4 HOURS

# INSTRUCTIONS TO CANDIDATES

- 1. This 55.00 point examination consists of 24 problem and essay questions.
- 2. For the problem and essay questions, the number of points for each full question and part of a question is indicated at the beginning of the question or part. Answer these questions on the lined sheets provided in your Examination Envelope. Use <u>dark</u> pencil or ink. Do not use multiple colors or correction fluid/tape.
  - Write your Candidate ID number and the examination number, 5, at the top of each answer sheet. For your Candidate ID number, four boxes are provided corresponding to one box for each digit in your Candidate ID number. If your Candidate ID number is fewer than 4 digits, begin in the first box and do <u>not</u> include leading zeroes. Your name, or any other identifying mark, must not appear.
  - Do not answer more than one question on a single sheet of paper. Write only on the front lined side of the paper DO NOT WRITE ON THE BACK OF THE PAPER. Be careful to give the number of the question you are answering on each sheet. If your response cannot be confined to one page, please use additional sheets of paper as necessary. Clearly mark the question number on each page of the response in addition to using a label such as "Page 1 of 2" on the first sheet of paper and then "Page 2 of 2" on the second sheet of paper.
  - The answer should be concise and confined to the question as posed. <u>When a specified number</u> of items are requested, do not offer more items than requested. For example, if you are requested to provide three items, only the first three responses will be graded.
  - <u>In order to receive full credit</u> or to maximize partial credit on mathematical and computational questions, you must clearly outline your approach in either verbal or mathematical form, <u>showing calculations</u> where necessary. Also, you must clearly <u>specify any additional</u> assumptions you have made to answer the question.
- 3. Do all problems until you reach the last page of the examination where "END OF EXAMINATION" is marked.

- 4. Prior to the start of the exam you will have a **fifteen-minute reading period** in which you can silently read the questions and check the exam booklet for missing or defective pages. A chart indicating the point value for each question is attached to the back of the examination. Writing will NOT be permitted during this time and you will not be permitted to hold pens or pencils. You will also not be allowed to use calculators. The supervisor has additional exams for those candidates who have defective exam booklets.
- 5. Your Examination Envelope is pre-labeled with your Candidate ID number, name, exam number and test center. <u>Do not remove this label.</u> Keep a record of your Candidate ID number for future inquiries regarding this exam.
- 6. <u>Candidates must remain in the examination center until two hours after the start of the examination.</u> The examination starts after the reading period is complete. You may leave the examination room to use the restroom with permission from the supervisor. To avoid excessive noise during the end of the examination, candidates may not leave the exam room during the last fifteen minutes of the examination.
- 7. <u>At the end of the examination, place all answer sheets in the Examination Envelope.</u> Please insert your answer sheets in your envelope in question number order. Insert a numbered page for each question, even if you have not attempted to answer that question. Nothing written in the examination booklet will be graded. <u>Only the answer sheets will be graded</u>. Also place any included reference materials in the Examination Envelope. <u>BEFORE YOU TURN THE EXAMINATION ENVELOPE IN TO THE SUPERVISOR, BE SURE TO SIGN IT IN THE SPACE PROVIDED ABOVE THE CUT-OUT WINDOW.</u>
- 8. If you have brought a self-addressed, stamped envelope, you may put the examination booklet and scrap paper inside and submit it separately to the supervisor. It will be mailed to you. <u>Do not</u> <u>put the self-addressed stamped envelope inside the Examination Envelope.</u> Interoffice mail is not acceptable.

If you do not have a self-addressed, stamped envelope, please place the examination booklet in the Examination Envelope and seal the envelope. You may not take it with you. <u>Do not put scrap</u> paper in the Examination Envelope. The supervisor will collect your scrap paper.

Candidates may obtain a copy of the examination from the CAS Web Site.

All extra answer sheets, scrap paper, etc. must be returned to the supervisor for disposal.

- 9. Candidates must not give or receive assistance of any kind during the examination. Any cheating, any attempt to cheat, assisting others to cheat, or participating therein, or other improper conduct will result in the Casualty Actuarial Society and the Canadian Institute of Actuaries disqualifying the candidate's paper, and such other disciplinary action as may be deemed appropriate within the guidelines of the CAS Policy on Examination Discipline.
- 10. The exam survey is available on the CAS Web Site in the "Admissions/Exams" section. Please submit your survey by November 5, 2018.

# END OF INSTRUCTIONS

#### 1. (2.5 points)

An insurer is considering changing the exposure base for boat owners line of business from boat-years to the insured value of the boat.

The insurer offers the following coverages for boat owners:

- i. Liability coverage pays for damages to another boat or injuries of people not on the insured's boat.
- ii. Physical damage coverage pays for damages to the insured's boat caused by common risks, such as sinking, fire, storms, theft, and collision.

Using three criteria for a good exposure base, evaluate the effectiveness of the proposed change in exposure base for both liability and physical damage coverages and provide a recommendation for the preferred exposure base.

# 2. (2 points)

Given the following premium and loss information:

|        | Premium Transactions |                     |                 |           |                        |  |
|--------|----------------------|---------------------|-----------------|-----------|------------------------|--|
|        |                      |                     |                 | Full-Term |                        |  |
|        | Original Effective   | Original Expiration | Transaction     | Premium   |                        |  |
| Policy | Date                 | Date                | Effective Date  | (\$)      | Notes                  |  |

| С      | January 1, 2018   | January 15, 2018 | 750               |  |  |

• Each claim is closed on the payment date.

a. (0.75 point)

Calculate the 2017 calendar year earned premium.

b. (1.25 points)

Calculate the 2017 policy year loss ratio evaluated at December 31, 2018.

#### 3. (1.75 points)

Given the following:

|                 | Overall Average | Rate Per      | Class    | Class    | Class    | Expense  |
|-----------------|-----------------|---------------|----------|----------|----------|----------|
| Effective Date  | Rate Change     | Exposure (\$) | Factor X | Factor Y | Factor Z | Fee (\$) |
| January 1, 2016 | 0.0%            | 1,000         | 1.20     | 0.85     | 1.00     | 120      |
| July 1, 2017    | 10.0%           | 1,112         | 1.20     | 0.85     | 1.00     | 120      |
| October 1, 2017 | 0.0%            | 1,175         | 1.10     | 0.75     | 1.00     | 120      |
| April 1, 2018   | 1.0%            | 1,175         | 1.10     | 0.75     | 1.00     | 132      |

- All policies are semi-annual.
- Exposures are written uniformly throughout the year.
- Expense fee is a per exposure fee that is added in the last step of the rate calculation.

#### a. (0.75 point)

Calculate the on-level factor for calendar year 2017 earned premium using the parallelogram method.

#### b. (0.5 point)

Calculate the on-level factor for a policy effective on April 1, 2017 within Class Y using the extension of exposure method.

#### c. (0.5 point)

Assess the appropriateness of using the parallelogram method to calculate indicated class factors using the loss ratio method.

#### 4. (1.5 points)

Given the following information:

|             | Loss Costs by Report Year Lag (\$) |     |     |
|-------------|------------------------------------|-----|-----|
| Report Year | 0                                  | 1   | 2   |
| 2015        | 500                                | 300 | 200 |
| 2016        | 525                                | 330 | 210 |
| 2017        | 550                                | 365 | 220 |

#### a. (0.25 point)

Calculate the report year 2015 loss costs for a claims-made policy.

#### b. (0.25 point)

Calculate the accident year 2015 loss costs for an occurrence policy.

#### c. (0.5 point)

Compare the effect of an unexpected increase in underlying trend on the accuracy of the pricing for a claims-made policy and an occurrence policy. Briefly explain why one of the policies is impacted more than the other.

#### d. (0.25 point)

Briefly explain why the risk of reserve inadequacy is reduced for a claims-made policy relative to an occurrence policy.

#### e. (0.25 point)

Briefly describe why the investment income earned from claims-made policies is less than under occurrence policies.

#### 5. (2 points)

Given the following:

| Accident Year | Incurred Loss and ALAE as of<br>December 31, 2017 (\$000s) |
|---------------|--|
| 2015          | \$15,000   |
| 2016          | \$8,000  |
| 2017          | \$2,000  |

| Year Ending Quarter | Frequency | Severity<br>(\$) | Pure<br>Premium<br>(\$) |
|---------------------|-----------|------------------|-------------------------|
| March 31, 2014      | 0.055     | 18,200           | 1,001                   |
| June 30, 2014       | 0.054     | 18,000           | 972                     |
| September 30, 2014  | 0.056     | 18,100           | 1,014                   |
| December 31, 2014   | 0.058     | 18,300           | 1,061                   |
| March 31, 2015      | 0.058     | 18,500           | 1,073                   |
| June 30, 2015       | 0.059     | 19,000           | 1,121                   |
| September 30, 2015  | 0.062     | 19,200           | 1,190                   |
| December 31, 2015   | 0.063     | 19,500           | 1,229                   |
| March 31, 2016      | 0.065     | 19,750           | 1,284                   |
| June 30, 2016       | 0.066     | 19,885           | 1,312                   |
| September 30, 2016  | 0.066     | 20,000           | 1,320                   |
| December 31, 2016   | 0.068     | 20,250           | 1,377                   |
| March 31, 2017      | 0.069     | 20,445           | 1,411                   |
| June 30, 2017       | 0.070     | 20,882           | 1,462                   |
| September 30, 2017  | 0.069     | 21,000           | 1,449                   |
| December 31, 2017   | 0.065     | 21,250           | 1,381                   |

| Annual Exponential Trends |           |          |         |  |  |  |
|---------------------------|-----------|----------|---------|--|--|--|
| # of                      | # of Pure |          |         |  |  |  |
| Points                    | Frequency | Severity | Premium |  |  |  |
| 16                        | 7%        | 5%       | 12%     |  |  |  |
| 12                        | 6%        | 5%       | 11%     |  |  |  |
| 8                         | 2%        | 4%       | 7%      |  |  |  |
| 6                         | 0%        | 5%       | 5%      |  |  |  |
| 4                         | -7%       | 5%       | -3%     |  |  |  |

- All policies are semi-annual.
- Rates are to be in effect for 2 years.
- There is no development after 36 months.
- An underwriting change went into effect on July 1, 2017, materially changing the composition of the book of business.
- A planned rate change will go into effect on January 1, 2019.

Calculate the projected 2015 accident year loss and ALAE to be used in the rate change analysis. Justify any trend selections.

#### 6. (1.5 points)

Two methods of deriving expense provisions in ratemaking include the premium-based projection method and the exposure-based projection method.

#### a. (1 point)

For each method, briefly describe how both fixed and variable expenses are treated.

#### b. (0.5 point)

Briefly describe one shortcoming (or distortion) of each method.

# 7. (5.75 points)

Given the following information as of December 31, 2017:

| Cu       | mulative Reported<br>as of (mon | Claim Counts ths) | 5   | Cumu     | lative Reporte<br>as of (m | d Loss + ALA<br>onths) | λE (\$)   |
|----------|---------------------------------|-------------------|-----|----------|----------------------------|------------------------|-----------|
| Accident |                                 |                   |     | Accident |                            |                        |           |
| Year     | 12                              | 24                | 36  | Year     | 12                         | 24                     | 36        |
| 2015     | 480                             | 456               | 447 | 2015     | 7,200,000                  | 8,208,000              | 8,850,600 |
| 2016     | 560                             | 532               |     | 2016     | 8,120,000                  | 9,256,800              |           |
| 2017     | 590                             |                   | 5   | 2017     | 9,145,000                  |                        |           |

\$98,000 Expected reinsurance recoveries
 \$318,000 Cost of reinsurance (expected ceded premium)
 3% Expected annual exposure increase

| Calendar | Earned    |  |
|----------|-----------|--|
| Year     | Exposures |  |
| 2015     | 14,000    |  |
| 2016     | 15,000    |  |
| 2017     | 17,000    |  |

| 5%               | ULAE provision as a percent of loss and ALAE         |
|------------------|--|
| 3%               | Annual pure premium trend                            |
| \$2 <sup>-</sup> | Projected fixed expenses per exposure                |
| 15%              | Variable expense ratio                               |
| 10%              | Profit provision                                     |
| 2%               | Contingency provision                                |
| \$950            | On-leveled and projected earned premium per exposure |

Exposures are written evenly throughout each year.

All policies are annual.

There is no loss development or claim count development beyond 36 months.

The reinsurance contract has a 12 month term length and an effective date of January 1, 2019.

Rates are to be in effect for one year.

Rate revision is planned to be effective April 1, 2019.

a. (1 point)

Calculate the projected net reinsurance cost per exposure using a 12-month term for the reinsurance contract.

#### b. (2 points)

Calculate the ultimate losses and ALAE for each accident year using an appropriate frequency-severity technique.

#### c. (1.75 points)

Calculate the projected pure premium per exposure using even weights across the three accident years.

d. (1 point)

Calculate the indicated rate change.

#### 8. (2.25 points)

Given the following information:

| \$500 | Current average premium          |
|-------|----------------------------------|
| \$600 | Indicated average premium        |
| \$510 | All competitors' average premium |

a. (0.5 point)

List two likely consequences of the company implementing the indicated rate.

b. (0.5 point)

Briefly describe two factors that affect an insured's propensity to renew.

c. (0.75 point)

The company has decided to not implement the indicated rate. List three non-pricing solutions the company could implement to ensure profitability does not deteriorate.

d. (0.5 point)

Identify an issue with comparing one company's premium to another and briefly propose a solution to this issue.

.

#### 9. (2 points)

An auto insurer is evaluating the variable "number of vehicles" for inclusion in a rating plan. Given the following Generalized Linear Model (GLM) output:

Number of vehicles chi-square percentage: 10%

#### a. (1 point)

Fully justify whether number of vehicles should be included in the rating plan.

#### b. (0.75 point)

Briefly discuss three challenges associated with performing GLM analysis on loss ratio data.

#### c. (0.25 point)

GLM analysis is widely accepted in classification ratemaking. Briefly discuss one reason that univariate analysis may be more appropriate than GLM analysis.

#### 10. (2.5 points)

A company writes homeowners insurance in a large state divided in half by a mountain range. The company currently uses two geographic rating territories, one on either side of the mountains, as the range has an effect on weather patterns. Each territory has sufficient exposures for its loss experience to be considered fully credible.

#### a. (0.5 point)

Briefly discuss two disadvantages of the company's current territorial rating approach.

#### b. (2 points)

Discuss the process by which an actuary would develop new rating territory definitions for this state. Briefly explain a consideration for each step in the process.

#### 11. (1.75 points)

Given the following for a large deductible commercial general liability policy:

| \$500,000   | Per occurrence deductible  |
|-------------|--|
| 90.0%       | Loss elimination ratio for a \$500,000 deductible                |
| 10.0%       | ALAE/ground up loss ratio  |
| \$2,000,000 | Ground up loss estimate  |
| \$100,000   | Fixed expenses   |
| 12.0%       | Variable expenses as % of premium                                |
| 4.0%        | Underwriting profit as % of premium                              |
| 3.0%        | Deductible processing cost as a % of losses below the deductible |
| 1.0%        | Credit risk as a % of losses below the deductible                |
| 7.0%        | Additional risk margin as a % of excess losses                   |

• The insurer will handle all claims, including those that fall below the deductible.

- The insurer will make the payments on all claims and will seek reimbursement for amounts below the deductible from the insured.
- The deductible is for loss only.
- All ALAE is paid by the insurer.

Calculate the premium for the large deductible policy.

#### 12. (2.5 points)

Given the following for an insurance company:

#### Premium = (Base Rate) × (Rating Factor 1) × (Rating Factor 2)

| Variable 1 Segment | Rating Factor 1 |
|--------------------|-----------------|
| A                  | 0.90            |
| В                  | 2.00            |
| С                  | 1.00            |

| Variable 2 Segment | Rating Factor 2 |
|--------------------|-----------------|
| Х                  | 0.75            |
| Y                  | 0.95            |
| Z                  | 1.00            |

| Earned Exposures |            |       |       |  |  |
|------------------|------------|-------|-------|--|--|
|                  | Variable 1 |       |       |  |  |
| Variable 2       | A B C      |       |       |  |  |
| Х                | 800        | 1,500 | 600   |  |  |
| Y                | 300        | 750   | 500   |  |  |
| Z                | 500        | 500   | 1,500 |  |  |

| Reported Loss & ALAE (\$) |            |           |           |  |  |
|---------------------------|------------|-----------|-----------|--|--|
|                           | Variable 1 |           |           |  |  |
| Variable 2                | A B C      |           |           |  |  |
| Х                         | 320,000    | 2,100,000 | 400,000   |  |  |
| Y                         | 170,000    | 1,535,000 | 500,000   |  |  |
| Z                         | 305,000    | 1,100,000 | 1,600,000 |  |  |

• The base rate is \$1,000.

- The base classification for Variable 1 is C.
- The proposed overall rate level change is 0%.
- a. (1.5 points)

Calculate the indicated relativities for Variable 1 using the adjusted pure premium method.

b. (0.5 point)

Calculate the proposed base rate assuming the company selects half of the indicated relativity change for each segment of Variable 1.

#### c. (0.5 point)

Briefly describe two social criteria for evaluating the appropriateness of rating variables.

#### 13. (2.75 points)

| Size of Loss |        |             | Loss Distribution |
|--------------|--------|-------------|-------------------|
|              | X ≤    | \$400,000   | 50.0%             |
| \$400,000    | < X ≤  | \$550,000   | 25.0%             |
| \$550,000    | < X ≤  | \$700,000   | 10.0%             |
| \$700,000    | < X ≤  | \$850,000   | 10.0%             |
| \$850,000    | < X ≤  | \$1,000,000 | 2.5%              |
| \$1,000,000  | < X ≤  | \$1,500,000 | 2.5%              |
|              | Total: |             | 100.0%            |

Given the following information about a home's propensity for loss:

• Expected claim frequency is 2%.

• Expected losses are uniformly distributed within each layer of loss.

• The home is valued at \$1,500,000.

#### a. (1.25 points)

Calculate the rate per \$1,000 of coverage for the home at the following amounts of insurance:

- i. \$1,500,000
- ii. \$800,000

#### b. (0.5 point)

Briefly discuss a problem associated with underinsurance from the following perspectives:

- i. Insured
- ii. Insurer

c. (1 point)

The home is insured for \$1,000,000 with a coinsurance requirement of 80%. Calculate the indemnity payments and coinsurance penalties for the following losses:

- i. \$800,000
- ii. \$1,200,000

# 14. (1.5 points)

For each of the following stakeholders, describe the importance of having accurate unpaid claim estimates:

i. Internal Management

 $\langle \gamma \rangle$ 

- ii. Investors
- iii. Regulators

#### 15. (2.75 points)

Given the following:

|          |                  |                   | Gross Amount Paid on  | Gross Ending Case |
|----------|------------------|-------------------|-----------------------|-------------------|
| Claim ID | Accident Date    | Transaction Date  | Transaction Date (\$) | Outstanding (\$)  |
|          |                  | December 24, 2015 | 1,000                 | 550               |
| A        | May 30, 2015     | August 1, 2016    | 500                   | 225               |
|          |                  | June 1, 2017      | 725                   | 0                 |
|          |                  | August 29, 2015   | 300                   | 1,050             |
| В        | August 28, 2015  | February 6, 2016  | 600                   | 375               |

| D        | October 11, 2016 | May 17, 2017      | 800                   | 625               |

| 60%     | Quota share ceded percentage for reinsurance that applies to claims occurring in 2015.       |
|---------|--|
| \$1,500 | Per claim excess of loss retention for reinsurance that applies to claims occurring in 2016. |

#### a. (0.25 point)

Calculate calendar year 2015 reported claims, gross of reinsurance.

#### b. (0.75 point)

Calculate calendar year 2016 paid claims, net of reinsurance.

#### c. (0.75 point)

Calculate calendar year 2016 reported claims, gross of reinsurance.

#### d. (1 point)

Calculate calendar year 2017 reported claims, net of reinsurance.

#### 16. (2 points)

An insurance company with a book of business (Book A) has recently acquired a smaller book of business (Book B) in the same state and line of business. Given the following as of December 31, 2017:

#### Book A

| Accident | Report | ed Claims (\$0 | 000) as of (mo | onths)  | Ca |
|----------|--------|----------------|----------------|---------|----|
| Year     | 12     | 24             | 36             | 48      |    |
| 2014     | 55,000 | 92,000         | 112,500        | 123,700 | 2  |
| 2015     | 54,800 | 92,600         | 111,100        |         |    |
| 2016     | 57,000 | 94,400         |                |         | 2  |
| 2017     | 62,600 |                |                |         | 2  |

| Calendar | Earned          |
|----------|-----------------|
| Year     | Premium (\$000) |
| 2014     | 175,200         |
| 2015     | 179,400         |
| 2016     | 182,800         |
| 2017     | 184,200         |

| 75%  | Book A expected claims ratio                     |
|------|--|
| 1.06 | 48 to ultimate reported claim development factor |

#### Book B

| Accident | Reported Claims (\$000) as of (months) |       |       | 1 [   | Calendar | Earned |                 |
|----------|--|-------|-------|-------|----------|--------|-----------------|
| Year     | 12                                     | 24    | 36    | 48    |          | Year   | Premium (\$000) |
| 2014     | 2,600                                  | 5,900 | 6,700 | 7,500 |          | 2014   | 8,700           |
| 2015     | 3,500                                  | 4,300 | 6,000 |       |          | 2015   | 9,700           |
| 2016     | 2,600                                  | 2,700 |       |       |          | 2016   | 11,000          |
| 2017     | 4,400                                  |       |       |       |          | 2017   | 13,900          |

#### a. (0.75 point)

Calculate the Book A ultimate claims for accident year 2015 using the reported development technique.

#### b. (0.5 point)

Calculate the Book A ultimate claims for accident year 2016 using the Bornhuetter-Ferguson technique.

#### c. (0.25 point)

Calculate the Book A ultimate claims for accident year 2017 using the expected claims technique.

#### d. (0.5 point)

Recommend an approach for estimating ultimate claims for Book B in accident year 2015 without performing any calculations. Justify all assumptions.

# 17. (3.5 points)

Given the following information as of December 31, 2017:

| Calendar<br>Year | Earned<br>Premium<br>(\$000) | On-Level<br>Adjustment | Accident<br>Year |  |

• In 2015 the company started writing a new class of insureds within this line of business.

• Both existing and new classes of insureds are priced accurately.

#### a. (1.25 points)

Estimate ultimate claims for accident year 2017 using the reported Cape Cod technique.

#### b. (0.5 point)

Discuss the effect the new class of insureds has on the reported Cape Cod technique for accident year 2017.

#### 19. (1.5 points)

One year ago, an automobile insurer implemented a mobile claims reporting platform. The company anticipated that this would lead to shorter reporting patterns.

Since the mobile platform was implemented, the company has identified a shift in mix of business towards younger drivers, with younger drivers having a higher loss cost than older drivers.

2.000

Evaluate the effect on the IBNR estimated using each of the following techniques if no adjustments are made:

- i. Development Technique
- ii. Expected Claims Technique
- iii. Cape Cod Technique

#### 20. (2.25 points)

Given the following data as of December 31, 2017:

| Accident | Case   | Outstanding (\$0 | 000) as of (mon | ths)  |
|----------|--------|------------------|-----------------|-------|
| Year     | 12     | 24               | 36              | 48    |
| 2014     | 50,400 | 51,150           | 35,100          | 9,600 |
| 2015     | 45,900 | 64,500           | 36,000          |       |
| 2016     | 60,300 | 68,400           |                 |       |
| 2017     | 62,100 |                  |                 |       |

| Accident | Cumulat | tive Paid Claims | (\$000) as of (m | nonths) |

| 2017     | 5,600                                    |        |        |        |

There is no development beyond 48 months.

# a. (0.25 point)

Calculate the last diagonal of the Cumulative Paid Claims Only triangle as of December 31, 2017.

#### b. (1.75 points)

Estimate ultimate ALAE for Accident Year 2017 using an additive ratio approach.

# c. (0.25 point)

Identify one disadvantage of using a ratio technique to estimate ALAE,

#### 24. (3.5 points)

The following information is available for an insurance company:

|         | Cumulative          | Cumulative           |
|---------|---------------------|----------------------|
| Age     | Paid Development    | Reported Development |
| (Month) | Factors to Ultimate | Factors to Ultimate  |
| 12      | 2.44                | 1.69                 |
| 15      | 2.00                | 1.46                 |
| 18      | 1.65                | 1.38                 |
| 21      | 1.49                | 1.30                 |
| 24      | 1.38                | 1.22                 |

Accident year 2017 as of March 31, 2018:

| 2,400     | Reported claims (\$)          |
|-----------|-------------------------------|
| <br>1,820 | Paid claims (\$)              |
| <br>3,300 | Selected ultimate claims (\$) |

Accident year 2017 as of May 31, 2018:

| 2,750 | Reported claims (\$) |
|-------|----------------------|
| 2,050 | Paid claims (\$)     |

Loss emergence between evaluation points is linear.

a. (1.25 points)

Considering the data through March 31, 2018, compare the cumulative expected reported claims to the actual reported claims as of May 31, 2018 for accident year 2017.

#### b. (1.25 points)

Considering the data through March 31, 2018, compare the cumulative expected paid claims to the actual paid claims as of May 31, 2018 for accident year 2017.

#### c. (0.5 point)

Describe a situation in which the actuary **would** revise the March 31, 2018 estimate of ultimate claims given the results calculated in parts a. and b. above.

#### d. (0.5 point)

Describe a situation in which the actuary **would not** revise the March 31, 2018 estimate of ultimate claims given the results calculated in parts a. and b. above.

#### FALL 2018 EXAM 5 EXAMINER'S REPORT

The Syllabus and Examination Committee has prepared this Examiner's Report as a tool for candidates preparing to sit for a future offering of this exam. The Examiner's Report provides:

- A summary of exam statistics.
- General observations by the Syllabus and Examination Committee on candidate performance.
- A question-by-question narrative, describing where points were commonly achieved and missed by the candidate.

The report is intended to provide insight into what the graders for each question were looking for in responses that received full or nearly-full credit. This includes an explanation of common mistakes and oversights among candidates. We hope that the report aids candidates in mastering the material covered on the exam by providing valuable insights into the differences between responses that are comprehensive and those that are lacking in some way.

Candidates are encouraged to review the Future Fellows article from June 2013 entitled "Getting the Most out of the Examiner's Report" for additional insights.

# **EXAM STATISTICS:**

- Number of Candidates: 600
- Available Points: 55.0
- Passing Score: 36.5
- Number of Passing Candidates: 187
- Raw Pass Ratio: 31.2%
- Effective Pass Ratio: 33.8%

The Syllabus and Examination Committee understands the pass ratio for this exam is lower than recent prior sittings, and as a result spent additional time analyzing the results prior to selecting the pass mark. In determining the final pass score the committee examined the performance of first time exam takers and repeat exam takers and compared these groups with similar groups from prior sittings.

The recent spring exam sitting gave many candidates two attempts to pass exam 5, as a make-up exam was offered due to technology issues associated with the original exam. The extra attempt resulted in a larger than normal number of candidates passing. This directly resulted in the fall exam being taken by disproportionately fewer repeat exam takers. Repeat exam takers have historically performed better than first time exam takers. In this sitting there was a noticeable drop in performance by the group of repeat takers, while the first-time exam takers performed right in line with prior sittings.

Based on the consistent performance of first time takers, the Syllabus and Examination Committee is satisfied that the selected passing score is reasonably consistent with the standard that candidates have been held to in the past.

We understand this explanation is of little comfort to those candidates who did not achieve the passing score. We hope that the details by question provided throughout this Examiner's Report will be helpful to those candidates and future candidates.

# **GENERAL COMMENTS:**

- Candidates should note that the instructions to the exam explicitly say to show all work; graders
  expect to see enough support on the candidate's answer sheet to follow the calculations
  performed. While the graders made every attempt to follow calculations that were not welldocumented, lack of documentation may result in the deduction of points where the
  calculations cannot be followed or are not sufficiently supported.
- Candidates should justify all selections when prompted to do so. For example, if the candidate selects an all year average and the question prompts a justification of all selections, a brief explanation should be provided for the reasoning behind this selection. Candidates should note that a restatement of a numerical selection in words is not a justification.
- Incorrect responses in one part of a question did not preclude candidates from receiving credit for correct work on subsequent parts of the question that depended upon that response.
- Candidates should try to be cognizant of the way an exam question is worded. They must look for key words such as "briefly" or "fully" within the problem. We refer candidates to the Future Fellows article from December 2009 entitled "The Importance of Adverbs" for additional information on this topic.
- Some candidates provided lengthy responses to a "briefly describe" question, which does not provide extra credit and only takes up additional time during the exam.
- Candidates should note that the sample answers provided in the examiner's report are not an exhaustive representation of all responses given credit during grading, but rather the most common correct responses.
- In cases where a given number of items were requested (e.g., "three reasons" or "two scenarios"), the examiner's report often provides more sample answers than the requested number. The additional responses are provided for educational value, and would not have resulted in any additional credit for candidates who provided more than the requested number of responses. Candidates are reminded that, per the instructions to the exam, when a specific number of items is requested, only the items adding up to that number will be graded (i.e., if two items are requested and three are provided, only the first two are graded).
- It should be noted that all exam questions have been written and graded based on information included in materials that have been directly referenced in the official Syllabus, which is located on the CAS website. The CAS takes no responsibility for the content of supplementary study materials and/or manuals produced by outside corporations and/or individuals which are not directly referenced in the official Syllabus.

# **QUESTION 1 TOTAL POINT VALUE: 2.5** LEARNING OBJECTIVE(S): A1 SAMPLE ANSWERS Sample 1 i. Liability Coverage a. Proportional to Expected Loss: Value of the boat is not proportional to the damages it causes to others b. Practical: It is not easy to obtain and verify the value of the boat. If we take the insured's word for the value, it is subject to manipulation. Also, it is not objective as to what we define as the value of the boat: is it the price in the market today or the original sale price? c. Considerate of Historical Precedence: It could be costly for the insurer to change the exposure base both from an IT standpoint and modification of the data. It could also result in large premium swings for the insured. ii. Physical Damage Coverage: a. Proportional: Yes, there is a logical relationship between the severity of claims and the value of the boat. b. Practical: same as liability c. Historical Precedence: same as liability I would recommend continuing to use boat-years because: 1. It is proportional to expected loss (more boats = more claims) 2. Objective, easy to verify and obtain 3. No change needed, so no cost to implement new exposure base Sample 2 1. Practical – Insured value of the boat can be clearly defined and measured and would be a value already on-record by the insurance company 2. Proportional to Loss – IV is proportional to loss for physical damage, because a higher value boat will cost more to the insurer to fix or replace. However, the value of the boat is not proportional to liability coverage because injuries to people not on the boat is not dependent on how expensive the boat is and damages to another boat will not vary based on the insured's own boat value 3. Considerate of Historical Precedence – Changing the exposure base is both expensive for the insurer due to the changes in reporting/systems required and disruptive to the insured due to premium swings from the change in how the policy is rated.

I would recommend sticking with boat-years as the preferred exposure base due to the disruption that changing the base would cause and the limited benefit, since insured value is not proportional to liability loss.

# EXAMINER'S REPORT

Candidates were expected to:

- List and define the 3 criteria of a good exposure base
- Justify how insured value meets each of these criteria for both Liability and Property damage coverages
- Recommend and justify an appropriate exposure base that meets these criteria

Common mistakes include:

- Not accurately listing or defining 3 criteria of a good exposure base
- Not evaluating the differences between Liability and Property Damages Coverages
- Not recommending an exposure base or recommending a base that was not supported by the justification

| QUESTION 2   |  |  |  |
|--|--|--|--|
| TOTAL POINT VALUE: 2   | LEARNING OBJECTIVE(S): A2, A3, A5  |  |  |
| SAMPLE ANSWERS   |  |  |  |
| Part a: 0.75 point   |  |  |  |
| <u>Sample 1</u><br>800 x 1/2 + 400 x 3/12 + 1000 x 9/12 + 500 x 3/1  | 2 = 1375   |  |  |
| <u>Sample 2</u><br>CY 2017 EP = $800 \times 3/12 + 1200 \times 3/12 + 1000 \times 9$<br>(1/1 to 3/31) (4/1 to 6/30) (4/1 to 1  | 9/12 + 500 x 3/12<br>2/31) (10/1 to 12/31)   |  |  |
| = 200+300+750+125 = 1375   |  |  |  |
| Part b: 1.25 points  |  |  |  |
| $\frac{Sample \ 1}{1000 + 500 \ x \ 6/12} = 100\%$   |  |  |  |
| Sample 2   |  |  |  |
| Policy PY 17 EP Loss   |  |  |  |
| A 0 0  |  |  |  |
| B 1000 500   |  |  |  |
| C 500 (.5) = 250 750   |  |  |  |
| Loss Ratio = (500 + 750) / (1000 + 250) = 1.00   |  |  |  |
| EXAMINER'S REPORT  |  |  |  |
| Candidates were expected to determine which p<br>(CY) 2017, which premium and loss transactions<br>premium, prorate the premium for the endorser<br>calculate a PY loss ratio. | remium transactions pertained to calendar year<br>pertained to policy year (PY) 2017, earn the CY<br>nent and cancellation where applicable, and |  |  |

# Part a

Candidates were expected to earn the Policy A, B and C premium transactions for CY 2017 based on their effective and expiration dates, prorating the full-term Policy A endorsement premium for the partial year that the endorsement was in effect, excluding the Policy C cancellation that was effective after CY 2017, and summing the earned premium from all policies for the total premium.

Candidates did not receive credit for stating an assumption that the Policy A endorsement premium was already prorated, as the premium was identified in the question as "Full-Term Premium".

Common mistakes include:

- Not prorating the full-term endorsement premium for Policy A
- Earning the Policy A premium and endorsement premium over the same time period

# Part b

Candidates were expected to determine that only Policy B and C pertained to PY 2017, sum the premium and loss transactions for those policies, adjust the Policy C premium for the mid-year cancellation, and calculate the loss ratio.

Common mistakes include:

- Not recognizing the policy cancellation for Policy C
- Calculation more resembling calendar year than policy year

| QUESTION 3                                    |  |

| Part c: 0.5 point                             |  |
| Sample 1                                      |  |
| The parallelogram method is inappropriate     | e because it is applied at the aggregate level using   |
| overall average rate change. It would not a   | account for different class factor changing on         |
| 10/1/2017.                                    | 0.0  |
|   |  |
| <u>Sample 2</u>                               |  |
| If the parallelogram method is applied at t   | he class level using each class rate impact then it is |
| appropriate. Otherwise this method would      | d not account for the changing class factor on         |
| 10/1/2017.                                    |  |
| EXAMINER'S REPORT                             |  |
| Candidates were expected to understand b      | both parallelogram and extension of exposure           |
| methods, their underlying assumptions, an     | id how to apply those methods to calculate on-level    |
| factors.                                      |  |
| Part a  |  |
| Candidates were expected to identify each     | rate level at different points in time and weight them |
| to calculate the on-level factor.             |  |
|   |  |
| A common mistake was miscalculating wei       | gnts (portion of year) to apply to each rate level.    |
| Part D  | tton promium on different effective dates for a de-    |
| then calculate the an lovel factor            | tien premium on different effective dates for a class, |
| then calculate the on-level factor.           |  |
| Common mistakes include:                      |  |
| Ilsing wrong noint in time (row in t          | table) or class factors                                |
| <ul> <li>Not including expense fee</li> </ul> |  |

# Part c

Candidates were expected to understand that the parallelogram method is applied at the aggregate level using the average rate change.

Common mistakes include:

- Not identifying the different class factor changes
- Not realizing the parallelogram method uses overall average rate change
LEARNING OBJECTIVE(S): A3

## **QUESTION 4**

**TOTAL POINT VALUE: 1.5** 

#### SAMPLE ANSWERS

Part a: 0.25 point

## Sample 1

Report year 2015 loss costs for a claims-made policy = 500 + 300 + 200 = 1000

## <u>Sample 2</u>

Assuming this is a first-year claims-made policy Report year 2015 loss costs = 500

#### Part b: 0.25 point

Accident year 2015 loss costs for an occurrence policy = 500 + 330 + 220 = 1050

## Part c: 0.5 point

#### <u>Sample 1</u>

A change in underlying trend will have little to no impact for a claims-made policy relative to an occurrence policy. The occurrence policy will be impacted more because occurrence policies are susceptible to both report and settlement lag, while claims-made policies only have settlement lag. As a result, occurrence policies remain open longer and are thus more susceptible to trends.

## <u>Sample 2</u>

An unexpected increase in underlying trend will distort the accuracy of the occurrence policy more than the claims-made policy. Whereas claims-made are all reported within one report year/term, occurrence losses could be reported over several years, and all of those losses would be subject to trends, at varying trend periods.

#### <u>Sample 3</u>

This unexpected increase has less impact on the accuracy of claims-made policy pricing as claimsmade policy has no pure IBNR. All claims are reported within the year. The change only impacts IBNER and has short term development period. It has bigger impact on occurrence policy as there are IBNR and IBNER and it has longer development period.

#### Part d: 0.25 point

#### Sample 1

Because claims-made policies do not have report lag, there is no risk of IBNR and thus reserve adequacy risk is greatly reduced. They only have IBNER, i.e. settlement lag.

## <u>Sample 2</u>

Because claims-made policies only cover the lag from reported date to settlement date. However, occurrence policies need to cover the lag from occurrence date to report date as well. So occurrence policies have higher reserve risks.

# Part e: 0.25 point

<u>Sample 1</u>

Relative to the occurrence policy, the claims-made policy shortens the period of time between collection of premium and payment of claim; consequently, funds invested for a shorter time horizon result in less investment income.

## EXAMINER'S REPORT

Candidates were expected to understand how a claims-made policy works and know the main differences between an occurrence policy and a claims-made policy.

#### Part a

Candidates were expected to know that all loss costs reported during the year 2015 would be covered by a claims-made policy, regardless of when the losses occurred.

A common mistake was to assume that the claims-made policy only covered loss costs reported and occurred in 2015 without stating any assumptions (i.e. \$500).

## Part b

Candidates were expected to know that all loss costs that occurred during the year 2015 would be covered by an occurrence policy, accounting for various lags in reporting.

A common mistake was to assume an occurrence policy covered claims reported in 2015 Part c

Candidates were expected to understand that an occurrence policy has a longer development period than a claims-made policy because claims can still be reported further into the future for an occurrence policy. They were expected to recognize that these claims would be more impacted by a change in future trend.

A common mistake was simply stating that claims-made policies are shorter tailed than occurrence policies, without explaining why they were shorter tailed or why it matters.

## Part d

Candidates were expected to know that the IBNR includes two components: pure IBNR or IBNYR for losses incurred but not yet reported, and IBNER for losses incurred but not enough reported. Candidates were expected to know that a claims-made policy only has IBNER, while an occurrence policy has both pure IBNR an IBNER.

A common mistake was to mention that claims-made policies had no IBNR, without elaborating why this is meaningful to the question being asked.

## Part e

Candidates were expected to understand that the investment period is shorter for a claimsmade policy since there is less time between the collection of premium and the claim payment, thus resulting in less investment income.

A common mistake was stating that claims-made policies have a longer time lapse between the claim occurrence and the claim payment, instead of between the premium collection (or beginning of coverage) and the claim payment.

| QUESTION 5   |  |
|--|--|
| TOTAL POINT VALUE: 2   | LEARNING OBJECTIVE(S): A3  |
| SAMPLE ANSWERS   |  |
| Sample 1<br>The severity trend is stable, so I will select 5%. Th<br>2017, so a two-step trend for frequency is best. I<br>then I will choose the -7% trend from July 1, 2017  | ere is a major change that occurs on July 1,<br>will select a 6% trend up until July 1, 2017, and<br>7 and onward. |

| Sample 3<br>In the premium-based projection method, fixed and<br>are divided by either written or earned premium to<br>ratios to premium. If the premium and fixed expen-<br>be applied to the fixed expense rate to adjust for th<br>projection method, fixed and variable expenses are<br>either written or earned premium to produce a var<br>divided by either written or earned exposures to pr<br>A fixed expense trend can be applied to the fixed er<br>future level. | d variable expenses are separated, and each<br>o produce separate fixed and variable expense<br>uses are trending at different rates, a trend can<br>ne difference. In the exposure-based<br>e separated. Variable expenses are divided by<br>riable expense ratio. Fixed expenses are<br>roduce an average fixed expense per exposure.<br>xpense per exposure to project the average |
| <u>Sample 4</u><br>For both methods, the expense categories are assig   | gned fixed and variable percentages.  |
| The variable provision is calculated the same for bo<br>expense category is divided by the appropriate pre<br>written, earned if incurred over the policy period.<br>analysis and a selection representative of future ex<br>%.   | oth methods. The variable percent of each<br>mium – written if incurred when a policy is<br>This is done for all historical years in the<br>spense levels is made. The result is an expense   |

For fixed expenses under the premium-based method, the approach is the same as above except with fixed percent of each expense category.

For fixed expenses under the exposure-based method, fixed expenses are divided by exposures – earned if expenses incurred over the policy period or written if incurred at time policy is written. The result is a dollar amount of expense per exposure. Done for all relevant years, and a selection for future expense levels is made. One consideration for fixed expenses under this method is that the fixed expense provision may need to be trended.

Another consideration for both methods is whether to use state-specific or countrywide expenses and premiums. Generally, commission and taxes, licenses and fees use state and General and other acquisition use countrywide as state-specific allocations of these expenses might be impossible or difficult to do.

# Part b: 0.5 point

Sample Premium Based Shortcomings (distortions)

- A shortcoming with the premium-based projection method is rate changes during or after the experience period can distort the historical fixed expense ratios.
- Premium-Based Projection Method can be problematic if expenses are calculated at the countrywide level and allocated to state. The allocation between countrywide and state can cause distortions.
- Premium-based projection method: fixed expenses might trend at a different rate than premium.
- Premium-based projection Method can be distorted based on the split between the fixed and variable expenses. Need to find more accurate way to split the expenses into fixed and variable components.
- In the premium-based method, since fixed costs are a percentage of premium, high premium policyholders would be paying significantly higher fixed costs than low premium policyholders. This would not be appropriate as some cost are truly fixed.

# Sample Exposure Based Shortcomings (distortions)

- A shortcoming with the exposure-based projection method is the existence of the economies of scale in a changing book may lead to increasing or decreasing projected average fixed expenses.
- Exposure-Based Projection Method can be distorted based on the split between the fixed and variable expenses. Need to find more accurate way to split the expenses into fixed and variable components.
- Exposure based projection method: Some fixed expense actually vary by risk characteristics. For example, new and renewal business tend to have different fixed expense. Allocation of fixed expense to different classes are therefore distorted to the extent to which these risk characteristics vary between classes.
- Exposure based method may be distorted if exposures are trending at a different rate than expenses.

## **EXAMINER'S REPORT**

Candidates were expected to distinguish fixed and variable expenses from total expenses, as well as the differences between and details of both expense provision approaches.

### Part a

Candidates were expected to explain how fixed and variable expenses are treated in the 2 common methodologies.

Common mistakes include:

- No mention of separating total expense into fixed and variable buckets.
- Not identifying the use of exposure or policy count for the fixed expense portion of the exposure-based method.

## Part b

Candidates were expected to understand and describe a potential shortcoming/distortion of each method.

Common mistakes include:

Premium-based method

• Stating a need for on-level premium without any explanation for why.

Exposure-based method

- Stating simply that exposures must be clearly defined or aren't readily available.
- Stating that exposures are difficult to estimate or subject to change.

#### Part a

Candidates were expected to calculate the net cost of reinsurance and project the latest year's exposures forward to the period covered by the reinsurance contract in order to determine the projected net reinsurance cost per exposure.

Common mistakes include:

- Incorrectly calculating the projection period for which to apply the exposure trend
- Not including the expected reinsurance recoveries in the net reinsurance cost calculation
- Using the sum of exposures over multiple accident years rather than the exposures from the latest accident year to determine projected exposures

## Part b

Candidates were expected to use a frequency-severity technique to develop claim counts and severities to ultimate levels for each accident year and use those results to determine the ultimate losses and ALAE for each accident year.

Common mistakes include:

- Using the chain ladder method rather than a frequency-severity technique to determine ultimate losses
- Using a frequency-severity technique that involved trending, but not applying the appropriate trend for all components of the technique

#### Part c

Candidates were expected to calculate the loss trend period for each accident year, trend losses, apply the ULAE factor, and determine the projected pure premium. Credit was given to candidates that omitted ULAE from the response to this part of the question if it was correctly included in the response to part d.

Common mistakes included:

- Calculating the pure premium using losses and exposures summed across accident years rather than applying equal weights to each year's pure premium
- Trending the exposures used to calculate pure premium

## Part d

Candidates were expected to calculate the indicated premium and indicated rate level change.

- Omitting the net reinsurance cost per exposure from the calculation of the indicated premium
- Omitting or incorrectly including the contingency provision when calculating the indicated premium

## QUESTION 8

# TOTAL POINT VALUE: 2.25

# LEARNING OBJECTIVE(S): A6, A9

#### SAMPLE ANSWERS Part a: 0.5 point

- Policyholders will not renew, will switch to competitors
- Retention rate will go down
- Company starts to lose market share as new insureds will also choose competitor
- The company may be subject to filing objections from the regulators
- The competitor might also raise their rates
- Close/hit/conversion rate will go down
- Loss ratio will improve/decrease
- Profitability of the company should increase
- Profit per risk will increase

# Part b: 0.5 point

- Price: if other factors are the same, insureds will choose an insurance policy with lower premium
- Level of service/customer satisfaction: insureds prefer insurance companies with better services
- Brand Loyalty: Loyal insureds/Insureds that have been with the company longer will more likely renew with the company than new customers
- Overall price of product: if the product is expensive in general, customers tend to shop around more
- Competitor Price: customers might choose to non-renew if they can find a cheaper policy from competitors
- Rate Change: A big rate increase will trigger customers to shop around
- Renewal rates offered by current insurer: If the renewal rates offered are relatively similar to previous rates, client is likely to stay
- Younger insureds tend to shop around more than older insureds
- Claim handling service quality, if the policyholder has filed a claim
- The need for the coverage: if the coverage is not mandatory, clients may not renew if the coverage is no longer needed (e.g. sell property)

# Part c: 0.75 point

- Reduce expenses by laying off staff/ reducing marketing expenses
- Reduce fixed expenses/variable expenses/commissions
- Modify underwriting rules to write less risky policies/ to target more profitable risks
- Decrease benefits by rising deductibles/ lowering limits
- Target favorable risks to market to
- Non-renew high risk exposures
- Hire experienced claim adjusters to control claims paid/ avoid claim leakage
- Change mix of business by tightening UW guidelines to write better risks
- Introduce loss mitigating programs to insureds to help reduce claims

## Part d: 0.5 point

Sample Responses for identifying an issue

- Companies do not always have the same types of policyholders, so a lower rate could mean a company only writes low risk policies and a different company writes high risk but are both profitable.
- Companies can have different mix of business/ underwriting guidelines/ growth strategies/ targeted markets/ coverage levels/ products

## Sample Responses for proposing a solution

- Instead, company should compare premium by segment
- We should find a competitor with similar mix of business to compare
- We can pick risks that share the same coverage level to compare
- Company can choose a risk profile and get a quote for it from competitor to compare
- Can re-rate our book of business using information found in competitor's rate manuals and filings and then compare
- We can compare average premiums of a segment and relativities of the segment

## **EXAMINER'S REPORT**

Candidates were expected to understand the impact of rate changes and elements contributing to customer renewal decisions. They were also expected to know non-pricing solutions to increase profitability.

#### Part a

Candidates were expected to provide two different consequences to the given scenario (both positive and negative consequences were accepted).

Common mistakes include:

- Company is subject to adverse selection
- Company's LR will deteriorate
- Company should not implement the indicated premium (not a consequence)

## Part b

Candidates were expected to briefly describe two factors affecting the insureds' propensity to renew.

Common mistakes include:

- Listing "Price" without any description as to why this affects renewal
- Other listed items without description

## Part c

Candidates were expected to list three non-pricing solutions to maintain profitability.

Common mistakes include:

• Better segment risks by changing relativities but don't change overall rate

- Change mix of business (need more verbiage as to shifting to a better performing mix)
- Change coverage (a direction needs to be given)
- Increase investment income
- Purchase reinsurance

## Part d

Candidates were expected to show understanding of conditions required for a fair premium comparison between companies.

Some candidates did not answer this part in conjunction with the information provided in the questions, or provided solutions to another issue rather than the one identified.

Common mistakes for issues include:

- Premiums are not comparable due to different expense assumptions
- Premiums are not comparable due to different profit provisions

Common mistakes for solutions include:

- We can look at pure premium instead
- Adjust for bias and then compare (too vague)

| QUESTION 9   |  |  |  |  |  |
|--|--|--|--|--|--|
| TOTAL POINT VALUE: 2   | LEARNING OBJECTIVE: A8   |  |  |  |  |
| SAMPLE ANSWERS   |  |  |  |  |  |

| Univariate is more transparent   |  |  |  |  |  |
| <ul> <li>Simple rating algorithm, does not require</li> </ul>  | e higher complexity/cost GLM analysis  |  |  |  |  |
| EXAMINER'S REPORT  |  |  |  |  |  |
| Candidates were expected to understand how to  | o analyze GLM output, recognize challenges of                                      |  |  |  |  |
| loss ratio data within a GLM, and specify when u   | inivariate methods are more appropriate than                                       |  |  |  |  |
| multivariate methods.  |  |  |  |  |  |
| Part a   |  |  |  |  |  |
| Candidates were expected to demonstrate know   | vledge and proper application of tests used to                                     |  |  |  |  |
| analyze the predictive quality of a variable based   | d on GLM output: Main Effect Test, Consistency                                     |  |  |  |  |
| Test, Statistical Test, and Judgment. Candidates   | were also expected to demonstrate a clear  |  |  |  |  |
| decision on whether the variable should or shou  | ld not be included based on the test results.                                      |  |  |  |  |
| Candidates did not receive credit if they incorreg   | tly stated/implied the variable passed the main                                    |  |  |  |  |
| effect test or the consistency test. Further, candidates did not receive credit for simply stating a |  |  |  |  |  |
| recommendation on exclusion/inclusion of varia   | ble with no justification.   |  |  |  |  |
|  | · · · · · · · · · · · · · · · · · · ·  |  |  |  |  |
| Common mistakes include:   |  |  |  |  |  |
| Did not clearly indicate whether the vari  | able passed or failed each test  |  |  |  |  |

• Did not clearly state whether variable should or should not be used

#### Part b

Candidates were expected to list three challenges of using GLM on loss ratio data.

A common mistake was to list general challenges of GLM without any reference to the specific issues of using loss ratio data.

## Part c

Candidates were expected to discuss one reason why univariate analysis could be more appropriate than multivariate analysis.

A common mistake was to describe a difficulty but not specify whether that was a difficulty for multivariate or an univariate approach so credit could not be awarded.

| QUESTION 10   |
|---|
| TOTAL POINT VALUE: 2.5     LEARNING OBJECTIVE: A8   |
| SAMPLE ANSWERS  |
| Part a: 0.5 point   |
| <ul> <li>Sample 1</li> <li>The company's current approach doesn't take into account differences between rural &amp; urban areas since there are only two relativities (not enough territories)</li> <li>The company's current approach doesn't have homogeneous risks in the territories since it's only based on one variable</li> </ul>   |
| <ul> <li>Sample 2</li> <li>First, this is a large state but only contains two territories. That means we are only accounting for the mountain range and ignoring all other factors</li> <li>Second, these groups are not homogeneous, which will lead to adverse selection on the basis of territory</li> </ul>   |
| <ul> <li>Sample 3</li> <li>Other companies may deviate greater and have more than two territories. You could gain competitive advantage if you added more territories</li> <li>Homeowner claims come from many other perils besides weather (ie theft, liability, fire, water) so breaking the territories by just the weather pattern might not be as accurate as you could be</li> </ul>  |
| Part b: 2 points  |
| Sample 1  |
| Step #1: Divide the state in geographic units, such as zip codes or counties.   |
| <ul> <li>Consider: 2ip code definitions are subject to change</li> <li>Step #2: Estimate the geo-demographic and geo-physical relativities of each unit using a GLM</li> <li>Consider: geographic units are highly correlated with other rating variables, so need to distinguish signal from noise</li> <li>Step #3: Calculate a residual geographic factor not explained in step #2 and smooth across units</li> </ul>  |
| using spatial smoothing, for example  |
| adjacency for theft)  |
| Step #4: group geographic units into territories using clustering methods, for example<br>- Consider: figure out if you want an equal number of units in each territory to create balance   |
| Sample 2<br>First, the actuary should define the basic geographical unit, usually a zip code or county. A consideration might be balancing granularity (zip code) or a constant unit definition (county).<br>Second the actuary should quantify each basic unit's geographic systematic risk. Preferably using a GLM. This will remove the effect of exposure correlation in the analysis & ensure the geographic rating variable is just for territory. If that's not a consideration, a consideration might be in choosing the link function. |
| residual geographic risk (which should also be given by a GLM). A consideration might be the  |

optical weight for smoothing, like using distance or adjacency bases. Fourth, the actuary should

consider if they want to group the basic units into larger territories. Considerations for this step include choosing the clustering method, such as quantile or similarity method

## **EXAMINER'S REPORT**

Candidates were expected to understand the importance of sufficiently granular rating territories and how these rating territory definitions are created

#### Part a

Candidates were expected to understand why company would not want to use overly broad territorial definitions.

Common mistakes included:

- Providing only one disadvantage
- Providing advantages of the companies territorial rating approach

Part b

Candidates were expected to understand the steps involved in developing new rating territories.

- Simply listing each step, and not providing any consideration for each step
- Neglecting to cluster geographic units into final rating territories
- Describing criteria for evaluating rating variables

| QUESTION 11                                       |   |
|---|---|
| TOTAL POINT VALUE: 1.75                           | LEARNING OBJECTIVE: A11                     |
| SAMPLE ANSWERS                                    |   |
| <u>Sample 1</u>                                   |   |
| Losses below ded = 1,800,000 = 2M x 0.9           |   |
| Losses above ded = 200,000 = 2M x 0.1             |   |
| ALAE = 200,000 = 2M x 10%                         |   |
| Fixed Expense = 100,000                           |   |
| Var Expense = 0.12                                |   |
| Profit = 0.04                                     |   |
| Ded processing cost = 54,000 = 0.03 x 1,800,000   |   |
| Credit risk = 18,000 = 0.01 x 1,800,000           |   |
| Add'l risk margin = 14,000 = 0.07 x 200,000       |   |
|   |   |
| (200,000 + 200,000 + 100,000 + 54,000 + 18,000 -  | + 14,000) / (11204) = 697,619               |
|   |   |
| <u>Sample 2</u>                                   |   |
| {2,000,000 x [ 10% + (1 - 90%) x 1.07 + 90% x (3% | + 1%)] +100,000} / (1 - 12% - 4%) = 679,619 |

#### **EXAMINER'S REPORT**

Candidates were expected to calculate the premium for a large deductible policy by correctly applying the loss elimination ratio then further including the appropriate costs and expenses.

- Forgetting to include Fixed Expense, ALAE, or Excess Loss in the final calculation
- Calculating the Excess Deductible Loss as (Ground Up Loss x LER) or (Ground Up Loss 0.5M per occurrence deductible) instead of (Ground Up Loss x (1-LER))
- Using incorrect loss amount for the Credit Risk and Deductible Processing Fee calculation
- Including one or several of the following: Credit Risk, Deducible Processing Fee, and Risk Margin, in the denominator
- Including losses below the deductible in the final premium calculation instead of losses above the deductible
- Only including ALAE related to the Excess Deductible Loss amount, while the problem clearly states that all ALAE is paid by the insurer

TOTAL POINT VALUE: 2

| Part c: 0.5 point |         |           |        |         |            |        |  |
|                   |         |           |        |         |            |        |  |

- Affordability insurance should be affordable for everyone
- Controllability should be able to change the class you are in to get a lower rate
- Privacy should not infringe on someone's privacy
- Causality/Logical/Intuitive causal relationship to loss makes sense

## **EXAMINER'S REPORT**

Candidates were expected to calculate class relativities using the adjusted pure premium method, off-balance a final base rate given constraints, and recognize social criteria of rating variables.

## Part a

Candidates were expected to understand the adjusted pure premium methodology and how to calculate class relativities.

Common mistakes include:

- Using unadjusted exposures
- Not using the base class to rebase indicated relativities

## Part b

Candidates were expected to understand how to calculate a proposed base rate given a premium change goal and a constraint on the change in class relativities.

Common mistakes include:

- Using exposures rather than adjusted exposures as the weights for total relativity change
- Using indicated relativities rather than selected relativities

## Part c

Candidates were expected to understand social criteria of rating variables.

- Using legal criteria
- Using operational criteria

| Part c: 1 point  |  |
| i)<br>Coinsurance Apportionme<br>a = min(1M/(1.5M*.8),1) =<br>I = min(800K*.8333,1M) =<br>e = 800K - 666.667K = 133  | nt Ratio:<br>= .8333<br>\$666.667K<br>3.333K   |

## ii)

<u>Sample 1</u> I = min(1.2M\*.8333,1M) = 1M

e = min(1.2M, 1M) - 1M = \$0

Sample 2

I = min(1.2M\*.8333,1M) = \$1M Penalty = \$0 because they have hit their limit

## **EXAMINER'S REPORT**

Candidate were expected to calculate the rates per \$1000 AOI given frequency and severity distribution, recognize issues for both insureds and insurers when insureds are underinsured, calculate indemnity payments and coinsurance penalties

#### Part a i)

Candidates were expected to calculate the rate per Amount of Insurance (AOI) by calculating the average severity using the midpoint of the range and supplied loss distribution then using this to get a pure premium for this level of coverage and divide by the AOI (in \$000s).

Common mistakes include:

- Using the upper or lower bound of the range instead of the midpoint
- Not multiplying by frequency
- Not dividing by AOI

#### ii)

Candidates were expected to properly cap losses at \$800K and adjust the loss distribution for the layer in which an \$800K loss fell in addition to the elements for part (i.)

Common mistakes include:

- Incorrectly accounting for the capping of coverage at \$800K by not using the correct average severity for the range 700K-850K
- Omitting all layers above 800K
- Using the upper or lower bound of the range instead of the midpoint
- Not multiplying by frequency
- Not dividing by AOI

## Part b

## i.)

Candidates were expected to demonstrate an issue with underinsurance from the insureds' perspective.

Common mistakes include:

• Simply stating that the insured would not receive the full loss payment as the explanation would need to specify that it was a total or near-total loss

• Stating an issue of the insurer rather than the insured, such as the insured would not be charged adequate premium

ii.)

Candidates were expected to demonstrate an issue with underinsurance from the insurers' perspective.

Common mistakes include:

- Stating that the insurers' profitability would be impacted without directional justification
- Stating that rates would be inaccurate without specifying they would be inadequate
- Stating that rates would be skewed without specifying how they were skewed

## Part c

Candidates were expected to calculate the appropriate apportionment ratio and apply it to the loss to determine the indemnity payment and coinsurance penalty.

- Using an incorrect apportionment ratio calculation
- Including the loss amount in excess of the coverage in the coinsurance penalty

| QUESTION 14   |  |
|---|--|
| TOTAL POINT VALUE: 1.5  | LEARNING OBJECTIVE: B1                             |
| SAMPLE ANSWERS  |  |
| Part a: 0.5 point   |  |
| The estimates are used to make busines                              | s decisions in pricing, underwriting, and strategy |
| <ul> <li>Low reserve estimates could lead to mar</li> </ul>         | nagement increasing prices until it is too late.   |
| <ul> <li>Inaccurately high estimates could lead to</li> </ul>       | o decisions such as raising rates or tightening    |
| underwriting guidelines   |  |
| Accurate reserve estimates help make a                              | opropriate reinsurance decisions                   |
|   |  |
| Part b: 0.5 point   |  |
| Inaccurate reserve estimates could disto                            | rt the financial reports that are relied on by     |
| investors.  |  |
| <ul> <li>Inaccurate reserve could lead investors t</li> </ul>       | o believe that the company is stronger or weaker   |
| than it really is   |  |
| An accurate reserve is needed to form a                             | n accurate estimate of the dividend that will be   |
| paid  |  |
| Part c: 0.5 point   |  |
| <ul> <li>If the reserves are understated, the regulation</li> </ul> | lator may not get involved until too late to       |
| prevent the insurer from entering insolv                            | ency   |
| Accurate reserve estimates are importar                             | t for assessing the insolvency risk by regulator.  |
| Accurate reserve estimates help to asses                            | s rate level.                                      |
|   |  |
| Candidates were expected to know the importa                        | ace of accurate estimates of uppaid claims and     |
| how under-reserving or over-reserving could im                      | pact different aspects of a company.               |
| In some cases, candidates did not receive full cre                  | edit based upon the amount of description          |
| provided. Full credit was awarded for situation                     | where two briefly describe items were provided.    |
| Part a  |  |
| Candidates were expected to know how under-r                        | eserving or over-reserving could impact internal   |
| management.   |  |
|   |  |
| Common mistakes include:  |  |
| <ul> <li>Providing one brief point when the question</li> </ul>     | stion prompt specified describe                    |
| Part b  |  |
| Candidates were expected to know how under-r                        | eserving or over-reserving could impact            |
| investors.  |  |
|   |  |

A common mistake was providing one brief point when the question prompt specified describe.

Part c

Candidates were expected to know how under-reserving or over-reserving could impact regulators.

- Providing one brief point when the question prompt specified describe
- Specifying that regulators would use the information to determine the appropriate reserve level

| QUESTION 15  |                         |                   |                   |  |  |  |  |  |  |

| Total = 3,400  |                         |                   |                   |  |  |  |  |  |  |
|  |                         |                   |                   |  |  |  |  |  |  |
|  |                         |                   |                   |  |  |  |  |  |  |
|  |                         |                   |                   |  |  |  |  |  |  |

Sample 2

CY 2016 Paid Claims = (500 + 600 + 450 + 1200 + 400) = 3,150 CY 2016 Change in Case Reserves: A = 225 - 550 = -325 B = 150 - 1050 = -900 C = 575 D = 900 Total CY 2016 Change in Case Reserves = -325 - 900 + 575 + 900 = 250

Total CY 2016 Reported Claims = CY 2016 Paid + CY 2016 Change in Case Reserves = 3,150 + 250 = 3,400

Part d: 1 point

<u>Sample 1</u>

A: 0.4\*(725 - 225) = 200

B: No incurred claims in CY 2017. 0

C: Retention limit reached in CY 2016. 0

D: 1300 incurred at start of CY 2017.
 Gross incurred at end of CY 2017 = 1300 + 800 + (625 - 900) = 1,825
 Since Excess of Loss limit reached, net incurred = 1500 - 1300 = 200

Total = 200 + 0 + 0 + 200 = 400

<u>Sample 2</u>

| Claim | CY 2017 Gross Reported      | CY 2017 Reinsurance          | CY 2017 Net     |
|-------|-----------------------------|------------------------------|-----------------|
|       |                             | Ceded                        | Reported        |
| А     | 725 + (0 – 225) = 500       | 0.6 * (725 – 225) = 300      | 500 - 300 = 200 |

| С     | 700 + 200 + (0 - 575) = 325 | *(1200 + 700 + 200 - 1500 -  | 325 - 325 = 0   |
|       |                             | (1200 + 575 – 1500)) = 325   |                 |
| D     | 800 + (625 – 900) = 525     | 400 + 800 + 625 - 1500 = 325 | 525 - 325 = 200 |
| Total |                             |                              | 400             |

\*CY 2017 Reinsurance Ceded for Claim C = Total Ceded – CY 2016 Ceded = CY 2017 Ceded

#### **EXAMINER'S REPORT**

Candidates were expected to understand the basic mechanics of case outstanding, paid claims, reported claims in relation to both Accident Year and Calendar Year. The candidate was also expected to demonstrate basic knowledge of reinsurance.

Part a

Candidates were expected to understand how to derive total reported claims for a specific Calendar Year when given a list of paid and case outstanding claim data.

- Calculation errors when summing paid and change in case
- Incorporating reinsurance calculations into the final answer

#### Part b

Candidates were expected to understand how to derive total gross paid claims for a specific Calendar Year and then apply both quota share and excess of loss reinsurance where appropriate.

Common mistakes include:

- Calculation errors when summing net paid claims
- Forgetting to incorporate reinsurance and only calculating gross paid claims
- Multiplying gross paid claims by 0.6 rather than 0.4

## Part c

Candidates were expected to understand how to calculate reported claims for a specific Calendar Year. Candidates did not receive full credit if they did not take into account change in case reserves for claims A and B.

Common mistakes include:

- Not including change in case reserves when calculating reported amounts for claims A and B.
- Unnecessarily applying reinsurance to paid or reported claims.
- Calculation errors in summing up total reported for claims A or B when taking case reserves into account.

## Part d

Candidates were expected to understand how to calculate total reported claims in a given Calendar Year net of both Quota Share as well as Excess of Loss reinsurance.

- Not applying or applying the wrong Quota Share to claim A.
- Not capping claims C and D at the 1,500 excess of loss limit.
- Incorrectly applying the 1,500 excess of loss limit on an aggregate claim basis.

| Part d: 0        | .50 point    |               |              |  |
| <u>Sample :</u>  | <u>l</u><br> |               |              |  |
| Since B i        | s in the sa  | me state ar   | nd LOB as /  | A, we can use the CDF in Book A to estimate ult claims for             |
| B in AY 2        | .015, assu   | ming the lo   | ss develop   | oment pattern is the same.   |
|                  |              |               |              |  |
|                  |              |               |              |  |
|                  |              |               |              |  |

# <u>Sample 2</u>

B is small but given it's the same coverage/state as A, it makes sense to combine the data. A & B together would provide more credibility. With more data to make estimates more stable, I suggest the development technique, so it will be responsive to changes.

# <u>Sample 3</u>

Given this is a small book of business and perhaps very correlated with book A (same state and same LOB), I think a B-F technique would work well, using the same ECR and CDF as book A.

# <u>Sample 4</u>

Since it is a smaller company with same line and same state, we can directly use the expected claim ratio for book A to calculate book B.

# **EXAMINER'S REPORT**

Candidates were expected to demonstrate the mechanics of the development technique, Bornhuetter-Ferguson technique, and expected claims technique. Candidates were expected to recognize the challenges of loss development with a small and volatile book of business and recommend and justify an appropriate technique in this situation.

## Part a

Candidates were expected to calculate Book A ultimate losses for accident year 2015 using the reported development technique, including calculation of age-to-age and cumulative development factors.

Common mistakes include:

- Calculating ultimate losses for an accident year other than 2015
- Omitting the 48-ultimate reported development factor
- Using nonadjacent columns of the loss development triangle to calculate age-to-age factors

## Part b

Candidates were expected to calculate ultimate losses for accident year 2016 using the Bornhuetter-Ferguson technique, including calculation of the % unreported and expected losses.

Common mistakes include:

- Using an age-to-age factor to calculate the % unreported instead of the cumulative development factor
- Calculating ultimate losses for an accident year other than 2016
- Using the % reported instead of the % unreported
- Calculating an expected claim ratio instead of using the given ECR

## Part c

Candidates were expected to calculate ultimate losses using the expected claims technique.

A common error was calculating an expected claim ratio instead of using the given ECR.

#### Part d

Candidates were expected to recognize that Book B is small and volatile, so any development technique that relies on Book B's historical development pattern is inappropriate. Candidates were expected to recommend and justify a specific alternative approach. For recommended techniques using Book A, candidates were expected to state the Book A is appropriate to use since A and B operate in the same state and line of business.

- Recommending a technique using Book B's historical development pattern
- Providing a recommendation with no justification
- Recommending a technique using Book A without stating why A is appropriate to use
- Recommending use of an "appropriate" expected claims ratio for Book B without making a recommendation for how to select one (e.g. using industry data)
- Attempting to diagnose a change in case reserve adequacy and recommending a Berquist-Sherman adjustment

- Claim counts consistent over time
- Mix by claim type consistent / homogeneous
- Consistent definition of exposures
- Stable settlement pattern

- Stable case reserve adequacy
- Frequency/severity consistent in future

#### **EXAMINER'S REPORT**

Candidates were expected to calculate ultimate claims using the frequency / severity technique incorporating trend and discuss assumptions of frequency / severity techniques.

#### Part a

Candidates were expected to use the frequency /severity technique incorporating trend to calculate ultimate claims. Candidates were expected to trend the data from different accident years consistently, separately for frequency and severity. Then, provided a new exposure base for years 2016 and 2017, candidate were expected to estimate the total ultimate claims for each. Candidates were expected to apply frequency trend, severity trend, adjust for a change in premium per exposure, and apply an adjustment for a change in the tort environment.

Candidates were expected to calculate frequency by adjusting for the change in on-level premium. Next, candidates were expected to apply trend separately to the frequency and severities, individually for each accident year. Frequencies and severities could be trended to either 2016 or 2017 values. Selected frequency and severity were then detrended to 2016 (or trended to 2017 if selections were made at 2016 levels). The candidates were expected to apply the tort factor for the 2017 losses only. Lastly, candidates were expected to multiply selected frequency by premiums, resulting in ultimate claims counts and multiply these ultimate claim counts by selected ultimate severity to arrive at the ultimate claims estimate.

Common mistakes include:

- Failing to convert claim counts to frequency
- Incorrectly applying the on-level factors or applying them inconsistently
- Not applying the tort factor, applying it to both years, or applying it to 2016 only.
- Multiplying the calculated frequency and severity together, but not multiplying by premium (exposure).
- Attempting to calculate a loss ratio
- Averaging the 2014 and 2015 data without individually trending them

#### Part b

Candidates were expected to describe two key assumptions of the frequency / severity technique.

- Providing a generic answer regarding the availability or accuracy of data.
- Providing a specific required definition of claim count. The assumption of the frequency / severity technique is that the definition of a claim count is *consistent*, but there are alternate valid ways to define claim counts.

| averages or excluding the 2014 development factors due to the new class of business.                |  |  |  |  |  |  |  |
## Part b: 0.5 point

- Since the new class of insured is priced accurately, they should have no effect on the ultimate claims ratio. However, looking at the development factors from part (a), there looks to have been a speedup in reporting after the new class was introduced. This would lead to our LDFs being overstated and our "used up" premium being understated, resulting in an overstatement of the ECR and thusly the AY 2017 ultimate claims.
- Pre 2015, the development factors were higher, meaning ultimate claims were higher. Since the CC method uses these development factors, it is overestimating the ultimate claims in 2017.
- Since the development technique shows a change in development patterns in 2015, I reduced the influence of 2014 by not including that factor into my selection. The 36-48 is based on the 2014 AY, so it might be higher than what it should be, and as a result, ultimate might be slightly overstated using the CC method due to a higher % unreported and slightly higher ECR.

## **EXAMINER'S REPORT**

Candidates were expected to calculate the estimated ultimate loss using the Cape Cod technique, and explain how the change in the mix of business impacted the Cape Cod ultimate claims for Accident Year 2017.

## Part a

Candidates were expected to select claim development factors from a reported claims triangle and use these development factors to calculate used up premium. Candidates were expected to calculate the expected claims ratio as the ratio of reported losses to used up premium (as defined by the Cape Cod technique), and apply this expected claims ratio to get the estimated unreported claims, and subsequently, the ultimate claims.

Common mistakes include:

- Calculating the expected claims ratio as something other than total reported losses over total used up premium (e.g., straight average or total developed claims over total earned premium)
- Multiplying the expected claims ratio by the earned premium to get the ultimate claims

### Part b

Candidates were expected to recognize the change in the development factors as a result of the change in the mix of business, and to discuss the impact of this change in development factors on the estimated ultimate claims.

Common mistakes include:

- Stating that the Cape Cod ultimate claims would be impacted without detailing how.
- Stating that the new mix of business would have no impact on Cape Cod ultimate claims.
- Confusion regarding the loss ratio as the source of the effect to the Cape Cod technique rather than the change in reported development.
- Stating that the new mix of business would lower the estimated ultimate claims.

## QUESTION 19

## **TOTAL POINT VALUE: 1.5**

## LEARNING OBJECTIVE(S): B4

## SAMPLE ANSWERS

ANIMING ODJECTIVE(3): [

# i. Development technique:

# <u>Sample 1:</u>

IBNR would be overestimated as the mobile platform has a shorter reporting pattern and thus requires the selection of lower LDFs for the latest AY.

# Sample 2:

Overstates IBNR. Development technique will apply higher loss development factors based on historical data (prior to implementing mobile reporting platform), to higher reported claims based upon latest mix shift to higher loss cost drivers if the change in reporting pattern is not considered.

# Sample 3:

Assume that it is true that reporting patterns are shorter and loss costs higher, but no adjustments are made for these changes. IBNR will be overstated since it is based on old, higher LDFs than should be selected under the new, shorter reporting patters. With higher loss cost due to mix shift, the impact is further amplified.

# ii. Expected claims technique:

# <u>Sample 1:</u>

No effect on IBNR if the premium paid for both young and old drivers are adequate and accurate; expected claim technique not affected by any changes in reporting pattern

# <u>Sample 2:</u>

The change in reporting pattern does not affect expected claims technique. If young and old drivers are correctly priced it should not change the ECR, so this method is accurate (losses higher for younger drivers, but so is associated premium).

# <u>Sample 3:</u>

Accurate – assuming premium charged for both loss cost levels is adequate, this method should not be impacted by mix shift. If that is not the case, and premium charged for youthful drivers is inadequate, this method has the potential to understate actual IBNR due to the shift towards higher loss cost drivers.

## iii. Cape Cod technique:

Sample 1:

Overstates IBNR, but the effect is less than the development technique; overstatement is due to higher % unreported from development technique without considering the change (speed up) in reporting pattern.

# Sample 2:

This method will be affected by the LDFs which are too high without adjustment for the new reporting pattern, but to a lesser extent than the dev method. If policies are correctly priced, then premium component of this method will be unaffected and ECR not impacted. In total – the method will overstate IBNR because the LDFs which are too high, will lead to a % unreported which is too high.

# Sample 3:

CDF's will be too high, which leads to lower used up earned premium, which leads to a higher ECR for the latest AY and in total across AYs. Higher ECR -> Higher expected claims -> Higher expected unreported claims as both % unreported is higher from inflated cdf's and expected claims are higher -> overstated IBNR

## **EXAMINER'S REPORT**

The candidate was expected to demonstrate knowledge with respect to the following:

- Assessing the influence of operating changes and distributional shifts in mix of business on the estimation of unpaid claims
- When the development technique works/does not work as well as how the technique is implemented
- When the expected claims technique works/does not as well as how the technique is implemented
- When the Cape Cod technique works/does not as well as how the technique is implemented

Candidates were expected to recognize that there are two changes taking place - a change in reporting pattern and a shift in mix of business - and to then to address the impact on IBNR if no adjustments are made to account for these changes. This means addressing impacts for each of the three techniques in question, and providing directional impact or lack thereof for each of the techniques accompanied by support for the stated impacts.

Common mistakes include:

- Simply stating a directional impact without providing any support
- Failure to identify correct directional impact from the changes
- Simply stating IBNR would be impacted or generalizing that a method would not account for changes appropriately
- Focusing on a single change and ignoring the fact that two changes are taking place

Common mistakes for part ii. Include:

• Failure to differentiate between *loss cost* impact and *loss ratio* impact, ignoring the premium component of this technique.

Common mistakes for part iii. Include:

• Simply stating that this method is a weighted average of the development technique and expected claims technique, without demonstrating real knowledge of the method, stating directional impact to IBNR or providing support for that impact.

# QUESTION 20

**TOTAL POINT VALUE: 2.25** 

LEARNING OBJECTIVE(S): B2, B5

SAMPLE ANSWERS

Part a: 0.5 point

<u>Sample 1</u>

|          | Unadjusted Average Case Outstanding (000s) |     |     |     |  |  |  |
|----------|--|-----|-----|-----|--|--|--|
| Accident |  |     |     |     |  |  |  |
| Year     | 12   | 24  | 36  | 48  |  |  |  |
| 2014     | 140  | 110 | 130 | 120 |  |  |  |
| 2015     | 135  | 150 | 144 |     |  |  |  |
| 2016     | 180  | 152 |     |     |  |  |  |
| 2017     | 180  |     |     |     |  |  |  |

Yes. There has been a change in the adequacy of case outstanding since the avg case O/S has increased down the column, suggesting strengthening in case O/S adequacy level.

## <u>Sample 2</u>

|          | Unadjusted A | Unadjusted Average Case Outstanding (000s) |     |     |  |  |  |  |
|----------|--------------|--|-----|-----|--|--|--|--|
| Accident |              |  |     |     |  |  |  |  |
| Year     | 12           | 24   | 36  | 48  |  |  |  |  |
| 2014     | 140          | 110  | 130 | 120 |  |  |  |  |
| 2015     | 135          | 150  | 144 |     |  |  |  |  |
| 2016     | 180          | 152  |     |     |  |  |  |  |
| 2017     | 180          |  |     |     |  |  |  |  |

Change in average case

| 12    | 24    | 36    | 48 |
|-------|-------|-------|----|
|       |       |       |    |
| -3.6% | 36.4% | 10.8% |    |
| 33.3% | 1.3%  |       |    |
| 0.0%  |       |       |    |

Trend is different than severity trend of 7.5%. Assume that difference in trend is due to a change in case adequacy over the experience period.

The Berquist-Sherman adjustment used in part (b) assumes that claim settlement rates have been consistent.

<u>Sample 2:</u>

The selection of the underlying trend in severity for this method required much care due to the sensitivity of reserve estimate & need for judgmental selection. If this trend is incorrect reserve estimates may be off by a lot.

## Sample 3:

A limitation would be if our loss trend unexpectedly changes throughout the historical period.

## <u>Sample 4:</u>

It highly depends on selected severity trend.

## Sample 5:

Assumes that change in case outstanding severity is due to case adequacy change and not due to other factors like change in prioritization between large and small claims.

## **EXAMINER'S REPORT**

Candidates were expected to apply the Berquist-Sherman case outstanding adjustment to adjust for changes in the adequacy of case outstanding. Candidates were also expect to know the limitations of the technique and understand how it impacts the calculated ultimate as compared to unadjusted techniques.

### Part a

The candidate was expected to calculate the average case outstanding triangle and evaluate the triangle to identify that there has been a change (increase) in the adequacy of case outstanding over time.

Common mistakes included:

- Concluding the case reserve adequacy was decreasing.
- Examine only a single period (for example: 12 month average case per open claim). A change in the average case outstanding per open claim at a single evaluation does not provide sufficient evidence of case reserve adequacy changes.

### Part b

The candidate was expected to apply the Berquist Sherman case outstanding adjustment to the data given. They were also expected to use the adjusted data to calculate the ultimate loss for AY 2017.

Common mistakes included

- Restating only the 2016 and prior average case outstanding diagonals using the 2016 diagonal as a basis and not restating the 2017 diagonal as well.
- Failure to apply the tail factor provided
- Applying the trend factor incorrectly (e.g., multiplied by trend factor or used 7% instead of 7.5%)

## Part c

The candidates were expected to identify that the unadjusted loss development method would overstate ultimate loss when case reserve adequacy increases.

Common mistakes include:

• Concluding that the unadjusted loss development method would understate the ultimate loss.

• Describing the mechanics of the adjustment but not providing a comparison to the unadjusted result.

## Part d

The candidates were expected to understand the limitations of the Berquist-Sherman case outstanding adjustment.

Common msitakes include:

- Identifying assumptions of the adjustment that could be violated instead of a limitation of the adjustment.
- Identifying when the technique is not appropriate.

- reported (IBNER), and incurred but not yet reported (IBNYR).
- Using the incorrect technique to estimate unpaid ULAE.

## Part a

Candidates were expected to calculate the incurred but not yet reported claim provision for all accident years.

Common mistakes include:

- Calculating the unpaid claim amount (ultimate claims paid claims) instead of the IBNYR provision.
- Calculating incurred but not yet reported claim counts instead of claims, or not knowing how to proceed after calculating IBNYR claim counts
- Incorrectly calculating IBNYR and/or open claim counts
- Estimating case outstanding and IBNER provision instead of the IBNYR provision
- Attempting to estimate IBNYR by taking the sum of the accident year ultimate or paid less CY paid

## Part b

Candidates were expected to calculate the unpaid ULAE estimate using the data presented and appropriate assumptions.

Common mistakes include:

- Using an invalid ULAE estimation method based on the data presented.
- Using the wrong denominator in the ratio of calendar year paid ULAE to calendar year paid claims.
- Using incorrect weights to apply to different claim provisions (eg, 50%/50% weighting, 60% to case outstanding + IBNER, etc.).
- Taking 100% of the pure IBNR and then 40% of the total unpaid losses (without subtracting pure IBNR), resulting in 140% weight to pure IBNR.
- Incorrectly calculating case outstanding + IBNER.
- Applying the ratio of calendar year paid ULAE to calendar year paid claims to total unpaid claims.
- Calculating unpaid ULAE for only one accident year
- Incorrectly mixing calendar and accident year data

| QUESTION 23                                       |                                     |                          |                      |                         |  |

| Sample 1:   |                                     |                          |                      |                         |  |
| A disadvantage is t                               | hat if you incor                    | rectly estimate claii    | ms you will then inc | correctly estimate ALAE |  |
| <u>Sample 2:</u>                                  |                                     |                          |                      |                         |  |

It will be distorted when some claims are closed without payment but with significant amount of ALAE

## **EXAMINER'S REPORT**

The candidate was expected to demonstrate knowledge of the additive ratio method of estimating unpaid ALAE

## Part a

The candidate was expected to calculate the December 31, 2017 paid loss diagonal using the prior diagonal and calendar year 2017 loss payments.

A common mistake was adding the calendar year payments to the incorrect year in the prior diagonal

## Part b

The candidate was expected to estimate ultimate ALAE using the additive ratio approach. This consists of constructing a triangle of paid alae to paid claims, calculating development factors of this triangle using addition, cumulating selected development factors, and applying the 12-ult factor to the 2017 estimate of ultimate loss, which can be determined using the development method on the cumulative paid claims triangle.

Common mistakes include:

- Only providing the ALAE ratio instead of an ultimate ALAE estimate
- Applying the ALAE ratio to 2017 paid loss instead of to the 2017 ultimate loss estimate
- Using the ALAE development method to calculate ultimate ALAE.

### Part c

The candidate was expected to describe a disadvantage of the additive ratio approach.

Common mistakes include:

- Describing an advantage of the approach
- Describing an assumption of the approach.

| QUESTION 24  |
|--|
| TOTAL POINT VALUE: 3.5 LEARNING OBJECTIVE(S): B3, B8   |
| SAMPLE ANSWERS   |
| Part a: 1.25 points  |
| Sample 1   |
| cumul exp rep to actual  |
| AY 2017 btw 15 & 17  |
| losses occur uniformly – will use linear interpolation   |
|  |
| % rep at $15 = 1/1.46 = 68.49\%$   |
| % rep at $18 = 1/1.38 = 72.46\%$   |
| % rep at 17 = 68.49% + (2/3)(72.46% - 68.49%) = 71.14%   |
| $AV_{2017}$ over represented = (2200, 2400)(71, 14%, 68, 40%)/(1, 68, 40%) = 75, 66  |
| $\frac{1}{2017} = \frac{1}{200} = 1$ |
| actual ren = 2750  |
| actual is 274 higher   |
|  |
|  |
| Sample 2   |
| Cum actual rept claim = 2750   |
| % rept at 15 = 1/1.46 = 0.685  |
| % rept at 18 = 1/1.38 = .725   |
| incremental expt rept claim from 15 to $17 = (3300 - 2400) \times (.725685)/(1685) \times 2/3 = 75.6$  |
| cum exp rept at 5/31/2018 = 2400 + 75.6 = 2475   |
| cum expected rept claim is lower than cum actual rept claim  |
|  |
| Part b: 1.25 point(s)  |
| Sumple 1<br>cumul paid btw 15 & 17   |
|  |
| % naid at $15 = 1/2 = 50\%$  |
| % paid at $18 = 1/1.65 = 60.6\%$   |
| % paid at $17 = 50\% + (2/3)(60.6\% - 50\%) = 57.07\%$   |
|  |
| AY 2017 exp rep emergence = (3300 - 1820)(57.07% - 50%)/(1 – 50%) = 209.3  |
| cumul exp = 1820 + 209.3 = 2029.3  |
| actual paid = 2050   |
| actual is only 21 greater. Quite close.  |
|  |
| <u>Sample 2</u>  |
| % paid at 15 = 1/2 = 0.5   |
| % paid at 18 = 1/1.65 = .606   |
| Incremental expt paid claim from 15 to $17 = (3300 - 1820) \times (.606 - 0.5)/(1 - 0.5) \times 2/3 = 209.293$   |
| cum expected paid at 5/31/2018 = 1820 + 209.293 = 2029.293   |

cum actual paid claim = 2050 cum expected paid claim is lower than actual paid claim, but it's still quite close

### Part c: 0.5 point

## <u>Sample 1</u>

You would revise ultimate claims in part a and b if caused by a large claim/cat which you expect to develop beyond current IBNR provisions

## <u>Sample 2</u>

Paid is close so no comment. Actual rep is higher than expected. If this was due to a large unpaid claim, I would increase the est of ult claims.

## Part d: 0.5 point

## <u>Sample 1</u>

If the difference btw actual rep & expected reported was due to a recent increase in case reserve adequacy, I would not revise est of ult claims.

## <u>Sample 2</u>

Increase case reserve adequacy. Because the cumulative paid claim is pretty close to the expected value, but the actual rept claim is much larger than the expected claim. If the case reserve adequacy increases, the ult claim will not change

### EXAMINER'S REPORT

Candidates were expected to assess the estimate of ultimate claims by utilizing reporting and payment patterns to derive expected claim emergence and compare this expectation to actual claim emergence.

Areas where candidates struggled included recognizing the need to interpolate between quarters and performing the associated calculations.

-notes on failure to calc incremental/cumulative amount

Additionally, many candidates failed to draw appropriate conclusions or provide adequate detail for situations that would justify changing (or not changing) the estimate of ultimate claims based on the actual vs expected.

### Part a

Candidates were expected to calculate expected cumulative reported claims for the given accident year and compare to actual cumulative reported claims. This required calculating

expected incremental reported emergence over a two month period based on an interpolated reporting pattern. Candidates were expected to derive the cumulative expected amount by adding the expected incremental amount to the latest inception to date reported amount. Candidates were expected to compare the actual and expected amounts.

Common mistakes include:

- Failing to recognize the need to interpolate between quarters
- Interpolating the cumulative LDFs rather than the percent reported
- Calculating the expected incremental emergence by multiplying expected emergence percentage by the selected ultimate instead of the unreported amount
- Leaving the expected amount as incremental, and not deriving the associated cumulative amount
- Failing to provide adequate comparison between the actual and expected amount

### Part b

Candidates were expected to calculate expected cumulative paid claims for the given accident year and compare to actual cumulative paid claims. This required calculating expected incremental paid emergence over a two month period based on an interpolated payment pattern. Candidates were expected to derive the cumulative expected amount by adding the expected incremental amount to the latest inception to date paid amount. Candidates were expected to compare the actual and expected amounts.

Common mistakes include:

- Failing to recognize the need to interpolate between quarters
- Interpolating the cumulative LDFs rather than the percent paid
- Calculating the expected incremental emergence by multiplying expected emergence percentage by the selected ultimate instead of the un paid amount
- Leaving the expected amount as incremental, and not deriving the associated cumulative amount
- Failing to provide adequate comparison between the actual and expected amount

### Part c

Candidates were expected to provide a situation in which the actuary would revise the estimate of ultimate claims given the results in parts a & b.

Common mistakes include:

Stating that the actual emergence being worse than expected is due to organizational changes such as case reserve strengthening or speed up in payment patterns is grounds for increasing the ultimate. If the driver of the actual vs expected amounts was due to organizational changes, this would only impact the timing of case revisions and payments, but would not necessarily change the ultimate claims.

### Part d

Candidates were expected to provide a situation in which the actuary would not revise the estimate of ultimate claims given the results in parts a & b.

Common mistakes include:

Stating that the actual emergence being worse than expected is due to a large loss would not require an increase to the estimate of ultimate. If there is a one-time shock loss that is not expected to happen again, it may be appropriate to exclude this from estimates of ultimates for future accident years. However, the question being asked is in regard to the selected ultimate for accident year 2017, and so the impact of the large loss should be reflected through an increase to the selected ultimate.
