided in Five-Year Historical Data

As displayed above, the result of IRIS Ratio 5 for Fictitious of 84% was well within the 100% benchmark imposed for unusual values.

IRIS Ratio 6 provides the yield in the company’s investment portfolio over the past year. IRIS Ratio 6 is calculated as net investment income earned during the year divided by the average of cash plus invested assets over the current and prior year. The source of this data can be readily found in an insurance company’s Annual Statement, from the balance sheet and Statement of Income.

The purpose of IRIS Ratio 6 is to identify companies earning unusually low or high yields, potentially indicating a risky, inefficient or expensive investment strategy. Unusual values are
FINANCIAL REPORTING THROUGH THE LENS OF A PROPERTY/CASUALTY ACTUARY

Appendix I. Fictitious Insurance Company

outside of a 3.0% to 6.5% range. That is, it is expected that companies will achieve a 3.0% to 6.5% yield on their invested assets during the year.

When reviewing the result of this ratio, consideration should be made for the cause by looking at each of the components of the calculation, and further investigation into the types of investment should be made.

The following provides the calculation of IRIS Ratio 6 for Fictitious.

<table>

Results of IRIS Ratio 6

IRIS Ratio 6 = 2 * (1) current year / [(2) for two-year period - (1) current year]

As displayed in the above table, the result of IRIS Ratio 6 for Fictitious of 5.0% was right around the midpoint of the expected benchmark range of 3.0% to 6.5% for usual values. This means that the company earned a return on its invested assets within what would be considered the “norm” for companies in 2018.

IRIS Ratio 7 is what the NAIC calls “the ultimate measure of improvement or deterioration in the insurer’s financial condition during the year.” It provides the change in policyholder surplus, current year over prior year, as a percentage of prior year surplus, with the surplus figures coming directly from the company’s balance sheet. We note that historical surplus figures are also provided in the Five-Year Historical Data of the company’s Annual Statement.

Unusual values are outside of a -10% to +50% range. That is, a decrease in a company’s surplus by 10% or more, or an increase by 50% or more, is considered a signal for the analyst to perform further inquiry and investigation. The NAIC recognizes that a 10% decrease is

FINANCIAL REPORTING THROUGH THE LENS OF A PROPERTY/CASUALTY ACTUARY

Appendix I. Fictitious Insurance Company

conservative; however, decreases in policyholder surplus are of course a greater concern than increases. Increases in surplus of 50% or more are very unusual for a stable company absent an acquisition or redistribution of capital amongst affiliates and therefore would be a sign of financial instability. According to the NAIC, “a number of insolvent insurers report dramatic increases in policyholders’ surplus prior to insolvency.”

Using the Five-Year Historical Data exhibit, we can calculate the result of IRIS Ratio 7 over the past four years.

<table>
<thead>
<tr>
<th>Data from Fictitious Insurance Company 2018 Annual Statement (USD)</th>
</tr>
</thead>
<tbody>
<tr>
<td>31,024,000</td>
</tr>
<tr>
<td>Results of IRIS Ratio 7</td>
</tr>
</tbody>
</table>

As displayed in the above table, the result of IRIS Ratio 7 for Fictitious did breach the -10% mark for unusual values in 2017 at -12%.

IRIS Ratio 8 is similar to IRIS Ratio 7, with the exception that current-year policyholders’ surplus is adjusted to remove changes in surplus notes, capital paid-in or transferred, and surplus paid-in or transferred. Removal of these items provides a picture of the improvement or deterioration in financial results due to operations. The source of the data used in the calculation of IRIS Ratio 8 is the balance sheet and Statement of Income of the company’s Annual Statement.

Unusual values are outside of a -10% to +25% range. That is, a decrease in a company’s surplus resulting from operations by 10% or more, or an increase by 25% or more, is considered a signal for the analyst to perform further inquiry and investigation. The lower bound benchmark is the same as in Ratio 7; however, the upper bound of +25% is lower, reflecting the expectation that operations would not typically cause an increase in surplus by more than 25%.

The calculation of IRIS Ratio 8 is shown below for Fictitious.

---

237 Ibid.
As displayed in the above table, the result of IRIS Ratio 8 for Fictitious did breach the -10% mark for unusual values in 2017 at -13%. This is consistent with the finding from IRIS Ratio 7; however, it shows that the surplus enhancement during 2017 of $361,000 helped to cushion the impact of the change in surplus observed in IRIS Ratio 7.

This ratio is telling us that the unusual value in 2017 could be attributed to the company’s operations. However, going back and reviewing the components of IRIS Ratio 5, we see that the company’s combined ratio for 2017 was 94% indicating that the company was operating at a profit from its underwriting results. Further, the investment income ratio in 2017 was 19% which was higher than in 2018. This indicates that the decrease in the company’s surplus was not a result of the company’s income; net income earned in 2017 was positive, at $4.955 million (see page 4, line 20, column 2). We therefore need to look to the capital and surplus account within the Statement of Income for the reason.

Within column 2 of the capital and surplus account, we see the biggest decrease in surplus came from dividends to stockholders totaling $10.023 million in 2017. This was more than
$7 million higher than dividends made in 2018 and was the reason for the decrease in surplus greater than 10%. Further investigation would determine why the company made such a large dividend payment in 2017 and whether regulatory approvals were required and obtained.

LIQUIDITY RATIOS

The liquidity ratios focus on the amount of liquid assets that the insurance company has to cover its obligations. There are two liquidity ratios:

- IRIS Ratio 9: Adjusted liabilities to liquid assets
- IRIS Ratio 10: Gross agents’ balances (in collection) to policyholders’ surplus

IRIS Ratio 9 provides an indication of the company’s ability to pay its financial obligations out of assets that are readily convertible into acceptable forms of payment (i.e., cash). In this calculation, an insurance company’s liabilities are adjusted to remove deferred agents’ balances, as these balances are not liquid assets. Liquid assets include the following:

- Bonds, excluding affiliates
- Stocks, excluding affiliates
- Cash, cash equivalents and short-term investments, excluding affiliates
- Receivable for securities
- Investment income due and accrued

Unusual values are greater than or equal to 100%, suggesting that the company would not be able to pay its liabilities with current liquid assets as defined above.

The primary source of this information is the balance sheet, with investments in parent, subsidiaries and affiliates coming from Five-Year Historical Data, lines 42 through 45 in the 2018 Annual Statement.

The following provides the calculation of IRIS Ratio 9 for Fictitious.

| Results of IRIS Ratio 9 | |
|------------------------|---|---|
| IRIS Ratio 9 | 80% | 79% | = (1) / (4) |

As displayed above, the result of IRIS Ratio 9 for Fictitious Insurance Company was 80% in 2018, about 20 points below the 100% benchmark for unusual values. This ratio was consistent with that in 2017 of 79%.

IRIS Ratio 10 provides the ratio of agents’ balances in the course of collection to policyholders’ surplus. The purpose is to show how dependent a company’s surplus is to assets that may not be collectible upon liquidation or are of questionable liquidity.

The source of the data is the balance sheet of the company's Annual Statement. Unusual values are greater than or equal to 40% of surplus.
The following provides the calculation of IRIS Ratio 10 for the current and prior year for Fictitious.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Results of IRIS Ratio 10

| IRIS Ratio 10 | 8% | 9% = (1) / (2) |

As displayed above, the result of IRIS Ratio 10 for Fictitious was 8% in 2018, which was well below the 40% threshold for unusual values. This was consistent with the result in 2017 of 9%.

**RESERVE RATIOS**

The reserve ratios focus on the development of an insurance company’s net loss and LAE reserves for purposes of understanding reserve adequacy. These are probably the most important ratios to the property/casualty actuary and where the actuary places most attention, as these ratios are specifically commented on by the appointed actuary in the SAO.

There are three reserve ratios:

- **IRIS Ratio 11**: One-year reserve development to policyholders’ surplus
- **IRIS Ratio 12**: Two-year reserve development to policyholders’ surplus
- **IRIS Ratio 13**: Estimated current reserve deficiency to policyholders’ surplus

IRIS Ratio 11 is the same one-year development test as provided in the Five-Year Historical Data exhibit within the Annual Statement (line 74 in the 2018 Annual Statement). It measures development in the company’s net loss and LAE reserves over the past year, whether adverse or favorable, relative to prior year surplus. Essentially, this test looks to see how much surplus would have been absorbed or enhanced in the prior year as a result of adverse or favorable development in the corresponding net loss and LAE reserves. Adverse development is shown as an increase to reserves and therefore a positive number. Results of IRIS Ratio 11 greater than or equal to 20% are considered unusual.

The following table provides the calculation of IRIS Ratio 11 for Fictitious over the period 2015 through 2018.
As displayed in the above table, Fictitious’ loss and LAE net reserves developed favorably over the period 2014 through 2018. As a result, IRIS Ratio 11 has historically been negative, ranging from -3% to -6% and therefore well below the benchmark imposed for unusual values (greater than or equal to +20%).

The trigger of an “unusual” value is a current year ratio greater than or equal to 20% This will capture reserve deficiencies in the immediate prior year. In addition to this warning, the AOS serves to notify regulators of any trends whereby development in three of the prior five years exceeds 5% The AOS has a lower threshold than IRIS 11, as it serves to identify those companies that consistently underestimate their loss and LAE reserves.

IRIS Ratio 12 is the same two-year development test as provided in the Five-Year Historical Data exhibit within the Annual Statement (line 76 of the 2018 Annual Statement). It measures development in the company’s net loss and LAE reserves over the past two years, relative to surplus at the end of the second prior year. Similar to Ratio 11, results of test 12 greater than or equal to 20% are considered unusual.

The following table provides the calculation of IRIS Ratio 12 for Fictitious over the period 2016 through 2018.
As displayed in the above table, Fictitious’ IRIS Ratio 12 results have historically been negative, ranging from -7% to -10% and therefore well below the benchmark imposed for unusual values (+20%).

IRIS Ratio 13 is a hindsight test. It looks at a company’s net outstanding loss and LAE reserves at the immediate prior two years relative to calendar year earned premium for those years and adds to the reserves development that has emerged over that period (one-year development for the immediate prior year; two-year development for the year prior to that). The test then applies the average of the resulting two “adjusted” loss ratios to earned premium for the recent year (2018) to determine what the outstanding loss reserve should be for that year (2018). A calculated deficiency in recorded loss and LAE reserves of 25% or more is deemed to be unusual.

The purpose of this test is to identify companies that may not have gotten their reserves “right” in the past. The expectation inherent in this test is if companies have had adverse development in the past, they will probably have adverse development in the future. Regulators want to see if companies who have had such adverse development have corrected for it in their current estimates.

The following are examples of considerations that should be made when reviewing the results of IRIS Ratio 13:

- The losses and premiums are not matched in Ratio 13; the numerator is unpaid loss and LAE for all accident years, whereas the denominator is earned premium for the current accident year.
This mismatch obstructs the usefulness of the ratio because growth or decline in premium volume, or changes in the mix of business between short- and long-tailed lines, will distort the “outstanding” loss ratio.

Similarly, because it is strictly a quantitative test, IRIS Ratio 13 cannot take into account qualitative factors that may mitigate adverse development in the future on current reserves, such as change in mix of business.

A good example is a company that had observed adverse development on its commercial automobile liability (CAL) line of business in the prior two years but significantly changed their product mix in the current year to be more heavily weighted toward short-tailed homeowners business. As a result of this change in mix, such adverse development would not be expected in the future.

IRIS Ratio 13 requires use of the prior year Annual Statement. While we have not included the 2017 Annual Statement for Fictitious, we have included the required values in the following table to calculate the result of IRIS Ratio 13 for 2018.

- Non-controlling Interests $961
- Equity Holders $3,311,854
Guideline

Subject: Corporate Governance

Category: Sound Business and Financial Practices

Date: September 2018

I. Purpose and Scope of the Guideline

This guideline communicates OSFI’s expectations with respect to corporate governance of federally regulated financial institutions (FRFIs). It applies to all FRFIs other than the branch operations of foreign banks and foreign insurance companies.¹

OSFI’s corporate governance expectations are principles-based and recognize that a FRFI’s corporate governance practices may depend on its size; ownership structure; nature, scope and complexity of operations; strategy; and risk profile.

This guideline complements:

- Relevant provisions of the Bank Act, the Insurance Companies Act, the Trust and Loan Companies Act, the Cooperative Credit Associations Act and associated regulations; and,
- OSFI’s Supervisory Framework and Assessment Criteria.²

Corporate Governance for Financial Institutions

Corporate governance is a set of relationships between a company’s management, its Board of Directors (Board), its shareholders, and other stakeholders. It also provides the structure through which the objectives of the company are set, and through which the means of attaining those objectives and monitoring performance are determined.

¹ Branches do not have a Board of Directors and, accordingly, this guideline does not apply to branch operations. OSFI looks to the Chief Agent or Principal Officer of a branch to oversee the management of the branch, including matters of corporate governance. The Chief Agent and/or Principal Officer of branches should refer to Guideline E-4A and Guideline E-4B, as appropriate.

² The terms “Senior Management” and “Operational Management” are used throughout this guideline, and are defined in OSFI’s Supervisory Framework. For the purpose of this guideline, however, the Oversight Functions include: Financial; Risk Management; Compliance; Internal Audit; and Actuarial.
The quality of FRFI corporate governance practices is an important factor in maintaining the confidence of depositors and policyholders, as well as overall market confidence. This guideline, therefore, draws attention to specific areas of corporate governance that are especially important for financial institutions (e.g., risk governance), owing to the unique nature and circumstances of financial institutions and risks assumed relative to other corporations.³

³ Refer to Annex A for a description of the special nature of financial institutions.
II. The Board of Directors

1. The Board is responsible for the FRFI’s business plan, strategy, and risk appetite and culture. The Board oversees the FRFI’s Senior Management and internal controls.

The Role of the Board

In addition to the roles and responsibilities of the Board outlined in federal legislation, the Board should discharge, at a minimum, the following essential duties in relation to the FRFI:

1. Approve and oversee:

   Strategy
   - Short-term and long-term business plan and strategy;
   - Significant strategic initiatives (e.g., mergers and acquisitions);

   Risk Management and Oversight
   - Risk Appetite Framework;\(^4\)
   - Internal Control Framework;
   - Significant policies, plans and strategic initiatives related to the management of, or that materially impact, capital and liquidity (e.g., internal capital targets, share issuance);
   - Codes of ethics and conduct;

   Board, Senior Management and Oversight Functions
   - Appointment, performance review, and compensation of the CEO and other key members of Senior Management, including the heads of the Oversight Functions;
   - Succession plans with respect to the Board, CEO and other key members of Senior Management, including the heads of the Oversight Functions;
   - Mandate, resources and budgets for the Oversight Functions;

   Audit Plans
   - External audit plan, including audit fees and the scope of the audit engagement; and
   - Internal audit plan.

The duties above are the primary responsibilities of the Board, and should be the main focus of the Board’s attention and activities. The Board is not responsible for the ongoing and detailed operationalization of its decisions; this is the responsibility of Senior Management.

---

\(^4\) Refer to Annex B for a description of the Risk Appetite Framework.
2. Provide challenge, advice and guidance to the Senior Management of the FRFI, as appropriate, on:

Operational and Business Policies

- Significant operational, business, risk and crisis management policies of the FRFI, including those in respect of credit, market, operational, insurance, regulatory compliance and strategic risks, and their effectiveness; and

- Compensation policy for all human resources that is consistent with the Financial Stability Board (FSB) *Principles for Sound Compensation*;

Business Performance and Effectiveness of Risk Management

- Performance of the FRFI relative to the Board-approved business plan and strategy;
- Effectiveness of the Risk Appetite Framework;
- Effectiveness of the Internal Control Framework;
- Effectiveness of the Oversight Functions; and
- Effectiveness of significant policies and plans related to management of capital and liquidity (e.g., stress testing, ICAAP/ORSA report).

The duties above are the responsibility of Senior Management. The Board has the discretion to decide the extent and nature of its input, and to provide challenge, advice and guidance on these matters and others.

The Board should be satisfied that the decisions and actions of Senior Management are consistent with the Board-approved business plan, strategy and risk appetite of the FRFI, and that the corresponding internal controls are sound.

The Board and Senior Management

2. Senior Management is responsible for implementing the Board’s decisions and directing the operations of the FRFI.

Senior Management is composed of the Chief Executive Officer (CEO) and individuals who are directly accountable to the CEO. This can include the heads of the Oversight Functions, such as the Chief Financial Officer (CFO), Chief Risk Officer (CRO), Chief Compliance Officer (CCO), Chief Internal Auditor (CIA), and Chief Actuary (CA), as well as the heads of major business platforms or units.

Senior Management is responsible for implementing the Board’s decisions and directing the operations of the FRFI within the authority delegated to them by the Board, and in compliance with applicable laws and regulations.

---

In order to fulfil its responsibilities, the Board relies on Senior Management to provide sound advice on the organizational objectives, plans, strategy, structure and significant policies of the FRFI. Senior Management should set out information, options, potential trade-offs, and recommendations to the Board in a manner that enables the Board to focus on key issues and make informed decisions in a timely manner.

The Board should, in turn, understand the decisions, plans and policies being implemented by Senior Management and their potential impact on the FRFI.

**The Board and the Oversight Functions**

The Oversight Functions provide objective assessments to the directors to allow them to fulfill their responsibilities. The Oversight Functions identify, measure, and report on the FRFI’s risks, assess the effectiveness of the FRFI’s risk management and internal controls, and determine whether the FRFI’s operations, results and risk exposures are consistent with the FRFI’s risk appetite.

The heads of the Oversight Functions should have sufficient stature and authority within the organization, and should be independent from operational management. The heads of the Oversight Functions should have unfettered access and a functional reporting line to the Board or the appropriate Board committee.

The Board, with the support of Senior Management, should regularly assess the effectiveness of the FRFI’s Oversight Functions.

**Boards of Subsidiaries or with FRFI Subsidiaries**

A FRFI that is part of a larger corporate group (another FRFI or company in Canada, or another company abroad) may be subject to or may adopt certain policies of the parent. In this situation, the subsidiary Board should be satisfied that these policies are appropriate for the FRFI’s business plan, strategy and risk appetite, and comply with specific Canadian regulatory requirements.

If the parent is another FRFI, the parent Board should exercise adequate oversight of the activities of the subsidiary FRFI to be satisfied that the parent Board can meet its enterprise-wide oversight responsibilities applicable to FRFIs under this guideline.

**Board Effectiveness**

3. *An effective Board should be independent and provide objective oversight of, thoughtful guidance, advice and constructive challenge to, Senior Management.*

The hallmarks of an effective Board include demonstrated sound judgment, initiative, proactiveness, responsiveness and operational excellence. Board members should strive to facilitate open communication, collaboration and appropriate debate in the decision-making process.
The Board should regularly assess its practices, and those of the Board committees, and should pursue strategies to enhance its overall effectiveness.

**Board Composition**

The Board should be diverse and, collectively, bring a balance of expertise, skills, experience, competencies and perspectives, taking into consideration the FRFI’s strategy, risk profile, culture and overall operations. The contributions of individual directors will reflect their particular expertise, skills, experience and competencies.

Relevant financial industry and risk management expertise are key competencies for the Board. There should be appropriate representation of these skills at the Board and Board committee levels.

The Board should have a skills and competency evaluation process that is integrated with the overall Board succession or Board renewal plans, and that pays particular attention to the positions of the Chair of the Board and Chairs of the Board committees. Diversity should also be a factor in these plans.

**Board Independence**

The Board, collectively, should be independent from Senior Management and the operations of the FRFI.\(^6\) Achieving independence can involve various Board structures and processes. Regardless of the approach, in all situations, OSFI views the separation of the Chair and CEO as critical (see next section). It is important that the Board’s behaviour and decision-making processes are independent, objective and effective, taking into account the particular circumstances of the FRFI.

The Board’s ability to act independently of Senior Management can be demonstrated through practices such as regularly scheduled Board and Board committee meetings that include sessions without Senior Management present.

To promote independence of thinking, the Board should have a director independence policy that considers, among other factors, the specific shareholder/ownership structure of the FRFI and director tenure. The recruitment process for new directors and the development of a director profile (both responsibilities of the Board) should emphasize the independence of Board members from Senior Management.

\(^6\) The notion of “independent”, as it applies in this guideline, is much broader than the notion of “non-affiliated”, as defined in the federal financial institution statutes. It has been described and elaborated upon in various legal and international documents (e.g., securities law, international standards, and reports).
Board and Board Committee Chairs

4. The role of the Board Chair should be separate from the CEO, as this is critical in maintaining the Board’s independence and its ability to execute its mandate effectively.

Effective Boards and Board committees require a Chair that is experienced, skillful and exhibits leadership that encourages open discussion and appropriate debate.

The Chair of the Board and the chairs of Board committees should have frequent dialogue with, and a strong level of influence among, other Board members and Senior Management, as well as access to all FRFI information and staff. Given the critical nature of the role, the Chair should also foster direct and on-going dialogue with regulators.

Board and Board committee chairs should be independent, non-executive directors.

III. Risk Governance

5. Consistent with their specific roles and responsibilities and through their behaviours, actions and words, the Board and Senior Management should promote a risk culture that stresses integrity and effective risk management throughout the FRFI.

General

Risk taking is a necessary part of a FRFI’s business. Accordingly, business strategies incorporate decisions regarding the risks the FRFI is willing to undertake and how it will manage and mitigate those risks.

Risk governance is a distinct and crucial element of the FRFI’s corporate governance. Risks may arise from direct exposures taken by the FRFI, subsidiaries, affiliates or counterparties, or indirectly through activities that create risks to the FRFI’s reputation. FRFIs should be in a position to identify the significant risks they face, assess their potential impact and have policies and controls in place to manage them effectively.

Risk Appetite Framework

6. The FRFI should have a Risk Appetite Framework that guides the risk-taking activities of the FRFI.

The FRFI should develop a Risk Appetite Framework that takes into account its risk profile. It should be enterprise-wide and tailored to the FRFI’s domestic and international business activities and operations. On an on-going basis, the FRFI should be satisfied that the Risk Appetite Framework remains appropriate relative to the risk profile of the FRFI, its long-term strategic plan and its operating environment.

---

A non-executive director is a member of the Board who does not have management responsibilities within the FRFI.
The Risk Appetite Framework, as approved by the Board, should be well-understood throughout the organization and embedded within the culture of the FRFI. All operational, financial and corporate policies, practices and procedures of the FRFI should be guided by the Risk Appetite Framework.

The Risk Appetite Framework should set basic goals, benchmarks, parameters and limits (e.g., level of losses) as to the amount of risk the FRFI is willing to accept, taking into account various financial, operational and macroeconomic factors. It should consider the material risks to the FRFI, as well as the institution’s reputation vis-à-vis policyholders, depositors, investors and customers.

The Risk Appetite Framework should be forward-looking and consistent with the FRFI’s business model, overall philosophy, short-term and long-term strategy and corresponding risk mitigation. It is intended to provide boundaries on the on-going operations of the FRFI with respect to asset class and liability choices, activities and participation in markets that are not consistent with the stated risk appetite of the institution.\footnote{Refer to Annex B for further details.}

The establishment of controls and a process to ensure their effectiveness are critical elements of the Risk Appetite Framework, as they help to ensure that the FRFI stays within the risk boundaries set by the Board.

Oversight of Risk

Risk management systems and practices will differ, depending on the scope and size of the FRFI and the nature of its risk exposures. To manage risks effectively, the Board and Senior Management must understand the risks attendant to the FRFI’s business model, including each business line and product, and how they relate to the FRFI’s strategy and Risk Appetite Framework.

\textit{Board Risk Committee}

\begin{boxed}{
7. The Board should establish a Board Risk Committee\footnote{For small, less complex FRFIs, in place of establishing a separate Risk Committee, the Board should be satisfied that it has the collective skills, time and information (i.e., appropriate reporting) to provide effective oversight of risk management on an enterprise-wide basis.} to oversee risk management on an enterprise-wide basis.
}

Guided by the FRFI’s Risk Appetite Framework, the Risk Committee should have an understanding of the types of risks to which the FRFI may be exposed, and the techniques and systems used to identify, measure, monitor, report on and mitigate those risks.

The Risk Committee should have a clear mandate. All Committee members, including the Chair, should be non-executives of the FRFI.
As part of its duty to oversee risk management of the FRFI, the Risk Committee should seek assurances from the CRO (or equivalent) that the risk management function of the FRFI is independent from operational management, is adequately resourced, and has appropriate status and visibility throughout the organization.

The Risk Committee should receive timely and accurate reports on significant risks of the FRFI and exposures relative to the FRFI’s risk appetite (including approved risk limits). It should provide input on material changes to the FRFI’s strategy and corresponding risk appetite. As well, the Risk Committee should be satisfied with the manner in which material exceptions to risk policies and controls are identified, measured, monitored, and controlled, as well as how exceptions/breaches are addressed.

Chief Risk Officer

8. The FRFI should have a senior officer (CRO or equivalent\(^\text{10}\)) who is responsible for the oversight of all risks across the firm.

The CRO is the head of the FRFI’s risk management function. The CRO and the risk management function are responsible for identifying, measuring, monitoring and reporting on the risks of the FRFI on an enterprise-wide and disaggregated level, independently of the business lines or operational management.

The CRO should have sufficient stature and authority within the organization, and should be independent from operational management. The CRO should have unfettered access and a functional reporting line to the Board or the Risk Committee.

The CRO and risk management function should not be directly involved in revenue-generation or the management and financial performance of any business line or product of the FRFI. As well, the CRO’s compensation should not be linked to the performance (e.g., revenue generation) of specific business lines of the FRFI.

While the CRO and the risk management function should influence the FRFI’s risk-taking activities (e.g., to ensure that the FRFI’s strategy or business initiative is operating within the stated risk appetite of the FRFI), the on-going assessment of risk-taking activities by the CRO and risk management function should remain objective.

The CRO should provide regular reports to the Board, the Risk Committee and Senior Management in a manner and format that allows them to understand the risks being assumed by the FRFI. The CRO should provide an objective view to the Risk Committee or the Board, as appropriate, on whether the FRFI is operating within the Risk Appetite Framework. The CRO should meet with the Risk Committee or the Board on a regular basis, with and without the CEO or other members of Senior Management present.

\(^{10}\) For small, less complex FRFIs, the CRO role can be held by another executive of the FRFI (i.e., the executive has dual roles). Some FRFIs may not have a CRO position \textit{per se}, but nonetheless can clearly identify an individual within the FRFI that is accountable to the Board and Senior Management for the same functions. In these cases, the dual role must not compromise the independence required of the CRO.
The CRO and risk management function should have processes and controls in place to assess the accuracy of any risk information or analysis provided by business lines in order to provide objective reporting to the Board, the Risk Committee and Senior Management.

IV. The Role of the Audit Committee

Federal legislation requires that each FRFI establish an Audit Committee comprised of non-employee directors, a majority of whom are not “affiliated” with the institution. ¹¹

The statutory duties of the Audit Committee, as described in federal legislation, include reviewing the annual statements of the FRFI, evaluating and approving internal control procedures for the institution, and meeting with the Chief Internal Auditor and/or the Appointed Actuary¹² to discuss the effectiveness of the institution’s internal controls and the adequacy of practices for reporting and determining financial reserves.¹³

The Audit Committee should approve the FRFI’s audit plans (internal and external). Audit plans should be risk-based and address all the relevant activities over a measurable cycle. Where part or all of the internal audit function is outsourced, the Audit Committee should still be responsible for overseeing the performance of the FRFI’s internal audit function as a whole.

The Audit Committee, not Senior Management, should recommend to the shareholders the appointment and removal of the external auditor. It should also agree to the scope and terms of the audit engagement, and review and recommend for approval by the Board the engagement letter and remuneration of the external auditor. Annually, the Audit Committee should report to the Board on the effectiveness of the external auditor.

The Audit Committee should discuss with Senior Management and the external auditor the overall results of the audit, the annual and quarterly financial statements and related documents, the audit report, the quality of the financial statements and any related concerns raised by the external auditor.

The Audit Committee should be satisfied that the financial statements present fairly the financial position, the results of operations and the cash flows of the FRFI. The Audit Committee should meet with the external auditor, the CIA and other heads of the Oversight Functions, as appropriate, with and without the CEO or other members of Senior Management present.

¹¹ As defined in the federal legislation and the Affiliated Persons Regulations associated with each financial institution’s governing statute.

¹² The role of the Appointed Actuary is outlined in OSFI’s Guideline E-15, Appointed Actuary: Legal Requirements, Qualifications and Peer Review.

¹³ FRFIs should ensure that they are in compliance with the relevant securities requirements in respect of the Audit Committee in the relevant jurisdictions.
V. Supervision of FRFIs

The Role of Corporate Governance in OSFI’s Supervisory Process

Effective corporate governance is an essential element in the safe and sound functioning of FRFIs. The Board and Senior Management are designated as key Oversight Functions in OSFI’s Supervisory Framework.

Effective oversight of the business and affairs of an institution by its Board and Senior Management is essential to the maintenance of an efficient and cost-effective supervisory system. It helps protect depositors and policyholders, and allows OSFI to use the work of the FRFI’s internal processes and functions, thereby reducing the amount of supervisory resources needed for OSFI to meet its mandate.

In addition, in situations where a FRFI is experiencing problems, or where significant corrective action is necessary, the important role of the Board is heightened and OSFI requires significant Board involvement in seeking solutions and overseeing the implementation of corrective actions.

OSFI’s Supervisory Assessment

OSFI supervises FRFIs to assess their financial condition and monitor compliance with the applicable federal legislation. Supervision is carried out within a framework that is risk-focused. OSFI has developed a comprehensive set of assessment criteria, key among which is the quality of oversight and control provided by the Board and Senior Management.

OSFI conducts supervisory work and monitors the performance of FRFIs to assess safety and soundness, the quality of control and governance, and regulatory compliance. The Board and Senior Management are ultimately accountable for the safety and soundness of the FRFI, as well as its compliance with federal legislation. As such, OSFI’s reports and findings can provide useful input to the Board’s own oversight of the FRFI. Open communication between the Board and regulators helps promote the mutual trust and confidence essential to the efficiency of OSFI’s principles-based approach to supervision. Accordingly, OSFI expects to be promptly notified of substantive issues affecting the FRFI.

The Board should understand the regulatory environment within which the FRFI and its subsidiaries operate. It should be informed of the results of supervisory work by OSFI and other regulators, and should follow-up with Senior Management accordingly.

The Board should consider regulatory findings in its on-going evaluation of Senior Management and oversight function performance, recognizing that primary responsibility for identifying weaknesses rests with the Board and Senior Management.

OSFI will undertake a number of approaches, including discussions with the Board, Board committees, Senior Management and Oversight Functions, as well as the review of Board and

---

14 Refer to OSFI’s Supervisory Framework.
Board committee material, in order to assess the effectiveness of the FRFI’s corporate governance. OSFI will look to gain insight into the discussions and deliberations at the Board and Committee level, including those with and without Senior Management. This may include understanding the Board’s behaviour and assessing the objectivity, degree of challenge and independence in the decision making process.

Where separate Oversight Functions do not exist, OSFI will look to other functions, processes or controls to assess the independent oversight provided.

**Changes to the Board or Senior Management**

OSFI recognizes that FRFIs make independent decisions regarding the nomination of Board members or appointment of Senior Management in the course of conducting their day-to-day business.

As part of OSFI’s on-going supervisory process, however, FRFIs should notify OSFI, as early as possible in the process, of any potential changes to the membership of the Board and Senior Management, and any circumstances that may adversely affect the suitability of Board members and Senior Management.

The process and criteria used by the FRFI in the selection process for Board and/or Senior Management members should be transparent to OSFI. Information regarding the qualifications of candidates of the Board and Senior Management should be provided to OSFI.
Annex A – The Special Nature of Financial Institutions

A number of factors set financial institutions apart from other business firms, and has led them to be subject to generally higher levels of regulation, including:

- The effectiveness of the economy depends significantly on how well its financial services sector functions. Relative to non-financial businesses, the failure of a financial institution can have a greater impact on members of the public who may have placed a substantial portion of their life savings with the institution and who may be relying on that institution for day-to-day financial needs. There is also potential in some circumstances for system-wide impacts from failures or material impacts in selected markets, given the interconnectedness of the financial system. Safety and soundness concerns are, therefore, of particular importance for financial institutions.

- Financial institutions may have high ratios of debt-to-equity (leverage), making them more vulnerable to unexpected adverse events.

- Financial institutions can experience severe liquidity problems if their customers or counterparties lose confidence in their safety and soundness.

- Financial institutions may accept funds from the public and often deal in long-term financial commitments, which are predicated on a high degree of confidence in the long-term stability and soundness of the institutions making these commitments.

- The value of many financial institutions’ assets and liabilities can be volatile and may be difficult to price accurately. Similarly, financial institutions may issue and trade in complex financial instruments, which can be difficult to evaluate properly and can materially and rapidly affect the risk profile of an institution.

- Financial institutions can have large mismatches between the term of their assets and liabilities. This can result in material funding or investment risks.

These characteristics create unique challenges for the governance of financial institutions and underscore the importance of effective risk management systems and rigorous internal controls. They point to the need for knowledgeable, independent oversight exercised by or on behalf of the Board, along with the additional assurance of regulatory oversight, to provide assurance to markets on the reliability of reporting and disclosure. Also, as a consequence of being a regulated industry, the governance processes of financial institutions are subject to review and may be influenced by the views of OSFI and other regulatory bodies.

Finally, many financial institutions have complex organizational structures with a large number of entities (some of which may not be regulated) used to deliver different financial products and services. For these organizations, the relationship between the parent company and its subsidiaries merits special consideration and the effective governance of subsidiaries should be a high priority for the Board and Senior Management.
Annex B – Risk Appetite Framework

The Risk Appetite Framework should contain a risk appetite statement and risk limits, as well as an outline of the roles and responsibilities of those overseeing the implementation of the Risk Appetite Framework. The Risk Appetite Framework is an integral part of the FRFI’s overall enterprise-risk management framework.

Risk Appetite Statement

The risk appetite statement reflects the aggregate level and type of risk that the FRFI is willing to accept in order to achieve its business objectives. Key features of the risk appetite statement are:

- It should be linked to the FRFI’s short-term and long-term strategic, capital and financial plans, as well as compensation programs.
- It includes qualitative and quantitative measures that can be aggregated and disaggregated.
  - Qualitative measure may include:
    - Significant risks the FRFI wants to take and why;
    - Significant risks the FRFI wants to avoid and why;
    - Attitude towards regulatory compliance; and
    - Underlying assumptions and risks.
  - Quantitative measures may include:
    - Measures of loss or negative events (such as earnings, capital or liquidity, earnings per share at risk or volatility) that the FRFI is willing to accept.
- It should be forward-looking.
- It should consider normal and stressed scenarios.
- It should aim to be within the FRFI’s risk capacity (i.e., regulatory constraints).

Risk Limits

Risk limits are the allocation of the FRFI’s risk appetite statement to:

- Specific risk categories (e.g., credit, market, insurance, liquidity, operational);
- The business unit or platform level (e.g., retail, capital markets);
- Lines of business or product level (e.g., concentration limits); and
- More granular levels, as appropriate.

Risk limits are often expressed in quantitative terms, and are specific, measurable, frequency-based and reportable.
Implementation of the Risk Appetite Framework

Once approved by the Board, the Risk Appetite Framework should be implemented by Senior Management throughout the organization as an integral part of the overall enterprise risk management framework of the FRFI. The Risk Appetite Framework should align with the organization’s strategy, its financial and capital plans, its business unit strategies and day-to-day operations, as well as its risk management policies (e.g., risk limits, risk selection/underwriting guidelines and criteria, etc.) and compensation programs.

Where the Risk Appetite Framework sets aggregate limits that will be shared among different units, the basis on which such limits will be shared should be clearly identified and communicated.

Effective control, monitoring and reporting systems and procedures should be developed to ensure on-going operational compliance with the Risk Appetite Framework, including the following:

- The CRO (or equivalent) should ensure that aggregate risk limits are consistent with the FRFI’s risk appetite statement.
- The CRO (or equivalent) should include in regular reports to the Board or Risk Committee, and Senior Management, an assessment against the risk appetite statement and risk limits.
- Internal Audit should routinely assess compliance with the Risk Appetite Framework on an enterprise-wide basis and in its review of units within the FRFI.

The Board and Senior Management should receive regular reports on the effectiveness of, and compliance with, the Risk Appetite Framework. These reports should include a comparison of actual results versus stated Risk Appetite Framework measures. Where breaches are identified, action plans should exist and be communicated to the Board. The Risk Appetite Framework should be an integral part of the Board’s discussions and decision-making processes.
Subject: Earthquake Exposure Sound Practices

No: B-9 Date: February 2013

I. Purpose and Scope

Catastrophic losses from exposure to earthquakes may pose a significant threat to the financial wellbeing of many Property & Casualty (P&C) insurers and reinsurers (insurers). As such, insurers must effectively measure, monitor and limit their exposures in accordance with a prudent risk appetite and risk tolerance.

The complexities associated with managing earthquake exposures, combined with the potential severity of losses, the difficulty of mitigating the risk post-event, and the high public profile of a major earthquake require insurers to have comprehensive policies and procedures in place, along with an appropriate level of oversight to ensure that they are effective.

This Guideline sets out OSFI’s expectations for policies and procedures applicable to insurers that write business materially exposed to earthquake-related losses. These policies and procedures should form part of an insurer’s overall catastrophe risk management. OSFI recognizes that individual insurers may have differing earthquake exposure risk management depending on, among other factors, their: size; ownership structure; nature, scope and complexity of operations; corporate strategy; and risk profile.

The Guideline also sets out common parameters and other factors to be considered when calculating probable maximum loss (PML). This information, when compared to the level of financial resources available, will enable an insurer to assess its capacity and financial preparedness to handle claims that may arise from a major earthquake. As further described in the Guideline, insurers are expected to report certain earthquake exposure information to OSFI on an annual basis.

---

1 For the purposes of this guideline, “insurers” refers to all federally regulated property and casualty insurers, including domestic insurance companies that are not mortgage insurance companies and foreign insurance companies in respect of their insurance business in Canada.

VI. Other OSFI Guidance .......................................................................................................... 14
II. Key Principles

The following key principles are intended to assist insurers in developing prudent approaches to managing their earthquake risk. OSFI will assess an insurer’s earthquake exposure risk management policy against these principles and, where considered necessary, will require remedial action consistent with its early intervention mandate.

Prudent use of catastrophe models to measure earthquake exposure risk is an important component of sound earthquake exposure risk management, and the following principles make numerous references to sound practices for use of catastrophe models. At the same time, there is significant uncertainty associated with catastrophe modeling, and it is critical that all users of the output of catastrophe models are conscious of this uncertainty. Accordingly, good corporate governance for this risk and other risk management techniques, such as risk limits, risk transfer and risk avoidance should also be considered by the insurer, and references in this guideline to these alternatives are as important as the guidance on the use of catastrophe models.

1. Earthquake Exposure Risk Management - Insurers should have a sound and comprehensive earthquake exposure risk management policy that is overseen by senior management.

Policies & Procedures

Earthquake policies and procedures should document the significant elements of the insurer’s approach to managing its earthquake risk.

Earthquake policies and procedures should include:

- the institution's risk appetite and risk tolerance for earthquake insurance;
- data management practices;
- exposure aggregation monitoring and reporting;
- appropriate understanding, selection and use of earthquake models, including considerations for model limitations, uncertainties and non-modelled classes of business;
- identification and estimation of relevant PML factors;
- the nature and adequacy of financial resources available in relation to the PML;
- contingency plans to ensure adequate claim handling resources and continued efficient operations;
- consideration of potential increases in claim and operating costs following a major loss event.
Senior Management

OSFI expects senior management to oversee the development of earthquake policies and procedures and to ensure that they are effectively implemented. At a minimum, senior management should review and discuss the policies and procedures as part of its periodic review of overall catastrophe risk management.

Senior management is responsible for implementing the policies and procedures throughout the organization. Exposure management is an ongoing process, and effective management may require internal reporting more frequently than annually. The exposure should be managed across the insurer, considering the accumulation of all related risks, such as insurance, reinsurance, investments and operations.

Senior management should ensure that appropriate internal controls exist to monitor the effectiveness of, and operational compliance with, the earthquake policies and procedures on an ongoing basis. Further, there should be controls in place to ensure the nature of exposure to earthquake risk (low frequency / high impact) is appropriately aligned with the design of management and broker/agent compensation plans. While all oversight functions are expected to contribute to this effort, the actuarial function can play a very important role in reviewing models used to determine exposures, the adequacy of the reinsurance programs to mitigate these exposures, and the pricing of earthquake insurance when delegated by senior management.

Please refer to OSFI’s Corporate Governance Guideline for OSFI’s expectations of insurer Boards of Directors in regards to operational, business, risk and crisis management policies.

2. Earthquake Exposure Data - Earthquake exposure data needs to be appropriately captured and regularly tested for consistency, accuracy and completeness.

The data required to run earthquake models goes beyond that traditionally used to rate insurance policies. Improving data consistency, accuracy and completeness is one area where an insurer’s efforts can significantly reduce the uncertainty inherent in earthquake exposure measurement. Good earthquake exposure data facilitates the management of this risk through risk transfer, pricing and monitoring against limits as well as catastrophe modeling.

Data Integrity

An insurer’s earthquake policies and procedures should reflect a strong commitment by senior management to obtain consistent, accurate and complete data to estimate the insurer’s exposure to earthquake risk. Senior management needs to understand the data requirements of the model(s) used and place a high priority on the quality of data and its timely capture. Data quality needs to be considered within the context of the assumptions and requirements of the earthquake model(s) used. If necessary, new processes should be put in place to improve data quality.

2 For foreign company branch operations in Canada, OSFI looks to the Chief Agent to oversee the management of the branch.
Responsibilities for the accuracy of data should be clearly defined, both within the insurer and in dealing with outside parties. Since intermediaries such as brokers and agents are often responsible for data collection, senior management should have policies and procedures in place to ensure that the data collected meets the insurer’s requirements.

As data quality is often impacted by a trade-off between completeness and accuracy, the insurer should implement a quality control process around data collection and entry including the adoption of criteria to measure data completeness and accuracy. Processes may include:

- Scoring data quality at the time of underwriting;
- Conducting remediation of sources providing inadequate data;
- Developing and implementing safeguards to prevent data collectors from miscoding business; and
- Investing in technology to improve data quality.

Data verification

OSFI expects insurers to have processes in place to verify that their databases are accurately capturing all the data received. While the quality of individual risk data is often the key driver of overall data quality, an aggregate analysis and assessment of the overall data quality of a portfolio/group of risks may be the most appropriate approach when the (re)insurer has limited access to the underlying policy processing system. This will often be the case for assumed reinsurance portfolios. Accordingly, reinsurers should have processes in place to evaluate the quality of data submitted by their cedants.

Data limitation

Senior management also needs to understand the data limitations and the level of possible errors in the data. While perfect data is the objective, it will be difficult or impossible to achieve this in practice. Therefore, senior management must understand the possible impact of data limitations on the results projected by the model and make prudent adjustments to the model estimates.

Data should be subject to periodic (at least annually) review by individuals independent of those responsible for data collection and data quality. While the insurer may use reinsurance brokers for this independent review, this work should extend beyond the regular review of data prior to submission to reinsurers to include a specific report that acknowledges that their work is being done to support the insurer’s compliance with this guideline. Less frequent and broader external reviews of the insurer’s data policies, testing and reporting can add value by providing independent benchmarking.

These reviews should cover the completeness, accuracy and consistency of the exposure data as well as the processes applied and the steps taken to achieve adequate data completeness and accuracy. Documentation of the testing and sign-off from the reviewers should be obtained. Testing, which should ensure that errors and erroneous coding are not occurring, could include:
• Summarizing data by key occupancy, construction and geocode and reviewing statistics such as the percent of data with known attributes, the amount of bulk coding and the most frequently observed values;
• Comparing year-to-year exposure changes;
• Using historical loss experience, if available, to identify specific portfolio coding issues and behaviour vs. model construction and assumptions; and
• Running portfolio-specific data quality sensitivity tests as a regular part of portfolio risk analysis process and incorporating into risk decision making

Senior management needs to ensure a plan is developed and documented to address all concerns identified in the reviews and select an appropriate time frame for updating the portfolio exposure data and model results.

3. Earthquake Models - Earthquake models should be used with a sound knowledge of their underlying assumptions and methodologies, as well as with a high degree of caution that reflects the significant uncertainty in such estimates.

Use of Earthquake Models

Insurers are expected to utilize theoretically sound earthquake models as part of their earthquake exposure management. Considering that earthquake-related PMLs are derived from a complex set of variables and related assumptions, earthquake models are an essential tool in providing a systematic approach to such estimates. However, while earthquake models continue to be refined as new information emerges, they have significant limitations and a high degree of inherent uncertainty. This uncertainty is demonstrated by the material differences observed when model estimates are compared to actual events and by the wide range of results from model to model. Nevertheless, when users appropriately consider model limitations and uncertainties, they provide a basis for PML estimation and reinsurance arrangements. Similarly, models further enhance their value as a risk management tool when they are also used to monitor earthquake exposure accumulations and to assist in underwriting decisions.

Sound Earthquake Model Practices

Earthquake models are available through a variety of means. They may be licensed from various commercial vendors and maintained in-house or run by third parties on behalf of the insurer. Some insurers have also developed their own in-house models. In any event, in order to ensure that earthquake models are appropriately used, insurers are expected to:

• Document how the use of earthquake models fits within their earthquake risk management process, including PML estimates and, where applicable, how models are used to monitor exposure accumulations and make underwriting decisions;
• Understand current modelling alternatives and why the model used is appropriate for the applicable insurance portfolio;
• Ensure there are adequately qualified staff to appropriately run the models on a regular basis when earthquake models are used in-house;

• Have a sound understanding of the key assumptions, methodologies and limitations underlying the model used, including:
  - how different settings (i.e., switches) impact PML estimates; insurers will need to justify why selected settings are appropriate when they vary from those recommended per the model;
  - ability to handle related factors such as demand surge, fire following and business interruption;
  - how changes in portfolio characteristics influence PML variability;
  - modelled losses versus non-modelled losses;

• Understand model uncertainty and how this is addressed in determining capital adequacy and related reinsurance arrangements;

• Have evidence that the granularity and quality of data used is appropriate for the model;

• When more than one model is used and they produce materially different results, be able to explain the results of their efforts to identify the key reasons for the differences and explain how this work is reflected in parameterization and adjustments (if any) to the particular model(s) chosen as the basis for PML.

Model Versions

While the use of an earthquake model is important, it represents only one element in an insurer’s risk management framework for earthquake exposure. While models continue to be refined, they retain inherent uncertainty. To counter the inherent uncertainty in models, insurers should consider the use of more than one model. Insurers should implement material updates to commercially available models in a timely manner. More specifically, it is expected that within one year of the release of any material change in a model, the revised model will be used, or an explanation provided for why not. Insurers are to identify the model(s) and version they are using.

When using vendor software to determine its PML, it is important for an insurer to understand the model, its purpose, use and limitations. The model documentation should provide sufficient detail to understand the model methodology, parameters, mathematical basis, limitations and specific insurer modelling refinements used.

Where an earthquake model has been developed in-house, it is expected to be updated on a regular basis and periodically tested for functionality and comparative PML results against other commercially available models.

Model Validation

Model validation provides important information on the performance of models.
An important element of this process is to ensure that the model prudently captures risks based upon actual events. This analysis should demonstrate that, over a sufficient historical period, the model-based measurement of loss is consistent with actual losses. To the extent that insufficient data exists to validate the model, an alternative but suitable prudent proxy should be employed for validation.

For example, one could compare the few major historical earthquake events to the losses produced by similar events in the model and assess any divergences. Given the limited number of major historical Canadian earthquakes, it may also be helpful to consider the lessons learned from earthquake events in other parts of the world.

One could also compare the modelled tail losses to market prices for reinsurance coverage. This test is not a validation per se but, rather, will serve as a source for further investigations. An outcome might be that the risk is treated more conservatively than the vendor model would show.

The setting and refinement of model parameters, including loadings for non-modelled risks or costs, should be robust and reflect the results of the model validation process.

The model validation process should be documented, and should clearly identify any limitations of the model or the data in assessing risk and should discuss how any such material deficiencies are mitigated.

4. PML Estimates - PML estimates should properly reflect the total expected ultimate cost to the insurer, including considerations for data quality, non-modelled exposures, model uncertainty and exposures to multiple regions.

While models are an essential tool in assisting insurers in the management of their earthquake exposures, they are limited in their capabilities. This results in a significant degree of uncertainty. As such, while insurers are required to develop PML estimates in accordance with this principle, they are also encouraged to consider other exposure limitation techniques, such as concentration limits by geography, occupancy and/or construction type.

Data Quality

Senior management needs to understand the possible impact of data limitations on the results projected by the model and to make prudent adjustments to the model estimates. While the upward PML adjustment may be necessary to offset some data shortcomings, it should be understood that a large adjustment to the PML for data quality is not a substitute for appropriate data capture.

Non-Modelled Exposures and Risk Factors

Many risks cannot be, or are difficult to, adequately consider within an earthquake model. As such, insurers need to take an inventory of exposures and risk factors relevant to their business and identify those that are not included in the model used. These non-modeled exposures and risk factors may include:
• exposure growth between the date of the data and the end of the relevant period of exposure;
• contingent business interruption;
• auto and marine insurance;
• claims handling expenses;
• adequacy of insurance to value;
• guaranteed replacement cost;
• increased seismicity after a large event; and
• blanket coverage and coverage extensions or clauses (i.e., debris removal).

These exposures and risk factors may be relatively small individually; however, their accumulation may be significant and need to be considered as part of an insurer’s earthquake PML.

Model Uncertainty

Many vendor models now automatically recognize the uncertainty associated with the conversion from the location specific estimate of ground motion to damage levels (secondary uncertainty) in their standard model outputs. There are other sets of assumptions in the earthquake models that are in a continuous process of being updated and refined. When considering its PML as a measure of the potential financial impact on the insurer, senior management needs to prudently factor in a margin of safety to reflect the uncertainty of these additional assumptions.

Exposures to Multiple Regions

Earthquake PMLs have historically been based on the larger of the British Columbia or Quebec PMLs. This approach understates the PML for insurers with significant exposures in both earthquake zones. It also ignores earthquake exposure elsewhere, which can have a material impact. Earthquake PMLs should be estimated and reported to senior management based on Canada wide\(^3\) exposure for foreign insurers or worldwide exposure for Canadian insurers, as well as any regulatory capital requirements. Therefore, insurers are expected to take account of risk which may result from exposures to more than one region.

5. Financial Resources and Contingency Plans - Insurers need to ensure that they have an adequate level of financial resources and appropriate contingency plans to successfully manage through a major earthquake.

Throughout this section, PML refers to a dollar amount that includes adjustments for data quality, non-modelled exposures and model uncertainty as outlined in Principle 4 above.

\(^3\) Throughout this guideline, Canada wide includes business reported on a company’s P&C-2 by virtue of the application of Part XIII.
Financial Resources

Earthquake policies and procedures should quantify an insurer’s willingness to take on earthquake insurance risk and outline how the insurer’s financial resources cover its gross PML. Insurers should refer to OSFI’s Guideline Minimum Capital Test for Federally regulated Property and Casualty Companies (MCT Guideline) in order to determine if they meet the regulatory test of financial preparedness for earthquakes. The following represent financial resources that could be used to support the insurer’s earthquake exposures:

1. Capital and Surplus

The MCT Guideline defines capital and surplus, making appropriate distinctions between Canadian incorporated insurers and Canadian branches of foreign insurance companies. It also specifies the maximum retention that can be supported within the insurer’s capital and surplus.

2. Earthquake Reserves

Refer to the MCT Guideline for details on the earthquake reserve requirements.

3. Reinsurance Coverage

While most insurers will use a catastrophe reinsurance treaty for this purpose, other reinsurance, such as per risk, quota share and whole account excess of loss may provide substantial coverage for some insurers. When an insurer includes non-catastrophe reinsurance in its determination of available financial resources, it needs to be prepared to demonstrate that it has appropriately considered per event limits and other events, terms and conditions that would otherwise exhaust coverage provided by these other types of reinsurance. In the case of whole account reinsurance insurers may need to use a full stochastic model.

Formal reinsurance agreements, evidenced by written documents between Canadian incorporated insurance companies and their foreign parent institutions, constitute a traditional mechanism with which insurers manage their insurance exposure. Other supporting financial arrangements provided by parent companies, such as letters of credit or guarantee facilities, cannot be used to support the insurer’s gross PML exposure.

Reinsurance programs should be arranged following Guideline B-3 Sound Reinsurance Practices and Procedures. Insurers that participate in global catastrophe reinsurance program must consider:

- on-going protection for Canadian operations (e.g., exhaustion of layers or program by other events); and
- adequacy and recoverability if other regions are impacted by the same event.
4. Capital Market Financing

Insurers can enter into innovative financing transactions designed to hedge their risk for a catastrophic event. In some cases, these are standby capital market financing facilities that become operative when a catastrophe occurs. Insurers also need to respect the provisions of the Borrowing (Property and Casualty Companies and Marine Companies) Regulations. Prior approval from OSFI is required before these instruments can be recognized as a financial resource under the MCT Guidelines.

Contingency Plans

Insurers must have contingency plans in place to ensure continued efficient business operations. The contingency plan should address the key elements of claims management, such as emergency communications links, availability and adequacy of claims and adjustment service personnel, and off-site systems back-up, that also includes reinsurance records.

III. Regulatory Reporting

All insurers will be required to annually file an Earthquake Exposure Data form with OSFI. The form will be updated periodically, and detailed instructions will be provided each year.

Insurers without material earthquake exposure should submit a letter stating this fact.

Note that earthquake exposure can exist for automobile and marine policies, as well as property policies, can arise from secondary sources such as fire-following and tsunami, and that all Canadian regions have some exposure to shake events.
IV. Guideline Administration

Supervisory Information

Enhanced transparency will allow OSFI to better understand the economic impacts and risks associated with an insurer’s earthquake exposure. Insurers with material exposure to earthquake risk are required to maintain and provide to OSFI, upon request, their policies that govern the earthquake exposure risk management, including PML and supporting reinsurance programs. Insurers with material exposure to earthquake risk should ensure that their overall catastrophe risk management provides enough coverage with respect to the B-9 principles.

OSFI expects the insurer’s annual Financial Condition Testing (FCT) will consider an earthquake event, and that the FCT report will either include this scenario or document the rational for not including it. The actuary would ensure consistency with any minimum return period for an earthquake event that may be required by the regulator.

Capital / Asset Requirements

Earthquake exposure may be a major risk to an insurer. If an insurer fails to meet the principles set out in this Guideline, on a case-by-case basis, OSFI may use its discretionary authority to adjust the insurer’s capital / asset requirements or target solvency ratios.

Reporting

A senior officer of an insurer should regularly report to senior management, details on the earthquake exposure and how the exposure is being managed. The officer should confirm the insurer’s practices and procedures meet, except as otherwise disclosed, the standards set in this Guideline. The report should also include the PML and detail the financial resources that support the exposure. The report should be available to OSFI, upon request.

Implementation

Each insurer should file an approved copy of its earthquake exposure risk management policy with its designated OSFI Relationship Manager.
V. Description of Terms

The following descriptions of terms are provided for their usage in the context of this guideline.

**Earthquake Insurance** - principally covers the damage from the initial shaking, but also covers the related risks of fire following and tsunami. Shake insurance is usually sold as an endorsement or rider to an insurance policy and covers damages to property and contents. In addition, it may include business interruption, additional living expenses, automobile damage and other types of coverage. Fire following an earthquake is the second main earthquake-related risk. Studies have shown that fire following damages can be quite severe because of broken gas mains, curtailment of water supply, road blockage for fire engines, etc. Coverage for damages from this risk may be sold as an endorsement or rider to an insurance policy (where legislation permits) or, alternatively, is sold as part of the standard property policy. Depending upon how this insurance is packaged, business interruption, additional living expenses, etc., may also be covered. A tsunami may also follow an earthquake that occurs under an ocean or a large lake. Although the impact of tsunamis is limited to coastal areas, their destructive power can be enormous and insurers should consider whether or not coverage (direct or indirect, as noted above for quake and fire following) is provided by any of their policies.

**Probable Maximum Loss (PML)** - the threshold dollar value of losses beyond which losses caused by a major earthquake are unlikely. When probabilistic models are used, PML is return period loss, which is defined as the dollar level of loss expected to be exceeded once in every X years. Gross PML is the PML amount after deductibles but before catastrophic and other reinsurance protection. Net PML is the PML after deductibles and catastrophic and other reinsurance protection. Note that a gross net PML (that is, after deductibles and other reinsurance inuring to the catastrophe treaty) is relevant to the placement of the catastrophe treaty; it is not directly relevant to this guideline.

**Risk Appetite** - the total level and type of risk exposure that an insurer is willing to undertake to achieve its objectives. Risk Appetite is often a qualitative assessment.

**Risk Tolerance** - specific parameters and/or limits on the level and amount of risk an insurer is willing to accept/retain.
VI. Other OSFI Guidance

This Guideline is complementary to, and should be read in conjunction with, other OSFI guidance that implicitly or explicitly addresses various elements of earthquake or governance, including:

The *Supervisory Framework* - describes the principles, concepts, and core process that OSFI uses to guide its supervision of federally regulated financial institutions (FRFIs).

*Minimum Capital Test* - for federally regulated property and casualty insurers;

*Corporate Governance* Guideline - provides information to Boards and management of insurers about OSFI’s expectations on corporate governance;

Guideline B-3: *Sound Reinsurance Practices and Procedures* - sets out expectations for effective reinsurance practices and procedures; and

Guideline E-17: *Background Checks on Directors and Senior Management of Federally Regulated Entities (FRE)* - outlines principles to assess the suitability and integrity of directors and senior management by FREs.
Guideline

Subject: Appointed Actuary: Legal Requirements, Qualifications and Peer Review

Category: Sound Business and Financial Practices

No: E-15 Date: August 2003
Revised: November 2006
Revised: September 2012

Introduction

This Guideline describes the role of the Appointed Actuary in federally regulated insurance companies and sets out some of OSFI’s expectations with respect to that role. The Guideline is divided into three parts. The first part summarizes the major responsibilities of the actuary as described in the Insurance Companies Act (ICA) and the related Guidelines and Memoranda published by OSFI. The second part deals with the actuary’s qualifications required to carry out the Appointed Actuary’s role, and the third part sets out OSFI’s expectations with respect to peer review of the Appointed Actuary’s work and reports.

Other OSFI Guidelines and Memoranda contain additional information related to the responsibilities of the Appointed Actuary. Particularly important in this regard is the annual Memorandum to the Appointed Actuary. OSFI issues separate versions of the Memorandum to actuaries of life insurance companies and to actuaries of property and casualty insurance companies.

1 In this Guideline, federally regulated insurance companies means Canadian insurance companies, including fraternal benefit societies and provincial companies (as that term is defined in subsection 2(1) of the Insurance Companies Act) and Canadian branches of foreign insurance companies, including foreign fraternal benefit societies.

2 The legislative summary in this Guideline is not intended to be a substitute for provisions of the ICA. The reader is advised to refer to the provisions of the ICA and not to rely on the interpretation of those provisions contained in this Guideline.

Section 1: Legal Requirements of the Appointed Actuary

This part summarizes a number of sections in the ICA (the applicable sections of the ICA are shown in brackets) that relate to the appointment and role of the Appointed Actuary, as well as key provisions of related Guidelines and Memoranda published by OSFI. It also sets out the Superintendent’s expectations regarding the annual reporting of companies’ expected future financial condition. The ICA refers to the actuary of the company. In this Guideline, in keeping with common usage in the insurance industry, this person is referred to as the Appointed Actuary (AA).

a. Appointment of an Actuary

Each company\(^4\) must appoint an actuary of the company (49(1), 165(2)(i), 623(1), 660(1)(a)) and notify the Superintendent, in writing, of the appointment (357, 623(2)). The AA must be a Fellow of the Canadian Institute of Actuaries (FCIA) (2(1)).

The chief executive officer or the chief operating officer (or a person performing like functions) of a Canadian company or society or of a provincial company, or the chief agent of a foreign company, may not be appointed as AA unless authorized in writing by the Superintendent (359.1(1), 624.1(1)). In the case of a Canadian or provincial company, the chief financial officer or a person performing like functions may not be appointed as AA unless the audit committee of the company has provided a written statement to the Superintendent and the appointment is authorized by the Superintendent (359.2).

The directors of a company or, in case of a foreign company, the company itself, may revoke the appointment of the AA. If this happens, the company must notify the Superintendent, in writing, of the revocation (360, 625). An AA who resigns or whose appointment is revoked shall submit to the Superintendent and to the directors of a Canadian or provincial company or to the chief agent of a foreign company a written statement that includes the circumstances and reasons for the resignation or why, in the actuary's opinion, the appointment was revoked (363, 627(1)).

Where an AA resigns or their appointment is revoked, no person shall accept an appointment or consent to be appointed as AA before requesting and receiving from the previous company actuary the written statement that was submitted to the directors or the chief agent and to the Superintendent (364(1), 627(2)). An appointment may be accepted if no reply is received within fifteen days after a request was made (364(2), 627(3)).

---

\(^4\) When unmodified, the term “company” refers to Canadian insurance companies, provincial companies (as that term is defined in subsection 2(1) of the Insurance Companies Act), fraternal benefit societies and Canadian branches of foreign insurance companies and foreign fraternal benefit societies.
b. Role and Duties of the Appointed Actuary

The AA is required to value the actuarial and other policy liabilities as at the end of a financial year, and any other matters specified by the Superintendent. The AA’s valuation is required to be in accordance with accepted actuarial practice, with such changes and any additional directions that may be made by the Superintendent (365, 629). The AA’s report in the annual financial statement must opine that the policy liabilities are valued in accordance with accepted actuarial practice (367). It is expected that the valuation includes the selection of appropriate assumptions and methods, where each separate assumption is expected to be appropriate. It should be noted that the Superintendent may appoint an actuary to value certain liabilities or other matters if the Superintendent is of the opinion that it is necessary (365.1(1), 629.1(1)).

The liabilities shown in the annual return are required to include as a reserve the value of the actuarial and other policy liabilities (667(1)). The AA is required to make, and the company to file with its annual return, the Appointed Actuary’s Report (AAR) on the policy liabilities and any other matters the Superintendent may specify in a form determined by the Superintendent (667(2)). OSFI’s annual Memorandum to the Appointed Actuary contains up-to-date instructions on the form and content of this report. Also, the AA shall, not less than twenty-one days before the date of the annual meeting of a Canadian or provincial company, make a report on the valuation of the liabilities to the shareholders and policyholders. The AA shall state whether, in the AA’s opinion, the annual statement presents fairly the results of the valuation (367).

The AA is also required in each financial year to meet with and report to the directors or the chief agent on the company’s financial position. When directed by the Superintendent, the AA must also report on the company’s expected future financial condition (368, 630). A report on the company’s expected future financial condition is normally prepared as described in the Canadian Institute of Actuaries (CIA) standard of practice on Financial Condition Testing (FCT).

The Superintendent expects that a report on the company’s expected future financial condition will be prepared annually in compliance with the CIA standards. The FCT report should be presented to the directors of the company, or where the directors so choose, with an appropriate subcommittee of the board (e.g. audit committee, risk committee, etc.). An FCT report shall be based on the prior year end financial position or a more recent position. If the FCT report is presented to the board of directors in the second half of the financial year, then it shall include material changes in experience and in financial position up to the period of 90 days before the date of presentation. It is expected that the projection period for studies of life companies will be for at least five years and for P&C companies will be for at least three years. A copy of the report will be filed with OSFI within thirty days of presentation to the company’s directors, but no later than the end of the calendar year.

In addition to the FCT, the AA is required to report, in writing, to the chief executive officer and the chief financial officer or to the chief agent of the company any matters that, in the AA’s opinion, have material adverse effects on the financial condition of the company and that require
rectification. The AA must supply a copy of this report to the board of directors. Where, in the opinion of the AA, suitable action is not being taken to rectify these matters, the AA shall send a copy of the report to the Superintendent and advise the directors or the chief agent of the company that this has been done (369, 631).

When a company maintains a participating account (456), the directors of a company must establish a policy for determining the dividends and bonuses to be paid to the participating policyholders and a policy respecting the management of each of the participating accounts (165(2)(e)) and (165(2)(e.1)). The AA is required to report to the directors in writing on the fairness to participating policyholders of any policy established or amended under 165(2)(e) and 165(2)(e.1) and report at least once a year on its continuing fairness (165(3.1) and 165(3.2)).

The AA is required to report, in writing, to the directors on the fairness to participating policyholders of a proposed dividend, bonus or other benefit and whether it is in accordance with the dividend or bonus policy. The directors must consider the actuary’s report before declaring the dividend, bonus or other benefit on participating policies (464(2)).

The AA is required to provide the company with a written opinion on whether the method selected for allocating investment income or losses and expenses to the participating account is fair and equitable to the participating policyholders (457, 458). The company must file a copy of the AA’s written opinion with the Superintendent (459), together with a description of the allocation method.

Each year, the AA must report, in writing, to the directors on the fairness and equitableness of the allocation method used by the company (460). The AA is also required to report on whether payment to shareholders or a transfer to an account from which payments can be made to shareholders from the profits of the participating account would materially affect the company’s ability to comply with its dividend or bonus policy or to maintain the level of dividends paid to participating policyholders (461(c)).

The directors of a company must establish criteria for changes made by the company to the premium or charge for insurance, amount of insurance or surrender value in respect of its adjustable policies (165(2)(e.2)). The AA is required to report to the directors in writing on the fairness to adjustable policyholders of the criteria established or amended under 165(2)(e.2)) and report at least once during each financial year on their continuing fairness (165(3.3)).

The AA is required to report, annually and in writing, to the directors on whether the changes the company made in respect of its adjustable policies during the preceding 12 months are in accordance with the criteria established under paragraph 165(2)(e.2) and are fair to the adjustable policyholders (464.1(1)).

Additional requirements and guidance concerning participating accounts can be found in the Policyholders Disclosure Regulations and OSFI’s Guideline E-16 Participating Account Management and Disclosure to Participating and Adjustable Policyholders.
For insurance companies, OSFI’s guideline: *Life Insurance Capital Adequacy Test* (LICAT) sets out requirements for the test of capital adequacy. The LICAT and *Life Insurance Margin Adequacy Test* (LIMAT) returns require the AA’s confirmation that the instructions pertaining both to the LICAT guideline and to the annual return have been followed. OSFI also expects an opinion signed by the AA and a memorandum, both covering the areas where the calculation required discretion or where significant technical calculations, methodologies and judgements were applied.

**Section 2: Qualifications Required**

As previously noted, the AA is required to be an FCIA. The AA is, therefore, subject to the CIA’s Rules of Professional Conduct. Rule 1 requires the AA to act honestly and to perform professional services with integrity, competence, skill and care. Rule 2 requires a CIA member to perform professional services only when the member is qualified to do so and meets applicable qualification standards. Professional services performed by a CIA member must, under Rule 3, meet applicable standards of practice.

The Superintendent may disqualify or remove a senior officer if the Superintendent is of the opinion that the senior officer is not suitable to hold the position (678.1(4) and 678.2(1)).

In assessing the suitability of an AA, the Superintendent expects that the AA has each of the following qualifications:

1. has appropriate Canadian practical experience, which is defined as *Work in Canada*\(^5\) for at least three of the last six years, of which at least one year was performing valuation of Canadian actuarial liabilities of an insurance company;
2. has experience with the CIA’s Standards of Practice and relevant insurance legislation and regulation;
3. is up to date with respect to the CIA’s Continuing Professional Development requirement;
4. has not been the subject of an adverse finding by a CIA Disciplinary Tribunal. Where there has been such a finding, the Superintendent may nevertheless conclude that the AA is a suitable person if the circumstances of the case and other information support such a conclusion.

\(^5\) “Work in Canada” is as defined in the CIA standards.
Section 3: Peer Review of the Work of the Actuary

a. Background

OSFI believes that regular peer review of certain work performed by the AA is of significant benefit both to OSFI and to a company’s stakeholders by contributing to the safety and soundness of insurance companies, as described in the general objectives below. In addition, regular peer review is also of benefit to the AA by providing a source of independent advice and a means of consulting with other knowledgeable actuaries. Consequently, OSFI expects that all federally regulated insurance companies will appoint peer reviewers to implement peer review processes consistent with the OSFI criteria described below. The peer review should be conducted in accordance with accepted actuarial practice as specified in the CIA’s Standards of Practice, in particular with section 1530 of these standards and any related educational notes.

b. General Objectives

In requiring peer review of the work of the AA, OSFI has the following objectives:

- assist OSFI in its assessment of the insurer’s safety and soundness: The AA has the responsibility for the valuation of policy liabilities in the financial statements and future financial condition reporting. Actuarial peer review is one tool OSFI uses in its assessment of the safety and soundness of insurers.

- be of benefit to the AA by providing (i) a source of independent consultation advice, and (ii) an additional source of professional education: This aids in narrowing the range of practice by AA’s and improving the quality of their work. OSFI recognizes that this is not the only source of professional development for the AA.

- maintain and strengthen confidence in the work of the AA by the public, by insurance company management and directors and by supervisory authorities.

It is OSFI’s intention to periodically meet with the peer reviewer to discuss the report and the findings of a review. It is also OSFI’s intention to periodically meet with the AA to discuss the value being obtained by the peer review process.

c. Work to be Reviewed

In order to assist in achieving OSFI’s objective to assess insurers’ safety and soundness, the reviewer is expected to:

1. ascertain that the work of the AA for the valuation of policy liabilities and ceded reinsurance assets is in compliance with accepted actuarial practice, as established by the Actuarial Standards Board and the CIA, and is consistent with any objectives or requirements established by OSFI in Regulations, Guidelines or the Memorandum to the AA (Note that the peer review work is not intended to duplicate the work of the external auditor. See Section 3d below);
2. review the appropriateness and extent of internal and external material changes affecting the valuation of policy liabilities and ceded reinsurance assets. The reviewer should assess the risk of material misstatement or omissions arising from each change, as opposed to just the net effect of off-setting changes.

3. review the adequacy of procedures, systems and the work of others relied on by the AA, to the extent that these are not reviewed by the external auditor. This includes checks on data integrity and checks on procedures and methodologies used to validate the valuation calculations and results;

4. discuss with the AA the appropriateness of each of the assumptions used and the methods employed in the valuation of actuarial policy liabilities and ascertain that the assumptions are at the appropriate point in the range of accepted actuarial practice, given the circumstances of the company;

5. determine whether the Appointed Actuary’s Report (AAR) sufficiently describes the valuation assumptions and valuation methodology employed by the AA;

6. for life insurance companies’ LICAT/LIMAT returns, and for P&C companies’ MCT/BAAT returns, and additionally, for mortgage insurance companies’ MICAT returns, review the work of the AA in the areas that require actuarial assumptions and calculations and ensure the work is consistent with the report, if any, accompanying these filings;

7. review and discuss with the AA the methodology, assumptions and scenarios used for future financial condition reporting as required by the Superintendent in Section 1 of this Guideline, usually based on Financial Condition Testing (FCT); and

8. produce a written report(s) documenting the findings of the peer review.

The AA and management of the company should co-operate fully with the peer reviewer when the review is being carried out. Best efforts should be used to provide the reviewer with access to any required documents and to provide any additional explanations that may be relevant to the peer review.

Examples of material changes referenced in point 2 above include, but are not limited to:

- changes in key actuarial valuation assumptions or unusual adverse or favourable loss development;
- changes in methodology used in the valuation;
- changes in company operations or circumstances (e.g. acquisitions, investment policy, etc.);
- use of a revised valuation model (e.g. the review should cover general methodology, but does not need to be a full software audit or a recalculation.);
- material events that would suggest that valuation assumptions or methods may need to be modified (e.g. fundamental economic changes, changes in corporate legal structure, taxation law changes, material new line of business, etc.). For such events, a review should also be included of the valuation assumptions and methods for material blocks of
business that are subject to high sensitivity, but where no changes have been made.

d. Materiality Considerations

The materiality level used for a company’s financial statements is set by the external auditor based on the size of the company as a whole. For the purpose of peer review, both the reviewer and the AA should follow the description of materiality as contained in the CIA standards of practice. This requires materiality to be set from the point of view of the prime user of the work. As such, OSFI expects the materiality level for peer review to be appropriate at the line of business level at which the assumptions are set.

Materiality is a matter of professional judgement in the particular circumstances. While auditors may determine quantitative materiality for audit purposes at the total company level, materiality for the purposes of peer review cannot be determined solely by means of the application of a numeric threshold. General quantitative guidelines are not a substitute for the AA’s and peer reviewer’s professional judgement.

Materiality should become more rigorous as the company approaches any internal capital targets or regulatory capital thresholds.

e. Peer Review and External Audit

The Canadian Institute of Chartered Accountants (CICA) and the Canadian Institute of Actuaries (CIA) have issued a paper entitled Guide: Audits of Financial Statements That Contain Amounts That Have Been Determined Using Actuarial Calculations (the CICA Guide). This paper provides guidance to external auditors for applying the requirements of the Canadian Auditing Standards (CASs). These standards state that the overall objective of the auditor is to obtain reasonable assurance about whether the financial statements as a whole are free from material misstatement.

However, OSFI’s objective and scope for peer review is to assess the safety and soundness of insurers by reviewing the AA’s work for the financial statements at a more granular level. It is OSFI’s view that each of the assumptions used should be independently reasonable, in accord with accepted actuarial standards, and that the methodology should be appropriate for each valuation model. OSFI expects the peer reviewer to express an opinion on the appropriateness of the policy liabilities at this more granular level and to provide feedback to the AA on the various aspects of their work. Therefore, since the objective of an external audit differs from the objective of a peer review, the audit work done to satisfy the audit requirements may not be sufficient to fully address the peer review requirements under this Guideline.

It is not OSFI’s intention that the requirements for the peer review work duplicate the work of the external auditor, including any actuary assisting the auditor. The peer reviewer is not required to perform any detailed recalculations, as long as the reviewer determines that the controls and procedures used by the AA are adequate to identify potential errors in the valuation results. The peer reviewer is also not required to verify data or controls.
Where the auditor’s actuarial specialist on the engagement team is not an FCIA, the peer reviewer should take extra care to verify that all CIA standards are met by the AA.

f. Contents of Peer Review Reports

OSFI expects the peer reviewer to prepare a report documenting the findings of the reviews.

In the case of a Canadian or provincial insurance company, the peer reviewer’s written report, or a summary of it, is expected to be submitted to the audit committee of the company’s board of directors at the meeting subsequent to the completion of the report. In the case of a Canadian branch of a foreign insurance company, the report is to be submitted to the Chief Agent. In both cases, the full report and any summary report are to be submitted to OSFI.

The full peer review written report should include the following:

- a description of the work done by the reviewer (both the specifics of the work and its extent);
- the timing during the year when the work was carried out;
- the materiality level used for the review;
- the reviewer’s statement of opinion with respect to the AA’s compliance with accepted actuarial practice and any objectives or requirements established by OSFI in Regulations, Guidelines or Memoranda to the AA;
- the reviewer’s observations with respect to changes made in methodology and assumptions;
- the reviewer’s acknowledgement that no additional material changes should have been made;
- a list of any recommendations for further review or work by the AA in the coming year;
- and
- a brief description of the relationship with the AA to support the specific objectives of providing consultation aid, professional education and improving the quality of the AA’s work.

g. Peer Review Cycle

Each item of the AA’s work described in subsection 3(c) above dealing with the financial statements should be reviewed and reported on at least once every three years, either all at once or in phases over a three-year cycle.

However, OSFI expects material changes (see subsection 3.c.2), if any, affecting the valuation of policy liabilities or ceded reinsurance assets to be reviewed and reported on annually. If there are no material changes, and the reviewer is in agreement that this is appropriate, the reviewer should still prepare and file a brief report to that effect.
A full review of the financial condition reporting (subsection 3.c.7) is expected to be prepared every three years. A limited annual review is only required to address the appropriateness of the scenarios employed. The peer reviewer is expected to prepare reports documenting the findings of both the full 3-year review and the limited annual review.

**h. Timing of the Peer Review Work and Reports**

Due to the separate timing during the year of the AA’s work for a company’s financial statements and for financial condition reporting, there can be more than one report.

With regard to the financial statement related work (items c.1, c.2, c.3, c.4 and c.6 above), OSFI encourages the peer review to be pre-release (i.e. carried out prior to the release of the AA reporting on the statement related work).

The review of the AAR (item c.5 above) can be post-release.

The review of the future financial condition reports is also encouraged to be pre-release, but may be post-release depending on the circumstances of the company.

To qualify as a pre-release peer review, the reviewer must prepare the report and sign his/her opinion on, or shortly before, the date the AA reports on any work. For example, the filing of the Life-1, Life-2, P&C-1 or P&C-2 statements with OSFI is deemed to be AA reporting. For a pre-release peer review of work subject to external audit, the peer review report should be submitted to the audit committee or to the Chief Agent on, or shortly before, the date the AA reports on any work.

The complete peer review reports, and any summaries, are expected to be submitted to OSFI on a confidential basis. Copies of pre-release reports, both the full peer review report, and any summary, for financial statement work should be forwarded to OSFI based on the same deadlines that apply to filings of the Life-1, Life-2, P&C-1 or P&C-2 reports. For post-release reviews, the reviewer’s report should be submitted to OSFI no later than thirty days after release of the AA’s report on the work reviewed, and for future financial condition reports, no later than December 31.

If a member or employee of the insurer’s external audit firm peer reviews work by the AA that is subject to audit, OSFI expects that such a peer review will be completed prior to the issuance of the audit opinion.

**i. Selecting a Reviewer**

OSFI expects each company to hire a single peer reviewer for the company as a whole. If there are affiliate or subsidiary companies within one group, a single peer reviewer should be responsible for assessment of the entire group of companies, including the preparation of the peer review reports and opinions. The reviewer may, however, engage other sub-reviewers to
take advantage of particular competencies.

A peer reviewer is expected to meet the same qualification standards as are outlined in Section 2 of this Guideline with respect to the AA, including the Superintendent’s minimum requirements for suitability.

It is good practice for the audit committee of the company’s board of directors, or the chief agent in the case of a foreign company, to be advised of the terms of the peer review and the selection of the reviewer before the review is undertaken.

OSFI expects a reviewer to have sufficient experience with respect to the type of work to be reviewed. The reviewer’s prior experience should include exposure to two or more unrelated insurance companies in order that the reviewer be familiar with the range of practices and assumptions used by actuaries in Canada. Knowledge of industry best practices is needed to ensure the review process appropriately fulfils its educational and consultative objectives.

OSFI expects a company to notify it in writing forthwith after hiring the peer reviewer, and to provide the reasons for any change in reviewer.

It is essential to the integrity of the peer review process that a reviewer be, and be seen to be, objective. The reviewer should, therefore, have no relationship with the insurer or with the AA that would in any way impair objectivity. The reviewer is expected to follow the CIA Standards of Practice as well as any additional OSFI requirements. In practice, without limiting the generality of the foregoing, OSFI believes that the following criteria should be applied in determining the objectivity of a reviewer:

- A reviewer may not be an employee of the company or any affiliated companies, and may not have been employed by the company or served as AA of the company during the three years prior to the date of the work being reviewed;
- A reviewer must not be a shareholder of, or have a direct financial investment (other than as a policyholder, depositor, beneficiary or insured) in the company;
- A reviewer may have an indirect interest (e.g. through a diversified mutual fund investment) in the company;
- If a member of a consulting firm is the AA, another member of the same firm may not be the peer reviewer;
- If a member of a consulting firm is involved in any actuarial work related to the financial statements or financial condition reporting for the company, another member of the same firm may be the peer reviewer only if he/she is not involved in this work for the company. In this context, “actuarial work” includes deciding on methodology, selecting assumptions and producing results.
- It is acceptable, and in fact expected, that the AA will be in contact with the peer reviewer during the course of the year to discuss the potential acceptability of changes in methodologies and assumptions that the AA is considering. However, the reviewer
should only provide advice with respect to these changes as part of the peer review work. This is similar to the interaction of a company with its external auditor.

- A peer reviewer may be an actuary working in the company’s external audit firm, but companies are encouraged to not use as a peer reviewer an actuarial specialist who is a member of the audit team for the company.

OSFI regards an actuary working for the external audit firm to be sufficiently independent to be a peer reviewer. Using an actuary from the external audit firm can accommodate smaller and simpler companies. Notwithstanding this, OSFI expects large and complex companies to engage a peer reviewer who is not a member of its external audit firm. While OSFI recognizes that external audit firms are independent, it is of the view that a separate independent actuarial peer review is desirable since it will give additional perspective to large and complex companies.

However, as noted in subsection 3(h), if an actuary in the external audit firm’s actuary is used for peer review, the peer review of any work that is subject to audit should be completed prior to the issuance of the audit opinion. In addition, this peer review work should be performed under a stand-alone engagement that is separate from the audit engagement.

Note that the criteria for objectivity for peer review purposes are not as restrictive as those found in OSFI’s Guideline E-14, Role of the Independent Actuary (i.e., rules required for amalgamations of companies or buying/selling of blocks of business). In the latter case, the Independent Actuary represents, in the transaction, policyholders who rely on the Independent Actuary. In the case of peer review, OSFI, policyholders, management and shareholders continue to depend on the AA.

j. Changing a Reviewer

To enhance the peer reviewer’s objectivity and increase the educational value of the review process, a regular change or rotation of reviewers is expected. This allows the AA to obtain different perspectives. Therefore, OSFI expects that a reviewer will be changed at least once every two cycles (i.e., every six years). However, the company has the option of making more frequent changes.

If a peer reviewer is a member of a consulting or audit firm, another member of the same firm may be acceptable as a new peer reviewer. In this case, a previous reviewer may be reappointed to this role after a period of at least one cycle (i.e., at least three years).

When a company changes its peer reviewer, it should notify OSFI in writing forthwith stating the reasons for the change.

Guideline

Subject: Stress Testing

Category: Sound Business and Financial Practices

No: E-18 Date: December 2009

Stress testing is an important tool for senior management to use in making business strategy, risk management and capital management decisions. This guideline sets out OSFI’s expectations with respect to stress testing and applies to banks and bank holding companies, and to all federally regulated trust and loan companies, cooperative credit associations, life insurance companies and fraternal benefit societies, property and casualty insurance companies and insurance holding companies (collectively referred to as “institutions”).

A. Stress Testing Defined

Stress testing is a risk management technique used to evaluate the potential effects on an institution’s financial condition, of a set of specified changes in risk factors, corresponding to exceptional but plausible events\(^1\). Stress testing includes scenario testing and sensitivity testing (refer to Glossary).

Stress testing is especially important after long periods of benign economic and financial conditions, when fading memory of negative conditions can lead to complacency and the underpricing of risk. It is also a key risk management tool during periods of expansion, when innovation leads to new products that grow rapidly and for which limited or no historical experience is available.

Stress testing attempts to determine the impact of situations where the assumptions underlying established models used in managing a business break down. This applies equally to valuation models, models of individual risks and models that aggregate individual risks.

B. Purposes of Stress Testing

Stress testing should be embedded in enterprise wide risk management. A stress testing program as a whole should be actionable, playing an important role in facilitating the development of risk mitigation or contingency plans across a range of stressed conditions. It should feed into the institution’s decision making process, including setting the institution’s risk appetite, setting exposure limits, and evaluating strategic choices in longer term business planning.

An institution’s stress testing program should serve the following purposes:

i. **Risk identification and control** – Stress testing should be included in an institution’s risk management activities at various levels, for example, ranging from risk mitigation policies at a detailed or portfolio level to adjusting the institution’s business strategy. In particular, it should be used to address institution-wide risks, and consider the concentrations and interactions between risks in stress environments that might otherwise be overlooked.

ii. **Providing a complementary risk perspective to other risk management tools** – Stress tests should complement risk quantification methodologies that are based on complex, quantitative models using backward looking data and estimated statistical relationships. In particular, stress testing outcomes for a particular portfolio can provide insights about the validity of statistical models at high confidence intervals, for example those used to determine VaR.

As stress testing allows for the simulation of shocks which have not previously occurred, it should be used to assess the robustness of models to possible changes in the economic and financial environment. Stress tests should help to detect

\(^1\) Stress Testing by Large Financial Institutions: Current Practice and Aggregation Issues, Committee on the Global Financial System, April 2000
vulnerabilities such as unidentified risk concentrations or potential interactions between types of risk that could threaten the viability of the institution, but may be concealed when relying purely on statistical risk management tools based on historical data.

Stress testing can also be used to assess the impacts of customer behaviour arising from options embedded in certain products – particularly where the impact is not easily modelled under extreme events.

iii. **Supporting capital management** – Stress testing should form an integral part of institutions’ internal capital management where rigorous, forward-looking stress testing can identify severe events, including a series of compounding events, or changes in market conditions that could adversely impact the institution.

iv. **Improving liquidity management** – Stress testing should be a central tool in identifying, measuring and controlling funding liquidity risks, in particular for assessing the institution’s liquidity profile and the adequacy of liquidity buffers in case of both institution-specific and market-wide stress events.

C. **Role of Senior Management**

Senior management (including, in the case of foreign insurance or bank branches, the Chief Agent or Principal Officer, respectively, and an appropriate senior official from the branch’s home office) involvement in the stress testing program is essential for its effective operation. Senior management is accountable for the program’s implementation, management and oversight and for ensuring that the institution has adequate plans to deal with remote but plausible stress scenarios.

Senior management must ensure there is a “fit for purpose” program in place that is enterprise wide and that operational management has adopted policies requiring appropriate use of stress testing as a management tool.

Senior management should be able to identify and clearly articulate the institution’s risk appetite and understand the impact of stress events on the risk profile of the institution. Senior management must participate in the review and identification of potential stress scenarios, as well as contribute to the development and implementation of risk mitigation strategies. In addition, senior management should consider an appropriate number of well-understood, documented, utilised and sufficiently severe scenarios that are relevant to their institution. Senior management’s endorsement of stress testing as a guide in decision-making is particularly valuable when the tests reveal vulnerabilities that the institution finds costly to address or difficult to resolve in a timely, appropriate and realistic manner.

Please refer to OSFI’s *Corporate Governance Guideline* for OSFI’s expectations of institution Boards of Directors in regards to operational, business, risk and crisis management policies.
D. General Considerations for Stress Testing Programs

Stress testing programs should take account of views from across the organisation and should cover a range of perspectives and techniques.

The identification of relevant stress events, the application of sound modelling approaches and the appropriate use of stress testing results each require the collaboration of different senior experts such as risk controllers, economists, business managers, traders and actuaries. Institutions should also use a range of techniques in order to achieve comprehensive coverage in their stress testing program, including quantitative and qualitative techniques to support and complement models and to extend stress testing to areas where effective risk management requires greater use of judgement.

Institutions should have written policies and procedures governing the stress testing program. The operation of the program should be appropriately documented.

The assumptions and fundamental elements for each stress testing exercise should be appropriately documented, including the reasoning and judgements underlying the scenarios chosen and the sensitivity of stress testing results to the range and severity of the scenarios. The level of documentation should be based on the nature and purposes of the stress testing. For example, documentation of ad hoc sensitivity tests for tactical decisions may be less elaborate than the documentation of enterprise-wide stress tests used for strategic decision making. An evaluation of fundamental assumptions should be performed regularly or in light of changing external conditions. The results of the assessments should also be documented.

An institution should have a suitably robust infrastructure in place, which is sufficiently flexible to accommodate different and possibly changing stress tests at an appropriate level of granularity.

The infrastructure should be able to aggregate comparable risks and exposures across the institution. It should allow for reporting to senior management in a timely manner throughout the fiscal year. The infrastructure and information systems should be sufficiently flexible to accommodate a timely increase in the frequency of ad hoc sensitivity testing to support senior management’s response to rapid changes in the operating environment and also for purposes of responding to the concerns of external stakeholders and regulators.

An institution’s stress testing infrastructure and information systems should be commensurate with the nature and complexity of the institution and its risk profile. For example, greater risk factor volatility and shorter time horizons for management actions require infrastructure and information systems that accommodate more frequent stress testing in those areas.

An institution should regularly maintain and update its stress testing framework. The effectiveness of the stress testing program, as well as the robustness of individual components, should be assessed regularly and independently.
Assessments of effectiveness should be qualitative as well as quantitative, given the importance of judgments and the severity of shocks considered. Areas for assessment should include effectiveness of the program in meeting its intended purposes, documentation, development work, system implementation, management oversight, data quality and hypotheses and assumptions used.

Since the stress test development and maintenance processes often imply judgmental and expert decisions (e.g. assumptions to be tested, calibration of the stress, etc.), the independent control functions such as risk management and internal audit should also play a key role in the process. In particular there should be an independent review (e.g., by internal audit) of the adequacy of the design and effectiveness of the operations of an institution’s stress testing programs.

E. Methodology and Scenario Selection

Stress tests should cover a range of risks and business areas, as well as at the institution-wide level. An institution should be able to integrate effectively, in a meaningful fashion, across the range of its stress testing activities to deliver a complete picture of institution-wide risk.

A stress testing program should consistently and comprehensively cover product-, business- and entity-specific views. Using a level of granularity appropriate to the purpose of the stress test, stress testing programs should examine the effect of shocks across all relevant risk factors, taking into account interrelations among them.

Comprehensive stress testing programs should consider the institution’s most material and significant risks. Where relevant and material, such risks may include:

- credit risk, including counterparty and reinsurance risk
- market risk, e.g.,
  - general market
  - specific
  - cash flow mismatch
  - interest rate
  - foreign exchange
  - commodity
- insurance risk, e.g.,
  - mortality
  - morbidity
  - claim frequency and severity
  - persistency and lapse risk
- liquidity risk
- operational and legal risk
- concentration risk
- contagion risk
- risk to reputation
- securitization risk
- new business risk
- regulatory risk
- inflation risk

The impact of stress tests is usually evaluated using one or more measures. The particular measures used will depend on the specific purpose of the stress test, the risks and portfolios being analysed and the particular issue under examination. A range of measures may need to be considered to convey an adequate impression of the impact. Typical measures used are:

- asset and liability values
- level of impaired assets and write-offs
- accounting profit and loss
- economic profit and loss
- required and available regulatory capital
- economic capital
- liquidity and funding gaps

Stress testing programs should apply across business and product lines and cover a range of scenarios, including non-historical scenarios, and aim to take into account system-wide interactions and feedback effects (e.g., second order and macroeconomic effects).

Stress tests should be conducted flexibly and imaginatively, in order to improve the likelihood of identifying hidden vulnerabilities. A “failure of imagination” could lead to an underestimation of the likelihood and severity of extreme events and to a false sense of security about an institution’s resilience.

The institution should assess the impact of severe shocks and periods of severe and sustained downturns, including its ability to react over the time horizon appropriate for the business and risks being tested.

Institutions should use stress tests to identify, monitor and control risk concentrations. To adequately address risk concentrations, the scenario should to be firm-wide and
comprehensive, covering balance sheet and off-balance sheet assets, contingent and non-contingent risks, and should give due consideration to actions beyond contractual obligations that might be undertaken to preserve reputation. Further, stress tests should identify and respond to potential changes in market conditions that could adversely impact an institution’s exposure to risk concentrations.

Stress tests should feature a range of severities, including events capable of generating the most damage, whether through size of loss or through loss of reputation. A stress testing program should also determine what scenarios could challenge the viability of the institution (reverse stress tests). Such tests may be useful in uncovering hidden risks and interactions among risks.

Stress tests should be geared towards events and business areas that might be particularly damaging for the institution. Areas which benefit in particular from the use of stress testing are business lines where traditional risk management models indicate an exceptionally good risk/return trade-off; new products and new markets which have not experienced severe strains; and exposures where there are no liquid two way markets.

Institutions should conduct reverse stress tests. A reverse stress test starts with a specified outcome that challenges the viability of the firm. One example of such an outcome would be that over a short time period, the firm incurs a very large loss that challenges its viability. The analysis would then work backward (reverse engineered) to identify a scenario or combination of scenarios that could bring about such a specified outcome. The reverse stress test induces institutions to consider scenarios beyond normal business settings that would include events with contagion and systemic implications.

As part of an overall stress testing program, a deposit-taking institution should aim to take account of simultaneous pressures in funding and asset markets, and the impact of a reduction in market liquidity on asset valuation. Funding and asset markets may be strongly interrelated, particularly during periods of stress. An institution should enhance its stress testing practices by considering important interrelations between various factors, including price shocks for specific asset categories; the drying-up of corresponding asset liquidity; the possibility of significant losses damaging the institution’s financial strength; growth of liquidity needs as a consequence of liquidity commitments; taking on board affected assets; and diminished access to secured or unsecured funding markets.

As part of an overall stress testing program at an insurance company, specific consideration should be given to important interrelations between various risk factors. For a life insurer, changes in economic conditions can significantly affect policyholder behaviour such as lapse rates, utilization of options within an insurance contract, and morbidity and recovery rates. For a property and casualty insurer, changing economic conditions will not only influence investment income and company expenses, but can also, particularly in times of inflation, lead to higher claims and loss reserves. The interrelations of various factors will depend upon the insurer’s products, its investment

---

2 See also Principles for Sound Liquidity Risk Management and Supervision, Basel Committee on Banking Supervision (September 2008).
policy and its approach to managing its business. A critical goal for insurers is to identify situations in which the assumed normal pattern of interrelationships breaks down due to a change in the business environment.

F. Specific Areas of Focus

The following risks have proven to require specific attention in light of experience of financial market turmoil:

- Risk Mitigation
- Securitization and Warehousing Risks
- Risks to Reputation
- Counterparty Credit Risk
- Risk Concentrations

As such, stress testing should be prominent among the risk assessment tools used where these specific risks are material.

Risk Mitigation

Stress testing should facilitate the development of risk mitigation or contingency plans across a range of stressed conditions. The performance of risk mitigating techniques, like reinsurance, hedging, netting and the use of collateral, should be challenged and assessed systematically under stressed conditions when markets may not be fully functioning and multiple institutions simultaneously could be pursuing similar risk mitigating strategies. Stress testing should also reflect constraints on management action and should not place undue reliance on the timeliness of mitigating actions.

Securitization and Warehousing Risks

The stress testing program should explicitly cover complex and customized products such as securitized exposures. Stress tests for securitized assets should consider the underlying assets, their exposure to systemic market factors, relevant contractual arrangements and embedded triggers, and the impact of leverage, particularly as it relates to the subordination level in the issue structure.

The stress testing program should cover pipeline and warehousing risks. These are market, credit and funding risks arising in the period prior to securitization or sale and which may arise from the need to hold assets for longer periods than originally planned when markets are disrupted. An institution should include such exposures in its stress tests regardless of their probability of being securitized. Many of the risks associated with pipeline and warehoused exposures emerge when an institution is unable to access the securitization or other markets due to either institution specific or market stresses.
**Risks to Reputation**

An institution should enhance its stress testing methodologies to capture the effect of risks to reputation. To mitigate reputational spill-over effects and maintain market confidence, an institution should have an approach to assess the impact of risks to reputation on other risk types.

The institution should integrate risks arising from off-balance sheet vehicles and other related entities in its stress testing program. An institution should carefully assess the risks associated with commitments to off-balance sheet vehicles related to structured credit securities and the possibility that assets will need to be taken on balance sheet for reputational reasons. Therefore, in its stress testing program, an institution should include scenarios assessing the size and soundness of such vehicles relative to its own financial, liquidity and regulatory capital positions. This analysis should include structural, solvency, liquidity and other risk issues, including the effects of covenants and triggers.

**Counterparty Credit risk**

An institution may have large gross exposures to leveraged counterparties, including hedge funds, financial guarantors, investment banks and derivatives counterparties that may be particularly exposed to specific asset types and market movements. Under normal conditions, these exposures are typically completely secured by posted collateral and continuous re-margining agreements yielding zero or very small net exposures. In the case of severe market shocks, however, these exposures may increase abruptly. The potential cross-correlation of the creditworthiness of derivative counterparties with the risks of the reference assets may emerge (i.e., wrong-way risk). An institution should ensure that its stress testing approaches related to derivative counterparties are robust in their capture of such correlated tail risks.

**Risk Concentrations**

Stress testing should consider risk concentrations resulting directly from risk taking activities as well as those resulting indirectly from actions to mitigate risks, e.g., concentrations of credit counterparty risk arising from hedges of market and insurance risk.

Risk concentrations may arise along different dimensions:

- single name concentrations
- concentrations in regions or industries
- concentrations in single risk factors
- concentrations in indirect exposures via posted collateral or hedge positions
- concentrations in off-balance sheet exposure, contingent exposure or non-contractual obligations by reputational reasons
In addition, concentrations may arise based on correlated risk factors that reflect subtlor more situation-specific factors, such as previously undetected correlations between market and credit risks, as well as between those risks and liquidity risk.

G. Supervisory Considerations

OSFI reviews institutions’ stress testing programs as part of the supervisory review process as described in the Supervisory Framework, and as part of its review of a deposit-taking institution’s Internal Capital Adequacy Assessment Process (ICAAP). For insurers, one example of stress testing is Financial Condition Testing (FCT). OSFI expects to see evidence that stress testing is integrated into institutions’ internal risk management processes.

OSFI uses the results of institutions’ stress testing programs as important information and integrates the results into its assessment of the inherent risks and risk controls and oversight of institutions’ business activities.

In assessing institutions’ stress testing programs, OSFI may:

i. Evaluate whether scenarios chosen are consistent with the risk appetite the institution has set for itself.

ii. Assess whether scenarios are appropriate to the portfolio of the institution and that they include severe shocks and periods of severe and sustained downturn. The scenarios chosen should also include, where relevant, an episode of market turbulence or a shock to market liquidity.

iii. Assess whether the frequency and timing of stress testing is sufficient to support timely management action. For example, stress testing and FCT are complementary initiatives. More frequent stress testing at the business unit level facilitates timely reaction to sudden market developments. It also supports the integration of the FCT process with the finalization of an annual business plan by providing timely inputs based on current information. While it is up to each institution to determine how to best integrate FCT and other stress testing into its business planning process to achieve the maximum benefits, ideally the annual FCT of an insurance company would be available to the Board of Directors, Principal Officer or Chief Agent as soon as is reasonably possible; in all cases the annual FCT should be submitted to OSFI within 30 days of its presentation to the Board of Directors, Principal Officer or Chief Agent.

iv. Ask institutions to evaluate scenarios under which viability is compromised and may ask institutions to test scenarios specific to different lines of business, to assess the plausibility of events that could materialize in significant strategic or reputational risk, in particular for business lines with significant balance sheet exposures.

v. Ask institutions, from time to time, to carry out standardized:

   o sensitivity tests for individual businesses/products given evolving market conditions or
   o scenario tests for use by OSFI to assess system wide vulnerabilities.
vi. Examine the future capital resources and capital requirements under adverse scenarios. In particular, OSFI would consider the results of forward-looking stress testing for assessing the adequacy of capital buffers.

vii. Take account of the extent to which capital might not be freely transferable within groups under adverse scenarios. OSFI would also consider the possibility a crisis impairs the ability of even very healthy institutions to raise funds at reasonable cost.

viii. Review the range of management actions envisaged by institutions in response to the results of the stress testing exercise and be able to understand the rationale for the management body decision to take or not to take remedial actions. Supervisors may challenge whether such actions will be available in a period of stress and whether the institution will realistically be able and willing to take such actions.

ix. Make recommendations to an institution to take appropriate remedial action to address weaknesses in its stress testing program.

From time to time, OSFI may conduct an analysis of the impact of system-wide stress scenarios. OSFI intends as much as possible to test the impact of these system-wide scenarios using information that is reported in regulatory returns or regularly collected as part of the supervisory review process in order to minimize data calls on institutions.
Glossary

Scenario testing:

Scenario testing uses a hypothetical future state of the world to define changes in risk factors affecting an institution’s operations. This will normally involve changes in a number of risk factors, as well as ripple effects that are other impacts that follow logically from these changes and related management and regulatory actions. Scenario testing is typically conducted over the time horizon appropriate for the business and risks being tested.

Sensitivity testing:

Sensitivity testing typically involves an incremental change in a risk factor (or a limited number of risk factors). It is typically conducted over a shorter time horizon, for example an instantaneous shock. Sensitivity testing requires fewer resources than scenario testing and can be used as a simpler technique for assessing the impact of a change in risks when a quick response or when more frequent results are needed.
Guideline

Subject: Minimum Capital Test
For Federally Regulated Property and Casualty Insurance Companies

No: A     Effective Date: January 1, 2019

Subsection 515(1) of the Insurance Companies Act (ICA) requires Federally Regulated Property and Casualty Insurance Companies (property and casualty companies) to maintain adequate capital. Subsection 608(1) of the ICA requires foreign property and casualty companies operating in Canada on a branch basis (foreign property and casualty companies) to maintain an adequate margin of assets in Canada over liabilities in Canada. The Minimum Capital Test (MCT) Guideline is not made pursuant to subsections 515(2) and 608(3) of the Act. However, the minimum and supervisory target capital standards set out in this guideline provide the framework within which the Superintendent assesses whether a property and casualty company maintains adequate capital pursuant to subsection 515(1) and whether a foreign property and casualty company maintains an adequate margin pursuant to subsection 608(1). Notwithstanding that a property and casualty company may meet these standards, the Superintendent may direct the property and casualty company to increase its capital under subsection 515(3) or the foreign property and casualty company to increase the margin of assets in Canada over liabilities in Canada under subsection 608(4).

This guideline outlines the capital framework, using a risk-based formula, for target and minimum capital/margin required, and defines the capital/assets that are available to meet the minimum standard. The MCT determines the minimum capital/margin required and not the level of capital/margin required at which property and casualty companies must operate.

Foreign property and casualty companies are reminded that the MCT is only one element in the determination of the required assets that must be maintained in Canada by foreign property and casualty companies. Foreign property and casualty companies must vest assets in accordance with the Adequacy of Assets in Canada test as prescribed in the "Assets (Foreign Companies) Regulations."

Chapter 1. Overview and General Requirements

The Minimum Capital Test (MCT) Guideline applies to Canadian property and casualty insurance companies and foreign property and casualty companies operating in Canada on a branch basis, collectively referred to as P&C insurers. Chapter 3 of this guideline, *Foreign Companies Operating in Canada on a Branch Basis*, defines assets available for foreign property and casualty companies operating in Canada on a branch basis (foreign companies). The MCT Guideline uses generic expressions that are meant to apply to both Canadian P&C insurers and foreign companies; e.g., capital available also refers to assets available for Branch Adequacy of Assets Test (BAAT) purposes, capital required refers to margin required for BAAT purposes and capital adequacy refers to margin adequacy for BAAT purposes.

This chapter provides an overview of the MCT Guideline and sets out general requirements. More detailed information on specific components of the capital test is contained under subsequent chapters.

Further guidance concerning some of the requirements of the MCT Guideline may be found in other guidelines and advisories available on OSFI’s website under the Property and Casualty Insurance Companies section.

- Table of OSFI Guidelines
- Guidelines and Related Advisories – Capital
- Regulatory and Legislative Advisories

1.1. Overview

1.1.1. Minimum and target capital requirements under the MCT

Under the MCT, regulatory capital requirements for various risks are set directly at a pre-determined target confidence level. OSFI has elected 99% of the expected shortfall (conditional tail expectation or CTE 99%) over a one-year time horizon as a target confidence level.\(^1\)

The risk factors defined in this guideline are used to compute capital requirements at the target level. The resulting MCT capital requirements are then divided by 1.5 to derive the minimum capital requirements. The MCT ratio is expressed as the capital available over the minimum capital required.

1.1.2. Risk-based capital adequacy

P&C insurers are required to meet the MCT capital requirements at all times. The definition of capital available to be used for this purpose is described in chapter 2 and includes qualifying criteria for capital instruments, capital composition limits, and regulatory adjustments and

\(^1\) As an alternative, a value at risk (VaR) at 99.5% confidence level or expert judgement was used when it was not practical to use the CTE approach.
deductions. The definition encompasses capital available within all subsidiaries that are consolidated for the purpose of calculating the MCT ratio.

P&C insurers’ minimum capital requirements are calculated on a consolidated basis and determined as the sum of the capital requirements at the target level for each risk component, less the diversification credit, divided by 1.5.

The minimum capital requirements are calculated as follows:

*Sum of:*

i.) Capital required for insurance risk (reference chapter 4):
   a. Capital required for unpaid claims and premium liabilities;
   b. Margin required for reinsurance ceded to unregistered reinsurers;
   c. Catastrophe reserves.

ii.) Capital required for market risk (reference chapter 5):
   a. Capital required for interest rate risk;
   b. Capital required for foreign exchange risk;
   c. Capital required for equity risk;
   d. Capital required for real estate risk;
   e. Capital required for other market risk exposures.

iii.) Capital required for credit risk (reference chapter 6):
   a. Capital required for counterparty default risk for balance sheet assets;
   b. Capital required for counterparty default risk for off-balance sheet exposures;
   c. Capital required for collateral held for unregistered reinsurance and self-insured retention (reference section 4.3.3).

iv.) Capital required for operational risk (reference chapter 7).

*Less:*

v.) Diversification credit (reference chapter 8).

*Divided by 1.5.*

### 1.1.3. Scope of consolidation

The capital adequacy requirements apply on a consolidated basis. The consolidated entity includes the P&C insurer and all of its directly or indirectly held subsidiaries, which carry on business that the parent could carry on directly in accordance with the *Insurance Companies Act* (ICA), including holding companies (e.g. P&C insurance and ancillary businesses such as agencies, brokerages and mutual funds). It therefore excludes:

- life insurance subsidiaries,
other regulated financial institutions carrying on business that the parent would not be permitted to carry on directly under the Insurance Companies Act (ICA).

Whether a subsidiary should be consolidated is determined by the nature of the subsidiary’s business (i.e. whether it carries on business related to P&C insurance), not the location where the subsidiary conducts its business (e.g. a U.S. P&C insurance subsidiary). All other interests in subsidiaries are considered “non-qualifying” for capital purposes and are excluded from capital available and capital required calculations.

### 1.1.4. Foreign companies

The margin requirement for foreign companies is set forth under the BAAT in chapter 3. The BAAT covers each of the risk components, and is determined using risk factors and other methods that are applied to assets under the control of the Superintendent, to specific assets under the control of the Chief Agent, and to liabilities in Canada.

The BAAT is only one element in the determination of the required assets that must be maintained in Canada by foreign companies. Foreign companies must vest assets in accordance with the Adequacy of Assets in Canada test, as prescribed in the Assets (Foreign Companies) Regulations.

### 1.1.5. Interpretation of results

The MCT is a standardized measure of capital adequacy of a P&C insurer. It is one of several indicators that OSFI uses to assess an insurer’s financial condition and should not be used in isolation for ranking and rating insurers.

### 1.2. General Requirements

#### 1.2.1. MCT supervisory capital ratio for federally regulated P&C insurers

The MCT ratio is expressed as a percentage and is calculated by dividing the P&C insurer's capital available by minimum capital required, which is derived from capital required calculated at the target level for specific risks.

Federally regulated P&C insurers are required, at a minimum, to maintain an MCT ratio of 100%. OSFI has established an industry-wide supervisory target capital ratio (supervisory target) of 150% that provides a cushion above the minimum requirement and facilitates OSFI’s early intervention process. The supervisory target provides additional capacity to absorb unexpected losses and addresses capital needs through on-going market access.

OSFI expects each P&C insurer to establish an internal target capital ratio (internal target) per Guideline A-4 Regulatory Capital and Internal Capital Targets, and maintain on-going capital, above this target. However, the Superintendent may, on a case-by-case basis, establish an alternative supervisory target (in consultation with a P&C insurer) based upon the P&C insurer’s individual risk profile.
P&C insurers are required to inform OSFI immediately if they anticipate falling below their internal target and to lay out their plans, for OSFI’s supervisory approval, to return to their internal target. OSFI will consider any unusual conditions in the market environment when evaluating P&C insurers’ performance against their internal targets.

P&C insurers are expected to maintain their MCT ratios at or above their established internal targets on a continuous basis. Questions about an individual P&C insurer’s target ratio should be addressed to the Lead Supervisor at OSFI.

1.2.2. Audit requirement

P&C insurers are required to engage their auditor appointed pursuant to section 337 or 633 of the ICA to report annually on the MCT or BAAT prepared as at fiscal year-end, in accordance with the relevant standards for such assurance engagements, as promulgated by the Canadian Auditing and Assurance Standards Board (AASB).

The annual audit report of the MCT or BAAT must be prepared separately from the audit report for the financial statements, and is to be filed no later than 90 days after the P&C insurers’ fiscal year-end. The annual audit opinion provided must be with respect to the current fiscal year-end, for page 30.61 of the P&C quarterly return.
Chapter 2. Definition of Capital Available

This chapter establishes requirements for the adequacy and appropriateness of capital resources used to meet capital requirements, having regard to their ability to meet P&C insurers’ obligations to policyholders and creditors and to absorb losses in periods of stress. This includes the determination of the criteria for assessing the quality of capital components for inclusion in capital available and the composition of capital available for regulatory purposes, focussing on the predominance of highest quality capital.

2.1. Summary of Capital Components

The four primary considerations for defining the capital available of a company for the purpose of measuring capital adequacy are:

- availability: the extent to which the capital element is fully paid in and available to absorb losses;
- permanence: the period for, and extent to which, the capital element is available;
- absence of encumbrances and mandatory servicing costs: the extent to which the capital element is free from mandatory payments or encumbrances; and
- subordination: the extent to which and the circumstances under which the capital element is subordinated to the rights of policyholders and creditors of the insurer in an insolvency or winding-up.

Regulatory capital available will consist of the sum of the following components: common equity or category A capital, category B capital, and category C capital.

2.1.1. Category A capital (i.e. common equity)

- Common shares issued by the P&C insurer that meet the category A qualifying criteria as described below;
- Surplus (share premium) resulting from the issuance of instruments included in common equity capital and other contributed surplus;
- Retained earnings;
- Earthquake, nuclear and general contingency reserves; and
- Accumulated other comprehensive income.

Retained earnings and accumulated other comprehensive income include interim profit or loss. Dividends are removed from capital available in accordance with applicable accounting standards.

---

2 Where repayment is subject to Superintendent’s approval.
2.1.1.1. **Qualifying criteria for inclusion of capital instruments in category A for regulatory capital purposes**

For an instrument to be included in capital available under category A, it must meet all of the following criteria:

1. Represents the most subordinated claim in liquidation of the insurer.

2. The investor is entitled to a claim on the residual assets that is proportional with its share of issued capital, after all senior claims have been paid in liquidation (i.e. has an unlimited and variable claim, not a fixed or capped claim).

3. The principal is perpetual and never repaid outside of liquidation (setting aside discretionary repurchases or other means of effectively reducing capital in a discretionary manner that is allowable under relevant law and subject to the prior approval of the Superintendent).

4. The insurer does not, in the sale or marketing of the instrument, create an expectation at issuance that the instrument will be bought back, redeemed or cancelled, nor do the statutory or contractual terms provide any feature that might give rise to such expectation.

5. Distributions are paid out of distributable items (retained earnings included). The level of distributions is not in any way tied or linked to the amount paid in at issuance and is not subject to a contractual cap (except to the extent that an insurer is unable to pay distributions that exceed the level of distributable items or to the extent that distribution on senior ranking capital must be paid first).

6. There are no circumstances under which the distributions are obligatory. Non-payment is, therefore, not an event of default.

7. Distributions are paid only after all legal and contractual obligations have been met and payments on more senior capital instruments have been made. This means that there are no preferential distributions, including in respect of other elements classified as the highest quality issued capital.

8. It is in the form of issued capital that takes the first and proportionately greatest share of any losses as they occur. Within the highest quality capital, each instrument absorbs losses on a going concern basis proportionately and *pari passu* with all the others.

9. The paid-in amount is recognized as equity capital (i.e. not recognized as a liability) for determining balance sheet solvency.

10. It is directly issued and paid-in and the insurer cannot directly or indirectly have funded the purchase of the instrument. Where the consideration for the shares is other than cash, the issuance of the common shares is subject to the prior approval of the Superintendent.

---

3 The criteria also apply to non-joint stock companies, such as mutuals, taking into account their specific constitution and legal structure. The application of the criteria should preserve the quality of the instruments by requiring that they are deemed fully equivalent to common shares in terms of their capital quality as regards loss absorption and do not possess features that could cause the condition of the insurer to be weakened as a going concern during periods of market stress.
11. The paid-in amount is neither secured nor covered by a guarantee of the issuer or related entity\(^5\) or subject to any other arrangement that legally or economically enhances the seniority of the claim.

12. It is only issued with the approval of the owners of the issuing insurer, either given directly by the owners or, if permitted by applicable law, given by the Board of Directors or by other persons duly authorized by the owners.

13. It is clearly and separately disclosed on the insurer’s balance sheet, prepared in accordance with the relevant accounting standards.

2.1.2. **Category B capital**

- Instruments issued by the institution that meet category B criteria and do not meet the criteria for classification as category A, subject to applicable limits;
- Surplus (share premium) resulting from the issuance of instruments meeting category B criteria.

2.1.2.1 **Qualifying criteria for inclusion of capital instruments in category B for regulatory capital purposes**

For an instrument to be included in capital available under category B, it must meet all of the following criteria:

1. Issued and paid-in in cash or, subject to the prior approval of the Superintendent, in property.
2. Subordinated to policyholders, general creditors and subordinated debt holders of the insurer.
3. Is neither secured nor covered by a guarantee of the issuer or related entity or other arrangement that legally or economically enhances the seniority of the claim vis-à-vis policyholders and creditors.\(^6\)
4. Is perpetual, i.e. there is no maturity date and there are no step-ups\(^7\) or other incentives to redeem\(^8\)

---

\(^4\) Paid-in capital generally refers to capital that has been received with finality by the institution, is reliably valued, fully under the institution’s control and does not directly or indirectly expose the institution to the credit risk of the investor.

\(^5\) A related entity can include a parent company, a sister company, a subsidiary or any other affiliate. A holding company is a related entity irrespective of whether it forms part of the consolidated insurance group.

\(^6\) Further, where an institution uses a special purpose vehicle to issue capital to investors and provides support, including overcollateralization, to the vehicle, such support would constitute enhancement in breach of criterion #3 above.

\(^7\) A step-up is defined as a call option combined with a pre-set increase in the initial credit spread of the instrument at a future date over the initial dividend (or distribution) rate after taking into account any swap spread between the original reference index and the new reference index. Conversion from a fixed rate to a floating rate (or vice versa) in combination with a call option without any increase in credit spread would not constitute a step-up.
5. May be callable at the initiative of the issuer only after a minimum of five years:
   a. To exercise a call option, an insurer must receive prior approval of the Superintendent; and
   b. An insurer’s actions and the terms of the instrument must not create an expectation that the call will be exercised; and
   c. An insurer must not exercise a call unless:
      i. It replaces the called instrument with capital of the same or better quality, including through an increase in retained earnings, and the replacement of this capital is done at conditions that are sustainable for the income capacity of the insurer\(^9\); or
      ii. The insurer demonstrates that its capital position is well above the supervisory target capital requirements after the call option is exercised.

6. Any repayment of principal (e.g. through repurchase or redemption) must require approval of the Superintendent and insurers should not assume or create market expectations that such approval will be given.

7. Dividend/coupon discretion:
   a. the insurer must have full discretion at all times to cancel distributions/payments,\(^{10}\)
   b. cancellation of discretionary payments must not be an event of default or credit event;
   c. insurers must have full access to cancelled payments to meet obligations as they fall due;
   d. cancellation of distributions/payments must not impose restrictions on the insurer except in relation to distributions to common shareholders.

8. Dividends/coupons must be paid out of distributable items.

9. The instrument cannot have a credit sensitive dividend feature, i.e., a dividend/coupon that is reset periodically based in whole or in part on the insurance organization’s credit standing.\(^{11}\)

---

\(^{8}\) Other incentives to redeem include a call option combined with a requirement or an investor option to convert the instrument into common shares if the call is not exercised.

\(^{9}\) Replacement issuances can be concurrent with, but not after, the instrument is called.

\(^{10}\) A consequence of full discretion at all times to cancel distributions/payments is that “dividend pushers” are prohibited. An instrument with a dividend pusher obliges the issuing insurer to make a dividend/coupon payment on the instrument if it has made a payment on another (typically more junior) capital instrument or share. This obligation is inconsistent with the requirement for full discretion at all times. Furthermore, the term “cancel distributions/payments” means to forever extinguish these payments. It does not permit features that require the insurer to make distributions/payments in kind at any time.

\(^{11}\) Institutions may use a broad index as a reference rate in which the issuing institution is a reference entity; however, the reference rate should not exhibit significant correlation with the institution’s credit standing. If an institution plans to issue capital instruments where the margin is linked to a broad index in which the institution is a reference entity, the institution should ensure that the dividend/coupon is not credit-sensitive.
10. The instrument cannot contribute to liabilities exceeding assets if such a balance sheet test forms part of national insolvency law.

11. Other than preferred shares, category B instruments included in capital available must be classified as equity per relevant accounting standards.

12. Neither the insurer nor a related party over which the insurer exercises control or significant influence can have purchased the instrument, nor can the insurer directly or indirectly have funded the purchase of the instrument.

13. The instruments cannot have any features that hinder recapitalization, such as provisions that require the issuer to compensate investors if a new instrument is issued at a lower price during a specified timeframe.

14. If the instrument is not issued directly by the insurer (e.g. it is issued out of a special purpose vehicle or SPV), proceeds must be available immediately without limitation to an insurer in a form that meets or exceeds all of the other criteria for inclusion in capital available as specified under category B. For greater certainty, the only assets the SPV may hold are intercompany instruments issued by the insurer or a related entity with terms and conditions that meet or exceed criteria specified under category B. Put differently, instruments issued to the SPV have to fully meet or exceed all of the eligibility criteria under category B as if the SPV itself was an end investor – i.e. the insurer cannot issue a lower quality capital or senior debt instrument to an SPV and have the SPV issue higher quality capital instruments to third-party investors so as to receive recognition as qualifying capital under category B.

Purchase for cancellation of Category B capital instruments is permitted at any time with the prior approval of the Superintendent. For further clarity, a purchase for cancellation does not constitute a call option as described in the above Category B qualifying criteria.

Tax and regulatory event calls are permitted during an instrument’s life subject to the prior approval of the Superintendent and provided the insurer was not in a position to anticipate such an event at the time of issuance.

Dividend stopper arrangements that stop payments on common shares or Category B instruments are permissible provided the stopper does not impede the full discretion the insurer must have at all times to cancel distributions or dividends on the Category B instrument, nor must it act in a way that could hinder the recapitalization of the institution pursuant to criterion number 13 above. For example, it would not be permitted for a stopper on a Category B instrument to:

- attempt to stop payment on another instrument where the payments on the other instrument were not also fully discretionary;
- prevent distributions to shareholders for a period that extends beyond the point in time that dividends or distributions on the Category B instrument are resumed;
- impede the normal operation of the institution or any restructuring activity, including acquisitions or disposals.
A dividend stopper may also act to prohibit actions that are equivalent to the payment of a dividend, such as the insurer undertaking discretionary share buybacks.

Where an amendment or variance of a Category B instrument’s terms and conditions affects its recognition as regulatory capital, such amendment or variance will only be permitted with the prior approval of the Superintendent.\footnote{12}

Insurers are permitted to “re-open” offerings of capital instruments to increase the principal amount of the original issuance provided that call options will only be exercised, with the prior approval of the Superintendent, on or after the fifth anniversary of the closing date of the latest re-opened tranche of securities.

Defeasance options may only be exercised on or after the fifth anniversary of the closing date with the prior approval of the Superintendent.

2.1.3. \textit{Category C capital}

- Instruments issued by the institution that meet category C criteria, but do not meet the category A or B criteria, subject to an applicable limit;
- Surplus (share premium) resulting from the issuance of instruments meeting the category C criteria.

2.1.3.1. \textit{Qualifying criteria for inclusion of capital instruments in Category C for regulatory capital purposes}

For an instrument to be included in capital available under category C, it must meet all of the following criteria:

1. Issued and paid-in in cash or, with the prior approval of the Superintendent, in property.
2. Subordinated to policyholders and general creditors of the insurer.
3. Is neither secured nor covered by a guarantee of the issuer or related entity or other arrangement that legally or economically enhances the seniority of the claim vis-à-vis the insurer’s policyholders and/or general creditors.
4. Maturity:
   a. minimum original maturity of at least five years;
   b. recognition in regulatory capital in the remaining five years before maturity will be amortized on a straight line basis;
   c. there are no step-ups\footnote{13} or other incentives to redeem.

\footnote{12} Any modification of, addition to, or renewal or extension of an instrument issued to a related party is subject to the legislative requirement that transactions with a related party be at terms and conditions that are at least as favourable to the institution as market terms and conditions.
5. May be callable at the initiative of the issuer only after a minimum of five years:
   a. To exercise a call option, an insurer must receive the prior approval of the Superintendent; and
   b. An insurer must not do anything that creates an expectation that the call will be exercised; and
   c. An insurer must not exercise a call unless:
      i. It replaces the called instrument with capital of the same or better quality, including through an increase in retained earnings, and the replacement of this capital is done at conditions that are sustainable for the income capacity of the insurer; or
      ii. The insurer demonstrates that its capital position is well above the supervisory target capital requirements after the call option is exercised.

6. The investor must have no rights to accelerate the repayment of future scheduled payments (interest or principal), except in bankruptcy, insolvency, wind-up, or liquidation.

7. The instrument cannot have a credit sensitive dividend feature, i.e. a dividend/coupon that is reset periodically based in whole or in part on the insurer’s credit standing.

8. Neither the insurer nor a related party over which the insurer exercises control or significant influence can have purchased the instrument, nor can the insurer directly or indirectly have funded the purchase of the instrument.

9. If the instrument is not issued directly by the insurer (e.g. it is issued out of an SPV), proceeds must be available immediately without limitation to the insurer in a form that meets or exceeds all of the criteria for inclusion specified under category C. For greater certainty, the only assets the SPV may hold are intercompany instruments issued by the institution or a related entity with terms and conditions that meet or exceed the above category C criteria. Put differently, instruments issued to the SPV have to fully meet or exceed all of the eligibility criteria under category C as if the SPV itself was an end investor – i.e. the institution cannot issue a lower quality capital instrument to an SPV and have the SPV issue higher quality capital instruments to third-party investors so as to receive recognition as qualifying capital under category C.

---

13 A step-up is defined as a call option combined with a pre-set increase in the initial credit spread of the instrument at a future date over the initial dividend (or distribution) rate after taking into account any swap spread between the original reference index and the new reference index. Conversion from a fixed rate to a floating rate (or vice versa) in combination with a call option without any increase in credit spread would not constitute a step-up.

14 An option to call the instrument after five years but prior to the start of the amortisation period will not be viewed as an incentive to redeem as long as the insurer does not do anything that creates an expectation that the call will be exercised at this point.

15 Replacement issuances can be concurrent with but not after the instrument is called.

16 Insurers may use a broad index as a reference rate in which the issuing insurer is a reference entity; however, the reference rate should not exhibit significant correlation with the insurer’s credit standing. If an insurer plans to issue capital instruments where the margin is linked to a broad index in which the insurer is a reference entity, the insurer should ensure that the dividend/coupon is not credit-sensitive.
Category C capital instruments must not contain restrictive covenants or default clauses that would allow the holder to trigger acceleration of repayment in circumstances other than the insolvency, bankruptcy or winding-up of the issuer.

Purchase for cancellation of category C instruments is permitted at any time with the prior approval of the Superintendent. For further clarity, a purchase for cancellation does not constitute a call option as described in the above Category C criteria.

Tax and regulatory event calls are permitted during an instrument’s life subject to the prior approval of the Superintendent and provided the insurer was not in a position to anticipate such an event at the time of issuance.

Where an amendment or variance of a Category C instrument’s terms and conditions affects its recognition as regulatory capital, such amendment or variance will only be permitted with the prior approval of the Superintendent.

Institutions are permitted to “re-open” offerings of capital instruments to increase the principal amount of the original issuance provided that call options will only be exercised, with the prior approval of the Superintendent, on or after the fifth anniversary of the closing date of the latest re-opened tranche of securities.

Defeasance options may only be exercised on or after the fifth anniversary of the closing date with the prior approval of the Superintendent.

2.1.3.2. Amortization

Category C capital instruments are subject to straight-line amortization in the final five years prior to maturity. Hence, as these instruments approach maturity, redemption or retraction, such outstanding balances are to be amortized based on the following schedule:

<table>
<thead>
<tr>
<th>Years to Maturity</th>
<th>Included in Capital</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 years or more</td>
<td>100%</td>
</tr>
<tr>
<td>4 years and less than 5 years</td>
<td>80%</td>
</tr>
<tr>
<td>3 years and less than 4 years</td>
<td>60%</td>
</tr>
<tr>
<td>2 years and less than 3 years</td>
<td>40%</td>
</tr>
<tr>
<td>1 year and less than 2 years</td>
<td>20%</td>
</tr>
<tr>
<td>Less than 1 year</td>
<td>0%</td>
</tr>
</tbody>
</table>

For instruments issued prior to January 1, 2015, where the terms of the instrument include a redemption option that is not subject to prior approval of the Superintendent and/or holders’

---

17 Any modification of, addition to, or renewal or extension of an instrument issued to a related party is subject to the legislative requirement that transactions with a related party be at terms and conditions that are at least as favourable to the institution as market terms and conditions.
retraction rights, amortization should begin five years prior to the effective dates governing such options. For example, a 20-year debenture that can be redeemed at the insurer’s option at any time on or after the first 10 years would be subject to amortization commencing in year 5. Further, where a subordinated debt was redeemable at the insurer’s option at any time without the prior approval of the Superintendent, the instrument would be subject to amortization from the date of issuance. For greater certainty, this would not apply when redemption requires the Superintendent's approval as is required for all instruments issued pursuant to the above criteria in section 2.1.3.1.

Amortization should be computed at the end of each fiscal quarter based on the "years to maturity" schedule above. Thus, amortization would begin during the first quarter that ends within five calendar years to maturity. For example, if an instrument matures on October 15, 2020, 20% amortization of the issue would occur on October 16, 2015 and be reflected in the December 31, 2015 regulatory return. An additional 20% amortization would be reflected in each subsequent December 31 return.

2.1.4. Non-controlling interests

P&C insurers are permitted to include, in capital available, non-controlling interests in operating consolidated subsidiaries, provided:

i. the capital instruments meet the qualifying criteria under category A, B and C;

ii. the capital in the subsidiary is not excessive in relation to the amount necessary to carry on the subsidiary’s business; and

iii. the level of capitalization of the subsidiary is comparable to that of the insurance company as a whole.

If a subsidiary issues capital instruments for the funding of the P&C insurer, or that are substantially in excess of its own requirements, the terms and conditions of the issue, as well as the intercompany transfer, must ensure that investors are placed in the same position as if the instrument were issued by the P&C insurer directly in order for it to qualify as capital available upon consolidation. This can only be achieved by the subsidiary using the proceeds of the issue to purchase a similar instrument from the parent. Since subsidiaries cannot buy shares of the parent P&C insurance company, it is likely that this treatment will only be applicable to the subordinated debt. In addition, to qualify as capital for the consolidated entity, the debt held by third parties cannot effectively be secured by other assets, such as cash, held by the subsidiary.

2.2. Capital Composition Limits

The inclusion of capital instruments qualifying under category B and category C criteria is subject to the following limits:

- The sum of capital instruments meeting the qualifying criteria under category B and category C will not exceed 40% of total capital available, excluding accumulated other comprehensive income;
- Capital instruments meeting the qualifying criteria under category C will not exceed 7% of total capital available, excluding accumulated other comprehensive income.
Category B and category C capital exceeding the allowable limits will be subject to the following treatment for regulatory capital purposes:

- In cases where capital instruments qualifying under one of either category B or C exceed the limits, the capital in excess of the limits will not be considered in the calculation of capital available. In cases where capital instruments both under category B and category C are in excess of the prescribed limits, the greater value of the two excess amounts will be excluded from capital available. In doing so, P&C insurers must first fully exclude excess capital under category C, followed by excess capital under category B.

- Under certain exceptional circumstances and subject to OSFI’s supervisory approval, a company may be permitted to continue to include such excess amounts in capital available temporarily, upon providing OSFI with a satisfactory plan outlining the company’s strategy to achieve compliance with the limits as soon as possible. Typically, only those excesses arising after issuance and as a result of operating losses or extraordinary events beyond the control of management will normally be eligible for temporary inclusion in capital available. In most other circumstances, for example, excesses resulting from:
  1) purchases or redemptions of capital instruments;
  2) discretionary dividend payments;
  3) new issuances of non-common capital instruments within the same fiscal quarter; or
  4) foreseeable events;

would generally not qualify for inclusion in capital available.

2.3. **Regulatory Adjustments to Capital Available**

2.3.1. **Deductions:**

1. Interests in and loans or other forms of lending provided to non-qualifying subsidiaries, associates, and joint ventures in which the company holds more than a 10% ownership interest:

   - Interests in non-qualifying subsidiaries, associates, and joint ventures in which the company holds more than a 10% ownership interest must be deducted from capital available (reference section 2.4);

   - Loans or other forms of lending provided to non-qualifying subsidiaries, associates, and joint ventures in which the company holds more than a 10% ownership interest that are reported as equity on their financial statements must be deducted from capital available (reference section 2.4).

2. Unsecured unregistered reinsurance exposures and self-insured retentions:
Chapter 2. Definition of Capital

- Amounts receivable and recoverable from an unregistered reinsurer to the extent that they are not covered by amounts payable to the same assuming reinsurer or acceptable collateral (reference section 4.3) must be deducted from capital available;
- Self-insured retentions, included in other recoverables on unpaid claims, where OSFI requires acceptable collateral to ensure collectability of recoverables, and no collateral has been received (reference section 4.4) must be deducted from capital available.

3. The earthquake premium reserve (EPR) not used as part of financial resources to cover earthquake risk exposure (reference section 4.5).

4. Deferred policy acquisition expenses (DPAE) associated with accident and sickness (A&S) business, other than those arising from commissions and premium taxes.
   
   The methodology for calculating insurance risk margin for A&S business will be revised at a future date. The current methodology where risk factors are applied to earned premiums necessitates a full deduction from capital of DPAE – other, and a capital requirement for DPAE – commissions (reference section 4.6).

5. Accumulated other comprehensive income on cash flow hedges:
   
   The amount of cash flow hedge reserve that relates to the hedging of items that are not fair valued on the balance sheet (including projected cash flows) must be derecognized in the calculation of capital available. This includes items that are not recognized on the balance sheet but excludes items that are fair valued on the balance sheet. Positive amounts should be deducted from capital available and negative amounts should be added back. This treatment specifically identifies the element of the cash flow hedge reserve that is to be derecognized for prudential purposes. It removes the element that gives rise to artificial volatility in capital available, as in this case the reserve only reflects one half of the picture (the fair value of the derivative, but not the changes in fair value of the hedged future cash flow).

6. Accumulated impact of shadow accounting:
   
   If an insurer has elected to use the shadow accounting option within IFRS, the accumulated net after-tax impact must be reversed from capital available.

7. Goodwill and other intangible assets:
   
   - Goodwill related to consolidated subsidiaries and subsidiaries deconsolidated for regulatory capital purposes and the proportional share of goodwill in joint ventures subject to the equity method accounting must be deducted from capital available. The amount reported on the balance sheet is to be deducted net of any associated deferred tax liability that would be extinguished if the goodwill becomes impaired or derecognized under relevant accounting standards.
   - All other intangible assets\(^\text{18}\) must be deducted from capital available. This includes intangible assets related to consolidated subsidiaries and subsidiaries deconsolidated for regulatory capital purposes, and the proportional share of intangible assets in joint ventures subject to the equity method of accounting. The full amount is to be deducted.

\(^{18}\) This includes computer software intangibles.
net of any associated deferred tax liability that would be extinguished if the intangible assets become impaired or derecognized under relevant accounting standards.

8. Deferred tax assets:

Deferred tax assets (DTAs), except for those eligible for the 10% risk factor, must be deducted from capital available. In addition, the amount of DTAs that is in excess of the amount that could be recoverable from income taxes paid in the three immediate preceding years is deducted from capital available. Deferred tax assets may be netted with associated deferred tax liabilities (DTLs) only if the DTAs and DTLs relate to taxes levied by the same taxation authority and offsetting is permitted by the relevant taxation authority. The DTLs permitted to be netted against DTAs must exclude amounts that have been netted against the deduction of goodwill, intangibles and defined benefit pension plan assets, and must be allocated on a pro rata basis between DTAs that are to be deducted in full and DTAs that are subject to the 10% risk factor (reference section 6.1).

9. Cumulative gains and losses due to changes in own credit risk on fair valued financial liabilities:

All accumulated after-tax unrealized gains and losses that have resulted from changes in the fair value of P&C insurer’s financial liabilities that are due to changes in the institution’s own credit risk must be deducted from capital available. In addition, with regard to derivative liabilities, all accounting valuation adjustments arising from the institution’s own credit risk should also be deducted on an after-tax basis. The offsetting between valuation adjustments arising from the institution's own credit risk and those arising from its counterparties' credit risk is not permitted.

10. Defined benefit pension fund assets and liabilities:

For each defined benefit pension fund that is in a surplus position and reported as an asset on the institution’s balance sheet, the amounts reported as a surplus asset on the balance sheet must be deducted from capital available, net of any associated deferred tax liability that would be extinguished if the asset becomes impaired or derecognized under the relevant accounting standards, and net of any amount of available refunds of defined benefit pension fund surplus assets to which the insurer has unrestricted and unfettered access. P&C insurers may only reduce this deduction by an amount of available refunds of defined benefit pension plan surplus assets if they obtain a prior written supervisory approval from OSFI.

11. Investments in own instruments (treasury stock):

All of institution’s investments in its own instruments, whether held directly or indirectly, must be deducted from capital available (unless already derecognized

---

19 This does not permit offsetting of DTAs across provinces.

20 To obtain OSFI supervisory approval, a P&C insurer must demonstrate, to OSFI’s satisfaction, that it has clear entitlement to the surplus and that it has unrestricted and unfettered access to the surplus pension assets. Evidence required by OSFI may include, among other things, an acceptable independent legal opinion and the prior authorization from the pension plan members and the pension regulator.
under IFRS). In addition, any own stock that the institution could be contractually obliged to purchase should be deducted from capital available.

12. Reciprocal cross holdings in the common shares of insurance, banking and financial entities:

Reciprocal cross holdings in common shares (e.g. Insurer A holds shares of Insurer B and Insurer B in return holds shares of Insurer A), also known as back-to-back placements, that are designed to artificially inflate the capital position of institutions must be fully deducted from capital available.

Items that are deducted from capital available will be subject to a 0% risk factor for capital required purposes.

2.3.2. Adjustments:

Adjustments to owner-occupied property valuations:\[21\]:

- For owner-occupied property accounted for using the cost model and where the deemed value of the property was determined at conversion to the International Financial Reporting Standards (IFRS) by using fair value, unrealized after tax fair value gains (losses) must be reversed from the institution’s reported retained earnings for capital adequacy purposes. The amount determined at conversion is an on-going deduction from capital available and can only be changed as a result of a sale of owner-occupied properties (owned at the time of IFRS conversion) and the resulting realization of actual gains (losses); and

- Accumulated net after tax revaluation losses in excess of gains accounted for using the revaluation model must be reversed from retained earnings. Net after tax revaluation gains must be reversed from accumulated other comprehensive income included in capital available.

2.4. Capital Treatment of Interests in and Loans to Subsidiaries, Associates and Joint Ventures

The equity method of accounting is used for all interests in non-qualifying subsidiaries, associates and joint ventures\[22\]. These interests remain unconsolidated for MCT purposes.

2.4.1. Consolidated subsidiaries (e.g. P&C insurance and ancillary businesses such as agencies, brokerages and mutual funds)

The financial statements of the subsidiaries are fully consolidated and the net value is included in the parent’s capital available. The assets and liabilities of these subsidiaries are therefore subject to risk factors and liability margins in the parent’s MCT.

\[21\] No adjustments are required for “investment properties” as fair value gains (losses) are allowed for capital purposes.

\[22\] Interests in limited partnerships that are reported using the equity method of accounting are subject to the same capital treatment as joint ventures.
2.4.2. **Non-qualifying subsidiaries**

Interests in non-qualifying subsidiaries are excluded from capital available. Loans or other forms of lending provided to a non-qualifying subsidiary, if they are reported as equity on the financial statements of the non-qualifying subsidiary, are also excluded from capital available of the P&C insurer. Loans or other forms of lending provided to a non-qualifying subsidiary that are not reported as equity are subject to a risk factor of 45%. Receivables from non-qualifying subsidiaries will attract a risk factor of 5% or 10% depending on how long the balances are outstanding (reference section 6.1).

2.4.3. **Associates**

An enterprise is an associate of another enterprise if:

- both are subsidiaries of the same enterprise; or
- each of them represents an investment by the same person or enterprise, in which the investor holds 20% or more of the voting power in each investment; or
- one enterprise exerts significant influence over the other. The notion of significant influence is defined in accordance with IFRS; or
- if an insurance broker is economically dependent on the P&C insurer, then the broker must be treated as an associate of the P&C insurer for capital purposes.

Interests in associates are excluded from capital available. Loans or other forms of lending provided to associates, if they are reported as equity in the financial statements of the associates, are also excluded from capital available of the P&C insurer. Loans or other forms of lending provided to associates that are not reported as equity are subject to a risk factor of 45%. Insurance receivables from associates that are registered reinsurers will attract a risk factor of 0.7%. Other receivables from associates will be subject to risk factors of 5% or 10% depending on how long the balances are outstanding (reference section 6.1).

2.4.4. **Joint ventures in which a company holds less than or equal to 10% ownership interest**

Where a P&C insurer holds less than or equal to 10% ownership in a joint venture, the investment is included in capital available. The investment is reported under capital required for equity risk, and is subject to the risk factor applicable to investments in common shares (reference section 5.3).

2.4.5. **Joint ventures in which a company holds more than a 10% ownership interest**

Interests in joint ventures with more than 10% ownership are excluded from capital available. Loans or other forms of lending provided to a joint venture with more than a 10% ownership interest, if they are reported as equity on the financial statements of the joint venture with more than a 10% ownership interest, are also excluded from capital available of the P&C insurer. Loans or other forms of lending provided to a joint venture with more than a 10% ownership interest that are not reported as equity are subject to a risk factor of 45%. Receivables from joint
ventures with more than a 10% ownership interest will attract a risk factor of 5% or 10% depending on how long the balances are outstanding (reference section 6.1).

2.4.6. **Ownership interests in an intra-group investment arrangement**

Where companies participate in an intra-group investment arrangement, and the arrangement has been approved by OSFI pursuant to the requirements of the ICA, companies are not required to deduct from capital available their ownership interest. A “look-through” approach should be used for intra-group investments, similar to that for mutual funds (reference section 6.1).

2.4.7 **Summary of exposures**

Types of exposures a P&C insurer might have with non-qualifying subsidiaries, associates, and joint ventures:

<table>
<thead>
<tr>
<th>Exposure</th>
<th>Capital treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common or preferred shares (non-qualifying subsidiaries and associates) including share of accumulated earnings/losses less dividends received based on equity accounting</td>
<td>Excluded from capital available</td>
</tr>
<tr>
<td>Ownership interests &gt; 10% joint venture</td>
<td>Excluded from capital available</td>
</tr>
<tr>
<td>Ownership interests ≤ 10% joint venture</td>
<td>Included in capital available with a risk factor of 30% applied to the ownership interest</td>
</tr>
<tr>
<td>Loans or other forms of lending (bonds, debentures, mortgages, etc.) reported as equity</td>
<td>Excluded from capital available</td>
</tr>
<tr>
<td>Loans or other forms of lending (bonds, debentures, mortgages, etc.) not reported as equity</td>
<td>Included in capital available with a risk factor of 45%</td>
</tr>
<tr>
<td>Insurance receivables from associates that are registered reinsurers</td>
<td>Included in capital available with a risk factor of 0.7%</td>
</tr>
<tr>
<td>Receivables from associates that are registered reinsurers</td>
<td>Included in capital available with a risk factor of 5% or 10% depending on how long the balances are outstanding</td>
</tr>
<tr>
<td>Receivables from other associates, non-qualifying subsidiaries and joint ventures</td>
<td>Included in capital available with a risk factor of 5% or 10% depending on how long the balances are outstanding</td>
</tr>
</tbody>
</table>
Appendix 2-A: Information Requirements for Capital Confirmations

Given the potential impact of the disqualification of a capital instrument, P&C insurers are encouraged to seek confirmations of capital quality from OSFI prior to issuing instruments. In conjunction with such requests, the insurer is expected to provide the following information to the Capital Division:

1. An indicative term sheet specifying indicative dates, rates and amounts and summarizing key provisions in respect of all proposed instruments.

2. The draft and final terms and conditions of the proposed instrument supported by relevant documents (i.e. Prospectus, Offering Memorandum, Debt Agreement, Share Terms, etc.).

3. A copy of the institution’s current by-laws or other constating documents relevant to the capital to be issued as well as any material agreements, including shareholders’ agreements, which may affect the capital quality of the instrument.

4. Where applicable, for all debt instruments only:
   a) the draft and final Trust Indenture and supplemental indentures; and
   b) the terms of any guarantee relating to the instrument.

5. Where the terms of the instrument include a redemption option or similar feature upon a tax event, an external tax opinion confirming the availability of such deduction in respect of interest or distributions payable on the instrument for income tax purposes.

6. An accounting opinion describing the proposed treatment and disclosure of the capital instrument (other than common shares) on the institution’s financial statements.

7. Where the initial interest or coupon rate payable on the instrument resets periodically or the basis of the interest rate changes from fixed to floating (or vice versa) at a pre-determined future date, calculations demonstrating that no incentive to redeem, or step-up, will arise upon the change in the initial rate. Where applicable, a step-up calculation should be provided according to the swap-spread methodology, which confirms there is no step-up upon the change in interest rate, and supported by screenshots of the applicable reference index rate(s).

8. Capital projections demonstrating that the insurer will be in compliance with its supervisory target capital ratios as well as the capital composition requirements specified in section 2.2 at the end of the quarter in which the instrument is expected to be issued.

9. An assessment of the features of the proposed capital instrument against the qualifying criteria for category B capital instruments or category C capital instruments, as applicable, as specified in the MCT Guideline. For greater certainty, this assessment would only be required for an initial issuance or precedent and is not required for subsequent issuances provided the terms of the instrument are not materially altered.

---

23 If an insurer fails to obtain a capital confirmation (or obtains a capital confirmation without disclosing all relevant material facts to OSFI), OSFI may, at its discretion and at any time determine that such capital does not comply with these principles and is to be excluded from the insurer’s capital available.

24 OSFI reserves the right to require a Canada Revenue Agency advance tax ruling to confirm such tax opinion if the tax consequences are subject to material uncertainty.

25 OSFI reserves the right to require such accounting opinion to be an external opinion of a firm acceptable to OSFI if the accounting consequences are subject to material uncertainty.
10. A written attestation from a senior officer of the institution confirming that the insurer has not provided financing to any person for the express purpose of investing in the proposed capital instrument.
Chapter 3. Foreign Companies Operating in Canada on a Branch Basis

Under subsection 608(1) of the ICA, a foreign company is required to maintain in Canada an adequate margin of assets over liabilities in respect of its insurance business in Canada. The Branch Adequacy of Assets Test (BAAT) provides the framework within which the Superintendent assesses whether foreign companies maintain an adequate margin pursuant to subsection 608(1).

All provisions in this guideline apply to branches unless stated otherwise in this chapter.

Notwithstanding the stated requirements, in any case where the Superintendent believes that the capital treatment is inappropriate, a specific additional capital requirement will be determined.

3.1. Branch Adequacy of Assets Test

The BAAT ratio measures the adequacy of net assets available to meet the margin requirements as determined in accordance with this guideline. The BAAT ratio is defined as the net assets available divided by the minimum margin required, expressed as a percentage. The determination of the net assets available and the minimum margin required is described below.

3.1.1 Net assets available

For BAAT purposes, net assets available are calculated as follows, subject to regulatory adjustments:

Total vested assets
Less:
Total net liabilities, which are equal to total liabilities, net of:

- Recoverables from registered reinsurers;
- Recoverables from unregistered reinsurers;
- Other (allowable) recoverables on unpaid claims, including salvage and subrogation;
- Self-insured retention recoverables to the extent permitted by OSFI (reference section 4.4);
- Unearned commissions; and
- Deferred policy acquisition expenses (DPAE) associated with accident and sickness (A&S) business (reference section 4.6), equal to:
  - 55% of the net of deferred commissions and unearned commissions (if the net value is zero or negative, there is no adjustment for this item); and
  - 100% of deferred premium taxes.
3.1.2 Regulatory adjustments to net assets available:

Additions:

1. Deferred policy acquisition expenses, including DPAE associated with commissions, premium taxes and others, net of unearned commissions. This excludes DPAE relating to A&S business (reference section 4.6).

2. Receivables from agents and policyholders, including brokers.

3. Balance sheet values of right-of-use assets associated with owner-occupied leased properties, as recognised on the branch’s balance sheet in accordance with relevant accounting standards.

4. Accumulated net after tax revaluation losses in excess of gains on owner-occupied properties that are reflected in the head office account for accounting purposes.

5. Amounts due from federally regulated insurers and approved reinsurers that can be legally netted against the insurance contract liabilities of the branch and that meet the following conditions:
   - The amount due does not exceed the liability owed to the insurer (i.e. any excess of receivables over liabilities is excluded).
   - The branch has executed a written, bilateral netting contract or agreement with the insurer to which the liability is owed that creates a single legal obligation. The result of such an arrangement must be that the branch has only one obligation for payment or one claim to receive funds based on the net sum of the liabilities and amounts due in the event the counterparty to the agreement failed to perform due to default, bankruptcy, liquidation or similar circumstances.
   - The netting arrangement specifies that only the liabilities to the counterparty arising out of the Canadian operations of the foreign company may be taken into consideration in determining the net amount owed. In particular, the counterparty must not be able to net amounts due to the branch against any liabilities of the home office or affiliates of the branch that are not liabilities arising out of the Canadian operations of the foreign company.
   - The branch must have written and reasoned legal opinions confirming that, in the event of any legal challenge, the relevant courts or administrative authorities will find the amount owed under the netting agreement to be the net amount under the laws of all relevant jurisdictions. In reaching this conclusion, legal opinions must address the validity and enforceability of the entire netting agreement under its terms.
     - The laws of “all relevant jurisdictions” are: a) the law of the jurisdiction where the counterparty is incorporated and, if the foreign branch of a counterparty is involved, the laws of the jurisdiction in which the branch is located; b) the law governing the individual insurance transaction; and c) the law governing any contracts or agreements required to effect the netting arrangement. The legal opinions must be generally recognized as
such by the legal community in Canada or by a memorandum of law that addresses all relevant issues in a reasoned manner.

- The branch must have procedures in place to update legal opinions as necessary to ensure continuing enforceability of the netting arrangement in light of possible changes in relevant law.
- The netting contract/agreements terms and conditions and the quality and content of the legal opinions must meet the conditions of this guideline and be submitted to OSFI for review prior to the branch including the receivables in its net assets available.

**Deductions:**

6. Amounts recoverable from unregistered reinsurers to the extent that they are not covered by acceptable collateral held as security from assuming reinsurers (reference section 4.3).

7. Unrealized fair value gains (losses) on owner-occupied properties reflected in the head office account at conversion to IFRS.

8. Accumulated net after tax revaluation gains on owner-occupied properties that are reflected in the accumulated other comprehensive income for accounting purposes.

9. Net after-tax impacts of shadow accounting. Where a P&C insurer has elected to use the shadow accounting option within IFRS, net after-tax impact of shadow accounting should be deducted from net assets available.

### 3.1.3 Margin required

Margin required is calculated with respect to the branch’s liabilities, vested assets and other assets available. The BAAT minimum margin required is the sum of the following risk margins, less the diversification credit, divided by 1.5:

**Sum of:**

i) Margin required for insurance risk (reference chapter 4):
   a. Margin required for unpaid claims and premium liabilities;
   b. Margin required for reinsurance ceded to unregistered reinsurers;
   c. Catastrophe reserves.

ii) Margin required for market risk (reference chapter 5):
   a. Margin required for interest rate risk;
   b. Margin required for foreign exchange risk;
   c. Margin required for equity risk;
   d. Margin required for real estate risk;
   e. Margin required for other market risk exposures.
iii) Margin required for credit risk (reference chapter 6):
   a. Margin required for counterparty default risk for balance sheet assets;
   b. Margin required for counterparty default risk for off-balance sheet exposures;
   c. Margin required for collateral held for unregistered reinsurance and self-insured retention (reference section 4.3.3).

iv) Margin required for operational risk (reference chapter 7).

Less:

v) Diversification credit (reference chapter 8).

Divided by 1.5.
Chapter 4. Insurance Risk

Insurance risk is the risk arising from the potential for claims or payouts to be made to policyholders or beneficiaries. Exposure to this risk results from the present value of losses being higher than the amounts originally estimated.

Insurance risk includes uncertainties around:

a) the ultimate amount of net cash flows from premiums, commissions, claims, and related settlement expenses, and

b) the timing of the receipt and payment of these cash flows.

The insurance risk component reflects the P&C insurer’s consolidated risk profile by individual classes of insurance and results in specific margin requirements for insurance risk. For the MCT, the risk associated with insurance exposure is divided into four parts:

i.) reserving risk associated with variation in claims provisions (unpaid claims);

ii.) underwriting risk including catastrophe risk, other than earthquakes and nuclear (premium liabilities);

iii.) earthquake and nuclear risks; and

iv.) risk associated with unregistered reinsurance.

4.1. Diversification Credit within Insurance Risk

The risk factors for each line of business contain an implicit diversification credit based on the assumption that insurers have a well-diversified portfolio of risks for a given portfolio of business.

4.2. Margins for Unpaid Claims and Premium Liabilities

Given the uncertainty that provisions will be sufficient to cover the anticipated liabilities, margins are added to cover a potential shortfall.

4.2.1. Margin for unpaid claims

The margin for unpaid claims is calculated by line of business, by multiplying the net amount at risk (i.e. net of reinsurance, salvage and subrogation, and self-insured retentions) less the provision for adverse deviation (PfAD), by the applicable risk factors.

4.2.2. Margin for premium liabilities

The margin for premium liabilities is calculated by line of business, by multiplying the greater of:

- net premium liabilities (i.e. net of reinsurance) less the PfAD; and

- 30% of the net written premiums for the past 12 months

by the applicable risk factors.
The insurance risk factors are as follows:

<table>
<thead>
<tr>

4.2.3. Risk factors for warranty business

The risk factors to be used for home and product warranty should be the same as those applied for personal property. The risk factors to be used for equipment warranty should be the same as the risk factors applied for boiler and machinery.

4.3. Risk Mitigation and Risk Transfer - Reinsurance

4.3.1. General

The terms "registered" and "unregistered," as defined below, are relevant in determining whether credit can be taken for reinsurance placed by P&C insurers. In order for a P&C insurer to obtain credit for reinsurance on account of any reinsurance arrangement with a registered or unregistered reinsurer, the reinsurance arrangement must comply with the requirements of Guideline B-3 Sound Reinsurance Practices and Procedures.
4.3.2. Registered reinsurers

4.3.2.1 Definition of registered reinsurer

A reinsurer is generally considered to be a registered reinsurer if it is:

(a) a reinsurer that is either:
   i. incorporated federally and has reinsured the risks of the ceding company, or
   ii. a foreign company that has reinsured in Canada the risks of the ceding company, and is authorized by order of the Superintendent to do so;

(b) a provincially/territorially regulated insurer that has been approved by the Superintendent;

(c) the Insurance Corporation of British Columbia;

(d) the Manitoba Public Insurance Corporation;

(e) Saskatchewan Government Insurance; or

(f) Export Development Canada.

Subsection 578(5) of the ICA requires a foreign company, in respect of risks it reinsures in Canada, to set out in all premium notices, applications for policies and policies (which may include cover notes, offer letters or quotations) a statement that the document was issued or made in the course of its insurance business in Canada. In cases where the cover note, offer letter or quotation can be considered neither an application for a policy nor a policy, a P&C insurer will be permitted to treat a reinsurance arrangement as registered reinsurance only if the foreign reinsurer includes, in the cover note, offer letter or quotation, a statement that the foreign reinsurer intends to issue the policy under negotiation in the course of its insurance business in Canada, and that it will take measures to ensure that the cedant’s risks will be reinsured in Canada in accordance with OSFI’s advisory No. 2007-01-R1 entitled Insurance in Canada of Risks.

With respect to a Canadian company’s reinsurance of out-of-Canada business only, reinsurers regulated in an OECD country may be recognized as “registered” on the basis of financial soundness, provided that the reinsurance agreements are recognized by the regulatory agencies of the countries in question. OSFI retains the authority to disqualify such reinsurance if not satisfied with the financial condition of the reinsuring company.

All out-of-Canada business ceded to reinsurers not satisfying the recognized “registered” definition in the previous paragraph must follow the requirements of section 4.3.3 and must be reported in the exhibit Reinsurance Ceded to Unregistered Insurers (the unregistered reinsurance exhibit) of the P&C Returns.

4.3.2.2 Risk factors

The risk of uncollectability of recoverables from reinsurers arises from the risk that the reinsurer will fail to pay the P&C insurer what it is owed. There is additional risk associated with mis-assessing the amount of the required provision. The risk factor applied to unpaid claims and unearned premiums recoverable from registered reinsurers is treated as a combined weight under
the MCT (reference section 6.1). Insurance receivables and amounts recoverable from intra-group pooling arrangements approved by OSFI are exempt from the application of the risk factors.

The balance sheet value used to calculate the credit risk requirement for reinsurance assets arising from registered reinsurance may be reduced by:

1. the liability for funds held by the ceding insurer for exclusive benefit of the ceding insurer (e.g. funds withheld reinsurance) to secure the payment to the ceding insurer by the reinsurer of the reinsurer’s share of any loss or liability for which the reinsurer is liable under the reinsurance agreement; and
2. any other liabilities of the ceding insurer due to the reinsurer for which the ceding insurer has a legal and contractual right of setoff against the amount recoverable from the reinsurer.

Total reinsurance assets by reinsurer cannot be negative. Acceptable collateral posted by reinsurers under registered reinsurance agreements may be recognized provided the conditions under section 4.3.3.4 are met.

4.3.3. Unregistered reinsurers

4.3.3.1. Definition of unregistered reinsurer

A reinsurer is generally considered to be unregistered if it is not a registered reinsurer as defined in section 4.3.2.1.

A ceding P&C insurer is given credit for unregistered reinsurance where the ceding P&C insurer obtains and maintains a valid and enforceable security interest that has priority over any other security interest in assets of an unregistered reinsurer that are held in Canada in accordance with OSFI’s Guidance for Reinsurance Security Agreements (RSA). A ceding P&C insurer is also given credit for the amount of acceptable letters of credit held to secure the payment to the ceding P&C insurer by the reinsurer of the reinsurer’s share of any loss or liability for which the reinsurer is liable under the reinsurance agreement. P&C insurers should refer to General Guidelines for Use of Letters of Credit available on OSFI’s website.

4.3.3.2. Deduction from capital available

Amounts receivable and recoverable from an unregistered reinsurer, as reported on the balance sheet, are deducted from capital available to the extent that they are not covered by amounts payable to the assuming reinsurer or acceptable collateral. Acceptable collateral is defined as non-owned deposits under a RSA, other acceptable non-owned deposits, funds held to secure payment from an assuming reinsurer, and letters of credit held as security from an assuming reinsurer. Section 4.3.3.4 outlines further conditions for using collateral to obtain credit for unregistered reinsurance. Amounts payable to an assuming reinsurer may be deducted from amounts receivable and recoverable only where there is a legal and contractual right of setoff.
The deduction from capital available for receivables and recoverables from an unregistered reinsurer is calculated in the unregistered reinsurance exhibit of the P&C Returns.

In respect of each unregistered reinsurer to which a P&C insurer has ceded business, a deduction from capital available is required if the following calculation is positive:

\[ A + B + C - D - E - F - G - H \]

Where:

(A) is the amount of unearned premiums ceded to the assuming insurer;
(B) is the amount of outstanding losses recoverable from the assuming insurer;
(C) is the amount of receivables from the assuming insurer;
(D) is the amount of payables to the assuming insurer;
(E) is the amount of non-owned deposits held as security from assuming insurer under an acceptable RSA;
(F) is the amount of other acceptable non-owned deposits;
(G) is the amount of funds held to secure payment from the assuming insurer;
(H) is the amount of acceptable letters of credit held as security from assuming insurer.

4.3.3.3. Margin required

The margin required for unregistered reinsurance is calculated in the unregistered reinsurance exhibit of the P&C Returns and reported as margin required for “Reinsurance ceded to unregistered insurers” in the MCT.

The margin is 20% of “Unearned premiums ceded to assuming insurer” and “Outstanding losses recoverable from assuming insurer” (collectively, “ceded policy liabilities”). The margin requirement for each unregistered reinsurer may be reduced to a minimum of zero by payables to the reinsurer and acceptable collateral (as defined in section 4.3.3.2) that are in excess of the amount of ceded policy liabilities and receivables from the assuming insurer.

Transition

Policy liabilities ceded on or before December 31, 2019 and any associated new claims or development on incurred claims are subject to a 15% margin required until December 31, 2022, the end of the transition period. During the transition period, any ceded policy liabilities on business from direct policies or assumed business with underlying direct policies with an effective date of January 1, 2020 or later are subject to the 20% margin required. After the transition period, starting January 1, 2023, all ceded policy liabilities for all unregistered reinsurance arrangements, including any remaining ceded policy liabilities that were subject to transition, are subject to the 20% margin required.

4.3.3.4. Collateral
The collateral used to obtain credit for a specific unregistered reinsurer must materially reduce the risk arising from the credit quality of the reinsurer. In particular, collateral used may not be related party obligations of the unregistered reinsurer (i.e. obligations of the reinsurer itself, its parent, or one of its subsidiaries or associates). With respect to the above three sources available to obtain credit, this implies that:

- To the extent that a ceding P&C insurer is reporting obligations due from a related party of the reinsurer as assets in its annual return, the ceding P&C insurer is precluded from taking credit for funds held to secure payment from the unregistered reinsurer;
- Reinsurers’ assets located in Canada in which a ceding company has a valid and perfected first priority security interest under applicable law may not be used to obtain credit if they are obligations of a related party of the unregistered reinsurer; and
- A letter of credit is not acceptable if it has been issued by a related party of the unregistered reinsurer.

Collateral must be available to the company for a period of not less than the remaining term of the ceded liabilities in order to be valid towards obtaining credit for unregistered reinsurance. In cases where an arrangement contains a renewal provision for the cedant to maintain collateral for a part of or the whole of the remaining term of ceded liabilities (e.g. additional fees or higher interest rate), the renewal provision should be included when determining the ceded reserves.

**Non-owned deposits from reinsurers**

P&C insurers that have received non-owned deposits provided by an unregistered reinsurer must comply with OSFI’s *Guidance for Reinsurance Security Agreements*.

Deposits from reinsurers that are “not owned” by a P&C insurer, including deposits held on behalf of reinsurers, are not to be reported on the P&C insurer's balance sheet. Details of these deposits must be reported in the unregistered reinsurance exhibit of the P&C Returns.

Non-owned deposits held on behalf of an unregistered assuming reinsurer must be valued at market value as at the end of the statement year, including the amount of investment income due and accrued respecting these deposits.

**Letters of credit**

In order to be recognized for capital purposes, letters of credit must be approved by OSFI. P&C insurers should refer to *Guidelines for Use of Letters of Credit*, available on OSFI’s website, for OSFI’s requirements relating to the use of LOCs and their approvals.

The limit on the use of letters of credit to obtain capital credit for unregistered reinsurance is 30% of “Unearned premiums ceded to assuming insurer” and “Outstanding losses recoverable from assuming insurer.” This limit is applied in the aggregate and not against individual reinsurance exposures.

**Capital requirements**
Letters of credit for unregistered reinsurance are considered a direct credit substitute and are subject to risk factors based on the credit rating of the issuing/confirming bank and the term of ceded liabilities. Non-owned deposits held as collateral are subject to the same risk factors as those applied to similar assets owned by the P&C insurer (reference sections 5.3 and 6.1).

Capital requirements for collateral associated with unregistered reinsurance are calculated on an aggregate basis for the total amount of acceptable collateral from each reinsurer using applicable risk factors. Acceptable collateral that is greater than the unregistered reinsurance requirements is considered excess collateral and are not subject to capital requirements.

Two steps are required to compute excess collateral and arrive at a reduction in capital required for excess collateral.

**Step 1: Computation of excess collateral** (reference P&C unregistered reinsurance exhibit of the P&C Returns)

<table>
<thead>
<tr>
<th>Reinsurance Ceded to an Unregistered Insurer</th>
<th>Amount ($)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unearned premiums ceded to assuming insurer</td>

<tr>
<td>1,200-740</td>
<td></td>
</tr>
</tbody>
</table>

The amount of excess collateral should be calculated separately for each individual reinsurer and then added together.

**Step 2: Reduction in capital required for excess collateral**

The total amount of capital required for collateral should be pro-rated to discount for excess collateral. Following step 1, the ratio of 0.38 (460/1,200) should be applied to the total amount of collateral required.

\[^{26}\] For unearned premiums ceded and outstanding losses recoverable subject to transition per section 4.3.3.3, a 15% margin will apply until December 31, 2022.
capital required for collateral in order to calculate the capital required for collateral excluding the excess. The calculation is provided in the following table.

</tbody>
</table>

The capital requirements for acceptable collateral, less the excess, are reported as part of capital required for credit risk (reference chapter 6).

**Funds held to secure payment from unregistered reinsurer**

Cash and securities received to secure payment from unregistered reinsurers that have been co-mingled with the P&C insurer’s own funds should be reported on the insurer’s balance sheet in the appropriate asset categories and will be subject to the corresponding risk factors. Funds held also include reinsurance premiums withheld by the ceding company as specified in the reinsurance contract. Details of funds held must also be reported in the unregistered reinsurance exhibit of the P&C Returns. The reinsurance contract must clearly provide that, in the event of the cedant’s or reinsurer’s insolvency, the funds withheld must form part of the property of the cedant’s general estate.

In order for a ceding insurer to obtain credit for funds held under a funds withheld reinsurance arrangement, the arrangement must not contain any contractual provision that would require payment of funds withheld to the reinsurer, other than those funds that, together with other forms of acceptable collateral, if any, are in excess of the ceded policy liabilities and the margin required for unregistered reinsurance, before all subject policies have expired and all claims settled (e.g. an acceleration clause). Furthermore, the ceding insurer may not provide non-contractual or implicit support, or otherwise create or sustain an expectation that any funds withheld could be paid to the reinsurer, other than those funds that, together with other forms of acceptable collateral, if any, are in excess of the ceded policy liabilities and the margin required for unregistered reinsurance, before all subject policies have expired and all claims settled.

---

27 This requirement only applies to reinsurance contracts that came into force on or after January 1, 2018, or that have been renewed after that date.
4.4. Self-Insured Retention

Self-insured retention (SIR) represents the portion of a loss that is payable by the policyholder. In some cases, SIRs may be included in the policy declaration or in an endorsement to the policy, stipulating that the policy limit applies in excess of the SIR.

To admit SIRs recoverable for regulatory capital purposes, OSFI must be satisfied with the collectability of recoverables, and may require collateral to ensure collectability. For example, collateral may be required when it is deemed that there is an excessive concentration of SIRs owed by any one policyholder.

Letters of credit and other acceptable securities may be used as collateral for SIRs. Collateral used may not be related party obligations of the policyholder (i.e. obligations of the policyholder itself, its parent, or one of its subsidiaries or associates).

Letters of credit for SIRs are considered a direct credit substitute and are subject to a risk factor based on the credit rating of the issuing/confirming bank and the term of ceded liabilities (subject to the provision for excess collateralization). General guidelines concerning letters of credit as referred to in section 4.3 also apply to SIRs. Risk factors for collateral other than letters of credit are the same as those applied to similar assets owned by the P&C insurer (reference Chapter 5 and Chapter 6).

4.5. Catastrophes

4.5.1. Earthquake risk exposure

Insurers must refer to OSFI’s Guideline B-9 Earthquake Exposure Sound Practices for details on OSFI’s expectations relating to P&C insurers’ earthquake exposure risk management and the related definitions. The MCT Guideline outlines the framework for quantifying the earthquake risk exposure for regulatory capital purposes and assessing insurers’ capacity and financial preparedness to meet contractual obligations that may arise from a major earthquake.

**Earthquake Reserves Formula:**

\[
\text{Earthquake Reserves} = (\text{EPR} + \text{ERC}) \times 1.25
\]

The amount of earthquake reserves includes Earthquake Premium Reserve (EPR) and Earthquake Reserve Component (ERC) and is added to total capital requirements for the purposes of the MCT/BAAT as capital/margin required at the target level.

\[
\text{ERC (Section 4.5.1.3)} = \{\text{Earthquake Risk Exposure (Section 4.5.1.1)}\} - \{\text{Financial Resources (Section 4.5.1.2)}\} \geq 0
\]

The ERC must always be greater than or equal to 0.
In the case where EPR is not used as part of financial resources to cover the earthquake risk exposure, i.e. the company has enough financial resources to cover its earthquake risk exposure without the voluntary reserve, the EPR can be deducted from capital available instead of being added to total capital requirements.

4.5.1.1. Measurement of Earthquake Risk Exposure

The earthquake *Probable Maximum Loss (PML)* is the threshold dollar value of losses beyond which losses caused by a major earthquake are unlikely. Gross PML, which is the PML amount *after* deductibles but *before* catastrophic and other reinsurance protection, is used for calculating earthquake risk exposure for regulatory purposes. In this section, PML refers to a dollar amount that includes adjustments for data quality, non-modelled exposures and model uncertainty as outlined in Guideline B-9 *Earthquake Exposure Sound Practices*.

**Model approach**

P&C insurers with material exposure to earthquake risk are required to use models to estimate their PML. Earthquake models include models licensed from various commercial vendors and maintained in-house or run by third parties on behalf of the insurer or can be an internal estimation technique or model developed by the insurer to OSFI’s satisfaction.

OSFI requires that P&C insurers continue to progress to a 500 year PML from earthquakes by 2022. Consequently, OSFI expects an insurer to meet a test of financial preparedness for a 500 year return period country-wide earthquake event by no later than the end of fiscal year 2022.

\[
\text{Country-wide PML500} = (\text{East Canada PML500}^{1.5} + \text{West Canada PML500}^{1.5})^{1/1.5},
\]

where

- **East Canada PML500** refers to a one in 500 year Eastern Canada event, which represents the 99.8\(^{\text{th}}\) percentile of the exceedance probability curve plus appropriate adjustments for data quality, model uncertainty, non-modelled business etc., using exceedance probability curves based only on earthquake risk exposure in Eastern Canada.
- **West Canada PML500** refers to a one in 500 year Western Canada event, which represents the 99.8\(^{\text{th}}\) percentile of the exceedance probability curve plus appropriate adjustments for data quality, model uncertainty, non-modelled business etc., using exceedance probability curves based only on earthquake risk exposure in Western Canada.

Recognizing the impact resulting from the new country-wide PML500 requirement, insurers may continue to phase-in their increased earthquake risk exposure until 2022 using the following formula:

---

28 The PML amount corresponds to the worldwide exposure for Canadian insurers and Canadian exposure for branches of foreign insurers.
Country-wide PML (Year) = Country-wide PML500 x (Year – 2014)/8 + MAX [East Canada PML420, West Canada PML420] x (2022 – Year)/8,

where

- **Year** is the current reporting year (subject to a maximum of 2022)
- **East Canada PML420** refers to a one in 420 year Eastern Canada event, which represents the 99.76th percentile of the exceedance probability curve plus appropriate adjustments for data quality, model uncertainty, non-modelled business etc., using exceedance probability curves based only on earthquake risk exposure in Eastern Canada. **East Canada PML420** is determined by using linear interpolation between PML 250 and PML500 (i.e. **East Canada PML420** = 0.68xEast Canada PML500 + 0.32xEast Canada PML250).
- **West Canada PML420** refers to a one in 420 year Western Canada event, which represents the 99.76th percentile of the exceedance probability curve plus appropriate adjustments for data quality, model uncertainty, non-modelled business etc., using exceedance probability curves based only on earthquake risk exposure in Western Canada. **West Canada PML420** is determined by using linear interpolation between PML 250 and PML500 (i.e. **West Canada PML420** = 0.68xWest Canada PML500 + 0.32xWest Canada PML250).

**Standard approach**

P&C insurers should use the following standard formula for calculating their PML if:

- The insurer does not use an earthquake model for calculating its PML, or
- An earthquake risk exposure estimation technique is not to OSFI’s satisfaction

Country-wide PML = Maximum (East Canada PTIV – applicable policyholder deductibles, West Canada PTIV – applicable policyholder deductibles),

where

PTIV is the property total insured value for earthquake risk exposure, which includes building, contents, outbuildings, additional living expenses and business interruption.

**4.5.1.2. Financial Resources**

An insurer must have adequate financial resources to cover its earthquake risk exposure calculated in section 4.5.1.1. Financial resources that can be used to support the insurer’s earthquake risk exposure include:

- capital & surplus;
- earthquake premium reserve;
- reinsurance coverage; and

---

29 Current reporting year is the financial reporting year being filed.
- capital market financing.

**Capital and Surplus**

Insurers can count up to a maximum of 10% of capital and surplus as part of their financial resources to cover their earthquake risk exposure. This maximum limit is subject to supervisory discretion and can be lowered to an amount less than 10% of capital and surplus.

For Canadian P&C insurers, the amount of capital and surplus corresponds to a maximum of 10% of total equity as at the end of the reporting period being filed.

A Canadian branch of a foreign P&C insurer may use up to 10% of its worldwide capital and surplus to cover its earthquake risk exposure; however, it must be able to demonstrate that after an event, at least 10% of the worldwide capital and surplus is still available to meet its obligations to Canadian policyholders. The amount of worldwide capital and surplus corresponds to the Canadian dollar amount as at the end of the most recent reporting period filed in the home jurisdiction.

**Earthquake Premium Reserve**

Earthquake Premium Reserve (EPR) is the voluntary accumulation of earthquake premiums. This amount must not exceed the country-wide PML500\(^{30}\).

- In the case where the earthquake coverage premium is implicitly included in an overall policy premium, the insurer should be able to demonstrate the reasonableness of the premium allocation specifically attributed to earthquake coverage. As an example, in the case of catastrophic reinsurance coverage not specific to earthquake risk, an allocation of the premium amount must be made and the reasonableness of the reinsurer’s premium allocation must be demonstrated.

- Any earthquake premium contributed to the EPR must remain in the EPR unless there is a material decrease in the exposure.

- Should an earthquake occur and trigger claims, companies would establish an unpaid claims provision as well as a provision for claims adjustment expenses. The EPR component would be reduced by an amount equal to the claims reserves.

- Any reduction in the EPR should be brought back into unappropriated surplus immediately.

- The EPR is a component of the reserves amount reported on the balance sheet.

**Reinsurance Coverage**

The estimated reinsurance coverage available should be based on reinsurance in force on the day immediately following the end of the financial reporting period and should be equal to an amount of reinsurance collectable for a loss of the size of the PML, net of retention (e.g., policies in force on July 1 for MCT calculations as at June 30).

---

\(^{30}\) Refer to the Canadian Income Tax Act for the annual contribution limit.
4. Capital Market Financing

Prior supervisory approval from OSFI is required before these instruments can be recognized as a financial resource in the calculation of the earthquake risk formula. Refer to Guideline B-9 Earthquake Exposure Sound Practices for additional information.

4.5.1.3. Earthquake Reserve Component

Earthquake Reserve Component (ERC) is an additional component used to cover an insurer’s earthquake risk exposure not covered by the financial resources. The formula to compute the ERC is as follows:

\[
ERC = \{\text{Country-wide PML500 x (Year} - 2014)/8 + \text{MAX [East Canada PML420, West Canada PML420]} \times (2022 - \text{Year})/8\} - \text{capital and surplus - reinsurance coverage - capital market financing - EPR}
\]

- Should an earthquake occur and trigger claims, companies would establish an unpaid claims provision as well as a provision for claims adjustment expenses. The ERC component would be reduced after the EPR, by an amount equal to the claims reserves.
- Any reduction in the ERC should be brought back into unappropriated surplus immediately.
- The ERC is a component of the reserves amount reported on the balance sheet.

4.5.2. Nuclear Reserve

P&C insurers issuing nuclear risk policies are required to record an additional provision of 100% of net premiums written, net of commissions, multiplied by 1.25. This provision must be held by the P&C insurer for twenty years, after which it may be reversed.

4.6. Accident and Sickness Business

Accident and sickness reserves determined by actuaries in their valuations are primarily intended to cover expected variations in these requirements based on assumptions about mortality and morbidity. Margins on premiums and unpaid claims for accident and sickness insurance are included in the MCT to take into account possible abnormal negative variations in actual requirements.

The premiums margin is calculated by applying a factor to annual earned premiums. Generally, the factor varies with the length of the premium guarantee remaining. For Canadian P&C insurers, a margin for deferred policy acquisition expenses (DPAE) arising from commissions is also required and is calculated by multiplying DPAE commissions, net of an adjustment for unearned commissions, by 45%. The unpaid claims margin is calculated by applying a factor to the unpaid claims experience relating to prior years. Generally, the factor varies with the length of benefit period remaining.
Instructions for calculating the margin required for accident and sickness business are included in this section. The total requirement calculated should be included in the amount reported as the margin required for unpaid claims and premium liabilities in the MCT.

**Instructions for calculating the margin required**

Mortality/morbidity risk for accident and sickness insurance is the risk that the liability assumptions about mortality and morbidity rates will be wrong.

To compute the mortality/morbidity component, a factor is applied to the measure of the exposure to the risk. The resulting values are added to arrive at the premiums and unpaid claims margin requirements.

The factors used in deriving the risk component vary with the guaranteed term remaining in the exposure measure. The measure of the exposure to risk is as follows:

<table>
<thead>
<tr>
<th>Risk</th>
<th>Measure of Exposure</th>
<th>Applicable Guaranteed Term</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disability Income, New Claims Risk</td>
<td>Annual net earned premiums</td>
<td>the length of the premium guarantee remaining</td>
</tr>
<tr>
<td>Disability Income, Continuing Claims Risk</td>
<td>Disability income net reserves relating to claims of prior years</td>
<td>the length of the benefit period remaining</td>
</tr>
<tr>
<td>Accidental Death and Dismemberment</td>
<td>Net amount at risk = the total net face amount of insurance less the policy liabilities (even if negative)</td>
<td>the period over which the mortality cost cannot be changed (limited to the remaining period to expiry or maturity)</td>
</tr>
</tbody>
</table>

1. **Disability income insurance**

The additional risks associated with non-cancellable guaranteed premium business should be recognized. As well, increased volatility is characteristic of disability income insurance, as compared to medical and dental expense reimbursement business.

*Premium margin*

The premium component relates to claims arising from the current year's coverage, and includes the risks of incidence and claims continuance. The factors applied to the measure of exposure are as follows:
<table>
<thead>
<tr>
<th>Percentage of Annual Earned Premiums</th>
<th>Length of Premium Guarantee Remaining</th>
</tr>
</thead>
<tbody>
<tr>
<td>Individually Underwritten</td>
<td>Other</td>
</tr>
<tr>
<td>15%</td>
<td>15%</td>
</tr>
<tr>
<td></td>
<td>less than or equal to 1 year</td>
</tr>
<tr>
<td>25%</td>
<td>31.25%</td>
</tr>
<tr>
<td></td>
<td>greater than 1 year, but less than or</td>
</tr>
<tr>
<td></td>
<td>equal to 5 years</td>
</tr>
<tr>
<td>37.5%</td>
<td>50%</td>
</tr>
<tr>
<td></td>
<td>greater than 5 years</td>
</tr>
</tbody>
</table>

*Unpaid claims margin*

The unpaid claims component covers the risk of claims continuance arising from coverage provided in prior years. The factor applies to disability income claim reserves related to claims incurred in prior years, including the portion of the provision for incurred but unreported claims. The factor applied to the measure of risk exposure is as follows:

<table>
<thead>
<tr>
<th>Duration of Disability</th>
<th>Length of Benefit Period Remaining</th>
</tr>
</thead>
<tbody>
<tr>
<td>less than or equal to 2 years</td>
<td>less than or equal to 1 year</td>
</tr>
<tr>
<td>greater than 2 years but less than or equal to 5 years</td>
<td>greater than 1 year but less than or equal to 2 years</td>
</tr>
<tr>
<td>greater than 5 years</td>
<td>greater than 2 years or lifetime</td>
</tr>
<tr>
<td>5.0%</td>
<td>3.75%</td>
</tr>
<tr>
<td>7.5%</td>
<td>5.625%</td>
</tr>
<tr>
<td>10.0%</td>
<td>7.5%</td>
</tr>
</tbody>
</table>

2. *Accidental death and dismemberment*

To compute the components for accidental death and dismemberment, the following factors are applied to the net amount at risk:

<table>
<thead>
<tr>
<th>Type</th>
<th>Factor</th>
<th>Guaranteed Term Remaining</th>
</tr>
</thead>
<tbody>
<tr>
<td>Participating</td>
<td></td>

31 For travel insurance, annual earned premiums should be considered revenue premiums.
For participating business without meaningful dividends, and participating adjustable policies where mortality adjustability is not reasonably flexible, the factors for all other non-participating business should be used.

If current premium rates are significantly less than the maximum guaranteed premium rates, the guarantee term used is that applicable to the current rates.

Additional adjustments are according to group insurance. They are as follows:

- The above factors may be multiplied by 50% for any group benefit that carries one of the following features: 1) a "guaranteed no risk", 2) deficit repayment by policyholders, or 3) "hold harmless" agreement where the policyholder has a legally enforceable debt to the insurer.

- No component is required for "Administrative services only" group cases where the insurer has no liability for claims.

Only "all cause" policies solicited by mail should be included in this section for automobile and common carrier accidental death and dismemberment. Specific accident perils included in accidental death and dismemberment policies solicited by mail, and "free" coverages on premium credit card groups, should be included in the "Other accident and sickness benefits" section.

3. Other accident and sickness benefits

Premium margin
The component requirement is 15% of annual earned premiums.

Unpaid claims margin
The component requirement is 12.5% of the provision for incurred but unpaid claims relating to prior years. The use of prior years avoids a double component requirement for incurred but unpaid claims arising from coverage purchases by premiums paid in the current year.

4. Special policyholder arrangements

For group insurance deposits in excess of liabilities, excluding the liability for such deposits may reduce the component requirement on any policy to a minimum of zero. Such deposits must be:

- made by policyholders;
- available for claims payment (e.g., claim fluctuation and premium stabilization reserves, and accrued provision for experience refunds); and
- returnable, net of applications, to policyholders on policy termination.
Chapter 5. Market Risk

Market risk arises from potential changes in rates or prices in various markets such as for interest rates, foreign exchange rates, equities, real estate, and other market risk exposures. Exposure to this risk results from trading, investing, and other business activities, which create on- and off-balance sheet positions.

Investments in mutual funds or other similar assets must be broken down by type of investment (bonds, preferred shares, common shares, etc.) and assigned the appropriate risk factor relating to the investment. If these investments are not reported on a prorated basis, then the factor of the riskiest asset held in the fund is assigned to the entire investment.

5.1. Interest Rate Risk

Interest rate risk represents the risk of economic loss resulting from market changes in interest rates and the impact on interest rate sensitive assets and liabilities. Interest rate risk arises due to the volatility and uncertainty of future interest rates.

Assets and liabilities whose value depends on interest rates are affected. Interest rate sensitive assets include fixed income assets. Interest rate sensitive liabilities include those for which the values are determined using a discount rate.

To compute the interest rate risk margin, a duration and an interest rate shock factor are applied to the fair value of interest rate sensitive assets and liabilities. The interest rate risk margin is the difference between the change in the value of interest rate sensitive assets and the change in the value of interest rate sensitive liabilities, taking into account the change in the value of recognized interest rate derivative contracts, as appropriate.

5.1.1. General requirements

The components used to calculate the interest rate risk margin are as follows.

5.1.1.1. Interest rate sensitive assets

The interest rate sensitive assets to be included in the calculation of the interest rate margin are those for which their fair value will change with movements in interest rates. Although certain assets, for example loans and bonds held to maturity, may be reported on the balance sheet on an amortized cost basis, their economic value, and changes in that value, are to be considered for interest rate risk margin purposes. Interest rate sensitive assets include:

- term deposits and other similar short-term securities (excluding cash),
- bonds and debentures,
- commercial paper,
- loans,
• mortgages (residential and commercial),
• mortgage-backed and asset-backed securities (MBS and ABS),
• preferred shares, and
• interest rate derivatives held for other than hedging purposes.

Investments in mutual funds and other similar assets should be broken down by type of investment (bond, preferred share, common shares, etc.). The assets in the fund that are interest rate sensitive are to be included in the determination of the fair value of the P&C insurer’s total interest rate sensitive assets.

Other assets, such as cash, investment income due and accrued, common shares and investment properties, are not to be included in the determination of the value of interest rate sensitive assets. Such assets are assumed for interest rate risk margin determination purposes to be insensitive to movements in interest rates.

Branches of foreign companies are to include only vested interest rate sensitive assets and interest rate sensitive assets included as adjustments to net assets available in the determination of the margin for interest rate risk.

5.1.1.2. Interest rate sensitive liabilities

The interest rate sensitive liabilities to be included in the calculation of the interest rate risk margin are those for which their fair value will change with movements in interest rates. The following liabilities are considered sensitive to interest rates and are to be included:

• net unpaid claims and adjustment expenses,
• net premium liabilities, and
• liabilities due to reinsurers under funds withheld reinsurance arrangements

P&C insurers must obtain OSFI’s supervisory approval in order to include other liabilities in the calculation of interest rate risk margin.

Net unpaid claims and adjustment expenses, which include PfADs, are net of reinsurance, salvage and subrogation, and self-insured retentions. Net premium liabilities, which also include PfADs, are after reinsurance recoverables.

5.1.1.3. Allowable interest rate derivatives

Interest rate derivatives are those for which the cash flows are dependent on future interest rates. They may be used to hedge a P&C insurer’s interest rate risk and as such may be recognized in the determination of the margin required for interest rate risk, subject to the conditions below.
Only plain-vanilla interest rate derivatives that clearly serve to offset fair value changes in a company’s capital position due to changes in interest rates may be included in the interest rate risk calculation. Plain-vanilla interest rate derivative instruments are limited to the following:

- interest rate and bond futures,
- interest rate and bond forwards, and
- single-currency interest rate swaps.

Other interest rate derivatives, including interest rate options, caps and floors are not considered plain-vanilla and may not be recognized in the determination of the interest rate risk margin.

P&C insurers must understand the interest rate hedging strategies that they have in place and be able to demonstrate to OSFI, upon request, that the underlying hedges decrease interest rate risk exposure and that the addition of such derivatives does not result in overall increased risk. For example, P&C insurers are expected to be able to demonstrate that they have defined the hedging objectives, the class of risk being hedged, the nature of the risk being hedged, the hedge horizon, and have considered other factors, such as the cost and liquidity of the hedging instruments. In addition, the ability to demonstrate an assessment, retrospectively or prospectively, of the performance of the hedge would be appropriate. If the P&C insurer cannot demonstrate that the derivatives result in decreased overall risk, then additional capital may be required, and companies in this situation should contact OSFI for details.

Derivatives used for hedging a P&C insurer’s interest rate risk are subject to credit risk requirements. Refer to section 6.2 for further details.

5.1.1.4. Duration of interest rate sensitive assets and liabilities

P&C insurers are required to calculate the duration of the interest rate sensitive assets and liabilities for the purpose of the interest rate risk requirement calculation. The duration of an asset or a liability is a measure of the sensitivity of the value of the asset or liability to changes in interest rates. More precisely, it is the percentage change in an asset or liability value given a change in interest rates.

The calculation of duration for an asset or liability will depend on the duration measure chosen and whether the cash flows of the asset or liability are themselves dependent on interest rates. Modified duration is a duration measure in which it is assumed that interest rate changes do not change the expected cash flows. Effective duration is a duration measure in which recognition is given to the fact that interest rate changes may change the expected cash flows.

A P&C insurer may use either modified duration or effective duration to calculate the duration of its assets and liabilities. However, the duration methodology chosen should apply to all interest rate sensitive assets and liabilities under consideration and the same methodology must be used consistently from year to year (i.e. “cherry-picking” is not permitted).

The cash flows associated with interest rate derivatives are sensitive to changes in interest rates and therefore the duration of an interest rate derivative must be determined using effective...
duration. In particular, if a company has interest rate derivatives on its balance sheet that lie within the scope of section 5.1.1.3, then it must use effective duration for all of its interest rate sensitive assets and liabilities.

The portfolio duration (modified or effective) can be obtained by calculating the weighted average of the duration of the assets or the liabilities in the portfolio.

The dollar duration of an asset or liability is the change in dollar value of an asset or liability for a given change in interest rates.

5.1.1.5. Modified duration

Modified duration is defined as the approximate percentage change in the present value of cash flows for a 100 basis point change in the annually compounded yield rate, assuming that expected cash flows do not change when interest rates change.

Modified duration can be written as:

\[
\text{Modified duration} = \frac{1}{1 + \text{Yield}} \times \frac{\sum t \times \text{PVCF}_t}{\text{Market Value}}
\]

where,

\[
\text{Yield} = \text{the annually compounded yield to maturity of the cash flows,}
\]

\[
\text{PVCF}_t = \text{the present value of the cash flow at time } t \text{ discounted at the yield rate, and}
\]

the sum in the numerator is taken over all times \( t \) at which a cash flow occurs.

5.1.1.6. Effective duration

Effective duration is a duration measure in which recognition is given to the fact that interest rate changes may change the expected cash flows. Although modified duration will give the same estimate of the percentage fair value change for an option-free series of cash flows, the more appropriate measure for any series of cash flows with an embedded option is effective duration.

Effective duration is determined as follows:

\[
\text{Effective duration} = \frac{\text{Fair value if yields decline} - \text{fair value if yields rise}}{2 \times (\text{initial price}) \times (\text{change in yield in decimal})}
\]

where,

\[
\Delta y = \text{change in yield in decimal}
\]

\[
V_0 = \text{initial fair value}
\]

\[
V_\Delta = \text{fair value if yields decline by } \Delta y
\]

\[
V_+ = \text{fair value if yields increase by } \Delta y,
\]

then effective duration is as follows:
5.1.1.7. Portfolio duration

The duration of a portfolio of interest rate sensitive assets or liabilities is to be determined by calculating the weighted average of the duration of the assets or liabilities in the portfolio. The weight is the proportion of the portfolio that a security comprises. Mathematically, a portfolio’s duration is calculated as follows:

\[
\frac{V_+ - V_-}{2 \times (V_0) \times (\Delta y)}
\]

where,

\[w_i = \frac{\text{fair value of security } i}{\text{fair value of the portfolio}}\]

\[D_i = \text{duration of security } i\]

\[K = \text{number of securities in the portfolio.}\]

5.1.1.8. Dollar fair value change

Modified and effective duration are related to percentage fair value changes. The interest rate risk requirements depend on determining the adjustment to the fair value of interest rate sensitive assets and liabilities for dollar fair value changes. The dollar fair value change can be measured by multiplying duration by the dollar fair value and the number of basis points (in decimal form). In other words,

\[
\text{Dollar fair value change} = \text{duration} \times \text{dollar fair value} \times \text{interest rate change (in decimal)}
\]

5.1.1.9. Duration of allowable interest rate derivatives

Effective duration is the appropriate measure that should be used when assets or liabilities have embedded options. For portfolios with eligible plain-vanilla interest rate derivatives, P&C insurers should be using effective dollar duration because the insurer is hedging the dollar interest rate risk exposure.

Example 5-1: Effective dollar duration of a swap

Assuming a P&C insurer has a longer duration for its interest rate sensitive assets and a shorter duration for its interest rate sensitive liabilities, the current dollar duration position of the P&C insurer, prior to taking into consideration any interest rate derivatives, is effectively as follows:

\[
P&C \text{ insurer’s dollar duration} = \text{dollar duration of assets} - \text{dollar duration of liabilities} > 0
\]

The P&C insurer enters into a single-currency interest rate swap in which it pays fixed-rate and receives floating-rate. The dollar duration of a swap for a fixed-rate payer can be broken down as follows:
Effective dollar duration of a swap for a fixed-rate payer = effective dollar duration of a floating-rate bond – effective dollar duration of a fixed rate bond

Assuming the dollar duration of the floating-rate bond is near zero, then

Effective dollar duration of a swap for a fixed-rate payer = 0 – effective dollar duration of a fixed-rate bond

The dollar duration of the swap position is negative; therefore, adding the swap position reduces the company’s dollar duration of assets and moves the P&C insurer’s overall dollar duration position closer to zero.

5.1.2. Interest rate risk margin

The interest rate risk margin is determined by measuring the economic impact on the P&C insurer of a Δy change in interest rates. The Δy interest rate shock factor is 1.25% (Δy = 0.0125).

A. The estimated change in the interest rate sensitive asset portfolio for an interest rate shock factor increase of Δy is determined as follows:

Dollar fair value change of the interest rate sensitive asset portfolio = (Duration of interest rate sensitive asset portfolio) x Δy x (Fair value of interest rate sensitive asset portfolio)

B. The change in the interest rate sensitive liabilities for an interest rate shock factor increase of Δy is determined as follows:

Dollar fair value change of the interest rate sensitive liabilities = (Duration of interest rate sensitive liabilities) x Δy x (Fair value of interest rate sensitive liabilities)

C. The change in the allowable interest rate derivatives for the interest rate shock factor increase of Δy is determined as follows:

Effective dollar duration of the allowable interest rate derivatives portfolio = sum of the effective dollar duration of the allowable interest rate derivatives for a Δy increase in interest rates

D. The capital requirement for an interest rate shock factor increase of Δy is determined as the greater of zero and A – B + C.

E. Steps A through C are repeated for an interest rate shock factor decrease of Δy (i.e. -Δy) and the capital requirement for an interest rate decrease of Δy is the greater of zero and A – B + C.

F. The interest rate risk margin is then determined as the maximum of D or E.
5.2. **Foreign Exchange Risk**

The foreign exchange risk margin is intended to cover the risk of loss resulting from fluctuations in currency exchange rates and is applied to the entire business activity of the P&C insurer.

5.2.1. *General requirements*

Two steps are necessary to calculate the foreign exchange risk margin. The first is to measure the exposure in each currency position. The second is to calculate the capital requirement for the portfolio of positions in different currencies.

The foreign exchange risk margin is 10% of the greater of:

1. the aggregate net long positions in each currency, adjusted by effective allowable foreign exchange rate hedges if any are used, and
2. the aggregate net short positions in each currency, adjusted by effective allowable foreign exchange rate hedges if any are used,

where effective allowable foreign exchange rate hedges are limited to plain-vanilla foreign currency derivatives such as futures and forward foreign currency contracts and currency swaps.

Investments in mutual funds and other similar assets should be broken down by type of investment (bonds, preferred shares, common shares, etc.) for calculating foreign exchange risk margin. The assets in the fund that are denominated in a foreign currency are to be included in the calculation to determine the capital requirement for each currency position. In cases where a claim liability is recorded in Canadian dollars but the settlement of the claim will be made in a foreign currency, the liability must be included in the calculation of the foreign exchange risk margin.

5.2.2. **Foreign exchange risk margin**

**Step 1: Measuring the exposure in a single currency**

The net open position for each currency is calculated by summing:

- the net spot position, defined as all asset items less all liability items denominated in the currency under consideration, including accrued interest and accrued expenses if they are subject to exchange rate fluctuations;
- the net forward position (i.e. all net amounts under forward foreign exchange transactions, including currency futures and the principal on currency swaps), valued at current spot market exchange rates or discounted using current interest rates and translated at current spot rates;
- guarantees (and similar instruments) that are certain to be called and are likely to be irrecoverable;
net future income/expenses not yet accrued but already fully hedged (at the discretion of the reporting institution); and
any other item representing a profit or loss in foreign currencies.

Adjustments:

For P&C insurers with foreign operations, those items that are currently deducted from capital available in calculating the MCT ratio and are denominated in the corresponding currency may be excluded from the calculation of net open currency positions, to a maximum of zero. For example:

- Goodwill and other intangibles;
- Interests in non-qualifying subsidiaries, associates and joint ventures; and
- Non-allowable foreign exchange rate hedges that are not considered in capital available.

Carve-out:

A P&C insurer with a net open long position in a given currency may reduce the amount of the net exposure, to a maximum of zero, by the amount of a carve-out, which is equivalent to a short position of up to 25% of the liabilities denominated in the corresponding currency.

Step 2: Calculating the capital requirement for the portfolio

The nominal amount (or net present value) of the net open position in each foreign currency calculated in step 1 is converted at a spot rate into Canadian dollars. The gross capital requirement is 10% of the overall net open position, calculated as the greater of:

- the sum of the net open long positions; and
- the absolute value of the sum of the net open short positions.

Example:

A P&C insurer has $100 of U.S. assets and $50 of U.S. liabilities.
- The net spot position, defined as assets less liabilities, is a long position of $50.
- The carve-out, using 25% of liabilities, is:
  \[= 25\% \times 50\]
  \[= 12.5\]
- Therefore, the foreign exchange risk margin is:
  \[= 10\% \times \text{MAX}^{32} ((\text{net spot position} - \text{carve-out}), 0)\]
  \[= 10\% \times \text{MAX} ((50 - 12.5), 0)\]

---

32 The carve-out can be used to reduce the net open long currency position to a minimum of zero.
5.2.2.1. Allowable foreign currency hedges

Foreign currency derivatives are those for which the cash flows are dependent on future foreign exchange rates. They may be used to hedge an insurer’s foreign exchange risk and as such, may be recognized in the determination of the capital requirement for foreign exchange risk, subject to the following requirements.

Only effective hedges that offset the changes in fair value of the hedged item may be included in the foreign exchange risk calculation. The company must be able to demonstrate to OSFI the effectiveness of its foreign exchange hedges.

Companies with foreign currency derivatives on their balance sheet must be able to demonstrate that the addition of such derivatives does not result in increased risk. If the insurer cannot demonstrate that the derivatives do not result in increased risk, then OSFI may require additional capital.

Only plain-vanilla foreign currency derivatives may be recognized in the calculation of the foreign exchange capital requirement. Plain-vanilla foreign currency derivative instruments are limited to the following:

- futures foreign currency contracts,
- forward foreign currency contracts, and
- currency swaps.

Other foreign currency derivatives, including options on foreign currencies, are not considered plain-vanilla and are not to be recognized in the determination of the foreign exchange risk margin.

Derivatives used for hedging a P&C insurer’s foreign exchange risk are subject to credit risk requirements. Refer to section 6.2 for further details.

5.2.2.2. Measurement of forward currency positions

Forward currency positions should be valued at current spot market exchange rates. It would not be appropriate to use forward exchange rates since they partly reflect current interest rate differentials. Companies that base their normal management accounting on net present values are expected to use the net present values of each position, discounted using current interest rates and translated at current spot rates, for measuring their forward currency positions.

5.2.2.3. Accrued and unearned interest income and expenses

Accrued interest, accrued income and accrued expenses should be treated as a position if they are subject to exchange rate fluctuations. Unearned but expected future interest, income or expenses
may be included, provided the amounts are certain and have been fully hedged by allowable forward foreign exchange contracts. Companies must be consistent in their treatment of unearned interest, income and expenses and must have written policies covering the treatment. The selection of positions that are only beneficial to reducing the overall position will not be permitted for capital purposes.

5.2.2.4. Unregistered reinsurance

A separate component calculation must be performed for each group of liabilities ceded to an unregistered reinsurer that is backed by a distinct pool of assets, where the defining characteristic of the pool is that any asset in the pool is available to pay any of the corresponding liabilities. Each calculation should take into consideration the ceded liabilities, the assets supporting them, and deposits placed by the reinsurer to cover the capital requirement for the ceded liabilities if the deposits are in a currency different from the currency in which the ceded liabilities are payable to policyholders. If some of the assets supporting the liabilities ceded to an unregistered reinsurer are held by the ceding company (e.g. funds withheld), the company’s corresponding liability should be treated as an asset in the calculation of the open positions for the ceded business.

Excess deposits placed by an unregistered reinsurer within a pool of supporting assets may be used to reduce the foreign exchange risk requirement for the corresponding ceded business to a minimum of zero. Any requirements not covered by excess deposits must be added to the ceding company’s own requirement.

5.3. Equity Risk

Equity risk is the risk of economic loss due to fluctuations in the value of common shares and other equity securities.

5.3.1. Common shares and joint ventures

A 30% risk factor applies to investments in common shares and joint ventures in which a company holds less than or equal to 10% ownership interest.

5.3.2. Futures, forwards, and swaps

Equity futures, forwards, and swaps attract a 30% risk factor, which is applied to the market value of the underlying equity security or index. Where a swap exchanges a return on an equity security or index for a return on a different equity security or index, a 30% risk factor applies to the market value of both equity securities or indices for which the returns are being exchanged.

Example:

A P&C insurer has entered into a one-year swap during which it will pay the 3-month Canadian Dollar Offered Rate (CDOR) plus fees, and receive the total return on a notional index of equities that was worth 100 at the time of inception. The index of equities is currently worth 110. A 30% equity risk charge will apply to 110 for the long position in the index, but no capital
charge will be required on the short position in the bond because such a position is not subject to an equity risk charge.

In addition to the capital requirements set out in this section, futures, forwards, and swaps are subject to credit risk requirements. Refer to section 6.2 for further details.

5.3.3. Short positions

The capital requirements for short positions in common shares, equity futures, forwards, and swaps that do not wholly or partially offset a long equity position are determined by assuming the instrument is held long and then applying the corresponding risk factor. Common shares, futures, forwards, and swaps eligible for offset recognition and the corresponding capital treatment are described in section 5.3.4.

5.3.4. Recognition of equity hedges

Equity futures, forwards, and swaps, as well as common shares can be used to wholly or partially hedge an equity exposure. P&C insurers may recognize qualifying equity hedges in the calculation of the capital requirements in accordance with section 5.3.4.1 and 5.3.4.2.

P&C insurers must document the equity hedging strategies employed and demonstrate that the hedging strategies decrease the overall risk. The documentation must be available for review, upon request. If the P&C insurer cannot demonstrate, to the satisfaction of the Superintendent, that the hedging strategies result in decreased overall risk, then additional capital above that calculated as per sections 5.3.4.1 and 5.3.4.2 may be required, at the discretion of the Superintendent.

For hedges to qualify, they must be issued by an entity that:

- issues obligations which attract a 0% factor under section 6.1.2; or
- is rated A- or better (including clearing houses rated A- or better).

5.3.4.1. Identical equity securities or indices

Long and short positions in exactly the same underlying equity security or index may be considered to be offsetting so that the capital requirements are calculated for the net exposure only. Individual instruments of portfolios that qualify for the capital treatment under section 5.3.4.2 cannot be carved out of the portfolios to receive the capital treatment of section 5.3.4.1.

Only common shares and plain-vanilla equity futures, forwards, and swaps can obtain the capital treatment under this section. Exotic equity derivatives do not qualify for this treatment.

---

33 An insurer may contact OSFI to discuss the adequacy of its documentation and/or risk assessment to assess the likelihood or amount of potential additional capital that may be required.

34 An example of an exotic derivative would be one that has a discontinuous payoff structure.
5.3.4.2. Closely linked equity securities or indices

A portfolio of common shares and equity futures, forwards, and swaps can be used to partially hedge the equity exposure of another portfolio of similar instruments. When the instruments contained in both portfolios are closely linked, instead of following the capital requirements set out in sections 5.3.1, 5.3.2, and 5.3.3, P&C insurers may calculate the capital requirements for the combined portfolios in the following manner:

\[(1 - \text{Correlation Factor}) \times 1.5 \times \text{MIN (market value of the portfolio of hedging instruments, market value of the portfolio of instruments being hedged)}\]

The capital requirements set out above are capped at 60% of the minimum market value of both portfolios.

The difference between the market value of the two portfolios is not considered a hedged position and is subject to a 30% risk factor.

The Correlation Factor is derived by using:

\[\text{CF} = A \times (B/C)\]

where:

- \(A\) represents the historical correlation between the returns on the portfolio of instruments being hedged and the returns on the portfolio of hedging instruments
- \(B\) represents the minimum of \([\text{standard deviation of returns on the portfolio of instruments being hedged, standard deviation of returns on the portfolio of hedging instruments}]\)
- \(C\) represents the maximum of \([\text{standard deviation of returns on the portfolio of instruments being hedged, standard deviation of returns on the portfolio of hedging instruments}]\)

The historical correlations and standard deviations must be calculated on a weekly basis, covering the previous 52-week period. The returns on each portfolio of hedging instruments used to calculate the components of the CF must be determined by assuming that the portfolio is held long. The returns on each portfolio must be measured net of additional capital injections, and must include the returns on each component of the portfolio. For example, the returns on both the long and short legs of a total return swap included in a portfolio must be reflected in the calculation of the CF.

The CF for the previous 52 weeks is required to be calculated for each of the past four quarters. The Correlation Factor is the lowest of the four CFs calculated and is used to calculate capital requirements.

In order for the portfolios to obtain the capital treatment set out in this section, the following conditions must be met:
The instruments in both portfolios are limited to exchange-traded common shares, and plain-vanilla equity futures, forwards, and swaps where the underlying asset is an exchange-traded common share or an equity index. Portfolios that contain instruments other than those specified in this section will be subject to the capital treatment under sections 5.3.1, 5.3.2, and 5.3.3.

The CF is determined at the portfolio level. Individual instruments cannot be carved-out of the portfolios and receive the capital treatment as per section 5.3.4.1.

The portfolios that are part of a hedging strategy must have been established at least two years prior to the reporting date. In addition, the hedging strategy and the active management strategy on which both portfolios are based must not have changed in the past two years prior to the reporting date. Portfolios that have been established for at least two years but have undergone a change in the hedging strategy or active management strategy will attract a 30% risk factor.

Example:

Suppose a portfolio of instruments is valued at $200 and is paired with another portfolio of instruments as part of a qualifying equity hedge. Assuming that the second portfolio is worth $190 and that the Correlation Factor between the two portfolios is 0.95, the total capital charge for both portfolios will be $190 \times 5\% \times 1.5 + $10 \times 30\% = $17.25.

Portfolios that were established less than two years prior to the reporting date attract the following capital treatment:

1. No recognition of the equity hedge in the first year following the establishment of the portfolios (i.e. a 30% factor is applied to both portfolios); and
2. in the second year, the sum of:
   - \( T \times \) capital requirements for the combined portfolios using the correlation factor approach described in this section\(^{36}\); and
   - \( (1-T) \times \) capital requirements set out in 1 above.

\( T \) equals 20\%, 40\%, 60\%, and 80\% in the first, second, third, and fourth quarter, respectively, of the second year following the establishment of the portfolios.

---

\(^{35}\) For the purposes of this section, the hedging strategy and active management strategy together are deemed to be unchanged if the ex-ante equity risk profile of the combined portfolios is maintained. For example, the ex-ante equity risk profile is maintained if the combined beta is continuously targeted to be 0 (the hedging strategy), and if instrument selection is continuously based on the price-earnings ratio (the active management strategy).

\(^{36}\) For the purposes of this calculation, the Correlation Factor must be determined based on actual portfolio returns (i.e. portfolio returns up to the reporting date). Projected (simulated) returns cannot be used. The Correlation Factor must be determined as the lowest of available 52 week Correlation Factors given the actual history of portfolio returns. During the second year, the number of available 52 week Correlation Factors will increase from one to four as time elapses.
Example:
Two portfolios (as part of an equity hedge), each equal to 100, are established on April 1, 2016. On March 31, 2017, the capital charge for both portfolios will be \(30\% \times 100 + 30\% \times 100 = 60\). On June 30, 2017, assuming that the Correlation Factor is 0.90, the combined portfolios will be subject to a capital charge of \(20\% \times 10\% \times 1.5 \times 100 + 80\% \times 60\% \times 100 = 51\).

5.4. Real Estate Risk

Real estate risk is the risk of economic loss due to changes in the value of a property or in the amount and timing of cash flows from a property.

The risk factors are as follows:

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Risk Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner-occupied properties</td>
<td>10%</td>
</tr>
<tr>
<td>Investment properties</td>
<td>20%</td>
</tr>
</tbody>
</table>

For owner-occupied properties, the risk factor is applied to the value using the cost model, excluding any unrealized fair value gains (losses) arising at the conversion to IFRS, or subsequent unrealized fair value gains (losses) due to revaluation.

5.5. Right-of-Use Assets

The risks associated with right-of-use assets are related to fluctuating market lease rates and to potential changes in the amount and timing of cash flows from early cancellation penalties, and costs associated with renegotiating or locating a new lease.

A 10% risk factor is applied to right-of-use assets, determined in accordance with relevant accounting standards, associated with leased owner-occupied properties and associated with leased assets that fall in the category of “other assets” (e.g. equipment).

A 20% risk factor is applied to right-of-use asset, determined in accordance with relevant accounting standards, associated with leased investment properties.

5.6. Other Market Risk Exposures

Other market risk exposures include assets that fall in the category “other assets,” for example, equipment, that are exposed to asset value fluctuations that may result in the value realized upon disposal being less than the balance sheet carrying value. A 10% risk factor applies to other assets as part of the total capital requirements for market risk.
Chapter 6. Credit Risk

Credit risk is the risk of loss arising from a counterparty’s potential inability or unwillingness to fully meet its contractual obligations due to an insurer. Exposure to this risk occurs any time funds are extended, committed, or invested through actual or implied contractual agreements. Components of credit risk include loan loss/principal risk, pre-settlement/replacement risk and settlement risk. Counterparties include issuers, debtors, borrowers, brokers, policyholders, reinsurers and guarantors.

All on- and off-balance sheet exposures are subject to a specific risk factor that either: 1) corresponds to the external credit rating of the counterparty or issuer or 2) represents a prescribed factor determined by OSFI. To determine the capital requirements for balance sheet assets, factors are applied to the balance sheet values or other specified values of these assets. To determine the capital requirements for off-balance sheet exposures, factors are applied to the exposure amounts determined according to the section 6.2. Collateral and other forms of credit risk mitigators may be used to reduce the exposure. No risk factors are applied to assets deducted from capital available (reference section 2.3). The resulting amounts are summed to arrive at the credit risk capital requirements.

In respect of invested assets, P&C insurers must comply with OSFI’s Guideline B-2 Investment Concentration Limit for Property and Casualty Insurance Companies.

6.1. Capital Requirements for Balance Sheet Assets

For the purpose of calculating the capital requirements for credit risk, balance sheet assets should be valued at their balance sheet carrying amounts, with the following exceptions:

- loans carried at fair value under the fair value option, fair value hedge accounting, or available-for-sale accounting, which should be valued at amortized cost; and
- off-balance sheet exposures should be valued in accordance with section 6.2.

6.1.1. Use of ratings

Many of the risk factors in this chapter depend on the external credit rating assigned to an asset or an obligor. In order to use a factor that is based on a rating, a P&C insurer must meet all of the conditions specified in this section. For MCT purposes, P&C insurers may recognize credit ratings from the following rating agencies:

- DBRS
- Fitch Rating Services
- Japan Credit Rating Agency (JCR)
- Kroll Bond Rating Agency (KBRA)
- Moody’s Investors Service
- Rating and Investment Information (R&I)
- Standard and Poor’s (S&P)
A P&C insurer must choose the rating agencies it intends to rely on and then use their ratings for MCT purposes consistently for each type of asset or obligation. Companies should not select the assessments provided by different rating agencies with the sole intent to reduce their capital requirements (i.e. “cherry picking” is not permitted).

Any rating used to determine a factor must be publicly available, i.e. the rating must be published in an accessible form and included in the rating agency’s transition matrix. Ratings that are made available only to the parties to a transaction do not satisfy this requirement.

If a P&C insurer is relying on multiple rating agencies and there is only one assessment for a particular asset or obligor, that assessment should be used to determine the capital requirements. If there are two assessments from the rating agencies used by a P&C insurer and these assessments differ, the P&C insurer should apply the risk factor corresponding to the lower of the two ratings. If there are three or more assessments for an asset or obligor from a P&C insurer’s chosen rating agencies, the P&C insurer should exclude one of the ratings that corresponds to the lowest capital requirement, and then use the rating that corresponds to the lowest capital requirement of those that remain (i.e. the P&C insurer should use the second-highest rating from those available, allowing for multiple occurrences of the highest rating).

Where a P&C insurer holds a particular securities issue that carries one or more issue-specific assessments, the capital requirements for the asset or obligor will be based on these assessments. Where a P&C insurer’s asset is not an investment in a specifically rated security, the following principles apply:

- In circumstances where the borrower has a specific rating for an issued debt security, but the P&C insurer’s asset is not an investment in this particular security, a rating of BBB- or better on the rated security may only be applied to the P&C insurer’s unrated asset if this asset ranks pari passu or senior to the rated security in all respects. If not, the credit rating cannot be used and the P&C insurer’s asset must be treated as an unrated obligation.
- In circumstances where the borrower has an issuer rating, this assessment typically applies to senior unsecured assets or obligations on that issuer. Consequently, only senior assets or obligations on that issuer will benefit from a BBB- or better issuer assessment; other unassessed assets or obligations on the issuer will be treated as unrated. If either the issuer or one of its issues has a rating of BB+ or lower, this rating should be used to determine the capital requirements for an unrated asset or obligation on the issuer.
- Short-term assessments are deemed to be issue specific. They can only be used to derive capital requirements for assets or obligations arising from the rated facility. They cannot be generalized to other short-term assets or obligations, and in no event can a short-term rating be used to support a risk factor for an unrated long-term asset or obligation.
- Where the risk factor for an unrated exposure is based on the rating of an equivalent exposure to the borrower, foreign currency ratings should be used for exposures in foreign currency. Canadian currency ratings, if separate, should only be used to determine the capital requirements for assets or obligations denominated in Canadian currency.
The following additional conditions apply to the use of ratings:

- External assessments for one entity within a corporate group may not be used to determine the risk factors for other entities within the same group.
- No rating may be inferred for an unrated entity based on assets that the entity possesses.
- In order to avoid the double counting of credit enhancement factors, companies may not recognize credit risk mitigation if the credit enhancement has already been reflected in the issue-specific rating.
- A P&C insurer may not recognize a rating if the rating is at least partly based on unfunded support (e.g. guarantees, credit enhancement or liquidity facilities) provided by the P&C insurer itself or one of its associates.
- Any assessment used must take into account and reflect the entire amount of credit risk exposure a P&C insurer has with regard to all payments owed to it. In particular, if a P&C insurer is owed both principal and interest, the assessment must fully take into account and reflect the credit risk associated with repayment of both principal and interest.
- P&C insurers may not rely on unsolicited ratings in determining the risk factors for an asset, except where the asset is a sovereign exposure and a solicited rating is not available.

6.1.2. Credit risk factors

Various risk factors are applied to invested assets depending on the external credit rating and the remaining term to maturity as outlined below.

Investments in mutual funds or other similar assets must be broken down by type of investment (bonds, preferred shares, etc.) and assigned the appropriate risk factor relating to the investment. If these investments are not reported on a prorated basis, then the factor of the riskiest asset held in the fund, is assigned to the entire investment.

6.1.2.1. Long-term obligations

Long-term obligations, including term deposits, bonds, debentures, and loans that are not eligible for a 0% risk factor attract risk factors according to the following table. Long-term obligations generally have an original term to maturity at issue of 1 year or more.
Chapter 6. Credit Risk

### Long-Term Obligations

<table>
<thead>
<tr>

<td>18.00%</td>
<td>18.00%</td>
</tr>
</tbody>
</table>

- Remaining term to maturity denotes the number of years from the reporting date until the maturity date.
- P&C insurers may use effective maturity as an option for determining risk factors for investments in long-term obligations subject to a determined cash flow schedule. The following formula may be used to calculate effective maturity:

  \[
  \text{Effective Maturity } (M) = \frac{\sum_t t \times CF_t}{\sum_t CF_t},
  \]

  where \( CF_t \) denotes the cash flows (principal, interest payments and fees) contractually payable by the borrower in period \( t \).
- In cases where a P&C insurer elects not to calculate an effective maturity or if it is not feasible to do so using the above formula, the insurer is required to use the maximum remaining time (in years) that the borrower is permitted to fully discharge its contractual obligation (principal, interest, and fees) under the terms of the loan agreement. Normally, this would correspond to the nominal maturity or term to maturity of the instrument.
- Where information is not available to determine the redemption/maturity of an asset, P&C insurers must use the “greater than 5 years” category for that asset.

#### 6.1.2.2. Short-term obligations

Short-term obligations, including commercial paper, that are not eligible for a 0% risk factor have risk factors assigned according to the following table. Short-term obligations generally have an original term to maturity at issue of no more than 365 days.

<table>
<thead>
<tr>
<th>Rating</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>A-1, F1, P-1, R-1 or equivalent</td>
<td>0.25%</td>
</tr>

<tr>
<td>Unrated</td>
<td>6.00%</td>
</tr>
<tr>
<td>All other ratings, including non-prime and B or C ratings</td>
<td>8.00%</td>
</tr>
</tbody>
</table>
6.1.2.3. Asset-backed securities

The category of asset-backed securities encompasses all securitizations, including collateralized mortgage obligations and mortgage-backed securities, as well as other exposures that result from stratifying or tranching an underlying credit exposure. For exposures that arise as a result of asset securitization transactions, insurers should refer to Guideline B-5: Asset Securitization\(^{37}\) to determine whether there are functions provided (e.g., credit enhancement and liquidity facilities) that require capital for credit risk.

National Housing Act (NHA) mortgage-backed securities:

NHA mortgage-backed securities that are guaranteed by Canada Mortgage Housing Corporation (CMHC) receive a factor of 0% to recognize the fact that obligations incurred by CMHC are legal obligations of the Government of Canada.

Other asset-backed securities:

The capital requirements for all other asset-backed securities are based on their external ratings. In order for an insurer to use external ratings to determine a capital requirement, the P&C insurer must comply with all of the operational requirements for the use of ratings in Guideline B-5: Asset Securitization.

For asset-backed securities (other than resecuritizations) rated BBB or higher, the capital requirement is the same as the requirement specified in subsection 6.1.2.1 for a long-term obligation having the same rating and maturity as the asset-backed security. If an asset-backed security is rated BB, a P&C insurer may recognize the rating only if it is a third-party investor in the security. The credit risk factor for an asset-backed security (other than a resecuritization) rated BB in which a company is a third-party investor is 300% of the requirement for a long-term obligation rated BB having the same rating and maturity as the security.

The credit risk factors for short-term asset-backed securities (other than resecuritizations) rated A-3 or higher are the same as those in subsection 6.1.2.2 for short-term obligations having the same rating.

The credit risk factor for any resecuritization rated BBB or higher is 200% of the risk factor applicable to an asset-backed security having the same rating and maturity as the resecuritization.

The credit risk factor for securitization exposures classified within the highest risk category of securitization exposures, as defined in Guideline B-5: Asset Securitization, is 60%.

The credit risk factor for any asset-backed security that is not mentioned above (including unrated securities and any asset-backed security that is rated lower than BB) is 60%.

\(^{37}\) Guideline B-5 should be read in conjunction with any current Advisories concerning securitization (e.g., the October 2008 Advisory, Securitization – Expected Practices).
6.1.2.4.  Preferred shares

Risk factors for preferred shares should be assigned according to the following table:

<table>
<thead>
<tr>
<th>Preferred Shares</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>AAA, AA+ to AA-, Pfd-1, P-1 or equivalent</td>
<td>3.00%</td>
</tr>
<tr>
<td>A+ to A-, Pfd-2, P-2 or equivalent</td>
<td>5.00%</td>
</tr>
<tr>
<td>BBB+ to BBB-, Pfd-3, P-3 or equivalent</td>
<td>10.00%</td>
</tr>
<tr>
<td>BB+ to BB-, Pfd-4, P-4 or equivalent</td>
<td>20.00%</td>
</tr>
<tr>
<td>B+ or lower, Pfd-5, P-5 or equivalent or unrated</td>
<td>30.00%</td>
</tr>
</tbody>
</table>

6.1.2.5.  Other balance sheet assets

Other risk factors for balance sheet assets:

<table>
<thead>
<tr>
<th>Factor</th>
<th>Asset</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00%</td>
<td>• Cash held on the company’s own premises(^{38}),</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>• Obligations of agents of the federal, provincial or territorial governments in Canada whose obligations are,</td>
</tr>
<tr>
<td></td>
<td>by virtue of their enabling legislation, direct obligations of the parent government,</td>
</tr>
<tr>
<td></td>
<td>• Obligations of sovereigns rated AA- or better and their central banks(^{40}),</td>
</tr>
<tr>
<td></td>
<td>• Obligations that have been explicitly, directly, irrevocably and unconditionally guaranteed by a government entity eligible</td>
</tr>
<tr>
<td></td>
<td>for a 0% risk factor including, for example, residential mortgages insured under the NHA or equivalent provincial mortgage</td>
</tr>
<tr>
<td></td>
<td>insurance program and NHA mortgage-backed securities that are guaranteed by the Canada Mortgage and Housing Corporation,</td>
</tr>
<tr>
<td></td>
<td>• Instalment premiums receivable (not yet due),</td>
</tr>
<tr>
<td></td>
<td>• Deferred policy acquisition expenses (DPAE), including DPAE on commissions, premium taxes and others, and excluding DPAE on</td>
</tr>
<tr>
<td></td>
<td>commissions for A&amp;S business,</td>
</tr>
<tr>
<td></td>
<td>• Current tax assets (income tax receivables),</td>
</tr>
<tr>
<td></td>
<td>• Any deductions from capital, including goodwill, intangible assets and interests in non-qualifying subsidiaries, associates, and</td>
</tr>
<tr>
<td></td>
<td>joint ventures with more than 10% ownership interest.</td>
</tr>
</tbody>
</table>

\(^{38}\) Applies to all vested cash assets of branches.

\(^{39}\) Includes securities, loans and accounts receivable.

\(^{40}\) Sovereign obligations rated lower than AA- may not receive a factor of 0%, and are instead subject to the factor requirements in section 6.1.2.
0.25%  
- Demand deposits, certificates of deposit, drafts, checks, acceptances and similar obligations that have an original maturity of less than three months, and that are drawn on regulated deposit-taking institutions subject to the solvency requirements of the Basel Framework.

(Note: where the maturity of the asset is longer than three months, the risk factor related to the credit rating of the regulated deposit-taking institution would apply instead.)

0.70%  
- Insurance receivables from registered reinsurers, excluding intra-group pooling arrangements approved by OSFI,
- Receivables from the Facility Association and the Plan de répartition des risques.

2.50%  
- Investment income due and accrued,
- Unearned premiums recoverable from registered reinsurers, excluding intra-group pooling arrangements approved by OSFI,
- Unpaid claims and adjustment expenses recoverable from registered reinsurers, excluding intra-group pooling arrangements approved by OSFI.

4%  
- First mortgages on one- to four-unit residential dwellings.

5%  
- Receivables, outstanding less than 60 days, from agents, brokers, non-qualifying subsidiaries, associates, joint ventures, and policyholders, including instalment premiums and other receivables.\(^{41}\)

10%  
- Receivables, outstanding 60 days or more, from agents, brokers, non-qualifying subsidiaries, associates, joint ventures and policyholders, including instalment premiums and other receivables.\(^{42}\),
- Commercial mortgages and other residential mortgages that do not qualify as first mortgages on one- to four-unit residential dwellings,
- The amount of available refunds of defined benefit pension fund surplus assets included in capital available,
- Deferred tax assets arising from temporary differences that the institution could recover from income taxes paid in the three immediate preceding years. DTAs from temporary differences that are in excess of the amount of taxes recoverable in the three immediate preceding years should be deducted from capital available.
- Other investments not specified in this section or section 5.5 as part of other market risk exposures, excluding derivative-related amounts. Capital requirements for derivative-related amounts included in other investments are set out in section 6.2.
- Other assets not specified in this section or section 5.5 as part of other market risk exposures, excluding other investments.

15%  
- Mortgages secured by undeveloped land (i.e. construction financing), other than land used for agricultural purposes or for the production of minerals. A property recently constructed or renovated will be considered as “under construction” until it is completed and 80% leased.

---

\(^{41}\) Includes receivables for assumed business from unregistered insurers.

\(^{42}\) Includes receivables for assumed business from unregistered insurers.
6.2. Capital Requirements for Off-Balance Sheet Exposures

The capital required for off-balance sheet exposures such as structured settlements, letters of credit or non-owned deposits, derivatives and other exposures is calculated in a manner similar to on-balance sheet assets in that the credit risk exposure is multiplied by a counterparty risk factor to arrive at the capital required. However, unlike most assets, the face amount of an off-balance sheet exposure does not necessarily reflect the true credit risk exposure. To approximate this exposure, a credit equivalent amount is calculated for each exposure. This amount, net of any collateral or guarantees, is then multiplied by a credit conversion factor. For letters of credit and non-owned deposits, the credit equivalent amount is the face value. The determination of the counterparty credit risk categories and the approach for determining the eligibility of collateral and guarantees is the same as it is for other assets. For letters of credit and non-owned deposits, the counterparty credit risk is found under section 4.3.

P&C insurers should also refer to OSFI’s Guideline B-5: Asset Securitization, which outlines the regulatory framework for asset securitization transactions, including transactions that give rise to off-balance sheet exposures.

The risk to a P&C insurer associated with structured settlements, letters of credit, non-owned deposits, derivatives and other exposures and the amount of capital required to be held against this risk is:

i.) The credit equivalent amount of the instrument at the reporting date;

ii.) Less: the value of eligible collateral securities or guarantees (reference section 6.3);

iii.) Multiplied by: a factor reflecting the nature and maturity of the instrument (credit conversion factor); and

---

43 1) Alternatively, assets classified as held for sale may be re-consolidated (look-through approach) at the option of the insurer. If this method is selected, any write-down made as a result of re-measuring the assets classified as held for sale at the lower of carrying amount and fair value less costs to sell should be reflected in the MCT after re-consolidation. Any asset within a consolidated group that is deducted from capital available for MCT purposes should continue to be deducted from capital when it becomes an asset held for sale.

2) If the insurer has elected to apply a 20% risk factor to assets held for sale instead of using the look-through approach, associated liabilities held for sale should be subject to the usual MCT treatment of liabilities as per chapter 4.
iv.) Multiplied by: a factor reflecting the risk of default of the counterparty to a transaction (counterparty credit risk).

6.2.1. Credit equivalent amount

The credit equivalent amount related to off-balance sheet exposures varies according to the type of instrument.

6.2.1.1. Structured settlements

The credit equivalent amount for a “Type 1” structured settlement is the current replacement cost of the settlement, which is gross of the coverage provided by Assuris.

“Type 1” structured settlements are not recorded as liabilities on the balance sheet, and have the following characteristics:

i.) An annuity is purchased by a P&C insurer who is named the owner. There is an irrevocable direction from the P&C insurer to the annuity underwriter to make all payments directly to the claimant.

ii.) Since the annuity is non-commutable, non-assignable and non-transferable, the P&C insurer is not entitled to any annuity payments and there are no rights under the contractual arrangement that would provide any current or future benefit to the P&C insurer.

iii.) The P&C insurer is released by the claimant indicating settlement of the claim amount.

iv.) The P&C insurer remains liable to make payments to the claimant in the event and to the extent the annuity underwriter fails to make payments under the terms and conditions of the annuity and the irrevocable direction given.

Under this type of structured settlement arrangement, the P&C insurer is not required to recognize a liability to the claimant, nor is it required to recognize the annuity as a financial asset. However, the P&C insurer is exposed to some credit risk by guaranteeing the obligation of the annuity underwriter to the claimant and, consequently, must set aside additional capital.

P&C insurers should refer to Guideline D-5 Accounting for Structured Settlements.

6.2.1.2. Derivatives

The credit equivalent amount for derivatives is the positive replacement cost (obtained by “marking to market”) plus an amount for potential future credit exposure (an “add-on” factor).

Derivatives include forwards, futures, swaps, purchased options, and other similar contracts. P&C insurers are not exposed to credit risk for the full face value of these contracts (notional principal amount); only to the potential cost of replacing the cash flow (on contracts showing a positive value) if the counterparty defaults. The credit equivalent amounts are assigned the risk factor appropriate to the counterparty in order to calculate the capital requirement.
The credit equivalent amount depends on the maturity of the contract and the volatility of the underlying instrument. It is calculated by adding:

i.) the total replacement cost (obtained by "marking to market") of all contracts with positive value; and

ii.) an amount for potential future credit exposure (or "add-on"). This is calculated by multiplying the notional principal amount by the following factors:

### Derivative “Add-On” Factors

<table>
<thead>
<tr>
<th>Residual Maturity</th>
<th>Interest Rate (02)</th>
<th>Exchange Rate and Gold (03)</th>
<th>Equity (04)</th>
<th>Precious Metals except Gold (05)</th>
<th>Other Instruments (06)</th>
</tr>
</thead>
<tbody>
<tr>
<td>One year or less</td>
<td>0.0%</td>
<td>1.0%</td>
<td>6.0%</td>
<td>7.0%</td>
<td>10.0%</td>
</tr>
<tr>
<td>One year to five years</td>
<td>0.5%</td>
<td>5.0%</td>
<td>8.0%</td>
<td>7.0%</td>
<td>12.0%</td>
</tr>
<tr>
<td>Over five years</td>
<td>1.5%</td>
<td>7.5%</td>
<td>10.0%</td>
<td>8.0%</td>
<td>15.0%</td>
</tr>
</tbody>
</table>

Notes:

1. Instruments traded on exchanges do not require capital for counterparty credit risk where they are subject to daily margining requirements.

2. For contracts with multiple exchanges of principal, the factors are to be multiplied by the number of remaining payments in the contract.

3. For contracts that are structured to settle outstanding exposures following specified payment dates, and where the terms are reset so that the market value of the contract is zero on these specified dates, the residual maturity is considered to be the time until the next reset date. In the case of interest rate contracts with remaining maturities of more than one year and that also meet the above criteria, the add-on factor is subject to a floor of 0.5%.

4. Contracts not covered by columns (02) to (05) in the above table are to be treated as “other instruments” for the purpose of determining the add-on factor.

5. No potential credit exposure would be calculated for single currency floating/floating interest rate swaps; the credit exposure on these contracts would be evaluated solely on the basis of their mark-to-market value.

6. The add-ons are based on effective rather than stated notional amounts. In the event that the stated notional amount is leveraged or enhanced by the structure of the transaction, companies must use the actual or effective notional amount when determining potential future exposure. For example, a stated notional amount of $1 million with payments calculated at two times LIBOR would have an effective notional amount of $2 million.

7. Potential credit exposure is to be calculated for all over-the-counter (OTC) contracts (with the exception of single currency floating/floating interest rate swaps), regardless of whether the replacement cost is positive or negative.
No add-on for potential future exposure is required for credit derivatives. The credit equivalent amount for a credit derivative is equal to the greater of its replacement cost or zero.

6.2.1.3. Other exposures

Commitments

A commitment involves an obligation (with or without a material adverse change or similar clause) of the P&C insurer to fund its customer in the normal course of business should the customer seek to draw down the commitment. This includes:

i.) extending credit in the form of loans or participations in loans, lease financing receivables, mortgages or loan substitutes; or

ii.) purchasing loans, securities, or other assets.

Normally, commitments involve a written contract or agreement and a commitment fee or some other form of consideration.

The maturity of a commitment should be measured from the date when the commitment was accepted by the customer, regardless of whether the commitment is revocable or irrevocable, conditional or unconditional, until the earliest date on which:

i.) the commitment is scheduled to expire, or

ii.) the P&C insurer can, at its option, unconditionally cancel the commitment.

Repurchase and reverse repurchase agreements

A securities repurchase (repo) is an agreement whereby a transferor agrees to sell securities at a specified price and repurchase the securities on a specified date and at a specified price. Since the transaction is regarded as a financing transaction for accounting purposes, the securities remain on the balance sheet. Given that these securities are temporarily assigned to another party, the factor accorded to the asset should be the higher of the factor of the security and the factor of the counterparty to the transaction (net of any eligible collateral).

A reverse repo agreement is the opposite of a repo agreement, and involves the purchase and subsequent sale of a security. Reverse repos are treated as collateralized loans, reflecting the economic reality of the transaction. The risk is therefore to be measured as an exposure to the counterparty. Where the asset temporarily acquired is a security that attracts a preferential factor, this would be recognized as collateral and the factor would be reduced accordingly.

Guarantees provided in securities lending

In securities lending, P&C insurers can act as principal to the transaction by lending their own securities or as agent by lending securities on behalf of clients. When the P&C insurer lends its own securities, the risk factor is the higher of:

- the risk factor related to the instruments lent, or
• the risk factor for an exposure to the borrower of the securities. The exposure to the borrower may be reduced if the P&C insurer holds eligible collateral (reference section 6.3). Where the P&C insurer lends securities through an agent and receives an explicit guarantee of the return of the securities, the P&C insurer may treat the agent as the borrower subject to the conditions in section 6.3.2.

When the P&C insurer, acting as an agent, lends securities on behalf of a client and guarantees that the securities lent will be returned, or the P&C insurer will reimburse the client for the current market value, the P&C insurer should calculate the capital requirement as if it were the principal to the transaction. The capital requirements are those for an exposure to the borrower of the securities, where the exposure amount may be reduced if the P&C insurer holds eligible collateral (reference section 6.3).

6.2.2. Credit conversion factors

Separate credit conversion factors exist for structured settlements, letters of credit, non-owned deposits, derivatives and other exposures.

For other exposures, the weighted average of the credit conversion factors, described below, for all of these instruments held by the P&C insurer, should be used.

<table>
<thead>
<tr>
<th>Factor</th>
<th>Instrument</th>
</tr>
</thead>
<tbody>
<tr>
<td>100%</td>
<td>• Direct credit substitutes (general guarantees of indebtedness and guarantee-type instruments, including standby letters of credit and non-owned deposits serving as financial guarantees for, or supporting, loans and securities).</td>
</tr>
<tr>
<td></td>
<td>• Derivatives such as forwards, futures, swaps, purchased options (including options purchased over the counter) and other similar derivative contracts, including:</td>
</tr>
<tr>
<td></td>
<td>i.) Interest rate contracts (single currency interest rate swaps, basis swaps, forward rate agreements and products with similar characteristics, interest rate futures, interest rate options purchased, and similar derivative contracts based on specific parameters as well as on indices, etc.).</td>
</tr>
<tr>
<td></td>
<td>ii.) Equity contracts (forwards, swaps, purchased options, and similar derivative contracts based on specific parameters as well as on indices, etc.).</td>
</tr>
<tr>
<td></td>
<td>iii.) Exchange rate contracts (gold contracts, cross-currency swaps, cross-currency interest rate swaps, outright forward foreign exchange contracts, currency futures, currency options purchased, and similar derivative contracts based on specific parameters as well as on indices, etc.).</td>
</tr>
<tr>
<td></td>
<td>iv.) Precious metals (except gold) and other commodity contracts (forwards, swaps, purchased options, and similar derivative contracts based on specific parameters as well as on indices, etc.).</td>
</tr>
<tr>
<td></td>
<td>v.) Other derivative contracts based on specific parameters as well as on indices (such as catastrophe insurance options and futures).</td>
</tr>
<tr>
<td></td>
<td>• Forward agreements (contractual obligations) to purchase assets.</td>
</tr>
</tbody>
</table>
6.2.3. Risk factors

Risk factors for off-balance sheet exposures are assigned a risk factor consistent with section 6.1. All criteria in section 6.1 around the use of ratings are applicable to off-balance sheet exposures.

Risk factors for structured settlements, which are considered long-term exposures, are based on the credit rating of the counterparty from which the annuity is purchased. The risk factors are as follows:

<table>
<thead>
<tr>
<th>Structured Settlements</th>
<th>Rating</th>
<th>Risk factor</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Rated A- and higher</td>
<td>2%</td>
</tr>
<tr>
<td></td>
<td>Rated BBB+ to B-</td>
<td>8%</td>
</tr>
<tr>
<td></td>
<td>Unrated</td>
<td>10%</td>
</tr>
<tr>
<td></td>
<td>Below B-</td>
<td>18%</td>
</tr>
</tbody>
</table>

If the structured settlement is not rated by one of the four rating agencies listed in section 6.1.1, a P&C insurer may use a credit rating from another reputable rating agency. The use of an alternative rating agency must comply with all the criteria around the use of ratings specified in section 6.1.1, including a consistent use of the same rating agency in order to assign a risk factor based on the credit rating of the annuity underwriter.
6.3. Capital Treatment of Collateral and Guarantees

6.3.1. Collateral

A collateralized transaction is one in which:

- a company has a credit exposure or potential credit exposure; and
- the credit exposure or the potential credit exposure is hedged in whole or in part by collateral posted by a counterparty or by a third party on behalf of the counterparty.

Recognition of collateral in reducing the capital requirement is limited to cash or securities rated A- or higher. Any collateral must be held throughout the period for which the exposure exists. Only that portion of an exposure that is covered by eligible collateral will be assigned the risk factor given to the collateral, while the uncovered portion retains the risk factor of the underlying counterparty. Only collateral securities with a lower risk factor than the underlying exposure will lead to reduced capital requirements. All criteria in section 6.1 around the use of ratings are applicable to collateral. Where a rating is not available for the collateral asset, exposure, or counterparty where applicable, no reduction in capital required is permitted.

The effects of collateral may not be double counted. Therefore, insurers may not recognize collateral on claims for which an issue-specific rating is used that already reflects that collateral.

Collateral securities used to reduce capital requirements must materially reduce the risk arising from the credit quality of the underlying exposure. In particular, collateral used may not be related party obligations of the issuer of the underlying exposure (i.e. obligations of the underlying counterparty itself, its parent, or one of its subsidiaries or associates).

6.3.2. Guarantees

Investments (principal and interest) or exposures that have been explicitly, directly, irrevocably and unconditionally guaranteed by a guarantor whose long-term issuer credit rating is A- and higher, may attract the risk factor allocated to a direct claim on the guarantor where the desired effect is to reduce the risk exposure. Thus only guarantees issued by entities with a lower risk factor than the underlying counterparty will lead to reduced capital requirements. To be eligible, guarantees must be legally enforceable.

Where the recovery of losses on a loan, financial lease agreement, security or exposure is partially guaranteed, only the part that is guaranteed is to be weighted according to the risk factor of the guarantor (see examples below). The uncovered portion retains the risk factor of the underlying counterparty.

---

44 Letters of credit for which a company is the beneficiary are included within the definition of guarantees, and receive the same capital treatment.
All criteria in section 6.1 around the use of ratings remain applicable to guarantees. Where a rating is not available for the investment, exposure, or guarantor where applicable, no reduction in capital required is permitted.

A P&C insurer may not recognize a guarantee provided by a related party (parent, subsidiary or associate) of the insurer. This treatment follows the principle that guarantees within a corporate group are not a substitute for capital.

The effects of credit protection may not be double counted. Therefore, no capital recognition is given to credit protection on claims for which an issue-specific rating is used that already reflects that protection.

To be eligible, a guarantee must cover the full term of the exposure, i.e. no recognition will be given to a guarantee if there is a maturity mismatch\textsuperscript{45}.

### 6.3.2.1. Additional requirements for guarantees

The following conditions must be satisfied in order for a guarantee to be recognized:

1. On the qualifying default/non-payment of the counterparty, the insurer may in a timely manner pursue the guarantor for any monies outstanding under the documentation governing the transaction. The guarantor may make one lump sum payment of all monies under such documentation to the insurer, or the guarantor may assume the future payment obligations of the counterparty covered by the guarantee. The insurer must have the right to receive any such payments from the guarantor without first having to take legal action in order to pursue the counterparty for payment.

2. The guarantee is an explicitly documented obligation assumed by the guarantor.

3. Except as noted in the following sentence, the guarantee covers all types of payments the underlying obligor is expected to make under the documentation governing the transaction, for example notional amount, margin payments etc. Where a guarantee covers payment of principal only, interest and other uncovered payments should be treated as an unsecured amount in accordance with section 6.1.2.

\textsuperscript{45} A maturity mismatch occurs when the residual maturity of the credit protection is less than that of the underlying exposure.
Example 6-1: Credit risk exposure.

To record a $100,000 bond rated AAA due in 10 years that has a government guarantee of 90%, the P&C insurer would report a balance sheet value of $90,000 ($100,000 x 90%) in the 0% risk weighted category and a balance value of $10,000 ($100,000 - $90,000) in the AAA category under bonds expiring or redeemable in more than five years. The capital required in the 0% risk weighted category is $0 ($90,000 x 0.0%). The capital required in the AAA category is $125 ($10,000 x 1.25%) for a total capital requirement of $125. An example of the calculation, assuming no other assets, is provided in the chart below.

<table>
<thead>
<tr>
<th>Investments:</th>
<th>Factor (%)</th>

Example 6-2: Type 1 structured settlement.

To record a $300,000 Type 1 structured settlement rated BBB+ to B-, backed by collateral or a guarantee of $200,000 from a counterparty rated A- or higher, the P&C insurer would report a credit equivalent amount of $300,000 and collateral and guarantees of negative $200,000 in the BBB+ to B- category, and collateral and guarantees of $200,000 in the A- and higher category.

The capital required in the BBB+ to B- category is $4,000 (($300,000 - $200,000) x 50% x 8%). The capital required in the A- and higher category is $500 ($200,000 x 50% x 0.5%) for a total capital requirement of $4,500. An example of the calculation, assuming no other exposures, is provided in the table below.

Chapter 7. Operational Risk

Operational risk is the risk of loss resulting from inadequate or failed internal processes, people and systems or from external events. The definition includes legal risk but excludes strategic and reputation risk.

Exposure to operational risk results from either day-to-day operations or a specific, unanticipated event.

7.1. Operational Risk Formula

The two risk drivers used to determine the operational risk margin are capital required and premiums, subject to a cap.

\[
\text{Operational risk margin} = \text{MIN} \{ 30\% \ CR_0, (8.50\% \ CR_0 + 2.50\% \ P_w + 1.75\% \ P_a + 2.50\% \ P_c + 2.50\% \ P_{\Delta}) + \text{MAX}(0.75\% \ P_{aig}, 0.75\% \ P_{cig}) \}
\]

where:

- \( CR_0 \) is total capital required for the reporting period, before the operational risk margin and diversification credit
- \( P_w \) is direct premiums written in the past 12 months
- \( P_a \) is assumed premiums written in the past 12 months arising from third party reinsurance
- \( P_{aig} \) is assumed premiums written in the past 12 months arising from intra-group pooling arrangements
- \( P_c \) is ceded premiums written in the past 12 months arising from third party reinsurance
- \( P_{cig} \) is ceded premiums written in the past 12 months arising from intra-group pooling arrangements
- \( P_{\Delta} \) is growth in gross premiums written in the past 12 months above a 20% threshold

7.2. Components of Operational Risk Margin

7.2.1. Capital required

A portion of the operational risk margin is based on total capital required, reflecting the overall riskiness of a P&C insurer. An 8.50% risk factor applies to total capital required, before the operational risk margin and diversification credit.

---

46 Legal risk includes, but is not limited to, exposure to fines, penalties, or punitive damages resulting from supervisory actions, as well as private settlements.
7.2.2. **Premium volume**

The following risk factors apply to insurance premiums:

- 2.50% for direct written premiums
- 1.75% for assumed premiums written arising from third party reinsurance
- 0.75% for assumed premiums written arising from intra-group pooling arrangements
- 2.50% for ceded premiums written arising from third party reinsurance
- 0.75% for ceded premiums written arising from intra-group pooling arrangements

The 2.50% risk factor for direct written premiums and the 1.75% risk factor for assumed premiums from third party reinsurance capture an insurer’s operational risk exposure on new business and renewals.

The 2.50% risk factor for ceded premiums from third party reinsurance captures the operational risk remaining with the ceding insurer. While the insurer cedes a portion of its insurance risk exposure through reinsurance, the operational risk remains with the ceding insurer. Because the capital requirements for insurance liabilities (reference section 4.2) are calculated on the net amount of risk (net of reinsurance), the portion of operational risk requirement calculated as 8.50% of capital required does not account for the operational risk on the entire business of the insurer.

**Intra-group pooling arrangements**

The 0.75% risk factor for assumed and ceded premiums arising from intra-group pooling arrangements captures the additional operational risks associated with pooling premiums within a group compared to a company that does not enter into transactions moving the premiums from a company to another within a group.

Only premiums assumed and ceded from intra-group pooling arrangements between associated Canadian federally or provincially regulated companies are included in $P_{aig}$ and $P_{cig}$, and a prior supervisory approval from OSFI is required. If prior approval is not granted, the premiums assumed and ceded in the intra-group pooling arrangement will be considered as premiums arising from a third party reinsurance arrangement and, therefore, will be included in $P_a$ and $P_c$ for capital requirement calculation purposes.

In cases where P&C subsidiaries are consolidated in the financial statements of the P&C parent company, $P_w$, $P_o$, and $P_c$, at the parent level, must be determined on a consolidated basis, while $P_{aig}$ and $P_{cig}$ must be equal to the non-consolidated intra-group pooled premiums assumed and ceded by the parent company, respectively.

- For example, assume that two subsidiaries, company Y and company Z cede 100% of their direct written business to Company X (the parent). Company X then cedes 20% of the total of the direct business of each company (including the parent’s business) to each subsidiary. Assuming that each of the three companies write $100 of direct premiums, the following amounts would apply to calculate the operational risk margin for company X:
Chapter 7. Operational Risk

$P_w$: $3 \times $100 (direct premiums written by each company) = $300

$P_a$ and $P_c$: $0$ (assuming all three companies are not part of third party reinsurance arrangements)

$P_{aig}$: $2 \times $100 (premiums assumed by company X as part of the intra-group arrangement) = $200

$P_{cig}$: $2 \times $60 (premiums ceded by company X as part of the intra-group arrangement) = $120

The capital requirement for operational risk associated with the premiums would be calculated as follows:

$\left(2.50\% \times P_w + 1.75\% \times P_a + 2.50\% \times P_c + 2.50\% \times P_{aig}\right) + \text{MAX}\left(0.75\% \times P_{aig}, 0.75\% \times P_{cig}\right) = $(7.50 + 0 + 0 + 0) + $1.50 = $9.00

7.2.3. Year-over-year premium growth beyond a threshold

Rapid growth, which is linked to the acquisition of another entity, the acquisition of a block of business through assumption reinsurance, new lines of business or changes to existing products or underwriting criteria, can create additional pressures on people and systems. Companies with premium growth beyond a 20% threshold are subject to additional capital requirements for operational risk.

The premium growth requirement is calculated using gross premiums, i.e. direct premiums written plus assumed premiums written. For the purposes of this section, assumed premiums written arising from intra-group pooling arrangements (i.e. $P_{aig}$) are excluded from gross premiums. A 2.50% risk factor applies to the total amount of gross premiums written in the past 12 months above the 20% growth threshold compared to the gross premiums written for the same period in the previous year.

- For example, assume that as a result of rapid growth, gross premiums increase by 50% from $100 to $150. The amount above the 20% increase ($30) is subject to an additional risk factor of 2.50%.

In the case of an acquisition, the total gross written premiums for a prior reporting period (before the acquisition) is the sum of the gross premiums written by the two separate entities, i.e. the sum of the acquiring and the acquired companies’ gross written premiums.

- For example, assume that in Year T a company A with gross written premiums of $100 for the 12 months period ending December 31, Year T-1 acquired a company B with gross written premiums of $50 for the same period. The merged company reported a total of $225 in gross written premiums for the 12 months period ending December 31, Year T. The capital requirement for operational risk associated with rapid growth in premiums would be calculated as follows:

$2.50\% \times [225 - ((100 + 50) \times 1.20)]$ or $2.50\% \times $45 = $1.13
7.2.4. Cap on operational risk margin

A 30% cap serves to dampen the operational risk margin for companies that have high-volume/low-complexity business. The 30% cap is calculated in relation to total capital required, before the operational risk margin and diversification credit.
Chapter 8. Diversification Credit

Because losses arising across some risk categories are not perfectly correlated with each other, a company is not likely to incur the maximum possible loss at a given level of confidence from each type of risk simultaneously. Consequently, an explicit credit for diversification is permitted between the sum of credit and market risk requirements, and the insurance risk requirement so that the total capital required for these risks is lower than the sum of the individual requirements for these risks.

8.1. Risk Aggregation and Diversification Credit

The diversification credit is calculated using the following formula:

\[ Diversification\ credit = A + I - \sqrt{A^2 + I^2 + 2 \times R \times A \times I}, \]

where:

- **A** is the asset risk margin, which is the sum of capital required for:
  - credit risk, including requirements for balance sheet assets and off-balance sheet exposures, and collateral for unregistered reinsurance and self-insured retentions;
  - market risk, including interest rate risk, foreign exchange risk, equity risk, real estate risk and other market risk exposures.

- **I** is the insurance risk margin, which is the sum of capital required for:
  - unpaid claims and premium liabilities;
  - margin required for unregistered reinsurance exposures; and
  - catastrophe risk.

- **R** is the correlation factor between **A** and **I**, equal to 50%.

-END-
Guideline

Subject: Regulatory Capital and Internal Capital Targets

Category: Capital Management

No: A-4 Date: December 2017
Effective Date: January 1, 2018

This guideline sets out OSFI’s expectations with regard to the capital and solvency assessment of federally regulated insurers (insurer)¹, within the context of OSFI’s Supervisory Framework.²

Table of Contents

I. The Role of Capital in OSFI’s Risk Assessment Process ...........................................2
II. Regulatory Capital ......................................................................................................3
III. Internal Capital Targets ............................................................................................5
IV. Capital Management Policy .....................................................................................6

¹ Insurer refers to federally regulated insurers including Canadian branches of foreign life and property and casualty companies, fraternal benefit societies, regulated insurance holding companies and non-operating insurance companies.

² Consult OSFI’s website (www.osfi-bsif.gc.ca) for more information regarding OSFI’s Supervisory Framework, including related Assessment Criteria documents.
I. The Role of Capital in OSFI’s Risk Assessment Process

OSFI’s risk assessment process begins with an evaluation of the inherent risk within each significant activity of an insurer and the quality of risk management applied to mitigate these risks. After considering this information, OSFI determines the level of net risk and direction (i.e., whether it is decreasing, stable, or increasing) of the rating for each significant activity.

The net risks of the significant activities are combined, by considering their relative importance, to arrive at the Overall Net Risk (ONR) of the insurer. The ONR is a consolidated rating or assessment of the potential adverse impact that the significant activities collectively could have on the insurer’s earnings performance and adequacy of capital. OSFI then develops a Composite Risk Rating (and its direction) for the insurer, after considering the assessments of its earnings and capital in relation to the ONR, and the assessment of liquidity.

While regulatory capital is an important factor in OSFI’s capital assessment, other factors are also considered. OSFI’s Capital Assessment Criteria include, for example:

- adequacy of capital to support the insurer’s risk profile and business plan, including risks that are not fully captured in the regulatory capital guidelines;
- ability to access capital at reasonable rates to meet projected needs;
- quality of capital;
- quality or strength of the insurer’s capital management policy, including its capital management processes; and
- effectiveness with respect to the insurer’s capital management processes.

Capital considerations should include elements of capital that contribute to financial strength through periods when an insurer is under stress (e.g., common shares) as well as elements that contribute to policyholder and creditor protection during wind-up (e.g., subordinated debt). Some elements may contribute to both, while others are less likely to do so.

OSFI expects the level and quality of an insurer’s capital and its capital management to be commensurate with its circumstances, including its risk profile, appetite for risk and operating environment. Past and emerging trends, including the outlook for capital, earnings and liquidity, as well as the insurer’s preparedness to deal with potential capital deficiencies, are relevant in assessing the adequacy of an insurer’s capital position. In this regard, the number, severity and overall quality of the stress scenarios used by an insurer to assess its capital adequacy in relation to all relevant regulatory and internal capital expectations are important considerations for OSFI when it assesses the strength of an insurer’s capital.

Insurers should have risk and capital management processes that take into account their risk profile and business strategy, potential stress situations and future changes to enable them to effectively monitor and manage their ability to meet, on a continuous basis, regulatory as well as internal capital expectations.
II. Regulatory Capital

The *Insurance Companies Act* requires federally regulated insurance companies and fraternal benefit societies to maintain adequate capital and companies operating in Canada on a branch basis to maintain an adequate margin of assets in Canada over liabilities in Canada. Guidelines A: *Mortgage Insurer Capital Adequacy Test (MICAT), Minimum Capital Test (MCT) and Life Insurance Capital Adequacy Test (LICAT)* (together referred to as Capital Guidelines) provide the framework within which the Superintendent assesses whether a mortgage insurer, a P&C insurer that is not a mortgage insurer, or a life insurer, respectively, maintains adequate capital or margin.³

The Capital Guidelines establish standards for measuring specific insurer risks and for aggregating these results to calculate the amount of an insurer’s regulatory capital needed to support these risks (capital requirement). For P&C insurers, the MICAT and the MCT guidelines define the capital requirement amount as the minimum capital required, while for life insurers the capital requirement amount is referred to as the Base Solvency Buffer in the LICAT. In relation to these capital requirements, OSFI has determined industry minimum and target capital levels.⁴ These serve as a gauge of a financial institution’s regulatory capital adequacy and can trigger intervention actions.⁵

The Capital Guidelines also define and establish criteria and limits for determining the amount of an insurer’s qualifying regulatory capital (Capital Resources). For P&C insurers, this is referred to as capital available in the MICAT and MCT guidelines, while for life insurers, it is Available Capital plus Surplus Allowance (SA) and Eligible Deposits (ED) in the LICAT.

<table>
<thead>
<tr>
<th>Components of Regulatory Capital⁶</th>

</tr>
<tr>
<td><strong>Capital requirement</strong></td>
<td>Minimum capital required</td>
<td>Minimum capital required</td>
<td>Base Solvency Buffer</td>
<td>Base Solvency Buffer</td>
</tr>
</tbody>
</table>

³ In this guideline, the use of concepts applicable to companies and societies also includes the equivalent concepts applicable to foreign companies’ and societies’ branch operations in Canada. For example, the concept “capital” includes the equivalent concepts of “margin” and “Net Assets Available” as it applies to branches; “Available Capital” includes “Available Margin” and “Tier 1” includes “Available Margin excluding Other Admitted Assets”.

⁴ For life insurers, regulatory minimum and target capital levels are calculated on the basis of both total and core, while P&C insurers base theirs solely on total.

⁵ The *Guide to Intervention for Federally Regulated Life Insurance Companies* and *Supervisory Guide Applicable to Federally Regulated Insurance Companies* can be found on OSFI’s website.

⁶ The terms capital available, Available Capital, Surplus Allowance, Eligible Deposits, minimum capital required and Base Solvency Buffer are defined in the Capital Guidelines.

⁷ For life insurers, the LICAT includes additional criteria for determining the amount that qualifies as Tier 1 Capital (Tier 1), which is comprised of only the highest quality capital elements.
Minimum Capital

The Capital Guidelines address specific insurer risks and determine minimum capital levels (Minimums) to support these risks.

**Minimums:** The minimum levels of capital necessary for an insurer to cover the risks specified in the Capital Guidelines.

If an insurer’s Capital Resources approached, or were to fall below, the Minimums, OSFI would be very concerned about the ongoing viability of the insurer and/or the level of risk to policyholders and creditors.

Supervisory Target Capital

OSFI’s mandate includes an early intervention approach. This is partly addressed by establishing supervisory target capital levels (Supervisory Targets) above the Minimums that provide an early signal so that intervention will be timely and for there to be a reasonable expectation that actions can successfully address difficulties.8

**Supervisory Targets:** The target levels of capital necessary for an insurer to cover the risks specified in the Capital Guidelines as well as to provide a margin for other risks.

From a supervisory perspective, an insurer’s failure to maintain Capital Resources above the Supervisory Targets is indicative of material safety and soundness concerns and a vulnerability to adverse business and economic conditions that require immediate attention. An insurer whose Capital Resources approach or fall below the Supervisory Targets will attract increased supervisory attention, which would generally include an early warning intervention status (i.e. stage 1). The intensity and nature of supervisory intervention would depend on the circumstances of the particular insurer.

Regulatory Capital Levels

OSFI has set the following capital levels expressed as a percentage of the amount of an insurer’s capital requirements:

<table>
<thead>
<tr>
<th>Regulatory Capital Levels</th>
<th>MICAT</th>
<th>MCT / BAAT</th>
<th>LICAT / LIMAT</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Total</strong></td>
<td>100%</td>
<td>100%</td>
<td>90%</td>
</tr>
<tr>
<td><strong>Minimums</strong></td>
<td>100%</td>
<td>100%</td>
<td>90%</td>
</tr>
<tr>
<td><strong>Supervisory Targets</strong></td>
<td>150%</td>
<td>150%</td>
<td>100%</td>
</tr>
</tbody>
</table>

---

8 Supervisory Targets are not applicable to regulated insurance holding companies and non-operating insurance companies.

9 Regulated life insurance holding companies and non-operating life insurance companies are required to maintain a minimum Core level of 50%.
For monitoring purposes and in OSFI supervisory and other documentation, the amount of Capital Resources is generally expressed as a percentage of the amount of an insurer’s capital requirements and compared to the above capital levels.

III. Internal Capital Targets

All risks specific to an individual insurer cannot be explicitly addressed by industry-wide Capital Guidelines alone. The Minimums and Supervisory Targets are based upon simplifying assumptions applicable on an industry-wide basis, and are not tailored to individual insurers’ risk profiles. Accordingly, an insurer should not unduly rely on these regulatory capital measures but should conduct its Own Risk and Solvency Assessment (ORSA) and, based on this process, determine its own capital needs and establish Internal Capital Targets (Internal Targets).10

**Internal Targets:** The target levels of capital, determined as part of an insurer’s ORSA, needed to cover all the risks of the insurer, including the risks specified in the Capital Guidelines.

Insurers are expected to determine an Internal Target of total capital. Life insurers are expected to determine, in addition to the Internal Target of total capital, an Internal Target of core capital. OSFI should be notified when an insurer changes its Internal Targets.

Internal Targets should be set above Supervisory Targets. To determine whether Internal Targets are above Supervisory Targets, insurers should compare their total and core Internal Targets to the total and core Supervisory Targets respectively.11

Parent/head office guarantees, potential future injections of capital or other potential management actions that change the insurer’s business or risk profile are not assumed in the determination of the Supervisory Targets12 and should therefore not be assumed in the setting of Internal Targets.13 These factors should only be considered when determining the level at which the insurer will operate.

Insurers are expected to operate at Capital Resources levels above the Internal Targets.14 OSFI understands that an insurer’s Capital Resources levels may fall below its Internal Targets on unusual and infrequent occasions. If this happens, or is anticipated to happen within two years15,

---

10 Guideline E-19: Own Risk and Solvency Assessment outlines OSFI expectations and principles with respect to setting Internal Targets, based on an insurer’s ORSA.
11 To determine whether Internal Targets are above Supervisory Targets, Internal Targets should be expressed as a percentage of the amount of an insurer’s capital requirements and compared to the Regulatory Capital Levels.
12 Parent/head office guarantees, potential future injections and other potential management actions that change the insurer’s business or risk profile are also not considered in the calculation of the Minimums.
13 Consistent with Canadian P&C insurers that are not mortgage insurers, Canadian branches of foreign P&C insurers use a specified amount of the company’s worldwide capital and surplus in the calculation of their capital requirements for earthquake risk, a component of the Supervisory Target. Both Canadian P&C insurers that are not mortgage insurers and Canadian branches of foreign P&C insurers may therefore include such amounts, to the extent permitted in the MCT, in the determination of their Internal Target.
14 For monitoring purposes, an insurer’s capital ratios, calculated per the Capital Guidelines, are used to determine whether an insurer is operating above its Internal Targets.
15 As may be contained in financial forecasts or other reports (e.g., projections of very likely scenarios) prepared for Senior Management, the Board, investors or the public.
the insurer should inform OSFI promptly and provide plans on how it expects to manage the risks and/or restore its Capital Resources levels to its Internal Targets within a relatively short period of time.

IV. Capital Management Policy

Capital management is the on-going process of determining and maintaining the quantity and quality of capital appropriate to support an insurer’s planned operations. Capital should be managed to maintain financial strength, absorb losses so as to withstand adverse economic conditions, allow for growth opportunities and meet other risk management and business objectives. It should also be managed in order to provide, in extreme cases such as imminent failure or insolvency, sufficient assets to transfer or run-off policyholder obligations and pay creditor claims.

The insurer’s ORSA and its strategic and business plans should support the insurer in establishing and maintaining capital management policies and procedures that include, among other things16:

- Clearly defined roles and responsibilities with respect to the design and execution of relevant policies and procedures;
- A policy that states capital adequacy goals relative to risk, taking into account the insurer’s strategic focus and business plan, and that sets its Internal Targets;

Please refer to OSFI’s Corporate Governance Guideline for OSFI’s expectations of insurer Boards of Directors in regards to the management of capital and liquidity.

---

16 For additional guidance on how an insurer’s ORSA links risk management, capital management and other management processes, please refer to OSFI’s Guideline E-19: Own Risk and Solvency Assessment.

1. OVERVIEW

This Memorandum describes the requirements of the Office of the Superintendent of Financial Institutions (OSFI or Superintendent) with respect to the Appointed Actuary’s Report (AAR) specified in subsection 667(2) of the Insurance Companies Act (ICA). It sets out the minimum standards used in determining the acceptability of the AAR and provides guidance for the Appointed Actuary preparing reports in matters relating to presentation, level of detail and nature of the discussions to be included.

Many insurers are required to file an AAR, as part of the Annual Return forms, with more than one regulator, federal or provincial, in Canada. The insurer is responsible for ensuring that the AAR submitted as part of the Annual Return complies with the requirements of each regulator.

The term AAR refers to the detailed actuarial report submitted to a regulator. This includes the opinion of the Appointed Actuary concerning the fairness and adequacy of the policy liabilities included in the insurer's financial statements, a detailed commentary, data exhibits and calculations supporting that opinion.

The AAR comprehensively documents the work done by the Appointed Actuary to calculate policy liabilities. OSFI views the AAR as a key component of its review of the company’s financial position and profile.

The AAR is not solely a report from the company’s Appointed Actuary to OSFI’s actuaries. It is also intended for company management and is read by regulators who may not be actuaries but who are knowledgeable about insurance. Therefore, the AAR should be presented in a manner generally understandable to both company management and the regulator.

2. REGULATORY REQUIREMENTS

2.1 Application of Professional Standards to the Appointed Actuary’s Valuation

Subsections 365(2) and 629(2) of the ICA require that “The actuary’s valuation shall be in accordance with generally accepted actuarial practice with such changes as may be determined by the Superintendent and any additional directions that may be made by the Superintendent.”

OSFI’s Guideline E-15 Appointed Actuary: Legal Requirements, Qualifications and Peer Review describes the role of the Appointed Actuary and sets out some of OSFI’s expectations with respect to that role. The guideline also outlines the actuary’s qualification required to carry out the Appointed Actuary’s role.

The Canadian Institute of Actuaries (CIA) annually issues a letter (the Fall Letter) from the Committee on Property and Casualty Insurance Financial Reporting (PCFRC) and, from time to time, may issue other educational notes. While the Fall Letter and educational notes are not standards, the Appointed Actuary should disclose when either the educational notes and/or the PCFRC Fall Letter are/is not followed as well as the supporting justification.

For purposes of the Appointed Actuary’s valuation of policy liabilities (and the associated opinion), OSFI currently accepts that work performed in accordance with “accepted actuarial
practice” in Canada (as defined by the CIA) is sufficient to satisfy the ‘generally accepted actuarial practice’ requirement referred to in the ICA sections identified above. “Accepted actuarial practice” is defined by the professional actuarial standards of practice promulgated by the Actuarial Standards Board (ASB), together with the additional requirements and directions of this Memorandum. Any deviations from CIA Standards of Practice or from the additional requirements of this Memorandum must be reported in the AAR and justified.

This Memorandum for 2020 year-end financial reporting does not contain any requirements that override or limit accepted actuarial practice.

In complying with accepted actuarial practice, the Appointed Actuary must meet a standard of care with respect to the data used in valuations. This standard of care, implicitly stated in the CIA Standards of Practice, requires the Appointed Actuary to establish suitable check procedures for the verification of data. While the CIA Standards of Practice (SOP Subsection 1520) offer the Appointed Actuary the option to consider the Auditor’s work, the existence of the Joint Policy Statement does not override the ICA’s requirement for filing reports with the Annual Return that meet the standard of care implicitly stated in the CIA Standards of Practice. The AAR must discuss the extent to which the Appointed Actuary considers the work of the Auditor. Where the Appointed Actuary uses the work of the Auditor, the details of the Auditor’s work should not be addressed in the AAR. If there are instances where the Appointed Actuary does not use the work of the Auditor because of any special circumstances, this must be disclosed in the data section of the AAR. The Appointed Actuary should describe the data verification that was performed.

The CIA Standards of Practice (SOP Subsection 1510) describe the Appointed Actuary’s use of another person’s work. Such use of the work of others should be disclosed in the section of the AAR where it most logically applies (e.g., at the company level, a specific product level, etc.).

2.2 Filing Directions for the AAR, FCT Report and Peer Review Report

The filing deadlines for the above reports are:

- AAR - no later than 60 days after the end of the fiscal year,
- FCT Report - the earlier of 30 days after the presentation to the Board of Directors, Audit Committee or Chief Agent and one year after the fiscal year end,
- Peer Review Report (full 3-year review or the limited annual review) - Copies of pre-release reports, both the full peer review report, and any summary, for financial statement work should be forwarded to OSFI based on the same deadlines that apply to filings of the P&C regulatory financial returns. For post-release reviews, the reviewer’s report should be submitted to OSFI no later than thirty days after release of the AA’s report on the work reviewed, and for future financial condition reports, no later than December 31.

OSFI’s Guideline E-15 Appointed Actuary: Legal Requirements, Qualifications and Peer Review provides more details on filing deadlines.

For the AAR, the FCT Report and the Peer Review Report, the company must submit one electronic copy uploaded via the Regulatory Reporting System (RRS). A scanned copy of the signed opinion must be included in the electronic submission. Failure to meet the
deadlines of the filings will result in a penalty fee under OSFI’s Late and Erroneous Filing Penalty Framework.

For security reasons, companies should not file reports through e-mail. The file should be in PDF format and preferably created with a PDF software rather than through scanning, as the former is searchable while the latter is not. The information should be easily copied by OSFI staff from the AAR, the FCT or the Peer Review Report. Therefore, the reports should not be security protected and exhibits should be in a format that can easily be transferred to a spreadsheet. Otherwise, the company should be prepared to promptly provide searchable data in an alternative media upon request.

With the exception of some companies, OSFI does not require hard copies of the AAR. Companies required to provide hard copies will be contacted individually.

Companies should follow the file naming conventions outlined in the instructions for Unstructured Financial Returns. Both the full 3-year review and the limited annual review share the same naming conventions.

The filing instructions may be obtained on the OSFI website at www.osfi-bsif.gc.ca under Regulatory Data and Returns / Filing Financial Returns / Canadian & Foreign Property and Casualty Insurance Companies.

In order to file a Peer Review Report within RRS, companies are reminded that these filings must first be requested by contacting ReturnsAdmin@osfi-bsif.gc.ca or by calling 613-991-0609.

The ICA requires companies to file their AAR with their Annual Return. OSFI will not accept a certificate containing only the opinion of the Appointed Actuary in lieu of a full AAR.

Companies are reminded that the filing of AARs and opinions with the P&C Return requires that each copy of the P&C Return filed with OSFI should contain a properly signed copy of the AAR.

Note that Section 7.5 requires a separate cover letter for Disclosure of Compensation.

### 2.3 Differences (if any) Between the Appointed Actuary’s Valuations and Corresponding Annual Return Liabilities

Companies are expected to book the Appointed Actuary’s estimated policy liabilities in the Annual Return. In circumstances where the booked gross, ceded or net policy liabilities differ from the estimated policy liabilities by more than the Appointed Actuary’s selected standard of materiality, the AAR must describe the reasons for the differences.

For federally regulated companies, the provision for policy liabilities in the liabilities shown in the balance sheet of the Annual Return should be greater than or equal to the corresponding estimated policy liabilities on a discounted basis including PfAD calculated by the Appointed Actuary.

### 2.4 Persons Signing the Appointed Actuary’s Report

The AAR must be signed by the Appointed Actuary, who must be a Fellow of the CIA.
3. OSFI’S REVIEW PROCESS

OSFI recognizes the confidential nature of the AAR. Reviews of the filed Annual Returns may disclose that an Appointed Actuary’s valuation warrants further assessment and questioning. The Superintendent may reject assumptions and methods where it appears that the policy liabilities produced are inappropriate.

Since the review of an AAR may take place over an extended period after filing, OSFI may request the Appointed Actuary to provide supplemental detail to sufficiently assess the assumptions and methods. The Appointed Actuary is expected to respond promptly to all supplemental requests. Working papers required to support the computation of the policy liabilities reported in the Annual Return and the AAR should be available at all times and should be made available to OSFI upon request.

Where the appropriateness of particular assumptions or methods is not sufficiently demonstrated, the Superintendent will require the Appointed Actuary to choose other acceptable assumptions or methods, and to re-compute the policy liabilities. In such a situation, the Appointed Actuary must re-file the AAR. The Superintendent may also require the company to amend the Annual Return. Alternatively, the Superintendent may ask the company to reflect the changes in the Annual Return for the following year. The Superintendent may request a report from an Independent Actuary.

4. SPECIAL LINE OF BUSINESS CONSIDERATIONS

4.1 Marine Insurance

Marine insurance business, if transacted, must be included within the scope of the AAR. The AAR should clearly identify the Appointed Actuary’s provisions for marine insurance.

4.2 Title Insurance

Premiums for title insurance are earned at issue. Unearned premium reserves are therefore not usually required. The accident date for all claims is the issue date of the policy as most problems with the title that could cause a claim would be in existence at the issue date of the policy.

4.3 Accident and Sickness Insurance

This Memorandum does not deal specifically with accident & sickness insurance valuation.

Companies and their actuaries preparing reports on accident and sickness business should refer to OSFI’s Memorandum to the Appointed Actuary on the Report on the Valuation of Life Insurance Policy Liabilities. The opinion described later in this document, included in the AAR, should cover these related provisions.
5. FORMAT OF THE APPOINTED ACTUARY’S REPORT

5.1 Report Outline

While the format of the AAR differs from Appointed Actuary to Appointed Actuary, most AARs include sections similar to the following:

- Introduction
- Expression of Opinion
- Supplementary Information Supporting the Opinion
- Executive Summary
- Description of Company
- Data
- Claim Liabilities
- Premium Liabilities
- Other Liabilities
- Other Disclosure Requirements
- Unpaid Claims and Loss Ratio Analysis Exhibit
- Exhibits and Appendices

In Section 6 “Contents of the Appointed Actuary’s Report”, the above outline is used to discuss the required contents. The Appointed Actuary is encouraged to use the above outline.

5.2 Table of Contents

A table of contents showing where the above information is located must be included at the beginning of the AAR. The AAR must also include a table of contents for the Exhibits and Appendices.

To facilitate the review, the AAR should include clearly identified sections and numbered pages. Reference to such pages should be part of the table of contents.

6. CONTENTS OF THE APPOINTED ACTUARY’S REPORT

6.1 Introduction

This section should identify the scope of the AAR and should indicate clearly that the AAR is an actuarial valuation report or supports an actuarial opinion. This section should also identify:

- the company involved,
- the date of valuation,
- the identity of the author,
- the author's full address and telephone number, and
- the author's authority for preparing the AAR.
6.2 Expression of Opinion

The Appointed Actuary must use the prescribed opinion format (see Appendix I). The opinion wording is as recommended in the CIA Standards of Practice – Practice-Specific Standards for Insurers. OSFI will consider any opinion that varies from this wording to be a qualified opinion.

Note that:

- The liability figures carried by the company in the Annual Return must be stated in the opinion.
- The liability figures derived by the Appointed Actuary must be stated in the opinion.

This section must contain an original signature of the Appointed Actuary, the Appointed Actuary's name in type, the date and location of signing.

The actuarial opinions presented to the shareholders and policyholders of the company should be essentially the same as the opinions filed with OSFI. Should this not be the case, the Appointed Actuary must disclose in writing to OSFI the material differences between the opinions, as well as the rationale for such differences.

Any qualification or limitation concerning any aspect of the valuation should be noted in this section of the AAR. These qualifications or limitations should be similar to the ones included in the opinion for Canadian Annual Returns presented to the shareholders and policyholders. Caveats or any form of disclaimer should be excluded from the opinion but could be included in Section 6.3 “Supplementary Information Supporting the Opinion”.

For branches where the External Auditor Report is not available at the time the Appointed Actuary has to render his/her opinion, a qualified opinion, conditional upon receiving an unqualified opinion from the External Auditor (Auditor), must be issued. The expected completion date of the External Auditor’s work should be stated. When the auditor’s work is completed, the Appointed Actuary must either:

a. file an unqualified opinion with OSFI, or

b. file a revised opinion with a supporting AAR issued if the Auditor is unable to give an unqualified opinion or modifies the financial statements.

6.3 Supplementary Information Supporting the Opinion

Reader of the AAR should be able to understand how the Appointed Actuary’s figures, as shown in the opinion, are derived. This section should contain references to the report sections, exhibits and/or appendices where these results are derived or summarized. Where results from several places must be added together, a table should be included.

This section should also include any conditions or limitations pertaining to the policy liabilities.

Consolidated reporting will be required within the P&C Returns. For capital purposes, the consolidated entity includes the parent company and all subsidiaries that carry on business that the parent could carry on directly pursuant to the Insurance Companies Act.
The above rule does not apply to life company subsidiaries, which are to be reported using the equity method. OSFI anticipates that most Actuaries will continue to prepare non-consolidated AARs. However, the Appointed Actuary must include an additional exhibit and commentary that reconciles the information within the AAR to the consolidated opinion. Actuaries will be expected to value non-federally regulated subsidiaries under Canadian generally accepted actuarial practices and include these AARs as appendices or as a separate part of the AAR.

6.4 Executive Summary

The actuary must briefly explain and comment on in this section as well as in detail in all the other sections of the report where it is relevant the impact that the COVID-19 pandemic has had for the insurer and the adjustments that were made in this year’s policy liabilities valuation to take it into account. For this purpose, the actuary may refer, among others, to the document 2020 Guidance to P&C actuaries: Special considerations due to COVID-19 which is available on the website of the Canadian Institute of Actuaries.

This section should contain a summary of the key results and findings and any other information the Appointed Actuary wishes to bring to the attention of the reader. In particular, it should comment on the comparison of the actual experience with the expected experience in the prior year end valuation for all lines combined.

It should also reference any significant changes in methods or assumptions from the prior AAR, significant issues and how they were resolved, data or other concerns identified by the Appointed Actuary and any other unusual circumstances identified as part of the valuation. This section must also include any deviation from CIA Standards of Practice or from the requirements of this memorandum.

6.5 Description of Company

6.5.1 Ownership and Management

The Appointed Actuary should provide a brief history of the company covering ownership and senior management. Changes over the past several years should be identified and potential impacts on the valuation as a result of these changes should be discussed.

6.5.2 Business

This section should contain a brief description of the lines/classes of business written, distribution channels and geographic distribution. It should also describe recent changes in business written, underwriting policies, claims policies and procedures as well as the impact of these changes.

6.5.3 Reinsurance

6.5.3.a Reinsurance Arrangement

The Appointed Actuary should describe the company’s reinsurance arrangements (type of arrangements, significant terms and conditions, order of application of treaties, and whether the arrangements are specific to the Canadian operations only) and any changes in the arrangements (including changes in retention or limits) during
the experience period used in the AAR. This description should be included for all years where the ceded unpaid claims could be material. In many cases, it is useful to include the rationale for the changes (if any). In particular, the Appointed Actuary should identify whether the terms and conditions of the reinsurance/retrocession arrangements require payments to be made from the reinsurer/retrocessionaire directly to the ceding company in Canada, including in the event of the cedant’s insolvency.

6.5.3.b Reinsurance Ceded

The provision for reinsurance ceded must be reduced for expected reinsurer defaults, disputes, the time value of money due to delays in payment or other reasons that could reduce the amount recoverable. This reduction is in addition to the unexpected defaults within the reinsurance margin. The AAR should clearly indicate where none of the above reductions are made to the provision for reinsurance ceded.

When making this estimate, the Appointed Actuary will not necessarily assess the financial condition of each reinsurer. However, the existence of any of the following situations and the actions taken should be described:

- a dispute has arisen with a reinsurer;
- a reinsurance collectible is significantly overdue;
- the reinsurer has a history of not settling accounts promptly;
- the reinsurer is known to have been the subject of regulatory restrictions in its home jurisdiction; or
- the reinsurer has a poor credit rating.

It is expected that the Appointed Actuary will discuss reinsurance matters with management and the Auditor of the company to determine whether there are unusual problems and/or delays expected to be encountered in collecting the relevant amounts from the reinsurers.

Where reinsurance agreements were commuted or changed, the Appointed Actuary should clearly indicate how any changed arrangements were taken into account.

6.5.3.c Financial Reinsurance Agreements

The Appointed Actuary must disclose information of any material financial reinsurance agreements ceded where there is not significant insurance risk transfer between the ceding company and the reinsurer, or where there are other reinsurance agreements or side letters that could offset the financial effect of the first reinsurance agreement. If no such agreements exist, the Appointed Actuary must state that there are no material financial reinsurance agreements. The Appointed Actuary should also describe the process used to reach the above conclusion.

The Appointed Actuary should disclose any related party reinsurance that has or could have a material impact on the policy liabilities. The disclosure should include the parties involved, a description of the reinsurance and the impact on policy liabilities.

6.5.4 Materiality Standards
In preparing the company’s Annual Return, the company management and the Auditor routinely agree on a level of materiality. The standard of materiality applied for accounting purposes and for valuation of an insurer’s policy liabilities must be reported in the AAR. In addition, the Appointed Actuary must report how the materiality standard is selected for the valuation of policy liabilities.

6.6 Data

The AAR should note the extent of the Appointed Actuary's review and verification of the data and the extent of the Appointed Actuary's reliance on data prepared by others. The AAR should also describe the methods and procedures used to ensure that the valuation data are sufficient, reliable and accurate.

In particular the AAR should describe the type of data provided and the review and verification procedures applied thereto and the procedures and steps undertaken to ensure that the valuation data are sufficient, reliable and accurate.

The statutory requirement that the Appointed Actuary file an AAR with the Annual Return assumes that the Appointed Actuary has met the standard of care, as implicitly stated in the CIA Standards of Practice. In particular this requires that the Appointed Actuary establish suitable check procedures to verify that the data utilized is reliable and sufficient for the valuation of policy liabilities.

In the event that the External Auditor’s work is not complete when the Appointed Actuary provides his/her opinion, please refer to Section 6.2 Expression of Opinion.

With respect to any line of business (including, more specifically, accident & sickness business, pools and facility associations), the Appointed Actuary should describe 1) any reliance on or use of the work of another actuary; 2) the scope of such reliance; 3) a justification for such reliance and 4) the extent of the review of the other actuary’s work should also be described.

6.7 Claim Liabilities

6.7.1 Undiscounted Claim Liabilities

The commentary on the claim liabilities must contain details of the derivation of the gross, ceded and net provisions. Normally the Appointed Actuary will calculate two of these provisions directly and derive the third by addition or subtraction. The provisions calculated directly will depend on the circumstances of the company and the preference of the Appointed Actuary; however, the individual provisions should each be reasonable.

The data, analysis and commentary will normally be provided by actuarial lines of business. These lines will be selected by the Appointed Actuary based on the credibility and homogeneity of the resulting data. Where the actuarial lines of business have changed from the prior AAR, the current year’s AAR should clearly state the reasons for the changes. In some cases, it may be appropriate to use different lines of business for the ceded and gross/net provisions.
The commentary should disclose whether or not the company has exposure to mass tort and latent claims, and if the company has had a subsequent event. If the company has such exposure, the Appointed Actuary should discuss the nature and treatment of those claims in the calculation of the provisions for unpaid liabilities.

Where the actuarial lines of business do not include all the business written by the company (e.g. pools and associations), the AAR should clearly indicate the additional amounts and include them in a reconciliation exhibit.

In determining the provision for each actuarial line of business, the Appointed Actuary should consider, at a minimum:

- any significant trends in the severity and frequency of claims,
- any important changes in the coverage of the policies,
- the changes in the cost of reinsurance and/or in reinsurance arrangements,
- any changes in the lags in the reporting of claims and in the payment of claims,
- changes to the loss reserving practices and
- the effects of regulatory changes.

The commentary should discuss the existence of any significant development (adverse or favourable) in the run-off of the reserves that had been set up in prior years, reasons for the development and changes to methods and assumptions that would eliminate the recurrence of any consistent development.

### 6.7.2 Claims Expenses

Claims expenses are normally split between internal (unallocated) and external (allocated).

Some actuaries combine external expenses with incurred losses and base their analysis on the total of losses and expenses. Other actuaries calculate separate provisions for indemnity and external expenses. Both approaches are acceptable; however, the Appointed Actuary should clearly indicate the approach followed.

A variety of methods are used for internal loss expense provisions. Any method in accordance with accepted actuarial practice is acceptable. The AAR should describe the method(s) as well as any changes in methods from prior AARs. The impact of such changes should be clearly indicated and, if material, included in the Executive Summary.

### 6.7.3 Comparison of Actual Experience with Expected Experience in Prior Year-End Valuations

In order to assess the effect of changes in the estimated claim liabilities, OSFI requires companies to provide a comparison of Actual Experience with Expected Experience on an undiscounted basis for each actuarial line of business and for all lines combined for 10 years. However, if data for 10 years is not currently available, the Appointed Actuary should comment on this fact but also move toward the 10 year standard.
These comparisons must be provided gross and net of reinsurance. Normally these comparisons will include external adjustment expenses, exclude internal adjustment expenses and exclude classes of business not reviewed by the Appointed Actuary (e.g. pools).

Actual Experience refers to the ultimate gross and net undiscounted estimates selected for each accident year for each actuarial line of business valued as of the current year-end (December 31 or October 31). Expected Experience in Previous Year End Valuations refers to the ultimate undiscounted estimates selected by the Appointed Actuary at each of the prior year-ends. If the ultimate undiscounted estimates are not available for a line of business (e.g. tabular reserves), then the ultimate discounted estimates may be used. The AAR must include the total for all lines combined as well as subtotals, where useful.

Where there are changes in the actuarial lines of business, the Appointed Actuary must allocate the actual total undiscounted claim liabilities from prior AARs to the current actuarial lines of business using a reasonable approximation. For the first year following the change, the AAR should show the development using the old actuarial lines of business as well.

Where the Appointed Actuary uses underwriting/policy year rather than accident year, the Appointed Actuary may show the comparison of actual to expected experience using projected loss ratios based on underwriting/policy year data. In this case, the Appointed Actuary should estimate the dollar impact of the development. This would normally be calculated by multiplying the change in loss ratio by the underwriting/policy year earned premium at the prior year-end.

Whenever significant differences in ultimate estimates occur for any accident year, the Appointed Actuary should provide commentary explaining such changes in ultimate estimates for each accident year. In addition, the Appointed Actuary should discuss any actions taken to reduce the likelihood of similar differences in the future. The Appointed Actuary should update commentary from prior AARs based on the most recent experience. For this section, the Appointed Actuary may use a standard greater than the selected materiality standard to eliminate comments on normal fluctuations in data. A lower standard should be used for individual lines and a moderately higher standard may be used for older accident years to avoid repeating some of the less important comments from prior AARs.

Significant differences may exist between the loss development on page 60.40 of the Annual Report and that shown in the Comparison of Actual Experience. OSFI acknowledges that the company is not required to use the AAR as a basis for completing page 60.40 and that the differences can arise from such items as the allocation of internal loss adjustment expenses, Facility Association and Other Reserves. The Appointed Actuary should inform the Company of any significant differences and include a discussion of the differences in the AAR or indicate that there are no differences.

On a net basis, ultimate loss development is expected to be the same as that calculated by summing over columns (3) and (6) using data from the UCLR Analysis Exhibit in the current AAR compared to data in prior year AARs. The Appointed Actuary should
quantify and explain any difference that is expected due to changes to the presentation of data in the UCLR Analysis Exhibit.

### 6.7.4 Discounted Claim Liabilities

The claim liabilities must be discounted and include appropriate margins as required by CIA Standards of Practice.

The AAR should indicate the discount rate(s) used for the valuation and describe in detail the method used to select the discount rate(s). In particular, the selected discount rate(s) should be reduced by an explicit margin for expected credit-related events, including expected asset default. This deduction is in addition to the unexpected credit risks within the investment return rate margin. The Appointed Actuary should clearly document the rationale for the selections, including where the explicit margin is zero. The AAR should include all supporting exhibits.

The Appointed Actuary should quantify, disclose and justify the impact of changes in selected margins. The Appointed Actuary should also disclose in the Executive Summary cases where the impact of the changes in selected margins is material.

### 6.8 Premium Liabilities

The premium liabilities are normally calculated by line of business; however, the lines need not be identical to the actuarial lines of business used to estimate the claim liabilities.

OSFI expects the Appointed Actuary to comment on all aspects of components of premium liabilities, and particularly on the following (Please indicate if not applicable):

- expected losses, loss expenses and servicing costs on the policies in force,
- anticipated broker/agent commission,
- expected adjustments (plus or minus) to swing rated policies,
- expected changes to premiums as a result of audits, late reporting or endorsements and
- expected commission adjustments on policies with variable commissions.

The commentary should disclose whether or not the company has had a subsequent event. If there was a subsequent event, the Appointed Actuary should discuss the nature and treatment of the event in the calculation of the provisions for premium liabilities.

The Appointed Actuary should discount the premium liabilities with appropriate margins as required by CIA Standards of Practice. Where the selected interest rate or margins differ from those used in the Claim Liabilities Section, the AAR should describe the reasons for the selections.

The treatment of the above items may differ by company. The Appointed Actuary must demonstrate that the total of the carried premium liabilities is at least as large as his/her provision.
6.9 Other Liabilities/Other Assets

The Appointed Actuary must comment on the adequacy of reserves, including IBNR, maintained for Self-Insurance Retention (SIR) plans. SIRs represent the portion of a loss that is payable by the policyholder. The Appointed Actuary should include these in his/her opinion as “other net liabilities”. They should be reported net of reinsurance, not net of the supporting assets. These supporting assets are to be included in the opinion as “other amounts to recover”. The AAR should describe these provisions and provide details of their calculation.

Whenever amounts for salvage and subrogation are material, and therefore presented separately in the Annual Return, the Appointed Actuary must include such amounts in the opinion as “other amounts to recover”. The AAR should describe the method used to calculate these amounts.

The AAR opinion should include, with commentary, any other amounts reported as Other Liabilities or Other Assets.

7. OTHER DISCLOSURE REQUIREMENTS

7.1 Dynamic Capital Adequacy Testing (DCAT) / Financial Condition Testing (FCT)

The AAR must disclose the following information with respect to the DCAT/FCT reporting in the last three years:

- the date on which the DCAT/FCT reports were signed by the Appointed Actuary,
- the date on which the DCAT/FCT reports were presented,
- to whom the DCAT/FCT reports were presented (e.g. full board, audit committee, chief agent),
- whether the reports were presented in person or only in written form and
- the date used as the start of the projection period in the DCAT/FCT reports.

7.2 New Appointment

OSFI expects Appointed Actuaries to comply with the qualification requirements contained in OSFI Guideline E-15, *Appointed Actuary: Legal Requirements, Qualifications and Peer Review*. The AAR must explicitly disclose any deviations from these qualifications, including future steps being/to be taken to meet the qualification requirements.

If the Appointed Actuary was appointed to the role during the last year, the AAR must include the following disclosures:

- the date of appointment,
- the date of resignation of the previous Appointed Actuary,
- the date on which OSFI was notified of the appointment,
- confirmation of communication with the previous Appointed Actuary, as required by the ICA section 364(1), and
• a list of the Appointed Actuary’s qualifications, keeping in mind, but not limited to, the CIA’s Rules of Professional Conduct.

7.3 Annual Required Reporting to the Board or Audit Committee

For a Canadian company, the AAR must disclose the date on which the Appointed Actuary met with the board or the audit committee of the board, as required by paragraph 203(3)(f) of the ICA.

For a foreign company, the AAR must disclose the date on which the Appointed Actuary met with the chief agent, as required by section 630 of the ICA.

7.4 Continuing Professional Development Requirements

The Appointed Actuary must disclose in the AAR that he/she is in compliance with the Continuing Professional Development requirements of the CIA.

7.5 Disclosure of Compensation

The Appointed Actuary must disclose their compensation. This disclosure is consistent with the Financial Stability Board’s Principles for Sound Compensation Practices, which have been adopted by OSFI. The form of the disclosure statement should be as follows:

Disclosure of Compensation

I attest that all of my direct and indirect compensation is derived using the following methodology:

I confirm that I have performed my duties as Appointed Actuary without regard to any personal considerations or to any influence, interest, or relationship in respect of the affairs of my client or employer that might impair my professional judgment or objectivity.

I confirm that my ability to act fairly is unimpaired and that there has been full disclosure of the methodology used to derive my compensation (and/or my firm’s compensation, if applicable) to all known direct users of my services as Appointed Actuary.

If the Appointed Actuary is an employee of the insurance company, the methodology should include a list of the major components of the Appointed Actuary’s compensation. This could include: base salary, cash and/or stock-based bonuses, retirement and other significant benefits, other compensation (e.g. signing bonuses, severance packages), and perquisites (e.g. car allowances).

For each component of the Appointed Actuary’s compensation listed above that varies with the performance of the company, the value of that component as a target percentage of the
base salary must be disclosed. This might include, but is not limited to, participation in a bonus plan and/or a stock option plan that is based on company performance. The company must disclose the basis used to determine the amounts of these variable compensation components.

If the Appointed Actuary serves as an external consultant to the company, then the information provided to OSFI must include:

- The consulting fees payable for the preparation of the AAR, FCT, and any other work performed as the Appointed Actuary in respect of the company’s current fiscal year;
- The basis used to determine the consulting fees payable for the Appointed Actuary’s work (for example, fixed fee basis, time and expense basis, as well as any caps etc.), and whether the fees include any element of incentive or results-based compensation;
- The proportion that the consulting fees payable for the Appointed Actuary’s work for the company represents, as a percentage of the total revenue billed by the consulting firm’s Canadian legal entity to the company in the consulting firm’s prior fiscal year (<10%, 10-25%, 25-50%, 50-75%, 75%+); and
- The proportion that the consulting fees payable for the Appointed Actuary’s work for the company represents, as a percentage of the total revenue billed by the consulting firm’s Canadian legal entity to all clients in the consulting firm’s prior fiscal year (<10%, 10-25%, 25-50%, 50-75%, 75%+).

Due to its sensitive nature, the “Disclosure of compensation” must be included in a separate cover letter to AA Compensation Letter P&C (aacompleterpc@osfi-bsif.gc.ca), Actuarial Division at OSFI and, on request, to other Canadian regulators with reference to the cover letter made in the relevant section of the AAR.

7.6 Reporting Relationships of the Appointed Actuary

The AAR should disclose the reporting relationships and dependencies of the Appointed Actuary.

For Appointed Actuaries who are employees of the company, the AAR should disclose the name and position of the person (or persons) to whom the Appointed Actuary reports as well as any changes in this regard over the past year. Both solid line and dotted line reporting relationships should be disclosed, as well any anticipated change.

When the Appointed Actuary is not an employee of the company, the AAR should disclose the names and positions of the main contacts within the company with respect to the different functions of the Appointed Actuary, such as the valuation, FCT, and MCT support (if any).

For example, the AAR should disclose the name and position of:

- The person who hired the Appointed Actuary; and
- The company employees with whom the Appointed Actuary discusses findings and reports.
7.7 Peer Review of the Work of the Appointed Actuary

OSFI requires the work of the Appointed Actuary to be externally peer reviewed, as set out in OSFI’s Guideline E-15, *Appointed Actuary: Legal Requirements, Qualifications and Peer Review*.

For each Peer Review Report filed in the last three years, the Appointed Actuary must complete the following table:

<table>
<thead>
<tr>
<th>AAR</th>
<th>DCAT/FCT</th>
</tr>
</thead>
<tbody>
<tr>
<td>(b). Peer reviewer name</td>
<td></td>
</tr>
<tr>
<td>(c). Work reviewed and nature of the peer review (e.g. full 3-year or limited annual)</td>
<td></td>
</tr>
<tr>
<td>(d). Peer reviewer date signed</td>
<td></td>
</tr>
<tr>
<td>(e). Date submitted to OSFI</td>
<td></td>
</tr>
<tr>
<td>(f). Date submitted to Audit Committee or Chief Agent</td>
<td></td>
</tr>
<tr>
<td>(g). Whether the Peer Review Report was issued pre-release or post-release</td>
<td></td>
</tr>
<tr>
<td>(h). Year of next full 3-year review</td>
<td></td>
</tr>
<tr>
<td>(i). Next peer reviewer (if known) including the plan and the name of the next reviewer</td>
<td></td>
</tr>
<tr>
<td>(j). End year for last 6 year cycle to change reviewer</td>
<td></td>
</tr>
</tbody>
</table>

*Y = the most recent year.

In addition, the AAR should indicate when the peer reviewer last reviewed the information, if any, prepared by the Appointed Actuary to assist the insurer in the completion of the MCT (BAAT) schedules in the P&C returns.

For each peer review report, the Appointed Actuary should summarize each key finding or recommendation, and the status of each finding / recommendation by year.

The Appointed Actuary should disclose if no peer reviews were completed in the last three years and the reasons why. Note that such circumstances would be rare and require OSFI pre-approval.

7.8 Re-submitting the report

The AAR must disclose the reason(s) for resubmission.

8. UNPAID CLAIMS AND LOSS RATIO ANALYSIS EXHIBIT

8.1 Introduction

The Unpaid Claims and Loss Ratio Analysis Exhibit (UCLR Analysis Exhibit), as shown in Appendix II, is constructed to allow the presentation and collection of industry loss information in a standard format. The compiled information allows for the analysis of the impact of discounting on claims reserves and the analysis of the evolution of loss trends. In order to achieve these objectives, the exhibits are constructed by class of insurance and by accident year and contain information on a current year and on a cumulative year basis.
8.2 Data

A page must be completed for each actuarial line of business and should reconcile to supporting exhibits in the AAR. Each actuarial line of business must be uniquely linked to one, and only one, Annual Return line of business as listed in Appendix III. For reinsurers, proportional and non-proportional business should be reported separately.

The company must specify on each page the basis, on which the Exhibit is completed, either “accident year” or “underwriting year”. The selected basis should be the same for all pages. Insurers completing the exhibits on a “report year” basis should select “accident year”.

If an actuarial line of business is a combination of two or more Annual Return lines, the Appointed Actuary must determine in which Annual Return line to place it to best represent the operations of the company. For actuarial lines of business where the earned premium is not available in the same detail as the claims (e.g. automobile-liability bodily injury and property damage), the Appointed Actuary should either estimate a split of the earned premium or combine the data showing it in the Annual Return line that best represents the line of business underwritten by the company.

A “Total” page must also be completed; this exhibit should balance to the AAR. An individual page does not have to be completed for a category that is not reviewed by the Appointed Actuary but the total discounted reserves including PfAD for the category must be included in Line 15 (“Other Provisions”) of the “Total” page. The Appointed Actuary should also provide a breakdown with commentary in the AAR when “Other Provisions” is greater than the selected materiality.

In the UCLR Analysis Exhibit, the present value of unpaid claims and adjustment expenses (excluding PfADs) (Column [7]) is expected to be less than the total undiscounted unpaid claims and adjustment expenses (Column [6]). If amount in the column [7] is greater than the amount in column [6], the AAR must comment on the reason for the exception.

Claim counts reported in the UCLR Analysis Exhibit should be consistent with the way the Appointed Actuary defines and records claim counts in the AAR. The Appointed Actuary should provide the definition of claim count in the AAR, and describe any changes in the definition from the prior AAR. If it is difficult to obtain claim count information (e.g. reinsurers, assumed business, etc.), the Appointed Actuary should provide a rationale in the AAR for why claim count cannot be reported.

The definition of claim count could include, if applicable, but not be limited to:

- whether an occurrence with payments for multiple coverages/parties is counted as one claim or multiple claims,
- whether claims with no case outstanding and no payments are included in the definition of reported claim counts, and
- how reopened claims are treated.

The UCLR Analysis Exhibit should be completed on a net basis, with the Appointed Actuary defining “net” in the AAR. For instance, if the Appointed Actuary has completed his or her net analysis gross of intra-group reinsurance, the UCLR Analysis Exhibit should also be completed on this basis. Any adjustments to the net basis as reported in the AAR (e.g. industry pools or inter-company reinsurance) should be made in Lines 14 and 15 of the “Total” page.
The Appointed Actuary is responsible for ensuring the accuracy of the UCLR Analysis Exhibit and accompanying electronic filing.

Note that figures must be expressed in thousands of Canadian dollars.

Appendix IV contains detailed instruction for completing the UCLR Analysis Exhibit.

Effective Q4 2019, the data submission for the UCLRE return is changing from an ASCII format to XML format. Detailed instructions for completing the electronic filing can be found on OSFI’s website: *Unpaid Claims and Loss Ratio Analysis Exhibit (UCLRE)*.
9. Appendix I - Expression of Opinion

I have valued the policy liabilities [and reinsurance recoverables] of [the Company] for its [consolidated] [statement of financial position] at [31 December XXXX] and their changes in the [consolidated] [statement of income] for the year then ended in accordance with accepted actuarial practice in Canada including selection of appropriate assumptions and methods.

(Qualifications should be included here)

In my opinion, the amount of policy liabilities [net of reinsurance recoverables] makes appropriate provision for all policy obligations and the [consolidated] financial statements fairly present the results of the valuation.

The results of my valuation together with amounts carried in the Annual Return are the following:

<table>
<thead>
<tr>
<th>Claim Liabilities</th>
<th>Carried in Annual Return($'000)</th>
<th>Appointed Actuary's Estimate($'000)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Direct unpaid claims and adjustment expenses</td>

12. Appendix IV - Unpaid Claims and Loss Ratio Analysis Exhibit

12.1 Information Contained in the Unpaid Claims and Loss Ratio Analysis Exhibits (by Column)

The UCLR Analysis Exhibit contains amounts segregated by accident years (refer to Section 12.3 for instructions on other than an accident year basis). All amounts entered on the UCLR Analysis Exhibit should be expressed in Canadian dollars and rounded to the nearest thousand dollars.

Columns 03, 13, 16, 19, 21 and 22 must be completed for the past 10 accident years while columns 02, 04 through 12, 18 and 20 must be completed for all accident years.

12.1.1 Column 01 – Accident Year or Underwriting Year

Column 01 of the exhibit represents the segregation by accident/underwriting year, as specified in Aggregation Type Code. Line 11 represents the most recent accident/underwriting year, lines 02 to 10 represent the nine prior accident/underwriting years and line 01 represents all prior years to line 02.

12.1.2 Column 02 – Paid Losses: Current Year

Column 02 represents the paid claims and paid allocated adjustment expenses for the current calendar year.

Paid losses for Accident year XXXX-10 & Prior should be reported in Line 1.

12.1.3 Column 03 – Paid Losses: Cumulative

Column 03 represents the cumulative paid claims and paid allocated adjustment expenses for all calendar years.

12.1.4 Column 04 – Undiscounted Unpaid Claims and Adjustment Expenses: Case Reserves

Undiscounted case basis reserves of the unpaid claims and allocated adjustment expenses are presented in column 04. If the claim liabilities are case reserved on a discounted basis (e.g. tabular reserves), the discounted case reserves are to be entered.

12.1.5 Column 05 – Undiscounted Unpaid Claims and Adjustment Expenses: IBNR

Undiscounted incurred but not reported reserves are shown in column 05. These reserves also include any adjustment for the deficiency or redundancy of the case reserves (also known as the broad definition of IBNR) presented in column 04. The undiscounted IBNR includes all amounts related to the undiscounted unpaid allocated adjustment expenses. If the undiscounted claim liabilities for a line are not available, (e.g. tabular reserves), then the discounted IBNR should be entered.
12.1.6 Column 06 – Undiscounted Unpaid Claims and Adjustment Expenses: Total

This is the total of columns 04 and 05.

12.1.7 Column 07 – Present Value of Unpaid Claims and Adjustment Expenses: Total

Present value case basis reserves and IBNR of the unpaid claims and allocated adjustment expenses are presented in column 07. The underlying rule to be respected with the completion of the UCLR Analysis Exhibit is that the amounts shown should correspond to those calculated by the Appointed Actuary in the AAR. Do not add any PfAD to this column.

12.1.8 Column 08 – Provision for Adverse Deviation (PfAD): Claims

The provision for adverse deviation on claims is presented in column 08.

12.1.9 Column 09 – MfAD: Claims (%)

This column is the margin for adverse deviation and is equal to the ratio of column 08 to column 07.

12.1.10 Column 10 – PfAD: Reinsurance

The provision for reinsurance adverse deviation is presented in column 10.

12.1.11 Column 11 – PfAD: Interest Rate

The provision for interest rate adverse deviation is presented in column 11.

12.1.12 Column 12 – Discounted Reserves Including PfAD

Column 12 is the result of the following formula:

\[ \text{Column (07)} + \text{Column (08)} + \text{Column (10)} + \text{Column (11)} \]

**Note:** for the “Total” exhibit, amounts for column 12 are entered on line 13 (ULAE – Total), line 14 (Facility Association and Plan) and line 15 (Other Provisions) as well as line 16 (Grand Total). Lines 13 through 16 are included only in the “Total” exhibit.

12.1.13 Column 13 – Earned Premiums

Earned premiums are shown separately by accident year. Net earned premiums are reported and developed at ultimate where development is possible, for example, where experience rating is used.

12.1.14 Column 16 – Loss Ratio (%): Undiscounted

The undiscounted loss ratio is calculated using the following formula:
100 x $[\text{Column}(03) + \text{Column}(06)] / \text{Column}(13)$

12.1.15 Column 18 – Open Claim Counts as at Year-end

Open claim counts for an accident/underwriting year refer to the number of claims that has not been settled or on which payments are still being made as at the current year-end. If it is difficult to obtain claim count information (e.g. reinsurers, assumed business, etc.), this column should be left blank (i.e. not zero) and the Appointed Actuary should provide a rationale in the AAR.

12.1.16 Column 19 – Reported Claim Counts to Date

Reported claim counts for an accident/underwriting year refer to cumulative reported claim counts as at the current year-end. If it is difficult to obtain claim count information (e.g. reinsurers, assumed business, etc.), this column should be left blank (i.e. not zero) and the Appointed Actuary should provide a rationale in the AAR.

12.1.17 Column 20 – Total Undiscounted Unpaid Claims and Adjustments Expenses As at Prior Year-end

This is equal to column 06 from the corresponding pages of the prior UCLR Analysis Exhibit. Where there are changes in the actuarial lines of business or the reinsurance/retrocession arrangements, the Appointed Actuary must allocate total undiscounted unpaid claims and adjustment expenses from the prior AAR to the current actuarial line of business, based on the current reinsurance/retrocession arrangements, using a reasonable approximation.

12.1.18 Column 21 – Reported Claim Counts to Date as at Prior Year-end

This is equal to column 19 from the corresponding pages of the prior UCLR Analysis Exhibit. When the actuarial lines of business or definition of claim count have changed from the prior AAR, the AA must allocate reported claim counts to date from the prior AAR to the current actuarial line of business and definition of claim count using a reasonable approximation. If it is difficult to obtain claim count information (e.g. reinsurers, assumed business, etc.), this column should be left blank (i.e. not zero) and the Appointed Actuary should provide a rationale in the AAR.

12.1.19 Column 22 – Bornhuetter-Ferguson Initial Expected Loss Ratio Assumptions

This is the expected loss ratio assumptions used in the Bornhuetter-Ferguson (B-F) or the Expected Loss Ratio (ELR) method to estimate ultimate loss for the current year’s valuation. If neither the B-F nor the ELR method is considered for an actuarial line of business, this column should be left blank (i.e. not zero).
12.2 Information Contained in the Unpaid Claims and Loss Ratio Analysis Exhibit (by Line)

The amounts contained in lines 1 to 12 of UCLR Analysis Exhibit exclude all paid and unpaid ULAE.

12.2.1 Line 13 – ULAE - Total

Discounted unpaid ULAE, including provisions for adverse deviation (PfAD), are entered in line 13 in the “Total” exhibit but excluded entirely from the other exhibits.

12.2.2 Line 14 – “Facility Association” and “Plan”

The discounted unpaid claims of all automobile pools (e.g. Facility Association, Ontario Risk Sharing Pool and Plan de Répartition des Risques) are entered in line 14 (Facility Association and Plans) of the “Total” exhibit but excluded from all the other exhibits.

12.2.3 Line 15 – Other Provisions

The discounted unpaid claims for all other provisions (e.g. non-material lines of business, non-automobile industry pools and inter-company reinsurance) are entered in line 15 (Other Provisions) of the “Total” exhibit.

12.2.4 Line 16 – Grand Total

This is the total of lines 12 through 15 of column 12 of the “Total” exhibit. The Grand Total should balance to the Appointed Actuary’s Estimate of net unpaid claims and adjustment expenses in the Opinion Page.

12.2.5 Line 17 – MfAD: Reinsurance (%)

The margin for adverse deviation on reinsurance is presented in line 17. If the margins vary by year, a weighted average of margins that produces the same total PfAD should be entered.

12.2.6 Line 18 – MfAD: Interest Rate (%)

The margin for adverse deviation on interest rate is presented in line 18. If the margins vary by year, a weighted average of margins that produces the same total PfAD should be entered.

12.2.7 Line 19 – Interest Rate to Discount Unpaid Claims & Adjustment Expenses (%)

The interest rate entered on this line should include an explicit provision for asset default – cross reference with Section 6.7.4. Do not subtract interest rate MfAD from this line. If the interest rates vary by year, a weighted average of interest rate that produces the same total present value of unpaid claims and adjustment expenses should be entered.
12.3 Claims Reported on Other than an Accident Year Basis

Normally, the UCLR Analysis Exhibit will be completed on an accident year basis (year in which the claim was incurred).

However, some insurers may have used a basis other than accident year when completing the AAR. This includes reinsurers reporting on an underwriting year basis (year when the policy is written) as well as insurers writing policies on a claim-made basis who declare on report year (year when the claim is reported). These insurers may encounter difficulties in completing the UCLR Analysis Exhibit on an accident year basis.

It is recommended that the basis that is most suited to the company’s operation be used to complete the exhibits. Insurers completing the exhibits on an underwriting year basis must advise OSFI. In such case, line 15 (Other Provisions) of the “Total” exhibit must be adjusted so that line 16 (Grand Total) equals to the net unpaid claims and adjustment expenses reported in the opinion page of the AAR.
This guideline sets out OSFI’s expectations with respect to the Own Risk and Solvency Assessment (ORSA) of federally regulated insurers (insurer).¹

The ORSA should reflect an insurer’s own risk and solvency assessment. OSFI expects an insurer to have processes in place to conduct an ORSA that is proportionate to the nature, scale and complexity of its business and risk profile.

¹ Insurer refers to federally regulated insurers including Canadian branches of foreign life and property and casualty companies, fraternal benefit societies, regulated insurance holding companies and non-operating insurance companies.
I. Introduction

This guideline outlines OSFI’s expectations with respect to an insurer’s own assessment of its risks, capital needs and solvency position, and for setting Internal Targets, based on an insurer’s Own Risk and Solvency Assessment (ORSA).

The ORSA should serve as a tool to enhance an insurer’s understanding of the interrelationships between its risk profile and capital needs. The ORSA should consider all reasonably foreseeable and relevant material risks, be forward-looking and be congruent with an insurer’s business and strategic planning.

As the ORSA is a dynamic forward-looking process, stress and scenario testing should be an important component used in an insurer's determination of its own capital needs and as it sets and evaluates the adequacy of its Internal Targets and operating capital level throughout the business cycle.

This guideline addresses the scope of the ORSA, its relation to enterprise risk management, the role of Senior Management and other participants in performing, monitoring, reporting or reviewing the ORSA, and other key elements of the assessment process.

OSFI, in its normal course supervisory monitoring, may review the company’s ORSA including related documentation and reports. OSFI will consider this information in its assessment of inherent risks and risk management practices. OSFI does not approve an insurer’s ORSA.

For further guidance and considerations about the identification, assessment, management and other aspects of risk, insurers may also consult other OSFI guidelines or publications such as: 

For further guidance and considerations about stress and scenario testing, insurers may also consult sources such as OSFI’s Guideline E 18: Stress Testing and actuarial standards of practice with respect to an insurer’s Financial Condition Testing (FCT).

---

2 With respect to Canadian branches of foreign insurers, the term “capital” in this guideline includes the parallel concept of “margin of assets over liabilities”.

3 Guideline A-4: Regulatory Capital and Internal Capital Targets outlines OSFI’s expectations with respect to Internal Targets.

4 For foreign company branch operations in Canada, OSFI looks to the Chief Agent to oversee the management of the branch.
II. Scope

OSFI expects the ORSA to be tailored to and cover the consolidated operations of an insurer. An insurer’s capital assessment should consider the risks of its domestic and foreign operations as well as group risks. It should also consider the availability of capital and assets in each jurisdiction for on-going viability and for the protection of policyholders and creditors of each insurance entity.

The ORSA can be prepared either on an individual insurer basis or on a group basis (Group ORSA). Where the Group ORSA includes, in addition to the consolidated operations of an individual insurer, the operations of other related insurers or the operations of its parent or home office, it should give adequate consideration to the business and risk profile of the individual insurer and the particular circumstances of the relevant markets in which it operates (e.g. by using relevant subsets of group data and modified methodologies, tools and/or assumptions) to yield own capital needs and Internal Targets that are appropriate for the individual insurer. The components of the Group ORSA that are used in or otherwise support an individual insurer’s ORSA should be consistent with the expectations of this guideline.

When an insurer’s business and risk profiles or circumstances are not adequately reflected in a Group ORSA, or its own capital needs and Internal Targets are not adequately determined or supported using a Group ORSA, OSFI expects the insurer to have a separate ORSA that covers only the consolidated operations of the insurer and not the operations of its parent, home office or other related insurers.

III. ORSA and Enterprise Risk Management

In conducting its ORSA, an insurer should determine its own capital needs and establish its Internal Targets based on an internal assessment of all material risks, including the results of the enterprise risk management process\(^5\). The existence of a robust enterprise risk management framework enhances the ability of an insurer to effectively reflect risks in its ORSA.

Enterprise risk management, along with related controls and governance mechanisms, and the ORSA should be well integrated so that the information, analysis and results from both processes are consistent. The same is true for other processes that either feed into the ORSA or are impacted by ORSA results.

---

\(^5\) For further guidance on enterprise risk management, refer to OSFI’s sound business and financial practices guideline: [Corporate Governance](#).
IV. **Key Elements**

The ORSA should contain, at a minimum, certain key elements and considerations, including:

I. Comprehensive Identification and Assessment of Risks

II. Relating Risk to Capital

III. Oversight

IV. Monitoring and Reporting

V. Internal Controls and Objective Review

There is no single correct approach to an ORSA, and one approach will not fit all insurers. Therefore, these key elements and considerations are broadly stated and it is understood that the manner with which some of these elements are integrated in an insurer’s ORSA may vary by company.

**Comprehensive Identification and Assessment of Risks**

An insurer’s ORSA should identify, define and assess the materiality of all known, reasonably foreseeable, emerging and other relevant risks that may have an impact on an insurer’s ability to continue operations, in both normal and stressed situations. An insurer’s identified risks are expected to evolve as its business activities and environment evolve.

The assessment should include all material risks, whether these are explicitly captured in the regulatory capital framework or not, as well as risks that are not easily quantifiable.

Some risks can be broken down into other more discrete risks and may take different forms depending on the nature of the business and activities of an insurer. The ORSA should give proper consideration to non-material risks that, when combined with other non-material risks, become material. For example, risk categorisation or break down should not produce a lower assessment of own capital needs that would otherwise result if related risks were combined or aggregated.

Insurers should document underlying assumptions, processes and key considerations with regard to the drivers, the assessment, measurement and mitigants in place for each risk. The appendix *Supplementary Risk Considerations* includes other risk identification and assessment considerations.

**Relating Risk to Capital**

As part of its ORSA, an insurer is expected to set Internal Targets. These should normally be determined without undue reliance on regulatory capital measures.

Before an insurer gives consideration to external constraints, Internal Targets should be, first and foremost, based on an insurer’s assessment of its own capital needs. For example, Internal Targets should normally not be determined by simply adding a margin on the Supervisory Targets. However, as stress and scenario testing should be an integral part of an insurer’s process
for determining its Internal Targets, consideration of the results of these tests may cause an insurer to add explicit capital cushions/buffers to complement its initial assessment of own capital needs and set its Internal Targets so it can withstand a specified level of losses without falling below the Supervisory Targets\(^6\).

*Nature, Scale and Complexity*

The ORSA is an internal assessment process, tailored to an insurer’s own view of its risk profile and appetite, and reflective of the nature, scale and complexity of the insurer.

Insurers are expected to use more sophisticated methods to estimate the amount of own capital needed for material complex risks they take on or are exposed to. For less material and less complex risks, or for those that are not readily quantifiable, insurers may opt for simpler quantitative analysis (e.g. generally accepted prudent factors or extremely severe but plausible deterministic stress scenarios) combined with well documented qualitative considerations, and incorporate these amounts into their overall assessment of capital adequacy.

*Determining Own Capital Needs*

In conducting an ORSA, insurers should determine whether or not, for each risk, an explicit amount (quantity) of capital should be held and how the results for each risk should be aggregated. In doing so, insurers’ own capital assessments will reflect their choice of data sets, distributions, measures, confidence levels, time horizons, valuation approaches, financial tools and methodologies, appropriate to their unique profile.

The approaches and tools used should be calibrated to determine the total amount of capital needed to cover extremely severe losses. Aggregated, these losses should represent the insurer’s total quantity of capital that it needs to absorb the losses and be left with an equal amount of assets and liabilities.

Insurers are expected to consider publications and professional and other research materials dealing with quantification of risks and risk mitigants such as:

- Regulators, consulting firms, professional and other associations, academia, credit rating agencies and other purveyors of research, data, models and publications relating to the measurement of risks and risk mitigants;

- Empirical data, evidence and studies of the different and varying manifestations of historical and potential new risks in different markets for similar and dissimilar business activities and products;

- Developments in the insurance, financial and other markets and their potential impact on the continued appropriateness of current measurement tools, data and assumptions used by the insurer;

---

\(^6\) Supervisory Target capital levels are not applicable to regulated insurance holding companies and non-operating insurance companies.
• Benchmarking exercises with respect to risk measurement and mitigation tools and their results, whether in the insurance sector or in other sectors where similar risks exist.

When giving consideration to various methodologies, tools or resulting factors, insurers should consider, among other things, that these may be calibrated using a confidence level/time horizon that is different from what the insurer desires, calibrated at an unspecified confidence level/time horizon or designed for a different purpose (e.g. scenario and stress testing can be used to gain a better understanding of risks and identify potential management actions that an insurer can take or its ability to continue to meet regulatory requirements during a stressful event). In these cases, the insurer should make adjustments to the methodology, tool or resulting factor so that the ORSA results are appropriate for determining its own capital needs.

When discrete methods (e.g. sensitivity testing, statistical analysis) are used for determining own capital needs with respect to individual risks, the assessment may not identify or measure dependencies or inter-relations that cause some risks to be greater in the presence of other stresses to other risks. To complement the assessment of individual risks, other tools (e.g. stochastic models or multi-dimensional deterministic scenarios of extremely severe but plausible past, potential or theoretical events) may be used to uncover potential impacts that are due to concentrations, dependencies and interactions between risks. The appendix Supplementary Risk Considerations includes other considerations for relating risks to own capital needs.

**Setting Internal Targets**

Once an insurer has determined its own capital needs, these initial results should be assessed to determine if they are appropriate in relation to external or third party capital expectations, including OSFI’s expectation that Internal Targets exceed Supervisory Targets.

In setting Internal Targets, an insurer should assess the adequacy of its Capital Resources for supporting its current risk profile, and enabling it to continue its current operations in the normal course, under varying degrees of stress and under a wind-up scenario.

Therefore, in addition to the process described above to determine an insurer’s own capital needs, an insurer should also consider the impact of a range or series of adverse scenarios (e.g. an economic downturn) of varying nature or severity and its ability to avoid supervisory interventions (i.e. not fall below its Supervisory Targets) or continue as a going concern (i.e. not fall below the Minimums). The results of stress testing per OSFI’s Guideline E-18: Stress Testing, along with other single and combined forward-looking stress and reverse stress tests, including an insurer’s Financial Condition Testing (FCT) scenarios, can be directly incorporated, referenced or otherwise used in the ORSA for setting an insurer’s Internal Targets.

---

7 For example: securities, insurance or other regulators and credit rating agencies.
8 As outlined in Guideline A-4: Regulatory Capital and Internal Capital Targets.
9 In determining capital needed to support an insurer’s current risk profile and for continuing its current operations, it is expected that an insurer would, for example, assume that its current capital needs include any amount required to support short-term insurance contract renewals at the current business level.
10 As defined in Guideline A-4: Regulatory Capital and Internal Capital Targets.
As outlined in OSFI’s Guideline A-4, while all insurers are expected to determine an Internal Target of total capital, life insurers are expected to also determine an Internal Target of core capital. Core capital should serve to reduce the likelihood of insolvency, both in normal times and during periods when the insurer is under stress. When setting a core capital Internal Target, a life insurer should consider its target capital composition/mix and its assessment of the characteristics and quality of Capital Resources.

With respect to Canadian branches of foreign insurers, the determination and assessment of the composition of the margin of assets over liabilities may not include all of the same considerations that are relevant for determining and assessing the quality of capital instruments needed or issued by insurers if the branch does not raise capital within Canada. However, the ORSA should include many of the same considerations with respect to the quality of the assets vested in trust in Canada and other assets under the control of the Chief Agent in Canada that support the liabilities in Canada and how these are recognized and valued for capital adequacy purposes.

**Integration with Other Business Processes**

The ORSA is a forward-looking process. It should be consistent with an insurer’s strategic and business planning and should contemplate the potential adverse capital impacts over an insurer’s planning horizon (e.g. 3 to 5 years). An insurer’s ORSA process should be consistent with and linked to the enterprise risk management and other management processes. For example, quantifiable estimates of risks that are used for ORSA purposes should be consistent with or feed into the decision making process and, where appropriate, have other business uses.

The assessment of adequacy of capital should also consider the capital needed to support an insurer’s longer term business strategies and, in particular, new business and planned growth. Considering this, an insurer should determine an appropriate level or range of capitalization at which it operates, set above its Internal Targets. In determining an operating level, an insurer should consider the impact of future planned, foreseen and likely potential changes to its risk profile due to changes in its operations, its business strategy or its operating environment. For example, it should consider a series of varying adverse scenarios and, at a certain operating level, assess the insurer’s ability to continue operating and not fall below its Internal Targets. It should also evaluate whether long-run Internal Targets are consistent with short-run goals, and adjust its operating levels as appropriate; recognizing that accommodating additional capital needs or additional risk mitigants can require significant lead time.

In this context, an insurer should relate its capital needs to, for example, potential changes in risks, anticipated growth, acquisitions and divestments, potential group needs and limits on fungibility/transfer of capital, plans to access external sources of capital and the level of capital desired to enable the insurer to take identified potential countervailing actions against a stress event at an acceptable cost.

All material risks, including those that are difficult to quantify in the ORSA, should be subject to internal controls. An insurer should identify relevant countervailing measures and actions that could be taken to improve its solvency position, should it be negatively impacted by economic downturns or other stress events. These may include, for example, raising additional capital,
slowing or ceasing new business, entering into reinsurance arrangements, implementing changes to product pricing and/or changes to business mix.

Oversight

A sound risk management and oversight process should assist an insurer in performing an effective assessment of its own capital needs, in determining its Internal Targets and in assessing the adequacy of its current and likely future solvency position. In this context, the establishment of appropriate policies, procedures, systems, controls and personnel for identifying, analysing, assessing, monitoring and measuring its risk exposures can improve the quality and effectiveness of the ORSA.

Senior Management should have a good understanding of the nature and significance of the risk exposures of the insurer, the related risk mitigants, risk management tools/techniques and oversight processes and how these relate to adequate levels of capital. Senior Management should review the appropriateness of the formality and sophistication of the methods used to quantify risks and risk mitigants as well as the risk management and reporting processes vis-à-vis the Risk Appetite Framework\(^\text{11}\) and the general risk profile and business plans of the insurer.

The ORSA should assist the insurer in its risk assessment, risk management and planning by exploring and assessing potential threats to an insurer’s capital and solvency positions. For example, the results of stress scenario tests should be used to identify actions that could be taken either to lessen the likelihood of such threats occurring or to mitigate the impact of an adverse scenario, should one actually occur.

Please refer to OSFI’s *Corporate Governance Guideline* for OSFI’s expectations of insurer Boards of Directors in regards to operational, business, risk and crisis management policies.

Monitoring and Reporting

The ORSA should be performed on a regular basis so that it continues to provide relevant information for an insurer’s management processes. It should be clearly and formally documented in a report at least annually and more often if circumstances warrant, for example when there are changes to the insurer’s risk profile or risk appetite.

The ORSA report should contain sufficient information about the process, underlying principles, methodologies, key assumptions, key sensitivity information and overall results relative to the risk appetite, strategic and operational plans and capital management framework of the insurer. The report should be used by the insurer to assess the appropriateness of the ORSA, including the overall results and the quality/composition of its capital, and confirm the insurer’s Internal Targets.

\(^{11}\) Refer to OSFI’s *Corporate Governance Guideline* for additional guidance in this area.
An insurer’s Senior Management should receive regular and timely reports on the insurer’s risks and capital. These reports should allow Senior Management to:

- Evaluate the level and trend of material risks and their potential effect on capital;
- Evaluate the sensitivity and reasonableness of assumptions used in the risk and capital assessment and measurement process;
- Determine that the insurer holds sufficient capital in relation to established capital adequacy targets and goals (both internal and regulatory/external);
- Evaluate the adequacy of capital using stresses and scenarios;
- Assess future capital needs (e.g. dividend plans, issuance/retirement of capital instruments and capital fungibility constraints) and make any adjustments to the insurer’s strategic, capital and other plans, as necessary;

The monitoring and reporting process should take into account the current and forecasted business environments and should, consistent with the risk and capital adequacy assessment, be adjusted when appropriate so that capital remains adequate during periods when the insurer is under stress and through entire business cycles.

**Internal Controls and Objective Review**

An insurer’s internal control structure is essential to the quality of its ORSA. An insurer’s Senior Management reviews the insurer’s method for monitoring and reporting on compliance with internal policies as well as the system for assessing risks and for relating risks to the insurer’s own capital needs. Senior Management should satisfy itself that the insurer’s system of internal controls continues to be adequate for well-ordered and prudent conduct of business, including the quality of its ORSA process.

An insurer should conduct regular reviews of its ORSA process for integrity, accuracy, and reasonableness. Areas that should be reviewed include, among others:

- Comprehensiveness and appropriateness of an insurer’s assessment process, given the insurer’s nature, scale and complexity, the soundness of the controls underpinning it, and OSFI’s expectations with respect to the ORSA process;
- Governance mechanisms related to the assessment and review by the insurer of group processes used in its operations, where the insurer uses a group ORSA;
- Process for identification of risks, large exposures, risk concentrations, dependencies and interactions;
- Appropriateness of the methodologies, distributions and measures and accuracy and completeness of financial and quantitative data inputs;
- Reasonableness and validity of the ORSA results, including the embedded assumptions and inputs from stress tests, scenarios, models and other methodologies and tools used in the assessment process;
- Reasonableness of the individual risk and other components and overall ORSA results;
• Consistency of the ORSA results with an insurer’s risk limits and risk appetite;
• Appropriateness of the documentation that supports the ORSA and the contents of the ORSA report;
• Effectiveness of information systems that support the ORSA;
• Consistency and linkages of the ORSA process and results with the risk management, strategic, business and capital planning processes.

The ORSA, including the ORSA report, should be subject to periodic objective reviews. The objective review may be conducted by an internal or external auditor, by a skilled and experienced internal or external resource or by a skilled and experienced individual, who reports directly to or is a member of the Board.

An objective reviewer should not be responsible for nor have been actively involved in the part of the ORSA that it reviews. For example, where the internal auditor is not otherwise involved in the process, the ORSA may be included in the internal audit plan so that it is covered within the audit cycle.12

V. Interaction of the ORSA with the Supervisory Review

OSFI assesses capital adequacy at multiple levels. An insurer should have sufficient capital to meet Minimum and Supervisory Target regulatory capital, as well as sufficient capital to support its risk profile, (i.e. Inherent and Net Risks of its significant activities and Overall Net Risk (ONR)) as determined through the OSFI’s Supervisory Framework.

OSFI may review the ORSA and, upon request, the ORSA report (and/or other supporting documentation) in its assessment of the risk profile of an insurer to determine whether the ORSA is consistent with OSFI’s understanding and assessment of the insurer’s risk appetite and risk profile.

The depth and frequency of supervisory review of an insurer’s ORSA will be proportional to the nature, scale and complexity of its activities, and the risks assumed by an insurer as assessed through OSFI’s Supervisory Framework.

The supervisory review of the ORSA is not intended to prescribe how an insurer should perform, use or report on its ORSA. Rather, the review allows for dialogue on OSFI’s assessment of inherent risk, capital and Composite Risk Rating (CRR), and of an insurer’s ORSA including:

• The approach/methodology, assumptions, data and other considerations (e.g. level of confidence and rationale) supporting internal estimates of risks that are also explicitly captured in the regulatory capital guidelines;
• Risks not fully captured (e.g. concentration, contagion and aggregation of risks) and/or not explicitly captured (e.g. reputation and strategic risk) by regulatory capital guidelines;

12 OSFI may request that a report by an objective reviewer be prepared and made available at a specific date so it can be included in a planned review of an insurer’s ORSA.
• External factors, where not already considered in the previous points, including stress
testing, impact of economic cycles and other external risks;
• The level and quality of the insurer’s capital, and the quality of the assessment by the
insurer using a range of stress scenarios included or referenced in the ORSA;
• Limitations of the insurer’s ORSA;
• Other regulatory requirements and expectations or market considerations;
• Identification of best practices and potential gaps arising from a cross-sector review of
ORSA;
• How and to whom ORSA related information is communicated and how ORSA issues or
limitations are shared with users and appropriately elevated to relevant parties within the
insurer.

In addition to quantitative efforts, OSFI understands and expects that expert judgement will be
necessary to operationalize an insurer’s assessment and measurement of risks and to integrate
those results into the overall assessment of own capital needs and the determination of Internal
Targets. The ORSA is a process and a tool that OSFI expects will be used to support insurers risk
and capital assessment, on-going management, governance and other decision making activities;
therefore, both the quantitative and the qualitative aspects of the ORSA are equally important.

– END –
Appendix – Supplementary Risk Considerations

The risk considerations contained within this appendix do not constitute an exhaustive list of exposures and factors that insurers should consider for purposes of the ORSA and for establishing Internal Targets. Rather, they provide some examples that may be relevant for a particular insurer and that may be used when exploring and assessing risks in the context of the ORSA.

Comprehensive Identification and Assessment of Risks

Emerging/Evolving risks

Certain risks may be identified based on possible new developments or emerging trends in the internal or external environment. While some may have been reviewed and found to be non-material, others may not have yet been defined or evaluated. Also, risks that were once considered immaterial may become material as the insurer’s environment changes.

The ORSA should consider how risks may evolve and what measurement and management techniques are required for monitoring purposes.

Risk transfer/Mitigation activities

Insurers should be cognizant of any risks that may exist within certain risk transfer or risk mitigation activities (such as reinsurance, hedging or securitization transactions), and how these would behave under stress conditions. Resulting new or additional risks such as credit/counterparty and operational risk should be taken into consideration.

Cross border activities

Insurers that operate in multiple jurisdictions or otherwise engage in cross border investments and transactions with foreign counterparties may be subject to increased risk including: country risk, concentration risk, foreign currency risk (market risk) as well as regulatory, legal, compliance and operational risks. Laws and regulators’ actions in foreign jurisdictions could make it much more difficult to realize on assets and security in the event of a default.

An insurer's ORSA should consider these types of activities and assess the controls, capital or assets needed in support of the regulatory, legal and compliance risks associated with concentrations in cross border activities. If an insurer has operations in foreign jurisdictions where restrictions on fungibility or access to capital apply (or could apply), where there is potential ring-fencing of funds, or where minimum/target regulatory capital requirements exceed levels in Canada, this should also be clearly identified and taken into account in setting both group-wide capital needs and Internal Targets for individual insurers.

Relating Risk to Capital (Determining Own Capital Needs)

This guideline does not provide a list of available approaches, methodologies or tools. As a result ORSA practices across insurers are likely to vary. For example, some insurers may:
• consider that their assessment of a material complex risk or set of risks would be best performed through the use of sophisticated internal models;
• determine that developing complex internal models for a material complex risk, although desirable, is not feasible and, as a result, select somewhat simpler, less refined approaches and compensate with more prudent assumptions that nonetheless yield reasonable estimates of own capital needs;
• expend considerable effort to develop an advanced methodology to assess a specific complex risk which they believe will give them a competitive advantage in the market and allow for improved capital allocation;
• choose to rely heavily on qualitative considerations, including expert judgement, for risks that are difficult to quantify and for which measurement results vary significantly depending on the approach and method used;
• develop complex methodologies to aggregate results and estimate the capital needs for concentrations, dependencies and risk interactions along with prudent benefits of diversification;
• choose a simple aggregation approach producing cruder results that achieve little or no diversification benefits.

Aggregation/Diversification Adjustment

Where risk aggregation/diversification adjustment benefits are applied in an insurer’s ORSA, they should be validated and calibrated by the insurer on a regular basis. Insurers should be prudent in their assessment of aggregation/diversification benefits and should consider whether such benefits exist in periods of stress. When giving consideration to the benefits of diversification, equal consideration should be given to the potential concentrations, dependencies and interactions of risks that may cause the total impact to be greater than the sum of the impact of the risks considered individually.

Concentrations, Dependencies and Interactions of Risks

Situations in which risk concentrations, dependencies and interactions can arise include, among others, exposures to:

• one or many severe or extremely severe events/scenarios and their knock-on effects;
• a series of many small events/scenarios or individual claims and their knock-on effects;
• a common cause across many underwriting years (e.g. asbestos, pollution, etc.);
• one or very few reinsurers or other counterparties, or connections between counterparties;
• one or very few products/lines of business or sources of business/assets;
• geographical regions.

Risk concentrations, dependencies and interactions can arise through a combination of exposures across these and other broad categories. An insurer should have an understanding of its insurance, market, credit and other risk concentrations, dependencies and interactions resulting from exposures within and across its different business lines.
SUPERVISORY FRAMEWORK

OSFI’S ROLE

The Office of the Superintendent of Financial Institutions (OSFI) is an independent agency of the Government of Canada established in 1987 to contribute to public confidence in, and the safety and soundness of, the Canadian financial system. OSFI supervises and regulates federally registered banks and insurers, trust and loan companies, cooperative credit associations, and fraternal benefit societies, as well as private pension plans subject to federal oversight, and ensures that they are complying with their governing legislation.  

When OSFI identifies issues that may impact the stability of the financial system, it reports them to the Financial Institutions Supervisory Committee. OSFI supervises financial institutions in accordance with its Supervisory Framework, first introduced in 1999 and updated in 2010 in this document. Supervision of pension plans is guided by a similar but separate Framework. 

---

1 The Financial Institutions Supervisory Committee (“FISC”) meets on a quarterly basis to facilitate the exchange of information among OSFI, the Department of Finance, the Bank of Canada, Canada Deposit Insurance Corporation, and the Financial Consumer Agency of Canada on matters relating to the supervision of federally regulated financial institutions. 

2 Available on OSFI’s website, under “Pension Plans/Risk Assessment Framework”.

SUPERVISORY FRAMEWORK

THE SUPERVISORY FRAMEWORK

The Supervisory Framework describes the principles, concepts, and core process that OSFI uses to guide its supervision of federally regulated financial institutions (FRFIs). These principles, concepts, and core process apply to all FRFIs in Canada, irrespective of their size, and accommodate the unique aspects of the deposit-taking, life insurance, and property and casualty insurance sectors.

Supervision involves assessing the safety and soundness of FRFIs, providing feedback as appropriate, and using powers for timely intervention where necessary. Its primary goal is to safeguard depositors and policyholders from loss. As such, the focus of supervisory work is determining the impact of current and potential future events, both internal to a FRFI and from its external environment, on the risk profile of the FRFI.

Since OSFI’s Supervisory Framework was first introduced in 1999, significant developments in the financial services industry have changed the nature of the risks and risk management of financial institutions. For example, product sophistication has increased, globalization has caused risks to become more systemic, and financial institutions have experienced multiple and severe stresses to their solvency and liquidity. Meanwhile, international standards and requirements for supervising financial institutions have also been strengthened.

The updated Supervisory Framework described in this document reflects the enhancements OSFI has made to address these changes, and the experience gained from applying the 1999 Framework over the past ten years. In summary, these enhancements continue to make OSFI’s risk-based supervision as dynamic and forward-looking as possible and help ensure that OSFI can respond effectively to changes in the Canadian and international financial sectors, now and in the future.

STATUTORY OBLIGATIONS

The Supervisory Framework is designed to assist OSFI in meeting its statutory obligations set out in the Office of the Superintendent of Financial Institutions Act (OSFI Act) and other governing legislation regarding the supervision of FRFIs. These obligations are broad and overarching, and to meet them in practice requires detailed and consistent standards and criteria for supervising FRFIs.

INTERNATIONAL EXPECTATIONS

OSFI has adopted the Basel Committee on Banking Supervision’s “Core Principles for Effective Banking Supervision”, and the International Association of Insurance Supervisors’ “Insurance core principles and methodology” as its sources for detailed supervisory standards and criteria. These methodologies specify international expectations for banking and insurance supervision. OSFI applies these methodologies within the context of its mandate and the nature of the financial services industry in Canada.
GENERAL APPROACH

CONSOLIDATED SUPERVISION
The supervision of Canadian financial institutions is conducted on a consolidated basis, which involves an assessment of all of a FRFI’s material entities (including all subsidiaries, branches and joint ventures), both in Canada and internationally. OSFI uses information available from other regulators as appropriate.

RELATIONSHIP MANAGER
OSFI designates a relationship manager (RM) for each FRFI. The RM is responsible for maintaining an up-to-date risk assessment of the FRFI. Specialists and other staff within OSFI help support this work. The RM is the main point of contact for the FRFI.

PRINCIPLES-BASED SUPERVISION
The supervision of FRFIs is principles-based. It requires the application of sound judgment in identifying and assessing risks, and determining, from a wide variety of supervisory and regulatory options available, the most appropriate method to ensure that the risks that a FRFI faces are adequately managed.

SUPERVISORY INTENSITY AND INTERVENTION
The intensity of supervision will depend on the nature, size, complexity and risk profile of a FRFI, and the potential consequences of the FRFI’s failure. Where there are identified risks or areas of concern, the degree of intervention will be commensurate with the risk assessment, and in accordance with the Guide to Intervention for Federal Financial Institutions.

BOARD AND SENIOR MANAGEMENT ACCOUNTABILITY
A FRFI’s Board of Directors and Senior Management are responsible for the management of the FRFI and ultimately accountable for its safety and soundness and compliance with governing legislation. OSFI’s mandate to supervise includes apprising FRFIs of situations having material risk that it has identified during its work, and recommending or requiring corrective actions to be taken. OSFI also looks to the Board and Senior Management to be proactive in providing OSFI with timely notification of important issues affecting the FRFI.

RISK TOLERANCE
While OSFI’s supervision will reduce the likelihood that FRFIs will fail, the OSFI Act explicitly recognizes that FRFIs operate in a competitive environment and need to take reasonable risks. As such, FRFIs can experience financial difficulties that could lead to their failure.

RELIANCE ON EXTERNAL AUDITORS
OSFI relies upon FRFIs’ external auditors for the fairness of the financial statements. OSFI’s assessment of a FRFI’s overall financial performance depends upon the FRFI’s audited financial statements.

Available on OSFI’s website, under “About OSFI/How We Regulate”.
**USE OF THE WORK OF OTHERS**

OSFI uses, where appropriate, the work of others to reduce the scope of its supervisory work and minimize duplication of effort. This enhances both OSFI’s efficiency and its effectiveness. For example, as supervisors do not perform audit work, they may use the detailed testing performed by a FRFI’s external auditor and Internal Audit function to help them assess the effectiveness of controls. Similarly, they may use the detailed analysis performed by a FRFI’s Risk Management function to help them assess the effectiveness of the FRFI’s models.

**External sources of work that may be of use to OSFI are the FRFI’s external auditor and appointed actuary, as well as the FRFI’s oversight functions, which include the Financial, Compliance, Actuarial, Risk Management, Internal Audit, Senior Management and Board functions. Other useful external sources include rating agencies, industry groups, foreign regulators, consultants, and other domestic and international organizations.**

---

**KEY PRINCIPLES**

Risk assessment—the fundamental work activity of supervision—is undertaken by following seven key principles.

**PRINCIPLE #1**  
**FOCUS ON MATERIAL RISK**

The risk assessment OSFI performs in its supervisory work is focused on identifying material risk to a FRFI, such that there is the potential for loss to depositors or policyholders.

**PRINCIPLE #2**  
**FORWARD-LOOKING, EARLY INTERVENTION**

Risk assessment is forward-looking. This view facilitates the early identification of issues or problems, and timely intervention where corrective actions need to be taken, so that there is a greater likelihood of the satisfactory resolution of issues.

**PRINCIPLE #3**  
**SOUND PREDICTIVE JUDGMENT**

Risk assessment relies upon sound, predictive judgment. To ensure adequate quality, OSFI management requires that these judgments have a clear, supported rationale.

**PRINCIPLE #4**  
**UNDERSTANDING THE DRIVERS OF RISK**

Risk assessment requires understanding the drivers of material risk to a FRFI. This is facilitated by sufficient knowledge of the FRFI’s business model (i.e., products and their design, activities, strategies and risk appetite), as well as the FRFI’s external environment. The understanding of how risks may develop and how severe they may become is important to the early identification of issues at a FRFI.
PRINCIPLE #5
DIFFERENTIATE INHERENT RISKS AND RISK MANAGEMENT
Risk assessment requires differentiation between the risks inherent to the activities undertaken by the FRFI, and the FRFI’s management of those risks – at both the operational and oversight levels. This differentiation is crucial to establishing expectations for the management of the risks and to determining appropriate corrective action, when needed.

PRINCIPLE #6
DYNAMIC ADJUSTMENT
Risk assessment is continuous and dynamic in order that changes in risk, arising from both the FRFI and its external environment, are identified early. OSFI’s core supervisory process is flexible, whereby identified changes in risk result in updated priorities for supervisory work.

PRINCIPLE #7
ASSESSMENT OF THE WHOLE INSTITUTION
The application of the Supervisory Framework culminates in a consolidated assessment of risk to a FRFI. This holistic assessment combines an assessment of earnings and capital in relation to the overall net risk from the FRFI’s significant activities, as well as an assessment of the FRFI’s liquidity, to arrive at this composite view.

PRIMARY RISK ASSESSMENT CONCEPTS
The Supervisory Framework uses many concepts to enable a common approach to risk assessment across FRFIs and over time. The primary concepts are described below.

1. SIGNIFICANT ACTIVITIES
The fundamental risk assessment concept within the Supervisory Framework is that of a significant activity. A significant activity is a line of business, unit or process that is fundamental to the FRFI’s business model and its ability to meet its overall business objectives (i.e., if the activity is not well managed, there is a significant risk to the organization as a whole in terms of meeting its goals).
OSFI identifies significant activities using various sources including the FRFI’s organization charts, strategic business plan, capital allocations, and internal and external reporting. This facilitates a close alignment between OSFI’s assessment of the FRFI and the FRFI’s own organization and management of its risks, and enables OSFI to make use of the FRFI’s information and analysis in its risk assessment.
Judgment is used in selecting significant activities, which may be chosen for quantitative reasons (such as the activity’s percentage of total FRFI assets, revenue, premiums written, net income, allocated capital, or its potential for material losses), and/or qualitative reasons (such as its strategic importance, planned growth, risk, effect on brand value or reputation, or the criticality of an enterprise-wide process).
2. INHERENT RISK

In the Supervisory Framework, the key inherent risks are assessed for each significant activity of a FRFI. The definition of inherent risk is directly related to OSFI’s mandate to protect depositors and policyholders. Inherent risk is the probability of a material loss due to exposure to, and uncertainty arising from, current and potential future events. A material loss is a loss or combination of losses that could impair the adequacy of the capital of a FRFI such that there is the potential for loss to depositors or policyholders.

Inherent risk is intrinsic to a significant activity and is assessed without regard to the size of the activity relative to the size of the FRFI, and before considering the quality of the FRFI’s risk management. A thorough understanding of both the nature of the FRFI’s activities and the environment in which these activities operate is essential to identify and assess inherent risk.

OSFI uses the following six categories to assess inherent risk: credit risk; market risk; insurance risk; operational risk; regulatory compliance risk; and strategic risk. For each significant activity, the key inherent risks are identified and their levels are assessed as low, moderate, above average, or high. The categories and levels of inherent risk are described in more detail in Appendix A.

OSFI does not view reputational risk as a separate category of inherent risk. It is a consequence of each of the six inherent risk categories. Accordingly, it is an important consideration in the assessment of each inherent risk category.

Based on the key inherent risks identified for a significant activity and their levels, supervisors develop expectations for the quality of risk management. The higher the level of inherent risk, the more rigorous the day-to-day controls and oversight expected. State-of-the-art controls are expected where appropriate.

3. QUALITY OF RISK MANAGEMENT

OSFI assesses the quality of risk management (QRM) at two levels of control. These are:

OPERATIONAL MANAGEMENT

Operational management for a given significant activity is primarily responsible for the controls used to manage all of the activity’s inherent risks on a day-to-day basis. Operational management ensures that there is a clear understanding by FRFI line staff of the risks that the activity faces and must manage, and that policies, processes, and staff are sufficient and effective in managing these risks. When assessing operational management, OSFI’s primary concern is whether operational management is capable of identifying the potential for material loss that the activity may face, and has in place adequate controls.

Inherent risk is the probability of a material loss due to exposure to, and uncertainty arising from, current and potential future events.
Oversight functions are responsible for providing independent, enterprise-wide oversight of operational management. There are seven oversight functions that may exist in a FRFI: Financial; Compliance; Actuarial; Risk Management; Internal Audit; Senior Management; and the Board (see Appendix B). The presence and nature of these functions are expected to vary based on the nature, size and complexity of a FRFI and its inherent risks. Where a FRFI lacks some of the oversight functions, they are not sufficiently independent, or they don’t have enterprise-wide responsibility, OSFI expects other functions, within or external to the FRFI, to provide the independent oversight needed.

For each significant activity, OSFI assesses operational management and each of the relevant oversight functions as strong, acceptable, needs improvement, or weak. The appropriate rating is determined by comparing the nature and levels of the FRFI’s controls or oversight to OSFI’s expectations developed when assessing the levels of the key inherent risks.

THE IMPORTANCE OF THE NET RISK OF THE SIGNIFICANT ACTIVITY IS A JUDGMENT OF ITS CONTRIBUTION TO THE OVERALL RISK PROFILE OF THE FRFI.

For each relevant oversight function present in a FRFI, OSFI also determines an overall rating (strong, acceptable, needs improvement, or weak) that reflects the quality of the function’s oversight across the entire FRFI (see Appendix B). OSFI has Assessment Criteria that guide the determination of the overall rating for each oversight function. The assessment includes a determination of the direction of the quality of oversight (improving, stable, or deteriorating).

4. NET RISK

NET RISK IS INHERENT RISK(S) AFTER MITIGATION BY QRM

For each significant activity, the level of net risk is determined based on judgment that considers all of the key inherent risk ratings and relevant QRM ratings for the activity. Net risk is rated low, moderate, above average, or high. Appendix C shows typical net risk ratings for combinations of inherent risk and QRM ratings. The net risk assessment includes a determination of the direction of net risk (decreasing, stable, or increasing).

OSFI expects a FRFI to maintain controls and oversight that are commensurate with the key inherent risks, so that levels of net risk are considered prudent by OSFI. Where levels of net risk are considered imprudent, a FRFI is expected to address the situation by either improving QRM or reducing inherent risk.

5. IMPORTANCE AND OVERALL NET RISK

The importance of the net risk of the significant activity is a judgment of its contribution to the overall risk profile of the FRFI. Importance is rated as low, medium, or high. The significant activities assigned higher importance ratings are the key drivers of the overall risk profile.

The net risks of the significant activities are combined, by considering their relative importance, to arrive at the Overall Net Risk of the FRFI. The Overall Net Risk is an assessment of the potential adverse impact that the significant
activities of the FRFI collectively could have on the earnings performance and adequacy of the capital of the FRFI, and hence on the depositors or policyholders. Overall Net Risk is rated as low, moderate, above average, or high, and the direction is assessed as decreasing, stable, or increasing.

6. EARNINGS

Earnings are an important contributor to a FRFI’s long-term viability. Earnings are assessed based on their quality, quantity and consistency as a source of internally-generated capital. The assessment takes into consideration both historical trends and the future outlook, under both normal and stressed conditions. Earnings are assessed in relation to the FRFI’s Overall Net Risk.

Earnings are rated as strong, acceptable, needs improvement, or weak, and their direction is assessed as improving, stable, or deteriorating.

7. CAPITAL

Adequate capital is critical for the overall safety and soundness of FRFIs. Capital is assessed based on the appropriateness of its level and quality, both at present and prospectively, and under both normal and stressed conditions, given the FRFI’s Overall Net Risk. In the case of foreign branches, OSFI considers the adequacy of capital equivalency deposits and vested assets. The effectiveness of the FRFI’s capital management processes for maintaining adequate capital relative to the risks across all of its significant activities is also considered in the assessment. FRFIs with higher Overall Net Risk are expected to maintain a higher level and quality of capital and stronger capital management processes.

Capital is rated as strong, acceptable, needs improvement, or weak, and its direction is assessed as improving, stable, or deteriorating.

8. LIQUIDITY

Adequate balance sheet liquidity is critical for the overall safety and soundness of FRFIs. OSFI assesses liquidity at a FRFI by considering the level of its liquidity risk and the quality of its liquidity management. Liquidity risk arises from a FRFI’s potential inability to purchase or otherwise obtain the necessary funds to meet its on- and off-balance sheet obligations as they come due. The level of liquidity risk depends on the FRFI’s balance sheet composition, its funding sources, its liquidity strategy, and market conditions and events. FRFIs are required to maintain, both at present and prospectively, a level of liquidity risk and liquidity management processes that are prudent, under both normal and stressed conditions.

Liquidity is rated as strong, acceptable, needs improvement, or weak, and the direction is assessed as improving, stable, or deteriorating.

9. THE RISK MATRIX AND COMPOSITE RISK RATING

A Risk Matrix (see Appendix D) is used to record all of the assessments described above. The purpose of the Risk Matrix is to facilitate a holistic risk assessment of a FRFI. This assessment culminates in a Composite Risk Rating (CRR).

The CRR is an assessment of the FRFI’s risk profile, after considering the assessments of its earnings and capital in relation to the Overall Net Risk from its significant activities, and the assessment of its liquidity. The CRR is OSFI’s assessment of the safety and soundness of the FRFI with respect to its depositors and policyholders. The assessment is over a time horizon that is appropriate for the FRFI, given changes occurring internally and in its external environment. Composite Risk is rated low, moderate, above average or high. The assessment is supplemented by the Direction of Composite Risk, which is OSFI’s assessment of the most likely direction in
which the CRR may move. The Direction of Composite Risk is rated as decreasing, stable, or increasing.

The CRR of a FRFI is used in determining its stage of intervention, which is described in the Guide to Intervention for Federal Financial Institutions. Appendix E shows the combinations of Composite Risk Ratings and intervention ratings usually assigned.

While the Risk Matrix is a convenient way to summarize OSFI’s conclusions of risk assessment, it is supported by detailed documentation of the analysis and rationale for the conclusions.

THE CORE SUPERVISORY PROCESS

OSFI uses a defined process to guide its FRFI-specific supervisory work: the first step is planning supervisory work; the second is executing supervisory work and updating the risk profile; and the third is reporting and intervention. This process is dynamic, iterative and continuous, as shown below:

Performing supervisory work in this fashion helps keep OSFI’s risk assessments current and future oriented, which is vital to its ongoing effectiveness.

1. PLANNING SUPERVISORY WORK

A supervisory strategy for each FRFI is prepared annually. The supervisory strategy identifies the supervisory work necessary to keep the FRFI’s risk profile current. The intensity of supervisory work depends on the nature, size, complexity and risk profile of the FRFI.

The supervisory strategy outlines the supervisory work planned for the next three years, with a fuller description of work for the upcoming year. The supervisory strategy is the basis for a more detailed annual plan, which indicates the expected work and resource allocations for the upcoming year.

Supervisory work for each significant activity is planned and prioritized after considering the net risk assessment of the activity (including the types and levels of inherent risk, the quality of risk management, and any potential significant changes in these), the need to update OSFI’s information on the activity (due to information decay), and the importance of the activity. Similarly, supervisory work for each relevant oversight function is planned and prioritized after considering the assessment of the quality of its oversight, and the need to update OSFI’s information on the function.

In addition to FRFI-specific planning, OSFI’s planning also includes a process to compare the work effort across FRFIs. This is done to ensure that assessments of risk for individual FRFIs are subject to a broader standard, and that supervisory resources are allocated effectively to higher-risk FRFIs and significant activities.
2. EXECUTING SUPERVISORY WORK AND UPDATING THE RISK PROFILE

There is a continuum of supervisory work that ranges from monitoring (FRFI-specific and external), to limited off-site reviews, to extensive on-site reviews, including testing or sampling where necessary.

Monitoring refers to the regular review of information on the FRFI and its industry and environment, to keep abreast of changes that are occurring or planned in the FRFI and externally, and to identify emerging issues.

FRFI-specific monitoring includes the analysis of the FRFI’s financial results, typically considering its performance by business line and vis-à-vis its peers, and any significant internal developments. It may also extend to gathering information on non-regulated entities which have a significant influence on the FRFI, such as a holding company or foreign parent company. FRFI-specific monitoring usually also includes discussions with the FRFI’s management, including oversight functions.

Given the dynamic environment in which FRFIs operate, OSFI also continuously scans the external environment and industry, gathering information as broadly as possible, to identify emerging issues. Issues include both FRFI-specific and system-wide concerns. OSFI periodically requires FRFIs to perform specific stress tests which OSFI uses to assess the potential impact of changes in the operating environment on individual FRFIs or industries. Environmental scanning and stress testing have increased in importance since the Supervisory Framework was first introduced in 1999; changes in the external environment are a main driver of rapid changes in FRFI risk profiles.

Reviews refer to more extensive supervisory work than monitoring. The nature and scope of information reviewed, and the location of the review (“off-site” at OSFI premises when the scope of the review is limited or “on-site” at the FRFI’s premises when the scope is more extensive), are based on the specific requirements identified in the planning process. When an on-site review is conducted, OSFI may request information from the FRFI in advance. Reviews include discussions with FRFI management, including oversight functions.

In addition to the core supervisory work of monitoring and reviews, OSFI frequently undertakes comparative or benchmarking reviews to identify standard and best industry practices.

As supervisory work is conducted, the RM updates the overall risk profile of the FRFI. The Risk Matrix and supporting documentation detail OSFI’s
formal assessment of the FRFI’s business model and associated safety and soundness, both current and prospective. Key documents are subject to sign-off protocols within OSFI.

When there are shifts in the risk assessment of the FRFI, OSFI responds by adjusting work priorities set out in the supervisory strategy and annual plan, as necessary, to ensure that important matters emerging take precedence over items of lesser risk. Such flexibility is vital to OSFI’s ability to meet its legislated mandate.

3. REPORTING AND INTERVENTION

TO FRFIs

In addition to ongoing discussions with FRFI management, OSFI communicates to FRFIs through various formal, written reports.

Annually, or as appropriate, the RM writes a Supervisory Letter to the FRFI. The Supervisory Letter is the primary written communication to the FRFI. It summarizes OSFI’s key findings and recommendations (and requirements, as necessary) based on the supervisory work that was conducted since the last Supervisory Letter was issued, and discloses or affirms the FRFI’s Composite Risk Rating.

Supervisory Letters to Canadian companies are addressed to the Chief Executive Officer (CEO) and copied to the Chair of the Audit Committee (and Risk Committee, where applicable).

Supervisory Letters to Canadian branches of foreign companies are addressed to the Principal Officer or Chief Agent of the branch. Where there are significant issues with a Canadian branch or subsidiary of a foreign company, a copy of the Supervisory Letter is sent to the CEO and the Chair of the Audit Committee at the home office or parent company. In all cases, OSFI requests that a copy of the Supervisory Letter be provided to the external auditor, and to the appointed actuary where applicable.

During the year, OSFI may also issue an Interim Letter to the FRFI so as to provide the FRFI with timely feedback on issues arising from a specific body of supervisory work. The Interim Letter is sent to the appropriate senior manager within the FRFI, and a copy may also be provided to other individuals within the FRFI, if warranted.

With both types of letters, findings and recommendations are discussed with the FRFI before the letter is issued. A letter is generally issued within 45 calendar days of the completion of a review. The FRFI is typically asked to provide a response within 30 calendar days. OSFI analyzes the FRFI’s response for appropriateness, and follows up on the FRFI’s actions on a timely basis.

Both types of letters remind FRFIs that applicable Supervisory Information Regulations prohibit them from disclosing, directly or indirectly, prescribed supervisory information, including Supervisory Letters, except as provided for in the regulations.

TO OTHER CANADIAN AND FOREIGN REGULATORS

OSFI shares its letters with the Canada Deposit Insurance Corporation (CDIC) and provincial regulators with whom it has agency agreements. Reporting to these parties is in accordance with their respective agreements.

In accordance with the OSFI Act, OSFI is also permitted to share information pertaining to compliance with Part 1 of the Proceeds of Crime (Money Laundering) and Terrorist Financing Act with the Financial Transactions and Reports Analysis Centre of Canada (FINTRAC).
In addition, OSFI shares information, as appropriate, with foreign regulators with which it has a home-host relationship and a Memorandum of Understanding. Such information-sharing may take place when OSFI hosts or attends supervisory colleges.

In all cases, the confidentiality of information is respected.

**FINANCIAL INSTITUTIONS SUPERVISORY COMMITTEE (“FISC”) AND SENIOR ADVISORY COMMITTEE (“SAC”)**

As part of its ongoing supervisory work, OSFI monitors FRFIs and also scans the financial system in which they operate. In doing so, OSFI is able to identify issues that may impact the stability of the financial system. Where OSFI identifies such issues, it reports them to FISC and/or SAC, as appropriate, for further discussion and the determination of any necessary actions.

Information received from FISC and SAC members according to their unique mandates also, in turn, informs OSFI’s environmental scanning and identification of broad issues that may impact specific FRFIs.

**TO THE MINISTER OF FINANCE**

OSFI reports annually to the Minister of Finance on the safety and soundness of FRFIs and their compliance with the governing legislation.

---

*The Senior Advisory Committee (“SAC”) is a non-statutory body chaired by the Deputy Minister of Finance. The membership of the SAC is the same as FISC. The SAC operates as a consultative body and provides a forum for policy discussion on issues pertaining to the financial sector.*
CATEGORIES

CREDIT RISK
Credit risk arises from a counterparty’s potential inability or unwillingness to fully meet its on- and/or off-balance sheet contractual obligations. Exposure to this risk occurs any time funds are extended, committed, or invested through actual or implied contractual agreements.

Components of credit risk include: loan loss/principal risk, pre-settlement/replacement risk and settlement risk.

Counterparties include: issuers, debtors, borrowers, brokers, policyholders, reinsurers and guarantors.

MARKET RISK
Market risk arises from potential changes in market rates, prices or liquidity in various markets such as for interest rates, credit, foreign exchange, equities, and commodities. Exposure to this risk results from trading, investment, and other business activities which create on- and off-balance sheet positions.

Positions include: traded instruments, investments, net open (on- and off-) balance sheet positions, assets and liabilities, and can be either cash or derivative (linear or options-related).

INSURANCE RISK
Insurance risk arises from the potential for claims or payouts to be made to policyholders or beneficiaries. Exposure to this risk results from adverse events occurring under specified perils and conditions covered by the terms of an insurance policy. Typical insured perils include: accident, injury, liability, catastrophe, mortality, longevity, and morbidity.

Insurance risk includes uncertainties around:

a) the ultimate amount of net cash flows from premiums, commissions, claims, payouts, and related settlement expenses,
b) the timing of the receipt and payment of these cash flows, and

c) policyholder behavior (e.g., lapses).

Although the business of insurance contributes to the investment portfolio of an insurer, actual or imputed investment returns are not elements of insurance risk.

OPERATIONAL RISK
Operational risk arises from potential problems due to inadequate or failed internal processes, people and systems, or from external events. Operational risk includes legal risk i.e., potential unfavourable legal proceedings. Exposure to
operational risk results from either normal day-to-day operations (such as deficiencies or breakdowns in respect of transaction processing, fraud, physical security, money laundering and terrorist financing, data/information security, information technology systems, modeling, outsourcing, etc.) or a specific, unanticipated event (such as Enron-like litigation, court interpretations of a contract liability, natural disasters, loss of a key person, etc.).

REGULATORY COMPLIANCE RISK
Regulatory compliance risk arises from a FRFI’s potential non-conformance with laws, rules, regulations, prescribed practices, or ethical standards in any jurisdiction in which it operates.

STRATEGIC RISK
Strategic risk arises from a FRFI’s potential inability to implement appropriate business plans and strategies, make decisions, allocate resources, or adapt to changes in its business environment.

RATINGS
A material loss is a loss or combination of losses that could impair the adequacy of the capital of a FRFI such that there is the potential for loss to depositors or policyholders.

LOW
Low inherent risk exists when there is a lower than average probability of a material loss due to exposure to, and uncertainty arising from, current and potential future events.

MODERATE
Moderate inherent risk exists when there is an average probability of a material loss due to exposure to, and uncertainty arising from, current and potential future events.

ABOVE AVERAGE
Above average inherent risk exists when there is an above average probability of a material loss due to exposure to, and uncertainty arising from, current and potential future events.

HIGH
High inherent risk exists when there is a higher than above average probability of a material loss due to exposure to, and uncertainty arising from, current and potential future events.
APPENDIX B – QUALITY OF RISK MANAGEMENT CATEGORIES AND OVERALL RATINGS

CATEGORIES

OPERATIONAL MANAGEMENT
Operational management is responsible for planning, directing and controlling the day-to-day operations of a significant activity of a FRFI.

OVERSIGHT FUNCTIONS

Financial
Financial is an independent function responsible for ensuring the timely and accurate reporting and in-depth analysis of the operational results of a FRFI in order to support decision-making by Senior Management and the Board. Its responsibilities include:

- providing financial analysis of the FRFI’s and business line/unit performance and the major business cases to Senior Management and the Board, highlighting matters requiring their attention; and
- ensuring an effective financial reporting and management information system.

Compliance
Compliance (including the Chief Anti-Money Laundering Officer) is an independent function with the following responsibilities:

- setting the policies and procedures for adherence to regulatory requirements in all jurisdictions where the FRFI operates;
- monitoring the FRFI’s compliance with these policies and procedures; and
- reporting on compliance matters to Senior Management and the Board.

Actuarial
Actuarial is an independent function, applicable only to FRFIs with insurance business, with responsibilities beyond the legal requirements of the appointed actuary that could include the following:

- evaluating the design, pricing and valuation of the insurance products offered by the FRFI;
- assessing the reasonableness of provisions set for policy liabilities, and the appropriateness of the process followed;
- reviewing models used to determine exposures, and the adequacy of reinsurance programs to mitigate these exposures;
- analyzing stress testing results, and the process used, to establish the adequacy of capital and capital planning for the FRFI under adverse conditions; and

THE PRESENCE AND NATURE OF OVERSIGHT FUNCTIONS ARE EXPECTED TO VARY BASED ON THE NATURE, SIZE AND COMPLEXITY OF A FRFI AND ITS INHERENT RISKS.
Risk Management
Risk Management is an independent function responsible for the identification, assessment, monitoring, and reporting of risks arising from the FRFI’s operations. Its responsibilities typically include:

- identifying enterprise-wide risks;
- developing systems or models for measuring risk;
- establishing policies and procedures to manage risks;
- developing risk metrics (e.g., stress tests) and associated tolerance limits;
- monitoring positions against approved risk tolerance limits and capital levels; and
- reporting results of risk monitoring to Senior Management and the Board.

Internal Audit
Internal Audit is an independent function with responsibilities that include:

- assessing adherence to, and the effectiveness of, operational controls and oversight, including corporate governance processes; and
- reporting on the results of its work on a regular basis to Senior Management and directly to the Board.

Senior Management
Senior Management is responsible for directing and overseeing the effective management of the general operations of the FRFI. Its key responsibilities include:

- developing, for Board approval, the business model and associated objectives, strategies, plans, organizational structure and controls, and policies;
- developing and promoting (in conjunction with the Board) sound corporate governance practices, culture and ethics, which includes aligning employee compensation with the longer-term interests of the FRFI;
- executing and monitoring the achievement of Board-approved business objectives, strategies, plans and the effectiveness of organizational structure and controls; and
- ensuring that the Board is kept well informed.

Board
The Board is responsible for providing stewardship and oversight of management and operations of the entire FRFI. Its key responsibilities include:

- guiding, reviewing and approving the business model and associated objectives, strategies and plans;
- reviewing and approving corporate risk policy including overall risk appetite and tolerance;
- ensuring that Senior Management is qualified and competent;
> reviewing and approving organizational and procedural controls;
> ensuring that principal risks are identified and appropriately managed;
> ensuring that compensation for employees, Senior Management and the Board is aligned with the longer term interests of the FRFI;
> reviewing and approving policies for major activities; and
> providing for an independent assessment of management controls.

**OVERALL RATINGS**

**STRONG**

The characteristics (e.g., mandate, organization structure, resources, methodologies, practices) of the function exceed what is considered necessary, given the nature, scope, complexity, and risk profile of the FRFI. The function has consistently demonstrated highly effective performance. The function’s characteristics and performance are superior to sound industry practices.

**ACCEPTABLE**

The characteristics (e.g., mandate, organization structure, resources, methodologies, practices) of the function meet what is considered necessary, given the nature, scope, complexity, and risk profile of the FRFI. The function’s performance has been effective. The function’s characteristics and performance meet sound industry practices.

**NEEDS IMPROVEMENT**

The characteristics (e.g., mandate, organization structure, resources, methodologies, practices) of the function generally meet what is considered necessary, given the nature, scope, complexity, and risk profile of the FRFI, but there are some significant areas that require improvement. The function’s performance has generally been effective, but there are some significant areas where effectiveness needs to be improved. The areas needing improvement are not serious enough to cause prudential concerns if addressed in a timely manner. The function’s characteristics and/or performance do not consistently meet sound industry practices.

**WEAK**

The characteristics (e.g., mandate, organization structure, resources, methodologies, practices) of the function are not, in a material way, what is considered necessary, given the nature, scope, complexity, and risk profile of the FRFI. The function’s performance has demonstrated serious instances where effectiveness needs to be improved through immediate action. The function’s characteristics and/or performance often do not meet sound industry practices.
APPENDIX C – TYPICAL NET RISK RATINGS

The chart below shows typical net risk ratings for combinations of inherent risk and QRM ratings.

The compensation plan for property and casualty insurers (the "Plan") funded by property and casualty insurance companies resulted from extensive negotiations that took place with the provincial and federal Superintendents of Insurance over a period of five years and is designed to come into operation on the insolvency of a property and casualty insurer. The details of the Plan having been agreed upon by the Superintendents, the corporation which administers the compensation arrangements was incorporated as a federal non-profit corporation in 1988. Its name is the Property and Casuality Insurance Compensation Corporation/Societe d'indemnisation en matiere d'assurances IARD ("PACICC"). Prior to PACICC entering into agreements with each of the provinces and territories, it was necessary to have each provincial and territorial Superintendent agree with PACICC on "prudential criteria" i.e. solvency standards to be imposed on all P&C insurers in his or her jurisdiction. The Plan has been in effect country-wide since 1989.

The following sections describe the main features of the Plan.
1. The Plan

The Plan is designed to provide a reasonable level of recovery for claims of policyholders under most policies issued by property and casualty insurance companies. The life insurance industry has a similar plan for life insurers which are therefore excluded from the Plan. Also excluded, because of their distinctive characteristics are aircraft, credit, crop, directors' and officers', employer's liability, certain errors and omissions (medical malpractice is not excluded), fidelity, financial guarantee, marine, mortgage, surety and title insurance. Automobile insurance in Manitoba and Saskatchewan is excluded, as are claims for bodily injury arising from automobile accidents occurring in Quebec for which compensation is available from the Société d'assurance automobile du Québec. However, government-owned insurers otherwise participate in the Plan. Accident and Sickness Insurance is protected by the Plan, if the insurer writes it and also writes one or more classes of general insurance; if the insurer writes A and S insurance only, or A and S and Life insurance, the life insurance industry plan applies. Notwithstanding these exclusions, the Plan covers most claims under most P&C insurance policies.

The Plan, to begin with, assumed no liability for unearned premiums whatsoever but for insolvencies occurring after 1996, it now responds to claims for unearned premiums. This is limited, however, to 70% of a maximum unearned premium of $1,000 so that, effectively, the most PACICC will pay in respect of a claim for unearned premiums is $700. To take an example, if your policy period is January 1 to December 31 and a winding-up order is made in respect of your insurer on May 31, that means, in effect, that the premium for the period January 1 to May 31 has been earned (your insurance has been on risk for that period) and the premium for the period June 1 to December 31 (7 months) is unearned. If your premium was $960, your claim for unearned premium is 7/12's of $960 i.e. $560. PACICC would pay 70% x $560.00=$392.

2. Initiation of the Plan

The Plan is administered by PACICC, a non-profit corporation incorporated under Part II of the Canada Corporations Act. All participating insurance companies are members of PACICC. A participating insurance company is a company licensed in a participating jurisdiction to sell any of the classes of insurance for which PACICC provides protection. Those jurisdictions enacting legislation relating to the Plan have provided for exemptions for e.g. reinsurers, farm mutuals, and reciprocals. Some of the jurisdictions have enacted appropriate legislation that deems all licensed property and casualty insurers to be members of PACICC and to be bound by its By-laws and Memorandum of Operation, including commitments to make their appropriate contributions to assessments. Others have enacted legislation or regulations making it a condition of being licensed that the property and casualty insurer enter into a contract of membership with PACICC that imposes similar obligations on the insurer. All Provinces and Territories have the necessary legislation in place.

While a company is licensed in a participating jurisdiction it may not withdraw from membership in PACICC and PACICC may not terminate its membership. The company's membership is, however, deemed to be terminated six months after cancellation of its licence by a jurisdiction, if that cancellation results in its not being licensed in any participating jurisdiction to sell any of the classes of insurance protected by PACICC.
In addition, as mentioned earlier, agreement had to be reached with the Superintendents of Insurance on prudential criteria and before amending prudential criteria in future, the jurisdiction concerned is required to consult with PACICC.

3. Operation of PACICC

PACICC is administered by a Board of Directors elected by its members i.e. participating insurers. It operates in close liaison with the Federal Superintendent of Financial Institutions and with Superintendents of Insurance or similar insurance regulatory authorities of participating jurisdictions. The Superintendents are not official members of the Board of Directors of PACICC but they may designate representatives to participate in Board discussions on a non-voting basis. Also, the Board has the right to appoint an advisory committee as to any specific insolvency and to delegate responsibilities to that committee; again, the Superintendents are entitled to designate non-voting representatives to any advisory committee.

The obligations of PACICC come into operation only upon a formal winding-up order under the federal Winding-Up and Restructuring Act. Until that occurs, PACICC has no financial responsibility in connection with an insurer.

4. Procedure in an Insolvency

Immediately after the winding-up order is made, representatives of PACICC consult with the court appointed liquidator to arrive at an appropriate working relationship. Indeed, preliminary consultations are held on an informal basis prior to the appointment although, as mentioned earlier, PACICC is not called upon to make any payments until after the winding-up order has been made.

PACICC has discussions with the relevant Superintendent of Insurance as to pre-selecting the liquidator or the agent of a liquidator, when an insolvency is imminent. The major accounting firms tend to be invited to take part in a tender process, although the firm that has been the auditor of the insolvent insurer is excluded from consideration. We have also developed a model wind-up order (in conjunction with the liquidators) and we find the liquidators invariably use it.

PACICC's Memorandum of Operation is sufficiently flexible to allow for a variety of factual situations that may arise and to permit appropriate working arrangements to be made.

Under current arrangements, the procedures established by the liquidator to settle the quantum of policyholder claims against the insolvent insurer are reviewed with PACICC in order that PACICC is prepared to accept and act upon the settlements reached by the liquidator's adjusters. Where consensus is reached as to the procedures, it is possible for PACICC simply to make payment to a policyholder after the quantum of his claim is settled with the liquidator. PACICC is not, however, obligated to do this - it may review the settlement to verify that the amount is appropriate.

PACICC has discretion to make payments to third parties and in such cases the model wind-up order deems the policyholder has transferred her/his rights against the insurer to PACICC. PACICC does not stand in the shoes of the liquidator but it is generally the
case that the co-operation between them is such that PACICC requires minimal staff resources.

5. Payment of Claims

The maximum recovery from PACICC is currently $250,000 for all covered policies (with the exception of personal property policies, where the maximum recovery is $300,000) in respect of all claims arising from policies issued to a single named insured by the insolvent insurer and which arise from a single occurrence. The actual amount to which a particular insured (or third party claiming through the insured) is entitled is determined by first calculating what the aggregate of his entitlement is under all applicable provisions of his or her policy or policies (such as deductibles, co-insurance, etc.) and secondly, determining the lesser of that amount and the PACICC limit.

For example, an automobile insurance policyholder with a policy deductible of $250 and a claim of $300,000 can look to PACICC for $250,000; a policyholder with a claim of $175,000 and with a policy deductible of $500 can look to PACICC for $174,500. The purpose of the Plan, therefore, is to provide policyholders with basic compensation. It is not designed to provide full protection in all cases.

Because all claims by a policyholder arising out of a single occurrence are aggregated, it is sometimes necessary for PACICC to establish priorities as to how a particular payment is to be applied. You may, for example, as a result of your negligence in driving your vehicle, be sued by, say, 3 passengers in your vehicle, and by 2 occupants of the other vehicle.

6. Other Arrangements as to Plan Payments

So that the Plan can operate effectively, other limitations are necessary as to the claims that PACICC will pay. Claims asserted by persons who have a special relationship with the insolvent insurer may be excluded by the Board of PACICC. Further, in extreme cases, a major insolvency might trigger the limit (see paragraph 8 following) on the extent to which a participating insurer can be called upon in any year to pay assessments to PACICC; in such case it may be necessary for the Board of PACICC to make decisions that will stretch out the time over which claims will be met by PACICC.

Subject to these limitations, the Plan applies to any claims that arise under insurance policies described in paragraph 1 either prior to the winding-up order or within such time thereafter as the PACICC Board may determine. The extended time period is intended to give ample time to brokers and others to notify policyholders of the need to put in place other insurance arrangements.

7. Recovery by PACICC of Amounts Paid

A key principle of the Plan is that any amounts paid by PACICC are recovered by PACICC before any additional payment is received by the policyholder as to that claim. To the extent that resources to pay a particular claim are available from the insolvent insurer (or through third party claims) payments by PACICC towards that claim would therefore be of an interim nature.
Before a payment is made to or on behalf of a policyholder, the policyholder is required to certify that he or she has exhausted any available claim against any solvent insurer with whom he has a policy that covers the same loss. Further, he or she is required to assign to PACICC all of his or her rights against the insolvent insurer that arise under the particular policy. This is normally dealt with in the wind-up order. The consequence of this assignment for an insured with a claim of $300,000, as to which PACICC pays $250,000, would be that the insured would receive no participation in a distribution of $150,000 made by the liquidator of the insolvent insurer; if the distribution was $275,000, the insured would receive $25,000.

PACICC is also entitled to first priority against amounts received by the insured from third parties with respect to the loss for which PACICC provided payment.

8. Assessment Process

PACICC recovers the amount that it advanced to and on behalf of the policyholders of an insolvent insurer through assessments levied against particular participating insurers licensed in the participating jurisdictions in which the insolvent insurer was writing business. Separate assessments are made in respect of each participating jurisdiction in which the insolvent insurer wrote business. These assessments are limited to the shortfall between amounts advanced by PACICC and amounts recovered by it from the insolvent insurer and third parties.

To ensure that PACICC is in a position to respond to the financial demands that may be made on it, provisions were added to its Memorandum of Operation in 1996 to provide for some pre-insolvency funding. In each of the years 1998, 1999 and 2000 a special levy was made on companies to establish a Compensation Fund of approximately $30 million. Investment income is being accumulated to the Fund. The value of the Fund was approximately $43 million as of June 2009. (The Fund value is publicly disclosed at each calendar year-end in PACICC’s Annual Report).

A particular participating insurer is assessed as to each participating jurisdiction in which it is licenced and in which the insolvent insurer was also licenced in accordance with the following formula:

\[
A = \frac{B \times C}{D}
\]

Where:

"A" is the assessment to be borne by the particular participating insurer in respect of the relevant participating jurisdiction;

"B" is the total amount being assessed against all participating insurers in respect of the relevant participating jurisdiction;
"C" is the total direct written premiums for protected policies of the particular participating insurer in respect of the relevant participating jurisdiction; and

"D" is the total direct written premiums for protected policies of all participating insurers in respect of the relevant participating jurisdiction.

For the purpose of determining the premium income of insurers, PACICC relies on the reports which insurers are required to file with the relevant Superintendents of Insurance. The maximum annual levy that an insurer may be asked to pay in a particular jurisdiction is 1.5% of its direct written premium in that jurisdiction. The Board of Directors of PACICC, in practice, makes a general assessment in respect of each participating jurisdiction early in the course of a particular insolvency, reflecting the maximum exposure that it anticipates under the particular insolvency, subsequently levying draws on that assessment as the need for funds has arisen. The Board may also choose to have PACICC borrow money from its Compensation Fund and delay implementing an assessment until it is better able to estimate PACICC’s exposure. The money borrowed from the Fund must be fully repaid with interest, with the relevant insurers being assessed for the appropriate amount.

The Board of Directors is also entitled to levy administrative assessments for the administration expenses of PACICC. In 2009, the fee varied from $1,850 for the smallest companies to $9,200 for the largest companies.

If the making of Compensation Payments is likely to cause financial difficulty to the property and casualty industry or to PACICC, the Corporation is required to have discussions with the regulators with a view to modifying the compensation arrangements and possibly to defer making payments, if this is appropriate, while the discussions are continuing.

**9. Conclusion**

The Plan protects policyholders who are in need of protection against the more serious results of the insolvency of a property and casualty insurer without exposing the general insurance industry to an unlimited liability for all claims against an insolvent insurer. Prior recovery of amounts advanced by PACICC from any other recoveries of the insured against the same claim is consistent with this approach.

It has been proved that the plan arrangements can operate effectively and efficiently in the context of the established degree of co-operation among Superintendents of Insurance, liquidators and the insurance industry in insolvencies.
