This Chapter considers the one-time event of presenting statements applying IFRS 17 for the first time. It has four sections: an overview and then a section for each of the three transition approaches described in IFRS 17 – the retrospective approach of IAS 8 and the alternative approaches introduced by IFRS 17, modified retrospective and fair value. The Chapter has a sample timeline. It also references content from Chapter 10 on Fair Value Measurement.

12.B. Which sections of IFRS 17 address this topic?

Appendix C of IFRS 17 provides guidance on this topic.

12.C. What other IAA documents are relevant to this topic?

None.
Overview

12.1. Where does the IASB describe the requirements for transition of the in-force insurance contracts from current accounting standards to IFRS 17?

The effective date, requirements and approaches are described in Appendix C of IFRS 17 and the accompanying Basis for Conclusions.

The transition requirements apply when an entity first applies IFRS 17.

12.2. What is the effective date of IFRS 17?

IFRS 17 applies to annual reporting periods beginning on or after 1 January 2021, with early application permitted. The start of the annual reporting period in which an entity first applies IFRS 17 is called the date of initial application. Some jurisdictions may adopt other effective dates.

12.3. What IFRS 17 comparative information is required?

There is a requirement to provide IFRS 17 financial statements (comparatives) as of the beginning of the period immediately preceding the date of initial application.

The dates that follow apply for entities with quarterly financial reporting and an assumed date of initial application of 1 January 2022. Analogous dates would apply in other situations.

On 31 March 2022 the entity will report the following on the new IFRS 17 basis:

- the 31 December 2020 statement of financial position
- the statement(s) of financial performance for the 3-month period ending 31 March 2021
- the 31 March 2021 statement of financial position will not be presented, but will be necessary to the extent needed to prepare the 31 March 2021 statement(s) of financial performance
- the 31 December 2021 statement of financial position
- the statement(s) of financial performance for the 3-month period ending 31 March 2021
- the 31 March 2021 statement of financial position

Further, on 31 March 2021, the entity will disclose the impact of the change in accounting standards. This disclosure will be as of 31 December 2020.

12.4. Can more than one year of IFRS 17 comparative information be presented?

Yes, an entity is permitted to present more than one year of IFRS 17 comparative information (paragraphs C25-C28). The beginning of the earliest adjusted comparative period presented (which would be the beginning of the period immediately preceding the
date of initial application when only one year of comparative information is presented) is called the “transition date”. In the example shown in question 6.3, the transition date would be December 31, 2020 (January 1, 2021). If an entity chooses to present two years of comparative information (both of which are based on IFRS 17), the transition date would be December 31, 2019 (January 1, 20120). See paragraphs C2 and C25.

12.5. If provided, how is comparative information for earlier periods presented?

If the comparative information and disclosures for earlier periods are adjusted by applying IFRS 17, Question 12.3 above applies. If the comparative information and disclosures for earlier periods are unadjusted, paragraph C27 requires the entity to “clearly identify the information that has not been adjusted, state that it has been prepared on a different basis, and explain that basis.”

12.6. If the implementation of IFRS 9 is deferred until 1 January 2021, what is the interaction with the IFRS 17 comparative financial statements?

IFRS 9 does not require comparative financial statements. However, the implementation of IFRS 9 (e.g., the designation of assets) might be different under IFRS 17 than under the current financial reporting standards. If so, the IFRS 17 comparative financial statements would be presented assuming the implementation of IFRS 9 that is consistent with IFRS 17. Assuming the above timeline with one year of comparatives, the re-designation of assets under IFRS 9 would be as of 31 December 2020 for the purposes of IFRS17 comparatives only.

12.7. If IFRS 9 is implemented before IFRS 17, are financial assets re-designed when IFRS 17 is implemented?

The guidance for re-designation and related disclosures is in paragraphs C29-C33. If there are assets designated as fair value through profit or loss to avoid an accounting mismatch, that designation must be revoked if the accounting mismatch no longer exists under IFRS 17. Otherwise, re-designation of assets is permitted but not required.

As described in question 12.6 above, the IFRS 17 comparative financial statements would be presented assuming the implementation of IFRS 9 that will be adopted with IFRS 17.

12.8. What time period does the transition guidance cover?

The transition guidance applies to all insurance contracts in force at the transition date, which is 31 December 2020 in the above timeline. All insurance contracts issued after that date would be subject to IFRS 17.

12.9. In addition to IFRS 17, what other guidance applies to transition?

Implementing IFRS 17 is considered a change in accounting policy, so IAS 8 Accounting Policies, Changes in Accounting Estimates and Changes in Accounting Policies applies, except, per paragraph C3, the entity need not disclose the quantitative information required by paragraph 28(f) of IAS 8.

12.10. What is the impact on previous business combination balances of paragraph C4(b) of IFRS17?
Paragraph C4(b) requires the entity to derecognise all balances related to business combinations that would not have existed had IFRS 17 been in effect at the time of the business combination. For example, Value of Business Acquired (VOBA) balances will be derecognised, but goodwill balances will be unchanged at the transition date.

12.11. What is to be measured or determined at transition?

At the transition date, the following is required for each group of contracts:

- the carrying value of the liability (or asset), with separate measurement of the risk adjustment and the CSM or loss component,
- the “locked-in discount rate”, being the discount rate used for CSM accretion,
- the accumulated OCI (if the OCI option is elected), and
- the balance of unamortised insurance acquisition cash flows (unless the fair value approach is used).

12.12. How should these items be measured or determined?

Appendix C describes three approaches for transition: full retrospective, modified retrospective and fair value.

The measurement of fulfilment cash flows at the transition date is a straightforward application of paragraphs 33-37. However, the CSM or loss component, the locked-in discount rate and the accumulated OCI all require information from the date of initial recognition, which may be many years before the date of transition. These items are therefore the focus of the transition guidance.

The following questions of this Chapter describe the identification of groups of contracts, the determination of the locked-in discount rate, the measurement of accumulated OCI, and the measurement of the CSM or loss component under the three approaches (full retrospective, modified retrospective, fair value).

12.13. How does the entity decide which approach to use for each group of contracts? As set out in paragraph C5, the full retrospective approach must be used unless it is impracticable to do so, in which case the entity must choose between the modified retrospective approach and the fair value approach. However, if reasonable and supportable information necessary to apply the modified retrospective approach is not available, the fair value approach must be used.

12.14. How does the entity identify groups of contracts at transition?

Paragraphs 14-24 describe the criteria for identifying groups of contracts. Under the full retrospective approach, identification of groups requires the assessment of these criteria as at the date of initial recognition of the contracts in each group. If this information is not available, the full retrospective approach would not be used. Identification of groups under the modified retrospective approach and the fair value approach are described in later questions of this Chapter.

12.15. What other information is needed to use the full retrospective approach?
See questions 12.24 to 12.32. If any material information is not available, the full retrospective approach would not be used.

12.16. Would multiple approaches be used on a single group of contracts?

For a group of contracts, only one approach would be applied.

12.17. What does impracticable mean?

IAS 8 states:

“Applying a requirement is impracticable when the entity cannot apply it after **making every reasonable effort** to do so. For a particular prior period, it is impracticable to apply a change in an accounting policy retrospectively or to make a retrospective restatement to correct an error if:

(a) the effects of the retrospective application or retrospective restatement are not determinable;

(b) the retrospective application or retrospective restatement **requires assumptions about what management’s intent would have been in that period**; or

(c) the retrospective application or retrospective restatement **requires significant estimates of amounts and it is impossible to distinguish objectively information** about those estimates that:

I. provides evidence of circumstances that existed on the date(s) as at which those amounts are to be recognised, measured or disclosed; and

II. would have been available when the financial statements for that prior period were authorised for issue from other information.”

Effectively, this means that the entity must demonstrate that although it has made every reasonable effort to gather the necessary information to enable it to determine the required elements retrospectively, that information is not available, or not available in a form that would enable it to be used without undue cost and effort. Information might be unavailable for a variety of reasons including:

- the information is no longer in the entity’s possession;
- the information is available but outside the entity’s normal retention policy and so might not be complete;
- the entity has the information but is unusable because of technological constraints;
- the need to determine what decisions management might have taken in the past (e.g., declaration of bonus rates);
- the information requires hindsight to understand management’s intent or the entity’s view.
Paragraph BC378 gives examples of items needed for retrospective application for which measurement would often be impracticable.

12.18. Are separate disclosures required for groups using different approaches?
Yes. Paragraphs 114-116 describe the required disclosures.

12.19. After transition, can new contracts be added to the groups established at transition?
The disclosure requirements of paragraphs 114-116 would prohibit new contracts being added to groups measured at transition using the modified retrospective approach or the fair value approach.

12.20. What is different for groups of insurance contracts with (vs. without) direct participation features?
The locked-in discount rate is not needed for CSM accretion or future CSM adjustments and so is only required if the OCI option is elected.

12.21. What is different for groups of contracts measured using the premium allocation approach?
For the liability for remaining coverage, there is no risk adjustment or CSM or loss component to be determined at transition. Also, the locked-in discount rate is not needed.

12.22. What is different for incurred claims liabilities?
There is no CSM or loss component to be determined at transition. The locked-in discount rate is not needed for CSM accretion or future CSM adjustments and so is only required if the OCI option is elected.

12.23. What is different for groups of reinsurance contracts?
There is never a loss component for groups of reinsurance contracts. This is true even if (per paragraph 66(c)(ii)) losses are recognised in profit and loss (rather than adjusting the CSM) to mirror the treatment applying to a group of underlying direct contracts.

The Full Retrospective Approach

12.24. Are simplifications and approximations permitted when applying the full retrospective approach?
The full retrospective approach involves looking back to the date of initial recognition and determining the liability (and in particular, the CSM or loss component) on that date as if IFRS 17 had been in effect. Then, to determine the CSM or loss component at the transition date, the CSM or loss component at the date of initial recognition would be adjusted through time as described in paragraphs 43-45 (CSM) and 50-52 (loss component).

Simplifications and approximations are permitted if they do not have a material impact on the results. If any material information is not available, the full retrospective approach would not be used.
12.25. How are groups of contracts identified?

Paragraphs 14-24 describe the criteria for identifying groups of contracts. Under the full retrospective approach, identification of groups requires the assessment of these criteria as at the date of initial recognition of the contracts in each group.

12.26. How is the locked-in discount rate determined?

The locked-in discount rate is the discount rate that would have been established at the date of initial recognition as described in paragraph 36.

12.27. How is the liability (and in particular, the CSM or loss component) determined at the date of initial recognition?

Actual policy data for the contracts in the group would be used. Information (e.g., assumptions, pre-coverage acquisition expenses) required to estimate future cash flows, the risk adjustment and the CSM or loss component would, to the extent possible, be consistent with the information that would have been available at the date of initial recognition, without the use of hindsight.

In particular, the risk adjustment at the date of initial recognition should reflect the assessment of risk from the perspective of the entity as at the date of initial recognition. As noted in question 12.26 above, the discount rate would be the discount rate that would have been established at the date of initial recognition as described in paragraph 36.

12.28. How is the CSM or loss component measured at the transition date?

The CSM or loss component at the transition date would be measured by taking the CSM or loss component at the date of initial recognition (determined as in question 12.27 above) and adjusting through time as described in paragraphs 43-45 (CSM) and 50-52 (loss component) of IFRS 17.

12.29. Should contracts that are not in-force at the transition date, but which at the date of initial recognition would have been included in the group of contracts as determined in question 12.25 above, be included in the retrospective calculation?

Yes. All contracts that were in the group at the date of initial recognition would contribute to the determination of the liability at the date of initial recognition. Furthermore, cash flows and coverage units associated with these contracts would contribute to the adjusting through time of the CSM or loss component described in question 12.28 above.

12.30. What pattern should be used for CSM amortisation between the date of initial recognition and the transition date?

The adjustments made to the CSM or loss component would, to the extent possible, be consistent with the information that would have been available at the date each adjustment would have been made, without the use of hindsight. However, per paragraph C3(b), for groups of contracts with direct participation features, the option described in paragraph
B115 (to reflect the economic offset of derivatives in profit and loss rather than the CSM) would not be applied.

The adjustments to the CSM or loss component would be made as at each reporting date between the date of initial application and the transition date. If the resulting CSM or loss component would be materially similar, adjustments could be made less frequently, (e.g., annually).

12.31. If the OCI option is elected, how is the accumulated OCI at the transition date measured?

For groups of contracts for which changes in assumptions that relate to financial risk do not have a substantial effect on the amounts paid to the policyholder, the accumulated OCI at transition is the difference between the fulfilment cash flows measured using the locked-in discount rate and the fulfilment cash flows measured using the discount rate in effect at the transition date.

For groups of contracts for which changes in assumptions that relate to financial risk have a substantial effect on the amounts paid to the policyholder but which are not insurance contracts with direct participating features where the entity holds the underlying items (i.e., when paragraph 88 applies), the systematic allocation that would have been adopted at the date of initial recognition (per paragraph B132) would be determined and applied retrospectively to measure the accumulated OCI at transition.

For groups of contracts applying the premium allocation approach, the accumulated OCI at transition for the liability for incurred claims is the difference between the fulfilment cash flows measured using the discount rate in effect at the date the claim was incurred and the fulfilment cash flows measured using the discount rate in effect at the transition date.

For groups of contracts with direct participation features where the entity holds the underlying items (i.e., when paragraph 89 applies), the accumulated OCI at transition would be measured retrospectively applying paragraphs B134-B136.

12.32. How is the balance of unamortised insurance acquisition cash flows determined?

The balance of unamortised insurance acquisition cash flows would be determined by taking the insurance acquisition cash flows allocated to the group for the purpose of calculating the CSM or loss component at the date of initial recognition and removing the portion that would have been amortised under paragraph B125.

The Modified Retrospective Approach

12.33. When can the modified retrospective approach be used?

When it is impracticable to apply the full retrospective approach to a group of contracts, the entity must choose to use either the modified retrospective approach or the fair value approach. However, the entity may only choose the modified retrospective approach if it can obtain reasonable and supportable information necessary to do so. If not, as per the requirements of IFRS 17, the fair value approach must be used.
12.34. What is the modified retrospective approach trying to achieve?

The objective of the modified retrospective approach is to achieve the closest outcome to
the full retrospective approach possible.

12.35. How does the entity achieve this objective?

The entity would maximise the use of information that would have been used to apply the
full retrospective approach, though only to the extent that information is reasonable and
supportable and available without undue cost or effort.

Appendix C describes specific modifications, each of which is permitted only to the extent
that the entity does not have reasonable and supportable information to apply the full
retrospective approach (per paragraph C8). The assessment of which modifications are
permitted would be made for each modification for each group of contracts.

For the remainder of this section, “available information” should be read as “reasonable and
supportable information that is available without undue cost or effort”.

12.36. How are groups of contracts identified under the modified retrospective approach?

If the information is available, groups of contracts would be identified applying paragraphs
14-24.

Paragraph 14 requires the identification of portfolios of insurance contracts, where a
portfolio comprises contracts that are subject to similar risks and managed together. To
the extent information is not available, one of the permitted modifications of the modified
retrospective approach allows the entity to identify portfolios of contracts based on how its
business is managed at transition.

Furthermore, insurance contracts with direct participation features would be in different
portfolios than contracts without direct participation features. At the time of transition,
information from the date of initial recognition about whether contracts would have met the
definition of insurance contracts with direct participation features when they were issued
may not be available. In this case, one of the permitted modifications of the modified
retrospective approach allows the entity to use information available at transition to
determine whether a contract meets the definition of an insurance contract with direct
participation features, i.e., contracts would be included in a portfolio of insurance contracts
with direct participation features if they meet the definition of insurance contracts with
direct participation features at the date of transition.

Paragraphs 15-21 indicate that portfolios are split into three (or more if desired) groups
based on the profitability of contracts at initial recognition. At the time of transition,
information from the date of initial recognition about the profitability of contracts issued in
past years may not be available. In this case, one of the permitted modifications of the
modified retrospective approach allows the entity to use information available at transition
to assess the profitability of contracts for the purpose of grouping. That is, information
about the profitability of contracts currently being issued can be applied to similar contracts
issued in past years. However, such information must be reasonable and supportable,
otherwise the fair value approach would be used. The longer it has been since the policy
has been issued may be a consideration in determining if the information at transition is reasonable and supportable.

Paragraph 22 requires the groups determined per paragraphs 14-21 to be further divided so that contracts issued more than one year apart are not included in the same group. Paragraph C10 permits a modification of this requirement when information is not available. This modification allows the entity to group contracts issued more than one year apart to allow the application of the modified retrospective approach whenever reasonable and supportable information necessary to do so is available. For example, if reasonable and supportable information is only available for contracts issued within 5 years of the transition date and the entity wishes to use the modified retrospective approach for such contracts, the entity could establish two groups of contracts, viz., those issued within 5 years of the transition date (for which the modified retrospective approach would be applied) and those issued more than 5 years before the transition date (for which the fair value approach would be applied).

12.37. How is the locked-in discount rate determined under the modified retrospective approach?

If contracts issued more than one year apart are included in the same group (i.e., the modification in paragraph C10 is made), the entity is permitted to determine the locked-in discount rate using the discount rate in effect at the date of transition rather than the discount rate in effect at the date of initial recognition.

Otherwise, if available, the locked-in discount rate is the discount rate that would have been established at the date of initial recognition as described in paragraph 36.

If not available, one of the permitted modifications of the modified retrospective approach allows the entity to use the relationship between an observable yield curve and the current discount rate to estimate the discount rate as at the date of initial recognition as follows:

If there is an observable yield curve that approximates the current discount rate for at least three years before the transition date, that observable yield curve at the date of initial recognition would be used to determine the locked-in discount rate.

If such an observable yield curve does not exist, but there is an observable yield curve with a reasonably consistent spread to the current discount rate, the average spread between that observable yield curve and the current discount rate would be applied to that observable yield curve at the date of initial recognition to determine the locked-in discount rate. The average spread should be an average over at least three years before the transition date (paragraph C13b)

12.38. How is the CSM or loss component at the transition date measured under the modified retrospective approach?

The full retrospective approach would be used to the extent information is available. The following modifications are permitted to the extent information is not available:

*Insurance contracts without direct participation features*
Discretionary cash flows - The entity would use information at the transition date (rather than the date of initial recognition) to determine how to identify discretionary cash flows for the purpose of applying paragraphs B94-B96. That is, the entity would use policies on discretionary payments that apply at the date of transition if the policies on discretionary payments that applied at the time of initial recognition are not available.

Future cash flows – The future cash flows at the date of initial recognition would be estimated as the future cash flows at the transition date (or an earlier date if the information is available) adjusted by the cash flows that are known to have occurred between the initial recognition and the transition date (or earlier date). Such known cash flows would include cash flows related to all contracts that would have been in the group at the date of initial recognition, including contracts that are no longer in force at the transition date.

Risk adjustment – The risk adjustment at the date of initial recognition would be estimated as the risk adjustment at the transition date adjusted by the expected release of risk before that date. The expected release of risk would be based on the release of risk for similar contracts the entity is issuing at the transition date (paragraph C14).

CSM amortisation – The entity would estimate the amount of CSM recognised in profit or loss because of the transfer of services (paragraph 44(e) between the date of initial recognition and the transition date by comparing the remaining coverage units (for contracts still in-force at the transition date) with the coverage units provided under the group of contracts before the transition date.

Loss component – If there is a loss component at initial recognition, the entity would estimate the amount allocated to the loss component before the transition date using a systematic allocation consistent with the modifications adopted above.

**Insurance contracts with direct participation features**

The entity would measure the CSM at the transition date as the total fair value of the underlying items at the transition date minus:

- the fulfilment cash flows at the transition date, adjusted as described in paragraph C17(c), and
- (if CSM), minus the amount of CSM that relates to service provided before the transition date, estimated by comparing the remaining coverage units with the coverage units provided under the group of contracts before the transition,
- (if loss component), adjust the loss component to nil and increase the liability for remaining covering by the same amount.

If information is not available to apply a permitted modification, the fair value approach must be used.

12.39. If the OCI option is elected, how is the accumulated OCI at the transition date measured under the modified retrospective approach?
For contracts with direct participation features where the entity holds the underlying items (i.e., when paragraph B134 applies), the accumulated OCI at transition would be the accumulated OCI on the underlying items.

Otherwise, the accumulated OCI at transition would be:

- the difference between the fulfilment cash flows measured using the locked-in discount rate and the fulfilment cash flows measured using the discount rate in effect at the date of transition, for contracts for which changes in assumptions that relate to financial risk do not have a substantial effect on the amounts paid to the policyholder, and

- nil for contracts for which changes in assumptions that relate to financial risk have a substantial effect on the amounts paid to the policyholder.

Furthermore, if contracts issued more than one year apart are included in the same group (i.e., the modification in paragraph C10 is made), the entity is permitted to determine the accumulated OCI as nil.

Note that the accumulated OCI would be nil whenever (per the first paragraph of question 12.36 above) the entity chooses to determine the locked-in discount rate as the discount rate in effect at the date of transition.

12.40. How is the balance of unamortised insurance acquisition cash flows determined under the modified retrospective approach?

The modification related to future cash flows in question 12.37 above can be used if the information required to determine the balance of unamortised insurance acquisition cash flows retrospectively (see question 12.31) is not available.

The Fair Value Approach

12.41. What is the fair value used for?

The CSM or loss component at transition is determined as the fair value of a group of contracts at the transition date minus the fulfilment cash flows of the group as at the transition date.

12.42. How are groups of contracts identified under the fair value approach?

Per paragraphs C21-C22, the entity may choose to use the information available at transition rather than the information as at initial recognition to identify groups of contracts. This includes identifying portfolios of insurance contracts (see question 12.35 above).

Furthermore, per paragraph C23, the entity may choose not to apply paragraph 22 and thereby include contracts issued more than one year apart in a group.

Therefore, when applying the fair value approach at transition, the entity may identify portfolios of contracts based on how it manages the business at transition and determine there are three groups per portfolio (onerous, no significant risk of becoming onerous, other), with no division of those groups by year of issue.
12.43. How is the locked-in discount rate determined under the fair value approach?

Per paragraph C23, the entity may choose to determine the locked-in discount rate as the
discount rate in effect at the date of transition.

Note that the same locked-in discount rate would apply to groups within the same portfolio.

12.44. How is the fair value of a group of contracts as at the transition date measured?

The fair value of a group of contracts is analogous to the consideration received/paid on
portfolio transfer or business combination. It is the amount the entity would have to pay a
third party to take on the obligations and risks of the group.

IFRS 13 Fair Value Measurement provides guidance on measuring fair value. See Chapter
10 for guidance on the application of IFRS 13 to insurance contracts on transition to IFRS
17.

The fair value at the date of transition would use observable market information,
assumptions, economic information, views on the cost of risk etc. as at the date of
transition.

12.45. How are the fulfilment cash flows of the group as at the transition date measured?

The measurement of fulfilment cash flows at the transition date is described in paragraphs
33-37.

12.46. If the OCI option is elected, how is the accumulated OCI at the transition date measured
under the fair value approach?

For contracts with direct participation features where the entity holds the underlying items
(i.e., when paragraph B134 applies), the accumulated OCI at transition would be the
accumulated OCI on the underlying items.

Otherwise, the entity can choose to set the accumulated OCI to nil, or to measure the
accumulated OCI retrospectively if the information is available.

12.47. Is balance of unamortised insurance acquisition cash flows required under the fair
value approach?

No.
Section D – Other IFRS 17 Topics

This section includes three chapters that cover topics that do not logically fall within any of the other sections. These are:

- Embedded Derivatives – Chapter 13
- Contract Modifications and Derecognition - Chapter 14
- Measurement, Presentation and Disclosure – Chapter 15

Chapter 13 discusses the issues which may arise in detecting and identifying embedded derivatives in such contracts which may need to be separated. This Chapter only considers the requirements under IFRS 17 for the separation of certain derivatives embedded in contracts subject to the scope of IFRS 17. Further information about embedded derivatives based on other IFRSs is found in IAN 10 Embedded Derivatives.

Chapter 14 discusses what is and is not considered to be a contract modification and how to account for them. The chapter also discusses the circumstances under which a contract is derecognised whether due to a contract modification or otherwise.

Chapter 15 discusses the measurement, presentation and disclosures resulting from IFRS 17. In many instances these are significantly different from those of most existing accounting regimes used for insurance contracts and companies. This chapter also considers changes in presentation permitted or required when using the PAA. Any changes permitted when using the VFA are discussed in chapter 8.
Chapter 13 – Embedded Derivatives

Before consulting this chapter, be sure to read the Introduction to this IAN, particularly the sections on References to IFRS 17, Materiality and Proportionality

13.A. What does this chapter address?

This Chapter considers the requirements under IFRS 17 for the separation of certain derivatives embedded in contracts subject to the scope of IFRS 17. This Chapter discusses the issues which may arise in detecting and identifying embedded derivatives in such contracts which may need to be separated. Further information about embedded derivatives based on other IFRSs is found in the existing IAN 10 Embedded Derivatives.

13.B. Which sections of IFRS 17 address this topic?

Paragraphs 11c and B10 provide guidance on this topic.

13.C. What other IAA documents are relevant to this topic?

None
13.1. What is a derivative and an embedded derivative?

Derivatives and embedded derivatives are defined in IFRS 9 in paragraph 4.3.1. As in IAS 39, IFRS 9 differentiates between derivatives and embedded derivatives and accordingly references to “derivatives embedded in the contract” (as in paragraphs 54 (a) and 70 (a) of IFRS17 relating to the premium allocation approach) might be seen to refer to the definition of a derivative rather than to that of an embedded derivative.

Paragraph 4.3.3 of IFRS 9 includes conditions for separating an embedded derivative, which are applicable according to paragraph 11 (a) of IFRS 17 to insurance contracts and other contracts in the scope of IFRS 17. The guidance regarding definition of derivatives and embedded derivatives and the conditions for separation of those has not changed from those in IAS 39 and accordingly the contents of IAN 10 Embedded Derivatives referring to IAS 39 remains valid. This also applies to other aspects of accounting for embedded derivatives that are to be separated.

13.2. What are the IFRS 17 requirements on the accounting for derivatives embedded in the contract and embedded derivatives?

The requirements in IFRS 17 on the accounting for derivatives embedded in the contract and embedded derivatives are limited (see paragraph 11(a) as noted above).

IFRS 9 defines a derivative as a “financial instrument or other contract within the scope of” and IFRS 9 as “with all three of the following characteristics:

a. Its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the ‘underlying’).

b. It requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors.

c. It is settled at a future date.”

On the conditions for separating an embedded derivative in paragraph 4.3.3 of IFRS 9:

- Paragraph 4.3.3 (b) (meeting stand-alone the definition of a derivative) might be seen as not met if the embedded derivative would be considered stand alone under IFRS 17 (see paragraphs B10 of IFRS 17 and 2.1 (e) of IFRS 9).

- Paragraph 4.3.3 (c) (fair value measurement of the entire contract) for separation might be seen to be met generally by contracts in the scope of IFRS 17 since the condition might be seen to refer explicitly to the measurement of the entire contract.
Paragraph B.4.3.1 of IFRS 9 notes that paragraph 4.3.3 of IFRS 9 “requires the entity to identify any embedded derivative, assess whether it is required to be separated from the host contract and, for those that are required to be separated, measure the derivatives at fair value at initial recognition and subsequently at fair value through profit or loss.”

Embedded derivatives that are not required to be separated (under IFRS 9) are considered as part of the insurance contract and accounted for under IFRS 17.

13.3. Are the IFRS 17 requirements on embedded derivatives different from those in IFRS 4?

The requirements may be different.

Paragraph 8 of IFRS 4 stated that, as “an exception to the requirements in IAS 39, an insurer need not separate, and measure at fair value a policyholder's option to surrender an insurance contract for a fixed amount (or for an amount based on a fixed amount and an interest rate), even if the exercise price differs from the carrying amount of the host insurance liability.” This exception is not included in IFRS 17. This might be seen as a requirement to separate embedded derivatives of that kind, if they meet the conditions in paragraph 4.3.3. of IFRS 9.

In addition, the IFRS 4 implementation guidance (IG3 and 4) provided 20 examples of products, some with and some without embedded derivatives requiring separation. The IFRS 4 implementation guidance has not been included in the implementation guidance to IFRS 17. As a consequence, there may be a difference in the scope of embedded derivatives requiring separation. This might require an assessment based on the nature of individual contract types.

Experience of applying IFRS 4 showed that in many countries the majority of insurance products do not contain embedded derivatives which require separation. It is unclear yet whether the mentioned changes might have a different result.

13.4. Are there specific disclosure requirements for embedded derivatives?

For embedded derivatives that are not separated and so are part of an insurance contract, there are no additional specific disclosure requirements in IFRS 17. For reference in IFRS 4, paragraph 39(e) specifically required that information about the exposure to market risk be disclosed if such embedded derivatives are not measured and presented at fair value through profit or loss.

For embedded derivatives that are separated, the disclosure requirements are as set out in IFRS 17.
Chapter 14 Contract Modifications and Derecognition

Before consulting this chapter, be sure to read the Introduction to this IAN, particularly the sections on References to IFRS 17, Materiality and Proportionality

14.A. What does this chapter address?

This chapter considers the treatment under IFRS 17 of contract modification to insurance contracts, including reinsurance contracts, and de-recognition including on transfer to third parties.

It discusses what is a contract modification and which of these:

- result in the derecognition of the original contract and recognition of the modified contract as a new contract for a deemed premium; or
- can simply be treated as a change in estimates.

The chapter also describes:

- a possible approach for determining the deemed premium when the modification is treated as a cancellation and replacement of the original contract; and
- as well as their application under the premium allocation approach.

14.B. Which sections of IFRS 17 address this topic?

Paragraphs 72 to 77 provide guidance on this topic.

BC 306 and 316-322 also provide background on the subject.

14.C. What other IAA documents are relevant to this topic?

None
Overview

This flowchart is included to help in understanding whether or not there is a contract modification which needs to be accounted for. It is designed to be used in conjunction with the questions in this chapter.

What is a contract modification?

14.1. What is a contract?

Refer to Chapter 1 “Classification of Contracts and Contract Boundaries”.

14.2. How does IFRS 17 define a Contract Modification?

IFRS 17 defines a contract modification as a change to the legally enforceable terms of the contract, for example, either by agreement between the parties to the contract or by change in law or regulation (see paragraph 72). Note that the exercise of any rights or options available under the contract, by one or both parties, are not contract modifications (see paragraph 72) and form part of the expected cash flows of original contract.

14.3. What is a contract modification?
Examples of what is and is not a contract modification for IFRS 17 purposes are given below. These examples are not a complete or exhaustive list.

(a) The following are considered to be a contract modification (so long as it does not arise from an option available to either the insurer or policyholder) as they require the agreement of both insurer and policyholder to take affect (note, this does not include any requirement to notify the other party in order to exercise the option):

   (i) an increase or decrease in the nature or level of benefits under the contract, note these could include changes to extend or reduce the period of cover under the contract (i.e., affect the contract boundary) - unless they arise from the exercise of an option under the contract, or they only effect coverage beyond the contract boundary (refer Chapter 1);

   (ii) the addition or removal of benefits under the contract;

   (iii) the addition or removal of coverages under the contract;

   (iv) the addition or removal of options or guarantees available under the contract;

   (v) any change to premiums;

   (vi) any change of reinsurance contracts terms and conditions requiring the consent of both parties;

   (vii) by change to contractual terms arising from change in regulation;

(b) The following are considered not to be a contract modification:

   (i) the exercise of any options available to the policyholder under the terms of the contract (or law), within the contract boundary, that do not require the agreement of the insurer (this does not include any requirement to notify the other party in order to exercise), for example:

      • an option to renew the contract under the terms of the contract without further underwriting;

      • an option to surrender the contract or to cease paying premiums while still receiving benefits under the contract;

      • exercise of a contractual right to suspend and later resume cover under the contract without a new risk assessment;

      • an option to increase cover on renewal e.g., with consumer price index or at other times under the contract (e.g., guaranteed future insurance options) without further underwriting;

      • contracts arising from guaranteed insurability options as these form part of the original contract terms and are neither a new contract nor a contract modification (e.g., guaranteed annuitisation option under a deferred annuity contract);
(ii) the exercise of any options available to the insurer under the terms of the contract (or law), within the contract boundary, that do not require the agreement of the policyholder (the need to notify the other party to exercise the option does not mean their agreement is required, unless they have right to refuse the exercise of the option), for example:

- changes to premium or benefits permitted under terms of the contract, law or regulation. Note:
  - if the policyholder has the right to terminate the contract upon such a change, this does not mean agreement of both parties is required for the insurer to exercise the right to make such changes, simply that it gives the policyholder rights. In both cases they can be exercised without the agreement of the other party and hence these are not contract modifications;
  - where the insurer has the right or practical ability to change the premium in such a way that the payment of that premium is outside of the boundaries of the contract (refer to chapter 1) then it creates a new contract which is to be measured as such.

14.4. How are changes that are not contract modifications treated?

Changes that are not contract modifications (see question 14.3) form part of the expected cash flows under the contract (see Chapter 2) so long as they are within the contract boundary (see Chapter 1). That is both when:

a) measuring it upon initial recognition under paragraphs 32 -35, paragraphs B61 and B62; and

b) upon subsequent measurement under paragraph 40.

14.5. What about the exercise of a contractual option to add features that is outside the contract boundary?

A special case may occur if there is a contractual right to add new features to the original contract which could be outside the contract boundary because the entity is able to reprice or underwrite the contract for the additional feature added at the time it is added.

IFRS 17 treats cash flows outside the contract boundary as relating to future insurance contracts (paragraph 35) and such a new feature might be eligible to be treated as a new contract.

The treatment of contractual options and their interaction with the contract boundary was discussed at the IASB May 2018 TRG meeting (see AP03 Cash flows within the contract boundary and the IASB Summary of the May TRG Meeting).

It was observed by the TRG, that unless the contractual option of itself, even before exercise, qualifies as a separate contract (see IASB Feb 18 TRG paper AP01 Separation of insurance components of a single insurance contract and IASB TRG summary for the limited circumstances in which this may apply), then it is a contractual feature of the
insurance contract. In that case it is included in measurement of the original contract to the extent it is with in the contract boundary.

The staff view was that:

- as the unit of account is the contract as a whole, the contract boundary depends on the substantive rights and obligations as a whole; and
- the ability to reprice a part (e.g., the feature being added on exercise of the option) does not mean that part has a different contract boundary.
- If the addition, upon exercise of the option, was able to be repriced at time of exercise, then the insurer would need to decide whether there was any contractual obligation that needed to be measured prior to exercise.

Also, it may not be practicable, where the new feature is not distinct (i.e., the cash flows of the new feature and the original contract are highly interrelated), to treat it as a separate new contract.

If not distinct, then the addition of new features that are outside of the contract boundary (e.g., because they can be underwritten at the time of exercise at an appropriate price for the change in insurance risk, if the alternative TRG view is taken) might be treated as a contract modification at the time of addition, as the ability to underwrite the new feature effectively means the consent of both parties is required. An example of such a feature is the reduction of payment limits (with risk assessment for the reduction) that occurs in German Health insurance.

If the contract modification is not a specified modification under paragraph 72, then paragraph 73 applies, i.e., the contract is not de-recognised and the changes in cash flows caused by the modification are treated as changes in estimates of fulfilment cash flows.

Specified Modifications

14.6. Which are the specified contract modifications that result in the derecognition of the original and recognition of the modified contract as a new contract?

These are those contract modifications specified in paragraph 72, (“specified contract modifications”). The discussion in the Basis for Conclusions (see BC317 – BC320) indicates that these criteria in paragraph 72 capture modifications that IASB sees as resulting in significantly different accounting treatment. For example, if the modified terms had applied at inception, they would have caused differences in the applicability of IFRS17, or the separation of components, or the contract boundary (only if substantially different), or the applicability of the measurement model of the original contract.

The specified criteria are such that had the contract had been written at inception as now modified, it would:

- not have been classified as an insurance contract (see Chapter 1); or
- have been included in the different group from the one it was included in at initial recognition; or
• have a substantially different contract boundary; or
• have had different components separated, resulting in a different insurance contract for IFRS 17; or
• if the PAA was applied to the contract and it would not have qualified (see Chapter 7); or
• have qualified (or ceased to qualify) for treatment as an insurance contract with direct participation features.

14.7. How do contract modifications or the exercise of options available under the contract influence the contract boundary?

The contract boundary is re-assessed in each reporting period (see paragraph B64) and ends when the criteria of paragraphs 34 are fulfilled (see Chapter 1).

14.8. What qualifies as a substantially different contract boundary for the purposes of paragraph 72?

The intent in setting the criteria in paragraph 72 was to capture those contract modifications that would result in a significantly different accounting treatment (see BC317-BC320) for the modified contract had the new terms always applied and only those contract modifications (see BC320).

This indicates that it is possible the criteria for assessing if the change in contract boundary is substantial, if it had occurred at inception, might impact on the accounting treatment.

A contract modification that changes the contract boundary in such a way that, if the contract had been written at inception as modified, it would:

• have not qualified for the PAA, when it was being accounted for under the PAA; or
• would have been included in a different group

is clearly a contract modification that results in a significantly different accounting treatment, as it is captured under the other criteria in paragraph 72.

Other contract boundary changes that possibly could be considered to result in a significantly different accounting treatment include but are not limited to:

• a change such that the renewal of the contract is now outside the contract boundary (e.g., the modification gives the insurer the right to reprice the contract at renewal) so that the contract becomes eligible for the PAA upon renewal; or
• a change to the contract boundary that has a substantial effect on the contract’s CSM release pattern.

Note that, if the relevant criterion is the impact of the change in contract boundary the impact of any other modifications to the contract on the contract’s CSM release pattern would, if material, need to be excluded from this assessment. For example, if the criterion is simply the change in the contract boundary itself, then a change that increased or
decreased the contract boundary by 50% or more at inception of the contract, might be a substantial change, but one that changed it by 20% or less might not be a substantial change, e.g.,

- The extension of a contract term from 20 years to 40 years might be substantial; and
- The extension of a contract that originally provided coverage from age 30 up to age 60 to age 65 might not be substantial.

It should be noted that these examples are for illustrative purposes only and that every case needs to be considered on its own merits.

Accounting for specified contract modifications

14.9. How are specified contract modifications accounted for?

The entity:

(a) derecognises the contract being modified from the group to which it was allocated at inception by:

- setting the contribution of its fulfilment value, including the risk adjustment and incurred claims, to the group to zero (paragraph 76 (a));
- adjusting the number of coverage units for expected remaining coverage (paragraph 76(c));
- adjusting the CSM of the group to the extent required by paragraphs 44(c) and 45(c) for the difference between (paragraph 77(a)):
  - the reduction in fulfilment value of the group from setting that for the contract prior to modification to zero (paragraph 77(a)(i)); and
  - the premium it would have charged for a new contract issued at the date of contract modification with equivalent terms, net of any additional premium charged for the modification (paragraph 77(a)(iii));
- per paragraphs 44(c) and 45(c), the CSM can only be adjusted to the extent that the adjustment does not reduce the CSM below zero, except in the case of reinsurance held. If there is a loss component already, paragraphs 44(c)(ii), 45(c)(iii) and 50(b) apply;

and

(b) recognises the modified contract as a new contract as at the date of modification under IFRS 17 assuming the net equivalent premium noted above was paid as at the date of modification (see paragraph 77(b)).

14.10. If the insurer does not have contracts with equivalent terms, how is the premium determined?
The premium is the price that the entity would have charged the policyholder if it had entered into a contract with equivalent terms at the date of the actual modification (see paragraph 77(a)(iii)).

The assumptions used in determining the premium would usually be consistent with those used in determining the liability arising from the modified contract at the date of actual modification, except for the CSM.

For example, the premium might be determined as the sum of:

- the fulfilment cash flows (the unbiased expected present value of the future cash flows, excluding the premium being determined and including any taxes on the premium, acquisition costs for the modified contract, and an adjustment for risk);
- any other elements not included in fulfilment cash flows under IFRS 17 that the entity would normally include in setting premiums, e.g., general overheads and costs not directly attributable to a portfolio of insurance contracts and charge for capital; and
- the CSM after allowing for any elements not included in fulfilment cash flows, that reflects the entity’s current approach to profit targets when pricing for similar business.

Note, this may not be the same as the fair value of the modified contract, and the premium possibly could differ from fair value because:

(a) it uses entity-specific assumptions for some inputs, including the degree of risk aversion, whereas fair value typically uses market participant assumptions in all cases;

(b) it excludes the entity’s own non-performance risk, whereas fair value would include the entity’s own non-performance risk; and

(c) it includes the entity’s targets for CSM, whereas fair value includes no such margin, although fair value implicitly includes a current value for any additional margin that market participants would require.

Other contract modifications

14.11. What other types of contract modifications are there?

Apart from specified contract modifications, as per paragraph 72, there are other contract modifications. Examples could include:

- Addition or Removal of benefits, where they do not cause the contract to fall into another portfolio and hence different group;
- Increase or reduction in benefits, where they do not change grouping;
- Changes to what is covered, e.g., an extension or renovation under home insurance, or a new car under motor insurance; or
• Extension or reduction of the contract term, with no substantial change in benefit levels, provided this does not materially change the contract boundary or change eligibility for PAA.

14.12. How are other contract modifications accounted for?

Contract modifications not specified in paragraph 72 are accounted for by treating the resulting changes in the fulfilment cash flows (i.e., expected cash flows, risk adjustment) as a change in estimates as per paragraphs 40-52 (see paragraph 73).

Derecognition

14.13. When can contracts be derecognised?

Contracts can be derecognised only when:

• A specified contract modification occurs (see question 1.6 above), in this case the modified contract is treated as a new contract which assumes all obligations arising from the contract pre and post modification; or

• A contract is transferred to a third party (see paragraph 77 and question 14.14 below), this applies only when the contract is transferred as a whole including any obligation for incurred claims arising from past coverage, otherwise the contract in full has not been extinguished and cannot be derecognised as per paragraph 74; or

• All obligations under the contract are extinguished (see question 14.15 below). This includes not only the liability for future coverage but also for incurred claims arising from past coverage (see paragraph 74(a)).

14.14. How are contracts that are transferred to a third party derecognised?

In a similar way to the derecognition of a contract upon a specified contract modification (per the paragraph 72 criteria) that is the contract being transferred is derecognised from the group to which it was allocated at inception by:

• setting the contribution of its fulfilment value (including the risk adjustment and incurred claims) to the group to zero;

• adjusting the number of coverage units (see paragraph.76(c))

• adjusting the CSM of the group for the difference between:
  o the reduction in the insurance contract liability of the group from setting that for the contract prior to modification to zero; and
  o the premium charged by the third party for transfer of the contract.

14.15. How are contracts derecognised other than due to a specified contract modification or transfer to a third party?
In a similar way to the derecognition of a contract upon a specified contract modification (per paragraph 72 criteria), that is the contract being transferred is derecognised from the group to which it was allocated at inception by:

- setting the contribution of its fulfilment value (including the risk adjustment and incurred claims) to the group to zero;
- adjusting the number of coverage units (paragraph 76(c));
- adjusting the CSM of the group for the reduction in fulfilment value of the group from setting the fulfilment value relating to future service for the contract being derecognized to zero.

14.16. What if only the obligation for future coverage is transferred to a third party

In this case, the contract does not qualify for derecognition under paragraph 77 and is treated as a contract modification.

Application to Reinsurance and Premium Allocation Approach

14.17. How are modifications to reinsurance contracts accounted for?

Reinsurance contracts are insurance contracts and the modifications to them are accounted for in the same way as for other insurance (paragraph 4), see also chapter 9.

14.18. How do modifications to underlying insurance contracts affect the subsequent measurement of the reinsurance contract?

To the extent that they change the expected cash flows under the reinsurance contract, they are:

- reflected in the re-measurement of the reinsurance contract (as per paragraphs 40-46 and 60-68); and
- not reflected in the CSM of the reinsurance contract to the extent that they do not adjust the CSM of the underlying group of insurance contracts (see paragraph 66(c)) and relate to future service.

14.19. How are contract modifications and derecognition accounted for under the PAA?

The requirements of paragraphs 73, 76 and 77 presume that the contract is being measured under the GMA. Where PAA applies to a contract (and in the case of a contract modification it continues to qualify for PAA), one possible interpretation is that they have no effect for PAA contracts.

Another possible approach is to apply the requirements of paragraphs 73, 76 and 77 appropriately modified for PAA, e.g.,

(a) For non-specified contract modifications, as per the answer to Q14.12 and Q14.15, (because a change in estimates under PAA only impacts the liability for incurred
claims as per paragraph 40 (b)) this element would reflect this change if appropriate. However, if the contract modification where to:

(i) cause the group of which it is a part to be viewed as onerous, paragraphs 57 and 58 would apply and liability for remaining coverage would also change as per these paragraphs; or

(ii) cause the premiums received to change then this would be reflected in the liability for remaining coverage as per paragraph 55.

(b) For specified contract modifications, the answer to Q14.9 applies, modified for PAA as follows:

(i) de-recognises the modified contract from the group of which it is part by setting the contribution of its carrying value to the group including liability for incurred claims to zero, consistent with paragraph 76 (a); and

(ii) recognises the modified contract as a new contract as at the date of modification under IFRS 17 assuming the premium it would have charged for a new contract issued at the date of contract modification with equivalent terms, net of any additional premium charged for the modification (paragraph 77(a)(ii)) was received as at the date of modification (paragraph 77(b)).

(c) When derecognising a contract, the answer to Question 14.15 applies, modified for PAA as per (b) (i) above.

(d) When derecognising a contract upon transfer to another party, the answer to Question 14.14 applies, modified for PAA as per (b)(i) above.

14.20. What if a modified contract was part of an Onerous Group?

If the modification is not specified in paragraph 72, then paragraph 73 applies and the changes in estimates of fulfilment cash flows are treated in accordance with paragraphs 50 & 51 in the same way as any other subsequent change in fulfilment cash flows under IFRS 17.

If the modification is specified in paragraph 72, then it is treated as per paragraphs 74-77, (see Question 14.9) and there is no CSM to be adjusted in respect of the Onerous Group to which the contract was allocated at inception. However, as noted in Question 14.9 it is allocated to the loss component as required by paragraphs 44(c)(ii), 45(c)(iii) and 50(b) unless measured under PAA.
Chapter 15 - Measurement, Presentation and Disclosure

Before consulting this chapter, be sure to read the Introduction to this IAN, particularly the sections on References to IFRS 17, Materiality and Proportionality

15.A What does this chapter address?

This chapter considers the general requirements for presentation of financial information under IFRS contained in IAS 1 as well as the specific additional requirements in IFRS 17. It also provides general comments on the disclosures required to explain the presentation such as the required reconciliations. This Chapter discusses the additional requirements of IFRS 17, what constitutes revenue and expenses, how experience variances are presented, what is to be reported in the Statement of Financial Performance versus Other Comprehensive Income, the level of aggregation to be used in presentation and disclosure, and required reconciliations. This chapter also covers changes in presentation permitted or required when using the Premium Allocation Approach (PAA), but differences in presentation for the Variable Fee Approach (VFA) are covered in the chapter 8 of this IAN on contracts with participation features.

This chapter is split into three sections discussing in

- Section A – Measurement
- Section B – Presentation and
- Section C – Disclosures

However, it should be noted that as there is much overlap between these subjects one will need to read the whole chapter to appreciate the subject in total. These three sections address the following subjects:

- Overview of IFRS 17 presentation;
- Statement of financial position;
- Statement of financial performance;
- Presentation: timing of cash flows;
- Presentation of acquisition costs and other insurance expenses;
- Presenting other features of IFRS 17 measurement;
- Presentation for different types of entity; and
- Interim reporting, disclosures and transition to IFRS 17.

15.B Which sections of IFRS 17 address this topic?

Paragraphs 78 to 132 and B120 to B137 set out the requirements on this topic.

Paragraphs BC328 to BC366 also provide background on the subject.
15.C What other IAA documents are relevant to this topic?

None
Overview of IFRS Presentation

15.1. What is meant by “presentation” in IFRS 17?

IFRS 17 sets out the items that will be presented in the statement of financial position (a term used in IFRSs for balance sheet) in paragraphs 78 to 79 and in the statement(s) of financial performance (a term used in IFRSs for the income statement or statement of profit or loss) in paragraphs 80 to 92 and B120 to B136. In addition to the profit or loss, the statement of financial performance also includes changes in the statement of financial position not included in the profit or loss, which are referred to as “other comprehensive income” or “OCI”.

Insurance contracts are not included in IFRS 17 presentation that relate to periods after the date of derecognition of those contracts.

Below is an illustrative example statement of financial position and statement of comprehensive income under IFRS 17 taken from selected illustrative disclosures published by EY. This illustrative example reflects certain options an entity might use but others may well choose other options.

The accounting policies and Notes on pages 11 to 81 form part of, and should be read in conjunction with, these financial statements.
The following commentary is based on GMA. Other treatment may apply for PAA and this is discussed in the discussion below.

The insurance service result (paragraphs 83-86 and B120-B127), includes:

- Insurance revenue, comprising the release of expected claim and other expense cash flows, release of CSM and release of risk adjustment for the period; and

- Insurance service expenses, comprising actual incurred claims and other expenses, including acquisition expenses, for the period.

Insurance finance income or expenses (refer paragraphs 87 – 92 and B128 – B136), for the effect of the time value of money and financial risk, includes:

- Investment income earned on assets during the period, and

- The effect of discounting of the expected future cash flows.

The insurance service result can be broadly thought of as the component of the result relating to claims and underwriting risk while insurance finance income or expenses can be thought of as the component relating to financial and market risk.

The insurance finance income and expenses can be disaggregated between the profit or loss and other comprehensive income (OCI) in order to reduce accounting mismatches (refer paragraphs 88(b) and B129 – B130).
Section A – Measurement of line items in the statement of financial performance

This section considers the general requirements for measurement of key line items for insurance contracts in the statement of financial performance in IFRS 17. It covers changes in presentation permitted or required when using the PAA, but differences in presentation for the VFA are covered in the chapter 8 of this IAN on contracts with participation features.

15.2. How is insurance revenue, gross of reinsurance, measured?

IFRS 17 paragraph 83 states that “[..]Insurance revenue shall depict the provision of coverage and other services arising from the group of insurance contracts at an amount that reflects the consideration to which the entity expects to be entitled in exchange for those services.[..]”

The measurement of insurance revenue is set out in paragraphs B120 to B127. Some of the key themes from these paragraphs are discussed below, but it is important to refer to the specific requirements in IFRS 17 as well.

In effect, insurance contract revenue represents the value of the services that the entity expected to provide during the reporting period. This includes amounts in the statement of financial position at the start of the reporting period for the value of future coverage, including the release of CSM and risk adjustment, which will not be included in the statement of financial position at the end of the reporting period as the related coverage is provided in the reporting period. This component of the revenue is based on a view of what services would be provided in the financial reporting period that were already included in the opening balance sheet.

It is necessary to also include revenue in respect of coverage provided by insurance contracts which were recognised for the first time during the financial reporting period and provided coverage during that period. The amount of this revenue is based on the value of the contracts at initial recognition and the portion of coverage and other services provided by those contracts during the reporting period.

Over the lifetime of the contract, the total revenue is the sum of the premiums received, adjusted for a financing effect and excluding investment components. It is still the premium but, for long term business, recognised in a very different way and timing compared to most accounting bases applying prior to IFRS 17.

Insurance revenue related to insurance acquisition cash flows is measured by allocating a portion of premiums related to recovering these cash flows to each reporting period. This allocation is based on the passage of time. An equal and offsetting amount is recognised in insurance service expenses (see paragraph B125).

Under the PAA, insurance revenue is measured as the expected premium receipts adjusted to reflect the time value of money and the effect of financial risk where significant (excluding any investment component) allocated to the period. In addition, paragraph 56 specifies that the time value of money need not be reflected if the time between premium
receipt and provision of coverage is one year or less. The allocation is based on the passage of time, unless the expected pattern of release of risk differs significantly from the passage of time, in which case it should be allocated based on the expected timing of incurred insurance service expenses (see paragraph B126). Liability for remaining coverage is defined in paragraph 40(a) and Appendix A. Paragraph 55 specifies the liability for remaining coverage for the PAA. See also Chapter 7.

The impact of reinsurance is discussed in question 15.9.

15.3. What is included in insurance service expenses?

The items included in insurance service expenses are identified in paragraph 103b as.

i. Incurred claims (excluding investment components) and other incurred insurance service expenses;

ii. amortisation of insurance acquisition cash flows;

iii. changes that relate to past service, i.e., changes in fulfilment cash flows relating to the liability for incurred claims; and

iv. changes that relate to future service, i.e., losses on onerous groups of contracts and reversals of such losses.

As discussed in question 15.34 amortisation of insurance acquisition cash flows are equal and offsetting to the amount included in insurance revenue.

The term “liability for incurred claims” is defined in paragraph 40(b) and in Appendix A.

15.4. What is the insurance service result?

Paragraph 80 details that the insurance service result comprises the insurance revenue and insurance service expenses, which are presented excluding investment components. Insurance revenue and insurance service expenses are discussed in the previous two questions and the exclusion of the investment component is discussed in the question below.

15.5. What does it mean to exclude the investment component from the presentation of the insurance revenue and insurance services expenses?

This question is primarily interested in the presentation on investment components that are not distinct. Appendix A defines investment components as “The amounts that an insurance contract requires the entity to repay to a policyholder even if an insured event does not occur.” The paragraph below briefly explains the treatment of distinct investment components, which are excluded from revenue and expenses and the subsequent paragraph clarifies what are investment component under IFRS 17. It will be necessary to identify which insurance contracts have investment components that are not distinct but need to be presented separately.
The IASB has separate financial reporting standards for financial instruments (IFRS 9) and contracts with customers (IFRS 15). Insurance contracts typically combine elements of the characteristics of both financial components and service components. In paragraph IN4 the IASB explains, in its rationale for implementing IFRS 17, long-term and complex insurance risks are difficult to reflect in the measurement of insurance contracts, are not typically traded in markets and may include a significant investment component which, poses further measurement challenges. Paragraph IN7 explains that IFRS 17 results in the liability for a group of insurance contracts relating to remaining future service under those contracts being measured broadly consistent with IFRS 15 except that the liability often includes an investment component typically not in contracts within the scope of IFRS 15. In IFRS 17 reporting entities are required to distinguish between the financial and non-financial performance from insurance contracts.

An investment component of an insurance contract is the amounts the entity is required to pay to the policyholder even if the insured event does not occur (Appendix A). For example, where there are guaranteed benefits, some profit commission arrangements or where there is a fund that is repaid to the policyholder if it is not required to settle claims or pay benefits. For example, guaranteed amounts or repayments of funds payable by the entity when a contract lapses or is surrendered, may meet the IFRS 17 definition of investment components as the payments do not depend on an underlying insured event.

Distinct investment components, will already have been separated from insurance contracts and reported for in accordance with IFRS 9 (see paragraphs 10-12 of IFRS17). This question is referring to investment components that are not distinct. Paragraph 13 makes clear that later references to investment components in IFRS 17 refer to treatment of indistinct investment components that have not already been separated and reported as if they were separate investment contracts.

IFRS 17 requires that insurance service revenue and insurance service expenses exclude investment components (refer to paragraphs 42(b), 55(b)(vi), 84, 85,103(b)(i)), B120, B123(a)(ii), B124(a)(ii)). Paragraph 103 (c) requires that investment components excluded from insurance revenue and insurance service expenses are disclosed separately in the reconciliations.

15.6. How is the investment component of an insurance contract in scope of IFRS 17 measured?

It is not necessary to explicitly measure investment components in order to be able to exclude them from insurance revenue and insurance service expenses. The requirement is only to exclude the amounts identified as arising from investment components at the reporting date. This is explained in BC34.

IFRS 17 identifies the determination of these investment components as a significant judgement and requires disclosure of the inputs, assumptions and estimation techniques used (see paragraph 117(c)(iv)).
There is a specific requirement to allow for the difference between the expected and actual value of investment components that become payable in the period, in the CSM (paragraph B96(c)). See Chapter 6 for further information on the CSM.

At the time of drafting, it seems likely that reporting entities will need to define a basis for measuring investment components of insurance contracts being reported under IFRS 17.

15.7. What is the insurance finance income or expense and how can it be presented in the statement of financial performance?

Paragraph 87 defines insurance finance income or expenses as the change in insurance contract liabilities arising from the effect of the time value of money or changes in the time value of money (which means the unwinding of the discount rates applied to the fulfilment cash flows, changes in the discount rates applied to the fulfilment cash flows and the accretion of interest on the CSM) and the effect of financial risk or changes in financial risk.

Groups of contracts with direct participation features that are onerous, may experience gains or losses due to the time value of money or financial risk that would otherwise result in an adjustment to the CSM if the contracts were profitable. These gains or losses arise when the carrying amount of the CSM is exceeded by the entity's share of a decrease in the fair value of the underlying items or increases in the fulfilment cash flows relating to future service (or when these amounts reverse due to the entity's share of an increase in the fair value of the underlying items or decrease in the fulfilment cash flows relating to future service). These gains or losses are excluded from the insurance finance income or expenses and reported in the insurance service expenses.

An accounting policy choice needs to be made between reporting insurance finance income or expenses entirely in profit or loss, or splitting it between profit or loss and OCI. The reasons for allowing this choice of presentation are considered in Chapter 3 on Discounting.

If an entity chooses to split insurance finance income or expenses for a portfolio of insurance contracts between profit or loss and OCI, the standard sets out the presentation requirements in two categories:

1. Contracts with direct participation features for which the entity holds the underlying items; and
2. All other contracts.

The basis for determining the discount rate that applies when calculating the insurance finance expense is covered in Chapter 3.

15.8. When do you not need to present insurance finance expense?

Paragraph 56 indicates that under the PAA an “entity is not required to adjust the carrying amount of the liability for remaining coverage to reflect the time value of money and the effect
of financial risk if, at initial recognition, the entity expects that the time between providing each part of the coverage and the related premium due date is no more than a year.” In this case no insurance finance expense calculation is needed.

15.9. Are ceded reinsurance premiums and recoveries included in revenue or as negative expenses?

Insurance contract revenue is calculated only in relation to groups of insurance contracts issued (paragraph 83).

Income and expenses from reinsurance contracts held is presented separately in the insurance service result from expenses and income from insurance contracts issued (paragraph 82). An entity may present income and expenses from a group of reinsurance contracts as a single amount or may present separately the amounts recovered from the reinsurer and an allocation of the premiums paid that together give a net amount equal to that single amount (paragraph 86), excluding investment components (paragraph 85).

If the income and expenses from reinsurance contracts held are presented separately, paragraph 86 sets out that other reinsurance cash flows contingent on claims on the underlying contracts are presented as part of the claims that are expected to be reimbursed. However, other reinsurance cash flows that are expected to be received that are not contingent on the claims to the underlying contracts, e.g., some types of ceding commissions, are presented as a reduction to the premiums paid to the reinsurer.

Presentation: timing of cash flows

15.10. How are future premiums on existing insurance contracts allowed for in revenue, for example, instalment premiums, adjustment premiums and reinstatement premiums?

Paragraph B124 sets out that insurance revenue is for the reduction in the liability for remaining coverage because of services provided in the period. Consequently, only future premiums in respect of service provided in the period would be included in revenue for that period. This may include premiums that have fallen due but have not yet been received, for example, from brokers where balances are settled quarterly or where adjustment premiums are paid at the end of the coverage period relating to changes in exposure across the entire reporting period.

Future premiums, such as instalment premiums and reinstatement premiums, may relate to the provision of future coverage, not services provided in the period so will be included in the valuation of insurance contracts but are not included in revenue until the services are provided. This means that the value of premiums receivable will be recognised in the statement of financial position based on when those premiums will be received as they are within the contract boundary for insurance contracts within the scope of IFRS 17 but will not be included in the statement of financial performance until a subsequent reporting period when the services related to those premiums have been provided.
Future premium collections in some instances relate to coverage provided in the past, such as for retrospectively rated contracts and audit premiums found in some non-life policies. In that case, these future premiums might have already been reflected in a past income statement while still impacting the current statement of financial position.

Scope, recognition and contract boundary considerations are covered in Chapter 1.

15.11. How are premiums already paid and premiums to be paid in the future in relation to currently held ceded reinsurance contracts shown in the statements of financial position and financial performance?

Premiums already paid to reinsurers are in the past so are not included in the valuation of reinsurance contracts held in the statement of financial position.

Future premiums due to be paid in respect of currently held reinsurance contracts that meet the recognition requirements and are within the contract boundary are included in the valuation of reinsurance contracts in the statement of financial position. They will be included in insurance expense in the statement of financial performance when the services are provided by the reinsurer which may be in a subsequent reporting period.

15.12. How is the impact of unexpected policy terminations determined and reflected in the insurance revenue?

Under the general model, paragraph B124 sets out that insurance revenue is for the reduction in the liability for remaining coverage because of services provided in the period.

B124a indicates that revenue includes “insurance service expenses incurred in the period (measured at the amounts expected at the beginning of the period)”. Therefore, insurance revenue reflects policy terminations expected at the beginning of the period and will not reflect unexpected policy terminations that occur during the period. If the change in the terminations changes the expected cash flows for future coverage then this adjusts the CSM.

If the unexpected terminations change the entity's view of risk which leads to a change in the valuation of the risk adjustment during the reporting period, this may change the amount of risk adjustment included in insurance revenue. If the change in the terminations changes the valuation of the risk adjustment for future coverage then this adjusts the CSM, see Chapter 5, which may affect the amount of CSM included in revenue in the period.

Unexpected termination in a reporting period may lead to changes in the assumption for terminations in respect of future coverage. The impact of changes to the assumptions for future terminations on the valuation of insurance contracts that do not result in an adjustment to the CSM (e.g., when the impact is a further loss on a group of onerous
contracts where the is no CSM) would be presented as an insurance expense in the period when the assumptions are updated but are not included in insurance revenue.

15.13. How is the impact of unexpected policy terminations determined and reflected in the insurance expense?

To answer this question, it is necessary to consider separately the impact of the unexpected policy terminations on the actual cash flows in the period and whether this changes the assumptions for the expected future cash flows for current service (i.e., the liability for incurred claims) and the expected future cash flows for future service (i.e., the liability for remaining coverage).

Assumptions about the number of policy terminations impact the likelihood of expected future cashflows and are taken into account in the timing and amount of cash flows for calculating the time value of money and the release of the CSM, whilst uncertainty about the level of future policy terminations is reflected in the risk adjustment.

**Presentation of changes to actual cash flows in the reporting period**

Where the level of policy terminations is different to that expected in the reporting period, the impact of the actual number of policy terminations will be reflected in the actual cash flows in the reporting period, which are included in the insurance expense for that period.

**Presentation of changes to expected future cash flows for the current or past coverage periods**

If the difference in actual policy terminations compared to those expected also leads to a change in the estimate of the fulfilment value for future cash flows for the liability for incurred claims (i.e., where the coverage has already expired), then the change in the valuation of the insurance contracts due to the change in assumptions for terminations is included in insurance service expense.

**Presentation of changes to expected future cash flows for future coverage**

Where the change in the valuation of insurance contracts relates to future coverage, the CSM may be adjusted. See Chapter 6 on the CSM for when and how changes in assumptions may lead to a change in the CSM. If the impact of the changes in assumptions in relation to future policy terminations cannot be offset by adjusting the CSM (i.e., because it relates to the current period and not future coverage), then the value of that impact of the change in assumptions is included in insurance expense.

**Disclosure of changes in termination rates**

There is no explicit requirement to present or disclose the impact of changes in the number of policy terminations separately and these changes in assumptions may be combined with other assumptions changes. However, where policy terminations are a key assumption to
the overall valuation, a reporting entity may consider that it would be appropriate to refer to changes in experience in the narrative disclosures describing the risk characteristics of the business (paragraphs 121-126) and consider whether it is appropriate to include the termination assumptions in the sensitivity analysis disclosures (paragraph 128-129). It may also be necessary to consider the significance of changes in termination rates when developing and explaining the reconciliations required in paragraphs 104-107.

Section B - Presentation

This section considers the general requirements for presentation of financial information under IFRS contained in IAS 1 as well as the specific additional requirements in IFRS 17. It also provides general comments on the disclosures required to explain the presentation such as the required reconciliations.

15.14. What are the general principles for IFRS presentation?

The general principles for presentation of financial statements under IFRS are set out in IAS 1 Presentation of Financial Statements, and these also apply to insurance contracts. In addition, IFRS 17 includes specific principles that only apply to insurance contracts. To understand the presentation requirements for insurance contracts under IFRS 17, it is necessary to consider IAS 1.

Paragraph 10 of IAS 1 sets out what a complete set of financial statements comprises. The key statements referred to are:

- The statement of financial position, which is traditionally referred to as the balance sheet under other reporting bases, and
- The statement of financial performance, which is also referred to as the statement of profit or loss and OCI (in IAS 1).

The statement of financial performance has three parts.

1. The top part presents sources of income and expenses that are included in profit or loss and ends with the assessment of profit or loss for the period.
2. Below this is presented sources of OCI that do not contribute to profit or loss.
3. Both these parts contribute to a total assessment of "comprehensive income" for the reporting period at the bottom of the statement.

IE185 includes an example of this presentation. While helpful for showing the three parts described above, this example is only intended to illustrate the amounts recognised as part of the insurance service result and not presentation requirements. For more details on the presentation requirements see Examples 3 and 9 of the IASB’s illustrative examples.

Amounts included in OCI typically include items that affect the financial position of the company but do not directly relate to the performance of the business in the reporting
period, for example, some unrealised gains on financial investments. In some cases there
are options for the reporting entity to elect whether performance is reported in OCI or in
profit / loss. In relation to insurance contracts, companies can choose in their accounting
policies whether to show movements in the value of insurance contracts arising from
changes in the current discount rates in the reporting period in profit or loss or as OCI.
Paragraphs 82 and 83 of IAS 1 set out what should be presented in profit or loss or in OCI.
IAS 1 paragraph 89 requires that all items of income and expenses should be included in
profit or loss unless an IFRS requires or permits otherwise. Paragraphs 90 to 96 of IAS 1
specify some items to be included in OCI. There is more specific guidance in individual
standards, such as in and IFRS 17 for insurance contracts.

Usually it is not necessary for an actuary working on the valuation of insurance contracts
to need to consider the presentation requirements set out in IAS 1 as the reporting entity’s
finance team will have considered how those presentation requirements will be met.
However, it is important to be aware that the presentation requirement in IFRS 17 should
not be applied in isolation but in the context of the overarching IFRS principles. IAS 1 makes
numerous reference to the IASB’s Conceptual Framework for Financial Reporting,
(“Conceptual Framework”). This describes the basic concepts that underlie the preparation
and presentation of financial statements for external users. The Conceptual Framework
serves as a guide to the IASB in developing future IFRSs and as a guide to resolving
accounting issues that are not addressed directly in an IAS or IFRS or Interpretation.

IAS 8 Accounting Policies, Changes in Accounting Estimates and Errors is another
overarching standard that may need to be considered when implementing and applying
IFRS 17. In the absence of a standard or an interpretation that specifically applies to a
transaction, management needs to use its judgement in developing and applying an
accounting policy that results in information that is relevant and reliable. In making that
judgement, IAS 8 paragraph 17 requires management to consider the definitions,
recognition criteria, and measurement concepts for assets, liabilities, income, and
expenses in the IFRS Framework.

In developing accounting policies in relation to IFRS 17, the entity may want to consider the
distinction between the need to make future changes to the estimation basis within the
context of the company’s relevant accounting policy and when it may be necessary to make
future changes to the companies account policies, which would require restatement of prior
year comparatives.

15.15. What principles of materiality apply to IFRS 17 presentation?

There is an IFRS Practice Statement on Making Materiality Judgements. Reporting entities
should have a basis for setting materiality for each set of financial statements and the same
materiality criteria should be applied to the application of IFRS 17. In the first instance it
would be appropriate to ask one’s principal what level of materiality should apply.
Although IAS 1 refers to separating material classes of similar items, IFRS 17 contains several levels of aggregation and disaggregation requirements, which also need to be taken into consideration for the purposes of presentation and measurement (see question 15.16 below). Materiality for presentation applies at the level of items required to be presented in the statement of financial position and statement of financial performance, not at the more granular level required for measurement. This means that where an assumption has a non-material impact on one class of business it may be regarded as a non-material assumption. However, even if an assumption has a non-material impact on each of several classes of business, it may still be necessary to consider whether the combined impact of that assumption on the reported line items is material to determine whether the assumption itself is a material assumption.

15.16. What is the level of disaggregation for insurance contracts presentation?

As discussed in Chapter 1, paragraphs 14-24 set out several requirements for the disaggregation of insurance contracts based on the definition of a portfolio; further segregation of onerous contracts from contracts that may become onerous in the future and from other contracts; and disaggregation of contracts issued more than one year apart. Similar principles also apply for reinsurance contracts held (paragraph 61). All these requirements apply to the measurement of insurance contracts and to reinsurance contracts held. Presentation and disclosures for insurance contracts and reinsurance contracts held does not necessarily need to be at this level of granularity. In particular, disclosures do not necessarily need to be at the insurance contracts group level as defined in paragraph 16. (For further information on the level of aggregation for measurement, please refer to chapter 5)

Paragraph 78 requires that reinsurance contracts held are presented separately from insurance contracts issued and further that these two groups should be further subdivided between groups of contracts that are onerous and those that are not. As the valuation of insurance contracts takes into account all future cash flows including future premiums it is possible that insurance contracts may be valued as assets rather than liabilities when the future premium income expected exceeds the future benefit payments, claims payments and expenses — for example, during the early stages of the coverage for contracts with regular or instalment premiums.

Paragraph 82 requires that income and expenses from reinsurance contracts held be presented separately from the expenses or income from insurance contracts issued.

IAS 1 (paragraphs 29-31) requires that each material class of similar items is presented separately. Paragraph 96 of IFRS17 provides examples of aggregation bases that might be appropriate for information disclosed about insurance contracts. Examples of aggregation bases that might be appropriate for information disclosed about insurance contracts are:

(a) type of contract (for example, major product lines);
15.17. What is segment reporting?

Although IFRS 17 sets requirements for the level of aggregation of insurance contracts in paragraph 96, it also refers to the requirements for reporting segments under IFRS 8, which already applies to insurance entities reporting under IFRS. It is only mandated for entities and groups with listed debt or equity, or those filing for a listing (IFRS 8 paragraph 2).

The core principle in IFRS 8 is that an entity should disclose information to enable users of its financial statements to evaluate the nature and financial effects of the business activities in which it engages and the economic environments in which it operates. IFRS 8 applies to individual financial statements for an entity and to the consolidated financial statements for a group.

Operating segments are identified on the basis of internal reporting about components of the entity that are regularly reviewed by management in order to allocate resources to the segment and to assess its performance. Similarly, the amounts reported are to be the measures used for internal reporting for these purposes. Disclosure includes information about how the entity identifies its operating segments and the types of products and services from which each segment derives its revenues.

An actuary considering how to apply IFRS 17 may also wish to consider the entity’s existing approach to reporting segments under IFRS 8 in order to consider the appropriate level of aggregation for insurance contracts in each component of the business.

Statement of financial position

15.18. What amounts are presented in the statement for financial position for insurance contracts?

As explained in the answer to question 15.16 above, IFRS 17 requires that groups of insurance contracts that are assets be presented separately from groups of insurance contracts that are liabilities. This is a change from IFRS 4 where, in some jurisdictions, insurance contracts are currently presented as one item. This may be operationally difficult as entities may not be set up to segregate the measurement of insurance contracts in this way when applying IFRS 17 for the first time.

“Insurance contracts” refers to all contracts issued by an entity that meet the IFRS 17 definition of an insurance contract (paragraphs 3-8), which includes reinsurance contracts issued and investment contracts with discretionary participating features. IFRS 17 also applies to reinsurance contracts held but IFRS 17 specifies where the requirements applying to reinsurance contracts held are different to those for insurance contracts issued. Please refer to chapter 9 on reinsurance.
Presentation of insurance contracts is after separating distinct investment components, distinct service components and, where required by IFRS 9, embedded derivatives (paragraphs 10-12), which are accounted for under IFRS 9 and IFRS 15.

Insurance and reinsurance contracts should be included in the statement of financial position when they meet the IFRS 17 recognition requirements (paragraphs 25-28 and 62), which are considered further in Chapter 10, and subject to the requirements for modification and derecognition (paragraphs 72-77), which are considered further in Chapters 1 and 14.

15.19. What amounts are presented in the statement for financial position for reinsurance contracts held?

As explained in the answer to question 15.16 above, reinsurance contracts held are to be presented separately from insurance contracts issued and reinsurance contracts that are liabilities are to be presented separately from those that are liabilities.

15.20. Can recoveries from ceded reinsurance be shown netted against insurance contract liabilities in the statements of financial position and financial performance?

No. Amounts in respect of reinsurance contracts held must be presented separately from amounts in respect of insurance contracts issued in the statements of financial performance and financial position and in the supporting disclosures required to explain these statements.

15.21. How are future cash flows that have fallen due but have not yet been received or paid shown in the statement of financial position (for example, premiums, claims, benefits, expenses and acquisition costs)?

The measurement of insurance contracts under IFRS 17 includes all expected future cash flows within the contract boundary. Hence, if these cash flows are expected to be received or paid, they would be included in the liability for remaining coverage, or possibly the liability for incurred claims for situations such as retrospective premium adjustments or audit premiums for certain non-life policies.

If there is a risk the cash flows may not be received the probability-weighting for those cash flows should be adjusted to reflect the likelihood of receipt.

Under PAA, only premiums received are included in the liability for remaining coverage. Hence if the premium is due but not received, this would not be included in the liability measurement.

This may represent a significant change from previous financial reporting bases. Typically, local reporting bases for long term insurance contracts have included the value of the insurer's rights to future premiums in the valuation of the insurance contracts. In contrast, for non-life insurance business where unearned premium reserves are held, the unearned
premium component of the technical provisions is often based on the total premium expected to be received, regardless of whether it has been received or not, and the portion of the premiums expected to be received in the future is presented as a receivable. Similarly, the reinsurer's portion of unearned premiums is based on the total premiums expected to be paid including amounts not yet paid where the latter are presented in the liability for payables.

15.22. How are cash flows paid for services not yet received shown in the statement of financial position? (For example, reinsurance premiums paid for cover that has not yet expired?)

The IFRS 17 measurement basis for amounts presented in the statement of financial position is a prospective cash flow basis. Cash flows already completed are not included in the measurement of insurance contracts issued or reinsurance contracts held.

Statement of financial performance

15.23. What line items are required in the statement of financial performance?

Paragraph 80 requires that, for insurance contracts, the entity includes the following line items in the statement of financial position:

- Insurance revenue;
- Insurance service expenses;
- Insurance service result (comprising the two items above); and
- Insurance finance income and expenses.

Presenting other features of IFRS 17 measurement

15.24. When is the value of options and guarantees and changes in the values of options and guarantees presented in the statements of financial position and financial performance?

Paragraph 11(a) requires embedded derivatives to be separated from host contracts and accounted for under IFRS 9. For all embedded derivatives that are not separated from the host contract, these are measured and presented under IFRS 17 and included as part of the fulfilment cash flows (see paragraph B65(d)).

15.25. When and where is the additional value for onerous contracts presented in the statement for financial position?

For all insurance contracts meeting the IFRS 17 recognition requirements at the reporting date, the additional value of onerous contracts is included in the value of insurance contracts. Paragraph 103(b)(iv) requires the disclosure of a reconciliation for the changes
in losses for onerous groups of contracts and the reversal of such losses over the
accounting period.

15.26. How is the value for onerous contracts at initial recognition and changes in that value at
subsequent measurement included in the statements for financial performance?

The illustrative examples include several examples considering the measurement of
onerous contracts. Example 1 (IE4-IE17), specifically example 1B, shows initial
measurement of an onerous contract. Example 2B (IE24-IE28) considers an example where
changes in fulfilment cash flows create an onerous group of insurance contracts and
shows a possible format for reconciliation of the changes in value of the insurance contract
(IE26-IE27) and shows the presentation in the statement of financial position and financial
performance (IE28). Example 8 (IE81-IE98) shows possible formats for the reconciliation
of the reversal of losses in an onerous group of insurance contracts.

15.27. How does presentation of financial position and financial performance differ for
contracts measured using the PAA?

There are no changes to the presentation requirements for entities using the PAA.
However, the amounts presented are based on the measurement amounts under the PAA
(see Chapter 7) and there are changes to the disclosure requirements explaining the
presentation.

Under the PAA the contribution towards the value of insurance contracts from the liability
for remaining coverage is the sum of the value of premiums allocated to the unexpired
portion of insurance contracts recognised at the reporting date plus any additional liability
for onerous contracts.

Insurance revenue under the PAA is the portion of expected premium receipts allocated in
respect of coverage provided over the reporting period.

Insurance finance expense may exclude the unwind of the discount rate on the value of the
unexpired coverage as entities using the PAA are not required to adjust for the time value
of money and the effect for financial risk if, at initial recognition, the entity expects that the
time between providing coverage and the related premium due date is no more than one
year or the financial effect is not significant (paragraph 56).

Similarly, where the coverage period for each contract in a group of contracts is no more
than one year, the entity may choose to recognise any insurance acquisition cash flows as
expenses when it incurs those costs (paragraph 59(a)). See also question 15.21 above.

Entities using the PAA are required to make additional disclosures as set out in paragraph
97.

Some of the requirements to disclose reconciliations (paragraphs 97-109) are amended or
not applied when using the PAA.
15.28. How are contracts measured using the variable fee approach presented?

Adjustments to presentation under the variable fee approach are explained in Chapter 7 on contracts with participating features and other variable cash flows.

Presentation for different types of entity

15.29. How does the presentation differ for mutual entities?

IAS 1 paragraph 6 explains that entities that do not have equity, such as some mutual funds, and entities whose share capital is not equity, such as some cooperative entities, may need to adapt the financial statement presentation of members’ or policyholders’ interests. Prior to implementation of IFRS 17, some entities presented a liability for unallocated divisible surplus to represent the surplus which had not been allocated between participating policyholders prior to reporting the financial statements.

Under IFRS 17 estimates of the expected cash flows to participating policyholders are included in the value of insurance contracts. Unallocated divisible surplus will not be presented as a separate item and the amount is included in the fulfilment cash flows. Accounting mis-matches could give rise to equity in mutual entities (see BC266 and BC267).

BC269 notes that a mutual entity can distinguish:

(a) in the statement of financial position, the liability attributable to policyholders in their capacity as policyholders from the liability attributable to policyholders with the most residual interest in the entity; and

(b) in the statement(s) of financial position, the income or expenses attributable to policyholders in their capacity as policyholders before determination of the amounts attributable to policyholders with the most residual interest in the entity.

15.30. How does the presentation differ for entities with run off business?

In this IAN, run off business refers to where an entity has ceased to issue new policies for part or all of its business but is continuing to manage previously issued contracts. (This is sometimes also referred to with regard to life / annuity business as “Closed books”) Provided that a business is a going concern, IFRS 17 presentation applies in the same way to reporting entities where some or all of the business is running off and to entities that continue to write new business.

IAS 1 requires that management of an entity reporting on an IFRS basis makes an assessment of the entity’s ability to continue as a going concern. An insurer or reinsurer may continue to be a going concern for IFRS reporting purpose even if all the business is discontinued. Where a reporting entity is not considered to be a going concern, IAS 1 requires additional disclosures which may need to be taken into consideration when applying IFRS 17.
15.31. How does IFRS 17 presentation results differ for consolidated financial statements?

There are no differences in the requirements for presentation by a solo insurer or reinsurer and for a group that has issued insurance contracts within one of its group companies. However, as explained above, IFRS 17 needs to be applied with reference to the requirements of other relevant standards.

IFRS 10: Consolidated Financial Statements, sets out the requirements for producing consolidated financial statements. One of the requirements of IFRS 10 is that intra-group balances are eliminated on consolidation (see paragraph B86(b) of IFRS10). For example, where there are intra-group reinsurance arrangements, the consolidated amounts for insurance contracts and reinsurance contracts are not simply the sum of these amounts in the entity financial statements. Rather the amounts presented exclude the intra-group balances such that the value of reinsurance contracts for the consolidated group are only in relation to contracts entered into with parties outside the group. Consequently, it is also necessary to be clear which entities in the group are consolidated for financial reporting purposes, as the consolidation requirements differ for wholly owned subsidiaries, different levels of participation in other businesses and joint ventures. Although these requirements are set out in IFRS 10, IFRS 17 and IAS 28, it is also important to understand how the reporting entity has implemented these requirements.

Where the consolidating group includes more than one insurer or reinsurer the valuation of groups of insurance contracts issued and reinsurance contracts held may be different in the results of the solo company compared to in the Group results. One example of this is in relation to the calculation of the risk adjustment and the CSM. Paragraph B88 permits the allowance of diversification in the calculation of the risk adjustment at the reporting entity level. This is discussed further in Chapter 4 on risk adjustment.

Further changes to the granularity of disclosures may be required, for example, in relation to segment reporting (see question 15.20 above), if the segments reported for the group and the solo entities within the group are not the same.

Interim reporting, disclosures and transition to IFRS 17

15.32. What is interim reporting and how does IFRS 17 apply to this?

An interim financial report is a financial report that contains either a complete or condensed set of financial statements for an interim period (i.e., a financial reporting period shorter than a full financial year). IAS 34 prescribes the minimum content of an interim financial report and the principles for recognition and measurement in financial statements presented for an interim period.

Paragraph B137 requires that, notwithstanding the requirements of IAS 34 that the frequency of an entity’s reporting shall not affect measurement of its annual results, an entity shall not change the treatment of accounting estimates made in previous interim financial statements.
when applying IFRS 17 in subsequent interim financial statements or in the annual reporting period. This requirement may result in different entities with different interim reporting periods reporting different results for similar transactions.

15.33. Why can an entity change its IFRS 9 classification of financial instruments the first time it implements IFRS 17?

Paragraph C29 sets out the conditions for redesignation of financial assets under IFRS 9 if the entity applied IFRS 9 to annual reporting periods before the initial application of IFRS 17.

This may be important to reporting entities as the designation of financial instruments affects whether the performance of those financial instruments is reported in profit / loss or in OCI. Considering the presentation of financial instruments and insurance contracts together under IFRS 9 and IFRS 17 respectively, can help to minimise accounting mismatches by allowing movements due to the same underlying factors (e.g., movements in financial market values and market consistent assumptions) to be presented in the same statement i.e., in profit/loss or in OCI.

If a redesignation of financial assets under IFRS 9 is made upon initial application of IFRS 17, then the entity must:

- Apply the designations and classifications retrospectively, applying the relevant transition requirements in IFRS 9 (paragraph C30);

- Either restate prior periods to reflect changes to designations and classifications or if the entity does not restate prior periods then the entity must recognise the impact of the redesignation in opening retained earnings (or other component of equity) (paragraph C31); and

- Include certain disclosures pertaining to any redesignation of financial assets (paragraphs C32-C33).

Presentation of acquisition costs and other insurance expenses

15.34. When and where are acquisition costs included in the statements of financial position and financial performance?

When insurance contracts are recognised (see Chapter 1), they are included in the statements of financial position and financial performance because the cash flows within the contract boundary may include an allocation of insurance acquisition cash flows attributable to the portfolio to which the contract belongs (B65(e)). This recognises that in order to sell insurance contracts where the sales force is not solely remunerated based on commission per contract sold, the entity will incur expenses attempting to sell some contracts that are ultimately not purchased.
If the acquisition expenses directly attributable to the portfolio were paid before initial recognition of the contract, that amount is included in the initial measurement of the portfolio of insurance contracts such that the CSM is reduced for the cost of the acquisition expenses (see Chapter 6).

If acquisition costs have been incurred prior to the financial reporting date and are associated with insurance contracts which will not be recognised until a later date, there will be no group of insurance contracts to which those expenses can be allocated. In those circumstances, the reporting entity can include an asset or liability in the statement of financial position for the value of those acquisition costs. This asset or liability for acquisition costs is derecognised when the relevant insurance contracts are recognised so there is a group of insurance contracts to which the acquisition expenses can be allocated (paragraph 27). If the contract boundary is one year or less and the PAA is used, this treatment of acquisition costs is optional and the reporting entity can choose to recognise the acquisition costs as expense or income in the statement of financial performance when they are incurred (paragraphs 27, 38(b) and 59(a)).

Assets or liabilities for acquisition costs are not shown as a separate line item in the statement of financial position but are included in the carrying amount of the related groups of insurance contracts issued or reinsurance contracts held (paragraph 79).

There are a number of specific disclosure requirements for insurance acquisition costs. In relation to the reconciliations required in paragraph 100, these are covered in paragraph 103-107. If an entity uses the PAA, it also discloses the method it has chosen to recognise insurance acquisition cash flows applying paragraph 59(a).

15.35. When and where are claims handling expenses included in the statements of financial position and financial performance?

Under the GMA, claim handling costs (i.e., the costs the entity will incur in investigating, processing and resolving claims under existing insurance contracts, including legal and loss-adjusters' fees and internal costs of investigating claims and processing claim payments) are included in the insurance contract cash flows (paragraph B65(f)) and so are recognised in the financial statements when the associated insurance contracts are recognised, if those cash flows are within the contract boundary. Consequently, claims handling expenses are included in the valuation of insurance contracts and reinsurance contracts held in the statement of financial position; are included in insurance revenue in respect of services expected to be delivered in the financial reporting period; and are included in insurance service expense in the period in which the actual costs are incurred.

Under the PAA, claims handling costs are not explicitly included in the liability for remaining coverage and therefore are recognised when the claim is incurred.

15.36. When and where are indirect expenses and overheads included in the statements of financial position and financial performance?
Indirect expenses (i.e., expenses that are not directly attributable to a portfolio of insurance contracts) and overheads are included in the valuation of insurance contracts in the statement of financial position if they are related to the fulfilment of insurance contracts that are recognised in the financial statements and if the expense cash flows are within the contract boundary. See Chapter 1 for insurance contract recognition and contract boundary.

Paragraph B65(l) sets out which types of insurance expenses may be included and restrictions on their inclusion. For example, overheads must be allocated to groups of contracts using methods that are systematic and rational. Paragraph B66(d) explicitly excludes costs that cannot be directly attributed to the portfolio (e.g., some product development and training costs). Which cash flows may be included is covered in more detail in Chapter 2.

Indirect expenses and overheads that are included in the valuation of insurance contracts are recognised in the financial statements when the associated groups of insurance contracts are recognised provided those cash flows are within the contract boundary. Consequently, indirect expenses and allocated overheads are included in the valuation of insurance contracts and reinsurance contracts held in the statement of financial position; are, under the GMA, included in insurance revenue in respect of insurance services expected to be delivered in the financial reporting period; and are included in insurance service expense in the period in which the costs are incurred.

Expenses that cannot be included in the valuation of insurance contracts are recognised in the statement of financial performance in the period in which they are incurred, unless they fall within another accounting standard which prescribed an alternative accounting treatment.

Section C - Disclosures

This section provides general comments on the disclosures required to explain the presentation such as the required reconciliations.

Overview of IFRS Disclosures

15.37. What is meant by "disclosures" in IFRS 17?

The objective of the disclosure requirements is for an entity to disclose information in the notes to the financial statements, enabling users of the financial statements to assess the effect of contracts within the scope of IFRS 17 on the entity's statement of financial position and statement(s) of financial performance and statement of cash flows. The disclosures cover information about the amounts recognised in the financial statements; significant judgement and changes in those judgements; and the nature and extent of risks from contracts in scope of IFRS 17. The disclosure requirements are set out in paragraphs 93 to 132.
15.38. What is the objective of the disclosure requirements and what might be the role of an actuary helping to produce IFRS 17 disclosures?

Paragraph 93 specifies that the objective of disclosure requirements is to give users of financial statements, together with information presented in the statement of financial position, statement of financial performance and statement of cash flows, a basis to assess the effect that contracts within the scope of IFRS 17 have on the entity's financial position, financial performance and cash flows.

Typically the finance or accounting team will have ultimate responsibility for the information contained in the financial statements, including the disclosures. The actuary's role in preparing disclosures is likely to be a supporting role to the individual or team responsible for preparing the overall financial statements. This may include:

- Preparing numerical information specific to the disclosures that is not recorded in core finance systems or which is sourced from actuarial models – for example estimates of claims development and sensitivities to insurance and market risks.
- Supporting the preparation of, or reviewing, qualitative information included in the disclosures – for example qualitative information on how the entity manages the various types of risk to which it is exposed.
- Review of other qualitative or quantitative information included in the financial statements to support the overall integrity of the disclosures and to ensure that the information included presents a fair and accurate representation of the effect of the contracts within the scope of IFRS 17 at the reporting date.

15.39. Do you need to show separate reconciliations for reinsurance contracts held?

Yes, paragraph 98 specifies that separate reconciliations shall be disclosed for insurance contracts issued and reinsurance contracts held and that the reconciliations should be adapted to reflect the features of reinsurance contracts held that differ from insurance contracts issued.

15.40. Are there any changes to the presentation or disclosure requirements when applying IFRS 17 for the first time?

Paragraphs C25 – C28 specifies exceptions to the presentation of comparative information when applying IFRS 17 for the first time. These are summarised below.

- Comparative information for periods earlier than the beginning of the annual reporting period immediately preceding the date of initial application may be included but is not required.
- Disclosures specified in paragraphs 93 – 132 are not required for comparative periods before the beginning of the annual reporting period immediately preceding the date of initial application.
• If unadjusted comparative information and disclosures are presented for earlier periods, it must be disclosed that the information has not been adjusted and explain the basis on which it has been prepared.

• Previously unpublished information about claims development that occurred earlier than five years prior to transition to IFRS 17 need not be disclosed. However, if an entity does not disclose that information, it shall disclose that fact.

If an entity redesignates financial assets under IFRS 9 in accordance with paragraph C29 then additional disclosures must be made in accordance with paragraphs C32 and C33.
Appendix - How does presentation and disclosures differ in IFRS 17 compared with the previous standard for insurance contracts IFRS 4?

The answer here is intended to give an overview of the key differences. The details of the changes in IFRS 17 are considered in more detail in other questions in this chapter.

Under IFRS 4, presentation of insurance contracts in the financial statements in each jurisdiction could vary as IFRS 4 permitted the grandfathering of previous accounting policies based on the local GAAP basis applying before IFRS 4 was implemented. Entities reporting under IFRS 4 also had to apply the principles set out in IAS 1. The presentation of insurance contracts in the statement of financial position under IFRS 17 might be broadly similar to the typical way in which the balance sheet is presented under IFRS 4. However, the values presented may be significantly different. This difference arises because the measurement basis for contracts within the scope of IFRS 17 is based on expected future cash flows rather than the deferral and matching approach used by many insurers reporting under IFRS 4. One of the impacts of this change is that some amounts previously included under amounts payable and amount receivable, such as balances with brokers and reinsurers, may now be included in the valuation of insurance contracts and reinsurance contracts held. Further, these valuations may also be adjusted for future cash flows to be received or to be paid, not currently included in the valuation of insurance contracts and ceded reinsurance under IFRS 4.

The cash flow basis in IFRS 17 may result in a significant change to the value of individual items presented in the statement of financial position. Impacts include changes to the measurement basis between IFRS 4 and IFRS 17, notably the introduction of, or changes to, the discounting basis (see Chapter 3), the basis for setting the risk margin (see Chapter 4), and the introduction of the CSM (see Chapter 6).

Under IFRS 17, it will be necessary to present and disclose separately the investment component of insurance contracts that is excluded from revenue and expenses. Paragraph 84-85, being read with reference to paragraph 13, requires that insurance revenue and insurance service expenses exclude receipt and payment of investment components. Paragraphs 103(c) and 117(c)(iv) requires separate disclosures for investment components excluded from insurance revenue and insurance service expenses.

The presentation of financial performance for insurance contracts is likely to be significantly different under IFRS 17 compared with IFRS 4. IFRS 17 introduces a new definition of revenue, which does not necessarily reconcile to actual premium income over the reporting period. IFRS 17 also sets out a new basis for calculating profit or loss. The presentation of financial performance separates the profit and loss arising from the insurance service from insurance finance income and expense, which includes the effect of allowing for time value of money. The extent of the changes to the presentation of financial performance may make it relatively difficult to make comparisons between the income and expenses presented under IFRS 17 with equivalent amounts presented on an IFRS 4 basis except where the PAA is used under IFRS 17.

For contracts where PAA is used, the presentation is likely to have greater similarity to the
presentation under IFRS 4. This will particularly be the case if the IFRS 4 reporting basis was based on earned premiums and claims reserves i.e., as is/was common for many non-life contracts under IFRS4.

The objectives of the disclosure requirements in IFRS 17 are broadly similar to those in IFRS 4. However, because the measurement basis in IFRS 17 is significantly different to the measurement basis used by insurers reporting under IFRS 4, there are requirements for many new reconciliations to explain the amounts presented in the financial statements (see paragraphs 97-117). To meet the overarching objective for disclosures under IFRS 17, risk metrics used in the disclosure on the nature and extent of risks (paragraphs 121-132) need to be consistent with the IFRS 17 measurement basis.

Section 3. Communication

3.1 General principles

3.2 Report
Preface

This International Standard of Actuarial Practice (ISAP) is a model for actuarial standard-setting bodies to consider.

The International Actuarial Association (IAA) encourages relevant actuarial standard-setting bodies to maintain a standard or set of standards that is substantially consistent with this ISAP to the extent that the content of this ISAP is appropriate for actuaries in their jurisdiction. This can be achieved in many ways, including:

- Adopting this ISAP as a standard with only the modifications in the Drafting Notes;
- Customizing this ISAP by revising the text of the ISAP to the extent deemed appropriate by the standard-setting body while ensuring that the resulting standard or set of standards is substantially consistent with this ISAP;
- Endorsing this ISAP by declaring that this ISAP is appropriate for use in certain clearly defined circumstances;
- Modifying existing standards to obtain substantial consistency with this ISAP; or
- Confirming that existing standards are already substantially consistent with this ISAP.

A standard or set of standards that is promulgated by a standard-setting body is considered to be substantially consistent with this ISAP if:

- There are no material gaps in the standard(s) in respect of the principles set out in this ISAP; and
- The standard or set of standards does not contradict this ISAP.

If this ISAP is translated for the purposes of adoption, the adopting body should select three verbs that embody the concepts of “must”, “should”, and “may”, as described in paragraph 1.6 Language, even if such verbs are not the literal translation of “must”, “should”, and “may”.

ISAPs are model standards of actuarial practice and, as such, are not binding on any actuary.

This ISAP was adopted by the IAA Council in November 2012. The reformatted version (to accommodate the separate Glossary) was adopted in October 2013. The conforming version was adopted in April 2017.

[Drafting Notes – When an actuarial standard-setting organization adopts this ISAP it should:

1. Replace “ISAP” throughout the document with the local standard name, if applicable;
2. Choose the appropriate phrase and date in paragraph 1.8;
3. Choose the appropriate phrase in sub-paragraph 2.1.2.a;
4. Review this ISAP for, and resolve, any conflicts with the local law and code of professional conduct; and]
5. *Delete this preface (including these drafting notes) and the footnotes associated with paragraphs 1.8. and 2.1.2.a.]*
Section 1. General

1.1. **Purpose** – This ISAP provides guidance to actuaries when performing actuarial services to give intended users confidence that

- Actuarial services are carried out professionally and with due care;
- The results are relevant to their needs, are presented clearly and understandably, and are complete; and
- The assumptions and methodology (including, but not limited to, models and modelling techniques) used are disclosed appropriately.

1.2. **Scope**

1.2.1. This ISAP is a general standard. It applies to all actuarial services performed by an actuary unless an element of guidance is explicitly superseded by another standard such as a practice-specific standard or by law.

1.2.2. Usually, the intent of a practice-specific standard is to narrow the range of practice considered acceptable under the general standards. In exceptional cases, however, the intent of a practice-specific standard is to define as acceptable a practice that would not be acceptable under the general standards, in which case that intent is specifically noted by words in a practice-specific standard like: “Notwithstanding the general standards, the actuary should . . .”, followed by a description of the exception.

1.3. **Compliance** – An actuary may fail to follow the guidance of this ISAP but still comply with it where the actuary:

1.3.1. Complies with requirements of law that conflict with this ISAP;

1.3.2. Complies with requirements of the actuarial code of professional conduct applicable to the work that conflict with this ISAP; or

1.3.3. Departs from the guidance in this ISAP and provides, in any report, an appropriate statement with respect to the nature, rationale, and effect of any such departure.

1.4. **Applicability** – This ISAP applies to actuaries when performing actuarial services. An actuary who is performing these actuarial services may be acting in one of several capacities such as an employee, management, director, external adviser, auditor, or supervisory authority of the entity.

1.4.1. The application of this ISAP is clear when a single consulting actuary is performing actuarial services for a client who is not affiliated with the actuary.

1.4.2. There are at least two general cases which do not meet the criterion stated in 1.4.1:

a. A team of actuaries is performing actuarial services; or
b. An actuary is performing actuarial services for an affiliated party (such as the actuary’s employer or affiliated entities within a group under common control).

1.4.3. When a team is performing actuarial services, most paragraphs of this ISAP apply to every actuary on the team. However, requirements in some paragraphs need not be met by every actuary on the team personally (e.g., 2.1.1). In the case of such paragraphs, each actuary on the team should identify, if relevant to that actuary’s work, which member of the team is responsible for complying with such requirements and be satisfied that the other team member accepts that responsibility.

1.4.4. If an actuary is performing actuarial services for an affiliated party the actuary should interpret this ISAP in the context of practices that apply normally within or in relation to the affiliated party, except that, if there are substantive inconsistencies between these practices and this ISAP, the actuary should endeavour to observe the spirit and intent of this ISAP as fully as possible.

a. The actuary should consider the expectations of the principal. These expectations might suggest that it may be appropriate to omit some of the otherwise required content in the report. However, limiting the content of a report may not be appropriate if that report or the findings in that report may receive broad distribution.

b. If the actuary believes circumstances are such that including certain content in the report is not necessary or appropriate, the actuary should be prepared (if challenged by a professional actuarial body with jurisdiction over the actuarial services) to describe these circumstances and provide the rationale for limiting the content of the report.

1.5. Reasonable Judgment – The actuary should exercise reasonable judgment in applying this ISAP.

1.5.1. A judgment is reasonable if it takes into account:

a. The spirit and intent of the ISAPs;

b. The type of assignment; and

c. Appropriate constraints on time and resources.

1.5.2. Nothing in this ISAP should be interpreted as requiring work to be performed that is not proportionate to the scope of the decision or the assignment to which it relates and the benefit that intended users would be expected to obtain from the work.

1.5.3. Any judgment required by the ISAP (including implicit judgment) is intended to be the actuary’s professional judgment unless otherwise stated.
1.6. Language

1.6.1. Some of the language used in all ISAPs is intended to be interpreted in a very specific way in the context of a decision of the actuary. In particular, the following verbs are to be understood to convey the actions or reactions indicated:

a. “Must” means that the indicated action is mandatory and failure to follow the indicated action will constitute a departure from this ISAP.

b. “Should” (or “shall”) means that, under normal circumstances, the actuary is expected to follow the indicated action, unless to do so would produce a result that would be inappropriate or would potentially mislead the intended users of the actuarial services. If the indicated action is not followed, the actuary should disclose that fact and provide the reason for not following the indicated action.

c. “May” means that the indicated action is not required, nor even necessarily expected, but in certain circumstances is an appropriate activity, possibly among other alternatives. Note that “might” is not used as a synonym for may, but rather with its normal meaning.

1.6.2. This ISAP uses various terms whose specific meanings are defined in the Glossary. These terms are highlighted in the text with a dashed underscore and in blue, which is also a hyperlink to the definition (e.g., actuary).

1.7. Cross-References – When this ISAP refers to the content of another document, the reference relates to the referenced document as it is effective on the adoption date as shown on the cover page of this ISAP. The referenced document may be amended, restated, revoked, or replaced after the adoption date. In such a case, the actuary should consider the extent the modification is applicable and appropriate to the guidance in this ISAP.

1.8. Effective Date – This ISAP is effective for {actuarial services performed/actuarial services commenced/actuarial services performed relevant to an event}¹ on or after [Date].

¹ Phrase to be selected and date to be inserted by standard-setter adopting or endorsing this ISAP.
Section 2. Appropriate Practices

2.1. Acceptance of Assignment

2.1.1. When providing actuarial services, the actuary should confirm with the principal the nature and scope of actuarial services to be provided, including:

a. The role of the principal;

b. Any limitations or constraints on the actuary;

c. Any requirements that the actuary is required to satisfy;

d. Identification of the schedule and expected cost or resources needed (especially if they are substantial); and

e. The information needed to be communicated to and by the actuary, especially if it is sensitive or confidential.

2.1.2. In accepting an assignment for actuarial services, the actuary shall:

a. {If adopting standard-setter has a standard on qualifications} Be qualified under [name of standard] to perform the services, or become qualified before the services are delivered;

{If adopting standard-setter does not have a standard on qualifications} Be competent and appropriately experienced to perform the services;

b. Be satisfied that the assignment can be performed under the applicable code of professional conduct; and

c. Have reasonable assurance of time, resources, access to relevant employees and other relevant parties, access to documentation and information, and the right of the actuary to communicate information, as may be necessary for the work.

2.2. Knowledge of Relevant Circumstances – The actuary should have or obtain sufficient knowledge and understanding of the data and information available, including the relevant history, processes, nature of the business operations, law, and business environment of the entity, to be appropriately prepared to perform the actuarial services required by the assignment.

2.3. Reliance on Others – The actuary may use information prepared by another party such as data, relevant contracts, insurance contract or pension plan provisions, opinions of other professionals, projections, and supporting analyses (but excluding assumptions or methodology). The actuary may select the party and information on which to rely, or may be

---

2 Adopting standard-setter to choose one of these two phrases as appropriate, insert the name of the qualification standard if applicable, and delete material between the { }.
given the information by the principal. The actuary may take responsibility for such information, or the actuary may state that reliance has been placed upon the source of this information and disclaim responsibility.

2.3.1. If the actuary selects the party on whom to rely, the actuary should consider the following:

a. The other party’s qualifications;

b. The other party’s competence, integrity, and objectivity;

c. The other party’s awareness of how the information is expected to be used;

d. Discussions and correspondence between the actuary and the other party regarding any facts known to the actuary that are likely to have a material effect upon the information used; and

e. The need to review the other party’s supporting documentation.

2.3.2. If the actuary uses information prepared by another party without disclaiming responsibility for that information, the actuary:

a. Should determine that the use of that information conforms to accepted actuarial practice in the jurisdiction(s) of the actuary’s services;

b. Should establish appropriate procedures for the management and review of the information that the actuary intends to use; and

c. Does not need to disclose the source of the information.

2.3.3. If the actuary states reliance on the information prepared by another party and disclaims responsibility for it, the actuary should:

a. Disclose that fact (including identifying the other party) in any report or other appropriate communication;

b. Disclose the nature and extent of such reliance;

c. Examine the information for evident shortcomings;

d. When practicable, review the information for reasonableness and consistency; and

e. Report the steps, if any, that the actuary took to determine whether it was appropriate to rely on the information.

2.3.4. If the information was prepared by the other party under a different jurisdiction, the actuary should consider any differences in the law or accepted actuarial practice between the two jurisdictions and how that might affect the actuary’s use of the information.
2.4. **Materiality** – In case of omissions, understatements, or overstatements, the actuary should assess whether or not the effect is material. The threshold of materiality under which the work is being conducted should be determined by the actuary unless it is imposed by another party such as an auditor or the principal. When determining the threshold of materiality, the actuary should:

2.4.1. Assess materiality from the point of view of the intended user(s), recognizing the purpose of the actuarial services; thus, an omission, understatement, or overstatement is material if the actuary expects it to affect significantly either the intended user’s decision-making or the intended user’s reasonable expectations;

2.4.2. Consider the actuarial services and the entity that is the subject of those actuarial services; and

2.4.3. Consult with the principal if necessary.

2.5. **Data Quality**

2.5.1. **Sufficient and Reliable Data** - The actuary should consider whether sufficient and reliable data are available to perform the actuarial services. Data are sufficient if they include the appropriate information for the work. Data are reliable if that information is materially accurate.

2.5.2. **Validation** - The actuary should take reasonable steps to review the consistency, completeness, and accuracy of the data used. These might include:

   a. Undertaking reconciliations against audited financial statements, trial balances, or other relevant records, if these are available;

   b. Testing the data for reasonableness against external or independent data;

   c. Testing the data for internal consistency; and

   d. Comparing the data to that for a prior period or periods.

The actuary should describe this review in the report.

2.5.3. **Sources of Data for Entity-Specific Assumptions** - To the extent possible and appropriate when setting entity-specific assumptions, the actuary should consider using data specific to the entity for which the assumptions are being made. Where such data are not available, relevant, or credible, the actuary should consider industry data, data from other comparable sources, population data, or other published data, adjusted as appropriate. The data used, and the adjustments made, should be described in the report.

2.5.4. **Data Deficiencies** - The actuary should consider the possible effect of any data deficiencies (such as inadequacy, inconsistency, incompleteness, inaccuracy, and unreasonableness) on the results of the work. If such deficiencies in the data are not likely to materially affect the results, then the deficiencies need not be considered.
If the actuary cannot find a satisfactory way to resolve the deficiencies, then the actuary should consider whether to:

a. Decline to undertake or continue to perform the actuarial services;

b. Work with the principal to modify the actuarial services or obtain appropriate additional data; or

c. Subject to compliance with the actuary’s code of professional conduct, perform the actuarial services as well as possible and disclose the data deficiencies in the report (including an indication of the potential impact of those data deficiencies).

2.6. Assumptions and Methodology

2.6.1. The assumptions and methodology may be

a. Set by the actuary (2.7);

b. Prescribed by the principal or another party (2.8); or

c. Mandated by law (2.9).

2.6.2. Where the report is silent about who set an assumption or methodology, the actuary who authored the report will be assumed to have taken responsibility for such assumption or methodology.

2.7. Assumptions and Methodology Set by Actuary – Where the actuary sets the assumptions and methodology, or the principal or another party sets an assumption or methodology that the actuary is willing to support:

2.7.1. Selection of Assumptions and Methodology - The actuary should select the assumptions and methodology that are appropriate for the work. The actuary should consider the needs of the intended users and the purpose of the actuarial services. In selecting assumptions and methodology, the actuary should consider the circumstances of the entity and the assignment, as well as relevant industry and professional practices. The actuary should consider to what extent it is appropriate to adjust assumptions or methodology to compensate for known deficiencies in the available data.

2.7.2. Appropriateness of Assumptions - The actuary should consider the appropriateness of the assumptions underlying each component of the methodology used. Assumptions generally involve significant professional judgment as to the appropriateness of the methodology used and the parameters underlying the application of such methodology. Assumptions may (if permitted in the circumstances) be implicit or explicit and may involve interpreting past data or projecting future trends. The actuary should consider to what extent it is appropriate to use assumptions that have a known significant bias to underestimation or overestimation of the result.
2.7.3. **Margins for Adverse Deviations** - In cases where unbiased calculations are not required, the *actuary* should consider to what extent it is appropriate to adjust the assumptions or methodology with margins for adverse deviations in order to allow for uncertainty in the underlying data, assumptions, or methodology. The *actuary* should disclose any incorporation of margins for adverse deviations in assumptions or methodology.

2.7.4. **Discontinuities** - The *actuary* should consider the effect of any discontinuities in experience on assumptions or methodology. Discontinuities could result from:

a. Internal circumstances regarding the *entity* such as changes in an insurer’s claims processing or changes in the mix of business; or

b. External circumstances impacting the *entity* such as changes in the legal, economic, legislative, regulatory, supervisory, demographic, technological, and social environments.

2.7.5. **Individual Assumptions and Aggregate Assumptions** - The *actuary* should assess whether an assumption set is reasonable in the aggregate. While assumptions might be justifiable individually, it is possible that prudence or optimism in multiple assumptions will result in an aggregate assumption set that is no longer valid. If not valid, the *actuary* should make appropriate adjustments to achieve a reasonable assumption set and final result.

2.7.6. **Internal Consistency of Assumptions** - The *actuary* should determine if the assumptions used for different components of the *work* are materially consistent, and that any significant interdependencies are modelled appropriately. The *actuary* should disclose any material inconsistency in the *report*.

2.7.7. **Alternative Assumptions and Sensitivity Testing** - The *actuary* should consider and address the sensitivity of the methodology to the effect of variations in key assumptions, when appropriate. In determining whether sensitivity has been appropriately addressed, the *actuary* should take into account the purpose of the *actuarial services* and whether the results of the sensitivity tests reflect a reasonable range of variation in the key assumptions, consistent with that purpose.

### 2.8. Assumptions and Methodology Prescribed

– Where the assumptions or methodology are prescribed by the *principal* or another party:

2.8.1. If the *actuary* is willing to support the prescribed assumption or methodology (following paragraph 2.7 as applicable), the *actuary* may disclose the party who prescribed the assumption or methodology and the *actuary*’s support.

2.8.2. If the *actuary* is unwilling to support the prescribed assumption or methodology because:

a. It significantly conflicts with what would be appropriate for the purpose of the *actuarial services*, the *actuary* should disclose in the *report* that fact, the party who prescribed the assumption or methodology, and the reason why this party, rather than the *actuary*, set the assumption or methodology; or
b. The actuary has been unable to judge the appropriateness of the prescribed assumption or methodology without performing a substantial amount of additional work beyond the scope of the assignment, or the actuary was not qualified to judge the appropriateness of the assumption, the actuary should disclose in the report that fact, the party who prescribed the assumption or methodology, and the reason why this party, rather than the actuary, set the assumption or methodology.

2.8.3. When the principal requests an additional calculation using an assumption set which the actuary does not judge to be reasonable for the purpose of the actuarial services, the actuary may provide the principal with the results based on such assumptions. If those results are communicated to any party other than the principal, the actuary should disclose the source of those assumptions and the actuary’s opinion of their appropriateness.

2.9. Assumptions and Methodology Mandated by Law – When an assumption or methodology is mandated by law, the actuary should disclose in the report that the assumption or methodology was mandated by law and that the report should not be used for other purposes where the assumptions and methodology used are not appropriate (unless appropriately adjusted).

2.10. Process Management

2.10.1. Process Controls - The actuary should consider to what extent, if any, the procedures used to carry out the work should be controlled, and if so, how.

2.10.2. Reasonableness Checks - The actuary should review the results produced by the selected assumptions and methodology for overall reasonableness.

2.11. Peer Review – The actuary should consider to what extent, if at all, it is appropriate for the report to be independently reviewed, in totality or by component, before the final report is delivered to the principal or distributed to the intended users. The purpose of peer review is to ensure the quality of the report, with the process tailored to the complexity of the work and the specific environment in which the actuary works. If a peer review is deemed to be appropriate:

2.11.1. The actuary should select a reviewer who is independent of involvement with the specific component(s) reviewed and is knowledgeable and experienced in the practice area of the actuarial services.

2.11.2. If the reviewer is an actuary, the reviewer should comply with the guidance of this ISAP, as applicable, in performing the review.

2.12. Treatment of Subsequent Events – The actuary should consider any subsequent event that has the potential of materially changing the results of the actuarial services if the event had been reflected in the work and disclose such an event in the actuary’s communication.

2.13. Retention of Documentation

2.13.1. The actuary should retain, for a reasonable period of time, sufficient documentation for purposes such as:
a. Peer review, regulatory review, and audit;

b. Compliance with law; and

c. Assumption of any recurring assignment by another actuary.

2.13.2. Documentation is sufficient when it contains enough detail for another actuary qualified in the same practice area to understand the work and assess the judgments made.

2.13.3. Nothing in this ISAP is intended to give any person access to material beyond the access that they are already authorized to have.
Section 3. Communication

3.1. General Principles – Any communication should be appropriate to the particular circumstances and take the skills, understanding, levels of relevant technical expertise, and needs of the intended user into consideration to allow the intended user to understand the implications of the actuary’s communication.

3.1.1. Form and Content - The actuary should determine the form, structure, style, level of detail, and content of each communication to be appropriate to the particular circumstances, taking into account the intended users.

3.1.2. Clarity - The actuary should word each communication to be clear and use language appropriate to the particular circumstances, taking into account the intended users.

3.1.3. Timing of Communication - The actuary should issue each communication within a reasonable time period. The timing of the communication should reflect any arrangements that have been made with the principal. The actuary should consider the needs of the intended users in setting the timing.

3.1.4. Identification of the Actuary - A communication shall clearly identify the issuing actuary. When two or more individuals jointly issue a communication, at least some of which is actuarial in nature, the communication shall identify all responsible actuaries, unless the actuaries judge it inappropriate to do so. The name of an organization with which each actuary is affiliated also may be included in the communication, but the actuary’s responsibilities are not affected by such identification. Unless the actuary judges it inappropriate, any communication shall also indicate to what extent and how supplementary information and explanation can be obtained from the actuary or another party.

3.2. Report – The actuary should complete a report unless any intended users will otherwise be adequately informed about the results of actuarial services (including access to the supporting information which is necessary to understand these results). The actuary should present all information with sufficient detail that another actuary qualified in the same practice area could make an objective appraisal of the reasonableness of the actuary’s work.

3.2.1. Content - In the report, the actuary should include, if applicable:

a. The scope and intended use of the report;

b. The results of actuarial services, including the potential variability of these results;

c. The methodology, assumptions, and data used;

d. Any restrictions on distribution;

e. The date of the report; and

f. Information on the authorship of the report.

3.2.2. Disclosures - In the report, the actuary issuing the report should disclose, if applicable:
a. Any material deviation from the guidance in this ISAP (1.3);
b. Any reliance on information prepared by another party for which the actuary disclaims responsibility (2.3.3);
c. Any data modification, validation and deficiencies (2.5);
d. The actuary’s assessment of the uncertainty inherent in the information used by the actuary (2.5.4.c);
e. Any material inconsistency in the assumptions used (2.7.6);
f. Where the report contains the results of an additional calculation using an assumption set requested by the principal which the actuary does not judge to be reasonable for the purpose of the assignment (2.8.3);
g. Assumptions and methodology that have been prescribed by another party (2.8);
h. Assumptions and methodology that are mandated by law (2.9); and
i. Any material subsequent event (2.12).

3.2.3. **Authorship** - The actuary issuing the report should include in the report:

a. The actuary’s name;
b. If applicable, the name of the organization on whose behalf the actuary is issuing the report, and the actuary’s position held;
c. The capacity in which the actuary serves;
d. The actuary’s qualifications;
e. The code of professional conduct and actuarial standards under which the work was performed, if there is any possible ambiguity; and
f. If applicable, attestations and relocations.

3.2.4. **Form** - A report may comprise one or several document(s) that may exist in several different formats. Where a report comprises multiple documents, the actuary should communicate to all intended users which documents comprise the report. The actuary should ensure that report components (especially those in electronic media) are such that they can be reliably reproduced for a reasonable period of time.

3.2.5. **Constraints** - The content of a report may be constrained by circumstances such as legal, legislative, regulatory, or supervisory proceedings. Constraints could also include other standards such as financial reporting standards or an entity’s accounting policy. The actuary should follow the guidance of this ISAP to the extent reasonably possible within such constraints.

Preface

This International Standard of Actuarial Practice (ISAP) is a model for actuarial standard-setting bodies to consider.

The International Actuarial Association (IAA) encourages relevant actuarial standard-setting bodies to maintain a standard or set of standards that is substantially consistent with this ISAP to the extent that the content of this ISAP is appropriate for actuaries in their jurisdiction. This can be achieved in many ways, including:

- Adopting this ISAP as a standard with only the modifications in the Drafting Notes;
- Customizing this ISAP by revising the text of the ISAP to the extent deemed appropriate by the standard-setting body while ensuring that the resulting standard or set of standards is substantially consistent with this ISAP;
- Endorsing this ISAP by declaring that this ISAP is appropriate for use in certain clearly defined circumstances;
- Modifying existing standards to obtain substantial consistency with this ISAP; or
- Confirming that existing standards are already substantially consistent with this ISAP.

A standard or set of standards that is promulgated by a standard-setting body may be considered to be substantially consistent with this ISAP if:

- There are no material gaps in the standard(s) in respect of the principles set out in this ISAP; and
- The standard or set of standards does not contradict this ISAP.

Local jurisdictions may adopt variants of IFRS 17, and in that case a local actuarial standard-setter may need to adjust ISAP 4 accordingly.

If an actuarial standard-setting body wishes to adopt or endorse this ISAP, it is essential to ensure that existing standards are substantially consistent with ISAP 1 as this ISAP relies upon ISAP 1 in many respects. Likewise, any customization of this ISAP, or modification of existing standards to obtain substantial consistency with this ISAP, should recognize the important fact that this ISAP relies upon ISAP 1 in many respects.

If this ISAP is translated for the purposes of adoption, the adopting body should select three verbs that embody the concepts of “must”, “should”, and “may”, as described in paragraph 1.6. Language of ISAP 1, even if such verbs are not the literal translation of “must”, “should”, and “may”.

This ISAP is a model standard of actuarial practice and, as such, is not binding on any actuary.

This ISAP was adopted by the IAA Council in November 2019.

[Drafting Notes: When an actuarial standard-setting organization adopts this standard, it should:

1. Replace “ISAP” throughout the document with the local standard name, if applicable;
2. Modify references to ISAP 1 in paragraphs 1.3., 2.1., 2.2.2., 2.3., 2.4., 2.5., 2.6.1., 2.6.14., and 3.1. to point to the local standard(s) that are substantially consistent with ISAP 1, rather than referring to ISAP 1 directly, if appropriate;
3. Choose the appropriate phrase and date in paragraph 1.7.;]
4. Review this standard for, and resolve, any conflicts with the local law and code of professional conduct; and

5. Delete this preface (including these drafting notes) and the footnote associated with paragraph 1.7.]
Introduction

This International Standard of Actuarial Practice (ISAP) provides guidance to actuaries when performing actuarial services in connection with International Financial Reporting Standard 17 Insurance Contracts (IFRS 17) issued in May 2017.

IFRS 17 Insurance Contracts establishes principles for the recognition, measurement, presentation and disclosure of insurance contracts and reinsurance contracts. The objective is to ensure that entities provide relevant information in a way that faithfully represents those contracts.

An entity which reports financial statements under IFRS is responsible for the information reported. This means it is responsible for, amongst other things, identification, combination, aggregation, separation, recognition and derecognition of contracts, the choice of measurement approach and assumptions, the measurement calculations and the disclosures in the IFRS financial statements.

Nevertheless, actuaries providing actuarial services in connection with IFRS 17 may be advising the entity on decisions, carrying out the calculations required or some combination of these.

The IAA intends this ISAP to:

- Facilitate convergence in standards of actuarial practice in connection with IFRS 17;
- Increase public confidence in actuarial services provided in connection with IFRS 17; and
- Demonstrate the IAA’s commitment to support the work of the International Accounting Standards Board (IASB) in achieving high quality, transparent and comparable financial reporting internationally, as envisaged by the Memorandum of Understanding between the IAA and the IASB.
Section 1. General

1.1. **Purpose** – This ISAP provides guidance to actuaries when performing actuarial services in connection with IFRS 17. Its purpose is to increase intended users’ confidence that:

- Actuarial services are carried out professionally and with due care;
- The results are relevant to their needs, are presented clearly and understandably, and are complete; and
- The assumptions and methodology (including models and modelling techniques) used are disclosed appropriately.

1.2. **Scope** – This ISAP applies to actuaries when performing actuarial services related to IFRS 17 for the preparation of an entity’s actual or pro-forma IFRS financial statements. Actuaries performing other actuarial services in connection with IFRS 17 (for example: an actuary advising a third party such as an auditor or a regulator, or advising a potential buyer regarding an acquisition) should apply the guidance in this ISAP to the extent relevant to the assignment.

1.3. **Relationship to ISAP 1** – Compliance with ISAP 1 is a prerequisite to compliance with this ISAP.

1.4. **Relationship to IFRSs** – This ISAP relates to the content of IFRS 17 and other relevant IFRSs, including any interpretations from the International Financial Reporting Interpretations Committee (IFRIC) or its predecessor, the Standing Interpretations Committee, as issued through 16 August 2019. The guidance in this ISAP complements the guidance in IFRS 17, which is not repeated in this ISAP.

1.5. **Defined Terms** – This ISAP uses various terms whose specific meanings are defined in the Glossary. These terms are highlighted in the text with a dashed underscore and in blue, which is a hyperlink to the definition (e.g., actuary).

This ISAP also uses key terms from IFRS 17, in which case they have the meaning as used in IFRS 17. These terms are highlighted in the text with a double underscore and in green (e.g., insurance contract).

1.6. **Cross References** – If IFRS 17, or any other IFRS referenced in this ISAP, is subsequently amended, restated, revoked or replaced by the IASB, or interpreted by IFRIC after 16 August 2019, the actuary should consider the extent to which guidance in this ISAP is still applicable and appropriate.

1.7. **Effective Date** – This ISAP is effective for actuarial services performed/actuarial services commenced/actuarial services performed with respect to IFRS financial statements for a reporting period ending on or after [Date].

---

1 [Phrase to be selected and date to be inserted by standard-setter adopting or endorsing this ISAP.]
2.1. Relevant Knowledge Requirements – In applying ISAP 1 paragraph 2.2, the actuary should have or obtain sufficient knowledge and understanding of information necessary to perform the assignment, such as:

a. IFRS 17, applicable sections of other relevant IFRSs (e.g., IFRS 13 when measuring Fair Value), the entity’s accounting policies and the relevant processes that are applied in the preparation of IFRS financial statements;

b. The business environment in which the entity operates, including the financial market(s) from which it obtains data;

c. The entity’s appetite for risks that have an impact on the measurement under IFRS 17;

d. The entity’s products and operations;

e. The methodologies and assumptions used by the entity in other relevant contexts and the rationale for any differences;

f. How law affects the application of IFRS 17; and

g. The relevant auditing standards.

2.2. Materiality – The actuary should understand the distinction between materiality with respect to the actuarial services, the preparation of IFRS financial statements and the auditing of those financial statements.

2.2.1. When appropriate for the work, the actuary should seek guidance from the principal or the entity regarding materiality.

2.2.2. In applying ISAP 1 paragraph 2.4, with respect to the preparation of IFRS financial statements the actuary’s threshold of materiality with respect to the actuarial services should not be greater than the entity’s threshold of materiality.

2.2.3. In all following paragraphs of this ISAP, any use of “material” or “materiality” is with respect to the actuarial services carried out in accordance with this ISAP.

2.3. Proportionality – In applying ISAP 1 paragraph 1.5, and in particular paragraph 1.5.2., the actuary should take into account materiality. In addition, the degree of refinement in specific assumptions or methods recommended by the actuary should be proportionate to their possible impact on the results of the actuarial services.

2.4. Identification, Combination, Aggregation, Separation, Recognition, Derecognition and Modification – The actuary should treat the processes of:

a. Identification of insurance contracts;

b. Combination of insurance contracts;

c. Determination of the level of aggregation (refer to 2.6.14.);

---

2 Knowledge of Relevant Circumstances
3 Materiality
4 Reasonable Judgment
d. Separation of components from an insurance contract for treatment under a different standard;

e. Separation of components of an insurance contract for different treatment under IFRS 17 (if and to the extent permitted);

f. Recognition of groups of contracts and derecognition of insurance contracts; and

g. Treatment of insurance contract modifications as being subject to ISAP 1 paragraph 2.7.5 or 2.8.6.

The actuary should disclose in the report changes in the above processes, including the rationale for and impact of the changes.

2.5. Measurement Approach – The actuary should treat the processes of selecting the appropriate measurement approach to be applied to each group of insurance contracts, whether it is the general measurement approach, the premium allocation approach (PAA) or the variable fee approach, as being subject to ISAP 1 paragraph 2.7.5 or 2.8.6.

The actuary should disclose in the report changes in the above processes, including the rationale for and impact of the changes.

2.6. The General Measurement Approach

2.6.1. General Approach for Selection of Assumptions – In applying ISAP 1 paragraph 2.7.5, when advising the principal or the entity on actuarial assumptions, the actuary should consider matters such as:

a. Combining similar risks based on the nature of the insurance obligation, without being constrained by the actual grouping of insurance contracts that is used for measurement purposes;

b. Whether assumptions developed in other contexts, for example pricing assumptions, may be inappropriate for IFRS 17 purposes;

c. Links as necessary to ensure consistency between assumptions (e.g., assumptions related to option exercise patterns should be linked to the economic scenarios);

d. The potential asymmetrical distribution of the current estimates (e.g., assumptions to deal with extreme events like tail events or options and guarantees that are triggered by market conditions);

e. The credibility of data when combining information from various sources or time periods; and

f. Long-term trends and seasonal variations, and other changes in the environment (e.g., applicable law, economic, demographic, technological and social).

2.6.2. Process for Updating Assumptions – If the actuary considers it appropriate to change the process, including the methodology, used to update a recommended assumption,
the actuary should discuss the change with the principal, including whether it would constitute a change in accounting policy or just a change in an accounting estimate as defined in International Accounting Standard 8 (IAS 8) Accounting Policies, Changes in Accounting Estimates and Errors.

The actuary should disclose in the report changes in such processes, including the rationale for and impact of the changes.

2.6.3. Insurance Risk – When advising the principal or the entity on assumptions to measure insurance risk, the actuary should consider factors including the following:
   a. Characteristics of the insurance contract including the risks being insured;
   b. Characteristics of the policyholder and the way the contract was sold;
   c. Past experience of incurred claims including patterns of delays in reporting and payment and the relevance to expected future experience; and
   d. Practices of the entity, such as underwriting procedures and claims management.

2.6.4. Policyholder Options – When advising the principal or the entity on assumptions for the exercise of options by policyholders, the actuary should consider factors such as the following:
   a. Past experience of how policyholders have exercised options;
   b. Likely behaviour of policyholders, taking into account factors such as anti-selection, the effects of non-financial considerations, and the relative advantages to the policyholder of exercising any options;
   c. Characteristics of how the insurance contracts are sold and serviced;
   d. Significant scheduled changes in premiums, charges, benefits or terms and conditions; and
   e. Any short-term spikes in cancellation rates created by the exercise of certain options.

2.6.5. Entity Discretion – When advising the principal or the entity on assumptions which consider the exercise of discretion by the entity, the actuary should take into account expectations or limitations that may arise from sources such as:
   a. The entity's marketing and promotional materials;
   b. The entity’s past practices;
   c. The entity’s current policy;
   d. Market practices; and
   e. Laws and rulings of relevant authorities.

2.6.6. Reinsurance Contracts Held – When advising the principal or the entity, on the measurement of reinsurance contracts held, the actuary should:
   a. When estimating amounts recoverable under multiple reinsurance arrangements, consider the order in which the reinsurance contracts apply;
   b. When estimating non-recoverable amounts:
i. Consider the financial condition of the reinsurer, the existence of collateral and the extent to which default by one reinsurer may affect the amounts recoverable from other reinsurers; and

ii. In the estimates of future cash flows to be received from reinsurance contracts, allow for the uncertainty caused by the potential of non-performance by reinsurers;

c. When estimating fulfilment cash flows, consider the extent to which each reinsurance counterparty exercises its control over recapture, cancellation or commutation to its advantage; and

d. Consider the impact of reinstatement of reinsurance contracts following claims.

2.6.7. Reinsurance Contracts Issued – When advising the principal or the entity, on the measurement of reinsurance contracts issued, the actuary should consider circumstances such as:

a. The expected behaviour with respect to the available options of the policyholders, the issuer of the underlying insurance contracts and all intermediate reinsurers;

b. The underwriting and management practices, including the underwriting for facultative placements, and the claim management processes impacting the reinsurance contracts issued;

c. Reinstatement of reinsurance contracts following claims; and

d. Default by the issuer of the underlying insurance contracts and all intermediate reinsurers.

2.6.8. Currency Exchange – When advising the principal or the entity on the estimation of the fulfilment cash flows in multiple currencies, the actuary should reflect current market expectations of future currency exchange rates.

2.6.9. Discount Rates – When advising the principal or the entity on the derivation of:

a. Discount rates for periods beyond those for which observable data from an active market are available, the actuary should consider how current rates are expected to evolve over time using the best information available in the circumstances, including such market prices as are observable;

b. Discount rates for cash flows of insurance contracts, that vary with the returns of the entity’s invested assets, the actuary should consider the entity’s investment policy, as applied in practice, taking into account the entity’s communications to various stakeholders and, where applicable, anticipated policyholder behaviour;

c. Illiquidity and credit or default adjustments for determining the discount rates, the actuary should consider:

i. Approaches that are robust and that should be able to be applied reliably over time and under a variety of market conditions, to reflect the illiquidity of the cashflows underlying the relevant liabilities; and

ii. The possible methods for calculating such adjustments to observed market rates. Methods include market-based techniques, structural model techniques and expected / unexpected credit loss techniques.
2.6.10. **Contracts with Cash Flows that Vary with Returns on Underlying Items** - When advising the principal or the entity on contracts whose cash flows vary with returns on underlying items, the actuary should:

a. Select discount rates used to calculate the present value of the cash flows to measure the fulfillment cash flows that are consistent with the investment returns anticipated in the estimates of the future cash flows. Returns on assets should be estimated using prospective expectations consistent with current market expectations of future economic conditions; and

b. For cash flows which are subject to a floor or a cap, consider the associated impact, if any, on the estimates of future cash flows, the risk adjustment for non-financial risk and the discount rates in the projection.

2.6.11. **Maintenance Expenses** – When advising the principal or the entity on the estimation of cash flows for maintenance expenses such as policy administration and claim handling costs, and attributable overheads, the actuary should consider factors such as:

a. The entity’s cost-accounting and expense allocation policies;

b. Expenses expected to arise from fulfilling insurance obligations existing on the measurement date. This estimate should consider factors such as the entity’s past experience and current business plans, and the impact of future inflation; and

c. Terms of any outsourcing arrangements.

2.6.12. **Insurance Acquisition Cash Flows** – The actuary should be satisfied that the allocation of insurance acquisition cash flows to each portfolio of insurance contracts is made on a consistent basis.

2.6.13. **Risk Adjustment for Non-Financial Risk** – When advising the principal or the entity on the risk adjustment for non-financial risk, the actuary should:

a. Understand the non-financial risk inherent in the insurance contracts;

b. In assessing what the entity requires as compensation for bearing the non-financial risk:

   i. Reflect the diversification benefit that the entity recognizes at the relevant level of consolidation; and

   ii. Consider sources of relevant information, such as the entity’s capital management, risk management and pricing policies.

c. Select a methodology that, at the chosen level of aggregation:

   i. Uses assumptions that are consistent with those used in the determination of the corresponding estimates of future cash flows;

   ii. Reflects the risk differences between the portfolios of insurance contracts; and

   iii. Allows for the diversification that the entity recognizes.

d. Make appropriate allowance for mechanisms that result in risk being passed to the policyholder (e.g., contracts with participation or adjustment features);
e. Consider whether the difference between the total of the calculated gross risk adjustment for non-financial risk and the total of the ceded risk adjustment for non-financial risk fairly reflects the compensation that the entity requires for bearing the uncertainty of its net exposure; and

f. When advising on the confidence level disclosure required by IFRS 17, where risk adjustment for non-financial risk has not been determined using a confidence level approach, consider:

i. The ability to diversify non-financial risk over the entity’s consolidated business; and

ii. The inherent uncertainty in the translation to a confidence level and the need to describe such uncertainty in the report.

2.6.14. Aggregation and Contractual Service Margin (CSM) – The actuary should treat the processes of:

a. Identification of portfolios of insurance contracts;

b. Allocation of individual insurance contracts into portfolios of insurance contracts, and division of each portfolio of insurance contracts into groups of insurance contracts;

c. Treatment of the loss component on onerous contracts;

d. Determination of the coverage units; and

e. Roll forward of the CSM as being subject to ISAP 1 paragraph 2.7.5 or 2.8.6.

The actuary should disclose in the report changes in the above processes, including the rationale for and impact of the changes.

2.7. The Premium Allocation Approach (PAA) – When advising the principal or the entity in relation to the use of the PAA for a group of insurance contracts, the actuary should:

2.7.1. At initial recognition if the coverage period is longer than one year, consider:

a. Differences between the expected patterns of insurance revenue under the general measurement approach and under the PAA;

b. Differences between the expected timing of cash flows under the general measurement approach and the insurance revenue under the PAA, resulting in different adjustments for the time value of money; and

c. Whether future assumption changes under the general measurement approach would render the simplification invalid when assessing whether material differences between the respective carrying amounts of the liabilities for remaining coverage under the PAA and the general measurement approach are reasonably expected to arise;

2.7.2. Assess whether insurance contracts in the group have a significant financing component, advise the principal or the entity, and measure the liability accordingly;

2.7.3. Be aware of whether the entity has chosen in accordance with IFRS 17 to recognize insurance acquisition cash flows as expenses when it incurs those costs and determine the liability in accordance with the entity’s choice;
2.7.4. Be aware of whether the **entity** has chosen to reflect the time value of money and the effect of financial risk, when not required to do so, and determine the liability in accordance with the **entity**’s choice; and

2.7.5. Consider whether facts and circumstances indicate that the **group of insurance contracts** is or has become **onerous** and advise the **principal** or the **entity** accordingly.

2.8. **The Variable Fee Approach** – In using the **variable fee approach**, the **actuary** should apply the guidance in paragraph 2.6., except for 2.6.6. (**Reinsurance Contracts Held**) and 2.6.7. (**Reinsurance Contracts Issued**), as the **variable fee approach** does not apply to reinsurance.

2.9. **Financial Statement Presentation and Disclosure**

2.9.1. Where the information provided by the **actuary** will be used in financial statement presentation and disclosure:

   a. The **actuary** should provide the related information needed to comply with the relevant presentation and disclosure requirements of **IFRS 17** and the **entity**’s **accounting policies**; and

   b. If the **actuary** becomes aware that such information is used in the presentations and/or disclosures incorrectly or inappropriately, the **actuary** should discuss and report these issues to the **principal**.

2.9.2. In providing advice on the disclosures of reconciliations where the order of calculations alters the information disclosed, the **actuary** should apply a consistent order of calculation across all reconciliations and from period to period, or disclose any change, including the rationale for and impact of the change, in the **report**.

2.10. **Transition** – When advising the **principal** or the **entity** on whether a full retrospective application of **IFRS 17** at transition is impracticable, the **actuary** should take into consideration factors such as:

   a. The availability and integrity of the past **data** that are required to determine the **fulfilment cash flows**;

   b. The availability and integrity of information on past products;

   c. The availability, without the benefit of hindsight, of sufficient **data** to determine the initial assumptions and subsequent changes that the **entity** would have adopted over the lifetime of the **insurance contracts**;

   d. The method that would have been used to adjust past known interest rates to achieve the rates that reflect the characteristics of the **insurance contracts**; and

   e. The difficulty, without the benefit of hindsight, in evaluating the past **risk adjustment for non-financial risk** and the **entity**’s use of discretion.
Section 3. Communication

3.1. **Disclosures** – In addition to complying with ISAP 1 Section 3. Communication, the actuary should disclose in the report:

3.1.1. Information regarding a change in assumptions or method, whether arising from a consistent or changed process;

3.1.2. Changes in processes, together with the rationale for and impact of the changes, related to:
   a. The identification, combination, aggregation, separation, recognition, derecognition and modification (2.4.);
   b. The selection of the measurement approach (2.5.);
   c. The process for updating assumptions (2.6.2.);
   d. Aggregation and CSM (2.6.14.); and
   e. The order of calculation on reconciliations provided for financial statement presentation and disclosure (2.9.2.); and

3.1.3. When the risk adjustment for non-financial risk has not been determined using a confidence level approach, the uncertainty inherent in the translation to a confidence level (2.6.13.f.).

Preface

This International Standard of Actuarial Practice (ISAP) is a model for actuarial standard-setting bodies to consider.

The International Actuarial Association (IAA) encourages relevant actuarial standard-setting bodies to maintain a standard or set of standards that is substantially consistent with this ISAP to the extent that the content of this ISAP is appropriate for actuaries in their jurisdiction. This can be achieved in many ways, including:

- Adopting this ISAP as a standard with only the modifications in the Drafting Notes;
- Customizing this ISAP by revising the text of the ISAP to the extent deemed appropriate by the standard-setting body while ensuring that the resulting standard or set of standards is substantially consistent with this ISAP;
- Endorsing this ISAP by declaring that this ISAP is appropriate for use in certain clearly defined circumstances;
- Modifying existing standards to obtain substantial consistency with this ISAP; or
- Confirming that existing standards are already substantially consistent with this ISAP.

A standard or set of standards that is promulgated by a standard-setting body may be considered to be substantially consistent with this ISAP if:

- There are no material gaps in the standard(s) in respect of the principles set out in this ISAP; and
- The standard or set of standards does not contradict this ISAP.

If an actuarial standard-setting body wishes to adopt or endorse this ISAP, it is essential to ensure that existing standards are substantially consistent with ISAP 1 as this ISAP relies upon ISAP 1 in many respects. Likewise, any customization of this ISAP, or modification of existing standards to obtain substantial consistency with this ISAP, should recognize the important fact that this ISAP relies upon ISAP 1 in many respects.

If this ISAP is translated for the purposes of adoption, the adopting body should select three verbs that embody the concepts of “must”, “should”, and “may”, as described in paragraph 1.6. Language of ISAP 1, even if such verbs are not the literal translation of “must”, “should”, and “may”.

ISAPs are model standards of actuarial practice and, as such, are not binding on any actuary.

ISAP 5 was adopted by the IAA Council in November 2016. This conforming version was adopted on 1 December 2018.

[Drafting Notes: when an actuarial standard-setting organization adopts this standard it should:

1. Replace “ISAP” throughout the document with the local standard name, if applicable;
2. Modify references to ISAP 1 in paragraphs 1.3., 2.3.52.2., 2.3.1., and 3.1. to point to the local standard(s) that are substantially consistent with ISAP 1, rather than referring to ISAP 1 directly, if appropriate;
3. Choose the appropriate phrase and date in paragraph 1.5.;
4. Review this standard for, and resolve, any conflicts with the local law and code of professional conduct; and
5. Delete this preface (including these drafting notes) and the footnote associated with paragraph 1.5]
Introduction
This International Standard of Actuarial Practice (ISAP) provides guidance to actuaries when performing actuarial services involving the use of enterprise risk models for insurers.

Actuaries play a principal role in assuring financial soundness of insurers, and their approach often includes the use of enterprise risk models. Specifically, the central importance of enterprise risk models to insurance business management is clearly demonstrated in two of the Insurance Core Principles (ICP) published by the IAIS for assessment and supervision purposes: ICP 16 – Enterprise Risk Management for Solvency Purposes and ICP 17 – Capital Adequacy.

Increasingly, boards and senior managers of insurers rely on enterprise risk modelling for both regulatory and management decision-making purposes. As a result, insurers, their stakeholders, and other interested parties have a strong interest in the reliable operation and transparent governance of the use of enterprise risk models. As employees or advisors, actuaries play an important role in advising insurers and others on the development or selection of the appropriate models and the related testing, validation, and interpretation of the outcomes.

This ISAP is intended to:

- Facilitate convergence in standards of actuarial practice in connection with insurer enterprise risk models within and across jurisdictions;
- Increase public confidence in actuarial services for enterprise risk management (ERM) purposes; and
- Demonstrate the IAA’s commitment to supporting the work of the IAIS in achieving effective insurer ERM practice internationally.
Section 1. General

1.1. Purpose – This ISAP provides guidance to actuaries when performing actuarial services involving enterprise risk models for insurers. It is expected to help increase public confidence in the ERM work provided by actuaries by giving intended users confidence that:

- Actuarial services are carried out professionally and with due care;
- The results are relevant to their needs, are presented clearly and understandably, and are complete; and
- The assumptions and methodology (including, but not limited to, models and modelling techniques) used are disclosed appropriately.

1.2. Scope – This standard applies to actuaries when performing actuarial services involving the selection, modification, development, and use of enterprise risk models, including stress tests and scenario tests, to assess solvency, assess capital adequacy, and produce risk metrics for ERM programs of insurers.

1.3. Relationship to ISAP 1 – Compliance with ISAP 1 is a prerequisite to compliance with this ISAP. References in ISAP 1 to “this ISAP” should be interpreted as applying equally to this ISAP 5, where appropriate.

1.4. Defined Terms – This ISAP uses various terms whose specific meanings are defined in the Glossary. These terms are highlighted in the text with a dashed underscore and in blue, which is a hyperlink to the definition (e.g., actuary).

1.5. Effective Date – This ISAP is effective for {actuarial services performed/actuarial services commenced/actuarial services performed for a valuation date} on or after [Date].

---

1 [Phrase to be selected and date to be inserted by standard-setter adopting or endorsing this ISAP].
Section 2. Appropriate Practices

2.1. Understanding of Risk and Uncertainty – The actuary should have, or obtain, sufficient understanding of the nature of risk and uncertainty in relation to the subject of the work. In performing services related to risk assessment, the actuary should consider, or may rely on others who have appropriately considered, the following:

2.1.1. Information about the financial strength, risk profile, business management, and risk environment of the insurer that is relevant to the assignment;

2.1.2. Information about the insurer’s own risk management framework and approach, including its attitude to the assumption of risk as relevant to the assignment; and

2.1.3. The relationship between the insurer’s financial strength, risk profile, business management, and risk environment as identified in 2.1.1. above, and the insurer’s risk management framework and approach as identified in 2.1.2. above. If, in the actuary’s professional judgment, a significant inconsistency exists, then that inconsistency should be reflected in the risk assessment and disclosed.

2.2. Proportionality – In applying ISAP 1 paragraph 1.5. Reasonable Judgment, and in particular paragraph 1.5.2., the actuary should also consider proportionality in respect of the nature, scale and complexity of the underlying risks.

2.3. Assumption Setting

2.3.1. When choosing or advising on the choice of assumptions for inclusion in the insurer enterprise risk model, in addition to following ISAP 1 paragraphs 2.7. Assumptions and Methodology Set by Actuary and 2.8. Assumptions and Methodology Prescribed, the actuary should consider factors including, but not limited to, the following:

a. Internal policies, likely management actions, and experience with past history of management actions;

b. Contractual requirements, policy wording, and past experience;

c. Factors outside of management control, such as policyholder behaviour, taxation, regulatory requirements, and reserving requirements; and

d. Risk mitigation techniques, such as reinsurance and hedging, and any limitations to these techniques.

The actuary’s assumptions should normally reflect the actual situation as of the valuation date, modified for any known or expected future changes.

2.3.2. When constructing or advising on the construction of insurer enterprise risk models, the actuary should be satisfied that the assumptions are reasonable by obtaining and reviewing information from appropriate sources, such as:

a. Management of the insurer being modelled;

b. Knowledgeable persons at the insurer;

c. The insurer’s business plan and, if available, the most recent assessment of how the insurer will function under severely adverse scenarios;

d. External industry experts;

e. Requirements of law; and
2.3.3. When probability distributions are incorporated into a model, the actuary should be satisfied that the assumed distributions and correlations are appropriate relative to historical information and anticipated future changes, and should also consider the possibility of plausible extreme values. In this regard, for each risk factor, the actuary should provide an explanation of the differences between the incidence of actual extreme events included in the historical data and the potential incidence of extreme events in the enterprise risk model. The various probability distributions and correlations should recognize the possibility of simultaneous extreme values from multiple risk factors.

2.4. Stress Testing and Scenario Testing

2.4.1. In relation to stress tests or scenario tests, the actuary should disclose:

a. The significant assumptions used in the stress test or the scenario test, including the actions assumed to be taken by management; and

b. Any known limitations of the stress test or the scenario test and include an assessment of the potential impact of these limitations on results.

2.5. Assessing Consistency Among Models – Multiple models and multiple stress tests or scenario tests are often developed for different purposes for the same insurer (e.g., accounting requirements, regulatory valuation, or risk evaluation to determine capital needs).

Where practical, the actuary should assess the reasons for and the impact of using multiple models and multiple stress tests or scenario tests and provide an explanation of any material differences in results.
Section 3. Communication

3.1. Disclosures – In addition to complying with ISAP 1 Section 3. Communication, the actuary should disclose:

3.1.1. Any significant inconsistency that exists between the insurer’s financial strength, risk profile, business management, and risk environment as identified in 2.1.1. and the insurer’s own risk management framework and approach as identified in 2.1.2. (2.1.3.);

3.1.2. An explanation of the differences between experience data and potential extreme adverse values in the risk model (2.3.3.);

3.1.3. An explanation of the differences between the experience data and the incidence of multiple extreme events in the enterprise risk model (2.3.3.);

3.1.4. The significant assumptions used in the stress test or scenario test, including the actions assumed to be taken by management (2.4.1.a.);

3.1.5. Any known limitations of the stress tests or scenario tests and an assessment of the potential impact of these limitations on results (2.4.1.b.); and

3.1.6. An appropriate explanation of any material differences in results if multiple models and multiple stress tests and scenario tests are used by the insurer (2.5.).

Preface

This International Standard of Actuarial Practice (ISAP) is a model for actuarial standard-setting bodies to consider.

The International Actuarial Association (IAA) encourages relevant actuarial standard-setting bodies to maintain a standard or set of standards that is substantially consistent with this ISAP to the extent that the content of this ISAP is appropriate for actuaries in their jurisdiction. This can be achieved in many ways, including:

- Adopting this ISAP as a standard with only the modifications in the Drafting Notes;
- Customizing this ISAP by revising the text of the ISAP to the extent deemed appropriate by the standard-setting body while ensuring that the resulting standard or set of standards is substantially consistent with this ISAP;
- Endorsing this ISAP by declaring that this ISAP is appropriate for use in certain clearly defined circumstances;
- Modifying existing standards to obtain substantial consistency with this ISAP; or
- Confirming that existing standards are already substantially consistent with this ISAP.

A standard or set of standards that is promulgated by a standard-setting body may be considered to be substantially consistent with this ISAP if:

- There are no material gaps in the standard(s) in respect of the principles set out in this ISAP; and
- The standard or set of standards does not contradict this ISAP.

If an actuarial standard-setting body wishes to adopt or endorse this ISAP, it is essential to ensure that existing standards are substantially consistent with ISAP 1 as this ISAP relies upon ISAP 1 in many respects. Likewise, any customization of this ISAP, or modification of existing standards to obtain substantial consistency with this ISAP, should recognize the important fact that this ISAP relies upon ISAP 1 in many respects.

If this ISAP is translated for the purposes of adoption, the adopting body should select three verbs that embody the concepts of “must”, “should”, and “may”, as described in paragraph 1.6. Language of ISAP 1, even if such verbs are not the literal translation of “must”, “should”, and “may”.

ISAPs are model standards of actuarial practice and, as such, are not binding on any actuary.

This ISAP was adopted by the IAA Council on 1 December 2018.

[Drafting Notes: when an actuarial standard-setting organization adopts this standard, it should:

1. Replace “ISAP” throughout the document with the local standard name, if applicable;
2. Modify references to ISAP 1 in paragraphs 1.3., 2.2. and 3.1. to point to the local standard(s) that are substantially consistent with ISAP 1 rather than referring to ISAP 1 directly, if appropriate;
3. Modify the reference to ISAP 5 in the Introduction, if appropriate;
4. Choose the appropriate phrase and date in paragraph 1.6.;
5. Modify the references to regulations consistent with ICP 8 and ICP 16, if appropriate;]
6. Review this standard for, and resolve, any conflicts with the local law and code of professional conduct; and

7. Delete this preface (including these drafting notes) and the footnote associated with paragraph 1.6.]
Introduction

This International Standard of Actuarial Practice (ISAP) provides guidance to actuaries who provide actuarial services involving enterprise risk management (ERM) programs that address insurer risks and are within the scope of regulations consistent with two of the Insurance Core Principles (ICP 8 and ICP 16) of the International Association of Insurance Supervisors (IAIS). Regulation of financial services businesses has evolved rapidly in the years following the Global Financial Crisis in 2008. While the most radical changes have been applied to banks, insurers have also been subject to enhanced scrutiny. An important component of this higher level of regulation is the assessment of ERM programs.

ERM programs include processes undertaken by insurers to identify, assess, measure, control, mitigate, monitor and communicate on risks in respect of the insurance enterprise. These programs have come to be seen by insurance supervisors globally as a critical activity of insurers. The IAIS has recognized the importance of ERM programs in two of the Insurance Core Principles (ICPs): ICP 8 Risk Management and Internal Controls and ICP 16 Enterprise Risk Management for Solvency Purposes. These ICPs are intended to encourage insurance supervisors around the world to incorporate the concepts expressed therein into the regulation of insurers. According to ICP 8 and ICP 16, an insurer’s management is responsible for establishing and operating frameworks to manage the risks to which the insurer is exposed, recognising that the intrinsic nature of insurance is to share or to manage risk.

Depending on the level of sophistication, insurers’ approaches to risk management may range from simple consideration of the adequacy of current financial resources to integrated holistic consideration and management of a wide range of risks. ICP 8 and ICP 16 encourage a supervisory-led minimum standard for these activities. Insurers, their stakeholders and supervisors all therefore have a strong interest in the reliable operation and transparent governance by insurers of an effective risk management system. The risk management system envisaged by ICP 8 and ICP 16 includes the identification and measurement of risks, a risk management policy including an explicit Asset and Liability Management (ALM) policy, investment policy and underwriting risk policy, the development and maintenance of a risk tolerance framework, and the Own Risk and Solvency Assessment (ORSA).

Many actuaries perform actuarial services in connection with ERM programs, including acting as an employee of an insurer, as an independent professional, as part of an external audit team or as a supervisor of insurers. In some jurisdictions, actuaries are called upon to give a professional opinion regarding the ERM program to the supervisor.

This ISAP addresses ERM programs that often involve stress testing, scenario testing and other modeling techniques. ISAP 5 (Insurer Enterprise Risk Models) provides helpful guidance on these subjects and actuaries reading this ISAP may find ISAP 5 to be a valuable resource.

Some terms, such as risk appetite, risk tolerance or risk limit, are used both in this ISAP and in ICP 8 and ICP 16. When such terms are referenced without definition in this ISAP or in the associated Glossary, they are intended to have the meaning in the context with which they are used in ICP 8 and ICP 16.

This ISAP is intended to:

- Facilitate convergence in standards of actuarial practice within and across jurisdictions in connection with ERM programs that are within the scope of regulations consistent with ICP 8 and ICP 16;
- Increase public confidence in actuarial services for ERM purposes; and
• Demonstrate the IAA’s commitment to supporting the work of the IAIS in achieving effective ERM programs for insurers internationally.
Section 1. General

1.1. **Purpose** – This ISAP provides guidance to actuaries when performing actuarial services involving ERM programs that are within the scope of regulations consistent with two of the ICPs of the International Association of Insurance Supervisors, namely Risk Management and Internal Controls (ICP 8) and Enterprise Risk Management for Solvency Purposes (ICP 16). It is expected to help increase public confidence in the ERM work provided by actuaries by giving intended users confidence that:

- Actuarial services are carried out professionally and with due care;
- The results are relevant to their needs, are presented clearly and understandably, and are complete; and
- The assumptions and methodology used are disclosed appropriately.

1.2. **Scope** – This ISAP applies to actuaries when performing actuarial services with responsibility for, or significant involvement in, the development, implementation, maintenance or review of some or all of the components of ERM programs, including ORSA, that are within the scope of regulations consistent with ICP 8 and ICP 16. This ISAP applies to an actuary only to the extent of the actuary’s responsibility and involvement.

1.3. **Relationship to ISAP 1** – Compliance with ISAP 1 is a prerequisite to compliance with this ISAP. References in ISAP 1 to “this ISAP” should be interpreted as applying equally to this ISAP 6, where appropriate.

1.4. **Defined Terms** – This ISAP uses various terms whose specific meanings are defined in the Glossary. These terms are highlighted in the text with a dashed underscore and in blue, which is a hyperlink to the definition (e.g., actuary).

1.5. **Cross-References** – When this ISAP refers to the content of another document, the reference relates to the referenced document as it is effective on the adoption date as shown on the cover page of this ISAP. The referenced document may be amended, restated, revoked, or replaced after the adoption date. In such a case, the actuary should consider the extent the modification is applicable and appropriate to the guidance in this ISAP.

1.6. **Effective Date** – This ISAP is effective for {actuarial services performed/actuarial services commenced} ¹ on or after [Date].

¹ [Phrase to be selected and date to be inserted by standard-setter adopting or endorsing this ISAP.]
Section 2. Appropriate Practices

2.1. Understanding of Insurer’s Risk Management System and ERM Framework – The actuary should have, or obtain, sufficient understanding of the risk management system and ERM framework of the insurer and should consider whether the risk management elements required by regulations consistent with ICP 8 and ICP 16 are in place, including risk management policies, risk tolerance statements, an ORSA, and the insurer’s assessment of its regulatory capital requirements.

2.2. Proportionality – In applying ISAP 1 paragraph 1.5.2., the actuary should also consider proportionality in respect of the nature, scale and complexity of the underlying risks.

2.3. Identification, Assessment and Management of Insurer Risks for an ERM Program

2.3.1. An actuary who is responsible for, or significantly involved in, identifying insurer risks should consider factors including, but not limited to, the following:
   a. The strategic objectives of the enterprise;
   b. The processes for collecting information and whether the staff have adequate qualifications, training and experience to understand and identify the risks;
   c. Whether the risk identification process is sufficient to identify current and emerging risks that are reasonably foreseeable, relevant, and material including risks that directly or indirectly impact the financial condition and other objectives of the insurer (e.g. reputational risk);
   d. The risks specifically referred to in regulations consistent with ICP 8 and ICP 16;
   e. The time frame over which the risks may emerge and may impact the insurer;
   f. The risks that may arise from reasonably foreseeable changes in the business of the insurer (operations, markets, products) and from business conduct;
   g. Whether underlying risks within financial structures that have limited transparency have been sufficiently identified (e.g. off-balance sheet exposures, complex asset or reinsurance structures);
   h. Whether the reasonably foreseeable causes of insurer risks and their consequences have been sufficiently identified;
   i. Risks arising or increasing as a consequence of risk management activities (e.g. credit risk arising from the transfer of risk);
   j. The impact that an insurer’s culture, governance structure and remuneration systems may have on the ability and willingness of the management and staff to identify and manage risks, and whether culture, governance structure or remuneration generates, magnifies or mitigates risks; and
   k. Input regarding the identification of risks from management, other knowledgeable persons within the insurer, other subject matter experts and supervisors.

2.3.2. An actuary who is responsible for, or significantly involved in, assessing the probability and impact of the insurer’s risks should consider factors including, but not limited to, the following:
a. The qualitative assessment of risks in addition to, or instead of, assessing them quantitatively;
b. Risk correlations, risk aggregations and tail risks (e.g. catastrophe and pandemic risks, and complex outsourcing risks);
c. The appropriateness of the risk modelling, stress testing, reverse stress testing and scenario testing techniques that are applied;
d. The extent to which the risk models that measure the probability and impact of risks provide results that are consistent with information expressed by market prices for the risks concerned or related risks;
e. The consistency among the various valuation methodologies underlying the ERM program;
f. The operation and effectiveness of the processes and mechanisms used to address risk control and risk mitigation;
g. The appropriateness of the assumptions regarding future actions taken by management and by external parties, taking into account prior experiences in the industry with similar actions;
h. Input regarding probability and impact from management, other knowledgeable persons within the insurer, other subject matter experts and supervisors; and
i. Consistency of risk assessments over time.

2.3.3. An actuary who is responsible for, or significantly involved in, implementing or maintaining risk management controls, mitigation, monitoring or communication and reporting of the insurer’s risks should consider factors including, but not limited to, the following:

a. The insurer’s risk management policies and risk appetite and tolerance statements;
b. The relationship between the insurer’s financial strength and risk profile, and the insurer’s risk management system;
c. Any significant inconsistency in the evaluation of the insurer’s risk tolerances and risk limits;
d. The extent to which the results of the risk models used to measure the economic costs and benefits of risk mitigation are consistent with information expressed by market prices for the risks concerned or related risks;
e. The operation and effectiveness of the processes and mechanisms used to address risk control and risk mitigation;
f. The appropriateness of the assumptions regarding future actions taken by management and by external parties, taking into account prior experiences in the industry with similar actions;
g. The culture within the insurer to commit to, and implement, risk mitigation actions when needed;
The impact of reasonably foreseeable future adverse circumstances on the availability and effectiveness of future risk mitigation practices;

i. The existence and effectiveness of feedback loops in the risk management process; and

j. How the nature and relative importance of risks may change over time.

2.4. Enterprise Level Risk Management

2.4.1. An actuary who is responsible for, or significantly involved in, performing an aggregate risk assessment of the insurer should, in addition to assessing the elements as addressed in section 2.3. above, consider factors including, but not limited to, the following:

a. The financial strength, risk profile, business management, governance structure and risk environment of the insurer;

b. Whether the risk management processes are suitably aligned with the insurer’s objectives and strategy, regarding aggregate risk taking and regarding each major risk category, as reflected by the risk appetite, risk tolerance and risk limits;

c. The interdependence of risks relating to the insurer’s assets and liabilities, noting that correlation of risks between different asset classes, products and business lines may not be linear, and may change under stressed conditions;

d. Off-balance sheet exposures that may revert to the insurer in times of difficulty; and

e. Diversification benefits that result from aggregation of risks.

2.4.2. An actuary who is responsible for, or significantly involved in, developing, implementing, maintaining or reviewing the insurer’s ERM framework should, in addition to assessing the elements as addressed in section 2.4.1. above, consider factors including, but not limited to, the following:

a. The engagement of the Board in assessing, setting, monitoring and reviewing the insurer’s risk appetite and risk profile, and whether the interests of policyholders and other relevant stakeholders are considered appropriately within those processes;

b. The adequacy of the risk management resources and capabilities within the insurer for the current and expected risk profile and risk management strategies;

c. The quality, extent and effectiveness of independence, challenge and monitoring reflected in the framework;

d. The extent and results of recent reviews and audits of control effectiveness, and management’s response to the findings;

e. The management of potential conflicts of interest;

f. The extent to which risk management and risk assessments are used in the decision-making practices of the insurer;
g. The effectiveness of risk communication channels within the insurer, including risk escalation processes, and with its supervisors;

h. The effectiveness and timeliness of the reporting of, and response to, incidences and breaches related to the operation of the ERM framework within the insurer;

i. The operational quality and effectiveness of key ERM framework related policies, processes and mechanisms, including, but not limited to, outsourcing management, business continuity management (including pandemic response management), whistle blowing policies, fraud and privacy risk management, model risk management and business conduct risk management;

j. The extent to which the ERM framework is adaptive to changes to the insurer and to its environment;

k. The extent that the ERM framework complies with regulatory requirements and guidelines applicable to it;

l. The adequacy of the insurer’s ORSA; and

m. Contingency plans to restore the insurer’s financial strength and viability in severe adverse circumstances.

2.4.3. In applying sections 2.4.1. and 2.4.2., if the insurer is part of a group, the actuary should consider factors including, but not limited to, the following:

a. The risks and benefits of belonging to a group structure, recognizing potential limits on fungibility of capital and on transfer of assets between separate legal entities;

b. Reasonably foreseeable changes in the group structure which could impact the capital and solvency of the insurer and its ability to continue in business;

c. Risk modelling, stress testing, reverse stress testing and scenario testing should include changes in the group structure and in the support that the insurer receives from other members of the group;

d. Assumptions that may be suitable for a self-standing insurer may not be suitable when the insurer is part of a larger group;

e. Imposition of risk management controls and tolerance limits by group management;

f. Differences in legal and regulatory requirements between jurisdictions; and

g. Contagion effect of adverse circumstances in other members of the group which could impact the capital and solvency of the insurer.

2.5. Own Risk and Solvency Assessment

2.5.1. The actuary responsible for, or significantly involved in, developing, implementing, maintaining or reviewing an ORSA for an insurer, should consider, in addition to the items in sections 2.3. and 2.4. above, factors including, but not limited to, the following:

a. The time horizon considered by the ORSA;
b. Whether the qualitative and quantitative risk assessments and the financial projections used in the ORSA are appropriate for their intended purpose;

c. Any changes to the insurer’s risk profile and risk appetite since the previous ORSA;

d. The various accounting bases of the insurer;

e. Reasonably foreseeable changes in the external environment;

f. Allowance for new business, and for the run-off of existing and new business;

g. Access to new capital in times of financial stress;

h. Differences between the insurer’s regulatory capital requirements and the insurer’s own assessment of its capital needs;

i. The quality and adequacy of the insurer’s capital resources in relation to quality and adequacy criteria established by the supervisor;

j. The degree of severity reflected in the risk modelling, stress testing, reverse stress testing and scenario testing; and

k. The circumstances that may trigger an ORSA to be performed at a time other than during the regular review schedule.
Section 3. Communication

3.1. **Disclosures** – In addition to complying with ISAP 1 Section 3. Communication the actuary should disclose, as applicable to the actuarial services provided:

3.1.1. Where risk management elements required by regulations consistent with ICP 8 and ICP 16 are not in place (2.1.);

3.1.2. Where risk exposures cannot be, or are not, reliably or meaningfully identified or quantified (2.3.1., 2.3.2., 2.4.1., 2.4.2.);

3.1.3. Where the selected assumptions or risk scenarios adopted give rise to ranges of outcomes or frequencies that are materially less severe or frequent than indicated by historic risk experience, known and expected future changes or reasonably foreseeable potential extreme adverse events (2.3.2., 2.4.1.); and

3.1.4. Any significant inconsistency that exists between the insurer’s financial strength and risk profile, and the insurer’s risk management system (2.3.3.).

Preface

Why is ORSA relevant today?

Insurance company management and boards of directors follow processes to assure themselves 1) that they have the financial resources available to accomplish their objectives and 2) that they can utilize these resources in an efficient manner. Since insurance companies are in the business of taking risk and have the primary objective of fulfilling obligations to policyholders, they must maintain financial resources (capital) to absorb fluctuations in financial results. To determine how much capital is required and to assess capital adequacy, some insurers have relied solely upon the requirements, standards and processes promulgated by regulators and rating agencies. Regulatory and rating agency capital requirements are determined based upon large market segments and hence they disregard the specific risks to which any individual insurance company is exposed. As a consequence, these capital requirements may be too conservative or too optimistic for any given insurer. Because of this, many insurers have spent considerable analytical resources to make their own internal assessment of risk, and of the adequacy and efficient use of their capital.

In response to the IAIS Insurance Core Principle ICP 16, many regulatory regimes around the world now require (or are in the process of developing requirements for) insurance companies to perform own risk and solvency assessments (ORSA) as part of effective risk management systems. New risk-focused regulations require the formalization of ORSA processes and the submission of reports that summarize the results of ORSA processes to regulators on a periodic basis. Regulators are expecting that reporting on ORSA will result in major changes in their own understanding of the inner working of insurers with regard to what they consider to be an issue of highest importance – the maintenance of adequate capital levels for the risks to which an insurance company is exposed, now and in the future, under both expected (baseline) and stressed conditions. Regulators are expecting that ORSA reports will reveal the degree of rigor that is applied by insurers to their ORSA processes and therefore indicate the commitment of the board and senior management to these processes.

As is often the case with the introduction of new regulatory requirements, the simple concept of reporting on an internal management process has taken on a life of its own. The minimum standards for what the regulator is expecting to see from an insurance company’s ORSA may be far in excess of the ORSA and risk management processes that many insurers have historically had in place. And the documentation requirements for reporting to the regulator are a far from trivial additional work requirement.

What is ORSA?

ORSA is an ongoing process by which a company's senior management team routinely assesses its own risk and solvency position; it provides a declaration of the company's assessment of its position in terms of profit, risk and capital, both now and in the future, under different scenarios and relative to the company's appetite for risk. ORSA needs to consider and be consistent with an insurance company's business strategy and the business planning process.

ORSA should consider risk and solvency both from a purely economic view and by applying the regulatory requirements, should reflect the material differences between the two, and should
demonstrate that the company’s resources are adequate considering both views looking forward over the time horizon of the business planning process under both baseline and stressed conditions.

The ORSA process consists of several major steps along a cycle of appropriate length. The major assessment process of ORSA needs to be carried out on a regular basis and whenever the company experiences a significant change in its risk profile and before major strategic decisions are made.

The main findings of the assessment should be thoroughly analyzed by management and be reported to the board. The ORSA process should be self-reflective, identifying the potential weaknesses and points of improvement of the ORSA process itself.

Introduction

An Executive Board (the Board) has a significant role to play in 1) overseeing management's assessments of risk and solvency and in 2) challenging ORSA results as they are communicated by management. The purpose of this paper is to provide members of the Board insight into the value of the ORSA process – regardless of the specific implementation and requirements for ORSA in a given regulatory environment - and to establish Board expectations for the information that senior management should routinely communicate to them.

Simply stated, ORSA provides a declaration of the company’s assessment of its position in terms of profit, risk and capital, both now and in the future, under different scenarios and relative to the company's appetite for risk. ORSA (provided it is effective and clearly communicated):

1. Enhances the information basis for Board decisions;
2. Provides an understanding of the company's risk profile going forward (how the evolving risk profile relates to the risk appetite under the various alternatives, including major risk drivers, and the capital resources available to support current and emerging risks);
3. Increases credibility with regulators or supervisors; and
4. Helps build/maintain risk awareness throughout the company.

ORSA is not just a report or an outcome. It is an ongoing process that a company needs to carry out on a regular basis and whenever the company experiences a significant change in its risk profile, and before major strategic decisions are made. Management is responsible for developing and maintaining ORSA processes that respond to the strategic and risk-taking objectives of the company. The true value of ORSA can only be realized when ORSA becomes integral to management's strategic decision-making.

Effective ORSA reporting will enable the Board, in their role of protecting the viability and reputation of the company, to review and challenge management's strategic decisions and recommendations. Boards that have ORSA communicated to them clearly will be knowledgeable about the risks to which their companies are exposed, and the effectiveness of the ERM practices deployed by their companies for evaluating and treating risk. They will ultimately be in a strengthened position to challenge or approve management's risk-based decisions. The success of ORSA processes within any given company will depend upon the strength of a company’s risk culture, which is supported - and strengthened - by the commitment of the Board itself.
Understanding the company's risk appetite and risk profile

A significant result of a company's ORSA process is a deepened understanding of the company's risk profile from the perspective of the company's ongoing viability, also called the "solvency risk profile". In the ORSA process, the company assesses all material risks that may have an impact on its viability, from either an economic or a regulatory perspective, and with regard to risks that are both quantifiable and those not readily quantified. This solvency risk profile is a reflection of the contribution of each of those material risks to the total solvency risk of the company.

In their oversight capacity, Board members become deeply familiar with the revenue or profit profile of a company, though the word “profile” is seldom used when looking at premiums or profits by line of business. While it is interesting for the Board to know about profit margins (or profit per unit of premiums), it may be much more important for the Board to regularly discuss with management different levels of profit per unit of risk, information that is available because of the development and communication of the risk profile through the ORSA process. This information can lead to strategic discussions with management about the reasons for participating in businesses with lower risk-adjusted profitability, company plans for growth of businesses with higher and lower risk-adjusted profitability targets as well as plans for the improvement of risk adjusted profitability over time. Similar discussions will consider non-quantifiable risks such as reputation risk.

In addition to revealing the sources for and levels of risk among the businesses of the company, the risk profile also provides a measure of total solvency risk. Attention to this quantum can lead to another vital discussion with management about acceptable levels of solvency risk. For some risks, companies may have a maximum level of acceptable risk. But because insurers are in the risk taking business, and in particular for those risks that are the primary business of the insurer, this acceptable level of risk may have both a minimum and a maximum. This band of acceptable risk is referred to as the risk appetite. A company’s risk appetite, once determined by management and reviewed by the Board, can be treated as a budget. When the aggregate risk profile falls outside the risk appetite of the company, management has the responsibility of managing risk activities and only reports to the Board after risk actions have been taken. However, should management contemplate an action that would result in an aggregate risk profile that exceeds the risk appetite, then the Board would need to be consulted in advance and give consent before such actions are undertaken. A Board that is highly involved in risk related decision-making may want to set a risk appetite that is only slightly in excess of the planned risk profile. This might be the case for an insurer that faces very tight constraints from external parties such as rating agencies or regulators on the level of their risk profile.

An insurance company often describes its risk profile within broad categories of risk such as insurance, market, credit, operational, strategic, and liquidity risk. Usually, an insurer will further define insurance risk into major sources of volatility such as mortality, morbidity, catastrophe, non-catastrophe underwriting and reserve risks. A life insurer may also include a major category of asset-liability risk to reflect the fact that the risks of many long term life insurance products are intertwined between the obligations to policyholders and the investments purchased to fund those obligations.

Risk profile and risk appetite assessments and related discussions form a major part of the ORSA process and can be a very helpful way for the Board to be kept aware of major changes in the business. These discussions should be undertaken whenever management proposes
mergers & acquisitions, entering or exiting lines of business (new products), territories (business units), or distribution networks or other major changes in its business model. The degree to which proposed new activities result in diversification or concentration of risk, and whether the resultant aggregate risk profile will fall within the risk appetite become a major part of ORSA discussions between management and the Board. A major consideration in all of those discussions will, of course, be the change in profits and risk adjusted profitability that is expected to result from management's planned actions.

Assessing the adequacy of the risk evaluation and risk treatment processes

Identification

Although insurance companies are exposed to similar types of risk overall (e.g. insurance, market, credit and operational risks), there is no such thing as a benchmark risk profile. Management is responsible for making sure that the company's ORSA process is capable of identifying the unique nature of the company's risk profile, the changes in the risk profile over time, the major drivers of these changes, and reporting this information in a timely fashion.

The Board will only be able to trust ORSA information reported as reliable and useful if the Board understands the linkage between the major individual characteristics of the company's risk profile and the management of risk including capital requirements. Periodic ORSA Board reporting by management, or more specifically, by the risk management function, enables the Board members to satisfy themselves that there is sufficient compatibility between management's business judgment and the ORSA findings.

Priorities

Through ORSA reporting, management will present and seek the Board's consideration of individual risks that have the potential of materially impacting business goals (either adversely or favorably), and the correlation or diversification effect among or between all risks. However, not all elements of the company's risk profile are equally demanding of the Board's attention. It is senior management's responsibility to provide the Board with a prioritized evaluation of all major risks on a periodic basis to enable the Board to effectively challenge and advise management on its evaluation and treatment of risk, including an assessment of the limitations of the evaluation itself (such as with models used).

Quantitative vs. qualitative evaluation and treatment of risks

Strong ORSA processes consider the nature of risks and the most effective means of evaluating and treating material and relevant risks within a company's risk appetite. Not all risks are either quantifiable or worth quantifying. As Einstein put it, "Not everything that can be counted counts – and not everything that counts can be counted." Risks having a material quantifiable impact on the balance sheet should be suitably modeled; using these models, the company's viability may best be protected by holding appropriate levels of capital. However, certain risks that could equally be material and quantifiable may still be treated better by using appropriate risk treatment techniques rather than capital. For example, liquidity risk could be material and quantifiable (such as through liquidity (reverse) stress tests) but may be better treated with a robust liquidity policy overseen with a good governance structure. Certain operational risks may be modeled and hence may contribute to a company's required capital, but it is perhaps more important to protect the firm through an operational risk management policy that applies to
management and all staff which contains carefully designed controls. It is important to note that the use of various risk treatment techniques such as reinsurance or hedging may in fact expose the company to other new risks such as credit risk and these too will need to be addressed in company's ORSA process.

Management needs to make sure that the company’s risk management system addresses the risks to which the company is exposed in proportion to the nature of these risks, and ORSA reporting will enable the Board to understand the evaluation and treatment of both quantifiable and non-quantifiable risks over time. In fact, an ORSA process most significant to the Board may not come from the ORSA information shared at a single point in time but through the comparison and analysis of results over time. Since the ORSA process will reflect both actual outcomes and management’s future expectations regarding the company’s risk profile in relation to the firm’s profits, risk and capital position over time, it is the changes to management’s expectations that may provide the Board with the most meaningful insight.

What-if analyses

Perhaps the best way to evaluate the impact of risks is the development of a set of carefully designed what-if analyses or stress and scenario tests. Such analyses should include both qualitative and quantitative considerations. The starting point for such analyses is a series of scenarios that express certain adverse future events that will affect solvency and management's potential responses to such events should they occur. These scenarios should be consistent with and proportionate to the nature, scale and complexity of the risks to which the company is currently or may be exposed. Dependencies / correlations should appropriately be incorporated in these evaluations.

As these analyses tend to serve as fundamental risk evaluation approaches within a company's ORSA process, Boards should be made aware of the appropriateness of the economic, strategic and operational scenarios tested. Boards will benefit by having a clear picture about how resistant and resilient the company is to such adverse scenarios. As a consequence the Board may become more informed about management's strategic decisions presented to them through understanding the company's ORSA position before and after a major change.

Capital and resource adequacy

Management routinely assesses the adequacy of available financial resources to fund strategic alternatives or unexpected outcomes, and presents these results to the Board through ORSA reporting. Often, capital adequacy will be evaluated from both an economic and a regulatory perspective, ensuring that the company is able to meet its obligations along the business planning horizon. At any point in time, the company's ORSA may reveal that an insurer has a positive or negative gap of available capital to that required by the company. This result may in turn support alternative capital management strategies proposed by the company.

ORSA should be undertaken regularly to understand how the company’s capital need itself changes in relation to the company's changing risk profile. Making sure that the company has adequate financial and operational resources to pursue the intended business strategy is one of the cornerstones of ORSA. The forward looking perspective of ORSA has to be understood to encompass strategic options that may be taken in the future.

Emerging risks

The Board should be made aware of those risks that may threaten the company in the future.
even though they may not be visible or material when standard evaluation techniques are used in the ORSA process. Special attention is needed to identify such risks using input from both the Board and the company. What-if analyses can be useful for assessing the potential impact of such emerging risks on the company.

Model validation and governance

ORSA processes may rely upon complex models, which in turn may introduce significant model risk. It is important to assure that models being used are subject to independent validation, and that there are appropriate controls around the inputs to the models (including assumptions and the quality of data), changes to the models, model outputs, and model execution.

Regular review of the ERM framework

It is in the Board's best interest that each and every major part of the ORSA process continues to be fit for purpose. Elements of the ORSA process may have been appropriate at a single point in the past but due to various changes they may no longer be fit for purpose. These elements include the identification and treatment of material and relevant risks, the risk evaluation processes and tools used by the company, and the alignment of ORSA processes with the company’s business planning process Regular assessment of the whole ORSA process, even if the result is that no change is necessary, should be part of the ORSA process itself. Periodic independent reviews of the entire ERM framework will benefit both the company and the Board.

Understanding management's strategic risk-based decisions

As discussed earlier with regard to a company’s risk profile, ORSA has the potential of shifting the Board’s discussion with management away from a strict focus on growth and profits. It can lead to a more holistic understanding of how management balances and ultimately plans to optimize the risks it takes on, the return that can be expected, and the capital required to support the business plan. Management that do this effectively take their company's ERM processes to a new level – away from simply identifying key risks and assuring that adequate risk mitigation controls are in place - to a strategic risk orientation. Such an orientation requires management to assess critically which risks it is willing to take on. It only considers risks within the company’s stated risk appetite. It then goes on to evaluate the potential return made possible by accepting the risk and the regulatory and rating agency capital that will be required, before accepting the risk. Strategic risk management therefore becomes an integral part of building shareholder value. To evaluate whether the company is moving in this direction, the Board should consider challenging management to demonstrate how each new major risk taken is consistent with the adopted risk strategy and the returns on capital expected from the venture.

Another aspect of strategic risk decision making involves a keen understanding of how risk can be diversified within the company. Generally speaking, taking on new risks that are loosely or even negatively correlated with a company’s current risks can lead to more effective management of the overall risk profile. However such diversification is not always easy to achieve for two reasons. First it is often difficult to understand and appreciate fully the correlation among various risks, particularly under stressed conditions. A full understanding requires not only studying the conceptual underpinnings of the various risks, but often requires data that can demonstrate the level of correlation involved. Second seemingly independent risks
can become much more correlated during extreme events as illustrated during the September 11th terrorist attacks and the 2008 economic crisis.

Moreover, the objective of diversifying risk must be carefully balanced with a cautious assessment of potential new ventures whose risks are not fully understood. New markets or product lines that potentially diversify the company’s risk profile may seem attractive. However, the company may suffer losses due to the company’s lack of experience and lack of business processes required to operate in these unknown areas.

The same type of approach and considerations apply to the overall strategic planning process itself. Before adopting a strategic plan, the Board should receive sufficient information to ensure that management has identified and quantified the risks inherent in various alternatives, and that sufficient risk mitigation plans have been developed to limit the risk associated with execution of the plan. Management should also explain to the Board the uncertainty in the quantification of risk, and the time to discovery of the actual experience, as this information itself may influence the decisions on how much risk to accept.

While the process of ORSA can be daunting and involve the assessment of many sources of risk, Board members will want to receive sufficient information from management to ensure that both management and the Board are focusing on critical decisions, such as those that address material risks in a manner that drives superior performance vis-à-vis peer competitors. For example, the Board or its risk committee may want to focus all of its attention on understanding management’s approach to addressing a handful of the company’s most material risks, after mapping and ranking risks in terms of severity and frequency. Also, attention should be focused on any material risks that are unique to the company. For example, a holding company with both insurance and non-insurance operations would be well advised to understand the reputational risks associated with the combined operations as well as the diversification benefits such a structure offers.

Limitations and caveats

Boards should be aware of risk associated with the ORSA process itself. The main risk related to an ORSA process emanates from incompleteness, or from overly complex assessments. Other important risks result from either over-reliance (trusting ORSA too much) or under-reliance (trusting ORSA too little).

While the first mentioned risk is permanently present, the other is often emerging over time.

- The risk of incompleteness of ORSA results from the fact that every predefined process can deal only with known unknowns. A complete ORSA would include the assessment of unknown unknowns which is by nature impossible to put in processes. Furthermore incompleteness often results from focusing on reporting past events instead of performing forward looking risk assessments.

- The risk of unnecessary complexity arises when a company devotes significant attention to too many categories of risk, thereby positioning itself to be too slow in making critical decisions.

- The risk of over-reliance on an ORSA process often arises in cases where the undertaking’s focus is more on process than on its content or results. If ORSA process runs effectively this does not imply that the risk taken by the undertaking is low.
The risk of under-reliance to an ORSA process arises in cases where the ORSA process is too far away from business decisions such that the results of an ORSA are not really used by the company, especially if decisions by the Board are made with no reference to the ORSA.

These major risks related to an ORSA process risks can be addressed by making sure that

- ORSA includes an idea of how the undertaking assesses the risks from unknown unknowns,
- ORSA results are routinely used for high level decisions of the undertaking; and
- The management culture of the undertaking encourages second opinions and critical views of everybody involved in the ORSA-process.
Appendix: Glossary of Terms

1. **Economic Capital**: The amount of capital a company requires to survive or to meet a business objective for a specified period of time and risk metric, given its risk profile.

2. **Risk**: The potential of future losses or shortfalls from expectations due to the deviation of actual from expected results.

3. **Risk Appetite**: The level of aggregate risk that a company chooses to take in pursuit of its objectives.

4. **Risk Profile**: The characteristics of the material and relevant risks to which a company is exposed over a specified period of time.

5. **Solvency**: The adequacy of available economic or regulatory capital to meet future obligations or regulatory requirements.
1. Executive Summary

The insurance community increasingly recognizes the importance of the actuarial function (AF) in mitigating risk within insurers and insurance groups through its provision of risk oversight. This has led to active dialogue among insurers, the actuarial profession, and supervisors concerning the scope and responsibilities of the AF and its relationship to various statutory roles (e.g., Appointed Actuary, Chief Actuary, Signing Actuary, and With Profits Actuary). The key messages from this dialogue are of interest to boards, senior management, financial analysts, actuaries, and supervisors. This dialogue has already led to enhanced risk management practices.

These key messages include:

1. Insurance supervisors are focusing on the oversight role of the AF as part of the second of the traditional “three lines of defence” in effective risk management.

2. Actuaries are not restricted to providing the oversight of risk (i.e., second line of defence), but are active in some or all of the three lines of defence within an insurer.

3. Independent risk oversight by the AF is important to boards, senior management, and supervisors because of the unique actuarial perspective of the insurer’s risks. Effective AF oversight can facilitate less intrusive supervision.

4. The AF is frequently expected to make material contributions to the risk management of the insurer.

5. The AF must be organized and operate within an insurer and insurance group in a clear, effective, and transparent manner. This benefits both internal management and interested external stakeholders, such as the insurance supervisor.

6. Insurance supervisors develop and maintain confidence in the work of the AF through a combination of:
   a. Validation of the important aspects of the work of the AF;
   b. Presence of strong professionalism as evidenced by codes of conduct, standards of practice, and a disciplinary process; and
   c. Presence of effective feedback loops between the supervisor, profession, standard-setters, and the disciplinary process.

Other related chapters in this IAA Risk Book include Governance of Models, Professional Standards, and Own Risk and Solvency Assessment (ORSA).

Within this chapter the word “insurer” is intended to include both reinsurers and insurers.
2. The Unique Role of the Actuary in Risk Oversight

Insurers require that they take on risk in a way that ensures both the payment of policyholder benefits and the provision of a reasonable return to shareholders. In so doing, insurance satisfies an important societal function in mitigating the financial consequences of adverse events. It also contributes to overall financial stability, timely payments to bondholders, and employment in the community. Due to their skills and education, actuaries have long played a unique role in managing risks and helping to ensure the long-term sustainability of insurers. As a result, jurisdictions have assigned various required roles to actuaries.

While actuaries work in many functional capacities within an insurer (e.g., marketing, product design, enterprise risk management (ERM), pricing, underwriting, investments, reserving/valuation, and financial reporting), their work typically entails both operational and oversight functions. The actuary’s work in providing oversight has been formally recognized through the standards of the International Association of Insurance Supervisors (IAIS) that identify the AF as one of four major insurer control functions.¹

The IAIS standards leave the definition of the AF to its members. As a result, as described later in this chapter, several jurisdictions have taken steps to define and assess the AF in their jurisdictions.

The recognition of the importance of the role of the AF in providing risk oversight within insurers has led to active dialogue among insurers, the actuarial profession, and supervisors concerning the scope and nature of the AF and its relationship to various statutory roles (e.g., Appointed Actuary, Chief Actuary, Signing Actuary, and With Profits Actuary). The key messages from this dialogue are of interest to boards, senior management, financial analysts, actuaries, and supervisors, and have led to enhanced risk management practices (e.g., consistent development and use of key assumptions in various processes such as pricing, valuation, and financial projections).

Regulatory recognition of the AF as a control function fits well with current risk management literature, which describes three lines of defence of risk management in the following categories:

1. Functions that own, manage, and report on risks (e.g., operational management);
2. Functions (and processes) that oversee risks (e.g., AF, risk management, compliance, risk committees, and sign-off requirements); and
3. Functions that provide independent assurance (e.g., internal and/or external audit).

Actuaries can actively contribute to each of these lines of defence.

With respect to the third line of defence, additional types of independent assurance external to the insurer can be provided by the external auditors and various specialized experts/consultants retained by the insurer (and sometimes by the supervisor) with regard to specific matters. Additional external actuarial oversight can be provided by actuaries employed for that purpose by the external auditor as well as by consulting actuaries retained to study specific matters.

¹ IAIS ICP 8.2.1: “As part of an effective system of risk management and internal controls, insurers have control functions, including for risk management, compliance, actuarial matters and internal audit.” Also, ICP 8.5 states: “The supervisor requires that there is an effective actuarial function capable of evaluating and providing advice to the insurer regarding, at a minimum, technical provisions, premium and pricing activities, and compliance with related statutory and regulatory requirements.”
3. **Scope of the AF**

Actuaries have been involved in the operations of insurers in many different roles since the beginning of the insurance industry. A partial list of these roles includes:

- Valuation of insurance obligations (technical provisions);
- Product design and marketing;
- Product pricing;
- Asset/liability management;
- Participating (with profits) product management;
- Risk mitigation (including reinsurance and hedging);
- Investment management; and
- Risk and capital management (including future financial condition reporting such as ORSA).

The involvement of actuaries in each of these roles has evolved over time and varies by practice area, jurisdiction, and company. For example, actuaries have been very involved in product design for life and annuity products, although in recent years some of these products have become similar to commodities subject to intense regulation, with marketing and sales units driving product design in many cases. While actuaries have had a negligible role with regard to some general insurance product management due to a perceived absence of the need for actuarial expertise in the management of such products, this may be changing as general insurance business has become much more technical in the last 20 years; as a result actuarial involvement has also increased substantially. As a further example, actuarial expertise is frequently involved in investment and asset/liability management within the life insurance and annuity businesses due to the presence of significant and long-term interest rate guarantees and investment-related benefits within these products. Since these types of guarantees and benefits tend not to be a feature of general insurance products, there is less need for actuarial involvement.

In fulfilling these roles, actuaries, due to their skills and experience, are frequently involved at all management levels within an insurer—including, for example, as a CEO, chief risk officer (CRO), CFO or chief actuary.

In carrying out their mandate of risk-based supervision, insurance supervisors have recognized the importance of the work of actuaries. This recognition includes, but may be broader than, the work of actuaries who carry out statutory defined roles (e.g., Chief Actuary, Appointed Actuary, Signing Actuary, and With Profits Actuary) as defined by various jurisdictions.

As a result, insurance supervisors are focusing on the oversight role of the AF as part of the second of the traditional three lines of defence. As footnoted previously concerning ICP 8.2.1, supervisors explicitly recognize the importance of the AF as an insurer control function.

Supervisors in their jurisdictions may provide additional direction regarding the AF and its assessment as part of the regime’s supervisory framework. Two examples are:

1. EU Article 48 of the Solvency II Framework Directive states:
Insurance and reinsurance undertakings shall provide for an effective actuarial function to:

a. coordinate the calculation of technical provisions;
b. ensure the appropriateness of the methodologies and underlying models used as well as the assumptions made in the calculation of technical provisions;
c. assess the sufficiency and quality of the data used in the calculation of technical provisions;
d. compare best estimates against experience;
e. inform the administrative, management or supervisory body of the reliability and adequacy of the calculation of technical provisions;
f. oversee the calculation of technical provisions ...;
g. express an opinion on the overall underwriting policy;
h. express an opinion on the adequacy of reinsurance arrangements; and
i. contribute to the effective implementation of the risk-management system ..., in particular with respect to the risk modelling underlying the calculation of the capital requirements ... and to the [ORSA] assessment ...

2. In Canada, the AF is one of the control functions assessed within the Office of the Superintendent of Financial Institutions’ (OSFI’s) risk-based supervisory framework. This assessment considers both the characteristics and the performance of the AF. While the scope of the AF is not defined by OSFI, insurers demonstrating a narrower scope of actuarial oversight would be determined to be less effective than other insurers with similar size, scope, and complexity of risks that demonstrate a broader scope of their AF.

These examples illustrate similar, yet different, supervisory approaches to the AF. Other jurisdictions have used various approaches to assessing the AF. Regardless of the specific supervisory expectations in a jurisdiction, the AF is always recognized for its important control and oversight role in insurers.

4. Setting Expectations for the Competencies of the AF

Given the variety of types of AF work (e.g., oversight and review of data quality, experience studies, risk management, actuarial calculations, models, and methods), it is not surprising that IAIS ICP 8 is not specific about the skills or experience that individuals within the AF should have, although ICP guidance 8.5.5 states “a robust actuarial function that is well positioned, resourced and properly authorised and staffed is essential for the proper operation of the insurer”.

In the EU, Article 48 of the Solvency II Framework Directive also states:

The actuarial function shall be carried out by persons who have knowledge of actuarial and financial mathematics, commensurate with the nature, scale and complexity of the risks inherent in the business of the insurance or reinsurance undertaking, and who are able to demonstrate their relevant experience with applicable professional and other standards.
Although members of European actuarial associations are well qualified to carry out the AF for EU supervised insurers, Article 48 does not rule out the possibility that others may also perform these functions. At the present time, the Actuarial Association of Europe is drafting a model European actuarial standard of practice to provide guidance to actuaries when issuing an Actuarial Function Report (AFR) in connection with Article 48.

Similar to the EU, Canada does not indicate specific credentials for individuals conducting the AF. Nonetheless, OSFI’s expectation is that members of the Canadian Institute of Actuaries would carry out the AF for insurers under its supervision. In the United States, actuaries who perform certain functions—e.g., asset adequacy testing or reserve adequacy attestations—must meet certain educational and experience requirements.

In summary, while the standards of the IAIS are not specific about the skills or experience that individuals within the AF should have, jurisdictions have either specified them explicitly or have specified that credentialed actuaries are expected to carry out the AF (however defined by local authorities) in their jurisdiction. In addition, at least one actuarial association is drafting a model standard of practice for actuaries issuing an AFR in compliance with local legislation.

5. Structural Considerations of the AF

Insurers generally organize their AF based on the nature, size, and complexity of their operations. They may be centralized or decentralized and may or may not separate the actuarial and risk functions. Regardless of the manner in which insurers organize themselves, it should always be possible to identify the manner in which actuarial oversight is exercised locally (i.e., in a decentralized model) and then brought together across the insurer or insurance group.

There is no single title used across insurers or within jurisdictions that uniquely identifies the Actuarial Function Head (AFH). Identifying the head of actuarial oversight should be able to be made from an understanding of the AF role rather than through the use of titles such as “Chief Actuary”, “Corporate Actuary”, “Senior Actuary” and “Appointed Actuary”, which may be assigned with different roles/mandates in mind from one insurer to the next. Insurers organize themselves as they see fit. As previously noted, even the supervisory expectations of the AF can differ across jurisdictions. To avoid “titling confusion” within this chapter, the terms AF and AFH are used generally in the context of actuarial oversight, without connection to any specific titling conventions used in the insurance industry.

For larger insurers (in terms of size and complexity), and especially for insurance groups, the manner in which actuarial oversight is provided depends on the needs of underlying businesses as well as organizational preferences toward centralized/decentralized structures. In highly decentralized structures, significant actuarial oversight responsibilities will be assigned to staff local to those business units or insurers. Regardless, the home supervisor for the insurer or the group-wide supervisor, as applicable, seeks to assess the effectiveness of the oversight provided by the AF across the insurer or insurance group. In the EU, for example, an individual must be designated as the main contact for the AF. In Canada, the effectiveness of actuarial oversight for an insurer or insurance group without a clear AFH would be rated as being less effective than a comparable entity with an effective AFH.

It is important that the AF make a strong contribution to the risk management of an insurer. As a result, some insurers may choose to align closely the work of the AF and the work of the CRO.
some cases it may make sense for the AF to report to the CRO or even to combine these roles into one position. Due to the seniority of the CRO role defined in this manner, reporting to the CEO, it would be in a position to present a very capable challenge to the first line of defence.

On the other hand, boards and supervisors of larger insurers and insurance groups may prefer to have both an AFH with sufficient gravitas to provide an actuarial view of the insurer’s risks as well as an organizationally separate CRO. According to this view, the CRO would be responsible for risk management for the insurer while the AFH is responsible for actuarial oversight; together they represent an effective team that can challenge each other’s ideas and perspectives. This approach can work well if both the CRO and AFH hold senior roles within the insurer (e.g., each reporting to the CEO). The synergy between the AFH and CRO may be less effective if the AFH and CRO do not have similar seniority in the organization.

In many insurers the actuary responsible for the technical provisions (i.e., perhaps a statutory role in some jurisdictions with a title such as Appointed Actuary or Valuation Actuary) is the most suitable candidate to be the AFH. In the event that this statutory role (e.g., Appointed Actuary) is positioned lower down in the organization structure, such an individual may not have sufficient breadth of perspective to enhance the work of the CRO or sufficient seniority to provide an effective challenge to the CRO. In these cases, another person, higher in the organization and to whom the statutory role reports, may be better positioned to provide effective actuarial oversight as the AFH (e.g., as noted previously this may be the CRO).

In contrast, it may not be economically viable for smaller insurers to maintain staff dedicated solely to the AF or to fully segregate the CRO and AFH duties. Indeed, staff performing the AF role may also have operational responsibilities (although preferably not when this would constitute a conflict of interest). A smaller insurer may be more likely to retain an external consulting actuary to carry out specific duties such as to value or provide an independent assessment of the insurer’s policy liabilities (i.e., technical provisions). The precise nature of external actuaries’ work and their relationship with the insurer will determine if they, or a staff member of the insurer, are the key providers of actuarial oversight to the insurer. Regardless of who provides it, the oversight and control provided by the AF are essential for the prudent operation of each insurer.

In conclusion, although the AF within an insurer frequently includes actuaries who carry out specified statutory roles (e.g., Appointed Actuary or Signing Actuary), identifying both the scope and responsibilities of the AF and its head or lead person may not be straightforward or obvious solely through examination of the insurer’s structure or titling conventions. While it is important for insurers to structure their operations—including their AF’s control function—according to their needs and staff, it is also important that the manner in which the AF is organized and operates within an insurer be clear, transparent, and effective for both internal, as well as interested external, stakeholders such as the insurance supervisor.

6. Reliance on the Competency of the AF

The supervisor benefits from the work of the AF (and indeed other insurer control functions) when the AF operates effectively as part of an insurer’s second line of defence. The insurance supervisor must validate important aspects of the AF’s work to enable the supervisor overseeing the company or group to have sufficient confidence in the work product of the AF. AF effectiveness, including

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
the AF’s material contributions to risk management, contributes to streamlining and minimizing the overall supervisory burden on the insurer.

It is important to note that under normal circumstances the validation of the AF’s work by the supervisor does not need to duplicate the work of the AF (e.g., model/methodology selection, data validation, recalculation, and assumption setting), nor is it to be performed solely through the application of a checklist. Rather the supervisor seeks sufficient understanding of the AF’s work (e.g., key risks, assumptions, and methods) and processes to have confidence that they have been completed in an appropriate and transparent manner in consideration of the risks involved. This in fact is one of the key purposes of this Risk Book—that is, to enable a supervisor to better understand the key issues faced by actuaries, both technical and professional, and to identify newly emerging issues.

Validation of the AF effectiveness by the supervisor seeks to confirm the reasonableness of the estimates and judgements applied by the AF. To effectively carry out this assessment, the supervisor must have both a formal and informal relationship with the AF and have access to suitable actuarial resources of its own, either internal to or externally contracted by the supervisor.

7. **Provision of Effective Actuarial Oversight**

As noted earlier, the AF as a control function fits well with current risk management literature that describes the second line of defence as a function that oversees risks (i.e., distinct from functions that own and manage risks—operational management). In addition, ICP 8.1.19 states:

*Subject to the nature, scale and complexity of the insurer, an effective internal controls system typically includes [among other things] ...*

*Appropriate segregation of duties where necessary and controls to ensure such segregation is observed. Appropriate segregation of duties means, among other things, having sufficient distance between those accountable for a process or policy and those who check if for such process or policy an appropriate control exists and is being applied. It also includes appropriate distance between those who design a control or operate a control and those who check if such control is effective in design and operation.*

The elements of an effective internal controls system, such as the AF (i.e., part of second line of defence; segregation of duties), are described collectively in this chapter by the term “independence”. The wider dictionary implications of the term “independence” (i.e., part of a stand-alone entity) are not intended to apply.

For larger, more complex financial institutions, fully independent oversight functions (e.g., risk management, internal audit, actuarial, and compliance) may be appropriate. These functions can be centralized or decentralized with a centralized oversight component. For all institutions it may be more appropriate for a focus that optimizes functional independence over a focus on the structure used. Whatever the size of the organization, the following questions need to be addressed:

1. Do the control function employees have clear performance objectives/incentives that link to the management of risk rather than only to targets related to profit, revenues, and volume?

2. Is their incentive compensation calculated independently of the results of the business unit they oversee?

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
The judicious and thoughtful review of risk management information (e.g., ORSA) by the supervisor will assist by means of structured feedback in the assessment, benchmarking, and reporting of the quality of the insurer’s AF. Boards and managements should also do more than rely on “gut and instinct” when assessing the effectiveness of the insurer’s risk management function. Nonetheless, gut and instinct are useful, as they are reflective of the degree of experience and judgement of those performing such assessment. It is preferable, however, to, in addition, quantify these beliefs and hold periodic third-party reviews of the insurer’s oversight functions. This can help boards and management (not to mention the supervisor) to benchmark the insurer’s risk management practices and processes, as well as to address any gaps that exist. One source for such reviews may be through the insurer’s external auditors, especially their actuarial team. Another source may be consulting firms active in this area.

The AF should be clearly identifiable, with disclosure of any firms or individuals who provide independent actuarial oversight. Given the importance of the work of actuaries to insurers, the risk oversight by the AF should be as independent of management as practical. As mentioned above, the organization of the AF may vary substantially from insurer to insurer, based on their circumstances. The AF need not be an individual in a statutory or designated actuarial role, although this is frequently the case. It is important that individuals providing independent oversight should not be conflicted by wearing a similar operational role. For example, it is difficult to independently design the set of oversight and control procedures for a hedging program if the individual responsible for this oversight is also responsible for the hedging program’s design and operation.

Because actuaries already have experience and skills in and often play a key role in risk management, many are also well suited to provide independent oversight of this area, in a manner similar to what actuaries have developed and applied in other areas. The AF is frequently expected to make material contributions to the risk management of the insurer. For example, this might include contributions to the risk and capital modelling of the insurer as well as in relation to stress and scenario testing undertaken for future financial condition analysis, such as for an ORSA or other board-related needs.

Independent oversight by the AF is important to boards, senior management, and the supervisor, as it provides additional comfort that the insurer’s controls are effective. This in turn can lead to enhanced assessment by the supervisor of an insurer’s net risk (i.e., the combined risks of the insurer net of the expected effects of applicable risk mitigation) and an appropriate adjustment of the nature and intensity of the supervisory work concerning the insurer or group. If the supervisor is comfortable that the insurer or group’s own oversight and risk limit functions are robust and transparent, supervisory oversight can be less intrusive. The opposite would be the case if internal oversight functions are inadequate.

Stuart Wason, FSA, FCIA, MAAA, Hon FIA, CERA, is senior director, Office of the Superintendent of Financial Institutions (OSFI). He is located in Toronto, Canada. His principal areas of expertise include life insurance and enterprise risk management. He can be contacted at stuart.wason@osfi-bsif.gc.ca.

IAA Risk Book
Chapter 3 - Professional Standards
Godfrey Perrott

1. Executive Summary

Codes of professional conduct (codes) and professional standards of qualification and practice (standards) provide the context in which sound actuarial practice addresses the needs of those who rely on the profession. The codes of actuarial organizations provide the framework within which standards and ethical behaviour of their members may be addressed. Codes are binding on member actuaries of most actuarial associations wherever they practice, as the scope of such codes and their application is generally international in nature.

2. Key Messages

1. Actuarial standards serve to assure the public that actuaries are professionally accountable. This gives the users of actuarial work confidence that the work has been performed appropriately. At the same time, standards provide practicing actuaries with a basis for assuring their work will conform to appropriate practice.

2. Actuarial standards (including those applicable to the assessment of risk and solvency of insurance companies and pension plans) can be of significant value to regulators.

3. Full Member associations (FMAs) of the International Actuarial Association (IAA) must have codes that contain a common core of general principles. One such principle is that their members comply with applicable actuarial standards.

4. Actuarial standards and regulations complement each other. Actuarial standards guide actuarial work. They are usually principle-based, rather than prescriptive, and permit departures from the standard’s guidance if they can be justified. Regulations, on the other hand, are usually prescriptive and mandatory.

5. Actuarial standards are adopted to apply to actuaries practicing in a particular jurisdiction by whatever authority(ies) in that jurisdiction is (are) entitled to enact standards.

6. The scope of actuarial standards includes the process of setting assumptions, selecting methodologies, and disclosing the purpose for which the calculations were made, who set the assumptions, the actuary’s opinion on their suitability, and the uncertainty associated with the actuary’s estimates.

3. Background

Qualification standards are the requirements that actuaries need to satisfy to be considered by the profession to be qualified to perform the work in question (and in some jurisdictions to describe themselves as an actuary). These usually include initial educational requirements required to obtain sufficient knowledge to practice (broadly or in a particular practice area), continuing professional development (CPD) requirements, and experience requirements. In some jurisdictions qualification

This paper has been produced and approved by the Insurance Regulation Committee of the IAA on 23 July 2015.
© 2015 International Actuarial Association / Association Actuarielle Internationale
standards may have additional requirements for specific actuarial services such as practicing certificates or heightened CPD requirements.

Actuarial standards of practice address how actuarial work should be performed, and usually apply to the individual actuaries doing the work (in contrast to accounting standards, for example, which apply to the entity that is reporting its financial results). These standards usually apply to specific types of actuarial work, although some apply to all actuarial work.

Both types of standards are generally promulgated by a local standard-setter (often, but not always, the local actuarial association). The applicable regulator in a jurisdiction can require such standards to be followed in that jurisdiction.

This requirement (to comply with codes and standards) is supported in each FMA by a discipline process that can admonish, reprimand, suspend, or even expel a member found (after appropriate due process) to have materially violated applicable codes or standards.

The IAA Professionalism Committee addresses these topics in its paper “The Principles of Professionalism”.¹ It includes a comprehensive overview of:

1. The accountability of individual actuaries to their actuarial association (or other professional oversight body);
2. The educational requirements to become a qualified actuary and the continuing education requirements to maintain that qualification (qualification standards); and
3. Codes of conduct (which also refer to standards of qualification, practice, and disciplinary processes).

Material addressing professionalism aspects of cross-border actuarial services can be found in the IAA paper “Principles in Relation to the Governance of International Actuarial Work”.²

4. **Benefits of Actuarial Standards**

A summary of the role and benefits of well-developed and well-managed standards of practice has been described by one standard-setter as follows³:

1. Standards of practice serve to assure the public that actuaries are professionally accountable. At the same time, standards provide practicing actuaries with a basis for assuring that their work will conform to appropriate practices. Standards protect the public by:
   a. Indicating for various areas of actuarial practice the appropriate procedures, techniques, and approaches, thereby enhancing the public’s trust in the credibility and completeness of the actuarial work product.
   b. Providing a means by which the many separate elements that make up actuarial practice can be reviewed and updated on a regular basis, so that practice remains current.

---

c. Furnishing criteria for evaluating actuarial work products.
d. Providing a basis for discipline in those instances in which standards are not adhered to.

2. For individual actuaries, standards confer major benefits as well, by:
   a. Providing guidance, particularly in practice areas that may be somewhat unfamiliar.
   b. Giving strong evidence to any interested observer that the profession serves the public in an effective and responsible way.
   c. Offering evidence of appropriate professional performance, which constitutes a defense in any civil or professional disciplinary action.

3. Standards of practice also serve to further assure regulatory authorities that they can depend on the actuarial profession to act effectively in the public interest. Written standards of practice, coupled with written provisions for disciplining members, show that a profession governs itself and takes an active interest in protecting the public.

The existence of effective standards enables a profession to describe appropriate practice, thereby narrowing the range of acceptable practice and discouraging poor practice. This is achieved both by establishing expectations of professional practice and behaviour and through the threat of professional sanctions. This gives the users of actuarial work confidence that the work has been performed appropriately.

Standard-setters promulgate practice standards to codify appropriate practice. They do not attempt to codify generally accepted practice, as such practice may become outdated or no longer be appropriate. Occasionally a standard may be promulgated for a new area of practice or to comply with new regulation, where no accepted practice has been established.

Actuarial standards also provide support for actuaries doing appropriate work who are challenged by their principal with respect to their work.

5. Standard-Setters and Regulators

Many standard-setters maintain a feedback loop with relevant local regulators (among other feedback loops). Periodic meetings allow regulators to bring issues or concerns that they have observed in their review of practice to the standard-setters. Periodic review of existing standards by practitioners also provides a feedback loop for working actuaries to comment on how the standards may be improved if modified, supplemented, amended, or repealed.

Standards of practice and regulations complement each other. Standards of practice guide actuarial work. They are usually principle-based, rather than prescriptive. In some jurisdictions standards use the verb “must”, meaning their guidance has to be followed in all circumstances. Much more often standards do not use the verb “must”. Instead, they state what the actuary “should” consider, do, and disclose when performing a particular type of assignment. This accommodates unforeseen situations, not contemplated in the standards, in which application of the standard would produce an inappropriate result. In such situations, it would be unprofessional to apply the standard. However, any such departure from the guidance of a standard should be identified and explained.

Regulations, on the other hand, are usually prescriptive and mandatory. In the event of a conflict between standards and applicable law (including regulations), the law would govern.

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
6. IAA Model Standards

There are currently two categories of standards—model standards, and local standards applicable to the jurisdiction where the actuarial services are rendered. The IAA promulgates model standards that are not binding but can be used in several ways:

1. An individual actuary may state compliance with one or more International Standards of Actuarial Practice (ISAPs) in his/her report (either of the actuary’s volition, or because the client requires it), in which case the actuary is bound by those ISAPs.

2. A local standard-setter may create a new local standard by adopting an ISAP making only the changes specified in the drafting instructions within the ISAP.

3. A local standard-setter may base a new local standard on an ISAP by making more extensive changes.

4. A local standard-setter may revise its existing standards to be substantially consistent with an ISAP.

5. A local standard-setter may conclude that one or more of its existing standards are substantially consistent with an ISAP.

The development of ISAPs as models is a contribution that the IAA is uniquely positioned to make to stakeholders in the financial services sector worldwide. The strategic objectives of the IAA include objectives to “[e]stablish, maintain and promote common standards of actuarial education and common principles of professional conduct. Promote the development and issuance of actuarial standards in the jurisdictions of all Full Member Associations, and the global convergence of actuarial standards.” The status of the development of ISAPs at this time can be found at www.actuaries.org/index.cfm?lang=EN&DSP=PUBLICATIONS&ACT=STANDARDS_ISAP.

Local actuarial standards are promulgated by a local standard-setter, which is often, but not always, an actuarial organization. Examples where this is not the case are the standard-setters in Canada and the United Kingdom (for technical standards), which are independent of the local actuarial organization(s). Local standards under most codes are binding on any credentialed actuary performing actuarial services in the standard-setter’s jurisdiction. They may or may not be derived from ISAPs. (Many developed countries, such as the United States, have standards that predate the ISAPs.)

7. Content of Standards

Actuarial standards cover actuarial work such as the process of setting assumptions, selecting methodologies, and making disclosures. These disclosures include the purpose for which the calculations were made, who set the assumptions, the actuary’s opinion on their suitability, and the uncertainty associated with the actuary’s estimates.

Although historically most actuarial standards of practice focused on the calculations actuaries make or the principles to be followed in making those calculations, they are increasingly focused on processes used by actuaries. Some examples of this process orientation are standards relating to enterprise risk management (ERM) in the United States, and parts of the European Standard of Actuarial Practice 2 Actuarial Function Report under Solvency II (a working draft as of June 2015)

---

4 Even if a local standard-setter does not follow any of these actions, it may still benefit from the IAA model standard in the development and maintenance of its own standards.
in Europe. The US ERM standards in particular address the appropriate processes and considerations needed to evaluate an ERM approach, rather than to produce a number. This is consistent with the recent focus of banking, insurance, and pension regulators on governance structures and processes.

Actuarial standards that are binding on actuaries within the applicable jurisdiction are different from educational or research material that may be published by an actuarial organization. Such material is educational in nature; an actuary may use it or not, as the actuary deems appropriate. This fact is often stated prominently. Examples of this type of material include International Actuarial Notes (IANs) published by the IAA, monographs, and research papers.

8. Enforcement of Standards

As stated in the beginning of this chapter, codes and standards are part of the professional context to ensure that sound actuarial practice addresses the needs of the public at large. This context also needs to include a formal discipline process to ensure that conduct follows the principles laid out in codes and complies with standards. The IAA has therefore established a set of criteria that a discipline process must satisfy as one of the accreditation requirements for FMAs. These criteria are:

1. A complaint process is accessible to anyone affected by an actuary’s work and the actuary’s professional peers.
2. Due process of defense is available to the actuary complained against, so that the actuary’s rights are fully respected.
3. There is an objective formal appeal process independent of the body that has ruled at the prior level.
4. There are available sanctions appropriate to the seriousness of the violations committed, including termination of membership in the association.
5. Appropriate notice and information are given to the public of the results of the complaint process where any penalty is imposed.

The IAA paper “Professionalism Committee Paper on Considerations in the Design of a Discipline Process” provides information on the items to be addressed when instituting a formal discipline process.

One way the regulator can verify that standards have been followed is to require a review of an actuary’s work by another qualified actuary. This should be an actuary who is qualified to provide the type of work that he or she is reviewing. This normally is an actuary who has not been involved in the work in question. It can be an independent actuary who does not work for the company or group.

---

9. Conclusion

Actuarial standards of practice benefit regulators, users of actuarial work, and practicing actuaries as each group carries out their different roles. Actuarial standards support the production of a professional, appropriate work product on which regulators and users may rely with confidence.

IAA Risk Book
Chapter 9—Distribution Risks
Sam Gutterman

1. Executive Summary

Each insurer uses one or more distribution channels to sell its products—insurance policies. These channels and their relationships with customers and potential customers represent a significant intangible asset of the insurer. Nevertheless, risks associated with the distribution process, including inappropriate marketing practices, create conduct of business risks. From a prudential perspective, these practices can pose a material risk to an insurer’s sustainability, brand value, and income-generating potential. The objective of this chapter is to describe and assess the major sources of these risks to which insurers may be exposed and the processes used to address them.

The key messages of this chapter include:

1. Although financial sustainability of an insurer is not often threatened by risks associated with its distribution system and marketing practices, these risks can lead to significant financial and reputational harm from lack of new business or poor quality of business, which can in turn adversely affect its income, brand value, and value as a going concern.

2. Distribution risks can result in risks to a distribution channel, to the insurer’s business, and ultimately to its financial sustainability.

3. Some types of distribution risks are similar to operational risks, which are unpredictable in nature, but can represent significant reputation and financial risks to the insurer.

4. Perceived concerns regarding sustainability or brand impairment of an insurer can result in a rapid deterioration of the size and effectiveness of the insurer’s distribution system.

5. Insurance market conduct supervisors are charged with ensuring that sales and service of insurance policies are made in a manner that delivers acceptable value to the consumer. Their policies and actions can include a range of consumer protection requirements such as suitability standards and disclosure requirements. In some countries, it is common for actuaries to sign off on the accuracy of illustrations of new sales/in-force insurance policies that clearly explain the mechanics of complex or long-term products and provide advice on the suitability of sales to customers.

6. Because of the importance of this risk, actuaries are involved in estimating the quality of sales, assessing policy performance in pricing insurance products, and helping to identify and measure distribution and conduct of business risks as part of the assessment of overall enterprise risk management (ERM) for the effective management of these risks.

2. Introduction

Although sales are important in every industry, due to the complex nature of many insurance products and that in many cases they are sold rather than bought, they are especially full of opportunities and risks. Distribution risks are ultimately the responsibility of the insurer.

Effective new sales to and continuation of coverage of an insurer’s customers are vital in enhancing the value of both insurers and their distribution channels, enabling them to operate soundly as effective and sustainable going concerns. Their customers may include individuals and commercial companies. Insurers conduct sales through one or more distribution channels (methods or processes of distributing an insurer’s products), either (1) by agents that represent a single or multiple insurers or (2) through other means, such as a website, mobile phone, or mail. Individuals involved in the selling process are often compensated through commissions and/or incentive rewards, often a percentage of the premiums paid or assets under management, or pre-set salary, possibly supplemented by bonuses or other incentives.

Agents that sell longer-duration insurance policies, some of which are complex and involve savings accumulation, are often paid more during the first policy year to reward successful new sales to customers or new policies to existing policyholders. There are also shorter-duration insurance policies, such as policies that provide group and short-term life insurance, motor, property, and other casualty insurance. Insurance can also be sold directly through partners (e.g., banks, micro-insurance institutions, and postal services) or other means (e.g., websites, phones, mail, or advertising).

There are many marketing methods used by insurers, nuances of which vary by market, coverage, country, technology available, and historical development of the insurer. In addition, an insurer can utilize multiple or hybrid forms of distribution methods. The appendix to this chapter provides a description of some of the most significant methods used in many countries.

---

1 This chapter uses the term “agent” in a broad sense, including agents, brokers, and employees. In its Insurance Core Principle (ICP) 18, the International Association of Insurance Supervisors (IAIS) identifies this category as “intermediaries”. They might also be distribution partners or sponsors that are responsible for or are involved in the distribution process, but whose primary business is not insurance and may not be licensed as an agent. They may be individuals or entities.

Differences between these types of agents can arise because an agent may be viewed legally as representing only one of the parties, typically the insurer, while a broker may be viewed legally as more independent, possibly having some level of fiduciary responsibility to the potential customer. ICP 18.0.9 indicates that (1) “where the intermediary acts primarily on behalf of the insurer, the intermediary sells products for and on behalf of one or more insurers, they are often referred to as ‘agent’ or ‘producer’. Intermediaries may act for a single insurer (sometimes referred to as ‘tied’) or represent several. The products they can offer may be restricted by agency agreements with the insurer(s) concerned. (2) Where the intermediary acts primarily on behalf of the customer, the intermediary of the insurer(s) whose products he sells. Often referred to as a ‘broker’, or ‘independent financial adviser’, they are able to select products from those available across the market.” As a result, many jurisdictions differentiate between the requirements of intermediates defined in the supervisory framework as agents and those of brokers.

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
There are three primary forms of “distribution risk”:

1. Risks to the distribution channel itself. The quality and sustainability of a distribution channel are subject to a range of risks, which in turn can affect the earnings and sustainability of relevant insurers.

2. Risks to the quality or volume of the insurer’s insurance policies caused by actions of the distribution channel.

3. Risks to the insurer as a company and to its future sales capacity caused by the actions of the distribution channel. These can include decreased volume and quality of business, misselling (i.e., selling an insurance policy inappropriate for the policyholder’s situation), and moving books of business in a way that may be inconsistent with the policyholders’ interests.

Insurance supervisors are also concerned with the effect an insurer and the distribution of its products has on the citizens of their jurisdiction. Distribution risks (such as inappropriate agent behaviour) and marketing risks (such as inaccurate marketing materials) are referred to together in this chapter as “distribution risks”. The distribution channel provides the connection between the insurer and its customers, with its attendant risks of unacceptable sales and marketing practice, especially with respect to those who are not financially or insurance savvy. Insurance supervisors are usually charged with oversight of appropriate product design and rates, including ensuring that insurance policies satisfy the needs intended and treat the insurers’ customers fairly. This is in addition to ensuring the sustainability of the insurance system and the insurers that make up that system. The complex nature and perceived lack of transparency of many insurance products, as well as the relative lack of knowledge regarding insurance risks and policy features, have resulted in the need for consumer protection, especially relating to sales of insurance to individuals. These consumer concerns have led, among other requirements, to the licensing of insurance agents, insurance rate regulation, and in some cases regulatory review of insurance products prior to their sale.

In some insurers, the marketing process is viewed as encompassing all elements of the development, maintenance, and management of new business and continuation of existing business of an insurer, from designing and rating its insurance products; growing, managing, and providing incentives for the insurer’s distribution channel(s); and communicating with and educating its agents and its customers, as applicable. In contrast, in other insurers the marketing function is distinct from the sales function, which has a separate organizational structure devoted to overseeing operations relating to the insurer’s distribution channels. In either case, marketing is involved with, if not responsible for, the development and management of its brand through such approaches as partnering, advertising, sales promotion, and sponsorships.

Some risks are joint risks between the insurer and its distribution channels, especially in the case of agents who are tied to a single insurer, whether as independents or as employees. For example, adverse events or publicity can affect both the insurer and the distribution channel, either directly as a result of data risks (such as cyber-risks or customer file hacking, or inadvertent incorrectly recorded transactions, not uncommon when the Internet or phone is

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
involved) or in the extreme through criminal activity (such as fraud). If trust in the industry is adversely affected, both the insurer and the insurance distribution channel are negatively affected as well.

Although the emphasis of this chapter is focused on the risks associated with an insurer’s distribution channel(s), it is important to note that the benefits of an effective distribution channel are quite significant to the success of the insurer. These risks can be assessed on a qualitative as well as a quantitative manner. Not only does the distribution channel(s) constitute the source of ongoing business and in some cases base from which policyholder services are provided, it can also serve as an effective mitigation tool against other business risks, including field underwriting, communicating the value of the insurer’s brand, a positive relationship between the insurer and its customers, and positive influences with respect to market conduct.

3. Risks to the Distribution Channel

Given that effective and efficient distribution channels are of crucial importance to the generation of the future business of an insurer (including in some cases the continued profitability of existing business), risks to one of the insurer’s distribution channels can in turn represent a substantial source of risk to the insurer.

Examples of such risks include a deterioration of agent continuity resulting from an aging sales force (for instance, in some developed countries a concentration of post-World War II baby boomers who are currently retiring); skilled salespeople who may not be skilled at being managers of field relationships and operations but have been placed or are chosen to serve as such managers; a poor reputation of its agents due to past inappropriate or fraudulent sales practices; new sources of competition to agents including mobile/Internet-based sales; more intense competition in the same type of distribution channel; poor sales management as evidenced by uncompetitive pricing, compensation, or support services; overconcentration of sales in a single agent or customer; managing general agents that are more focused on generating high sales volume than on generating quality or profitable (to the insurer) sales; and more modern technology that diminishes the relative effectiveness or efficiency of the current distribution channel.

Reputation risk to the insurer can, of course, arise from many sources in addition to the insurer’s agents. For example, it can also arise from adverse publicity generated by agents of other insurers (the industry), bad claim practices, intense competition, government actions, or bad media relations.

Especially if the agent is tied to a single insurer, a negative reputation event will also likely lead to adverse publicity to the agent. A related example is that if an insurer’s client data file is hacked, not only will there be a loss of customer privacy and possible adverse consequences to the policyholder, but the agent’s relation with the policyholder may also be negatively affected.
4. Risks to the Quality or Volume of the Insurer’s Policies Caused by the Distribution Channel

The distribution channel(s) and target market(s) of the insurer can significantly influence the type of insureds an insurer will provide insurance to, which consequentially results in different levels of expected insurance cost. Field underwriting\(^2\) may influence the nature and type of exposures to risk that the insurer will be subject to. Examples of concerns include quality of insurance risks covered in relation to what is anticipated in the insurer’s pricing assumptions and policyholder behaviour (e.g., applications not placed, policyholder terminations prior to the policy’s expiry) and move business away from the insurer.

1. Risk selection. Often, but not always, agents directly or indirectly participate in the risk selection process through identification of customers and field underwriting, which may result in experience inconsistent with pricing assumptions due to potential anti-selection, policyholder moral hazard, or even fraud by applicants. Agents can be more focused on maximizing their personal revenue than maximizing profitable sales—particularly a concern with managing general agents who have been given significant autonomy with respect to the field underwriting and management of their individual agents. If an independent agent splits its business between more than one insurer, the business directed to a particular insurer might be of worse quality, representing adverse risk selection against that insurer. In addition, if an agent gathers incorrect or incomplete information regarding the quality of the risk, the insurer may as a result make incorrect underwriting decisions.

2. Policyholder behaviour. Although often thought of solely in relation to premature voluntary policy terminations and nonpayment of premiums relative to pricing expectations, policyholder behaviour also can result in moral hazard with respect to the expected amount of claims or in fraud. Agents can also influence inappropriate exercise of policy options—for instance, the exchange of one policy for another, especially one of another insurer, is often referred to as replacement. Such a replacement may not be in the best financial interest of the policyholder, as it might be the result of an agent more incented by large front-end commissions on long-term insurance policies or by a bonus for block-transfers of a book of short-duration insurance policies such as automobile or personal property insurance, than by the best interest of the policyholder. In fact, a replacement can indicate a situation in which a conflict of interest\(^3\) or mis-selling may be present. In some cases it may not be evident who “owns” the insurance policyholder relationship—

\(^2\) Selection of potential insured risks by agents in the field, either judgmentally or in accordance with rules set by the insurer, often confirmed by an insurer’s underwriter.

\(^3\) A conflict of interest can arise where compensation is paid by the insurer for a sale of an insurance policy by an agent. Such compensation may incent an agent to steer a sale toward a product that provides a larger amount of compensation. It may especially arise where it is not clear whether the agent is working primarily on behalf of the insurer or the insured. This has led in some jurisdictions to a greater use of fees payable by the customer for the service of the agent or of required disclosures of the amount of compensation provided.
this may result in alternative service responsibilities and movement of insureds between companies. In summary, agents can influence policy lapse or non-continuation behaviour counter to the best interest of the policyholders, which at the same time can impair the recovery of acquisition expenses or increase anti-selection against the insurer.

3. Policyholder interfaces. A lack of effective and convenient customer interface, whether via technology (website, mobile phone, or toll-free call-in number) can cause significant brand (and even industry) damage for an insurer and its distribution channels.

Actuaries regularly monitor policy experience and develop expectations regarding policy performance and policyholder behaviour, indicated by such experience as high policy lapse and low policy continuation; agent retention; and claim approval rates, changes in sales volume, and expense margins, which are incorporated in premium rates and valuation assumptions. Whether through internally tracked or external customer complaint sources (e.g., sponsored by regulators, independent firm or social network), complaint resolution metrics (by type, resolution percent, and timeliness) can provide useful feedback information to the insurer and supervisor. These are suggestive of distribution issues needing immediate insurer attention. As deviations from these expectations emerge, the insurer assesses whether its expectations need to be revised or corrective action is needed with respect to the insurer’s distribution channel or underwriting.

5. Risks to the Insurer Caused by Distribution Channel Activities

The characteristics and quality of a distribution channel, or the effects of management decisions relating to a distribution channel, can also expose the insurer to direct damage in several ways.

Risks resulting from the operation of a distribution channel can include:

1. Concentration risk—that is, overreliance on a single distribution channel, a few agents, or a few insureds. In the extreme, this can be the result of over-dependence on the insurer on a single agent or relationship that could (1) adversely influence corporate policy, pricing levels or underwriting decisions; (2) adversely affect profitability; or (3) terminate a significant amount of business from the insurer if corporate decisions don’t go its way. Alternatively, if, for example, a large portion of an insurer’s sales are from agents located in a particular retail chain (such as a bank or department store), a decision by that retail chain to end the relationship may materially impact the insurer’s financial position.

2. Outsourcing risk. If the management of a distribution channel has been outsourced to an intermediary (e.g., to a managing general agent) or to a partner (see partnering risk below), the insurer usually has less control of the channel and its business. Although this can result in high acquisition costs because of relatively high commissions/fees, this may be offset by the functions and services provided that the insurer no longer has to fund directly. The outsourced entity may be able to provide immediate scale or recruit more agents more quickly through which higher

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
volume might be able to be achieved and access to new markets might be obtained, although the arrangement might at the same time contribute to increased concentration risk. Careful ongoing oversight may be required to overcome the direct loss of control.

3. Partnering risk. This can result from partnership with other firms, possibly with a bank (Bancassurance), a retail network, or micro-finance institution, with the responsibility for various functions, including distribution, split between the parties—the relationship involved is usually similar to the outsourcing situation. It should be noted that the more parties involved in the acquisition and servicing processes, the greater the likelihood of inadvertent or intended risks. In addition to the obvious risk of the partner becoming bankrupt, misaligned motivation and incentives, ineffective coordination, and a lack of an exit strategy may harm the insurer. In fact, the partner may be more involved with promoting itself than the success/profitability of the insurance co-venture; if, for example, a representative of the partner sits on the board of the insurer, that representative might influence the decisions of the insurer to favor the partner (as a result, many jurisdictions forbid agency firms to be on the insurer’s board). In the case of a bank partner that acted as a corporate agent, the partner could exert undue pressure and influence on the bank’s customers to purchase insurance policies passed off as investment products. If inadequately monitored and managed, a potential for mis-selling and fraud exists, which is bad for business both in the short and long term, representing brand and reputation risk for the insurer.

If the partner is responsible for collecting premiums, the insurer needs to monitor the delivery of premium payments directly to the agent or other intermediary, because they might never reach the insurer, resulting in loss of coverage by the policyholder and ultimately a loss of reputation by the insurer. This could also lead to significant increases in internal and external cost, including litigation costs. This type of risk, which may be widespread among insurers across a particular marketplace or isolated to a particular insurer, is similar to other types of operational risks, leading to loss of future new business. This risk can be exacerbated if the insurer delegates control and inadequately monitors the actions of the agents or managing general agent, as applicable. See Section 6 for further discussion of these risks and related issues of supervisory concern.

4. Cost versus control. The choice of a particular type of distribution channel requires an assessment of the risk of higher compensation, support cost, and effective oversight. Sudden changes in the cost, quality, or number of agents, especially involving a particular product or sector, have to be monitored on a regular basis. Indicators of such a change include unexpected changes in new business, not placement or lapse/continuation rates, outsourcer fees, or bankruptcy of outsourced agents. In any case, the actuary is sensitive to the level of expenses involved in the insurer’s operations, including the cost of acquisition—to assess relative competitiveness and the cost and success of agent recruitment—and care is needed to ensure that the agent does not benefit more than the policyholders.

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
5. **Up-front compensation.** Insurers in many countries pay significantly greater compensation (to those generating the sales or those who are compensated by additional sales) at policy origination than at the time of renewal, e.g., long-duration life insurance sold to individuals. On the one hand this can align the interests of the agent and the insurer because in both cases a profitable product can create long-term capital/value for the insurer while providing capital to the agent to build and invest in the business of the agent. On the other hand, it can negatively affect the sustainability of agents as they can become dependent on new sales for cash flows and do not build up a continuing stream of income. In addition, it is important to recognize that this can create a conflict of interest as a result of an over-emphasis on placing new business by agents and on moving (replacing) blocks of business between insurers or between products of the same insurer, a reduced ability to recover acquisition expense, moral hazard, and, in the extreme cases, fraud. Whereas the insurer has an interest in retaining policies and policyholders to ensure recovery of its up-front costs, up-front compensation reduces the incentive for the agent to keep a policy in force, increasing the incentives for selling policies with higher compensation and for churning (replacing) the policy that may not be in the policyholder’s best interest. Excessive compensation can prove to be a long-term detriment to consumers, especially for policies with a heavy investment component, e.g., privatized pension products previously sold in Latin America.

6. **Expense recovery risks.** Both greater expenses and inadequate new or total business volume relative to pricing assumptions can lead to a reduction in profitability. Although potentially caused by inaccurate actuarial estimates, this risk can also be caused by a sudden adverse change in distribution channel quality or effectiveness. This impaired expense recovery results from fixed or non-variable expenses or lack of new business or greater than expected policy lapse or non-renewal rates. Larger unit expenses are typically included as part of a stress test to assess the magnitude of its possible impact.

7. **Rogue agents.** In certain cases, an individual agent could act in a manner inconsistent with an insurer’s policies and rules, or collude with a third party to take advantage of the insurer, another party, or society. The action might be illegal, such as modifying an insurance policy without the consent of the insurer, charging unauthorized fees, or acting in a fraudulent manner. Such action, once identified and reported to the supervisor or communicated to the public, can cause irreparable harm to the insurer’s brand/reputation and cost the insurer a great amount of resources. This can be identified through monitoring of individual agents’ business for early lapses, poor placement rates, or missold policies. An insurer can also inquire of peer companies or an applicable supervisor whether a prospective agent has been terminated with cause.

8. **Tax payments.** In some countries, the tax status of agents might change retroactively (e.g., from being an independent contractor to an employee), possibly resulting in considerable tax payments or penalties for the insurer and restructuring of its distribution strategy.

*To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.*
9. Technology/regulations. New technology or new regulations can make the current distribution process irrelevant or overly expensive. An example of the use of new technology includes mobile phone apps used to purchase or pay premiums for insurance. For instance, new regulations may require additional continuing education requirements or fiduciary responsibilities, which may result in increased cost or inability to recover previous sunk cost.

10. Uncollected chargebacks. In some cases, commission will be charged back to an agent out of future commissions if long-duration policies lapse in their first policy year. However, if an agent severs its relationship with the insurer, the chargeback may become uncollectable.

11. Multi-level marketing. Ponzi, or pyramid schemes, where agents are compensated upon recruitment of additional agents, might arise, although rare in insurance. These situations, banned in several jurisdictions, can benefit agents, but eventually run their course to the benefit of no one, other than the first few participants in the scheme.

12. Political risk. If the agent or sponsorship is provided by a government or governmental agency, if the head of that government or governmental agency changes or changes policy, or if fraud or kick-backs are proven, the relationship and business can be adversely affected, especially if a large part of the business of the insurer.

Poor management governance practices related to its distribution can also weaken insurer performance. These can include:

1. Ineffective or unsuitable distribution channel. A poorly designed or managed distribution channel can develop a low quantity or quality of insurance sales and create a poor public image for the insurer. It can be unsuitable if it is not appropriate for the needs, knowledge, or culture of the target market. This may be as or more important than unsuitable products in providing quality products.

2. Management resource risk. It is often a priority to maintain the loyalty of top agents. This may require considerable time by top management and its employees in agent relationships to maintain their loyalty. Although this may be a consciously chosen business priority, it also might divert an inordinate amount of top management time from important strategic issues and toward quantity rather than quality of business.
   a. Over-emphasis on gaining market share. In some cases, the emphasis of management can be so focused on gaining or defending market share that the quality of its distribution channel, agents, and insurance risks suffers. This can arise when staff in charge of sales or marketing emphasizes increases in sales at the expense of quality of agents, sound underwriting practices, or premium adequacy. An early warning signal of this happening might be a surge in market share that cannot be explained by another factor. Regular discussions with agents can provide insight into the underlying reasons for such a change, which can then lead to appropriate corrective actions.

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
3. Inappropriate product and pricing governance. Mitigation efforts include the design of products suitable to the distribution channels used and target markets, and costs consistent with desired level of competition and risk tolerance.

4. Sponsorship risks. Advertisements and sales can be augmented through the endorsement or other use of sponsors and brand salespeople, such as a celebrity. As with any marketing effort, a deterioration in the reputation of the sponsor, celebrity, or agent can result in a significant reduction in the marketing potential of the insurer, although that might prove temporary with timely action by the insurer.

Because of the importance of these risks to the insurer, actuaries are involved in estimating the quality of sales and policy performance in the pricing and valuation of insurance products, as well as in the ERM assessment of the effective management of these risks and distribution performance. Effectiveness and accuracy of sales material, whether in sales brochures, presentations, policy illustrations, website, or mobile phone apps, can be pre-screened or audited, as applicable and needed. Although not normally involved in agent training, actuaries can be involved in the development of educational material regarding the products and needs addressed by the products. This involvement not only enables insurers to better identify these risks, but to also develop or enhance the mitigation tools that can reduce the incidence and management of the severity of these risks.

6. Consumer Protection/Selling Risks

Insurers owe their customers a duty of care, which goes beyond simple compliance with laws and regulations. Since either their agents or other contacts with customers are usually provided indirectly through others or by means of technology, distribution and sales risks need to be soundly managed. As a result, the protection of consumers against inappropriate market conduct risks is quite important and should be within the scope of an insurer’s ERM. A culture of fair business conduct, responsible pricing, and claims management is a key element of this area of risk management—both top-down and bottom-up methods and emphasis are needed to properly fulfil this important function.

In addition to assuring that contractual promises made by an insurer are kept by means of regulatory standards and supervision of those insurers, insurance supervisors are also often charged with ensuring that the customers of an insurer are treated fairly and are sold policies that meet their insurance needs. In some jurisdictions this supervision is conducted by the same supervisory authority as the supervisor charged with ensuring the solvency of insurers, while in others they are separate.

As a result, supervisors may regulate and monitor certain aspects of rates, products, and agents. This can be done, for instance, in areas such as rate and policy form approvals, minimum standards for policy illustrations and disclosure, remuneration limitations, and agent licensing.

It should be noted that certain regulatory rules designed for agent-based distribution may not be suitable for situations in which an agent is not involved. Supervisors in some less developed jurisdictions may not have adequate resources, rules, or ability to assess penalties for noncompliance. In addition, the regulation of distribution of insurance sales or products

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
may fall in the cracks between supervisors with specified responsibilities—for example, between different industries/products or solvency/distribution. In some cases, not all those involved in the selling process may be required to satisfy minimum knowledge and experience in the insurance area.

Insurers are subject to conduct of business risk. Effective management of this risk consists of both operational (process) and strategic (determining the business model followed, including distribution and marketing objectives) elements. A key component of this management is early identification and avoidance of inappropriate market conduct, which can ultimately lead to or be suggestive of future lack of sustainability and sound financial condition, which in turn represents a prudential solvency risk. In addition, they may be a symptom of ineffective governance and lack of internal controls over an insurer’s distribution process.

Inappropriate market conduct and lack of consumer protection can result partly from an asymmetry of knowledge regarding insurance and insurance policy features and practice that may be complex and include many technical aspects. This asymmetry is presumed to be more pronounced where the buyer is an individual (such as in the purchase of individual life insurance, micro-insurance, and personal automobile insurance) rather than where the buyer/sponsor is a commercial enterprise (such as is the case for group insurance, commercial liability, or reinsurance). This concern may also arise in less developed markets and jurisdictions. More consumer protection is needed where greater asymmetry exists.

Risks relating to a failure to adhere to regulatory-mandated or generally accepted behaviours, particularly if an insurer or its distribution channels take advantage of this asymmetry to the detriment of customers, are referred to as conduct risks in many jurisdictions. In this century some financial services companies, especially but not exclusively banks, have incurred large fines due to inadequate management of conduct risks. In some cases, conduct risks have been a significant driver of operational risk losses.

Insurance market conduct supervisors are charged with ensuring that sales of insurance policies are conducted in a manner that delivers acceptable value to the consumer, often resulting in consumer protection requirements, including relating to policy features and illustrations of new sales and in-force policies. In some jurisdictions the content of policy illustrations is highly regulated, while in others it is primarily self-policed.

In highly regulated jurisdictions, actuaries are often involved in preparing the values and descriptions of the content of policy illustrations and may be subject to actuarial standards. In self-policed jurisdictions it is especially important that objective advice be provided to those preparing the illustrations, particularly in jurisdictions with less developed insurance markets, where actuarial involvement can be beneficial to help ensure that they are objectively and accurately prepared and are accompanied by understandable information and education, which should be conveniently accessible.

---

4 Risks to customers, insurers, the insurance industry, or the insurance market that arise from the conduct of insurers and/or their distribution channels in developing and managing their business in a manner that may not fairly treat their customers. For further discussion, see the IAIS Issues Paper on “Conduct of Business Risk and its Management”: http://iaisweb.org/index.cfm?event=getPage&nodeId=25244.

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
User-friendly educational information and clear and concise disclosure suitable to the market concerning the workings of insurance (not excessive, as that will likely be ignored by most consumers), provided by insurers, agents, supervisors, schools, or the media can help mitigate any asymmetry and enable consumers to make more well-informed insurance decisions. The sophistication of disclosures should be tailored, where possible, to the knowledge of the users—this is valuable even when middle- and upper-income individuals have enhanced their knowledge through readings about insurance from the Internet or from price comparison websites. Less complex and clearly written policies and policy features can help, especially in less developed markets and jurisdictions. This is particularly important where investment risk is not transferred to the insurer, where there are benefit deductibles and exclusions and possible rate increases, or where the policyholder may not understand all available benefits.

Fairness in treatment may include ensuring that rates charged are not unfairly discriminatory among classes of consumers and that the insurance policies offered adequately meet the needs of the consumers and that they are not overcharged. Concerns over excessive premium rates have arisen for products such as credit life/health insurance (where the consumer is more interested in the loan than in the insurance, so may be subject to excessive premiums in relation to the cost of insurance) and extended warranty coverage, while also for policy fine print, which are inconsistent with policyholder expectations and may affect benefits and claims. Such situations may result from ineffective competition at the consumer level and a lack of informed choice.

Since the distribution system plays an important role in the effective delivery of insurance policies, insurance supervisors are concerned with the effectiveness of the distribution system in soliciting new customers and servicing existing customers. This has led to the licensing of insurance agents to help ensure that these agents have achieved and maintain an acceptable level of knowledge of insurance policies and insurance and financial needs—put in place to provide a framework for regulatory compliance and supervisory oversight.

In response to situations where insurance policies have been missold to consumers (that is, they are not suitable to satisfy the specific consumer needs for which the product was designed), possibly due to the incentives that led to up-front compensation to agents, supervisors have enforced certain consumer protection rules and, in extreme cases, redress. Depending on the market, type of insurance purchased, and individual involved, an insurance consumer may not have sufficient knowledge to completely understand the insurance policy, including its benefits and obligations. In certain cases, an agent or sales information might suggest, through explicit or implicit means, an insurance policy or amount of insurance that is inappropriate for a particular consumer. In others, benefit/claim limitations or exclusions are not clear. In some cases, a pattern of misselling has resulted in substantial fines of insurers or compensation to consumers, which can also result in a significant reduction in the insurer’s brand value.

Examples of misselling include: pension misselling in the United Kingdom, credit and payment protection insurance, selling a payout annuity to someone who is seriously ill, inappropriate tax advice or use of a policy designed to dodge a tax rule, the sale of a product designed to help customers in a different income tax category, and inadequate disclosure of

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
the need for a separate flood or earthquake policy to a customer with material exposure to such a hazard.

As mentioned above, historically, compensation provided by the insurer to agents who sell long-duration insurance policies, especially permanent life insurance, has been front-ended—that is, agent compensation in the first year of the insurance policy is much larger than in subsequent years. This has generally reflected the significantly larger investment of time needed to sell these policies than needed to service them. This can create a conflict of interest that can incent the agent to churn the business and has led to cases of misselling, or even fraud.

In some jurisdictions there has been a recent move toward increased disclosure of agent compensation and in some cases has led to the use of fees charged to the insurer’s customer instead of compensation provided by the insurer. Advocates of this change have claimed that this will contribute to more objective advice. In several areas, some supervisors have limited insurer expenses—for example, the state of New York in the United States has limited the expenses of insurers in an attempt to provide more value to consumers, while in the United Kingdom the insurance supervisor has conducted a review of "value for money" across numerous life and pension products. Due in part to concern with potential conflicts of interest, other supervisors have capped agent commissions at a certain maximum percentage, possibly a function of services provided, have banned or restricted certain commissions or other incentives, or required disclosure of commissions received.

Insurers, through a range of techniques, provide consumer protection that at the same time manages sales risks. For instance, these controls can include initial agent screening, training and continuing education programs regarding product features and proper sales techniques and sales process rules and requirements, agent compensation and sales targets that consider the implied incentives, agent discipline, periodic audit of sales processes, legal review of all advertising and sales promotional material, and consumer education programs. For distribution channels that do not involve agents, these include technology-efficient and consumer-sensitive information. Various techniques are available to ensure high quality distribution process, including the use of sales audits, customer satisfaction surveys, and a responsive independent sales ombudsman function.

These techniques not only provide consumer protection, but also protect the insurer from harm from distribution risks. In particular, they are managed and monitored by the insurer’s sales management and on the whole as part of insurers’ internal audit and ERM processes. Consumer recourse, redress, or consequential adverse publicity, a full discussion of which is outside the scope of this chapter, can be provided by many means, including through consumer complaint services such as a supervisory or other consumer entity or reported on an Internet website set up for this purpose.

Actuaries have also been involved in helping to control these risks. In some jurisdictions these activities have included signing off on the accuracy of illustrations of new sales/in-force policies that clearly explain the mechanics of long-term products and provide advice on the suitability of sales to customers.
7. Conclusion

Distribution- and marketing-related activities, although not often thought of as serious solvency risks, can represent significant financial risks to an insurer, as well as to its customers. In particular, inadequate management of an insurer’s distribution channel and agents can lead to situations with adverse consequences to an insurer’s sustainability, brand value, and income-generating potential. In addition, supervisors are concerned with inappropriate sales and service, which require consumer protection and consequential action against sales practices and ultimately affect the advisability of allowing the insurer to operate as a going concern.

Sound management of distribution risks will enhance and maintain the value of and trust in the insurer as an ongoing concern. These risks have to be protected against, using such elements as:

1. Key performance indicators of the performance of individual agents, intermediaries, and distribution channels addressing the number of customer complaints by type, retention rates of written business, surges in sales not seen company-wide, and possible fraudulent red and yellow flags seen in new business;
2. Use of actuarial standards for suitable policy illustrations of long-term products, where applicable;
3. Agent and consumer education as to suitable consumer needs for the offered products;
4. A possible independent, accountable function (such as ERM) including the monitoring of sales practices and suitability processes and their risks; and
5. Regulatory requirements that govern market conduct and sales practices, as well as reviews that can assess the effectiveness of the insurer with respect to disciplining/educating/managing its distribution systems.
Appendix—Types of Distribution Methods

There is a wide range of distribution methods in use by insurers, the relative importance of which depends upon the market, the coverage, available resources, technology, and historical development. An insurer can utilize multiple channels, often one for each business unit, although some business units also utilize multiple distribution channels. Agents (see footnote 1) serve as intermediaries between the insurer and the ultimate insurance consumer, and can be an individual or take the form of an agency, a group of individuals. An agent can specialize in a particular type of insurance product or sell many types. In addition, an insurer may use a combination of these methods in a particular market, e.g., through leads generated by direct or website contacts, followed up by contact from independent agents or insurer employees.

A distribution channel may involve more than one distribution approach or a hybrid method, and that any categorization represents an overlap of approaches, e.g., a full-time career agent may be an employee of an insurer or independent, and a sale may involve both website and agent. The following is one categorization of distribution channels:

1. Full-time (tied or captive) career agents. They can be employees or independent contractors who represent a single insurer, primarily involved in selling that insurer’s products. The classification as an employee or independent contractor can result from tradition or tax laws. A new agent can be subsidized for a period to allow for training and development of customer relations.

2. Salaried employees. They sell products directly to the customers of the insurer. This approach is often used in sales to large accounts—for instance, selling group life/health or commercial property/casualty insurance to large corporations, or direct insurers in the case of reinsurers. Salaries can be fixed or can include incentives /bonuses as a reward for successful sales.

3. Independent agents. These are not employees of the insurer. They can be brokers, who can represent multiple numbers of insurers, or those who only sell insurance provided by a single insurer. Their primary business may or may not be to sell insurance products.

4. Consultant-led agents. In some market segments, particularly institutional ones, clients employ specialist consultants or advisers to help consumers select between competing providers. Regulatory trends tend to differentiate between agents remunerated solely by the client and the sorts of independent agents referred to above who may traditionally have been remunerated primarily by the insurer. Some insurers’ distribution risks diminish if the gatekeeper to the client is remunerated by the client rather than the insurer, but other risks increase, such as the risk of falling out of favor with leading consultants for that market segment.

5. Partners. Sales can be generated by or as a result of a partnership with a wide variety of industries that would not otherwise specialize in selling any insurance or the insurance of the type sold. This can involve working with partners or sponsors, sometimes with their own existing networks, whose primary business is not insurance. In some cases, they may not be licensed as an agent. This may provide

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
an entrée, possibly in the form of bundled products, to potential customers that they would not otherwise be able to access. In some jurisdictions, this includes Bancassurance, in which banks participate, either as an affiliate, partner, or distributor of an insurer’s products. Other examples include retail chains, telecommunications entities, micro-finance institutions, trade unions, and post office outlets. Others can sell insurance:

a. As a consequence or coordinated with the sale of related products, e.g., financial institutions at the time loans are provided and mortuaries (e.g., pre-need insurance) in anticipation of a future burial.

b. That specialize in other types of insurance. For example, sales of life insurance by those who primarily sell property and casualty insurance.

c. As part of a broader portfolio of products, e.g., other financial institutions and asset managers, especially for wealth products such as annuity, pension, life insurance, and savings products, by employees of the financial institution or the insurer embedded in that related or unrelated companies’ operations.

6. No agent involvement. Many variations of distribution channels that do not involve or require sales representatives of an insurer exist. In some cases, particularly where a method does not involve an agent to attract a potential customer, an agent who may specialize in insurance will become involved to provide advice or close the sale. They include:

a. Website. Sales are obtained through use of a website, often from customers searching for a suitable insurer or insurance policy. In some jurisdictions, an increasing percentage of sales are conducted through the Internet (for example, based on price comparison websites (PCWs), which may not be able to match needs with product, and may increase the risk that a policyholder decides on a policy solely on price rather than quality or consistency with the individual’s needs). Needs for insurance may be established through information obtained on the website or exchanged through social media.

b. Mobile phone. Insurance is sold through or with some assistance provided by a mobile network operator, which may pay premiums on behalf of its customer as long as there is a minimum amount of phone usage in the period.

c. Advertisements. This method can either be aimed at enhancing an insurer’s brand or enticing potential customers to inquire about the insurer’s specific products.

d. Direct. Sales through this approach can be made through the mail (post), phone solicitation, or through various technologies.

---

5 In the European Union, the Insurance Distribution directive considers PCWs to be an insurance intermediary.
e. Affinity/loyalty. Sales are made through an affiliation of the customer, for example, through an association, labour union or cooperative where the customer is a member or through workplace schemes.

Some insurers have bought blocks of business from other insurers, if not through acquisition of an entire insurer, sometimes obtained through the use of an investment banker. In some cases this block of business or insurer is put into run-off mode—that is, the distribution system used to produce the business does not actively pursue new business for the insurer. Not only are the normal risks associated with deviations from expected experience (e.g., policyholder behaviour, mortality, or claims), but if inadequate due diligence was performed, they might include the cost associated with selling risks including misselling practices generated under prior management.

A managing general agent is a company or agency that controls the means of distribution, usually by means of multiple sub-agents. In some cases, in return for additional compensation it is responsible for specified marketing or other servicing functions.

Sam Gutterman, FSA, FCAS, MAAA, Hon FIA, CERA, FCA, is a consulting actuary, located in Glencoe, Illinois, USA. His areas of expertise include financial reporting for all lines of insurance, social insurance, demographics, and the environment. He can be contacted at sam.gutterman1@gmail.com.
1. Executive Summary

Own Risk and Solvency Assessment (ORSA) processes sit at the heart of effective enterprise risk management (ERM). While regulators worldwide understand the value of the information communicated as a result of ORSA processes, ORSA is best thought of not as a regulatory requirement but as a collection of internal “own” processes, highly tailored to the nature, scale, and complexity of an insurer, that result in key strategic information for senior management and the board.

Key observations/findings from the chapter include:

- ORSA is an ongoing part of risk and capital management practices and has merit beyond any regulatory requirement;
- ORSA is not a “one-size-fits-all” process. Significant variations occur from company to company, and even within different organizational units of large groups;
- Both quantitative and qualitative analyses support ORSA processes;
- ORSA processes are most effective when integrated within other business processes, particularly strategic and business planning, capital management, and, as appropriate, product pricing and underwriting;
- Promoting ORSA disciplines has value at both a macro (i.e., industry-wide) and at a micro (i.e., company- or group-specific) level; and
- Actuaries are highly experienced in assessing complex topics and have the skills and professional processes and perspective needed to create valuable risk analysis frameworks for management, boards, and regulators.

2. Introduction

The last decade has seen some important advances in the development, use, and application of sustainable enterprise risk management (ERM) frameworks within insurance organizations. As the insurance supervisory community observed the benefits of ERM, many key ERM practices were incorporated into Insurance Core Principle (ICP) 16 Enterprise Risk Management for Solvency Purposes, promulgated by the International Association of Insurance Supervisors (IAIS) during 2011. Likewise, more general core risk management principles have been codified in ICP 8 Risk Management and Internal Controls. ICP 16
reaffirmed for insurance and reinsurance companies the key elements needed for strong and effective ERM practices, and reminds regulators and supervisors worldwide of the need to encourage strong ERM practices within their regulated entities.

ICP 16 requires that a company (defined as either a solo entity or group) establish an ERM framework that specifies the processes and techniques the company will use to maintain its risk exposures within predefined risk limits, and states that a company’s risk management framework is to include several key elements, with each element operating in a manner that is consistent with the company’s nature, scale, and complexity. Some of the key elements identified within ICP 16 for an insurer’s ERM framework include:

1. It must provide for the identification and quantification of risk;
2. It must include risk management policies to guide the company;
3. It must establish and maintain risk tolerances setting out overall quantitative and qualitative levels within which the company assumes and manages risk; and
4. It must be responsive to changes in the risk profile and the environment through the periodic conduct and communication of ORSA results, and management’s strategic response to these results.

Specifically, ORSA is the ongoing process by which a company's senior management and board routinely assess the key risks to which the company is exposed and the adequacy of capital held to support the risks underwritten or accepted after mitigation and management activities have taken effect, both now and in the future, under different scenarios and relative to the company's appetite for risk. Periodic discussions of ORSA results provide benefits to senior management and the board. Effective use of the ORSA also has wider implications for effective regulatory review and oversight.

The primary objective of the ORSA is to support the company's strategic decision-making, by providing insights into the risks the company chooses to accept in return for the reward that can be expected over the business planning horizon. Specifically, the ORSA will:

1. Enhance the information basis for board decisions;
2. Provide senior management with an understanding of the company's current and evolving risk profile relative to the company’s appetite for risk under the various stress events or scenarios and an understanding of the adequacy of the capital resources to support both current and emerging risks;
3. Help build/maintain risk awareness throughout the company; and
4. Increase credibility and insight with regulators or supervisors.

Elements of the ORSA may also help supervisors better understand the company’s risk profile, risk management framework, and capacity to face the risks to which the company is or may become exposed. More broadly, promoting sound ERM and specifically ORSA disciplines across the insurance industry is considered by many to likely result in businesses that are better able to face current and future risks and uncertainties that will, in aggregate, lead to better and more robustly managed outcomes for policyholders.

3. The ORSA Process

The assessment of key risks and capital adequacy, both current and prospective, under both anticipated (or “baseline”) and stressed conditions is fundamental to the ORSA process. While these assessments must pay close attention to regulatory requirements, they fundamentally represent a company's own view of the key risks and the level of capital it needs and the risk management framework it will use to achieve its strategic objectives. It thus goes well beyond the capital required to satisfy rating agencies (i.e., capital sufficient to maintain a targeted financial strength or credit rating) or to satisfy regulators that capital, together with the underlying risk mitigation strategies and control framework, is sufficient to mitigate the risk of insolvency.

The ORSA process generally consists of a variety of assessments that result in an overall understanding of a company’s key risks leading to decisions regarding the management of these risks and an understanding of capital adequacy at a given point in time, all communicated through ORSA reporting. The process is expected to be carried out using an overall approach selected by the company that it believes to be appropriate and adequate for its own risk profile and strategic objectives. The ORSA approach is part of the company’s risk management framework and needs to fit the company’s organizational structure and take into account the nature, scale, and complexity of the risks the company faces and its appetite for risk.

ORSA processes and techniques, which are part of the risk management system of the company, consist typically of the following basic steps that need to be carried out on a periodic basis and upon significant changes to the company’s risk profile:

1. Identification of key risks, including:
   a. Identification of the gross (inherent) and net (residual) risk profile of the company; and
   b. Identification and prioritization of material risks and emerging risks, that is, specific risk events with a potential for having a significant impact on business performance.

2. Risk and capital adequacy assessments, including:
   a. Stress and scenario testing for assessing the financial effect of the quantifiable material known and emerging risks identified, complemented by qualitative techniques for assessing non-quantifiable material and emerging risks;
   b. Quantification of required capital using an “own” risk measure (e.g., economic capital), required regulatory capital, and other relevant risk measures such as required rating agency capital;
   c. Identification and acceptance of the principal expert judgements underlying the assessments including the key weaknesses and limitations in the data and models used;
   d. Assessment of the resultant individual and aggregate risk profile relative to the company’s risk appetite framework; and

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
3. Communication and reporting of ORSA results, including:
   a. The results of key risk and aggregate risk assessments relative to the risk appetite framework; and
   b. An ORSA summary report, prepared with the main findings of the different assessments and a description of the ORSA process.

4. Assessments of the ORSA process itself, identifying key expert judgements, potential weaknesses, and points of improvement.

It is important to emphasize that an ORSA is not just a report or an outcome. It is an ongoing process that a company carries out on a periodic basis and whenever the company experiences a significant change in its risk profile or before major strategic decisions are made. The true value of the ORSA can only be realized when ORSA becomes integral to management's strategic decision-making.

Complementing the basic steps of the internal ORSA process, the following regulatory expectations for the ORSA generally apply:

1. The ORSA is expected to include an assessment of the company's overall solvency needs (both regulatory requirement and the company’s own capital standard);
2. The ORSA is expected to be forward-looking, i.e., not merely assessing current solvency needs but also adopting a medium- or longer-term, forward-looking perspective where appropriate;
3. ORSAs take into account the company’s risk appetite, tolerance, and limits;
4. In certain jurisdictions, the ORSA is expected to explain any divergence between how assets and liabilities are valued and recognized in the ORSA and how they are valued and recognized in the company’s regulatory capital computations;
5. The results of the ORSA are expected to be taken into account in business decisions, including decisions relating to capital management, business planning, and product pricing and underwriting;
6. Group-wide ORSAs consider group-specific considerations, such as liquidity and fungibility of capital; and
7. The ORSA is expected to be adequately documented such that a third party of the appropriate level of expertise can understand the principal methodologies, processes, key assumptions made, and judgments applied in the ORSA process.

4. Conducting an ORSA

ORSAs are conducted on all material and relevant (“key”) risks; utilize appropriate processes for assessing risk and capital adequacy, both as of the evaluation or assessment date and over the business planning horizon; and are to be clearly and appropriately communicated to senior management, the board, and regulators.

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
I. Identification of Key Risks

The risk profiles of insurance companies vary widely from company to company as a result of the significant variability in business models that they adopt and environments in which they operate. This means that the types of risks to which a specific insurer or reinsurer is most exposed can vary significantly. In general, insurance companies are exposed to different combinations of market, credit, insurance (e.g., premium, reserve, catastrophe, mortality, morbidity, expense, and lapse), and operational risks based upon the products they underwrite, the investments they hold, and the quality of and control over their operations. For example, a “pure” unit linked life insurance company (writing savings products that do not include any embedded guarantees and with minimal protection cover) may be, relatively speaking, heavily exposed to operational risk (and possibly lapse risk) but may only be relatively indirectly exposed to market risk via the fees it collects on the assets being built up by its policyholders. In contrast a long-tail property-casualty (i.e., nonlife) insurer may be more heavily exposed to “insurance” risk.

Given the heterogeneous nature of risks a specific insurer or reinsurer may face, qualitative methods for identifying the risks that are most significant to the insurer, both currently and prospectively, include:

- Discussions with senior management and the board, revealing the type of risks that are most likely to keep senior leaders “awake at night”;
- Workshops (usually facilitated by risk managers) during which business leaders explore and rank a range of risks they think are important to their businesses or functional areas;
- Review of risks that other similar companies believe they are exposed to or have suffered loss from, possibly supported by external advisers or data sources;
- Consideration of scientific and environmental reports; and
- Review of the company’s own past losses and “near misses” to understand past risk drivers, causes, and impacts.

The processes involved can often be iterative in nature and would include consideration of risks, both gross and net of risk mitigation (e.g., before and after reinsurance). The risks identified will range from those risks amenable to quantitative assessment to those that are more difficult to quantify.

Within all risk assessment methods, it is important to take into account a consideration of known or potential changes to the environment in which the company operates that might have a significant impact on the risks to which the company may be exposed. Typically, an assessment of the potential changes to the environment will include some form of “horizon scanning” for emerging risks, bearing in mind that the environment in which the company operates is rarely static.

II. Assessing Key Risks and Capital Adequacy—Current and Future

Risk and capital adequacy assessments involve the analysis of all material risks the company faces. As a result, companies apply an assessment technique or combination of techniques that are most appropriate for each key risk and for all risks in aggregate, understanding
correlations between risks, the indicated levels of required capital relative to established capital targets, and the adequacy of available capital relative to both own and regulatory measures of required capital.

A. Techniques for Assessing Risk and Capital Adequacy

Risk and capital adequacy assessments may be conducted using a variety of quantitative techniques and tools, such as economic capital modeling and stress and scenario testing. Each type of quantitative approach has its strengths and weaknesses:

- Economic capital models (ECMs) can provide a robust view of a company’s future financial condition, and ability to fulfil obligations to policyholders. An ECM depends on a set of assumptions about the general economy, the environment in which the company operates, and the company’s operating situation. Economic assumptions are often derived from stochastic generators using parameters based on either historical experience or on current or recent conditions. The resulting models can be extremely complex. Assessing their reliability and validity can be a significant challenge.

- Stress and scenario testing is used either instead of or along with an ECM as part of the capital adequacy assessment process. These techniques can be critical in helping identify potential threats and developing resulting management actions. In contrast to economic capital models, scenario analysis and stress testing assess the financial effect of specific events. They can be used to enhance the understanding of a company’s vulnerability to highly uncertain tail risks, and develop suitable mitigating actions. Stress tests can be easier to communicate and be more easily understood by management, board members, and other stakeholders than the output of ECMs. Their use can enhance the risk culture of a company, as they can alert decision-makers to potentially problematic areas and provide a framework to enable companies to base their business strategies and risk mitigation activities on a range of forecasts, rather than on a single best-estimate projected result or an average of stochastic results. Insurers would typically supplement traditional types of stress tests with reverse stress tests that are designed to explore scenarios that result in the company’s business model being fatally damaged. One aim of reverse stress tests is to identify business models that are more robust to such scenarios, and also to develop triggers for mitigating actions when a potential threatening scenario may be developing.

- Factor-based models, which rely upon capital factors that are calibrated to a selected return period and applied to financial statement data, are straightforward to use, and can be beneficial for quick assessments of trends. However, they generally rely upon capital factors that have been developed considering industry experience as a whole, and therefore may not fully reflect the risk profile of any individual company.

While it is within the company’s discretion to determine the techniques and tools to be used for their “own” assessments of risk and capital, many regulatory regimes either require that companies perform stress and scenario testing for regulatory purposes (e.g., Australia, European Economic Area, Canada), prescribe certain stress tests and scenarios (e.g.,

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
Bermuda, Canada), or strongly encourage stress testing as a means to communicate the potential impact of the most significant risks and vulnerabilities to which a company is exposed. In addition, companies of a certain size are subjected to stress testing by regulatory bodies (e.g., European Insurance and Occupational Pensions Authority (EIOPA), through National Supervisors), and those insurance companies in the United States that operate within a bank holding company or own a thrift will be subjected to Federal Reserve Board stress testing. Given the sharp increase in regulatory use of stress testing, companies may need to consider how best to incorporate this testing into their ORSA processes.

In addition, in certain regulatory regimes (e.g., Solvency II) the ORSA also needs to include an assessment of the appropriateness of the methodology the company has selected to determine its regulatory capital requirements. Companies subject to this particular regulatory framework can select different approaches for their regulatory capital computations (e.g., standard formula approaches versus internal models and/or use of undertaking-specific factors). Regulators expect the company to justify why the selected approach is reasonable.

B. Establishing Capital Targets

As an integral part of a risk appetite framework, companies establish capital targets that consider the adequacy of own levels of required capital, regulatory required capital, and in certain circumstances rating agency or other measures of required capital. Differences between these capital measures are often based upon different valuation or accounting bases, or are based upon varying time horizons (e.g., one year of new business) and risk measures (e.g., 99.5 Value at Risk). Companies need to understand and be able to reconcile between valuation differences in measures of available capital and defined differences in measures of required capital when establishing capital targets and performing capital adequacy assessments relative to these targets.

Typically, capital targets reflect capital buffers above certain binding capital constraints to allow for loss absorption capacity in the event of a significant stress and in consideration of volatility of profits, uncertainty in the models and data, dividend policies, access to capital, and the overall quality of capital. In certain jurisdictions, ORSA regulatory requirements include the justification that the company will continuously comply with regulatory capital requirements and with other elements (such as computation of liabilities) that influence the company’s overall regulatory capital position, i.e., it is not just a point-in-time exercise. The principle underlying this requirement is that companies will not want to be so thinly capitalized (versus their capital risk appetite, as well as regulatory minimum levels, relative to the risks that they face) that they risk becoming undercapitalized just a short time after any capital assessment is carried out.

C. Forward-Looking Assessments

ORSA processes generally consider capital adequacy over the business planning horizon from a given evaluation date, in addition to a point-in-time assessment of risk and capital adequacy. While many companies utilize sophisticated methods and tools that allow for detailed assessment of capital adequacy over a one-year horizon, conducting ORSAs beyond one year requires the design and implementation of approaches that reflect key risk behaviors and likely management responses to risk events when they occur while limiting the additional uncertainty with projecting potential outcomes over multiple years.
There are several methods that can be used for performing multiyear assessments, including multiyear stochastic models, applying stress scenarios to the results of one-year models to reflect an additional year or years of stress events and the development of factor-based approaches based on more complex and granular one-year stochastic model results.

III. Communicating and Reporting ORSA Results

Although the risk and solvency assessments themselves, including the use of modelling and forecasting tools to support them, represent a significant part of the overall ORSA process, ORSAs will be conducted in vain if the results are not communicated and reported effectively and relied upon.

Communicating and reporting ORSA results require companies to distinguish between several distinct groups of users, all of whom may have different needs, both as a result of their own knowledge and the intended uses they have for the information received:

A. Senior Management, the Board, and the Business

To ensure effective communication of ORSA results, companies start by working with the ultimate owner(s) of the ORSA process so that the end results meet their needs. The owner may be designated by local legislation—for example, under Solvency II it is the company board—however, independent of who the owners are, the findings and insights developed through ORSA are carefully designed to meet the needs of the users. In addition to the structure and level of detail provided within ORSA reporting, the owners also approve key aspects of the methodology being used including the key judgements made (e.g., the design of the stress and scenario testing to be carried out).

As usage is not limited to board- or senior-management-level decisions, it is likely that business units may also want to/need to use certain ORSA results for their own decision-making and ORSA communications to satisfy the needs of the business may need to be taken into account.

The process of reporting to the board and senior management is likely to happen at multiple points in the year as various ORSA and other business processes are completed. Companies will need to develop communication plans that are responsive to the timing of ORSA processes, taking advantage of the opportunities to discuss various results more fully as they become available. This ORSA communication plan may need to include a final report that brings all the results together, ideally with references to any supporting documents so these can be accessed as required.

B. Supervisors

Where there may be a requirement, either formally or informally, to provide an ORSA summary report to the supervisor, use of internal reports generated for senior management or the board may be favored to encourage companies to avoid creating separate reports strictly for compliance purposes. However, as the supervisors typically do not have access to day-to-day ORSA processes and internal reporting of ORSA results, they will likely need to reference supporting documentation or the ORSA summary reports themselves will need to include some of this support.

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
C. Other External Parties

Because the ORSA delivers significant valuable information, such as the business strategy and analysis of key risks, external parties such as rating agencies (and even shareholders and policyholders if they have access to ORSA results) would find the information highly beneficial. However, given that the ORSA report will likely contain proprietary information that management would not want to disclose to competitors, confidentiality of the information must be given the highest priority. External disclosures are likely to be driven by any minimum regulatory requirements, and these may be consistent with the risk disclosures under accounting or investment securities standards.

ORSA internal reporting will aim to communicate at least the main conclusions of the ORSA to all relevant staff. An ORSA supervisory report (if different from internal reports) may need to be more highly tailored to the needs of the supervisor.

Key attributes of any ORSA report include:

- A succinct overview of all key insights arising from the ORSA and how they fit together;
- Analyses of the key scenarios considered, including any management actions that are assumed and confirmation of whether or not these have been approved by the board;
- Where there is "use test" as part of the local regulations, information on where the board has been consulted;
- Either explicitly within the report, or documented separately, descriptions of the methodology and key assumptions underlying ORSA results, including information on the principal limitations and judgements made in the assessment; and
- Cross-referencing to any relevant supporting documents so that additional supporting detail can be obtained if required.

5. Integration with Other Business Processes

The results of ORSA processes are to be taken into consideration in strategic and business decision-making, subsequently reflected in capital management plans, business plans, and decisions regarding product pricing and underwriting (where appropriate and relevant). The most significant phases of the integrated process are depicted in Figure 1 below.
Figure 1

Although the timing of the phases within the integrated process identified in Figure 1 appear to identify a single cyclical process, ORSA processes are to be integrated within the business cycle, e.g., risk and capital assessments are carried out in developing capital management plans. ORSAs are conducted both on a periodic, planned time frame as well as an ad hoc time frame, aligned with potential changes to business strategy or sudden changes to the company’s underlying risk profile.

This linkage between a company’s business strategy and decision-making processes with its ERM framework including ORSA processes is often referred to as the “use” test by independent reviewers of the ORSA process, including regulators. Ultimately, a strong ERM framework is dependent upon the company’s ability and willingness to take action based on the results of the ORSA process. Regulators would view a company’s ORSA process as less desirable if that company focuses strictly on understanding risks including implications for their capital and solvency position, but then ignores the insights uncovered in the process. Regulators often value the use test because it incentivizes companies to continue to enhance their risk management disciplines and processes, ultimately leading to further protections for policyholders.

The scope of the use test includes, but is not limited to, senior management and the board responsible for company oversight. Under the use test, senior management is expected to

*To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.*
actively consider ORSA results when developing future strategies, and reliance upon ORSA results is to be clearly evidenced. Boards are expected to be actively involved in framing and overseeing how the company’s ORSA is to be carried out, and ORSA results provide valuable information for helping the board oversee the business, challenge activities that seem inappropriate in the context of the company’s overall risk appetite, and generally hold senior management accountable. Engaging the board in the ORSA process makes it more likely that the ORSA will address the needs of all stakeholders and not just those most closely associated with the perspectives of senior management.

6. Other Group Considerations

Group-wide ORSAs will need to reflect potentially differing risk perspectives arising from different parts of the group, including risks arising from exposures that one member of the group may have relative to other group members, and group-wide exposure to risks that could impact multiple entities at the same time. Group-wide ORSAs would be expected to consider the extent to which capital is available to, and fungible and transferable between, different companies within the group (including exposure to foreign exchange risk), as well as the impact of any planned transfers of capital around the group or other planned risk redistribution activities. Group-wide ORSAs would also be expected to cover the extent to which business strategy and risk management disciplines were aligned across the group.

As groups can span many different jurisdictions and business types, regulatory reporting of group-wide ORSAs clearly identifies the companies that are within or excluded from the scope of the ORSA. If applicable, group ORSAs need to spell out how any governance requirements and variations in risk management perspectives applicable to individual companies within the group have been addressed. For multinational groups some more practical administrative issues would also typically be specified by regulation, e.g., the language(s) in which regulatory reporting of group-wide ORSAs need to be prepared and how the group-wide ORSA addresses any differences in supervisory needs across the different jurisdictions involved.

If the head (or other significant part) of the group is not an insurer then the intrinsic merits of a group ORSA are not diminished. However, the details might need adapting to address any regulatory requirements applicable to non-insurer elements of the group.

7. Guiding the ORSA Process

Companies develop policies and procedures related to key business processes, and for Solvency II, ORSA processes will be captured within a documented ORSA policy that articulates how the ORSA is to be carried out, a record of each ORSA conducted, and both an internal and a supervisory report on the ORSA (although these two reports may be the same). Solvency II also requires a summary of the ORSA approach to be made publicly available, so that customers and other external stakeholders can better understand the company’s risk management disciplines and solvency needs. The ORSA policy is expected to include descriptions of the processes, procedures, methodologies, and data quality standards used by the company. This would typically include information on the frequency and timing of the ORSA and how associated stress tests, sensitivity analyses, reverse stress tests, and other

To submit comments about this paper or to report any problems with the website, please send an email directly to riskbookcomments@actuaries.org.
relevant analyses are to be carried out. This ORSA policy is also expected to justify why the selected approach is suitable, given the company’s risk profile and how this profile might vary through time.

Public disclosures may also help to promote wider adoption of best practice ORSA disciplines, benefiting the industry and customers more generally. However, as stated earlier, since the ORSA reports would likely contain proprietary information that management would not want to disclose to competitors, confidentiality of the information must be given the highest priority.

8. Insurance Supervision and ORSA

In certain regulatory regimes, supervisors may have the authority to require enhancements to ORSA approaches if they be deemed to be deficient, or to penalize companies in specified ways.

Supervisors have the general authority to request information from insurers where that information is deemed important to understand the nature of the risks assumed and the adequacy of capital to provide for those risks. Supervisors may ask for additional information or analysis sufficient for this purpose if it is not already contained within the ORSA, or other relevant risk and capital assessment processes of the insurer. In some circumstances supervisors may also exercise their authority to affect capital targets by imposing additional external constraints to be taken into account by the insurer in its own capital identification process.

9. Actuaries and ORSA

Since the conduct of ORSAs is often highly technical, companies are likely to rely on actuaries and other professionals to lead or provide support for ORSA processes. While actuaries have a key part to play in ORSA processes, it is important that they work with other professionals who will also have a part to play, including other colleagues in risk, finance, legal, claims, and underwriting. In addition it is important actuaries in solo companies interact with their colleagues in group roles when applicable.

Actuaries are highly experienced in assessing complex topics, and have the skills and professional processes and perspective needed to create valuable risk analysis frameworks for management, boards, and regulators. Beyond their experience with ERM and ORSA, actuaries have practiced in areas in which they commonly assess the impact of low-frequency and high-severity events such as extreme market conditions, pandemics, or hurricanes. Traditional actuarial functions, such as pricing and reserving for insurance companies, include estimating the central tendencies of likely future outcomes and developing an understanding of the variability around those estimates. Pricing and reserving may require the estimation of margins for risk variability, and development of those margins requires a deep understanding of risk. Further, actuaries apply risk assessment techniques that account for the nature, scale, complexity, and correlation of a wide range of risks and that reflect risk-mitigation strategies.
I. Recent Professional Milestones

1. In 2009, actuaries embraced tailored ERM education through the Chartered Enterprise Risk Analyst (CERA) program, which expands on the existing risk management education of actuaries. The CERA syllabus requires that the actuary master such topics as the drivers and practical aspects of ERM, relevant regulation and regulatory capital requirements, and ERM standards and leading practices that are in use around the world.

2. In 2013, the U.S. Actuarial Standards Board (ASB) formally adopted Actuarial Standards of Practice 46 and 47 in regard to actuarial services relating to the evaluation and treatment of risk. The ASB is currently considering whether further guidance is needed for the conduct of capital adequacy assessments, and expects to publish an exposure draft in the second half of 2016.

3. The Actuarial Association of Europe (AAE) is preparing European Standard on Actuarial Practice 3 on actuarial practices in relation to the ORSA process.

4. In 2014, a similar project was initiated by the International Actuarial Association (IAA) to prepare an International Standard of Practice in relation to ERM.

5. In 2015, an issue brief developed by the IAA on the “Value of the ORSA” to a board was formally approved for distribution.

Maryellen Coggins, FCAS, MAAA, CERA, is a Managing Director at PwC. She is located in Boston, Massachusetts, USA. Her principal areas of expertise include enterprise risk management and property & casualty insurance. She can be contacted at mary.ellen.j.coggins@us.pwc.com.

Nick Dexter, FIA, FSA, is a Senior Advisor at the Prudential Regulation Authority and is based in London, United Kingdom. His principal areas of expertise include life insurance and enterprise risk management. He can be reached at Nick.Dexter@bankofengland.co.uk.

Malcolm Kemp, FIA, M.A., CERA, is Managing Director of Nematrian Limited and is based in London, United Kingdom. His principal areas of expertise include risk, investment management, and quantitative finance. He can be contacted at malcolm.kemp@nematrian.com.

John Oost, AAG, RBA, is a Senior Risk Manager at Achmea. He is located in Zeist, The Netherlands. His principal areas of expertise include enterprise risk management and Solvency II. He can be contacted at john.oost@achmea.com.

Using the Core Curriculum

Purpose
The IAIS Insurance Core Principles (ICPs) provide a globally accepted framework for the supervision of the insurance sector. The ICPs is suitable to apply to insurance supervision in all jurisdictions regardless of the level of development or sophistication of the insurance markets and the type of insurance products or services supervised.

The Core Curriculum provides non-commercial training materials to support insurance supervisors as they implement the ICPs. They give insight and background to the ICPs and the concepts underlying them. There is also a focus on the practical application of supervisory concepts.

Supervisory practices are constantly evolving reflecting experience and changing environments. Consequently, Core curriculum materials should not be read as providing ‘the answer’ to a particular issue, but as providing guidance, approaches and matters to be considered by supervisors when they address specific issues in their own particular context.

Audience
The key users of the Core Curriculum material include:

- Trainers of insurance supervisors
- Individual insurance supervisors, and
- Other parties interested in sound and effective regulatory and supervisory practices.

Link document
The Core Curriculum Link document provides a mapping between the ICPs and the Core Curriculum modules. As ICPs and/or the Core Curriculum modules evolve, their relationship is described by the Link document (see www.iaisweb.org). This allows users to navigate from ICPs to relevant Core Curriculum modules and in the opposite direction.

Learning advice
Different users have different needs to and will use the Core Curriculum modules in different ways. The Core Curriculum Learning advice document provides users with suggestions on using Core Curriculum materials to meet a variety of needs. You are recommended to use the Learning advice document (see www.iaisweb.org) to support your use of the Core Curriculum modules.
This module

Summary

The purpose of this module, 5.1.1, Reinsurance, is to provide an introduction to reinsurance, focusing on the following:

- Purpose and role of reinsurance
- Financial impact on a ceding insurer of reinsurance protection bought
- Security of the reinsurance protection bought
- Insurer failures due to reinsurance issues

Several points are relevant when reading this module. First, reinsurance is as broad and as complex as the insurance industry itself. As a result, in some cases, this module raises questions rather than providing answers. Second, the area of reinsurance and risk transfer is continually evolving area. For these reasons, users of this module should seek further review before making judgments or decisions based solely on information contained here.

Learning objectives

When you complete this module, you should be able to:

1. Identify and gain familiarity with key elements of reinsurance, including:
2. Most commonly used definitions in the field
3. Why insurers buy reinsurance
4. Variety of reinsurance protection traded
5. Understand the mechanics of reinsurance as a risk mitigation technique
6. How reinsurance works
7. Effects of reinsurance on the ceding insurer
8. How reinsurance relates to the overall ceding insurer’s risk management
9. Uses and misuses of reinsurance
1 Definition of reinsurance

Reinsurance refers to a mechanism that an insurer uses to obtain protection against some or all risks associated with the insurance policies it issues. Typically, this process involves an assuming reinsurer who, for a consideration, indemnifies the ceding or direct insurer against some or all of the loss it may incur under a policy or policies it has issued. From here on, the term “insurer” is used to mean the direct or ceding insurer, and the term reinsurer is self-explanatory.

1.1 Terms used

Many of the insurance related terms used in this module are defined in the IAIS Glossary of Terms (see www.iaisweb.org). When additional terms are used they are defined in the text.

The terms regulation and supervision are often used interchangeably, but they mean different things. In this module, regulators establish “the rules of the game,” such as regulations and guidelines related to an Insurance Act (or Acts). Supervisors are the “referees” whose role is to oversee that these rules are complied with and deal with the consequences of non-compliance. This requires supervisors to apply judgement when making determinations and decisions. Understanding the difference between the regulation and supervision is important when allocating of responsibilities between regulators and supervisors, especially when they are different agencies.

In this module “supervisor” is used to include both regulators and supervisors. The module also assumes that supervisors are insurance supervisors. Supervisors, as determined by the context of the particular use, may be either the individuals working for a supervisory agency or authority or the authority itself.

While the terms used in this module are suitable for the purposes of this module, it may be that in specific real situations, more detailed definitions or explanations are necessary. These more detailed definitions may also vary between jurisdictions.

Some terms may not have unique meanings, and definitions contained in various sources may differ. To avoid ambiguity and reduce the risk of misuse and misinterpretation, readers should take care to be comfortable they are clear on the definitions of the terms used.

1.2 Important aspects of reinsurance

Several important consequences flow from this definition:

- Direct insurer liability to policyholder. The direct insurer remains fully liable to the policyholder to whom policies were issued. In general, policyholders are unaware
of any reinsurance arrangements. If the direct insurer defaults or fails, policyholders do not have a direct claim on reinsurers.

- **Risk transfer.** Reinsurance transfers risk undertaken by the direct insurer. Establishing whether the risk is transferred properly requires identifying the risk(s) transferred, quantifying the risk(s) transferred, quantifying the considerations and benefits involved, and assessing whether the risk(s) transferred and considerations involved are appropriate to each other.

- The term reinsurance does not include specific insurance that an insurer may take out to address risks it has not underwritten, such as workers’ compensation insurance taken out by the insurer to cover injuries to employees. It is also possible that the insurer may choose to “self-insure” such risks if doing so is legally permitted and if the appropriate expertise, controls, and processes are in place. Issues relating to self-insurance are not pursued here.

- **Retrocession.** A reinsurer may transfer to other reinsurers some of the risk assumed. This is a common occurrence. Conceptually there is little difference between a retrocession by a reinsurer to another reinsurer and reinsurance between a direct insurer and a reinsurer, except that the retrocession is a transaction between “peers.”

- **Alternative Risk Transfer.** The risk transfer process does not necessarily require the involvement of another (re)insurer. Other risk transfer approaches may serve the same purpose as reinsurance in certain circumstances.

  For example, an insurer may purchase protection via an Industry Loss Warranty (ILW) which is a financial instrument that enables the insurer to collect a payment from the protection seller, not necessarily an insurer, based not on a loss suffered by the insurer. Different from ordinary insurance, ILWs do not operate on an indemnity basis; payouts are determined by the levels of losses suffered by the industry as a whole. This module focuses on reinsurance, although some alternatives are mentioned.

- **Process risks.** The implementation of reinsurance arrangements contains a number of risks that need to be considered. Reinsurance basis risk is the risk that the reinsurance cover might prove insufficient for the risk in question because the need for reinsurance has not been precisely identified.

  This may occur if, for example:

  o The insurer incorrectly identifies the need for reinsurance or incorrectly describes the need to reinsurers.
Relevant clauses in the reinsurance contract are inappropriate or omitted. Also, the wording of reinsurance contracts may be incompatible with the underlying insurance contracts, particularly in harder reinsurance markets when greater exclusions may be applied.

- **Operational risk.** This is the risk that the people, process, or systems on which the management and execution of the reinsurance process depend will fail or be inadequate. Outsourcing risk may also arise. Reinsurance arrangements are subject to the same risks as other outsourced functions. These risks may be exacerbated when a reinsurer is domiciled outside the supervisor’s and, most likely, the direct insurer’s jurisdiction.

- **Reinsurance credit risk.** While the insurer may pass risk to the reinsurer, the insurer takes on some risks, of a different nature, as a consequence. In particular, the insurer takes on the risk that its reinsurer might fail and so void the reinsurance coverage.

- **Specialisation.** A given insurer may be a direct insurer for certain risks, but a reinsurer for other risks. This gives rise to the use of the terms outward reinsurance and inward reinsurance (sometimes called reinsurance assumed) to describe the two directions in which the reinsurance arrangement may flow. While insurers may be specialist reinsurers or specialist insurers, it is not uncommon for insurance entities to be involved with both outward and inward reinsurance.

1.3 Other commonly used terms

Many terms take on specific meanings in the context of insurance and reinsurance. Moreover, while some terms used in reinsurance are recognised internationally, other meanings may vary from one jurisdiction to another. The following list includes key terms specifically relating to reinsurance:

- **Automatic treaty.** A reinsurance contract under which risks written by the reinsured are automatically assumed (accepted) by the reinsurer subject only to the terms and conditions of the treaty

- **Ceding company.** The company that places reinsurance as distinguished from the company that accepts reinsurance

- **Direct writer.** In reinsurance, the company that originally writes the business

- **Excess-of-loss reinsurance.** A form of reinsurance whereby the reinsuring company reimburses the ceding company for the amount and only the amount of loss the ceding company suffers over and above an agreed aggregate sum in any one loss or in a number of losses arising out of any one event
• **Facultative reinsurance.** Reinsurance effected item by item and accepted or declined by the reinsuring company after scrutiny as opposed to reinsurance effected by treaty

• **Quota share reinsurance.** A contract that reinsures an agreed fraction of every risk of the kind described in the contract, which the ceding company writes

• **Reinsurance.** Insurance placed by an underwriter with another company to reduce the amount of risk assumed under the original insurance

• **Reinsurance basis risk.** The risk that the amount of reinsurance might prove insufficient to cover the risk in question because reinsurance needs have not been identified precisely, with the result that relevant clauses of the reinsurance contract might be inappropriate

• **Reinsurance credit risk.** The risk that a reinsurer might prove unable or unwilling to pay its part of the liabilities or the claims incurred, which can put the insurer’s liquidity at risk and even cause its bankruptcy

• **Reinsurance risk.** The risk that reinsurance coverage will be insufficient or that reinsurers will fail to pay their part of the overall liabilities (or incurred claims) evaluated on a gross basis; this risk can be separated further between reinsurance basis risk and reinsurance credit risk

• **Retention.** The act of retaining an exposure to loss; also that part of the exposure that is retained

• **Retrocession.** The amount of risk that a reinsurer reinsures and the amount of a cession that the reinsurer passes on.
2 Purpose and benefits of reinsurance

2.1 Purpose

Insurers can be expected to undertake overall risk management programs. Within this, a key technical aspect is the control and management of underwriting risk. Underwriting is the process by which an insurer determines whether or not and on what basis it will accept an application for insurance, thus offering coverage against the specific risks identified.

In general, insurance can be viewed as an economic device whereby the individual substitutes a small certain cost (the premium) for a large uncertain financial loss (the contingency insured against) that would exist if it were not for the insurance contract. That is, the basic purpose of insurance is to provide individual policyholders with a means to spread or diversify risk that might otherwise be unacceptable or unmanageable to the individual. The mathematical justification as to why this can work in practice lies in the law of large numbers.

The law of large numbers concludes that, when statistically identical risks are pooled together, the larger the pool of risks becomes, the smaller the relative variability in results becomes. That is, the larger the pool, the more likely it is that the total amount of claims will converge to expectations (presuming no errors in underlying assumptions). Mathematically, the coefficient of variation, defined as the standard deviation divided by the mean, provides a measure of the relative variability of a statistical distribution—in this case, the distribution of claims results. It can be shown that the coefficient of variation of a sum of independent, identically distributed random variables is inversely proportional to the square root of the number of variables in the sum. This mathematical result is what makes insurance viable: by pooling large numbers of statistically similar risks, the individual, large coefficients of variation combine to provide a sufficiently small coefficient of variation for the pool.

Several key observations follow:

- **Capital.** The variability of results is reduced, because capital typically must be held to provide support in the case of adverse results—that is, adverse variations from expected results. In practice, capital is in limited supply for insurers and reinsurers. The pooling effect of reducing variability of results translates to reducing the capital requirements, when measured on a per policy basis. Alternatively, the need for capital increases at a slower rate than the growth rate of an insurance portfolio (assuming statistically independent and identical risks).

Reinsurance can reduce the probability of occasional large losses, reducing the variability of results, thereby potentially reducing the minimum capital that the insurer is required to hold.
• **Homogeneous risks.** In practice most pools of insured risks are not homogeneous. While homogeneity is a useful assumption for demonstrating the validity of the insurance concept and may be assisted by appropriate underwriting, it does not hold in practice. To the extent that risks are not homogeneous in type, severity, or frequency, the theoretical results are weakened.

This highlights the importance of insurers and reinsurers understanding the structure of their insured pools and sub-pools of risks. In the case of reinsurers who rely, perhaps entirely, on the underwriting of the ceding insurer, there is the added risk of underwriting error or bias of the insurer to consider.

• **Independence of risks.** The justification for pooling presumes that risks are independent of each other. Again this is rarely true in practice, and there may be correlations, albeit of varying strengths. A clear example of correlations is the level of geographic concentration of risk for, say, hailstone damage to motor vehicles.

• **Pooling in reality.** Despite the warnings in the prior two points, the pooling effect is strong, and it is generally held that, for similarly distributed variables that are not strongly correlated, the law of large numbers, which provides the basis for insurance, will continue to hold.

In summary, the traditional justification for reinsurance is the same as for insurance. The pooling of (similar) risks reduces the variability of the overall outcome. In the same way that insurance provides a means for policyholders to manage their risks, reinsurance provides a means for insurers to manage their risks. In particular, reinsurance offers an opportunity for ceding companies to cede risks or portions of risks that are outliers, thus increasing the homogeneity of their retained (net) insurance portfolios. Hence reinsured risks are typically large or concentrated in some way.

Most non-life reinsurance contracts last for one year and cover only a specified line of business. Life reinsurance contracts, in contrast, usually cover indefinite periods and commonly contain a termination condition for new business only.

The structure of a typical non-life reinsurance contract provides the opportunity for additional levels of pooling, such as covering an extended period, multiple product lines, or both. While commensurately harder to price and manage, the additional protection provided by increased pooling is a compensating advantage. This is one aspect of finite risk reinsurance and blended reinsurance covers.

Reinsurance provides an insurer with the opportunity to diversify certain risks, typically those that may reduce the homogeneity of the insured pool for some reason. Moreover, the insurer may not have the desire or sufficient capital to hold a full insurance portfolio and so may seek to share the risk with a reinsurer. In each of these situations, the transfer of risk is the key to
supporting the adequacy of the insurer’s capital position. From an accounting perspective, it is important to ensure that sufficient risk is transferred for the arrangement to qualify as reinsurance.

### 2.2 Benefits

A number of advantages generally accompany the implementation of reinsurance programs, these include:

- **Diversification of underwritten risk**, which limits catastrophic risks, total claims, and the variability of total claims in various ways.

- **Increase in new business capacity**, which provides the insurer with the ability to take on larger risks than it might prudently consider on a “standalone” basis.

- **Access to expertise**, which provides product advice, especially in the case of new or innovative products, underwriting advice, especially in the case of products new to the insurer, and claims advice, especially in the case of long-term insurance and emerging industry experience.

- **Opportunity to divest a product line**, for example, when an insurer plans to exit a certain business or product, perhaps in a given geographic area. In some cases, this may be via an assumption reinsurance arrangement where, in principle, the policyholders are notified that liabilities will be transferred permanently to the reinsurer and that all future premiums and claims will become the direct responsibility of the reinsurer.

- However, it is important to recognise specific national legal issues regarding the details of the transfer. Alternatively, a more standard indemnity reinsurance arrangement, contractually binding between the insurer and reinsurer (but leaving the policyholder’s direct contractual relationship with the insurer only), may be put in place.

- **Financial results management**, which allows insurers to use the financial reporting implications of reinsurance agreements to change their reported results. Specifically, reinsurance may enable insurers to stabilise annual earnings over time, improve capital efficiency, reduce strains from undiscounted technical provisions, spread or improve income tax effects, and provide financial leverage. In all cases, changes to reported profitability occur even if they are only changes in timing.

An example is relief from frontend strain, particularly in life insurance. The accounting and income tax treatments of reinsurance related items may also have a significant impact. While such arrangements may be subject to abuse, they also have a legitimate role in business development and support: for example, they may
relieve the financial strain on the insurer arising from the issue of capital intensive products. Abuses include the manipulation of financial results without significant transfer of risk.

- *Transfer of investment risk*, most commonly in life insurance with regard to interest sensitive life and annuity products, either to take advantage of the reinsurer’s asset management capabilities or to avoid undue concentration of assets.
3 Types of reinsurance

3.1 Treaty and Facultative

From a procedural perspective, there are two basic forms of reinsurance: obligatory reinsurance and facultative reinsurance.

- **Obligatory reinsurance**, where the insurer and reinsurer have in place a formal treaty or agreement for the cession of risks. Key to the treaty is that the insurer is obliged to cede risk to the reinsurer and the reinsurer is obliged to accept those risks from the insurer consistent with the terms of the treaty. In the non-life context, such treaties are typically annual, whereas in life insurance they may be for longer or indefinite periods.
  
  Such insurance is sometimes alternatively known as automatic or treaty reinsurance.

- **Facultative reinsurance**, when the ceding insurer is free to choose whether or not to offer an individual policy to a reinsurer for reinsurance and the reinsurer is free to choose whether or not to accept the risk. This approach is useful when either the insurer has a sum insured remaining after obligatory reinsurance is exercised or the policy covers risk not included under obligatory reinsurance. Facultative reinsurance is typically used only for larger or more complex risks.

In some cases, combinations or variations on these basic forms may appear, such as automatic facultative reinsurance. In this case, a reinsurer accepts certain risks that conform to agreed underwriting criteria. The agreement may require the sharing of such risks by one or both parties or make such risk sharing voluntary. Such arrangements are most commonly seen in the context of life insurance.

From a structural perspective, reinsurance may be either proportional or non-proportional. Both structures may occur in either an obligatory or a facultative context.

3.2 Proportional reinsurance,

In this case the insurer and reinsurer share the risk in accordance with a formula that is defined prior to the contingency occurring. The insurer and reinsurer share both the premiums and claims in a way predetermined by a reinsurance treaty. So, for each reinsured risk, the ratio between the risk retained and the risk ceded determines the split of premiums, technical provisions, and claims. Typically, the reinsurer pays reinsurance commissions to reimburse the insurer for agent commissions and other incurred costs.
There are two basic forms of proportional reinsurance: quota share reinsurance and surplus reinsurance. In the case of *quota share reinsurance*, each risk is split between the insurer and reinsurer in a fixed proportion (the quota) of the premiums. In the case of *surplus reinsurance*, the risk in excess of a specified level, or surplus retention limit, of risks underwritten is taken up by the reinsurer (in full).

For life insurance, within the context of proportional reinsurance, there are several common approaches, including:

- **(Traditional) coinsurance**, in which the reinsurer receives a proportionate share of all of the risks and cash flows of the policy. Often the policy fee remains with the ceding company. The reinsurer receives its share of the premiums and benefits and sets up its share of the technical provisions. The reinsurer usually pays an allowance (reinsurance commission) to the ceding company to represent the reinsurer’s share of the acquisition and maintenance expenses.

- **Modified coinsurance**, which differs from traditional coinsurance in that the assets supporting the technical provisions are held by the ceding company, including the assets supporting the portion of the risk assumed by the reinsurer. The ceding company is required to pay interest that the reinsurer would have earned if it had held the assets corresponding to the technical provisions in its own investment portfolio.

- **Yearly renewable term**, in which the insurer reinsures a specific risk, in exchange for premiums that change from year to year, based on amounts at risk and ages of the policyholders from year to year.

### 3.3 Non-proportional reinsurance

This also provides protection to the insurer, but the amount of protection depends on the claim amounts on a block of polices rather than on a specific predetermined amount of claims on individual policies. The reinsurer reimburses the insurer for claims in excess of a predefined amount. Non-proportional reinsurance is normally arranged under a treaty, with the premium being expressed as a percentage of the direct premium.

In some cases, profit-sharing arrangements may be built into the policy, such as is common with group life reinsurance.

There are several forms of non-proportional reinsurance. In all cases, the insurer retains the cost of claims up to a certain limit, commonly called the deductible or retention limit:

- **Excess-of-loss reinsurance** covers claims arising from a single event, treating separately each policy affected. Some care may be needed in the case where a
single policy provides cover for multiple claims (such as in liability insurance). Such reinsurance is often termed *working excess-of-loss reinsurance*.

- **Catastrophe reinsurance** covers large claims arising from a single infrequent event, but the claims amount is the aggregate over the group of policies affected.

- **Stop-loss reinsurance** covers all claims arising in a specified period, with the claims amount being the aggregate over the group of policies affected. Stop-loss insurance is rare in practice.

In the context of non-life insurance, the term *coinsurance* is typically used to mean an arrangement in which a risk is split into separate parts and each part is insured, on identical terms, by separate insurers. Such coinsurance may be arranged by brokers or through an ongoing arrangement between a group of insurers.

In practice, not all risks in excess of a defined retention level are passed from the insurer to a reinsurer, and risks not passed to the reinsurer remain with the insurer. Moreover, insurers may combine different types of reinsurance to address combinations of risks. Usually insurers have a reinsurance program made up of a number of treaties to cover a variety of risks. Such a program may also be supplemented by facultative placements for the more exceptional risks. This introduces a level of complexity into the reinsurance program, as different policies may cover different groups of risks over varying lines of business. It also introduces a risk that there may be inadvertent gaps in the reinsurance cover.

### 3.4 Order of application

For non-life reinsurance, reinsurance coverage is usually applied in the following order:

- Facultative reinsurance
- Proportional reinsurance (surplus and quota share, but may apply after excess-of-loss or after catastrophe insurance)
- Non-proportional reinsurance, in the following order: excess-of-loss (on net cost of claims after surplus recoveries), catastrophe (on event costs net of surplus and excess-of-loss recoveries), and stop-loss (on net cost of claims after all other recoveries).

For life insurance, reinsurance coverage is usually applied in the following order:

- Obligatory treaties, typically including proportional reinsurance
- Facultative reinsurance
- Non-proportional reinsurance.
Stop-loss treaties are not very common, and automatic facultative treaties are rare in the property-casualty business. These unusual types of treaties may be effective in special circumstances, but the most common treaties are proportional and per occurrence excess treaties. For normal casualty lines, small companies will combine quota share treaties (to increase the number of exposures) with per occurrence excess treaties in various layers. Large companies will forgo the quota share treaties. For property insurance, surplus share treaties and catastrophe covers are the usual ones.

Patterns in the choice of reinsurance covers will change over time and be affected by the state of the reinsurance market. For example, non-proportional contracts give reinsurers greater capacity to manage risk and so can be a feature of hard reinsurance markets.

### 3.5 Lines and layers

Particularly in non-life reinsurance, where the claim amount may vary significantly and may not be “capped” by a specified amount (for example, liability insurance, asbestos claims, and public liability claims), it is common to express the extent of coverage provided under a reinsurance treaty in terms of “lines” of coverage. Usually a line is a multiple of the retention limit.

So, for example, a surplus reinsurance treaty of five lines over a retention limit of $50,000 provides coverage of $250,000 over the retention limit. If the claims exceed $300,000 (the sum of the retention limit for the insurance and the five lines covered by the reinsurer), then the claim amounts in excess of $300,000 become the responsibility of the insurer. If a claim may exceed the amount covered by the lines, then the insurer should consider either a further surplus reinsurance treaty, perhaps with another reinsurer, or facultative reinsurance to cover the risk.

Limits on reinsurance coverage provided by a single reinsurer under a particular reinsurance treaty introduce the potential need for insurers to develop more complex reinsurance programs, involving more than one reinsurer, to cover their needs. Different treaties may then cover different “layers” of reinsurance. The reinsurance treaty covering the initial amounts in excess of the retention limit would be called the first layer, and then subsequent treaties would be the second and subsequent layers of reinsurance. The pricing of different layers of reinsurance typically varies due to changes in the underlying profile of the risks insured (as they move toward the tails of the overall risk distributions) and on whether reinsurance markets are hard or soft.

A reinsurance program for a particular insurer may become quite complex and difficult to manage. This highlights the importance of insurers having adequate internal controls on the design and management of their reinsurance programs. The structure of the reinsurance program may vary, depending on the particular lines of business considered.
For life insurance, reinsurance treaties may only cover claims for lives insured with names starting with certain letters of the alphabet (for example, A–K) as a further risk-spreading mechanism. Generally, life reinsurance programs are less complex than non-life ones.

### 3.6 Alternative risk transfer

*Alternative risk transfer* covers a range of risk transfer mechanisms that, for some reason (e.g. a special feature in the reinsurance arrangement), are not considered to be traditional reinsurance. Several types of alternative risk transfer products have emerged, including:

- **Insurance Linked Securities (ILS)**, an umbrella term used to describe cessions of insurance risk that are funded by the capital markets. ILSs are often broken down into four loosely defined groups known as “catastrophe bonds” (cat bonds), “collateralised reinsurance”, “industry loss warranties” (ILWs) and “sidecars”. These four groups, which are not mutually exclusive, focus on different elements of the risk transfer arrangements.

- “Cat bonds” take the name from the financial instrument (i.e. a debt security) issued to fund an insurance exposure, usually a catastrophe one.

- The name “collateralised reinsurance” is generally used to highlight the credit risk mitigation feature of certain insurance transactions (i.e. the collateralisation of the insurance exposure).

- “ILWs” refer to a range of financial instruments used by counterparties, which may or may not be insurers, to buy or sell protection related to insurance risks.

- Finally, the label “sidecar” is used for a legal entity created ‘on the side’ of an insurer and used to transfer insurance risk, usually to the capital markets.

- Hypothetically, there could be a “sidecar” that underwrites insurance risk via an “ILW” and funds the exposure through an issuance of “cat bonds”, the proceeds of which are used to “collateralise” the reinsurance risk assumed. Finally, while some ILSs are used in the life and non-life sectors (e.g. cat bonds may be issued to cover property catastrophe risk as much as pandemic risk), it is the non-life sector where this kind of alternative risk transfer has developed the most.

- **Contingent or committed capital**, in which a contractual commitment is made to provide capital, in the form of senior debt, preferred shares, and so forth, after a specified adverse event triggers the option. The expectation is that the cost of capital will be lower before the contingent event than after. Although potentially a useful means of managing risk, this is not an insurance product.
- **Multiyear or multilime products or multi-trigger products**, in which the users can consolidate risk and combine uncorrelated risks, thus allowing more efficient risk transfer to insurers or reinsurers. The multi-trigger aspect is designed to prevent moral hazard and requires a second event, highly correlated with the insured’s financial circumstances, to trigger payments.

- **Structured finance or credit enhancement**, in which the (re)insurer provides some form of financial guarantee to the borrowing institution, lowering its credit costs.

With the exception of finite risk insurance, these products are not considered further here.

### 3.7 Finite risk reinsurance

Finite risk reinsurance has evolved over time, essentially in the non-life insurance sector.

Finite risk reinsurance is based on the same instruments as traditional reinsurance. It has the following characteristics:

- **Timing risk.** The transfer of underwriting risk and the transfer of timing risk, with emphasis on the time value of money

- **Limited assumption.** Limited assumption of risk by the reinsurer, capping the potential economic downside for the reinsurer

- **Multiyear.** Multiyear period of contracts, providing some smoothing of experience

- **Investment income.** Explicit inclusion of investment income in the contract

- **Profit sharing.** The sharing of results between the insurer and reinsurer.

An issue that arises in some jurisdictions is whether there is sufficient risk transfer for finite risk reinsurance to be accounted for as reinsurance. For example, the September 11, 2001, terrorist attack in New York City, major accounting scandals, and the weakened state of several high profile insurers and reinsurers raised concerns about finite risk reinsurance and its accounting treatment. These concerns have been reduced, although treatments may vary among jurisdictions. In some cases, “blended” reinsurance covers emerged, combining traditional and finite risk reinsurance. This has the advantage of reinforcing the transfer of risk and of providing more cost effective reinsurance coverage by pooling over both product lines and multiple years.

Insurers commonly engage in our main forms of finite risk reinsurance:

- **Loss portfolio transfer (LPT),** in which the insurer transfers an existing loss portfolio and associated reserves to the reinsurer. This reinsures the timing risk of the claims being settled more quickly than expected. LPTs also improve the balance sheet
position, especially in the year of writing. By permitting insurers to exit particular lines of business, LPTs can facilitate mergers and acquisitions.

- **Adverse development cover (ADC)**, which protects the insurer against unexpected adverse development of claims that remain with the insurer. This provides protection against adverse incurred but not reported (IBNR) and incurred but not enough reported (IBNER) events. ADCs also improve balance sheet position, facilitate mergers and acquisitions, and may improve access to traditional excess covers.

- **Finite quota share (FQS)**, which is similar to traditional quota share but addresses the insurer’s financial needs more effectively. The insurer cedes part of its unearned premium provision and in return receives a reinsurance commission. This provides smoother financial results for the insurer, increased and stabilised underwriting capacity, and assistance with solvency requirements.

- **Spread loss treaty (SLT)**, which provides the insurer with more stable capacities and prices due to the multiyear nature of the contract. The insurer pays a specified premium into an “experience” account held by the reinsurer. At the end of the term, the experience account is settled. This smooths results for the insurer, reduces variability in underwriting, transfers timing risk, and stabilises reinsurance.

### 3.8 Retrocessions

A reinsurer may itself choose to spread risk further to other reinsurers. Such a process is called retrocession. In principle, retrocessions further diversify risk.

However, in practice, some issues can make retrocession less beneficial. It is often the case that reinsurance arrangements are not “look through” in the sense that a reinsurer may not disclose to an insurer where its retrocessions may be placed. As a consequence there is the possibility of a risk going through a “spiral” among a group of reinsurers and, ultimately, at least in part, unknowingly being passed back to the original insurer. A well-known example of a reinsurance spiral is the London market excess spiral of the 1980s, which either caused or contributed to the failure of several reinsurance companies in the early 1990s.

Although it may be difficult to assess the risk of reinsurance spirals, this suggests that an assessment of immediate reinsurers alone may not be adequate. Some understanding of the retrocession policies of reinsurers, as well as an assessment of the breadth of retrocession markets, can be helpful. In markets where the number of reinsurers is limited, the risk of reinsurance spirals may be increased.

Similarly, for an insurer dealing with both inward and outward reinsurance, inward reinsurance can bring the risk of retaking on its own risk without intending to: the insurer sells the initial
business, keeps the retention, reinsures, and then gets back some of the reinsured risk, either
directly from the reinsurer or indirectly through a more complex loop.

3.9 Government sponsored pools

There are certain perils, for example, floods or other natural disasters, or terrorism that
generate risks that are unlike other risks. They may be extremely severe and extremely
infrequent; in some cases, there is no precedent. They may not have the random nature typical
of other risks, like in the case of terrorism. Often, protection from these risks is provided by
government sponsored pools.

Motivations behind government pools vary by jurisdiction. In the US, for example, some pools
have arisen in the face of market failure of private sector insurance following a significant
natural disaster or, in the case of terrorism risk, the motivation was to address the un-
insurability emerging from the September 11 2001 terrorist attacks. In general government
contains relate to provision of affordable insurance and/or to the provision of insurance in the
absence of a market for it. Government pools have certain advantages over the private sector
including their ability to raise funds post-event, but face financial unsustainability given, for
example, political intervention to maintain affordability of cover in high-risk areas.

Examples of government sponsored pools include:

- Natural Disasters:
  - The Mexican Programa MultiCat México, that covers risks from hurricanes and
    earthquakes, and operational since 2009. MultiCat was jointly developed by
    Mexico and the World Bank and covers not only losses emerging from property
    damage but also post-event emergency costs. MultiCat is funded by ILSs (i.e. cat
    bonds), described in Section 3.1 above
  - The Caribbean Catastrophe Risk Insurance Facility (CCRIF) a regional risk pooling
    facility that offers parametric insurance designed to limit the financial impact of
    catastrophic tropical cyclones, earthquakes and excess rainfall events on Caribbean
    governments. CCRIF was created in 2007 and like MultiCat, it counted with the
    support of the World Bank. Also, like MultiCat, CCRIF is funded by ILSs (i.e. cat
    bonds), described in Section 3.1 above
  - The African Risk Capacity (ARC) offers, among other things, insurance coverage for
    drought, cyclone and flood to member countries. ARC has been active since 2012
    and over the years in excess of 30 African counties have become members.
  - The USA National Flood Insurance Program (NFIP), created in 1969 and
    administered by the Federal Emergency Management Agency (FEMA). NFIP cover
    damages from floods.
Also, at state level, other US programmes include:

- The Texas Windstorm Insurance Association (TWIA), originally created in 1972 and offering windstorm and hail insurance. TWIA also funds part of its exposure via cat bonds

- The Texas Catastrophe Reserve Trust Fund (CRTF), established in 1993 and providing property catastrophe insurance on natural disasters

- The Florida Hurricane Catastrophe Fund (FHCF), established in 1993 and providing property insurance on natural disasters. FHCF also funds part of its exposure via cat bonds

- The California Earthquake Authority (CEA), established in 1996 and providing both property and casualty insurance on earthquakes. CEA also funds part of its exposure via cat bonds

- The New Zealand Earthquake Commission (EQC), covering losses from hurricanes, tsunamis and volcanic eruptions amongst others.

- The Turkish Catastrophe Insurance Pool (TCIP) that has been offering earthquake insurance since 2015. TCIP also funds part of its exposure via cat bonds

Terrorism:

- The Australian Reinsurance Pool Corporation (ARPC), established in 2003

- The Belgian Terrorism and Reinsurance Pool (TRIP), operational since 2008

- The Danish Terrorism Insurance Pool for Non-Life Insurance (TIPNLI), operational since 2010

- The French Gestion de l’assurance et de la Réassurance des Risques Attentats et Actes de Terrorisme (GAREAT) and Caisse Centrale de Réassurance (CCR) of 2002 and 1946 respectively

- The German Extremus Versicherungs-AG, operational since 2002

- The Israeli Compensation Fund according to the Israeli Property Tax Act of 1941

- The Dutch Nederlandse Herverzekeringsmaat schappij voor Terrorismeschaden N.V. (NHT), operational since 2003

- The Spanish Consorcio de Compensacion de Seguros (CCS), of 1941

- The British Pool Reinsurance Company Limited (Pool RE), of 1993

- The USA Terrorism Risk Insurance Program (TRIP), of 2002
Exercises

Ex 2  Explain how finite risk reinsurance may differ from traditional reinsurance.
4 Levels of retention

4.1 Balancing risks

In general, insurers do not seek to transfer more risk to reinsurers than is efficient for capital purposes. The decision regarding the efficient or optimal level of retention for an insurer is often complex and subject to judgment; it can change over time as business objectives and conditions vary. There is a balance to be drawn between the cost of the reinsurance cover and the capital required to support the portfolio.

On the one hand, the desirable amount of retention depends on three elements: (a) the insurer’s current level of risk aversion (usually measured by a certain probability of failure, over a fixed time period, that the board of the insurer approves as acceptable, such as a probability of failure of 0.1 percent over one year), (b) the amount of capital the insurer is prepared to put at risk to support the portfolio, and (c) the variability of claims results expected from the portfolio, in terms of both size and time of occurrence.

On the other hand, the desired level of retention needs to be balanced against (a) the cost of the reinsurance cover considered desirable, (b) the availability of the desired cover, (c) practical issues in implementing the desired cover, and (d) any minimum retention criteria.

Insurers and reinsurers may set “per risk” and “per event” risk retention limits as well as consider blocks of business in aggregate.

Ideally, among other things, risk retention should be related to the ability of the insurer to access relatively liquid funds (noting that tangible assets may include illiquid assets).

A standard approach is to assess the level of retention required for a “typical” insurer—the “base” retention—and then to adjust this to apply to different classes of business and to determine more appropriate retention levels for a particular insurer.

Theoretical approaches to assessing retention levels generally depend on the mathematics of risk theory and are based on established actuarial models. The mathematics involved can get complex quickly and are outside the scope of this module.

4.2 Market practice

In practice it is not always possible to apply theoretical approaches—for example, due to inadequate data, particularly in the case of reinsurers. Approximations, experience, established practice, and judgment can all play a major role in the assessment and pricing of reinsurance cover.

• Prices quoted for reinsurance cover may vary for a number of reasons, including:
The reinsurer’s willingness to do business with a particular insured
The reinsurer’s willingness to offer a particular type of coverage
The general reinsurance marketplace and competitive issues
The amount of claims variation cover inherent in the reinsurance risk transfer.

Reinsurers are generally reluctant to provide unlimited coverage, except for statutory classes of business, such as workers’ compensation and motor bodily injury, where the insurer is required to provide unlimited cover. Unless additional layers of cover are put in place, risks in excess of the reinsurance limit are the responsibility of the insurer.

For the main classes of reinsurance, the following limits generally apply:

- **Quota share**. Limits are seldom imposed.
- **Surplus**. The overall limit is often a matter of administrative convenience, based on the business the insurer expects to write, and may be coupled with facultative cover.
- **Excess of loss**. The overall limit is driven by the maximum sum insured or the probable maximum loss (PML), which may be assessed by the insurer or based on industry data and discussions. An understanding of the assumptions and processes used to set the probable maximum loss is usually central to the understanding of reinsurance programs.
- **Catastrophe**. The limits may be based either on industry practice and analyses or on rules of thumb. A pragmatic approach proposes that the catastrophe limit is between two and four times the probable maximum loss for a catastrophe zone.

In all cases, depending on the size of the portfolios and other insurer specific needs, comparing the limits of retention and reinsurance cover with industry practice is a useful starting point for reviewing a particular insurer’s retention limits. Catastrophic exposures

### 4.3 Catastrophe retentions

The theoretical approach to setting catastrophe retentions is the same as that used to set excess-of-loss retentions. However, since the risks involved are in the (extreme) tails of the claims distributions and these distributions are poorly understood, it is common to rely on judgment and assumptions regarding experience in setting catastrophe retentions. A rough rule of thumb is that catastrophe retentions are often set at two to five times the basic excess-of-loss retention level, with the lower multiple usually being associated with higher basic retentions.
Catastrophe covers generally have quite tight definitions of what constitutes an event, particularly regarding the time frame of an event; they clearly specify the number of claims required before the cover is triggered. As with other insurance and reinsurance cover, catastrophe covers may contain limits to their continuity or the number of events claimable before the cover ceases.

Because the reinsurer is taking on the more extreme variability of result in the typically poorly understood tails of claims distributions, catastrophe cover may be relatively expensive.

4.4 **Minimum levels of retention**

The reinsurer must consider not only the ongoing business objectives of the insurer but also the question of “moral hazard” if the insurer retains only a small portion of the risk. See the discussion of “fronting.” Consequently it is common for reinsurers to insist, as a matter of prudence, that insurers retain a “reasonable” amount of their underwritten risks. There are no fixed rules regarding appropriate minimum retention levels, and these may vary depending on the circumstances of the individual insurer.

**Exercise**

Ex 3 What types of reinsurance are most commonly used in your jurisdiction, and what are the average levels of retention over the last five years?
5 Impact of reinsurance and risk transfer

5.1 Accounting treatment

The accounting treatment applied is of crucial importance to assessing the financial impact of reinsurance. Different accounting treatments may lead to significantly different reported financial results. Further, the accounting treatment of reinsurance arrangements may well flow through and affect income tax calculations.

Accounting standards may lead to the development of products specifically designed to take advantage of specified accounting treatments. As an example, U.S. statutory accounting does not allow immediate recognition of the equity in unearned premium provisions. Consequently, some insurers purchase proportional reinsurance treaties with ceding commissions as a surplus relief mechanism. Also, U.S. statutory accounting does not allow discounting of claims provisions, which creates an incentive to achieve the effect of discounting indirectly through the purchase of claims portfolio transfers.

There is an argument that insurance business, especially long tailed business, which remains in place over a number of years and accounting periods and has significantly uncertain cash flows, is not always well served by accounting practices that presume that all transactions are short term and have a measure of certainty. The issues around matching and spreading or smoothing transactions over a number of years can be significant and generate material issues.

In general, accounting standards must be followed, and insurers and supervisors rely both on the financial results provided and on the external audit typically required. Accounting standards evolve over time to reflect changes in environment and practice. It is an ongoing responsibility of insurers and reinsurers to remain abreast of developments and current professional standards.

In the context of insurance and reinsurance, the underlying accounting principles can be listed as follows:

- **Premiums.** Premiums are recognised from the risk attachment date, and the revenue earned is measured over the period of insurance in accordance with the incidence of the risk.

- **Expenses.** Premiums ceded to reinsurers are recognised as an outward reinsurance expense in accord with the pattern of reinsurance service.

- **Gross reporting.** Accounting for insurance and reinsurance transactions should be on a gross basis.
• **Liability recognition.** Technical provisions for outstanding claims are recognised for direct and inward reinsurance business and are measured as the present value of expected future payments.

• **Claims recoveries.** Anticipated claims recoveries from reinsurers are recognised as assets where the amounts can be measured reliably and calculated as the present value of the expected future receipts.

Recognition generally is on an accrued basis for premiums, on a policy or claim admitted basis for technical provisions, and on a received basis for claim payments. There is inherent uncertainty in the assessment of future claims, and this uncertainty increases the further into the future the finalisation of the claim is likely to be.

In order to apply these principles to an insurance transaction, the purported reinsurance arrangement needs to satisfy a test that a significant transfer of risk has been involved in the transaction. It is generally accepted that risk in this context includes both underwriting and timing risks, but it may not include investment risks. Risk also implies an expectation of a reasonable range of outcomes, which cannot be biased by the affected participants, from the transaction. The key to the test is the meaning or interpretation of the word significant.

Some jurisdictions (for example, the United States) have taken a more black-letter law approach and established a specific benchmark to determine whether significant risk is transferred. This test indicates that significant, or material, risk transfer has taken place if there is at least a 10 percent probability of at least a 10 percent loss by the reinsurer, with specific consideration of catastrophe risk, which does not have a 10 percent probability of occurrence. No matter what rules are in place, it is hard to sustain a position that 1 percent—namely, 1 percent—of a risk is a significant transfer of risk. A further potential difficulty is that such an approach creates an arbitrage point for players to move around and seek to subvert, in intent if not in form. Also, the assessment of such probabilities from the actuarial perspective cannot be exact, as they reflect the impact of future experience, which can be estimated but not known.

Other countries may take a more principles based approach aimed at assessing the intent and economic outcomes of the transaction (a “look through” approach). Also, in some countries supervisors may have to approve reinsurance arrangements before they are put in place and reserve the right to vary or void an arrangement after its inception. In principle, while valid arguments may be advanced in favour of such an approach, it may carry an element of moral hazard for the supervisor. If there is an adverse outcome, the supervisor may be blamed for a decision that should have been made by the insurer’s board and management.

If a transaction is not treated as reinsurance, it will be treated as a “funding” contract, meaning, effectively, as a loan. Ideally, a zero result should then be achieved, implying that discounting is being applied to the future claim recovery payments. The importance of allowing a
transaction to be treated as reinsurance can be seen in the following example regarding non-life insurance, which is relevant to a jurisdiction that does not permit the use of discounting when calculating technical provisions.

If a deposit is paid in return for a sequence of future payments derived from the invested premium, then, if properly accounted for in terms of present values, the contract should achieve essentially a zero result on the balance sheet at inception. However, treating the premium as reinsurance and the future “recovery” payments, at face value, as recovery payments leads to an apparent immediate increase in the insurer's solvency position. This occurs because premium income, net of reinsurance, is reduced, but net outstanding claims are reduced at the significantly higher undiscounted face value of the future recoveries.

The issues around whether a proposed arrangement may be treated and accounted for as reinsurance have been highlighted by the growing prevalence of financial reinsurance and some recent incidents in which reinsurance contributed to the failure of the insurer. In many cases, the insurer and reinsurer entered into a reinsurance arrangement in order to engage in a form of regulatory arbitrage, with the transaction being viewed as a transfer of risk and providing the associated accounting relief in the insurer’s jurisdiction, but with the reinsurer’s jurisdiction not viewing the transaction as involving a transfer of risk. As a result, no liability or capital requirements are ultimately created.

As insurance and reinsurance are generally accounted for under the same principles, most of the issues discussed here for reinsurance also arise in the context of standard insurance.

### 5.2 Effect on insurer’s financial position

Reinsurance, and other risk transfer mechanisms, can affect an insurer's reported financial results and capital management. Indeed, reinsurance arrangements provide capital adequacy assistance to an insurer's financial position.

Approaches taken to understand the financial effects of reinsurance include:

- **Ratios.** It is common to use ratios to provide a foundation for this analysis and resulting conclusions. Specific ratios for reinsurance include: cession and retention rates (the proportion of gross premiums ceded or retained by the insurer), maximum event ratios (the extent to which the insurer holds capital to cover such events; if not, the insurer may be at risk, which puts the appropriateness of the reinsurance program in question), and reinsurance recoveries (expected claims recoveries relative to net technical provisions).

- **Trends.** Insight can be gained from examining the trends in an insurer’s results over time.
• **Assessment of position excluding reinsurance.** Using reinsurance related information explicitly provided, ratios and other analyses are recomputed removing the impact of the reinsurance entries. Comparison of the ratios, including and excluding reinsurance, may, particularly if results “straddle” minimum or key values (for example, whether operating profits are positive or negative), provide focus for further investigation of the insurer.

• **Reflection of credit risk assessment.** To reflect the possible impact of credit risk of a reinsurer, ratios may be recomputed to reflect the potential default by the reinsurer on some expected claims obligations.

The impact of reinsurance in an insurer’s financial statement should be considered in the context other specific circumstances of the insurer. For example, small and newly established insurers face different challenges than larger and better established insurers. Different product lines have different risk characteristics, and, particularly for new products (either to the insurer in particular or to the market overall), high levels of reinsurance may be appropriate. These comments apply equally to reinsurers when assessing the impact of retrocessions.

### 5.3 Appropriateness of a reinsurance strategy and program

The insurer is responsible for establishing its reinsurance program. A number of elements help understand the soundness of an insurer’s reinsurance strategy and program, including:

• **Insurer’s position,** in particular the insurer’s risk profile, business, exposure, retention level, and structure. This means considering the insurer’s risk profile, risk tolerance, and available capital, the nature and extent of its gross business (such as the spread of business by geography and business class, which may be particularly important in the context of catastrophe covers), and the distribution of its exposure to identify large potential claims. Regarding retention level, this means considering the optimisation of retention levels for reinsurance programs in terms of costs and benefits, which is generally a complex matter in practice even if theoretically possible.

• Practical constraints, which imply that judgment is required in determining a good reinsurance program, include matters such as the need to work within the context of an established program, maintain continuity and long-term relationships with reinsurers, obtain sufficient detailed pricing information from reinsurers, and consider the impact of reinsurance pricing cycles and availability. Considering the structure of reinsurance programs means considering matters such as the choice of reinsurer, type of reinsurance, and diversification of reinsurance business among reinsurers.
• **Insurer’s reinsurance governance processes.** The board of directors and senior management are responsible for governance. The board of directors reviews and approves the insurer’s reinsurance strategy in the context of its risk profile, capital, and business plans. This should include strategies for:

  - Managing and monitoring the reinsurance program
  - Ensuring compliance with relevant legal and supervisory requirements
  - Setting appropriate risk limits.
  - Senior management implements the reinsurance strategy, including matters such as:

    - Ensuring that clear policies, procedures, and internal controls are established and maintained
    - Setting and approving specific program structures and limits
    - Ensuring appropriate, accurate, and timely reporting
    - Ensuring the presence of appropriate systems and processes of internal control to govern the interaction of the insurer with the reinsurer(s) with regard to reinsurance transactions. Such systems should be regularly reviewed.

• **Impact of external standards.** External standards affect the reported financial position and business management of insurers. Issues to consider include, but are not limited to, accounting standards and income tax. Accounting standards evolve over time and may not support long-term risk transfer. Such issues may be of heightened interest once the new international accounting standards are introduced, as expected in many countries over the next few years.

  - For example, the proposal to prohibit equalisation and catastrophe reserves may be significant, especially for reinsurers. The treatment of items for income tax purposes can significantly affect the insurer’s management decisions. In the context of reinsurance, it may affect the levels and types of reinsurance covers put in place.

Finally, changes in reinsurance capacity can also affect the capacity of direct insurers. That is, insurers may assume incorrectly that consistent reinsurance capacity will always be available; they need to ensure they are not overly exposed to the impact of a sudden reduction in reinsurance capacity. In an extreme, as happened after the September 11 terrorist attacks, this may result in a significant withdrawal of capacity from direct markets.
Exercise

Ex 4 Confirm how reinsurance arrangements are treated for accounting purposes in your jurisdiction. Explain why it may be to the disadvantage of an insurer if a purported reinsurance arrangement is not accounted for as reinsurance.
6 Security of reinsurance

From the perspective of an insurer, security of reinsurance can be viewed in terms of the appropriateness of placing business with the reinsurer. As noted, the insurer is responsible for conducting appropriate risk assessment and assuring itself of the financial soundness of the reinsurer. In managing the security of reinsurance, insurers should consider:

- **Consistency of approach.** Appropriate and up-to-date board and senior management reinsurance strategies must be consistent with the insurer’s risk appetite and approach and be reflected in reinsurance contracts.

- **Legal and statutory framework.** Understanding the framework is especially important if the reinsurer is not domiciled in the same jurisdiction as the insurer.

- **Financial assessment.** Appropriate and documented criteria are needed to assess the financial condition and credit risk of reinsurers.

- **Business practices.** It is important to understand the reinsurer’s underwriting and claims practices (understanding the underwriting and claims policies and procedures of the reinsurer and how they will integrate with the insurer’s practices and reporting), the use of alternative risk transfer tools, and the investment policy, including the use of derivatives.

- **Management.** It is important to evaluate the expertise, quality, and stability of management of the reinsurer.

- **Structural indicators.** Indicators of importance include ownership structures, affiliates, and group (assessment of any affiliated companies and other members of any group to which the reinsurer belongs).

Reinsurers should apply similar criteria when considering retrocessions.

6.1 Outsourcing

The general issues involved with the management and assessment of outsourcing apply in the case of reinsurance as well. Typically, reinsurance treaties seek to cover many of the issues involved with outsourcing in the context of reinsurance.
Exercise

Ex 5  What considerations should be taken into account and processes put in place by insurers (and so considered by supervisors) to manage reinsurance arrangements from the perspective of considering reinsurance as an outsourced service?

6.2 Operational risks

It is not uncommon for insurers to give the management of reinsurance matters a relatively low priority. Symptoms of the low priority accorded reinsurance matters include delays in the completion and signing of reinsurance treaties, poor administrative practices, and weak systems for reinsurance (for example, poor or manual reporting processes).

Although board or other high level approval or consideration may be needed for reinsurance matters and policies, it is a separate matter to ensure that the approved policies are implemented adequately and appropriately.
7 Failures and reinsurance

Insurers and reinsurers can, and do, run into financial problems. When an insurer or a reinsurer ceases to meet certain regulatory requirements like capital and surplus requirements or other financial conditions requirements, supervisors designate them as ‘financially impaired insurers’. Impairments may be successfully addressed or not. If unaddressed the insurer may be liquidated. Looking at insurer’s impairments and liquidations may provide a valid indication of the prevalence of the matter in the market.

7.1 Insurer failure

A longitudinal study by credit rating agency A.M. Best looking at impairments and liquidations among insurers rated by it found that over the period 1978 to 2015 a total of 761 cases of insurers, including reinsurers, that at some point were designated as impaired. The table below provides detailed of this:

</table>

The data above was drawn from a pool of 5,183 insurers, including reinsurers, that A.M. Best rated during the period. It is interesting to note that the period 1984 – 1993 represent one of heavy impairments, peaking in 1990 – 1991, with 92 impairments, or 12% of all impairments. A.M. Best attributes this circumstance to life and health insurers’ purchases of junk bonds and commercial mortgage holdings and to property and casualty insurers’ exposure to catastrophic losses.

Analysis of the 1978-2015 impairment dataset shows that when looked at average cumulative impairment rate over 15 year periods, rates vary dramatically depending on the rating of the insurers. For example, over 25 years while, the average cumulative impairment rate of an A+ rated insurer appears to be of 6.69%, the same indicator increases to 19.32% for a B+ rated carrier and to 40.47% for a C+ rated insurers.

AM Best also looked at the share of insurers that fail to address the causes of impairment and were liquidated. In this respect, and following the example of the A+ rated insurer above, average cumulative liquidation rate appears to be of 1.62%. This figure grows to 6.30% for B+ rated insurers and 13.80% for C+ rated insurers.

In addition to the prevalence of impairment or liquidation, it is important to understand the causes underlying these phenomena. At a summary level, perhaps 5–10 percent of insurer failures can be attributed to the failure of reinsurance in some form, and perhaps up to a further 5–10 percent can be attributed to causes (in particular, catastrophes) that could, or perhaps should in retrospect, have been reinsured.

From the reinsurance perspective, a couple of comments are relevant. The primary cause of insurer failures appears to be inadequate management and inadequate internal controls in the great majority of cases. Moreover, reinsurance risk appears to be a common trigger for problems.

### 7.2 Reinsurer Failure

From the reinsurer perspective, causes of failures include the following:

- Insufficient capital
- Insufficient IBNR or other technical provisions
- Fraud
- Catastrophic events
- Poor underwriting
- Over exposure to a high-risk market
- Risky assets
• Mismanagement
• Default of retrocessionaire
8 Abuses of reinsurance

An example of an abuse of reinsurance is “fronting,” where an insurer, often with minimal capital of its own, is established with a view to reinsuring the great bulk of the risks underwritten. This type of arrangement poses several significant problems:

- **No incentive for the direct insurer.** There is moral hazard in that the direct insurer has no or little incentive to underwrite or administer to claim properly, as reinsurance commissions probably outweigh any losses that may arise from the low level of retention.

- **Inappropriate ownership structure.** Major problems may arise when the reinsurer also owns the fronting company or vice versa.

An incentive for fronting may be an agent or broker seeking to capture not only commissions but also reinsurance profits, without the usual capital requirements or skills and experience to deal with adverse experience. In the event of a failure by the reinsurer, the full obligation for the direct insurance contracts reverts back to the insurer.

A review of retention levels is the key to detecting and addressing fronting. In general, reinsurers expect insurers to retain a significant amount of risk in order to provide an incentive to manage their insured business well, and there may also be supervisory constraints on the level of retention required. In general, insurers tend to seek to develop long-term relationships with their reinsurers.

Reinsurance issues have been involved in a number of high profile failures, and some are noted here:

- **HIH Group in Australia.** The HIH Royal Commission has established the role of abuses of reinsurance and financial reinsurance agreements in the failure of HIH Group in 2001. The situation was compounded by the existence of “side letters,” unknown to the supervisor and other parties. These voided some of the terms of the treaty. Also, the directors of the company may have been unaware of the side letters, calling into question the quality of the overall corporate governance of HIH. There is a large CC Case study which discusses HIH.

- **Gerling in the United States.** Gerling’s U.S. subsidiaries failed due to credit losses, the September 11 terrorist attacks, and asbestos losses. Gerling’s other reinsurance subsidiaries provided support, which, in turn, caused them to fail, even though they raised additional capital. This illustrates the risk of group contagion.

- **Independent Insurance Company Limited in the United Kingdom.** This significant and fast growing non-life insurer closed to new business in June 2001 and went into receivership. While the major cause of its demise appears to be under
reserving, some of the company’s reinsurance arrangements appear to have been questionable.

- **Reliance National in the United States.** This insurer fronted large amounts of workers’ compensation carve-out business. A reinsurance spiral behind it collapsed, leaving the company unable to pay claims. The subsequent loss of reputation then caused healthy non-U.S. companies in the group to fail.

- **Cardinal Insurance in the United States.** This insurer obtained stop-loss cover at very low premium rates, virtually ensuring that it made a profit no matter how bad the business experience. The reinsurer argued that the reinsurance cover was obtained in a fraudulent way and did not pay the claims. Cardinal was liquidated.

**Exercise**

**Ex 6** Explain why “fronting” has the potential to lead to abuse of reinsurance arrangements.
9 Reinsurance contracts

Reinsurance treaties should satisfy the standard requirements of contracts as well as address the particular needs of the specific reinsurance arrangement under consideration. This includes immediate matters such as having good records of treaties and ensuring that all current treaties are properly signed and executed.

9.1 Contract Content

At a summary level, reinsurance treaties should address the following broad areas:

- The details of parties
- Business line(s) covered, including limits and exclusions
- Premiums and commissions
- Management of changes in policies covered, such as changes in sums insured under inflation clauses
- Reporting between the parties
- Claims requirements and processes
- Profit-sharing arrangements, where applicable
- Arbitration in case of dispute, for example, through differing interpretations of a treaty or omission of information in a treaty
- Governing laws
- Accounting criteria
- Termination conditions, ensuring that the conditions of termination are clear because, particularly in the case of life insurance, they may refer only to new business or may involve the recapture of existing business previously placed with the reinsurer.

Some template reinsurance contracts are publicly available. A review of these templates shows some of the complexities involved in establishing clear and comprehensive reinsurance arrangements.

9.2 Timing

Especially when insurers or reinsurers are in difficulty or have failed, the clarity and completeness of documentation supporting reinsurance arrangements become increasingly important. However, in general business practice, clear and complete documentation is
considered good practice and should emerge as a result of good corporate governance processes.

9.3 Life and non-life reinsurance contracts

The discussions in this module are applicable to both life and non-life insurance unless specifically indicated otherwise. Several differences have been noted:

- **Reinsurance program structure.** Life reinsurance treaties tend to cover indefinite periods, and the termination conditions affect new business only, whereas non-life reinsurance arrangements traditionally last for one year and cover only a specific line of business.

  This increases the importance, for non-life reinsurance, of ensuring that proper documentation, such as cover notes, is in place. Facultative reinsurance is more common for life insurance. The term "coinsurance" has very different meanings in the context of life and non-life reinsurance, as may the usual order of application of reinsurance cover. The use of layers is common in non-life insurance, but not in life insurance.

- **Product structure.** Many life insurance products, especially traditional whole-of-life and endowment products, have high initial expenses that are expected to be recouped over the later years of the contract. This can lead to initial capital strain for life insurers. Reinsurance may alleviate some of this initial capital strain.

  This phenomenon is not as pronounced with non-life insurance, in which one year insurance contracts predominate.

- **Finite risk and alternative risk transfer.** While more recent developments in reinsurance can be used in the context of life insurance, they have developed primarily in the non-life context.

- **Supervisory regimes and practices.** Legislative requirements, actuarial approaches, and industry practices vary between life and non-life insurance and hence are reflected in reinsurance considerations. This is not surprising given the nature of the risks covered.

- **Retention levels.** Industry retention levels, in general, are significantly higher in life insurance than in non-life insurance. This reflects the increased heterogeneity of non-life insurance risks as well as the increased volatility of non-life insurance risks.

- **Credit risk.** Reinsurance failures of some type are a significant, although not the most likely, cause of failures of insurers, particularly for non-life insurance.
• **Complexity, volatility, and change.** As a general comment, the role of reinsurance is more important, more complex, and more subject to change and volatility in the non-life than in the life insurance industry. The non-life insurance, and so reinsurance, industry is more subject to changes in expectation, legislation, and volatility in potential claims than the life insurance industry. As a specific example, consider the ongoing risks and issues relating to the past use of asbestos.
10 Further reading

10.1 General sources

Many texts are available which are relevant to the material in this module. These texts may also go beyond the scope of this module, but usually include introductory chapters on the basic topics.

When reading these texts it is useful to consider the principles being as well as the details of their application in a particular environment. Also, it is important to recognise that as the environment changes the relative importance of issues may also change.

Other sources of information are also available. For example, in many countries there is an insurance institute of some form. The Chartered Insurance Institute (CII), based in England, provides a range of good educational programs and has links to more than 70 other insurance institutes worldwide (see www.cii.co.uk).

In some cases, supervisory websites are also valuable sources of information. This can be particularly the case when supervisors publish explanatory information explaining their requirements and approaches.
11 Review questions

R1 Outline the benefits that may be achieved by an insurer implementing an effective reinsurance program.

R2 The law of large numbers justifies the use of insurance to pool risks. Extend this to justify the use of reinsurance, despite the need for reinsurers to hold capital.
Appendix 1: Answers to Exercises and Review questions

Exercises

Answer 1  With proportional reinsurance, the insurer and reinsurer share the risk in accordance with a formula that is defined prior to the contingency occurring. The main types of proportional reinsurance are (traditional) coinsurance, modified coinsurance, and yearly renewable term. Non-proportional reinsurance provides protection to the insurer, but the amount of protection depends on the claim amounts on a block of policies rather than on a predetermined amount of claims on individual policies. The main types of non-proportional reinsurance are excess-of-loss, catastrophe, and stop-loss reinsurance.

Answer 2  Finite risk is based on the same instruments as traditional reinsurance, but may differ with respect to the following factors: timing risk (the transfer of underwriting risk and the transfer of timing risk, with emphasis on the time value of money); limited assumption of risk by the reinsurer (caps on the potential economic downside for the reinsurer); multiyear period of contracts (provision of some smoothing of experience); investment income (explicit inclusion of investment income in the contract); and profit sharing (the sharing of results between the insurer and reinsurer).

Answer 3  Consult with colleagues regarding the types of reinsurance most commonly used in your jurisdiction and the levels of retention (information may also be collected through regulatory returns or other reports).

Answer 4  Consult with colleagues or review local accounting standards to determine how reinsurance arrangements are treated for accounting purposes in your jurisdiction. The accounting treatment applied is of crucial importance to assessing the financial impact of reinsurance. Different accounting treatments may lead to significantly different reported financial results. Further, the accounting treatment of reinsurance arrangements may well flow through and affect income tax calculations. Accordingly, an insurer’s financial results may appear unfavourable, or the insurer may need to pay higher income tax if a purported reinsurance arrangement is not accounted for as reinsurance.

Answer 5  The general issues involved with the management and assessment of outsourcing apply in the case of reinsurance as well. An insurer remains responsible for meeting its obligations to policyholders, even where it has outsourced functions to others. Adequate controls should exist to ensure that the functions are performed properly. Contingency plans should be in place to deal with the potential failure of the service provider. Typically, reinsurance treaties seek to cover many of the issues involved with outsourcing in the context of reinsurance.
Answer 6  Fronting can lead to significant problems because the direct insurer may have no or little incentive to underwrite or administer claims properly, as reinsurance commissions probably outweigh any losses that may arise from the low level of retention. Fronting is often accompanied by an inappropriate ownership structure, for example, where the reinsurer also owns the fronting company or vice versa. In such cases, the control on risk taking that arises from the independent evaluation of risk by the parties to an arm’s length business transaction will be absent.

Review questions

Answer 1  Possible benefits of a reinsurance program include diversification of underwritten risk, increase in new business capacity, access to expertise, opportunity to divest a product line, ability to manage financial results, and transfer of investment risk.

Answer 2  The pooling of (similar) risks reduces the variability of the overall outcome. In the same way that insurance provides a means for policyholders to manage their risks, reinsurance provides a means for insurers to manage their risks. In particular, reinsurance offers an opportunity for ceding companies to cede risks or portions of risks that are outliers, thus increasing the homogeneity of their retained (net) insurance portfolios.
Core Curriculum for Insurance Supervisors

Module 5.1.1 Reinsurance

Using the Core Curriculum

Purpose

The IAIS Insurance Core Principles (ICPs) provide a globally accepted framework for the supervision of the insurance sector. The ICPs are suitable to apply to insurance supervision in all jurisdictions regardless of the level of development or sophistication of the insurance markets and the type of insurance products or services supervised.

The Core Curriculum provides non-commercial training materials to support insurance supervisors as they implement the ICPs. They give insight and background to the ICPs and the concepts underlying them. There is also a focus on the practical application of supervisory concepts.

Supervisory practices are constantly evolving reflecting experience and changing environments. Consequently, Core Curriculum materials should not be read as providing ‘the answer’ to a particular issue, but as providing guidance, approaches and matters to be considered by supervisors when they address specific issues in their own particular context.

Audience

The key users of the Core Curriculum material include:

- Trainers of insurance supervisors
- Individual insurance supervisors, and
- Other parties interested in sound and effective regulatory and supervisory practices.

Link document

The Core Curriculum Link document provides a mapping between the ICPs and the Core Curriculum modules. As ICPs and/or the Core Curriculum modules evolve, their relationship is described by the Link document (see www.iaisweb.org). This allows users to navigate from ICPs to relevant Core Curriculum modules and in the opposite direction.

Learning advice

Different users have different needs and so will use the Core Curriculum modules in different ways. The Core Curriculum Learning advice document provides users with suggestions on using Core Curriculum materials to meet a variety of needs. You are recommended to use the Learning advice document (see www.iaisweb.org) to support your use of the Core Curriculum modules.
This module

Summary

The purpose of this Core Curriculum module, 5.6.1 Solvency - Principles and structures, is to give readers an overview of the structure of solvency requirements and the need for capital that may be used across the world. While there need to be references to aspects such as liabilities and assets, because they form an essential part of any solvency regime, these are covered in detail in other modules.

Learning objectives

When you complete this module, you should be able to:

1. Describe the basic elements of a solvency regime
2. Describe what is meant by the terms “capital adequacy” and “solvency” and explain the difference
3. Explain the differences between going concern, run-off, and break-up concepts of solvency
4. Explain each of the following reasons for which insurers need capital:
   a) Financing start-up
   b) Financing growth and diversification
   c) Liquidity
   d) Precaution against fluctuation of asset and liability values
   e) Precaution against adverse experience
   f) Public confidence, and
   g) Statutory purposes.
5. Describe the sources of capital for an insurer
6. Summarise steps commonly taken by supervisors to guard against insolvency of supervised insurers
7. Describe the essential elements of a solvency regime
8. Explain the difficulties in measuring capital
9. Describe the criteria used to assess the suitability of potential forms of capital
10. Explain which risks of insurers are more amenable to being mitigated with capital and which are not
11 Compare the following types of capital requirements:
   a) Fixed minimum standards
   b) Standards proportional to size, and
   c) Risk-based standards.

12 Explain the purpose of solvency control levels

13 Explain why a solvency regime may place different requirements on an insurer operating through a branch and describe some commonly used requirements

14 Describe steps that may be taken to prevent the inflation of capital through double or multiple gearing, intragroup transactions, or other financing techniques available as a result of an insurer’s membership in a corporate group

15 Explain the linkages between the ICPs on Solvency and the other ICPs that relate to prudential requirements.
1 Introduction

Insurers, in exchange for the receipt of premiums from their policyholders, take on obligations to pay benefits in the future according to policy requirement.

Whether insurers meet these obligations satisfactorily depends on many things. A core issue is for insurers to have adequate financial resources stay in business and to pay benefits when they come due. The topics of solvency and capital adequacy focus on this. These topics are closely related, but not the same. The focus of this module is on solvency. Policyholders have expectations, so the fairness of how insurers and their intermediaries conduct their business are also important. Other modules address other issues such as market conduct.

1.1 What is solvency?

The word solvency can have many meanings. Therefore, it is important to clarify how it is used in this module and more widely by supervisors.

Commonly, solvency can be taken to mean that, at a specific point in time, a provider of services has more assets than liabilities and so has the capacity to pay all its debts thus meeting all its obligations. At a minimum, this is ‘cash flow’ solvency, meaning that today’s obligations can be paid for. This is simplistic and hides many issues and nuances that should be made explicit. Indeed, it is clearly inappropriate for a long-term insurer. Ponzi schemes are cash flow solvent until the point they collapse. Slightly stronger, having assets exceed liabilities may give some confidence, but does not consider liquidity, quality of assets, or future positions.

Usually, business models flow in the direction of making product first and then selling it. Insurance works in the opposite direction, take in premiums from selling a future promise and then sometime in the future delivering the product of the promised benefits. This implies that there is a strong interest, for both policyholders and supervisors, in the insurer being in business at some point(s) in the future. This future focus become increasingly important as the expected time policies will remain in force increases.

The core challenge is therefore to assess the likelihood of an insurer that is in business ‘now’ still being in business in the future. This is a challenge for both supervisors and insurers. They, and other stakeholders, may take different approaches for making their assessment and so come to differing conclusions. This module focuses on the supervisor’s perspective, no those of other stakeholders. This also highlights the need, when discussing ‘solvency’ to be clear on the context and purpose of the discussion.

The core solvency question to address, therefore, is “How can a supervisor gain adequate comfort that an insurer will remain in business in the future?”.
1.1.1 Time horizon

This highlights the need to specify a time horizon so that the ‘future’ is more clearly defined. An insurer’s obligations at a given point in time, to existing policyholders and claimants, generally will be influenced by future events. Therefore, the obligations can only be estimated. It is impossible to guarantee an insurer that currently appears able to meet its obligations will still be able to do so many in the future. At the other extreme, if an insurer appears able to meet its obligations today but is subject to a high risk that it may be unable to do so tomorrow, then it could not usefully be considered solvent.

A practical compromise employed by many supervisors and solvency regimes, is to use a one-year time horizon. This may also include a requirement to project business plans for longer period (say 3 years) and a demonstration that capital adequacy is expected to be maintained throughout the projection period. This compromise considers an insurer solvent only if it seems very likely that it will continue to be solvent one year hence.

1.1.2 Uncertainty

The nature of insurance business makes it impossible to guarantee solvency with certainty. No matter how financially strong an insurer might be, there may be an economic scenario, natural disaster, or human-made catastrophic event that will lead to insolvency.

A key component of solvency of an insurer is its financial strength. In particular, financial weakness is a threat to solvency. As noted later, there are also other important aspects to solvency.

One assessment of uncertainty with regard to solvency is the focus on the financial strength of the insurer. Having specified a time period to work with, a supervisor can then specify a measure confidence to be met for the insurer to be considered financially solvent.

A common, but not the only, approach is to require a high level of confidence that the insurer is not expected to breach the financial solvency requirement in the specified time period. For example, the Solvency II requirement is that there is 99.5% confidence level over a 1-year time period.

However, the question of how much certainty is necessary or appropriate is a matter of judgment. The process of making such assessment can be complex and challenging. Supervisory judgment may also be required in making assessments once the criteria have been specified.
1.1.3 Purpose

Insurer may experience varying circumstances and so solvency assessment may have varying purposes.

- **Going concern.** Insurers usually seek to operate as going concerns, meaning they are open to new business. Usually without specific supervisory restriction, but with supervisory awareness through appropriate reporting.

  For an insurer to be considered financially solvent on a going-concern basis, it should have adequate financial resources to meet obligations both to existing policyholders and to those who will become policyholders in the future. It is important to note the future orientations of this due to the inclusion of future policyholders. Clearly maintaining going-concern solvency is desirable for all stakeholders.

- **Inforce.** Financial solvency could focus strictly on an insurer’s ability to meet its obligations to existing policyholders. That is, no consideration is given to future policyholders. This may be relevant if the insurer ceased writing new business, either voluntarily or at the direction of the supervisor. It may also be the case if legislatively required. In this case, solvency would be considered assuming the insurer remained in operation, collecting premiums and paying benefits, until all existing policies had expired or matured and obligations under those policies had been settled.

  For some lines of business, such as life insurance, the run-off of business could take many years.

- **Break-up or winding-up.** In these circumstances, the insurer not only would stop writing new business but also its existing obligations would either be settled or transferred to another insurer as soon as possible. A supervisor’s interest in break-up or wind-up solvency will likely be greater than that of an insurer’s shareholders, board of directors, and senior management, who typically are more oriented toward a going concern perspective. In these cases, supervisors’ obligations toward policyholder protection become important.

- **Merger.** A special case of a breakup situation is when two insurers merger. Either one insurer into the other or both into a third entity. In these circumstances, there is a desire to transfer business as quickly as possible. There is also a risk that the insurers’ shareholders, boards of directors and senior management may be distracted from policyholder considerations. In these cases, supervisors’ obligations toward policyholder protection become important.
In each of these cases, the purpose of solvency assessments may be different as there are different circumstances and expectations involved.

### 1.1.4 A definition

We now pull the above discussion together.

- **Solvency** is the ability of an insurer to fully meet its obligations (liabilities) to policyholders as they fall due (in the future).

- **Supervisory solvency** is achieved, at a point in time, if the supervisor has sufficient confidence that an insurer will continuously remain viable, for the purpose of the solvency assessment, for specified length of time into the future.

This requires that the level of confidence, the time horizons and the purpose of the solvency assessment must be defined.

- An assessment of supervisory solvency needs to address many aspects of the insurer and its business.
  - **Capital adequacy.** Are adequate financial resources held? This is assessed by determining if the insurer is capital adequate that is, continuously expected to meet supervisory capital requirements. This includes, amongst other things, assessment of an insurer’s technical provisions.
  - **Liquidity.** Is there adequate liquidity to fully meet its obligations in timely and appropriate way?
  - **Corporate governance.** Are the qualitative requirements of good corporate governance in place? This includes matters such as corporate culture and incentives.
  - **Risk management.** Are the qualitative and quantitative requirements for effective enterprise risk management in place? This includes having the appropriate compliance and control functions in place.
  - Other requirements as specified by the supervisor or in legislation.

When an insurer fails to meet one or more of the supervisor’s solvency assessment requirements, it becomes insolvent from the perspective of the supervisor.

We emphasise that this may not mean that the common meaning of solvency (cash flow solvent) is breached. Rather, it means that, over a specified time period, and for specified purpose, the supervisor does not have sufficient confidence the insurer will be able to continuously meet all its obligations in a full and timely way. We acknowledge that over time this may still lead to loss of value and unmet expectations of policyholders (and perhaps other stakeholders).
As a shorthand, the following definition of (supervisory) solvency can be used:

*Solvency is the ability of an insurer to meet its obligations (liabilities) to policyholders as they fall due. Solvency includes capital adequacy but also involves other aspects of a solvency regime, for example, technical provisions, qualitative aspects (such as would be addressed in an enterprise risk management framework), supervisory review and reporting.*

The reader should be careful to retain a clear awareness of the point discussed above but not explicitly mentioned.

Supervisors monitor the solvency of insurers so they can get early warning of risks to (supervisory) solvency and then take appropriate actions. As the risk of breaching a solvency requirement increases, the challenges the supervisor faces may increase. A key indicator of increasing risk is financial weakness. However, other indicators, perhaps less quantifiable, are also important to support a supervisor forming a balanced view. It is not uncommon for insurers that become (supervisorily) insolvent to still meet capital adequacy requirements when they become insolvent.

Initial actions are likely to be remedial, with the insurer continuing in business and (hopefully) recovering. Actions that are more serious may be needed if the insurer cannot continue in business and needs to be wound up and resolution activities are required. Other modules and ICPs address these matters.

It is implicitly assumed above that the supervisor has the capacity to effectively conduct supervisory reviews and assessments. How supervisory reporting and assessments, for solvency and other matters, should be conducted is discussed in other modules and ICPs.

Although not specifically discussed, we note that if an insurer is part of a group, then the solvency of the group is a different matter to the solvency of each of the individual components of the group. These issues are addressed in other modules and ICPs. This module focuses primarily on a single insurer.

### 1.2 Solvency is challenging

Solvency not only is difficult to define but also can be difficult to maintain. Often, the solvency difficulties could be traced back to internal causes such as problems with management, shareholders, or other external controllers of the insurers. The problems may include incompetence, operating outside areas of expertise, lack of integrity or conflicting objectives, or weakness in the face of inappropriate group decisions. These internal weaknesses can lead to inadequate decision-making processes, internal controls, and risk decisions that, in turn, leave the insurers vulnerable to external “trigger events.” Case study 1 provides examples of problems encountered by insurers in this regard. Clearly, good governance and risk management are essential to the maintenance of solvency.
However, the vulnerability of insurers to financial difficulties can be reduced by ensuring that asset cash flows are available to meet liabilities when they come due, for example, through asset–liability management (ALM) and liquidity management; and by maintaining a safety margin of assets over liabilities. Such a safety margin is provided by an insurer’s capital.

### 1.3 The supervisors role

A fundamental objective of insurance supervision is protecting the interests of current and prospective policyholders. If they are to be protected, insurers must be able to make good on their promises. Those that become insolvent quite likely will be unable to meet their obligations in full and on time. Accordingly, solvency typically is a major focus of insurance legislation, regulation, and supervision.

### 1.4 The need for capital

What is capital? The IAIS Glossary defines capital as the financial resources of an insurer. Capital serves as a cushion against adverse experience and financial fluctuations, helping an insurer to maintain solvency while it deals with the many risks to which it is subject. The manner in which capital adequacy requirements can recognise these risks, which may be categorised as underwriting, credit, market, operational, and liquidity risk), is discussed in section 3. Many of these risks arise from the risk-taking and financial intermediation aspects of the insurance business itself.

However, capital is also essential in enabling insurers to meet the types of strategic and operational needs that it shares with any business. A new insurer needs cash, sometimes referred to as working capital, to finance its start-up expenses. Established insurers need capital to finance the expenses of, and provide a buffer against the risks posed by, diversification into new products, market segments, or geographic territories. As a company’s business grows, the amount of capital needed to provide an adequate safety margin also will grow, although perhaps less than proportionally, if the company is successful in diversifying its risks. At the same time, however, the costs of acquiring new business, particularly in the case of life insurance, may depress an insurer’s profits or even create losses, when the business is taken on (this may be despite the business being expected to make profits over the lifetime of the policies). In addition, the nature of long-term life insurance contracts with relatively high initial expenses can imply that it may take a number of years before a new company starts reporting overall profits.

In light of the fiduciary nature of the insurance business, a strong capital position can increase the confidence of current or prospective policyholders that an insurer will be able to meet its obligations to them. In fact, some insurance consumers, for example, large corporations or insurers seeking reinsurance, may refuse to do business with insurers that lack enough capital.
to qualify for a high rating from a rating agency. Viewed from a broader perspective, an insurance sector comprised of well-capitalised companies contributes to public confidence and the effective functioning of the insurance market.

Thus, the existence of capital may provide a number of benefits beyond keeping an insurer financially solvent. Determining how much capital will be adequate to respond to these various needs can be a complicated process, and, to some extent, a judgment call. The topic will be further explored in section 3.

1.5 Sources of capital

Adequate capital, however it may be defined and determined, is essential to an insurer.

There are a number of possible sources of capital for an insurer, the relevance of each to a particular insurer will depend on such factors as its corporate legal form, who owns it, its stage of development, and its financial position and performance.

Many insurers are constituted as shareholder-owned corporations. The initial capital for such an insurer is obtained by issuing and selling common shares (stock), which provide their purchasers with shares in the ownership of the insurer. Shareholders make this investment in the expectation that the insurer will be successful, that is, profitable and growing. Shareholders may then benefit through the distribution of a portion of these profits to them as dividends, through their ability to sell their shares at a higher price, or both. A shareholder-owned corporation may be either widely held, that is having many shareholders, or closely held with few shareholders. For example, the shares of an insurer that is part of a financial conglomerate may be wholly owned by its corporate parent.

Some insurers, for example, mutuals, friendly societies, and cooperatives, have no shareholders but are owned by some or all of their policyholders. The initial capital for such insurers is obtained from a founding group of policyholders. While their initial capital contributions will be returned to them once the insurer becomes well established, their claim against the insurer is not a transferrable right of ownership that can be sold to a third party, such as that of a shareholder in a shareholder-owned insurer.

Finally, some insurers may be state-owned. In such cases, their initial capital is obtained from the government.

Once an insurer is through its start-up period, its primary source of capital typically will be retained earnings. Retained earnings are the profits that have been earned by the insurer but have not been distributed to policyholders or shareholders. Both shareholder-owned and policyholder-owned insurers may, depending on their licensing requirements, issue participating or with-profits policies, which provide for sharing the insurer’s profits with the policyholders. In the case of policyholder-owned insurers, such policies also confer rights of
ownership, such as the right to elect directors to the board. As mentioned above, shareholders expect to share in the insurer's profits, and the board of a profitable shareholder-owned insurer would typically declare dividends payable to shareholders. However, the board of directors of any type of insurer will usually decide to retain a portion of its profits to expand its capital base.

If an insurer is growing rapidly or has adverse experience, it may need more capital than can be generated, at least in the short term, by profits on its existing policies. Shareholder-owned insurers may be able to raise additional capital by selling more shares to either existing shareholders or new investors. If the insurer is closely held, it most often will look to existing shareholders for additional capital. Additionally, as discussed in section 2, some of the capital raised may be in forms other than common shares, for example, preference shares. In any case, the willingness of investors to provide capital and the terms on which they are prepared to do so will depend on their assessment of the insurer's future prospects.

Policyholder-owned (often referred to as mutual) insurers are at a distinct disadvantage when it comes to raising capital, as they are unable to sell shares to investors. To overcome this constraint on their ability to grow and compete effectively, many mutual insurers have in recent years converted to shareholder-owned insurers, that is demutualised. In a demutualisation, participating policyholders receive shares or cash in exchange for the company ownership rights inherent in their policies. Subsequently, the demutualised insurer can raise capital in the same manner as any other shareholder-owned insurer.

Another technique used by insurers to cope with a shortfall in capital is to reinsure some of their business. Some of the risk is assumed by the reinsurer, thereby reducing the amount of capital needed by the insurer as a safety margin. Reinsurance arrangements might also be structured to provide for the upfront payment by the reinsurer of some of the expected future profits of the business reinsured (financial reinsurance), thereby providing the insurer with immediate additional capital.

An insurer might also decide to borrow money to help meet its needs, for example, by obtaining a loan or by issuing bonds. However, since borrowed money must be repaid together with interest, supervisors normally do not treat it as an eligible capital element. Section 2 includes a discussion of the criteria that might be applied to determine the suitability of different forms of capital.

1.6 Terms used

Many of the insurance related terms used in this module are defined in the IAIS Glossary of Terms (see www.iaisweb.org). When additional terms are used, they are defined in the text.

The terms regulation and supervision are often used interchangeably, but they mean different things. In this module, regulators establish “the rules of the game,” such as regulations and
guidelines related to an Insurance Act (or Acts). Supervisors are the “referees” whose role is to oversee that these rules are complied with and deal with the consequences of non-compliance. This requires supervisors to apply judgment when making determinations and decisions. Understanding the difference between the regulation and supervision is important when allocating of responsibilities between regulators and supervisors, especially when they are different agencies.

In this module “supervisor” is used to include both regulators and supervisors. The module also assumes that supervisors are insurance supervisors. Supervisors, as determined by the context of the particular use, may be either the individuals working for a supervisory agency or authority or the authority itself.

While the terms used in this module are suitable for the purposes of this module, it may be that in specific real situations, more detailed definitions or explanations are necessary. These more detailed definitions may also vary between jurisdictions.

Some terms may not have unique meanings, and definitions contained in various sources may differ. To avoid ambiguity and reduce the risk of misuse and misinterpretation, readers should take care to be comfortable they are clear on the definitions of the terms used.

**Exercises – Section 1**

Answer the following questions considering, where indicated, the practices in your jurisdiction. If you are working with others on this module, develop the answers through discussion and cooperative work methods.

**Ex 1** How might the interests of an insurer’s board and senior management in solvency coincide with those of the supervisor? How might they differ?

**Ex 2** Consider the most recent instances of insurers in your jurisdiction raising additional capital. Why did they do so? What were its sources?

**Ex 3** There is a trend toward broadening solvency regimes to include elements such as risk management and disclosure requirements. Comment on the presence and relative effectiveness of quantitative and qualitative elements in your jurisdiction’s solvency regime.
2 Elements of a solvency regime

2.1 Overview
ICPs are principles based and prescribe the essential elements that must be present in a supervisory regime. The objective is to promote a financially sound insurance sector and provide an adequate level of policyholder protection. The next level after ICPs are standards that are linked to specific ICPs and set out high level requirements that are fundamental to the implementation of the ICPs.

Essential elements of a solvency regime include:

- Valuation of liabilities, including technical provisions and the margins contained therein
- Quality, liquidity and valuation of assets
- Matching of assets and liabilities
- Suitable forms of capital
- Capital adequacy requirements.
- Group supervision

In section 2, each of these elements will be examined in turn, with the exception of capital adequacy requirements (see section 3). Before doing so, it is important to note that while these largely quantitative elements are necessary, their existence alone will not necessarily ensure solvency.

The board of directors and senior management of an insurer are responsible for its prudent operation and, therefore, must take primary responsibility for ensuring its solvency. They need to recognise the range of risks that the insurer faces and manage them effectively. Both the insurers and their supervisors need to understand that not all risks can be mitigated solely with capital. For example, capital can provide an effective safety margin against adverse claims experience on a portfolio of insurance policies that has been prudently designed, adequately priced, carefully underwritten, and appropriately protected by reinsurance. However, weaknesses in any one of these areas might make it impossible, or at the very least economically unfeasible, to maintain enough capital to provide an effective safety margin.

Taken to an extreme, consider how much capital might be needed to secure the solvency of a small insurer that operates in a coastal region prone to hurricanes, writes only property insurance on large risks, applies limited underwriting, and has purchased no reinsurance coverage.

There is a need for various stakeholders of an insurer, such as investors, creditors, policyholders, and intermediaries to have access to information on the risks it has undertaken.
and its financial capacity to bear these risks. Such disclosure by insurers enables markets to act efficiently, and the discipline it engenders serves as an adjunct to supervision.

Supervisors and others have responded to these issues by recognising that capital adequacy and other quantitative requirements should be integrated into broader solvency regimes. For example, EU Solvency II, various IAA publications, and the Basel II Capital Accord for banks each identify quantitative capital adequacy requirements, supervisory assessment of risk management, and disclosure of information as key elements, or pillars, of a broader solvency regime. The relative emphasis on each of these elements may vary by jurisdiction, reflecting differences in such things as supervisory philosophy, market development, and technical capabilities of the insurers. For example, supervisory assessment of risk management might be emphasised in a jurisdiction in which relatively little statistical information exists to support the development of risk weights for a capital adequacy test and few of the insurers are widely held, that is, accustomed to providing extensive public disclosures.

2.2 Liabilities and assets

Solvency is fundamentally an assessment of an insurer's current and, perhaps, prospective, balance sheet. Therefore, it is impossible to make an adequate assessment of solvency unless the liabilities and assets in the balance sheet are valued appropriately. While opinions may differ on what is "appropriate," a coherent solvency regime cannot exist in the absence of reliable and reasonably consistent bases of asset and liability valuation. It is worth noting that many exposures may exist that do not show up on the balance sheet such as high limit policies, large catastrophe exposures, or other concentrations of risk from future events.

To the extent possible, the valuation bases should provide a clear picture of insurers' financial situations, reflecting their economic viability. Distortions should be avoided, as should volatility that is unrelated to the true economics of the business. For example, if assets are valued at historical cost but liabilities are valued based on current market conditions, an insurer's financial results could well be both volatile and distorted. The valuation bases should not only produce results that are comparable from one period to the next for any particular insurer but also facilitate comparisons of one insurer to another.

Supervisors have responded to these measurement challenges in various ways. In some jurisdictions, accounting and actuarial standards provide the bases for the valuations used for both shareholder and supervisory reporting purposes. In other jurisdictions, insurance supervisors specify the valuation bases to be used for reporting to the supervisor, which may differ from that used for shareholder reporting. Still others take intermediate approaches, such as requiring specific adjustments to the valuation bases used for shareholder reporting. Regardless of the approach taken, it is essential that the solvency regime be sensitive to the valuation and accounting requirements that apply to the insurers.
2.2.1 Technical provisions

Technical provisions are the liabilities on an insurer’s balance sheet due to its obligations arising out of insurance contracts. Since technical provisions typically account for the vast majority of an insurer’s liabilities, it is essential that these provisions adequately reflect these obligations. The ICPs require supervisors to establish procedures for assessing the valuation of assets, non-policyholder liabilities and technical provisions. Insurers should comply with these standards for establishing technical provisions, assessing their adequacy, and increasing them if necessary. Supervisors usually also have the power to require insurer’s to increase any and all of the items listed here if they deem it necessary.

Technical provisions, particularly those of life insurers, are often calculated by actuaries. The techniques for doing so are varied and sometimes complex. Regardless of the techniques employed, to the extent possible, technical provisions should reflect all of the risks related to the policies written by the insurer. They should be sufficient to cover not only claims and other policy benefits but also any related administration expenses, taxes, embedded options, and policyholder dividends or bonuses, as well as required margins.

Since the technical provisions are only estimates of an insurer’s ultimate obligations under its policies, whether or not these estimates are adequate can only be known in retrospect, once the obligations have been settled. However, the ICPs give some guidance, saying that technical provisions plus supervisory capital requirements should be sufficient to ensure that policy obligations are satisfied with the probability of sufficiency required by the supervisor. This means that some margin for adverse experience should be included in the technical provisions.

Unsurprisingly, the supervisors, actuaries, and accountants in various jurisdictions have different ideas about how much margin there should be and how it should be calculated. For example, in some jurisdictions, technical provisions are calculated using assumptions that are best estimates plus explicit margins for adverse deviation in each assumption; the actuarial profession provides guidance on the size of these margins. In other jurisdictions, supervisors may limit or specify values for particular assumptions, which, although sometimes intended to be quite conservative, generally do not facilitate identification of the amount of the margin. Finally, some jurisdictions, have begun to explicitly state that the level of the margin should be to provide a particular level of confidence that the technical provisions will be adequate, as determined through stochastic modelling of multiple scenarios. It is important that the method being used should be appropriate to the complexity of the markets and environment in the relevant each jurisdiction.

It is important that capital adequacy requirements be sensitive to the level of margin in the technical provisions and how it may, or may not, change in response to changes in economic conditions and other factors. All else being equal, the supervisor in a jurisdiction in which the technical provisions include explicit margins that vary in accordance with changing conditions
may require its insurers to maintain less capital than the supervisor in a jurisdiction that specifies particular assumptions, whose initial conservatism may erode as conditions change.

2.2.2 Other liabilities

An insurer, like any other business, will have liabilities apart from its obligations under insurance contracts. These liabilities may include amounts borrowed from banks, equipment leases, accrued wages of its employees, pension obligations to both retired and currently active employees, taxes payable, accrued interest, and contingent obligations under derivative contracts. Typically, insurers will account for such liabilities in the same manner as other businesses in their jurisdiction.

Supervisors need to understand how such liabilities are being accounted for by insurers and ensure that the provisions established are adequate. Furthermore, when designing and enforcing a solvency regime, it is essential that supervisors understand the relative legal priority of liabilities to policyholders and those to other parties in the case of insolvency. In recognition of the fiduciary nature of the insurance business, insurance laws in many jurisdictions rank obligations to policyholders above some, but not necessarily all, other liabilities of an insolvent insurer. Furthermore, many jurisdictions also enforce separate policyholder and shareholder funds that can improve security for policyholders, especially for investments and savings of policyholders.

2.2.3 Assets

It is important that assets be realisable to meet obligations to policyholders at any time. Therefore, solvency regimes must address the quality, liquidity, and valuation of assets.

A diversified portfolio of high-quality assets is more likely to maintain its value than one whose assets are speculative in nature. Accordingly, solvency regimes typically include restrictions on the types and mix of assets in which insurers may invest. As discussed in section 3, risk-based capital adequacy requirements also provide an incentive to invest in high quality assets by requiring insurers to hold less capital as a margin against potential losses on such assets than on lower quality assets. Since the amount and timing of obligations to policyholders are seldom certain and, in fact, may fluctuate significantly, insurers need to maintain enough cash or liquid assets to meet these obligations on short notice. Liquid assets are those that can be quickly converted to cash in an amount equal or very close to their value on the insurer’s books. In normal circumstances, cash flows from premium payments and interest on invested assets often are sufficient to enable an insurer to meet its obligations, without the need to realise any assets. However, insufficient liquidity to cope with abnormal circumstances can lead an insurer to solvency difficulties. See case study 1 for an example.
Appropriate valuation of assets is also essential to the determination of an insurer's solvency. Investments must be valued according to a method prescribed by or acceptable to the supervisor. Valuation methods should be prudent, transparent, objective as possible, and produce consistent results. Some assets can easily be valued, for example, cash, government bonds, and shares that are regularly traded on an established exchange. The valuation of other assets may be more complex or subjective, for example, real estate, which may require periodic assessment by experts; and "over the counter" derivatives, which may require the use of models.

To provide greater assurance that the asset values in insurers' balance sheets are prudent, some solvency regimes incorporate mechanisms for deferring recognition of increases in the values of certain assets. For example, increases in the market values of investments in common shares might not be reflected in the balance sheet until the shares are sold, or only a portion of the previously unrecognised increases might be recognised each year. On the other hand, assets that have declined in value, perhaps due to the financial troubles of their issuers, might have to be held at their reduced market values, which are all that could be realised if the insurer were to become insolvent.

The values of some types of assets may diminish, or even vanish, in situations of stress or insolvency. For example, an insurer that has had some unprofitable years may be entitled to apply its losses against future years' profits, thereby reducing or eliminating the taxes payable on those profits. The insurer may carry an asset on its balance sheet in respect of this entitlement. However, if the insurer becomes insolvent, there is no prospect of future profits or tax savings, thereby rendering this asset worthless unless, perhaps, the insolvent insurer can be merged with a profitable one. Other assets that might be of limited value in meeting policyholder obligations in the event of insolvency include the furniture and equipment used by an insurer in its operations, amounts due from insurance intermediaries, and investments in subsidiaries or affiliated companies. Not only are these assets illiquid, but also enforcing the repayment of such amounts in an insolvency situation would likely be very difficult, if not impossible.

Solvency regimes respond to this risk in various ways. One approach is to disallow certain assets entirely, either on the balance sheet that insurers submit to the supervisor or for purposes of the capital adequacy test. In this case such assets are often called non-admitted or inadmissible. Another approach is to limit the recognition of such assets, for example, by ignoring the portion of their value in excess of a defined percentage of the insurer’s assets or by recognising only a certain percentage of their value, sometimes known as “haircutting”. Yet another technique is to apply a high-risk weight to such assets when calculating required capital under a risk-based capital adequacy test.
2.3 Case study 1. Liquidity crisis

In 1999, an American insurer’s credit rating was downgraded by a major rating agency. Shortly thereafter, many investors invoked the seven-day redemption clause in the short-term funding agreements issued by the insurer. Although these agreements suddenly behaved like short-term liabilities, the supporting assets were invested for longer terms.

The insurer was unable to sell assets quickly enough to meet the redemption requests. The combination of a mismatch in the terms of the liabilities and assets and the rating downgrade led to a liquidity crisis, causing the insurer to voluntarily seek state insurance department supervision.

2.3.1 Asset–liability management

As case study 1 demonstrates, a mismatch between the term of an insurer’s liabilities and that of its assets can create liquidity problems that are serious enough to threaten its solvency. However, the need for an insurer to align its assets with its liabilities is important for more reasons than just ensuring adequate liquidity. An insurer’s results can be subject to adverse fluctuations or trends, perhaps threatening its solvency, if its assets and liabilities are mismatched in terms of currency or the timing or amount of the cash flows. The risks may be particularly high in the case of long-term life insurance, annuity, or savings products that provide various guarantees or embedded options.

Solvency regimes need to address the matching of assets and liabilities. One way to do this is to require that insurers develop and implement programs of asset–liability management (ALM). ALM is the practice of managing a business so that decisions and actions taken with respect to assets and liabilities are coordinated. This is done through an ongoing process of formulating, implementing, monitoring and revising strategies related to assets and liabilities to achieve an organisation’s financial objectives, given the organisation’s risk tolerances and other constraints. ALM is relevant to, and critical for, the sound management of the finances of any organisation that invests to meet its future cash flow needs and capital requirements.

A wide range of techniques can be used in an ALM program, for example, stochastic modelling of asset and liability cash flows, Value at Risk (VaR) calculations, and hedging with derivatives. A more substantive discussion of ALM is beyond the scope of this module.

The mitigating influence of a well-executed program of ALM might be explicitly recognised in a solvency regime. For example, a supervisor may require life insurers to hold an amount of capital in respect of the assets backing index-linked products in inverse relation to the correlation between the rates of return credited to policyholders’ funds and the returns earned on the underlying assets. For example, if the returns are shown to be perfectly correlated, this component of required capital may be nil. If the returns are only 85 percent correlated, required capital may be 15 percent of assets.
2.3.2 Reinsurance

Any allowance for risk mitigation or transfer should consider both its effectiveness and the security of any counterparty. Reinsurance is one of the techniques most commonly used by insurers to mitigate or transfer some of the risk that they have assumed. Its use has a number of implications that must be addressed by a solvency regime.

It is important to note that the purchase of reinsurance protection does not extinguish or diminish an insurer’s ultimate obligations to its policyholders. Insurers enter into reinsurance arrangements with the expectation that their reinsurers will make good on their own obligations when they come due. While this expectation usually manifests, it is not a certainty. For example, a reinsurer may become insolvent or an insurer may have entered into an agreement with a disreputable reinsurer that refuses to pay claims promptly or in full. In the case of such a default, the insurer must nevertheless meet its obligations to policyholders out of its own resources.

For this reason, solvency regimes seek to limit this reinsurance counterparty credit risk in various ways. One way is to encourage insurers to deal with reputable, financially strong reinsurers. Insurers should be expected to perform due diligence on prospective reinsurers before entering into agreements with them. Some jurisdictions license and supervise reinsurers and may not allow insurers to deal with unlicensed reinsurers or, if such dealings are allowed, to take credit on their balance sheet for amounts due from unlicensed reinsurers. Others may apply “haircuts” to the credits that may be taken for amounts due from reinsurers that have lower ratings from ratings agencies, or allow credits only if the reinsurer posts collateral in a trust. Some jurisdictions establish limits to prevent excessive concentration of an insurer’s reinsurance program with a single reinsurer.

Credits for reinsurance on an insurer’s balance sheet may take the form of assets, for example, amounts receivable from reinsurers; or of reductions in liabilities, for example, lowering the technical provisions in proportion to the amount of coverage purchased. The precise treatment will depend on the accounting standards applied in the jurisdiction, perhaps supplemented by supervisory requirements.

The above discussion of taking credit for reinsurance on the balance sheet is premised on the assumption that there has actually been a meaningful transfer of risk from the insurer to the reinsurer. This assumption may not always be valid. Some reinsurance arrangements, for example, financial reinsurance, are designed primarily to assist insurers in meeting prudential requirements with little or no transfer of risk. Solvency regimes may include criteria for assessing the effectiveness of the risk transfer and provide no balance sheet credit unless the criteria have been met. Supervisors may need to review not only the financial records of a reinsurance arrangement but also the reinsurance contract itself—along with any “side letters” that may exist—to make such an assessment.
2.4 Capital

Finally, before turning to a discussion of how much capital might be required, it will be useful to consider what forms of capital might be suitable to meet such requirements and how the amount of capital available might be measured.

From a simple accounting perspective, the amount of capital available might be calculated by taking the arithmetic difference between an insurer’s assets and its liabilities. This measurement will obviously be affected by the ways these elements of the balance sheet have been valued. As noted above, the valuation bases vary from jurisdiction to jurisdiction, reflecting differences in accounting and actuarial standards and supervisory requirements. For example, in one jurisdiction, assets may be valued using current market values, while in another jurisdiction they are valued at historical cost. In either case, there may or may not be a mechanism for smoothing the changes in reported values. To the extent that the reported values of assets or liabilities differ from best estimate or fair market values, “hidden reserves” are created; such reserves may be positive or negative.

Within a particular jurisdiction, the valuation bases may also vary from insurer to insurer, although hopefully not too much, reflecting the choices each insurer has made within the confines of the local regime. One insurer may follow an aggressive accounting approach to show more favourable financial results by, for example, minimising the margins in its technical provisions and seeking optimistic appraisals of its real estate investments. Another insurer may elect to include extra margins in its technical provisions and use conservative appraisers in valuing its real estate.

The foregoing highlights the need for supervisors to be fully aware of the valuation and accounting practices being applied by insurers when examining their reported capital. Such awareness may be especially challenging when the examination involves the financial reporting done in the context of another jurisdiction’s requirements. However, simple balance sheet comparisons can easily lead to inappropriate conclusions.

Another way to look at capital is to consider the sources of an insurer’s assets and the nature of any claims against those assets. Predominantly, insurers’ assets come from the premiums paid by policyholders and the returns earned through the investment of those premiums prior to the payment of policy benefits. Likewise, the claims against insurers’ assets consist primarily of its obligations to policyholders. However, as mentioned in section 1, some assets come from sources other than policyholders, for example, the sale of shares. Other assets may arise from policyholders, but exceed the remaining obligation to them, that is, retained earnings. From this perspective, capital can be viewed as the claims against an insurer’s net assets, roughly, assets minus technical provisions and other liabilities. Capital instruments define the nature of those claims.
The capital shown on an insurer’s balance sheet may represent either equity claims or debt claims. Equity claims are defined by instruments such as shares of stock, contribution certificates in respect of the initial capital of a mutual insurer, and participating policies. Debt claims are defined by instruments such as bonds or commercial paper. The precise nature of the claims evidenced by these instruments must be evaluated in determining whether the corresponding amounts of reported capital are of suitable quality to be recognised in the context of a solvency regime.

Solvency regimes should either clearly define the forms of capital that will be recognised as suitable or set out criteria that can be used to assess the suitability of particular capital instruments.

Solvency regimes deal with any differences in the potential capital elements’ availability to cover unexpected losses and their permanence in various manners. Some jurisdictions define one or more categories, or tiers, of capital quality. For example, tier 1 would consist of the highest quality capital, such as common shares, retained earnings and perpetual non-cumulative preferred shares. Tier 2 capital, which falls short in meeting one or both of the quality criteria but still contributes to the overall financial strength of an insurer, might include goodwill and intangible assets, future income tax credits, and hidden reserves. Whether or not a tiered approach is employed, supervisors will generally specify additions or reductions to reported capital for purposes of assessing capital adequacy, for example, non-admitted assets, reinsurance with unregistered reinsurers, and market value smoothing reserves.

Exercises – Section 2.3

Answer the following questions considering, where indicated, the practices in your jurisdiction. If you are working with others on this module, develop the answers through discussion and cooperative work methods.

Ex 4 In your jurisdiction, who establishes standards for the valuation of the assets and liabilities of insurers that are reported in the financial statements prepared for their shareholders? Are these same values used in the supervisory returns? If not, how do they differ?

Ex 5 Technical provisions may be calculated using assumptions that are intended to be conservative, which method provides implicit margins. Alternatively, they may be calculated using “best estimate” assumptions to which explicit margins are added. What are the advantages and disadvantages of each in the context of establishing solvency requirements? Which approach to calculating technical provisions is used in your jurisdiction?
Ex 6 What are some of the ALM techniques used by insurers in your jurisdiction? How does your solvency regime recognise the presence or absence of ALM?

Ex 7 Solvency regimes sometimes seek to limit reinsurance counterparty risk by allowing insurers to take credit on their balance sheets only for reinsurance with highly rated reinsurers. However, if few highly rated reinsurers are operating in a jurisdiction, insurers that want to obtain credit may be subject to concentration risk. How might a solvency regime address this dilemma? What approach is used in your jurisdiction?

Ex 8 What forms of capital are recognised for supervisory purposes in your jurisdiction? How does supervisory capital in your jurisdiction differ from the result of simply subtracting an insurer’s liabilities from its assets?

Ex 9 The highest quality capital is both presently available and permanent. To what extent would you consider each of the elements of capital recognised for supervisory purposes in your jurisdiction to be presently available? To what extent is each permanent?
3  Capital adequacy

Capital adequacy is a concept that considers the interaction of the available resources and compares them to the potential for an adverse outcome that may erode these resources. To the extent that an insurer has sufficient resources to withstand a particular adverse event, it would be “capitalised adequately” if that event happens. The difficulty, however, is that there are many potential adverse events, and they have different likelihoods of occurring and different magnitudes of effects when they do occur. Furthermore, more than one adverse event may occur at the same time; they may be linked in cause and effect creating a correlation effect; or they may magnify or reduce the size of the resources required to withstand them if they occur together rather than separately.

The ICPs indicate that an insurer should be able to recognise, measure, manage, and mitigate the risks that it faces. Capital is one way of providing resources against such risks and is, therefore, a form of risk mitigation. Other forms of risk mitigation include reinsurance and underwriting controls. The regulation of capital has two basic objectives. The first is to provide a minimum level of resources considered prudent for supervisory purposes. This requirement can provide an element of capital over and above that considered necessary by the company itself to meet its business needs. The second is to provide a trigger for intervention.

The IAIS has established a number of features of a solvency regime. These are discussed above. Using the minimum solvency margin as a measure of the capital adequacy of an insurer means that it should be a measure of the level of risk that the company is carrying. It is not possible to have a perfect measure under any circumstance. The best measurements require considerable data collection and information, something usually practical only in the company itself. Therefore, the minimum solvency margin necessarily must be an approximation and be capable of broad, practical application.

The ICPs note that it is useful to establish solvency control levels above the minimum solvency margin. As such, the validity of a point of intervention at, for example, 1.5 times the minimum solvency margin will represent different levels of risk for different companies. This distinction will be more consistent if the solvency margin itself reasonably approximates, or follows in broad terms at least, the level of risk in the company itself.

This section considers the nature of risk, the relevance of capital as a risk mitigation tool, sample structures for a solvency margin, and the use of control levels and stress tests as tools for greater resilience. It briefly comments on issues relating to branches and insurers that are part of conglomerates.
3.1 Risks mitigated by capital

There are many ways to break down the various risks that are faced by insurers and other financial institutions. Several risk taxonomies have been published. The differences among them tend to reflect the preferences of those who prepared them and the level of detail at which individual risks are identified. This module outlines a relatively simple taxonomy.

Ultimately, risk is considered as the potential for variability in outcome, particularly adverse outcomes. If a particular outcome is known with certainty, there is no risk. In reality, even in cases in which the certainty is high, it is rare that a business operation of any sort does not face some uncertainty of outcome. For example, if an enterprise holds notes and coins as an asset, it may feel that their value is certain. However, the value may be reduced in the case of losses due to inadequate storage, misadventure, or theft when insufficiently insured.

More practically, in the case of an insurer, consider the liability side of the balance sheet. The majority of the liabilities consist of provisions for obligations under insurance policies. Depending on the types of insurance, the outcome in terms of claims and their cost will be more or less certain. For non-life insurance policies, both the likelihood of a claim and its size are usually uncertain, whereas the timing of life insurance claims is always uncertain even if the amount of the payment is defined in the contract.

The uncertainty in the financial outcome of an insurance portfolio often is referred to as “technical risk” or “underwriting risk.” Such risk relates to the uncertainty of the outcomes in policies, whether they are in force or have expired but for which claims either remain outstanding or could still be reported.

Considering the assets in which an insurer invests, the risks are similar to those faced by other investors.

- **Credit risk** generally refers to the potential that a counterparty may, by choice or inability, fail to repay its commitments to an investor.
- **Concentration risk** reflects the level of exposure to a single counterparty and should consider all types of commitments made from the counterparty together.
- **Liquidity risk** is the risk that an insurer will be unable to realise the value of an investment in a timely manner consistent with its needs.
- **Market risk** reflects the possibility that, even if an asset may be able to be realised, its value may have fluctuated adversely.

As discussed in section 2, for many types of risks that insurance face, it is possible to manage the assets and the liabilities so that fluctuations on the asset side of the balance sheet are matched by fluctuations on the liability side. However, this ideal is not always possible. The
extent to which risk may arise from mismatching should be considered in the capital adequacy requirements.

Efforts to measure most of these risks have led to a desire to apply risk mitigation techniques. A particular risk mitigation technique for insurers is to take out reinsurance, that is, transfer the risk to another party. However, transfer risk can lead to its own risk, because the mitigation may not be perfect. For example, if the definition of claims in the reinsurance policy differs from the definition in the insurance policies issued by the company, the cover may not be perfect in all circumstances. This discrepancy is referred to as basis risk, because the reinsurance claims are paid on a different basis than that of claims under the reinsured policies. Reinsurance also introduces counterparty risk as the insurer is dependent on the reinsurer being willing and able to pay its share of claims as they fall due.

Conventional wisdom has been that liquidity risk should not be a major concern for insurers. Normally, premiums exceed claim payments, and insurers are net investors. Similarly, if claims were to increase sharply, insurers can usually find mechanisms to make the payments progressively to avoid distress. In some cases, these mechanisms can include invoking clauses in contracts that enable the deferred payment of surrender values, or recognising that insurers do not have funds on call from the customer in the same way that a bank would or even paying claims by transferring the underlying assets rather than cash. Nevertheless, liquidity risk can have a significant impact on an insurer. See case study 1. In the event of an adverse outcome, the additional financial resources of capital can be available to meet most risks. However, the extent to which these resources can assist in dealing with a liquidity problem depends on whether these additional assets themselves are liquid. Recognising the difficulties inherent in quantifying liquidity risk, it is advisable that solvency implications be addressed through supervisory assessment rather than through quantitative capital adequacy requirements.

One additional risk that increasingly has been recognised is operational risk. This risk often is defined as "all other risks" but may be defined more explicitly. In particular, operational risk focuses on the adversity that can result from failures in the operations of the company. Examples of operational risk include a breakdown of procedures, failures in management, computer failure, poor recordkeeping, events that make it impossible for the insurer to operate from its regular offices, or even fraud. Operational risks vary widely and may be difficult to anticipate. While capital can mitigate operational risk, this type of risk also must be addressed effectively through good corporate governance, internal controls, and risk management practices.

Usually, consistent with the ICPs and principles on capital adequacy and solvency, there is a fixed minimum level of capital or solvency margin. The reason is that, regardless of the size of the insurer, some risks exist, and new insurers face particular risks. These challenges include difficulties in managing a start-up operation that do not exist in an ongoing business. An example would be not having adequate existing data to estimate the claims experience from
policies, compared to an established company that has good data. In addition, to quickly build their book of business to a viable size, new insurers may tend to accept riskier or less profitable business that an established company would pass up.

Absolute minimums also ensure that only operations of some substance are permitted to enter the insurance market. This standard is important in light of the unique nature of insurance, which requires an insurer to deliver on long-term and important promises.

### 3.2 Minimum requirements

Minimum solvency requirements must be clearly defined. The reason is that they identify the point at which final intervention occurs, that is, when the supervisor takes over the company and relieves senior management and owners of their rights. A requirement that is open to interpretation can hold up intervention in legal disputes. Such disputes can impede the important need to protect the interests of the policyholders. Thus, the minimum solvency requirement is usually defined in terms that enable it to be determined more precisely than the assessment of solvency, which is a matter of judgment, would suggest. To achieve more legal certainty, some matters of judgment need to be set aside.

Two main approaches are taken to define the minimum solvency requirement:

- The “index-based” method, and
- The “Risk-Based Capital” (RBC) method.

It is also possible to adopt an approach that reflects a middle ground. However, most jurisdictions are moving towards some form of risk-based capital method.

#### 3.2.1 “Index-based” requirements

While all regimes involve a range of elements, an index-based regime is characterised by a solvency margin that is expressed as the greatest of a range of balance sheet or income statement indexes.

The required solvency margin is based on a relatively simple formula. One part is a minimum capital requirement that uses fractions of various indices of risk exposure. In other words, factors are applied to various figures taken from the balance sheet of the insurer, and the minimum solvency margin is taken to be the greatest of the calculated results.

Certain scale effects can be recognised. In particular, as the portfolio grows, the volatility of total claims in a portfolio of independent or negatively correlated insured risks increases at a slower pace than the average claim. These scale effects are reflected through the application of lower factors for the part of the exposure that exceeds a certain threshold.
The premium index may use gross premium income as a measure of exposure. The average claims cost is defined as the claims incurred, in contrast with claims paid, over the last three years. The various percentages would generally be determined using a mathematical approach called ruin theory. Ruin theory estimates the probability that an insurer will face financial ruin during a time period, taking into account its risk profile and level of solvency margin. The “greater of” the various calculations constitutes the solvency margin requirement.

Risk limitations and the credit given for reinsurance cover are additional features of the system. The effect of reinsurance may be reflected in calculating the required solvency margin. However, the reduction may be limited.

In summary, the index-based method broadly relates risk to various index measures. The larger the premium or the claims provisions, the greater the overall risk that the company is carrying. Some observers argue that this index-based approach has been widely used and has shown relatively good empirical results. However, it focuses on the liability side of the balance sheet and thus does not reflect all the risks faced by an insurer. Others contend that the indexes selected are a proxy for the overall risk of the enterprise. Most major jurisdictions have moved from index-based requirements to risk-based capital requirements, for example Solvency II in Europe.

### 3.2.2 “Risk-based capital” requirements

Risk-based capital (RBC) solvency regimes attempt to more closely reflect the risks assumed by each insurer in the calculation of its required capital. They use more complex formulas and statistical techniques than those employed in an index-based solvency regime.

These solvency regimes have requirements that cover each risk within a defined taxonomy.

Risk-based capital computations specify the minimum amount of capital required based on a company’s size and risk profile. Major risk categories are:

- Asset risk
- Interest rate risk, primarily in life insurance
- Health credit risk, primarily accident and health insurance
- Underwriting risk
- Credit risk, especially with respect to reinsurance, and
- Other business risk.

The computation of RBC includes adjustments for correlation among risks and additional risks inherent in certain types of activity. Reinsurance is subject to specific limits, and the credit provided reflects the ability of the supervisor to recover insurance amounts owed by the reinsurers.
3.2.3 Internal models

A recent development in many jurisdictions is to allow the use of internal models. The benefit of using an internal model is that it more closely reflects the risks to which an insurer is exposed. However, it is costly and very complex, and has proven burdensome to get the model approved for statutory purposes. Additional observations

- Ultimately, a solvency regime is not simply driven by the solvency margin itself. The valuation of the assets and the technical provisions also influence the amount of the solvency margin in the accounts, and the parameters need to consider these elements.

- Actuaries and auditors can play a role in adding credibility to these accounting values in jurisdictions in which their professions are well developed. In other cases, the supervisor may have to make more specific and detailed rules directly on these elements as part of the overall solvency regime.

As shown by the examples in this section, while the structure of the solvency margin formula may differ, it must always be clearly defined. Finally, the solvency regime in every jurisdiction should reflect parameters that consider the risk in that jurisdiction. The adoption of, for example, the EU or US system without consideration of whether the parameters are appropriate in the local context may not result in adequate minimum solvency requirements. If risks are greater, or simply different, it is reasonable to have different parameters. If the accounting rules for the valuation of assets and liabilities or the treatment of reinsurance in the system are different, the resulting level of security provided to policyholders will be different if the same parameters are adopted without considering these differences.

3.3 Providing greater resilience

In the early phase of solvency regulation, a single solvency requirement or capital level obligation on an insurer usually was provided in the law. When an insurer fell below this level, the supervisory authorities would intervene to take over the company and take whatever action was necessary and permissible under the law to protect the interests of the policyholders.

More recently, it has been seen as desirable to have “solvency control levels”. In effect, the concept of these levels is to reflect the fact that supervision does not stop above the minimum requirement or that the only action available to the supervisor is the final step of ultimate intervention. A comprehensive discussion of early intervention criteria and mechanisms is beyond the scope of this module. Importantly, however, a level established above the minimum serves as a valuable tool for the supervisor to graduate the intervention.
The minimum solvency margin criteria may be viewed as providing a buffer at a base level of security. If an insurer is below this level, the market and the lawmakers have determined that it should not continue to operate. However, insurers operating as going concerns should not be content to function on this minimum, that is, on the borderline. When a company is well above the borderline, the supervisor and the public can expect that it can withstand a period of adversity without falling below this critical level. This higher level provides the company with the opportunity to take corrective action and to allow this corrective action to flow through to a turnaround in its financial position.

Consider figure 1, which sets out a very specific example of how the control level may be used to trigger supervisory intervention. In practice, processes will not always be as definitive between levels as is discussed here. The purpose of this description is to illustrate one approach. In this case, the supervisor uses three control levels: a regulated minimum and two control levels above this. The control levels in the example increase over time in response to the growth of the insurer.

**Figure 1. Insurer’s position vs. Control levels**

Initially, the company was below the first control level but not below the solvency requirement. The supervisor would be giving close attention to a company in this situation. The company position improved such that it exceeded the first control level and moved into the higher band. In such a situation, the confidence of the supervisor in the insurer’s viability
would have increased. Management had been able to execute a corrective action plan that worked well, although with a brief setback. Still, the degree of supervisory oversight was likely to reflect the concern that the company did not have as complete a capital buffer as it would have had if it had been above the second control level. Once the company exceeded the second control level, the supervisor became more comfortable with the company and less intrusive in its oversight.

In the example, the company continued under this less intense or “normal” supervision for an extended period before briefly dropping below the second control level. At this point, the supervisor became more concerned. Supervisory inquiries quickly produced an improvement in the situation. However, this improvement proved short-lived. The company’s situation deteriorated rapidly and, in spite of increasing supervisory intervention, management’s corrective actions failed to halt the deterioration. Eventually, when the minimum solvency requirement was breached, it became necessary to place the company into administration.

The example demonstrates that control levels can be used by supervisors to prompt earlier interventions on a graduated basis.

A second, equally important use of control levels is to encourage an insurer to explicitly incorporate solvency buffers when doing its business and financial planning. No insurer owner, board, or senior manager should be comfortable existing on the borderline of the ultimate supervisory intervention. Given the uncertainties of investment markets and insurance claims outcomes, there may be periods in which net worth declines, even if its general trend is upward. Therefore, management, boards, and owners should operate with a margin above the minimum level to avoid the risk of a “few bad days” leading to the company’s being placed under official administration and to their personal loss.

Both of these arguments illustrate the usefulness of understanding risk (volatility of results) when assessing the adequacy of capital, capital buffers, and having levels of control above the minimum. The level of control, from the perspective of the supervisor as well as the company management and boards, should be such that:

- The existence of a problem can be identified
- Corrective action can be put in place.
- The corrective action has a chance to take effect before the situation deteriorates.

Some jurisdictions establish control levels through legal instruments. Some do so by publishing their approach to intervention either with or without a precise numerical description of the actual levels. Supervisors in some jurisdictions, particularly those in which the number of companies is small, require each insurer to have a capital buffer policy approved by its board and then agree, formally or informally, to that internal level. Likewise, intervention can be more or less formal depending on the jurisdiction. Clearly, the ultimate intervention of
closure needs to have the full support of the law. However, depending on the history and practice in the jurisdiction, the use of moral suasion may play a significant role in higher-level interventions.

Another way that greater resilience can be promoted by a solvency regime is to test the effect of adverse situations on the company position. Stress testing is a very powerful tool that can be used by companies as part of their capital adequacy management systems.

Stress testing involves developing alternative scenarios and considering the effect that these scenarios would have on the company balance sheet position, either immediately or, in some cases, over time. Such testing can help the company identify significant risks and put in place procedures to limit these risks or plans to respond to the risks if they occur.

In some jurisdictions, stress testing is part of the broader solvency regime. Companies are required to perform stress tests as part of their risk management process, with results being considered by their boards. These tests then are discussed with the supervisor so that the supervisor can be comfortable that the company has adequately addressed the identified risks.

In other cases, the stress test can be part of the capital requirement itself. For example, for asset liability mismatch risks, a defined adverse scenario may be tested and the difference between the position under normal circumstances and the adverse scenario may be required to be held as an additional provision or reserve.

Many jurisdictions now require insurers to do what is generally termed an ORSA (Own Risk and Solvency Assessment), which is generally an internal tool that boards of insurers should use to assess the risk that the insurer is exposed to, and how these risks are managed and mitigated.

### 3.4 Issues related to branches and groups

When considering rules for solvency, special considerations arise in the case of branches of foreign insurers. The reason is that the branch is not a fully self-contained legal entity. Rather, it is part of the whole company, and that company is incorporated in another jurisdiction and does business in more than one jurisdiction. See case study 2.

A key concern of the supervisory regime is to ensure that the resources necessary to support policyholder obligations are available when needed. In the case of a branch, the capital is usually not segregated, and it is not possible for a branch operation to fail without the whole company failing. This situation is different from the case of a locally incorporated insurer, which could become insolvent even though the group or parent company remains solvent.

Of course, an insurer may become insolvent for reasons other than those relating to the assets and liabilities that are generated by its branch operations. If such insolvency occurs, the branch will nevertheless be affected. In contrast, in the case of a locally incorporated subsidiary, the
insolvency of its parent resulting from losses in business activities outside the subsidiary would not automatically cause the subsidiary to become insolvent. The parent company could sell the local subsidiary, which is a separate legal entity, to another owner. In the case of a branch, such a sale is not possible.

The legal requirements imposed on branches seek to limit the exposure of local policyholders to the risks associated with the branch legal structure. Supervisory requirements tend to focus on identifying the obligations to local policyholders and then securing the rights to assets sufficient to meet these obligations. These requirements provide some protection to policyholders without requiring a separate legal entity, thereby facilitating foreign branches.

For example, the regulations may require that assets equal to the technical provisions for the local business of the branch be held in the jurisdiction, under the control of a local authorised officer, or even subject to some control by the supervisor so that they will be available if needed. Some jurisdictions additionally require assets equal to the equivalent level of capital that would be required of a separate insurer to be held locally.

Some of the issues that arise with branch operations can be avoided by requiring the use of separate legal entities for various activities. However, if an insurer operates as part of a group, a different set of issues needs attention. These issues occur regardless of whether the group is locally owned, international, focused on the insurance sector, or more diverse in its scope of operations.

Risks can spread through a financial group when the group has transactions among its various entities. For example, if an insurer lends money to another company in the group, it would show that investment as an asset on its balance sheet. Without any adjustment to the solvency rules, this asset would count toward meeting the obligations to policyholders. If the borrowing company gets into financial difficulty, the value of the investment for the insurer may be at risk. In other words, the risk of the other company in the group is transmitted to the insurer, that is, contagion.

Although this credit risk may seem similar to that inherent in any investment, the risk is heightened because the lending decision may have been taken under pressure from group management rather than based on an objective assessment of the credit risk.

Another group risk is the potential contagion through the transfer of reputation. An insurer may be well run but may find that concerns arise in the minds of customers if there is some concern about another part of the group that operates under the same brand or name. In such cases, management must often take proactive steps to reassure customers that the problems in one part of the organisation has no effect on the insurer. For example, a supervisor may announce that it is investigating certain accounting issues with a non-life insurer. As a result, the life insurer operating separately but under the same brand name may suffer reduced sales and reduced confidence from the independent financial advisory community.
In the event of financial distress, related party assets often prove to be of limited value. A company that is badly run can use related party transactions to inflate the value of the assets of the group or to reduce the assets available to policyholders. Consider the following example, which also is displayed in figure 2.

**Figure 2: Example of an insurer within a corporate group**

An insurer and an investment company are both owned by the same parent holding company. Although the ultimate controller does not own the majority of the insurer via their 25 percent ownership of the holding company A, they nevertheless are able to control the board of the insurer by appointing directors with the votes of holding company B, which they control through 55 percent ownership. As a result, the insurer’s loan to its sister investment company transfers assets away from the supervisory sphere of the insurance supervisor.

Multiple gearing of capital can also be a consideration. In the above example, multiple gearing could occur if the insurer were going to use some of its assets to purchase another insurer. The value of the newly owned insurer subsidiary would appear as an asset on the balance sheet of the existing company. However, part of this value would be the solvency margin of the subsidiary, intended to protect its policyholders. If the full value of the subsidiary were counted on the existing company’s balance sheet for solvency purposes, the same capital would be providing protection twice and so be double counted. As a result, solvency regimes must include rules to avoid this double-counting of capital required for prudential purposes.

Recycling of capital can also occur in a group. Again using the above example, if the investment company were to take the proceeds of the loan from the insurer and lend them back to the
ultimate owner, the owner could use the funds to purchase more shares in the insurer. In effect, the assets of the insurer would have been used to increase its own capital. The more this type of transaction takes place, the greater the reported capital of the insurer when, in fact, there would have been no real improvement in its capital position. To restrict such practices, regulations usually make adjustments to the capital formula or prohibit such loans.

Ultimately, to address the concerns raised by the membership of insurers in groups, supervisors need to consider both the solvency of the insurer itself and the solvency situation of the wider group. In some jurisdictions, this is referred to as the “solo plus” approach. The term, “group-wide supervision,” when used in reference to insurance does not mean that the individual entity is ignored and only the consolidated accounts are considered. Rather, it refers to the need to assess the group-wide situation and is in addition to the “solo” entity position. Several techniques can be used to assess group-wide capital adequacy of a financial conglomerate. They include the:

- Building block approach, which compares the sum of the capital required of each solo entity with the consolidated capital of the group.
- Risk-based aggregation approach, which compares the sum of the capital required of each solo entity with the sum of the capital of each solo entity minus any intragroup holdings of supervisory capital.
- Risk-based deduction approach, which adjusts the unconsolidated capital of the parent by deducting its investments in dependents, adding any excesses or subtracting any shortfalls of supervisory capital of the dependents, and compares the result with the parent's solo capital requirement.

As a quick check for double gearing, a total deduction calculation can also be made. It is similar to the risk-based deduction approach but provides no credit for any excesses of supervisory capital of the dependants.

Case study 2 gives a more practical example of how the capital between different entities in a group can be compromised.

3.5 Case study 2. Effect of insolvency on a branch

An insurer that had a large branch in another jurisdiction became insolvent. Assets held in the branch equalled liabilities to policyholders in that jurisdiction. However, a large portion of these assets consisted of debt securities issued by the parent. When the parent went under, the branch was no longer solvent. The debt was listed under short-term securities, for which solvency is rarely an issue, which hampered the detection of this problem.
Exercises – Section 3

Answer the following questions considering, where indicated, the practices in your jurisdiction. If you are working with others on this module, develop the answers through discussion and cooperative work methods.

Ex 10 In some jurisdictions, the fixed-amount minimum capital requirements differ between life insurers and nonlife insurers. Why might that be the case? What are the fixed minimum solvency requirements for insurers in your jurisdiction?

Ex 11 Would you describe the solvency requirements in your jurisdiction as being index based or risk based? How does the solvency regime in your jurisdiction respond to each of the following risks: technical, credit, concentration, liquidity, market, basis, and operational?

Ex 12 Insurer A has been unprofitable, due to unexpectedly rapid increases in the cost of motor insurance claims. Management of the insurer has responded to this situation by increasing both premium rates and technical provisions. Solvency requirements in the local jurisdiction are calculated, in part, with reference to an insurer’s premiums and technical provisions. What are the short-term and longer-term implications of management’s action on Insurer A’s solvency position? How might the supervisor respond to this situation?
4 Summary and conclusions

A fundamental objective of insurance supervision is protecting the interests of current and prospective policyholders. Solvent insurers with adequate capital should have the financial means to make good on their obligations to policyholders. Those that are financially weak often present a range of supervisory challenges and pose a greater risk of defaulting on their obligations.

Solvency difficulties can often be traced back to internal causes such as problems with management, shareholders, or other external controllers of the insurers. Clearly, good governance and risk management are essential to the maintenance of solvency.

Capital serves as a precaution against adverse experience and financial fluctuations, helping an insurer to maintain solvency while it deals with the many risks to which it is subject. While possible sources of capital are numerous, the relevance of each to a particular insurer will depend on such factors as its corporate legal form, who owns it, its stage of development, and its financial position and performance. The quality of capital depends on its availability to cover unexpected losses, both currently and prospectively. Preferably, capital should be both presently available and permanent.

Solvency regimes must address, in a consistent manner, liabilities, assets, matching assets with liabilities, suitable forms of capital, and capital adequacy requirements. For example, since solvency is fundamentally an assessment of an insurer’s balance sheet, it is impossible to make an adequate assessment of solvency unless the liabilities and assets in the balance sheet are valued appropriately. In recent years, there has been a trend toward integrating quantitative solvency requirements into broader solvency regimes. For example, the EU Solvency II, the IAA recommendations, and the Basel II Capital Accord for banks each identify quantitative capital adequacy requirements, supervisory assessment of risk management, and disclosure of information as key elements, or pillars, of a broader solvency regime.

Risk is considered to be the potential for variability in outcome, particularly adverse outcomes. A relatively simple taxonomy of risks faced by an insurer might include technical, credit, concentration, liquidity, market, basis, and operational risks. New insurers may be subject to heightened risk. Each of these risks needs to be considered when establishing capital adequacy requirements.

The regulation of capital has two basic objectives:

- To provide a minimum level of resources considered prudent for supervisory purposes, and
- To provide a trigger for intervention.
Two main approaches are taken to define the minimum solvency requirement:

- The index-based method, and
- The risk-based capital (RBC) method.

An index-based regime is characterised by a solvency margin that is determined by using fairly simple calculations that refer to a range of balance sheet or income statement indexes. Risk-based capital solvency regimes attempt to more closely reflect the risks assumed by each insurer by using more complex formulas and statistical techniques.

However, there is some concern that neither of these approaches appropriately reflects the risks of insurers whose circumstances may vary significantly. Therefore, any jurisdiction considering changes in its solvency regime should take note of emerging international developments.

The solvency regime in every jurisdiction should reflect the circumstances in that jurisdiction. The adoption of another jurisdiction’s system without consideration of whether its parameters are appropriate in a different local context may not result in adequate minimum solvency requirements. For example, the valuation of the assets and the technical provisions influence the amount of the solvency margin in the accounts, and the parameters need to consider these elements.

As should be evident from this module, determining how much capital will be adequate to ensure solvency can be a complicated and, to some extent, judgmental process. Nevertheless, the ICPs reinforce the fact that, while the establishment of solvency requirements is essential, the work of supervisors cannot stop there. Solvency must be monitored and assessed regularly, through both offsite and onsite activities.

Finally, if solvency problems are noted, supervisors must intervene.

**Exercises – Section 4**

Ex 13 Each of the following three cases describes an insurer that presents a serious solvency challenge. For each case, answer the four questions below. If you are working with others on this module, develop the answers through discussion and cooperative work methods.

a) Why might the situation have occurred?

b) What elements of a solvency regime could help prevent its occurrence?

c) Given that it has occurred, what elements of a solvency regime could help protect policyholders from excessive loss?

d) What corrective actions would you propose?
Case 1
A bank has set up a composite insurer to provide life, annuity, motor, and property policies to its customers. The bank provides centralised human resources, investment, and accounting services to all group companies. The insurer has been growing rapidly in all lines of business. However, paid claims ratios on the nonlife business have been much higher than those of competitors, while the life and annuity lines experienced significant losses recently, when interest rates moved sharply.

Case 2
A large foreign nonlife insurer is operating locally through a branch. Its book of business includes local personal and small commercial clients, as well as very large risks arising from its multinational clients. Large risks are underwritten at the headquarters, where reinsurance is also arranged. Losses due to a recent fire that destroyed the factory of a multinational client exceed the assets invested locally.

Case 3
The board and management of a mutual insurer take pride in serving policyholders by charging low premium rates, providing long-term interest rate guarantees, and investing in their business ventures. A downturn in the economy has led to high investment defaults, market interest rates lower than the policy guarantees, and increased lapses.
5 Further reading

5.1 General sources

Many texts are available which are relevant to the material in this module. These texts may also go beyond the scope of this module, but usually include introductory chapters on the basic topics.

When reading these texts it is useful to consider the principles being as well as the details of their application in a particular environment. Also, it is important to recognise that as the environment changes the relative importance of issues may also change.

Other sources of information are also available. For example, in many countries there is an insurance institute of some form. The Chartered Insurance Institute (CII), based in England, provides a range of good educational programs and has links to more than 70 other insurance institutes worldwide (see www.cii.co.uk).

In some cases, supervisory websites are also valuable sources of information. This can be particularly the case when supervisors publish explanatory information explaining their requirements and approaches.
Review Questions

After studying this module on regulation and supervision supporting inclusive insurance markets, answer the questions below. The questions to help you gauge your understanding of this topic. An answer key is given in Appendix 1.

For each of the following questions, unless otherwise indicated, choose the response that is correct or most relevant.

R1 An insurer can be considered solvent if it:
   a) Has enough cash to pay all claims that are currently outstanding
   b) Is able to meet its obligations under all contracts at any time
   c) Has assets at least equal to its liabilities
   d) Is part of a conglomerate that is rated B+ or higher by a rating agency

R2 A shareholder-owned insurer may be able to obtain additional capital by:
   a) Drawing upon a line of credit with its bank
   b) Issuing shares and selling them to investors
   c) Making special capital assessments against its policyholders
   d) Borrowing money from its corporate parent

R3 Suitable forms of capital include:
   a) All assets in excess of an insurer’s technical provisions
   b) Margins of conservatism in the technical provisions due to the specification of a low discount rate by the supervisor
   c) Retained earnings available to cover any unexpected losses
   d) The proceeds obtained by issuing short-term debt securities
   e) The amount indicated in a letter from the board of directors of an insurer’s corporate parent expressing the intent to contribute additional funds

R4 Insurer A operates in a jurisdiction that has an index based solvency regime. The minimum solvency margin is based on the maximum of three indices: 15 percent of premiums; 25 percent of claims costs; and 10 percent of technical provisions. The regime also includes an absolute minimum solvency margin of $10 million. The financial statements of Insurer A show premiums of $100 million, claims costs of $80 million, and technical provisions of $200 million. What is the minimum solvency margin that must be maintained by Insurer A?
R5 Risk-based capital adequacy regimes generally require:

a) The application of factors to an insurer’s technical provisions, but not to its assets
b) The use of internal models to determine the capital required for operational risk
c) The addition of the amounts of capital required in respect of various types of risks to calculate the total minimum requirement
d) The services of actuaries to make the calculations

R6 The primary purpose of solvency control levels is to:

a) Establish a trigger for early intervention by the supervisor
b) Ensure that an insurer does not invest an excessive proportion of its assets in speculative ventures
c) Determine the portion of an insurer’s assets that should be invested in local currency in order to meet obligations to local policyholders
d) Indicate when an onsite inspection may be required

R7 A solvency regime may appropriately place different requirements on an insurer operating in the jurisdiction through a branch than on a domestic insurer because:

a) Branches have no capital that is legally their own
b) Domestic insurers may be more highly taxed than branches, so the competitive playing field must be levelled
c) Assets of a branch are likely to be invested in foreign currencies
d) Investment within the jurisdiction should be required in order to promote economic development
R8 Techniques for preventing the inflation of capital that might otherwise occur in the case of an insurer that is a member of a corporate group include:
   a) Calculating capital adequacy on a consolidated basis
   b) Valuing investments in affiliates at book value
   c) Closely examining the nature and financial impact of reinsurance placed with unrelated reinsurers by other companies in the group
   d) Prohibiting the issuance of insurance policies to an insurer’s parent

R9 It is reasonable to expect an insurer to maintain sufficient capital to fully mitigate the potential effects of inadequate risk management.
   a) True
   b) False

R10 Capital adequacy requirements ensure than an insurer will remain solvent.
   a) True
   b) False

R11 Which of the following concepts of solvency requires the most capital to achieve?
   a) Going concern
   b) Runoff
   c) Break up

R12 The capital available to meet solvency needs is most limited in which situation?
   a) Going concern
   b) Runoff
   c) Break up

R13 Which two of the following risks are least amenable to being mitigated by capital?
   a) Underwriting
   b) Credit
   c) Market
   d) Liquidity
   e) Operational
R14 Provide at least *three* reasons why it is appropriate to require that a small, newly formed insurer have more capital, in relation to its premium income, than a large, well established insurer.

R15 What are the *five* areas that a solvency regime should address in a consistent manner?

R16 Insurer B operates in a jurisdiction that has a risk-based solvency regime. The minimum capital requirement is based on factors of 10 percent of premiums, 5 percent of technical provisions, 10 percent of assets invested in corporate bonds and 15 percent of assets invested in equities and real estate, with no adjustment for correlation of risks. The regime also includes an absolute minimum capital requirement of $10 million and a solvency control level of 150 percent. The financial statements of Insurer B show premiums of $100 million, technical provisions of $200 million, and investments of $50 in bank accounts, $50 million in government bonds, $80 million in corporate bonds, $20 million in equities and $30 million in real estate. What is the minimum capital required of Insurer B?

R17 How much capital must be maintained by Insurer B to satisfy the solvency control level?
Appendix 1: Answers to Exercises and Review questions

Exercises

Answer 1  All parties are interested in the continued viability of the insurer. However, the board and senior management may focus more on returns to shareholders, and the rate of return will be higher if excess capital is minimised. The supervisor’s focus is on protecting policyholders, and additional capital increases the level of protection.

Answer 2  Discuss with others in your supervisor.

Answer 3  Discuss with others in your supervisor.

Answer 4  Discuss with others in your supervisor.

Answer 5  The first approach is generally easier to calculate and validate, while the alternative may provide a more accurate picture of an insurer’s economic condition, although it may require more actuarial expertise, both at the insurer and at the supervisor. Discuss with others in your supervisor the approach used in your jurisdiction.

Answer 6  Discuss with others in your supervisor.

Answer 7  Limits on concentration of reinsurance may be established. Credit for reinsurance in excess of specified limits may be disallowed. The posting of collateral by reinsurers may provide further protection.

Answer 8  Discuss with others in your supervisor the approach used in your jurisdiction.

Answer 9  Discuss with others in your supervisor.

Answer 10  Fixed amount minimums may differ if the level of resources required to establish a life insurer and build it to a viable size are viewed as being significantly different from those required for a nonlife insurer. Discuss with others in your supervisor the minimum requirements in your jurisdiction and how and when they were established.

Answer 11  Discuss with others in your supervisor.

Answer 12  In the short term, the solvency position may appear to worsen, because the higher premiums will translate into higher capital requirements and, therefore, less excess capital. In the longer term, the higher premiums should produce profits for the insurer, improving its level of capital. The supervisor might respond by requesting both short and longer-term projections of the insurer’s financial position and considering the results in deciding whether an additional infusion of capital should be required.
Answer 13

**Case 1**

a) It is quite possible that lack of insurance expertise is the root cause of the problems at this insurer. Rapid growth combined with high claims ratios provides an indication of underpricing. The losses on life and annuity business may be due to mismatching of assets and liabilities. Since many services are being provided at the group level, those doing so may have limited understanding of the insurance business and how it differs from the core banking business of the group.

b) Supervisory review of premium rates, restrictions on investments, a requirement that an investment policy be adopted by the board and reviewed by the supervisor, a requirement that asset liability management be implemented, and stress testing could help prevent such a situation.

c) Supervisory review of the adequacy of technical provisions, capital adequacy requirements, and solvency control levels could help protect policyholders.

d) The insurer might be required to adopt an investment policy, implement ALM, reduce or stop writing new business, or obtain additional capital.

**Case 2**

a) The local management of this branch does not fully control the business that is being written. Major financial and underwriting decisions are being made at the head office, which would appear to be focusing on overall results of the insurer without much attention to the financial position of the branch, that is, assets generated by the branch versus its liabilities.

b) Risk concentration limits, reinsurance requirements that relate to the size of the branch, and a requirement that assets in the branch exceed liabilities to policyholders of the branch by a solvency margin all might help prevent such a situation. Separation of the local personal and small commercial lines business into an adequately capitalised subsidiary also could help protect such policyholders.

c) Requirement that assets supporting local policyholders be held in a local trust, control of payments from the branch to the headquarters, supervisory monitoring of the financial condition of the insurer as a whole, and communication with the home supervisor could help protect policyholders.

d) The insurer might be required to limit the branch's exposure to large risks, to invest more assets in the branch, or to cease writing new personal or small commercial policies.
Case 3

a) The board and senior management of this insurer are excessively focused on customer satisfaction and growth, with inadequate consideration of the financial implications of their business approach. The insurer also might lack risk management expertise.

b) Supervisory review of premium rates and policy provisions, a requirement that an investment policy be adopted by the board and reviewed by the supervisor, supervisory review of the nature and quality of invested assets, a requirement that asset liability management be implemented, and stress testing could help prevent such a situation.

c) Asset quality and diversification requirements, a requirement that technical provisions explicitly reflect interest rate guarantees, supervisory review of the adequacy of technical provisions, capital adequacy requirements, and solvency control levels could help protect policyholders.

d) The insurer might be required to adopt an investment policy that restricts investments in policyholders’ businesses, implement ALM, reduce the interest rate guarantees and increase the premium rates for new business, or reduce or stop writing new business. If the insurer’s financial position is very poor, it may be required to raise capital, which is very difficult for a mutual insurer, or be wound up.

Review questions

Answer 1 b. See section 1.
Answer 2 b. See section 1.
Answer 3 c. See section 2.
Answer 4 b. See section 3; capital required is the greatest of the various results.
Answer 5 c. See section 3.
Answer 6 a. See section 3.
Answer 7 a. See section 3.
Answer 8 a. See section 3.
Answer 9 b. See sections 1 and 3. It is financially unfeasible to maintain enough capital to fully protect the solvency of an insurer that seriously neglects its risk management.
Answer 10 b. See sections 1 and 3.
Answer 11  a. See section 1.
Answer 12  c. See section 2.
Answer 13  d. and e. See section 3.
Answer 14  Any three of the following are correct; see section a:
   • It needs to finance start-up expenses.
   • Its new business acquisition costs are likely to be high.
   • It will have a small flow of profits from existing business.
   • It is at greater risk of adverse underwriting experience, due to its smaller and probably less diversified portfolio of business.
   • It is at greater risk of asset value fluctuations, due to its small and less diversified investment portfolio.
Answer 15  All five of the following;
   • Valuation of liabilities
   • Quality, liquidity and valuation of assets
   • Matching of assets and liabilities
   • Suitable forms of capital
   • Capital adequacy requirements
Answer 16  $35.5 million
Answer 17  $53.25 million

Using the Core Curriculum

Purpose

The IAIS Insurance Core Principles (ICPs) provide a globally accepted framework for the supervision of the insurance sector. The ICPs is suitable to apply to insurance supervision in all jurisdictions regardless of the level of development or sophistication of the insurance markets and the type of insurance products or services supervised.

The Core Curriculum provides non-commercial training materials to support insurance supervisors as they implement the ICPs. They give insight and background to the ICPs and the concepts underlying them. There is also a focus on the practical application of supervisory concepts.

Supervisory practices are constantly evolving reflecting experience and changing environments. Consequently, Core Curriculum materials should not be read as providing ‘the answer’ to a particular issue, but as providing guidance, approaches and matters to be considered by supervisors when they address specific issues in their own particular context.

Audience

The key users of the Core Curriculum material include:

- Trainers of insurance supervisors
- Individual insurance supervisors, and
- Other parties interested in sound and effective regulatory and supervisory practices.

Link document

The Core Curriculum Link document provides a mapping between the ICPs and the Core Curriculum modules. As ICPs and/or the Core Curriculum modules evolve, their relationship is described by the Link document (see www.iaisweb.org). This allows users to navigate from ICPs to relevant Core Curriculum modules and in the opposite direction.

Learning advice

Different users have different and will use the Core Curriculum modules in different ways. The Core Curriculum Learning advice document provides users with suggestions on using Core Curriculum materials to meet a variety of needs. You are recommended to use the Learning advice document (see www.iaisweb.org) to support your use of the Core Curriculum modules.
This module

Summary
The purpose of this Core Curriculum module, 6.1.1, Consumer protection, gives an overview of issues and processes to support supervisory review of the market conduct of insurers. This support the protection of consumers, and policyholders in particular. It considers concerns that may trigger examinations and areas that may be targeted for inspection. It also surveys the steps involved in designing inspections.

Learning objectives
When you complete this module, you should be able to:

1. Assess the fairness and adequacy of insurer practices regarding marketing and sales, on-going services to policyholders, claims handling and complaint handling
2. List the types of information insurers and intermediaries should provide consumers before the conclusion of an insurance contract and during the period of coverage
3. List the types of information that are to be sought from a consumer by an insurer or an intermediary to assess insurance needs before giving advice or concluding a contract
4. Recognise indicators that might prompt the supervisor to investigate an insurer or intermediary for its treatment of consumers
5. Describe the basic considerations involved in designing such an investigation
6. Describe the risks posed to consumers by insolvencies and inadequate business conduct and the methods you might use to minimise these risks
7. Describe the risks to consumers that arise when they purchase insurance across jurisdictional borders and through distance marketing, and the steps that the supervisor might take to reduce those risks
8. Assess the adequacy of methods used by insurers to protect the privacy of consumer information
9. Describe the ways in which consumers might be educated about insurance products and risks
10. List the methods that may be available to consumers to resolve insurance disputes without resorting to litigation
1 Introduction

Insurance is an intangible product as it focuses on future events. Policyholders pay premiums, sometimes for a long time before insured events occur. Policyholders cannot assess the overall quality of the insurance product when they buy it before the insured event occurs.

Also, there is often also an understanding gap between insurers and their distributors, and consumers who are policyholders or possible future policyholders. It is often difficult for policyholders to fully understand whether insurance contracts meet their expectations since they are legal documents set up by the insurer. Where policyholders rely on intermediaries it is crucial that they can expect intermediaries to perform their tasks in the best interest of the consumer.

Life insurers offer protection policies, such as term life insurance, and also often sell other products that focus on investment characteristics, such as for retirement savings. In contrast to protection policies, these investment products may properly be expected to provide an adequate return on investment over time to policyholders. Also, if the insurer fails the policyholders are at risk of losing some or all of their funds held by the insurer.

Non-life insurers typically offer protection products. It is also important for policyholders to understand the relevant contract features for non-life products. Features like coverage and exclusions impact assessing whether the product meets their expectations. Also, sometimes buying non-life insurance is compulsory, such as some types of motor insurance.

Where insurance is provided by profit-driven entities it is important to effectively regulate the fair allocation of profits between shareholders or owners and policyholders. Policyholders also need to be adequately serviced after they have bought an insurance policy. This is particularly the case for long-term insurance products and for claims settlement after the insured event has occurred.

The application of new technologies increases opportunities to buy and sell insurance products across national borders and to use new forms of distribution, such as the internet and mobile phones. These may increase availability of products to customers and improve services to policyholders but also raise additional risks for consumers and challenges for supervisors.

Insurance supervisors recognise these risks for consumers and usually seek to mitigate these inherent risks through consumer protection and education measures, and do not endorse a simple ‘buyer beware’ approach.

Supervisors typically set minimum requirements for insurers and intermediaries when dealing with consumers in their jurisdiction. Usually these requirements apply to all providers of insurance products, including foreign insurers selling cross-border.
These requirements normally address all stages of policy ownership from acquisition, maintenance and through claims to provide assurance that all contractual obligations are satisfied. These requirements also commonly govern the form, content (relevance and completeness) and timeliness of information provided.

Complaints and dispute resolution processes are considered good practice. Consumer financial education and literacy programs are also often put in place either by supervisors directly or with supervisors’ support.

This module discusses some of the risks faced by consumers and explains ways in which a supervisor can respond to them. Other CC modules and ICPs focus on intermediaries.

1.1 Terms used

Many of the insurance related terms used in this module are defined in the IAIS Glossary of Terms (see www.iaisweb.org). When additional terms are used they are defined in the text.

The terms regulation and supervision are often used interchangeably, but they mean different things. In this module, regulators establish “the rules of the game,” such as regulations and guidelines related to an Insurance Act (or Acts). Supervisors are the “referees” whose role is to oversee that these rules are complied with and deal with the consequences of non-compliance. This requires supervisors to apply judgement when making determinations and decisions. Understanding the difference between the regulation and supervision is important when allocating of responsibilities between regulators and supervisors, especially when they are different agencies.

In this module “supervisor” is used to include both regulators and supervisors. The module also assumes that supervisors are insurance supervisors. Supervisors, as determined by the context of the particular use, may be either the individuals working for a supervisory agency or authority or the authority itself.

While the terms used in this module are suitable for the purposes of this module, it may be that in specific real situations, more detailed definitions or explanations are necessary. These more detailed definitions may also vary between jurisdictions.

Some terms may not have unique meanings, and definitions contained in various sources may differ. To avoid ambiguity and reduce the risk of misuse and misinterpretation, readers should take care to be comfortable they are clear on the definitions of the terms used.

1.2 Insurance consumers

In this module an insurance consumer is defined as an individual who:

- Considers concluding an insurance contract (a potential policyholder), or
• Purchases a policy (a policyholder), or
• Has a valid insurance cover under which a claim may be filed, or
• Submits a claim under an insurance product or service.

This includes purchasers of insurance, persons insured under a policy (insureds), claimants (whether or not they own the policy) and beneficiaries (whether or not they own the policy).

For insurance, the definition of “consumer” may vary considerably between different jurisdictions. In this module, insurance consumers are be limited to those who are interested in insurance for personal, family, or household use. That is, the focus is on the consumer to business (insurer) relationship, not on a business to business (insurer) relationship.

Following from this, the most common types of insurance products for insurance consumers include automobile insurance, property insurance, health insurance and life insurance.

Consumers may buy insurance directly from an insurer or through an intermediary. In most cases, consumers might decide completely on their own whether to take out insurance or not. In some cases, such as third party motor insurance, purchase may be compulsory. Sometimes consumers are covered by an insurance policy purchased by another party, such as an employer or organisation they belong to. In these cases, this other party usually makes the purchase negotiation and decision. Since this other party often buys coverage for a group of individuals, this type of purchase is called ‘group insurance’. Although the institution, company or employer is the policyholder in such cases and the contract is therefore considered as a business-to-business transaction, it is important that the insureds receive relevant information, either from the insurer or from the policyholder.

At a high level, supervisors generally require insures and intermediaries to:

• Act with due skill, care and diligence in their dealing with consumers, and
• Have in place policies on how to treat consumers fairly and provide training to ensure compliance with those policies by their employees and other sales collaborators.

How these objectives are addressed in practice can vary significantly between jurisdictions, and may reflect different approaches. This applies to both regulation and supervisory practices.

Exercises – Section 1
Ex 1 How does your jurisdiction define ‘consumers’ in insurance?
Ex 2 Are there types of insurance products particularly designed for consumers in your jurisdiction other than those listed above?
2 Consumer education and policyholder information

Both intermediaries and insurers have roles to play in educating and informing consumers, as well as in obtaining information from them.

2.1 Role of intermediaries

Due to the complexity of insurance products and the abundance of providers, most consumers rely on the advice of intermediaries when buying insurance. Intermediaries can be divided into two main groups: those who are appointed by and represent a specific insurer or insurers (usually called “tied intermediaries” or “agents”) and those who represent the consumer (usually called “brokers”). Because their role is so important, insurance intermediaries are required by most jurisdictions to be licensed or registered or, in cases of tied agents, to act under the responsibility of a licensed insurer as a consumer protection measure. To obtain a license or registration, intermediaries usually are required to:

- Demonstrate their knowledge of the types of insurance products that they will sell
- Pass a background character check, and
- Obtain adequate insurance against liability that may result from their professional negligence.

Other CC modules and ICPs provide more information on the various roles of intermediaries.

2.2 Policyholder information

A key to protecting consumers is ensuring they are provided with full disclosure of pertinent policy-related and insurer-related information in a timely manner. Times when insurance consumers are most in need of such information include:

- At the point of sale
- Before policy renewals, non-renewals, and cancellations
- In case of the submission of claims
- Periodically during long-term insurance policies and annuity contracts.

2.2.1 Point of sale: information needed from the consumer

Consumers’ initial need to supply and receive accurate and pertinent information arises when they are preparing to buy an insurance policy.

The insurer/intermediary must ascertain the consumer’s current risk situation including any existing insurance policies and claims history, insurability, and needs; and then find the most
appropriate coverage at the best price. To accomplish these goals, the insurer/intermediary needs to obtain a fair amount of information from the consumer.

The insurer/intermediary also needs to ascertain the amounts of coverage that the consumer desires and can afford as well as any optional deductibles and sub-coverages. In addition, life insurance products require the intermediary to ascertain the consumer’s financial security goals such as retirement income and after-death support for dependents.

Much of the information that consumers provide will become part of the written and signed policy application. While consumers may be tempted to omit or distort information to lower their premiums, it is important that they be aware that relevant misrepresentations on their part may, if discovered, lead to the denial of claims, reduction of payments by the insurer or even criminal prosecution. For this reason, supervisors often require that applications contain prominent warnings to consumers of the risks of omitting information or providing false information.

2.2.2 Point of sale: Information to be provided to the consumer

Conversely, the consumer also needs information from the insurer/intermediary. The supervisor should set requirements for insurers and intermediaries regarding the content and timing of provision of information:

- On the product, including the associated risks, benefits, obligations, and charges
- On other matters related to the sale, including possible conflicts of interest to existing or potential policyholders.

Prior to the sale, the insurer/intermediary should provide the consumer with detailed information on the policy, including effective and expiration dates; the persons or properties that will be covered; coverage provisions and exclusions, such as policy limits, deductibles, face values, and bonuses (if applicable); and beneficiary provisions.

The insurer/intermediary should provide consumers with information about the total premium and on any taxes or fees that will be charged. If any portions of the premium are not specified at the point of sale, this should be made clear to the consumer, and examples of potential costs should be provided where feasible. Finally, consumers should be provided with premium payment information, including payment plans where available.

In addition to detailed information on the product and premiums to be charged, it is important that, prior to the sale, the insurer/intermediary provides information to the consumer on the insurer/intermediary and on complaint contacts. Such information should include:

- Insurer’s name, address, phone and license
- Intermediary’s name, address, phone, and license
• Intermediary’s relationship to the insurer
• Contact information for the supervisor and, if applicable, for ombudspersons and for alternative dispute resolution (ADR) mechanisms for the submission of complaints and disputes.

In order to allow the consumer to take an informed decision on whether or not to enter into an insurance contract it is important that the potential policyholder receives all relevant information prior to his/her binding acceptance of the offer.

For group insurance policies, in which the consumer is an insured party but is not the policyholder, information pertinent to the consumer usually is provided by the policyholder to the consumer through a document provided to each party insured under a group insurance contract that describes the coverage provided as well as the insured’s rights under the contract.

Insurers should provide privacy notices at the point of sale. These notices, alert policyholders to the kinds of non-public personal information that the insurer collects and how it safeguards protection of that information.

2.2.3 Renewals and cancellations

Unnecessary lapses, cancellations, and non-renewals of insurance policies are disruptive and usually costly to consumers and insurers. Insurers should provide policyholders with adequate written notice if they intend to renew fixed-term policies that are not guaranteed renewable so that policyholders can plan accordingly.

A residual market plan is a mechanism through which high-risk insureds who cannot obtain insurance through normal market channels are insured. In jurisdictions that have residual market mechanisms, non-renewal and cancellation notices should include contact information for applying to residual markets.

Renewal notices routinely include the amount of the renewal premium.

Reasons for cancellation that require only a short forewarning to the insured often include:

• Non-payment of premium,
• Concealment or misrepresentation of significant facts during the application process, and/or
• Submission of a fraudulent claim.
2.2.4 Submission of claims

Typically, insurers take several distinct steps in settling a claim, such as providing the claimant with notices, forms, payment checks, and other documents. Many jurisdictions specify the maximum amount of time that insurers may take to perform each of these steps for their claimants.

2.3 Consumer outreach efforts

Supervisors, government agencies, industry associations, and consumer organisations individually or jointly can attempt to educate consumers about insurance coverages, costs, and pitfalls as well as seek feedback and complaints from consumers. Outreach methods for these purposes can include brochures, toll-free hotlines, press releases, newspaper and magazine articles, teaching materials for schools, public events, media talk shows and websites.

Supervisors’ websites are becoming an increasingly important method for broadcasting information. Supervisors commonly use their websites to post and update various kinds of consumer information including lists of licensed or registered insurers, premium comparison guides, alerts on fraudulent operations, online submission of complaints and complaints statistics.

Premium comparison guides can be particularly helpful to consumers. Such guides show the premiums that each insurer charges for automobile, homeowner’s, and other types of standard insurance products. For a given type of insurance, premiums are displayed for a select sample of hypothetical insureds of different ages, genders, claim histories, locales, insured properties, and other risk characteristics.

Exercises – Section 2

Ex 3 Which distribution channels are most used in your jurisdiction for selling insurance products? What are the licensing or registration requirements for insurance intermediaries in your jurisdiction?

Ex 4 What residual market mechanisms, if any, exist in your jurisdiction?

Ex 5 For what reasons are insurers in your jurisdiction allowed to cancel policies before their expiration date?

Ex 6 What consumer outreach methods are in place or would be most effective in your jurisdiction?
3 Policy forms and rates

3.1 Coverage provisions

Insurance policies are legal contracts crafted by lawyers and insurance experts. Many policies include a variety of provisions that restrict or eliminate coverage under various circumstances. Such exclusionary provisions can be difficult to understand and can seriously weaken the overall coverage provided to the consumer by the policy.

Supervisors could play a relevant role in promoting the consumers' understanding of insurance contracts.

Some supervisors review all insurance products sold by licensed insurers to consumers in their jurisdictions to ensure that all policy forms, endorsements, riders, applications, and other standard components of insurance contracts contain coverage provisions that comply with applicable laws and regulations, are easy to read and understand and do not conflict with the public good.

Required provisions and disallowed provisions vary by jurisdiction and by type of product.

3.2 Readability

Supervisors may require that consumer insurance policies are written and printed in such a way that the average person can understand them. To achieve this, policies should be written in everyday, conversational language consistent with their legal standing as a contract.

Ways to make policies more readable include simplifying policy language, organising the content in a clear and logical manner, and using good graphic layout.

3.3 Rates

The derivation of premiums charged for insurance products is a mystery to most consumers, who simply rely on market competition to keep premiums as low as possible. Equally confusing to consumers are the differences in premiums charged for various options in coverage limits, benefits, deductibles, and co-payment provisions.

It is important that rates and rating methodologies used to determine premiums are not excessive, inadequate, or unfairly discriminatory. Rates and rating methodologies include everything used to determine the premium that a policyholder is charged, such as manuals of rates for each class of risk, all initial and recurring charges and commissions and instalment fees for premium payment plans.
Supervisors often do not have the actuarial and staff resources to thoroughly scrutinise consumer rate filings. In some cases, supervisors require appointed actuaries or other experts to certify the appropriateness of the rates or rating methodology.

### 3.3.1 Actuarial capacity

In order to be able to properly monitor the premium calculation, the setting of technical provisions and assessing an insurer’s solvency position supervisors need sufficient actuarial skills and resources. Actuaries are professionally trained to evaluate the financial implications of contingent events. Actuaries require an understanding of the stochastic nature of insurance, the risks inherent in assets and the use of statistical models. For example, these skills are applied to establish premiums and technical provisions for insurance products, using the combination of discounted cash flows and probabilities.

A universal concern of consumers is that their insurance rates not be too high. In theory, a transparent and competitive marketplace with well-informed consumers will self-police its own rates. However, it is important to make sure that potential policyholders have sufficient information available on rates before the conclusion of a contract in order to make an informed decision. For unilateral increases of rates during the contract period, regulations need to clearly define a methodology for those increases.

On the other hand, inadequate rates are commonly not a concern to policyholders. However, insufficient premiums may destabilise insurers, threaten their financial position and can contribute to insurer insolvencies. Insurer failures can be detrimental to consumers as they might lose their insurance coverage and in life insurance also lose their savings on the contract. Insurance guarantee schemes may provide a safety net for consumers in such cases.

### 3.3.2 Checking for unfairly discriminatory rates and rating practices

Rates and rating practices are unfairly discriminatory if they produce higher premiums for certain policyholders or demographic groups that are not correlated with increased risk for these policyholders or groups. In addition, it is widely accepted that the use of race, national origin, religion or income as rating factors should not be allowed, even if they correlate with insurance risk.

Gender is prohibited as a rating factor in some jurisdictions. Also, some jurisdictions allow supervisors to prohibit rating practices that disadvantage a particular demographic group, such as low-income ethnic minorities or those inflicted with HIV/AIDS, even if there is evidence that the particular demographic group is costly to insure.
Exercises – Section 3

Ex 7 Are you aware of any issues concerning the readability of consumer insurance policies in your jurisdiction?

Ex 8 What actuarial resources are available to the supervisor in your jurisdiction?
4 Unfair business practices

As mentioned earlier, most consumers have a limited understanding of the complexities of insurance products and, quite properly, rely on the advice of insurers or insurance intermediaries. Unfair business practices arise when insurers or intermediaries take advantage of this imbalance in insurance knowledge in their marketing, sales, underwriting, and rating practices.

4.1 Deceptive and unfair marketing and sales practices

Insurers and intermediaries take unfair advantage of consumers at or before the point of sale if they exaggerate the coverages and services provided, fail to mention exclusions and other product shortcomings, downplay the true price, or fail to mention hidden costs or contingencies.

Specific examples of deceptive or unfair marketing and sales practices can include:

- Using advertising and sales materials, intermediary training materials, and/or mass-marketing activities that are false or deceptive
- Selling products through inadequately trained intermediaries
- Selling consumers more coverage than they need
- Misrepresenting a product’s coverages, rates, terms, or benefits
- Failing to provide life insurance customers with full and accurate “illustrations” showing how costs and benefits may change with future changes in interest rates and other variables
- Making unfair or incomplete comparisons among insurance policies to induce policyholders to replace their current policy, called “twisting”
- Investing life insurance funds in riskier assets than those promised in marketing materials or contractual agreements.

Deceptive practices include fraudulently posing as an insurer or insurance intermediary or otherwise offering insurance-type products without a license. An example is the proliferation of fake insurers and unlicensed intermediaries selling fraudulent health, life, and funeral insurance plans.

4.2 Unfair underwriting practices

The key ingredient of good underwriting is the ability to properly assess the risks to be covered, in other words to distinguish good risks from bad risks. Insurers are expected to develop and maintain written guidelines to help determine which risks to accept and which to
decline. These guidelines should reflect a mixture of statistical analysis of the marketplace and underwriting judgment. Nonetheless, insurers and their underwriters will occasionally make decisions that supervisors view as unfair or illegal, such as using policy forms and endorsements that have not been filed, if required, with the supervisor or using

- Intermediaries who are not properly licensed and appointed, if required, or
- Refusing to insure an applicant because they have been rejected by another insurer

4.2.1 Unfair discrimination in underwriting

Issues involving social discrimination occur when either statistics or judgment lead insurers to believe that certain races, genders, age brackets, income levels, or credit histories generally represent worse than average or better than average risks. Insurers might act on such beliefs on a broad scale when defining the targets of their marketing efforts or on an individual basis when accepting or declining applications.

When such assessments are grounded in actuarial statistics or insurance legislation, supervisors may allow them. Examples include higher automobile insurance rates for young drivers and lower homeowner insurance rates for people with good credit histories.

However, social discriminations that are based primarily on judgment often are either illegal or are viewed by insurance legislation or supervisors as unfair. Examples of unfair discrimination usually include refusing to insure an applicant, or otherwise disadvantage a consumer, because of their gender, marital status, sexual orientation, race, ethnicity, religion, or income.

4.3 Unfair rating practices

Insurers are expected to develop, maintain, and adhere to their rating manuals that detail all the steps involved in calculating the premium to be charged for any coverage offered on any given risk. These processes should be fair.

The following are examples of unfair rating practices:

- Charging premiums that are not in accordance with filed rates and rating manuals
- Permitting illegal rebating, commission cutting, or other kickbacks to intermediaries or policyholders
- Applying credits and deviations in an inconsistent or discriminatory manner
- Charging higher or lower premiums to applicants or policyholders due to any reason not directly related to the respective insurance risk, like gender, marital status, sexual orientation, race, ethnicity, religion, or income.
4.4 Poor administration of policyholder accounts

As with banks and other entities entrusted with the proper handling of other people’s money, insurers are responsible for maintaining accurate accounting of various funds held in policyholder accounts. Such accounts include:

- Provisions for premiums paid but not yet earned. This includes the accurate calculation of the amount of money to be returned to a policyholder if their policy is cancelled before its expiration date.
- Cash surrender values, benefit amounts, outstanding loan balances, and other account values in permanent life policies, as well as the allocation of such funds to the proper investment portfolios.
- Policyholder dividends that have been paid or are payable for insurance policies that provide for participation in profits.

The poor administration of such accounts can lead to the improper calculation or denial of return premiums, life insurance benefits, and policyholder dividends as well as the improper investment of policyholder funds and errors or delays in the payment of claims.

4.5 Ways to combat unfair business practices

There are several possibilities to combat unfair business practices, such as the following:

- The requirements for obtaining and maintaining an insurance license or registration should be designed to ensure that intermediaries and insurance executives have adequate knowledge, experience, integrity, and financial resources to conduct insurance operations fairly and reliably
- Insurers should be required to maintain internal controls to prevent unfair, deceptive, or unprofessional business practices
- Insurers, supervisors, and ombudsmen can provide consumers with opportunities and methods to submit complaints against such practices
- Supervisors may be empowered to carry out onsite investigations into the business conduct of insurers and intermediaries suspected of engaging in such practices. Supervisors can take actions ranging from fines to the revocation of licenses or registrations if wrongdoing is revealed.
Exercises – Section 4

Ex 9  What fraudulent insurance schemes, if any, have recently been issues in your jurisdiction?

Ex 10 What demographic underwriting considerations or rating factors are not permitted in your jurisdiction?
Claim and complaints handling

The majority of consumer complaints relates to claims and benefit payments. While most insurers handle and pay claims and benefits in a timely and fair manner, some insurers may succumb to the temptation to look for ways to avoid or delay paying claims, particularly when under financial stress. Therefore, insurers and intermediaries should be required to deal with claims and complaints effectively and fairly through a simple, easily accessible, and equitable process.

Insurers may try to avoid paying legitimate claims, cash value settlements, policyholder dividends, and other benefits in a number of ways. Some examples are:

- Denying a claim without conducting a reasonable investigation
- Needlessly delaying the investigation or payment of a claim
- Requiring unnecessary or duplicate reports or documents
- Failing to explain the reason for denying a claim
- Paying or offering to pay less than a reasonable amount
- Refusing to communicate the status or outcome of a claim investigation
- Failing to adopt and follow reasonable guidelines for handling claims and other benefits
- Misrepresenting relevant facts and coverage provisions
- Compelling claimants to sue to get a proper settlement.

It is critical that insurers adopt and follow detailed internal guidelines and procedures for the fair and prompt handling of claims and other policyholder benefits. Such guidelines, among other things, should require review by senior management of claim and benefit decisions that exceed particular monetary or other thresholds. These guidelines also should list the steps required and timeframes allowed to investigate and process claims and benefits.

5.1 Consumer complaints

It is important for the protection of consumers that their complaints against insurers and intermediaries be promptly and fairly investigated and processed by the insurer and that those complaints also be knowable to the supervisor. Supervisors can learn of complaints:

- Directly from consumers
- Through inspections of insurers’ complaint databases
- Through formal reports from insurers on claims and claim handling
• From ombudsmen, that is an official appointed by an appropriate governmental, industry or other body to investigate consumer complaints.

Supervisors depend on insurers’ complaints databases for the review and investigation of the full body of recorded consumer complaints. The ability of a supervisor to scrutinise complaint databases provides additional motivation to insurers to treat consumers and complainants properly. Such databases should in particular include the nature of each complaint, the relevant line of business and the time required to process each complaint.

5.2 Alternative dispute resolution methods

Despite the efforts of insurers and supervisors, from the consumer’s viewpoint, a fair number of complaints do not get satisfactorily resolved. In these situations, litigation remains, or should remain, an option. However, it is often to the consumer’s benefit to resolve disputes in ways that are simpler, quicker, cheaper, and less stressful than litigation.

Various alternative dispute resolution (ADR) methods, that is methods that do not involve courts and litigation, have been developed in many jurisdictions. These methods are often administered by government bodies or by industry associations that include consumer representatives. Regardless of the sponsoring body, most ADR methods involve the key assistance of a neutral party knowledgeable in the type of issue that is under dispute. This neutral party, often an ombudsperson, renders a finding or decision after hearing both sides argue their cases.

When the insurance industry administers the dispute resolution mechanism, the decisions of the ombudsperson usually are binding on the insurer but not on the consumer, who retains the right to take the matter to court. When a government agency administers the dispute resolution, the decisions of the ombudsperson often are binding on both parties.

Consumer protection is strengthened when insurance policies contain clauses that allow the policyholder to decide whether to use ADR or go to court. Many supervisors therefore do not allow provisions in insurance policies that mandate the exclusive use of ADR.

Exercises – Section 5

Ex 11 What methods and venues do consumers in your jurisdiction have to submit complaints?

Ex 12 Does the supervisor in your jurisdiction use information on insurance complaints when performing its supervisory tasks? What alternative dispute resolution mechanisms are available to consumers in your jurisdiction?
6 Investigations of business conduct

As mentioned earlier, some insurers and intermediaries do engage in various unfair and deceptive practices toward consumers. Such practices often produce a high level of consumer complaints.

6.1 Business conduct

Business conduct rules deal with the treatment of policyholders, claimants, insureds, and beneficiaries by insurers with regard to claims handling, underwriting and rating, policyholder service, complaint handling, and marketing and sales.

To investigate alleged patterns of misconduct toward consumers, it is important that supervisors conduct onsite investigations into the business conduct of insurers and intermediaries. Supervisors may also use offsite supervision tools, such as screening insurers’ websites. Business conduct investigations may be routine examinations or triggered by a high level of complaints or a large market share.

The methods and standards that supervisors use in such investigations should be fair and unbiased, transparent, open to public inspection, and known in advance to the industry. Such investigations may focus on particular products or coverages as well as on one or more of the following operational areas:

- Underwriting and rating
- Policyholder service, such as required notices and account management
- Claims handling
- Complaint handling
- Marketing and sales.

Once the supervisor determines which product lines and operational areas to inspect, it should compile a list of specific supervisor standards that the insurer may be violating. For example, an inspection may be focused on claims handling, as claimants have alleged that the insurer is slow in investigating claims, often provides unrealistically low settlement offers, and does not communicate reliably with claimants. The supervisor may choose to inspect the insurer’s compliance with the following standards:

- Insurers initial contacts with claimants are within required timeframes
- Insurer conducts timely investigations
- Claims are resolved in a timely manner
- Insurer responds to claim correspondence in a timely manner
• Claim files are adequately documented
• In cases of clear liability and coverage, the insurer does not offer claimants unreasonably low amounts.

Exercises – Section 6
Ex 13   If business conduct investigations are performed in your jurisdiction, what most commonly triggers them?
7 Insolvencies and monopolies

7.1 Insolvencies

A sound business model, financial strength and good corporate governance, in particular experienced management, are the best indicators that an insurer will remain in business to fulfil its commitments. Nonetheless, all insurers, even the biggest and strongest, run the risk of failing financially, perhaps for reasons and events beyond their control.

When insurers become insolvent, consumers face the risk that existing claims, or claims that may yet arise during the remainder of their coverage period, may not be paid and that any other services that they have a right to expect from their insurers may no longer be provided. For these reasons, it is in consumers’ best interest to examine, either directly or with the help of their intermediaries, the strength of a particular insurer prior to purchasing its products.

Examinations are particularly important when buying insurance for life, as the insurer need to remain strong throughout the consumer’s lifetime. Life insurance policyholders should also be encouraged to study the annual financial communications from their insurers.

7.1.1 Guarantee funds

Many jurisdictions have established guarantee funds to pay the claims of insolvent insurers. These funds are often funded by levies from licensed insurers in proportion to each insurer’s prorated share of the market in the jurisdiction. Some guarantee funds are prefunded before insolvencies occur, and others charge insurers only in response to specific insolvencies.

Most guarantee funds cover only certain types of insurance and often limit the amount of claim payments. These provisions are intended to give highest priority to the disbursements of funds to consumers and to small businesses.

While the social benefits of guarantee funds are clear, the following negative consequences may also arise:

- Ultimately, contributions to guarantee funds are passed on, at least in part, to consumers in the form of higher premiums
- Contributions to guarantee funds penalise the prudent business practices of solvent insurers by forcing them to pay for the underpriced products and other imprudent business practices of their now-insolvent competitors
- The insolvencies of very large or a series of insurers can strain the resources of guarantee funds and leave claimants and other creditors with only a fraction of the reimbursements to which they otherwise would have been entitled
• The “safety net” provided by guarantee funds may entice insurers to underprice their products and lower their underwriting standards.

7.2 Monopolies

Dangers for consumers can also arise from high concentration in the market. When an insurer or group of insurers monopolise or otherwise exert undue control over products in the insurance marketplace, prices for these insurance products tend to increase and the range of coverage options available to consumers tends to diminish. If there are only very few viable insurers in the marketplace, residual market mechanisms, such as mandatory pools for insuring unattractive risks and sharing the experience among all insurers, tend to grow as consumers find it harder to obtain affordable insurance coverage in the voluntary market.

If a very large carrier goes insolvent, the resulting unpaid claims may either exceed the resources of the guarantee fund or require severe assessments that disrupt the market and ultimately are borne by consumers or taxpayers.

7.3 Licensing criteria

As a first line of defence against insolvencies, supervisors should license or register only the insurers that can demonstrate that they have

• Sound corporate governance in place,
• An experienced and reputable management team, a viable business plan, and
• Adequate capital to support their current and planned operations.

Supervisors should revoke licenses or registrations if an insurer does no longer fulfil any of the licensing or registration criteria and does not remedy this situation.

Exercises – Section 7
Ex 14 What guarantee funds, if any, exist in your jurisdiction? How are they administered and funded?
8 Privacy of consumer information

The electronic era has led to the capture and dissemination of increasing amounts of personal information about consumers. Insurers use this information when reviewing policy applications, determining rates, processing billings, handling claims, and marketing their products. There is an increasing risk that this information may be obtained by inappropriate entities and used for inappropriate purposes. Supervisors can contribute to the protection of private information when setting rules on the handling of customer information by paying attention to the protection of private information of customers.

The types of personal information that can cause damage to consumers, if mishandled, include highly sensitive information like medical records, lifestyle, credit card numbers, credit reports and credit or claims history.

To safeguard the privacy of consumer information, insurers should be prohibited from obtaining information under false pretences, and supervisors should encourage or require insurers and intermediaries to:

- Maintain procedures to safeguard such information
- Inform consumers of the insurer's privacy policies and practices
- Allow consumers, without penalty, to opt out of allowing their information to be further used or disseminated.

8.1 Information security programs

Insurers should be encouraged or required to develop and implement comprehensive written information security programs that include administrative, technical, and physical safeguards to protect consumer information. These safeguards should be appropriate to the size and complexity of the insurer and to the nature and scope of the insurer’s activities.

The goals of these security programs are to:

- Ensure the security and confidentiality of consumer information
- Protect against any anticipated threats or hazards to the security or integrity of the information
- Protect against unauthorised access to, or use of, the information that could result in harm or inconvenience to consumers.

An insurer’s information security program should include procedures to:

- Train its staff to properly implement the program
- Test or monitor the program’s key controls, systems, and procedures regularly
• Require service providers to implement appropriate measures to safeguard the insurer's customer information while it is in their possession

An insurer should adjust its information security program as changes occur in, for example:

• Relevant technology and its applications,
• Sensitivity of the consumer information,
• Internal or external threats to this information, and
• The insurer's business arrangements. Such as mergers, alliances, outsourcing, and consumer information systems.

### 8.2 Privacy notices to consumers

Insurers should provide their customers with written notices regarding the insurer’s use of personal information as well as any rights the consumer may have to further restrict the dissemination of such information. The timing and frequency of such notices may vary by jurisdiction.

---

**Exercises – Section 8**

Ex 15  Is the privacy of consumer information viewed as a problem in your jurisdiction? If so, what steps do most insurers in your jurisdiction take to protect such information from unwanted dissemination?
9 Cross-border issues and distance marketing

Many insurers sell and administer their products in multiple jurisdictions, whether through traditional methods or through “distance marketing” methods such as the internet. Problems arise when insurers sell in jurisdictions in which they or their products are not licensed.

Furthermore, products such as automobile insurance and accident and health insurance often offer worldwide coverage. It is generally understood that the laws and regulations of the jurisdiction in which the policy was sold or the risk is located should prevail. However, cross-border disputes still can arise when claims occur.

Purchasing insurance on the internet, while offering unique marketing opportunities and efficiencies, also presents consumers with new risks, including:

- Lack of an insurer/intermediary to explain the product and advise the consumer
- Uncertainty over whether the insurer or the product are authorised in the consumer’s or any other jurisdiction
- Unwanted dissemination of private consumer information
- Difficulties in enforcing claims or benefit payments.

Insurance products offered across borders or through distance marketing are subject to the same requirements as insurance products offered locally and through intermediaries. The insurer and intermediary (if used) should be licensed or registered in the consumer’s jurisdiction and be subject to the same laws and regulations regarding business practices and consumer notifications discussed earlier.

The supervisor should provide information to the public about whether and how local legislation applies to the cross-border offering of insurance, such as e-commerce. The supervisor should issue warning notices to consumers when necessary to avoid transactions with unsupervised entities.

9.1 IAIS Multilateral memorandum of understanding (IAIS MMOU)

In addition to educating consumers on distance marketing risks and on known fraudulent operations, supervisors can reduce cross-border problems by developing working relationships with their counterparts elsewhere. A frequently used tool for this purpose is the IAIS Multilateral memorandum of understanding (IAIS MMOU). This is a written statement of intended cooperation among all supervisors from different jurisdictions that are signatories to the MMOU.
Exercises – Section 9

Ex 16  Which forms of distance marketing are used in your jurisdiction and for which insurance products? What regulatory oversight exists over these sales?

Ex 17  Is the supervisor of your jurisdiction signatory to the IAIS MMoU? Have you encountered cases of bad business conduct by insurers in a cross-border context?
10 Summary

This module has discussed various dangers to which insurance consumers are exposed and the ways in which supervisors strive to protect consumers. The discussion focused on insurance products for personal, family, and household use, including automobile, property, life, and health insurance. The imbalance in insurance knowledge between consumers and insurance professionals, and the important advisory role of intermediaries, were noted.

There are various situations when consumers need to obtain information from, or supply information to, insurers and intermediaries. Key types of information and notifications expected have been highlighted. Supervisors, industry associations, and other organisations use various methods to provide helpful information to consumers.

Insurance contracts and policies should be easy to understand and comply with applicable laws and regulations regarding mandated provisions and prohibited exclusions. Rates also need to be appropriate for the underlying risks and coverages provided and not be unfairly discriminatory.

A range of unfair business practices may exist in marketing, sales, underwriting, rating, and claims handling. Some ways supervisors can curb these practices were mentioned in the module. Methods for encouraging the submission and reporting of complaints were discussed, along with methods other than litigation that might be used for resolving disputes between consumers and insurers.

The module provided an overview of business conduct investigations of insurers, including concerns that may trigger such examinations and areas that may be targeted for inspection. It also surveyed the steps involved in designing such examinations.

Insurer insolvencies and monopolies present dangers to consumers. Licensing requirements can help to protect consumers from such dangers, while detailed financial examinations of all insurers can provide early warning and allow supervisory intervention before insolvencies occur. The value and the shortcomings of guarantee funds in protecting consumers after insolvencies occur were discussed.

Insurers and intermediaries must safeguard the privacy of the financial, health, insurance, and identity information of consumers. Consumers should also be advised of their right to limit the dissemination of personal information.

Finally, we noted the risks posed by the sale and use of insurance products across jurisdictional borders and through distance marketing methods such as the internet. Communication and active cooperation among supervisors of various jurisdictions are essential in dealing with such risks. The use of the IAIS MMoU can support such cooperation.
11 Further reading

11.1 General sources

Many texts are available which are relevant to the material in this module. These texts may also go beyond the scope of this module, but usually include introductory chapters on the basic topics.

When reading these texts it is useful to consider the principles being as well as the details of their application in a particular environment. Also, it is important to recognise that as the environment changes the relative importance of issues may also change.

Other sources of information are also available. For example, in many countries there is an insurance institute of some form. The Chartered Insurance Institute (CII), based in England, provides a range of good educational programs and has links to more than 70 other insurance institutes worldwide (see www.cii.co.uk).

In some cases, supervisory websites are also valuable sources of information. This can be particularly the case when supervisors publish explanatory information explaining their requirements and approaches.
Appendix I: Answers to Exercises

Exercises

Answer 1 The products listed (automobile, health, property, and life insurance) are available to consumers in almost all jurisdictions. Examples of other consumer insurance products that might be available and subject to consumer protection requirements include liability insurance and motor vehicle assistance plans, although the latter is often exempted from insurance regulation. Review the website of your supervisor, examine legislation and regulations, or consult with colleagues to identify the types of consumer products available in your jurisdiction.

Answer 2 Examine legislation and regulations or consult with colleagues to determine the requirements for treating claimants in your jurisdiction.

Answer 3 Examine legislation and regulations or consult with colleagues to determine the requirements for licensing or registration of intermediaries in your jurisdiction.

Answer 4 Examine legislation and regulations or consult with colleagues to determine the existence of residual market mechanisms in your jurisdiction. When they do exist, the organisations that operate such mechanisms may have websites that provide information on their operations.

Answer 5 Examine legislation and regulations or consult with colleagues to determine the allowable reasons for cancellation in your jurisdiction. In some jurisdictions, such provisions are set out in legislation that deals specifically with insurance contracts.

Answer 6 Examine the websites of the supervisor and industry associations in your jurisdiction.

Answer 7 Consult with colleagues to determine whether to determine whether any fraudulent insurance schemes are currently of concern in your jurisdiction.

Answer 8 Consult with colleagues to determine the actuarial resources that are available to the supervisor. If the actuarial profession is formally established in your jurisdiction, review the website of the professional organisation for information on the extent of the profession, standards of practice, and so forth.

Answer 9 Consult with colleagues to determine whether any fraudulent insurance schemes are currently of concern in your jurisdiction.

Answer 10 Examine legislation and regulations or consult with colleagues to identify any demographic underwriting considerations or rating factors that are not permitted in your jurisdiction.
Answer 11  Examine the websites of the supervisor, industry associations, consumer protection organisations, and ombudspersons to identify the alternatives available to consumers in your jurisdiction for submitting complaints.

Answer 12  Examine legislation and regulations, as well as the websites of the supervisor, industry associations, consumer protection organisations, and ombudspersons to identify alternative dispute resolution mechanisms available to consumers in your jurisdiction.

Answer 13  Consult with colleagues to discuss the circumstances that have most commonly triggered market conduct investigations in your jurisdiction.

Answer 14  Examine the websites of the supervisor and industry associations in your jurisdiction to identify whether any guarantee funds exist in your jurisdiction. If they do exist, examine legislation and regulations, as well as the websites of the organisations that operate the guarantee funds, to determine how they are administered and funded.

Answer 15  Consult with colleagues to identify any consumer privacy issues that might currently exist and to discuss the steps taken by most insurers in response to such issues. Examine any legislation, regulations, and guidelines that may exist in this area.

Answer 16  Consult with colleagues to identify forms of distance marketing that are used in your jurisdiction, the products that are marketed in this manner, and the nature of regulatory oversight. Consider whether your supervisor has, for example, staff that are charged with surfing the internet to identify instances in which insurers or intermediaries are marketing insurance over the internet. Examine any legislation, regulations, and guidelines that may exist in this area.

Answer 17  Consult with colleagues to determine whether any MOUs exist and, if so, their main points.

Using the Core Curriculum

Purpose
The IAIS Insurance Core Principles (ICPs) provide a globally accepted framework for the supervision of the insurance sector. The ICPs are suitable to apply to insurance supervision in all jurisdictions regardless of the level of development or sophistication of the insurance markets and the type of insurance products or services supervised.

The Core Curriculum provides non-commercial training materials to support insurance supervisors as they implement the ICPs. They give insight and background to the ICPs and the concepts underlying them. There is also a focus on the practical application of supervisory concepts.

Supervisory practices are constantly evolving reflecting experience and changing environments. Consequently, Core curriculum materials should not be read as providing ‘the answer’ to a particular issue, but as providing guidance, approaches and matters to be considered by supervisors when they address specific issues in their own particular context.

Audience
The key users of the Core Curriculum material include:

- Trainers of insurance supervisors
- Individual insurance supervisors, and
- Other parties interested in sound and effective regulatory and supervisory practices.

Link document
The Core Curriculum Link document provides a mapping between the ICPs and the Core Curriculum modules. As ICPs and/or the Core Curriculum modules evolve, their relationship is described by the Link document (see www.iaisweb.org). This allows users to navigate from ICPs to relevant Core Curriculum modules and in the opposite direction.

Learning advice
Different users have different needs and will use the Core Curriculum modules in different ways. The Core Curriculum Learning advice document provides users with suggestions on using Core Curriculum materials to meet a variety of needs. You are recommended to use the Learning advice document (see www.iaisweb.org) to support your use of the Core Curriculum modules.
This module

Summary

The purpose of this Core Curriculum module, 7.1.1, Market analysis, is to outline aspects of market analysis relevant to insurance supervisors with a focus on market conduct topics. Other modules cover financial indicators. It should also be noted that market analysis may vary by jurisdiction according to market structures and constraints.

Learning objectives

When you complete this module, you should be able to:

1. List the benefits of market analysis for supervisors, insurers, and market participants, including how market analysis can be used in the supervisory process.
2. Describe different measurement categories that are used to assess the nature and performance of a market.
3. Illustrate the above categories with examples of specific measures that may be used.
4. Describe various sources of information, both domestic and international, that are used for market analysis.
5. Explain the strengths and weaknesses of these sources, noting how they can both inform and misinform.
6. Describe a process that might be used to identify possible future issues and scenarios.
7. Explain the use of trend analysis, noting different techniques that can be employed and describing their strengths and weaknesses.
8. Identify the attributes of competitive markets, and describe conditions that tend to induce market entry and exit.
9. Explain and discuss the presence of hard and soft markets.
10. Describe the sources of market power, and explain how market power might distort market outcomes.
11. Given sufficient information, construct a concentration ratio and a Herfindahl Index for a particular market.
12. Analyse the availability of insurance in relevant classes and market segments.
13. Analyse consumer complaints and investigate market conduct of insurers.
14 Describe the types of aggregate market data that might appropriately be published by a supervisor.

15 Illustrate situations in which a supervisor might require systematic reporting to monitor and analyse events of importance to financial stability.
1 Introduction

“Market analysis” is a term that can be used to describe a wide range of practices and approaches. Market analysis may be performed by various entities and for significantly different purposes. This module begins by describing the general concept of market analysis. It then focuses on issues important to an insurance supervisor (supervisor). “Supervisor” in this document includes any relevant supervisor in a jurisdiction. In some jurisdictions there may be more than one supervisor. For example, in Australia there are two main bodies the Australian Securities and Investment Commission (ASIC) and the Australian Prudential Regulation Authority (APRA).

Market analysis is an important tool that supports supervisors fulfilling their mandate. They need to monitor the state of the industry they supervise. This helps them prioritise their actions. The supervisor should review individual insurers (and reinsurers) and it should also actively monitor the “shape” the market. This includes matters such as competitiveness, trends, stability, transparency, and the mutual respect of the market participants and their clients.

Supervisors should monitor and analyse market conduct and financial developments and other environmental factors that may impact insurers and insurance markets and use this information in the supervision of individual insurers. The focus of this module is on market conduct topics. Other modules cover financial indicators. It should also be noted that market analysis may vary by jurisdiction according to market structures and constraints.

Market analysis has many links with other topics covered by other modules and the ICPs.

This module is not a simple set of instructions on how to carry out market analysis. Differences across jurisdictions due to legislation, market development, market situation, and other factors make it so that there is no “one size fits all” solution. This module does however provide guidelines for the preparation of market analysis given a particular environment. Supervisors should identify the tools that are available to them and then tailor their use of those tools to fit their own needs and objectives.

This module considers topics such as:

- What should be taken into consideration when preparing market analysis?
- What are the objectives of market analysis?
- What are the subjects of analysis?
- What are the possible sources of information?
- Which indicators can be used?
- What are the tools available for analysis?
- How can the analysis be organised efficiently?
How does market analysis interact with the supervisor’s other activities?

The role of market analysis is discussed in Section 2. This includes the scope and depth of the analysis, as well as the uses of market analysis for the supervisor. The sources of information that can be used for carrying out market analysis are discussed in Section 3.

Changes in the environment affecting the operation of insurers are discussed in section 4. It is impossible to give a universal method to quantitatively assess the impact of changes in the environment on the insurance market. This impact must be evaluated on a case by case method, employing commensurate assumptions and suitable mathematical tools.

Section 5 deals with basic indicators and methods of market analysis. They enable regular quantitative assessment of the structure of the market, its technical results, and its economic position; conduct of companies; market development; and market competition and availability of products; as well as the development of these factors.

Section 6 describes how a supervisor can establish a market analysis function and perform market analysis.

1.1 Terms used

Many of the insurance related terms used in this module are defined in the IAIS Glossary of Terms (see www.iaisweb.org). When additional terms are used they are defined in the text.

The terms regulation and supervision are often used interchangeably, but they mean different things. In this module, regulators establish “the rules of the game,” such as regulations and guidelines related to an Insurance Act (or Acts). Supervisors are the “referees” whose role is to oversee that these rules are complied with and deal with the consequences of non-compliance. This requires supervisors to apply judgement when making determinations and decisions.

Understanding the difference between the regulation and supervision is important when allocating of responsibilities between regulators and supervisors, especially when they are different agencies.

In this module “supervisor” is used to include both regulators and supervisors. The module also assumes that supervisors are insurance supervisors. Supervisors, as determined by the context of the particular use, may be either the individuals working for a supervisory agency or authority or the authority itself.

While the terms used in this module are suitable for the purposes of this module, it may be that in specific real situations, more detailed definitions or explanations are necessary. These more detailed definitions may also vary between jurisdictions.
Some terms may not have unique meanings, and definitions contained in various sources may differ. To avoid ambiguity and reduce the risk of misuse and misinterpretation, readers should take care to be comfortable they are clear on the definitions of the terms used.
2 Role of market analysis

Market analysis can assess the business development opportunities for new market entrants, including opportunities for profit generation. It can also access market conditions, market stability, fair competition, and consumer protection. This can be particularly useful as a preparation for legislative changes.

For this module, the following definition is used:

Market analysis is research carried out to understand the current state of a market and help predict its future.

This concise definition could seem too simple; however, the importance of prediction should be highlighted. Prediction of future market behaviour (and behaviour of its individual participants) helps supervisors anticipate unfavourable developments and be prepared to intervene in case of a threat to market stability or consumers’ interests.

This definition implies that:

- Market analysis is not only the description and analysis of the past (the goal of insurance supervision is informed action, not just knowledge for its own sake!)
- Market analysis is not a one-off process, and
- Market analysis is a systematic, repeatedly performed activity of collecting market information, putting the information into context, evaluating trends, and taking appropriate action.

Market analysis must be both:

- Proactive (studying and analysing trends during “normal” development, in order to help predict the future and inform supervisory actions), and
- Reactive (studying the impact of extraordinary market events, such as large natural catastrophes or failures of companies on the whole market, in order to better predict and manage such events in the future).

2.1 Market analysis in the context of the ICPs

The following concept of market analysis is covered in the ICPs:

Supervisors should monitor and analyse market and financial developments and other environmental factors that may impact insurers and insurance markets and use this information in the supervision of individual insurers.

Some criteria to help the supervisor check and evaluate the level of implementation of market analysis, together with basic comments and explanations, are listed below.
2.1.1 Regular market analysis

Supervisors need to have processes in place to conduct regular market analyses. This enables the supervisor to be aware of material changes in market conditions that may impact individual insurers, the whole insurance sector, and other financial sectors.

Supervision should promote the maintenance of a fair, safe and stable insurance sector for the benefit and protection of policyholders. Some risks that could undermine the achievement of this objective include:

- Jeopardized financial soundness of an insurer
- Poor conduct by an insurer when serving policyholders, particularly in claims handling
- Unavailability of products
- Unfair competition and misuse of market power, and
- Changes in the market environment.

Market analysis can help the supervisor predict the unfavourable development of the above risks, and therefore facilitate an adequate and timely response.

2.1.2 Market analysis: past, present and future

Supervisors, in performing market analysis, consider not only past developments and the present situation, but also trends, potential risks and plausible unfavourable future scenarios. They also consider capacity to take action at an early stage, if required.

Correct and efficient performance of market analysis requires timely delivery of well defined, reliable, and accurate data; understandable and unambiguous definition of analysed factors and indicators; and stable analytic methods. When interpreting the results of market analysis, risk tolerance limits (limits and thresholds representing “warning level” and/or “action level”) must be defined. All of these issues are dealt with in a greater detail in the following sections.

2.1.3 Market analysis: quantitative and qualitative

The ICPs indicate the supervisor should perform both quantitative and qualitative analysis and make use of both public and other sources of information, including horizontal reviews of insurers and relevant data aggregation.

Market development is always a result of the impacts of many different factors. While the results usually are measurable and can be expressed in quantitative form, quite frequently, the origin of the changes is non-measurable and difficult to assess (for example, legislative changes).
To the extent that a jurisdiction is observing certain ICPs, accessibility of data should not be an issue. To illustrate:

- For details on insurers’ public disclosure of data, see the ICP covering information disclosure and transparency toward the market, and.

- Reasonable data of any kind (including confidential information) can be requested by the supervisor from an insurer (see ICPs covering reporting to supervisors, off-site monitoring and on-site inspections).

More difficult to determine is what is a reasonable amount and structure of data and what is the availability of data. In particular, data that are newly requested from insurers, (such as complaints files and complaints statistics) may not necessarily be immediately available in a uniform structure and level of detail. Effective market analysis can be facilitated with a database that

- Has a stable and efficient structure (that is, does not require frequent structural changes and enables preparation of all necessary analyses)

- Does not impose an excessive burden on insurers when they are preparing the data (that is, requires data that the insurers are able to provide and that they can/should use also for themselves, for example, while performing risk management)

- Does not duplicate activities of other data collectors and providers (the supervisor should maintain extensive and intensive communication and cooperation with other institutions operating in this area)

- Is internationally compatible (that is, enables comparison with other markets, at least on regional level) and enables cooperation with other domestic financial supervisors and foreign supervisors, and

- Brings fast and efficient results (to enable prompt supervisory intervention as requested in the ICP on Preventive and Corrective Measures).

Quantitative and qualitative analysis reinforce and clarify each other. Quantitative analysis deals with indicators that can be expressed in figures. Qualitative analysis explains market changes and developments in words. Qualitative analysis includes reporting on general developments that may impact insurance markets, companies, and clients, including new or forthcoming financial sector and other relevant legislation, developments in supervisory practices and approaches, and reasons for market exits. Qualitative analysis should always be complemented with a quantitative analysis. The explanation or prediction of development is never complete without quantitative assessment of impacts. In the same way, quantitative analysis also needs its qualitative complement. Each table, figure, or any other form of
presentation of quantitative analytical results must be complemented with a verbal explanation of

- Reasons for the presented development
- Possible inaccuracies that may influence the results
- Expected future development trends, and
- Relevant comments and remarks of any other kind.

Otherwise, the presentation loses a significant part of its analytic value.

2.1.4 Market analysis: market wide reporting

Supervisor should require insurers to disclose relevant, comprehensive and adequate information on a timely basis in order to give policyholders and market participants a clear view of their business activities, performance and financial position. This is expected to enhance market discipline and understanding of the risks to which an insurer is exposed and the manner in which those risks are managed. Consequently, supervisors should make sufficiently detailed aggregated market data publicly available.

Market data is important for insurers and other market players, enabling them to compare their performance and activities.

2.1.5 Market analysis: systematic reporting

Supervisor should establish documented requirements for the submission of regular qualitative and quantitative information on a timely basis from all insurers licensed in its jurisdiction.

In addition to standard, regular reporting and public disclosures, specific data collection and analysis may be needed in the case of, for example, catastrophes that may influence the market. The terrorist attack at the World Trade Center in New York on September 11, 2001 and periodic windstorms affecting North America, the Caribbean and Asia may be cited as instances of human-made and natural catastrophes, respectively. Supervisors should be prepared to (re)act immediately to secure the maximum possible consumer protection. Exposure to such events should be monitored by the supervisor because they constitute a potential systemic threat, and will influence how the supervisor monitors financial strength and liquidity. The ICPs state the supervisor should require more frequent and/or more detailed additional information on a timely basis whenever there is a need.
2.1.6 Market analysis: regional and international

The ICPs state that insofar as international relationships affect internal insurance and financial markets, the analysis is not limited to domestic markets, but includes also regional and/or global developments.

The ICPs also state the supervisor should cooperate and coordinate with other relevant supervisors and authorities including those across borders.

International relationships and cooperation have become an inevitable part of today’s life, also for insurance and its supervision. Sometimes, the need for cooperation is directly embedded in the applicable legislation, and the supervisor would not be able to perform its duties without analysing other markets. Obviously, cross-border market analysis is difficult to perform. Let us briefly take the situation in the European Union. EU member countries have adopted two tiered legislation:

- Common EU legislation obligatory for all member states, and
- Individual state laws that may not contradict the common EU legislation.

The EU legislation enables:

- Single-licence principle (license to operate issued in one member state is also valid in other member states)
- Freedom to provide services (insurers may operate from one member state and in other member states), and
- Right of establishment (insurers may establish branches in other member states).

It is thus not surprising that international cooperation in such a market environment is not only vital but even obligatory (regulated by the EU laws).

Therefore, cooperation and market analysis information exchange between individual national supervisors is inevitable. Some of the market analysis indicators mentioned in this module serve the comparison of individual markets (see section 5: Analysing Market Developmental Level).

2.1.7 Market analysis: macroeconomic vulnerabilities and financial market risks.

The ICPs require the supervisor to assess the extent to which macro-economic vulnerabilities and financial market risks impinge on prudential safeguards or the financial stability of the insurance sector.

Basic information on market analysis has been discussed above. There are a number of related topics not covered or covered only partially due to the limited scope of this module, such as:

- Impact of trading and ownership links to market structure and its operation
• Insurance groups and financial conglomerates aspects of market analysis
• Non-traditional reinsurance, and
• Analysis of external markets and their impact to domestic market.

The world is changing and supervisors must keep pace with all relevant changes. Therefore, continuous observing of and learning about the market changes form inevitable parts of the supervisor’s job.

2.2 Use of market analysis and benefits for the supervisor

Modern supervisory techniques must include market analysis. The following discussion addresses the most important specific areas in which market analysis contributes to the execution of insurance supervision. This section deals with the general benefits and contributions that market analysis can provide the supervisor.

It is impossible to avoid totally all adverse developments. On the other hand, watching the trends and analysing the strengths and vulnerabilities of the market enable supervisors to be proactive, to put them at the ready and poised to (re)act before minor problems become major by adapting techniques as market conditions evolve.

2.2.1 Market benchmarks

Information related to individual market participants can be summarized and combined into market values, then analysed to establish market benchmarks and averages. These benchmarks can then be used to identify any significant differences between the benchmarks and the positions of individual companies for prudential and market conduct purposes. Deviations from such benchmarks may trigger more intensive monitoring or intervention.

Generally, in a sound market, companies close to the market average that keep pace with market benchmarks are less likely to have problems than insurers that deviate from the market in a negative direction.

2.2.2 Market efficiency

Market analysis enables the measurement of competition in the market. The market is efficient if products are available and sold at reasonable prices. It has been proven many times both in economic theory and in practice that efficiency can be achieved more easily in markets that have sufficient competition and the size of individual players is not great enough to enable them to misuse their market power.

For details see section 5 regarding analysing market structure and competition.
2.2.3 Insurance supervision efficiency

Not only the market but also the insurance supervision itself should be efficient. Here, market analysis can contribute a great deal. Efficiency of the supervisor means that:

- The supervisor acts in a timely manner, and
- The supervisor acts efficiently.

Analysis helps to set priorities within the supervisory process. Supervisors may need to pay more attention to certain insurers under adverse circumstances and/or in cases in which policyholders’ rights could be endangered. The manner in which a supervisor can organise closer supervision of "suspect" insurers in a transparent way, without breaching principles of equality, is discussed in other CC modules and the ICPs. However, some considerations on setting priorities and concentrating capacities in the supervisory process are mentioned here.

There are several reasons to watch some market players more closely. The most important reasons include, for:

- Larger insurers:
  - They could misuse their market power when pricing and serving their clients, and
  - More clients could face difficulties in case of the adverse development of the company.
- Smaller insurers:
  - They are often more sensitive to market fluctuations, and
  - Due to their size, it is more difficult for them to keep their fixed costs at an appropriate level and keep pace with their competitors.
- Insurers that deviate significantly from the market average in main indicators (such as provisioning level, combined ratio, solvency margin):
  - Such deviations could indicate adverse development of the company, nonprofessional approach, or poor financial position compared to market benchmarks.

Market analysis helps to concentrate the supervisor’s capacities on insurers that are more likely to have problems.

2.2.4 Market conduct

Compared to measuring purely economic indicators, it is more difficult to measure and analyse the behaviour of the market and individual companies. Desirable behaviour includes fair and transparent marketing of insurance products, timely response and settlement of claims,
resolving complaints, and complying with the requirements of public disclosure. Basic possibilities for such analysis are discussed in section 5.

Monitoring the market conduct of insurers is another way that market analysis protects policyholders.

### 2.2.5 Comparison of individual markets and cooperation with other supervisors

Some of the market analysis criteria enable the comparison of the level of development of individual markets (see section 5 regarding analysing market developmental level for details). Using equal or comparable market analysis in different market enables the supervisor to compare the market status of individual insurers in different markets. Comparable market analysis also facilitates cooperation with other supervisors, which is vital for cross-border cooperation in an international environment such as the European Union (applying the principles of right of establishment, freedom to provide services, and single license). Additional details and considerations regarding such cooperation can be found in the ICPs and have been referred to above.

### 2.3 Scope and depth of market analysis

Requirements for market analysis can be contradictory.

- Market analysis should be comprehensive, taking into account all factors affecting (or potentially affecting) the market and its development and performing quantitative measurement of such impact (or at least its estimation when quantification is impossible or appropriate mathematical methods are not available), and
- If such impact could lead to an adverse development endangering the consumers, market, or some of its participants, the analysis should identify decisive factors and suggest their alternative values (in case of quantitative factors) or qualities (in case of qualitative factors) that are achievable and would lead to a more favourable development.

On the other hand, the analysis should:

- Be reasonably priced
- Require reasonable capacities in terms of expertise and technological resources, and
- Be fast enough to enable taking measures against adverse development. It is necessary to establish the scope and depth of the analysis to comply as much as possible with the above requirements.
The following aspects and methods should be considered when setting the sensitivity:

- Learning by experience:
  - Is the market analysis sensitive enough to identify adverse development and negative events affecting the market in the past?
  - Would the signals brought by the market analysis come early enough to enable timely measures?

- Cooperation and exchange of information. The supervisor should cooperate and exchange information with:
  - Authorities supervising other areas of the financial market, and
  - Supervisors of other insurance markets.

- Adequacy regarding prudential requirements:
  - Is the market analysis sensitive enough to judge the prudential requirements and development of values of their indicators on the market-wide level?
  - Would the signals brought by the market analysis come early enough to enable timely measures?

The scope and sensitivity of market analysis must be continuously followed and assessed, and market developments must be reflected without delay.
3 Sources of information

The majority of the information needed for direct quantitative market analysis is supplied by insurers, as both reports to supervisors and findings during onsite inspections. However, a substantial portion of information useful for the analysis and its environment also can be obtained from other sources. The supervisor should look for opportunities to enhance its knowledge and helps to assess future market development.

Internal communication and information sharing within the supervisor have a particularly important role. Information from regular reporting, offsite monitoring, and onsite inspections should reach the department responsible for market analysis without unnecessary delay. Timeliness for all internal communication within the supervisor can help ensure that information is passed on expediently.

The market analysis staff should monitor relevant publications, press releases, market surveys, investigation reports, and discussion groups, both domestically and internationally, and extract information on issues that could affect the insurance sector. This monitoring can also be done using electronic tools and services (at least in some territories in which such tools are available and legal). Monitoring is not restricted only to items with “pure insurance content” but also to items that relate to insurance relatively loosely, such as demographic development, criminality, and exchange rates.

3.1 Insurance market participants

Market participants and their possible contributions to market analysis are listed below:

- **Insurers and insurance associations**

  Supervisors can meet formally and informally with insurer management and directors. These meetings can take place as part of onsite inspections or separately. Meetings also can also be held more formally, for example, through periodic meetings of senior management of the supervisor with industry counterparts. Mutual exchanges of views will improve communication, understanding, and trust; and complement information collected through other channels.

  Insurance associations usually also perform market analyses, prepare comprehensive market statistics and investigate the overall market environment. They may also prepare other outputs such as codes of conduct for member companies. Results of these activities are communicated in their annual reports, press releases, and other outputs; and may be useful and contribute to the analysis performed by the supervisor. Regular discussions with the top association representatives (who usually are senior management members of insurers) can
contribute to estimating and understanding future market development, problems faced by the insurers, their solutions, and other issues.

- **Reinsurers**
  Reinsurers perform global market analyses as well as analyses of individual events affecting the international insurance and reinsurance market. Their contributions are particularly valuable because of the global perspective of their approaches. It may be useful for the supervisor to keep in contact periodically with reinsurers and study the materials they issue.

- **Insurance and reinsurance brokers**
  The same statements above about reinsurers also are valid for large insurance and reinsurance brokers. In addition, in their efforts to attract consumers, to some extent they compete with rating agencies with respect to assessing the financial stability of reinsurers and finding methods for using the results of such assessments in their work. Their output may serve as an inspiration and comparison tool for the supervisor.

- **Other professionals** in the insurance sector, including:
  - Actuaries and their professional associations
  - Risk managers
  - Compliance officers
  - Advisors
  - Credit rating agencies
  - Insurance business analysts, and
  - Professional services companies that work in the insurance sector.

Furthermore, the supervisor can discuss with them particular technical issues as well as what they see as developing risks and business trends.

### 3.2 Wider economic and international environment

Regular discussions with a variety of other parties may be particularly useful for sharing views on developments and trends affecting the financial sector and legal environment.

- **Authorities supervising other financial sectors**
  Meetings can be useful even if the counterparty is legally constrained from sharing information about specific financial institutions.
• **Representatives of other organisations having roles in the financial markets**
  These officials include central bankers, finance ministers, and managers of policyholder protection funds.

• **Auditors and credit rating agencies**
  These entities have two common interests: investigating the soundness of market players and protecting the market from adverse developments. Therefore, these meetings should be held frequently.

• **Supervisors of other jurisdictions**
  These entities have two common interests: investigating the soundness of market players and protecting the market from adverse developments. Therefore, these meetings should be performed frequently.

• **International institutions**
  Such institutions include IAIS (International Association of Supervisors), EIOPA (Committee of European Insurance and Occupational Pensions Authority), Insurance Europe), and IASB (International Accounting Standards Board). The supervisor has a natural interest in following the developments and participating in activities of these institutions whenever possible.
4 Changes in the market environment

The environment in which the market operates is determined by the existing political systems, economic and financial contexts, legislation, developmental level of the jurisdiction, geographical location (climate), and the society. Political changes may trigger changes in each of these factors. The development in Eastern European jurisdictions may serve as a good example. In the early 1980s, these jurisdictions had state monopoly planning systems (with monopolies also in the insurance sector). At present, they are European Union members, and all aspects of life in these jurisdictions have changed, including not only legislation, economy, finance, and demographics but also areas seemingly unimportant to the insurance industry such as infrastructure and transportation.

It is not only the financial impact that should be considered but also the availability of reasonable and adequate insurance protection for consumers. When preparing the market analysis, the supervisor should always consider the particularities of the market. The influence of individual factors is different in different markets. (Furthermore, it is possible that some of the market-specific factors are not mentioned in this module).

4.1 General economic conditions and financial market situation

Any changes should be carefully followed by the supervisor:

- If the general economic situation is deteriorating (whatever the cause), it may negatively affect the disposable income of inhabitants, decrease the demand for insurance products, and shrink the insurance market, which may affect the viability of insurers,

- Surprisingly, improvement of the general economic situation (or even a stabilization of the economy) also may bring problems to insurers. In such an economic environment, interest rates go down so that reaching the yields guaranteed in fixed-interest-rate life policies may be difficult, and

- Negative development in the equity market has a negative impact on the value of insurance provisions and reserves invested in equities (and thus to the solvency of insurers).

In general, the three points above are valid not only for equities but for all possible types of investments of provisions and reserves. This is why the investment concentration of insurer portfolios is regulated: deterioration in one sector may be balanced by improvement in another. Investment risk, particularly in life insurance, should be as low as possible and thus subject to (reasonable) regulation.
Underestimation of changes and inadequately slow adaptation to new environments can significantly harm the insurance market. For instance, they were the main reason for the failures of Equitable, a British life insurer (see The Treasury Committee 2001) and Mannheimer Lebensversicherung AG, a Germany life insurer. The later was the first failure of a life insurer in Germany in more than 50 years. These failures triggered large discussions in the EU as to whether they could have been anticipated by their home supervisors through adequate market analyses and prevented by (or amended) prudential requirements; and whether sufficient measures could have been imposed under the circumstances existing prior to these failures. Consequences can be found even on the EU level. The European Commission introduced an initiative on the establishment of insurance guarantee schemes to enhance consumer protection.

4.2 Legislation

Legislation not only establishes the framework for insurance market operation but also highly influences its performance and results. The examples below are only a partial list of some of the legislative changes affecting the insurance market. The supervisor should follow the development and changes in legislation as a whole, and for each change analyse the impact on the market.

- **Taxation**
  - Taxation levels and/or changes can widely influence demand, particularly for life insurance products
  - Taxation changes can significantly influence the cost of claims, and
  - Taxation changes can also influence the price of insurance (i.e. the premium).

- **Claims indemnity**
  - Indemnity amounts for claims can change significantly over time due to changes in legislation as well as to changes in legal findings (usually, "change" means "increase"), and
  - New sources of indemnity unknown earlier in national legislation may be introduced in the legislative development process. Examples are pain and suffering awards for relatives of victims of traffic accident and punitive damages.

- **Traffic rules**
  Introducing or changing speed limits, and how strictly the police enforce traffic laws, influence the frequency and severity of automobile accidents and, consequently, paid claims. Even positive changes may have temporarily negative effects. For example, after the introduction of strict right of way for pedestrians on
zebra crossings in the Czech Republic, the frequency of accidents on zebra crossings increased by 400%! Pedestrians’ right of way was relatively ambiguous earlier, so the changes was undoubtedly correct and a standard development. Nevertheless, after the new legislation, pedestrians became too careless, while some drivers still do not fully observe the new rules. It will take some time to reap the benefits of the changes. Until then, people will be injured or killed, and the accident claims will burden the motor third-party liability insurers.

**Various liability fields**

Some types of claims that were not payable earlier may become payable under new legislation or a legal situation. This includes, for example, legislation that introduces minimum levels of cover that the insurer is required to provide in a particular insurance sector.

In this respect, it is not only local legislation and developments that should be considered but also those in international law.

### 4.3 Society

The influence of societal factors should be included in the market analysis prepared by the supervisor. Some examples are provided below.

**Demographic trends:**

- A decrease in population may imply decrease in demand for insurance products and thus affect viability of some companies in the market.
- The changing structure of population may lead to changes in the product mix in the market. For instance, an aging population will imply increasing demand for pension products, and
- An increase in population density or population displacements, such as to coastal areas, can accelerate the process of value concentration. This factor should not be underestimated in market analysis.

**Developmental level of the society:**

- The frequency and severity of insured events of a particular kind (terrorist attacks, road accidents) that influence the market and its development depend significantly on the general developmental level and other issues in the society, and
- Increasing life expectancy, which is also closely linked with the developmental level of the society, may significantly impact the market, particularly on the life insurers that underestimated such development.
4.4 Jurisdiction’s developmental level

A jurisdiction’s wealth and its development also influence the insurance market:

- Improving infrastructure (road system), changing age, number of vehicles, and structure of the fleet has a significant impact on motor insurance in both directions:
  - Improving safety of cars diminishes consequences of accidents, and
  - Their higher value increases cost of repair.
- Improving medical care means that victims survive accidents that would have been fatal in the past. From the social point of view, this is definitely a positive development, but the consequences for the insurance industry are:
  - Increasing cost of medical treatment, and
  - Increasing cost of loss of income after accident, caused by both higher life expectancy and higher income level.
- Improving material wealth:
  - Leads to higher value concentration and thus higher loss susceptibility in case of catastrophic events
  - Positively affects life expectancy, which decreases the frequency of life insurance claims, but also leads to the purchase of larger value life insurance policies
  - Increases the demand for savings and investment products, and
  - Increases traffic density and thus also the number of road accidents.

All these factors must be carefully observed both in the risk management of individual companies and in market analyses performed by the supervisors.

4.5 Geographical location and climate

Demand for insurance cover and insurance market operation may be significantly affected by local geographical and climatic conditions. Some natural perils in some geographical areas are almost uninsurable (e.g. high flood risk areas). State (legislative) intervention may improve the availability of protection. It is obvious that market analysis must be concerned with such issues and concentrate particularly on local problems. Global trends, such as what is referred to global warming, should be considered along with its potential impacts on the market.
5 Market analysis tools and methods

To a great extent, market analysis means risk analysis of summarized data collected from individual insurers. Therefore, the analytic methods and considerations applied to risks discussed in the CC modules and ICPs on risk assessment and risk management can be applied. Tools and considerations introduced in this module may overlap and/or be further developed with tools and considerations presented in other Core curriculum modules.

Usually, the basic data (gross premium written, absolute amount of provisions) collected from insurers and other sources are not suitable for market-wide analysis. When this data is combined into ratios, processed through mathematical formulas, monitored for development over time, and summarised with conclusions, it becomes more useful for market analysis. It can then be discussed with other entities in the market and broader environment to facilitate a deeper understanding of market development, assess its strengths and vulnerabilities, and forecast the future.

The extent and level of this module does not allow the introduction of sophisticated market analysis indicators and methods; therefore, only basic ones have been included here. References to sources of more extensive or advanced information are mentioned when necessary or useful.

Subsections dealing with individual indicators or groups of indicators have been structured as follows:

- Introductory comments on the purpose of the indicator(s), main fields of use, and benefits for the supervisor
- Definition, scope of use
- Remarks on how to interpret values of the indicator, how to indicate adverse developments, and what should be the supervisory action in such a case, and
- Example or case (sometimes a combined example, or case study, for multiple indicators).

5.1 Analysing market structure and competition

Market analysis indicators discussed in this subsection enable the assessment of the level of competition in the market and the development of competition over time. They also enable comparison with other markets. As regards their possible use in the supervisory process, they have a relatively less important role. These indicators help in assessing the market power of market participants. They also may have practical use for the supervisor when considering approval of mergers and acquisitions: mergers and acquisitions should not reduce the competitiveness of the market. On the other hand, in case of exit from the market and/or
portfolio transfers, more important reasons will probably play a decisive role in the supervisor’s decision making.

Market shares of insurance groups, as well as the shares of individual companies, can be analysed and the results compared. The supervisor can use whichever measures is more practical for the particular situation.

Other aspects of market structure that can also be analysed include the following:

- What is the number of insurers operating in a market (and its development over time)?
- What is the number of—and, particularly, the reasons for—market exits (and development over time)?
- What is the market structure with respect to domestic and foreign insurers, and branches?
- To what extent are insurers part of banking conglomerates or vice versa?
- What is the level of ceded reinsurance? How much of this is cross-border? How concentrated is the reinsurance ceded (e.g. is the market concentrating its cessions to a limited number of reinsurers)?
- Are there any other significant linkages between the insurance market and other financial sectors (e.g. share of the insurance market asset portfolio made up of banks’ securities)?

5.2 Concentration ratio

**Concentration Ratio:** The percentage of market share owned by the largest $m$ companies, where $m$ is a specified number of companies (usually 4 or 8).

The concentration ratio is often expressed as $CR_m$; for example, $CR_4$.

The concentration ratio can be expressed as:

$$CR_m = s_1 + s_2 + s_3 + \ldots + s_m$$

where $s_i =$ market share of the $i^{th}$ company.

The lower the concentration ratio, the more widespread—and usually, the better—the competition in the market. Competition has four aspects, defined as:

- Perfect competition—very low concentration ratio
- Monopolistic competition—concentration ratio below 40 percent for the 4firm measurement
• Oligopoly—concentration ratio above 40 percent for the 4firm measurement
• Monopoly—near to 100 percent concentration ratio for the 4firm measurement.

The competition in the insurance sector will probably never be so fierce, crowded, and “perfect” in the sense of concentration ratio as it is in, for example, agriculture. The supervisor should, however, take into account the particular market situation. In oligopoly, for instance, the market is dominated by a small number of sellers, and each oligopolistic is aware of the actions of the others. Oligopolies have a significantly higher risk of misusing their market power (particularly by dictating prices), to the detriment of consumers.

In addition, comparing market share information over time allows supervisors to identify companies whose operations are expanding or contracting and to inquire further into reasons for the change and whether the company has resources to deal effectively with growth or loss in business.

5.3 Herfindahl Index

The Herfindahl Index provides a more complete picture of market concentration than does the concentration ratio. This index uses the market shares of all companies in the market. It squares these market shares to place more weight on the larger companies. If there are n companies in the market, the Herfindahl Index can be expressed as:

$$HI = s_1^2 + s_2^2 + s_3^2 + \ldots + s_n^2$$

where $s_i$ = market share of the $i^{th}$ company.

Unlike the concentration ratio, the HI will change if there is a shift in market share among the larger companies.

The Herfindahl Index can be used to determine whether mergers are equitable to society and thus also influence the actions and decision-making processes of the supervisor. In the United States, for example, increases of over 100 points generally provoke scrutiny, although it may vary case to case. The Department of Justice considers Herfindahl Indices between 1000 and 1800 moderately concentrated and indices above 1800 concentrated. As the market concentration increases, competition and efficiency may decrease, and the opportunities for collusion and monopoly increase.

The Herfindahl Index should be examined not only with respect to the total market share but also to market share of individual products (that is, in the insurance sector for individual lines of business).
5.4 Example 1

As an illustration, we will calculate the Herfindahl index for a fictitious market, which we will name Frentovania. There are 4 insurers in the market, and they have, respectively, market shares of 10, 20, 30, and 40 percent of the market. The HI is calculated as follows:

$$HI = (.10)^2 + (.20)^2 + (.30)^2 + (.40)^2 = 5.5$$

5.5 Example 2

Tables 1 and 2 and figures 1 and 2 show the development of concentration and Herfindahl Indices of the Czech insurance market after the political changes in Central and Eastern Europe. (During the era before 1991, “market” was not market–monopoly of the only insurer was guaranteed by law.)

The figures show steady development interrupted only in 1998, when the company Kooperativa merged with its “sister” Msl. Kooperativa. The development has been slowing down since the year 2000. Shares of companies used to calculate the concentration ratio are shaded. Tables are sorted in descending order by market shares in 2003. For conversion of market volume into US dollars, the current approximate exchange rate is 1 US$ = 25 CZK (Czech Crown).

### Core Curriculum for Insurance Supervisors

Module 7.1.1 Market analysis
Figure 1. Czech insurance market: Concentration ratio development

Figure 2. Czech insurance market: Herfindahl index development
5.6 Analysing insurance financial indicators

There are a number of commonly used financial ratios that can be used to gain insight into an insurer’s financial situation. These include ratios that consider:

- Claims. For example, relative to premiums, in terms of trends over time, and comparing actual experience to that expected (in pricing).
- Expenses. For example, relative to premiums, in terms of trends over time, and comparing actual experience to that expected (in pricing).
- Lapses. That is, numbers of policyholders who discontinue their insurance coverages for reasons other than the insured event against which they took out the policy occurring. For example, in terms of trends over time, and comparing actual experience to that expected (in pricing).
- Investment yields. For example, comparing actual experience to that expected (in pricing), trends over time, relativity to market expectations and reflecting any constraints imposed by the liabilities the assets are held to support.
- Capital and Solvency. Amounts held relative to the technical provisions held, statutory minimums required, and trends over time.

While these types of ratios are useful in reviewing and assessing the situation of a particular insurer, they are also valuable as they provide the data to obtain a view of what is typical over the marketplace. That is, market averages and ranges. Comparing individual insurer performance against these can be valuable for identified outliers. Outliers do not necessarily indicate a problem, but they should be investigated further as they may suggest some unusual behaviours or circumstances.

This module does not pursue the investigation of financial indicators further. Other Core Curriculum modules do this and interested readers are encouraged to consult them.

5.7 Analysing market conduct of insurers

This subsection describes indicators the values of which clearly are expressed in figures (in other words, may be subject to quantitative analysis), while verbal commentary plays only a complementary role. It is more difficult to define a comparative scale (or indicator) that enables measuring and analysing the conduct of insurers in the market. Nevertheless, consumer protection is the dominant task of the supervisor, and supervision of market conduct of insurers often forms a significant part of it. Therefore, the market conduct of insurers and its development also should be analysed.
**Consumer protection** can be split into two processes. The first is *general preventive protection* through:

- Supervising the financial soundness of insurers, which as a consequence means their abilities to meet their existing and potential future liabilities—that is, prudential supervision, and
- Supervising the market conduct of companies, that is, their compliance with rules of conduct established by the supervisor and/or elsewhere in the legislation.

The second process may include a claim or group of claims that:

- Have been incorrectly or inappropriately handled (e.g. an insured(s) has been told their claim is not covered when in fact it is covered)
- Have been incorrectly dealt with because of unclear policy terms
- Should have been paid because despite what the insurance policy says the insured(s) was/were misled by advertising as to coverage, and/or
- Should be paid because there has been market misconduct by an insurer’s distribution network.

It may also include matters such as misleading advertising and/or sales communications by insurers or their distributors that induce consumers to purchase insurance that they did not really want, need or was inappropriate to their needs.

The follow-up, particular case protection may involve frequent and detailed reporting by the insurers (including detailed reporting individual cases and passing the complete case files to the supervisor) to be fully efficient and create strong pressure on the insurers with respect to consumers’ (policyholders’) protection. Onsite inspections often include inspection of complaints and problematic claims files (particularly those that proceed very slowly and/or lead to a lawsuit), and of revised advertising materials, policy forms, and other printouts used for advertising, marketing, and concluding policies, particularly if such an inspection is not performed on the basis of reports to supervisors and/or offsite monitoring.

Dealing with consumers’ complaints and claims with the supervisor requiring insurers to handle claims in a timely, fair and transparent manner and also requiring insurers and intermediaries to handle complaints in a timely and fair manner.

The following sections briefly comment how market analysis may help in assessing complaints.
5.8 Consumers’ complaints

Market analysis of consumers’ complaints consists of:

• Analysing the frequency of complaints
• Analysing the timeliness in answering the complaints, and
• Analysing the fairness of the approach in answering the complaints.

There are no established standards for how to evaluate the frequency of consumers’ complaints and the timeliness and fair approach of their responses. Therefore, the example below describes just one possible system, which can be replaced by another one or further developed and/or adjusted to local market environments and legislation.

When analysing complaints, the supervisor will be in a difficult position. It is not only the number of complaints that must be considered, but also their reasonability and severity—and here the correct assessment and evaluation often requires experience. Similarly difficult are the assessment and evaluation of fair answering of complaints.

Example

To enable transposition of consumers’ complaints—and all kinds of complaint should be included: ungrounded or unfair refusal of claim settlement, reduction or delay in claim settlement, incorrect attempt to terminate policies, unfair advertisement, and unclear insurance terms and conditions—regardless of being collected by the supervisor or the insurer, into a measurable indicator enabling evaluation of development over time, the insurance authority may establish a “severity scoring,” for instance:

• 1 points for ungrounded complaint
• 2 points for complaint on incorrect behaviour without financial impact on consumer. Please note, any financial effect on the client caused by incorrect behaviour by the insurer is not acceptable. Here the words “financial effect” are used only as an abbreviation of “What would happen if the client did not raise the complaint?”
• 3 points for complaint on incorrect behaviour with small financial impact on consumer
• 4 points for complaint on incorrect behaviour with medium financial impact on consumer, and
• 5 points for complaint on incorrect behaviour with large financial impact on consumer.
Similarly, “timeliness scoring” may be as follows:

- 1 point for answer without unnecessary delay
- 2 points for answer within reasonable period
- 3 points for delayed answer, and
- 4 points for significantly delayed answer. Since all complaints must be answered, a temporarily missing answer is scored as “What would the scoring be if the answer is dispatched at the moment of scoring?”

If the answer needs a preparation period (that is, the complaint cannot be dealt with immediately), the insurer should send an immediate “registration” letter informing the complainant:

- That the complaint was received by the company
- That the complaint was passed on for further processing (and to whom), and
- When the “material” reply will be sent.

Loading of 1 point will be added in the case of missing (one of) the abovementioned items in the “registration” letter and another 1 point in case of late dispatch of such letter.

“Fairness scoring” may be as follows:

- 1 point for fair and formally correct answer
- 2 points for fair answer with formal mistakes
- 3 points for answer whose fairness is disputable, and
- 4 points for unfair answer.

Then, the severity scoring $Sc$, timeliness scoring $Tc$, and fairness scoring $Fc$ relative to the number of policies $NP$ in the current period can be expressed as:

- $Sc = \left( \sum (s_i - 1) \right) / NP$, where $s_i$ is the scoring for the $i$th complaint
- $Tc = \left( \sum (t_i - 1) \right) / NP$, where $t_i$ is the scoring for the $i$th complaint
- $Fc = \left( \sum (f_i - 1) \right) / NP$, where $f_i$ is the scoring for the $i$th complain

and total scoring of market conduct with respect to giving reasons for complaints and answering them, in the current period, $TSc$ may be calculated as:

- $TSc = \left( \sum (s_i \times t_i \times f_i - 1) \right) / NP$. 

To evaluate the overall situation in complaints (including outstanding complaints from previous periods), indicators $St$ (and similarly $Tt$, $Ft$ and $TSt$) may be expressed as:

$$St = Sc + Sp,$$

where $Sp$ is equivalent of $Sc$ for outstanding past complaints.

Such scoring can be performed either on the basis of the regular reporting of individual insurers or, better, as a part of onsite inspections, and further evaluated and analysed market-wide on a regular basis and with respect to development over time. Companies showing results worse than the market average will deserve larger attention of the supervisor.

5.8.1 Claims handling

Similarly to complaints, claims handling should be evaluated with respect to timeliness and fairness. Unlike complaints, it may be impossible to deal with individual claims. However, the supervisor may require from individual companies statistics showing the average settlement time and percentages of claims and amounts paid within certain time limits after claim notifications by the policyholders. Fairness also may be evaluated as a success ratio of claims disputed by the consumers and/or insurers at the court or before a dispute resolution body (that is, the number of disputes resolved by the courts/dispute resolution body in favour of the insurers, expressed as a percentage of the total number of court cases).

No generally accepted standards exist in this respect. Due to the scope of this module, it is left to the reader to determine how the supervisor may approach this area. Inspiration may be taken from the example presented above. It is obvious that the accepted solution will largely depend on the local legislation, market development level, and capabilities of the supervisor.

5.8.2 Fair competition behaviour

While all indicators mentioned above enable quantitative analysis (although sometimes quantification is difficult), the overall market behaviour is hardly quantifiable. Yet, market analysis is also important in this area. To analyse fair competitive behaviour, the definition of such behaviour is first needed—and even this is not easy. In general, market behaviour includes all ways in which the insurer interacts with the public:

- Advertising
- Policy forms, general terms and conditions, and other printouts intended by the insurers for public use
- Internet pages of insurers
- Branch offices open to consumers
- Distribution networks
• Activities within insurance associations and similar institutions (such as nuclear insurance pools, green card offices), and
• Press conferences, press releases.

Market behaviour should be fair to all market players, policyholders, competitors, brokers, and agents, and also to the broader environment, that is, the general public. Significant offenses with respect to market behaviour usually are identified and classified in the insurance legislation or legislation that covers insurance, including adequate corrective measures that can be clearly imposed on misbehaving companies. Still, there can be a “grey area” of ambiguous interpretation of the law, gaps in legislation, and misbehaviour that is identified and classified insufficiently.

Fair behaviour can be broadly defined as the insurer behaving fairly in the market if it:
• Does not breach existing legislation
• Provides transparent and adequate public disclosure
• Its insurance terms and conditions and policy forms are written in a simple, transparent language and in a manner that does not leave room for misinterpretation, and
• Advertises and markets its products in such a manner that consumers know what they are buying and are not misinformed.

Misbehaviour can include, for example:
• Displaying information important to the policyholder (for example, exclusions from the insurance cover, coverage sub-limits, conditions on policy termination, conditions on claims reporting) insufficiently (in small letters or only at the end of forms and printouts), and
• Disseminating misinformation in advertising and marketing.

The supervisor’s role is to
• Monitor and analyse market behaviour of insurers
• Take measures against misbehaviour where such cases are covered by existing legislation, and
• Seek amendment of legislation when misbehaviour cannot be adequately addressed by existing legislation.
5.9 Analysing distribution channels

Insurance legislation also usually includes regulation of distribution channels. Indeed, it would be difficult to supervise insurance without having the possibility to supervise brokers, agents, and other intermediaries and distribution facilities. The challenges involved in the supervision of distribution channels have significantly increased with the introduction of distance selling (offer and sale of insurance service via telephone and internet).

Analysis of distribution channels consists in keeping an eye on the development of shares in individual lines of insurance sold through various distribution channels, finding explanations why the share of a particular channel is increasing or decreasing, and checking whether legislation is interfering with the selection of channels. Sometimes, it may be difficult to obtain fully consistent and detailed data across the market.

Checking underwriters and their distributors for compliance with legislation is also important.

5.10 Analysing availability of products

Insurance products should be widely and easily available in a competitive environment to disable misuse of market power by the dominant players. The supervisor’s task is to collect information on the market about individual products, analyse it, and take necessary measures.

Availability of products can be shown in the form of simple table, as shown in table 3. Schemes, for instance, may involve pooling arrangements with state participation. Protection against natural catastrophes in France, against terrorism in the United Kingdom, or against floods in the United States may serve as examples. It is important that such information is broadly available to the public, thus helping consumers to find solutions in covering their insurance needs. In case some of the companies do not operate throughout the whole market territory, it would be helpful to provide information on the availability of products in various geographical areas.

More detailed analysis can be performed by using indicators (concentration ratio, Herfindahl Index) described above, analysing market structure and competition using information relating to the market shares of companies for individual products.

The supervisor can use the results of analysis of product availability in order to:

- Investigate the potential misuse of market power by focusing supervision on companies providing products where competition is insufficient, and
- Take measures, perhaps including recommending changes in legislation, in case of unavailability or insufficient availability of some products.

If products considered important are not available to the public, measures can go as far as creating state organised insurance schemes.
State intervention in response to the unavailability of insurance products may be triggered by:

- Reluctance of the private sector to provide cover after bad past experiences
- Difficulties in calculating an adequate price for the cover (for example, protection against terrorism)
- Unacceptability to the public of the price (prices charged by the private insurers may be is too high due to the uncertainty of results. Protection against terrorism is an example.)
- Insufficient capacity of the private insurance sector to cover the potential loss, and
- Other reasons.

**Table Notes:**
- All data is at the time of the data collected on June 30, 2010.
- Data was collected from the insurance companies’ websites and reports.
- Some companies may offer additional insurance products that are not listed.
- Mutual Health Insurance offers a wide range of health insurance products.
- Mutual Car Insurance offers a variety of car insurance products.
- Mutual Property Insurance offers different types of property insurance.
- Mutual Casualty Insurance offers casualty insurance.
- Mutual Liability Insurance offers liability insurance.
- Mutual Workers’ Compensation Insurance offers workers’ compensation insurance.
- Mutual Life Insurance offers life insurance.
- Mutual Disability Insurance offers disability insurance.
- Mutual Pension Insurance offers pension insurance.
- Mutual Annuity Insurance offers annuity insurance.
- Mutual Travel Insurance offers travel insurance.
- Mutual Reinsurance offers reinsurance.
- Mutual Professional Indemnity Insurance offers professional indemnity insurance.
- Mutual Environmental Liability Insurance offers environmental liability insurance.
- Mutual Cyber Risk Insurance offers cyber risk insurance.
- Mutual Data Breach Insurance offers data breach insurance.
- Mutual Cyber Security Insurance offers cyber security insurance.
- Mutual Intellectual Property Insurance offers intellectual property insurance.
- Mutual Product Liability Insurance offers product liability insurance.
- Mutual Environmental Liability Insurance offers environmental liability insurance.
- Mutual Professional Indemnity Insurance offers professional indemnity insurance.
- Mutual Environmental Liability Insurance offers environmental liability insurance.
- Mutual Cyber Risk Insurance offers cyber risk insurance.
- Mutual Data Breach Insurance offers data breach insurance.
- Mutual Cyber Security Insurance offers cyber security insurance.
- Mutual Intellectual Property Insurance offers intellectual property insurance.
- Mutual Product Liability Insurance offers product liability insurance.
- Mutual Environmental Liability Insurance offers environmental liability insurance.
- Mutual Professional Indemnity Insurance offers professional indemnity insurance.
- Mutual Environmental Liability Insurance offers environmental liability insurance.
- Mutual Cyber Risk Insurance offers cyber risk insurance.
5.11 Analysing market developmental level

Indicators in this section—insurance density and insurance penetration—are of an informational nature only. They do not directly impact the execution of insurance supervision; therefore, they are mentioned only in brief. They serve as tools to enable the comparison of individual markets and for the analysis of market development over time. Benfield Group 2004c and Swiss Re 2003 may serve as examples of market analyses assessing an insurance market’s developmental level. Swiss Re and the Benfield Group use indicators from this section and combine them with the descriptions of the financial and economic environments of the markets.

5.11.1 Insurance density

**Insurance Density**: Amount spent on purchasing insurance per capita during one year, expressed in monetary units.

This indicator enables a relatively reliable and fair comparison of individual markets. Its calculation needs only broadly available information (insurance market volume and numbers of inhabitants); therefore, it is easily accessible. Insurance density is usually calculated separately for life and non-life sectors. Its value, however, does not purely reflect the jurisdiction’s wealth as it can be impacted by local jurisdictional and particular market conditions.

For example, in jurisdictions in which local legislation requires or encourages retirement pensions to be funded through life insurance products, the ratio of life insurance density compared to non-life insurance density is significantly above average. This is demonstrated in the figures 3 and 4 below, taken from the Swiss Re Sigma publication. Finland, Japan, and South Africa serve as typical examples. In this respect, in Iceland, pensions are not funded through insurance; therefore, Iceland’s spending on life insurance is low despite the relative economic wealth of its inhabitants).

5.11.2 Insurance penetration

**Insurance Penetration**: Proportionate relationship of total market premiums to gross domestic product, expressed as a percentage.

Similarly to insurance density, insurance penetration is also easy to calculate because it is based on widely available information. This indicator is normally used to compare market development: the higher the insurance penetration ratio, the more developed the market. As with insurance density, this interpretation is subject to the caveat that in jurisdictions in which pensions are not funded through life insurance, the insurance penetration may be lower than
in other jurisdictions, despite similar levels of both market development and jurisdiction wealth.

Differences in the value of this indicator between the most and least developed markets are striking. The values range from less than 1 percent for some African and Asian jurisdictions to more than 10 percent (South Africa, Switzerland, and United Kingdom, among other jurisdictions).

Both indicators described above (insurance penetration and insurance density) highly correlate, despite the fact that one is expressed as monetary units and the other as a percentage.
Figure 4. Insurance density and penetration in the emerging markets in 2003

5.12 Insurers’ ratings

In some respects, rating agencies, and independent auditors perform tasks similar to those of the supervisor. They check financial soundness, performance, and strategies of (re)insurers and markets. Supervisors may be interested in comparing their own findings with those of rating agencies. Development of ratings over time also may serve as an indicator of market stability.

5.13 Reinsurance

Reinsurance is a stabilizing factor for insurers. This occurred as an example in the Czech insurance market: unprecedented insured losses incurred during August 2002, reaching approximately CZK 35 billion (US$ 1.4 billion), which represented an additional loss ratio of more than 60% for the non-life sector. Reinsurance paid more than 98% of these losses; without reinsurance, all the local insurers would have gone bankrupt. It is relatively easy to calculate the impact of reinsurance after an event or at year-end; it is not, however, easy to calculate how much reinsurance is needed in advance. There are several basic risks connected with reinsurance that should be analysed by the supervisor:

- Risk of insufficient reinsurance cover, which can be further split into:
  - Risk of too high net retention (insurer is not sufficiently covered in case of large claims or an unexpected frequency of smaller claims), and
  - Risk of insufficient reinsurance capacity (particularly in the case of catastrophic events).
- Risk of unavailability of reinsurance (particularly after large events, when the reinsurers become reluctant to continue providing cover), e.g. reluctance to cover terrorist risk after 2001 World Trade Center attack), and
- Counterparty credit risk of failing reinsurers.

A frequently used risk management method is modelling results on the basis of various adverse scenarios. This method should be also employed by supervisors on the market-wide level. It is particularly useful for assessing whether their reinsurance protection is adequate for the risks underwritten by the insurers. However, the existing sophisticated tools used by the insurance markets have not been constructed to serve the needs of supervisors but rather those of the individual insurers.

The position of the supervisor with respect to the market reinsurance protection analysis is further complicated by the fact that the scope of protection varies over time. Insurers usually tend to buy more protection when the market is "soft" (that is, reinsurance is cheap) and increase their retentions (that is, buy less reinsurance) when the market is "hard".
Individual companies can never be fully protected against all of the risks they face. On the other hand, they should buy sufficient reinsurance protection. In the case of catastrophic events, many believe that reinsurance should provide protection from failure due to events that are expected to occur no more frequently than once every 200 years.

Non-traditional reinsurance and the fact that it may impact the market also should be mentioned here. Although non-traditional reinsurance operates in many respects like traditional reinsurance, it has its own specific risks which the supervisor should understand and assess. Further, non-traditional reinsurance is a growing segment of the market, approaching to 20% of the global reinsurance capacity. Other CC modules and the ICPs discuss reinsurance in more detail.
6 Organising market analysis in supervisor

Supervisors typically have objectives targeting the financial soundness of individual insurers and the financial stability of the insurance market. Proper analyses of individual companies, the insurance market, and the national and international contexts are essential to achieve this end.

There are no internationally accepted standards as to how supervisors should carry out market analysis. Individual supervisors deal with this matter in very different ways. The following subsections provide a general description of the steps taken by the supervisor when preparing and maintaining market analysis. For some supervisors, this information may serve as a guideline how to establish a market analysis function within their frameworks. Others may use it as a checklist for completeness and evaluation of activities already performed. To keep it concise and clearly organised, the subsection on planning the market analysis contains only the list of activities, while the following subsection explains individual activities and comments on them.

6.1 Planning the market analysis

The individuals who will coordinate and carry out the market analysis should be selected taking into account the intended nature, scope and purpose of the analysis, as well as the characteristics of the market environment. Market analysis should include:

- Regular preparation of insurance indicators and their development trends
- Regular preparation of insurance-related indicators (such as investment, demographics, and road accidents), their development trends, and the evaluation of their importance (influence) for the insurance market, and
- Ad hoc, irregular analytical reaction to important events that impact the insurance market (both with respect to insurance events such as natural catastrophes and market environment development events such as changes of legislation).

The main objectives of the analysis (nature, scope, purpose) will be further fine-tuned during the initial analysis. The Supervisor should consider the following as part of its initial planning and on-going adjustments to the process:

- Appoint a responsible market analysis coordinator
- Define data to be collected for market analysis and information to be publicly released
- Explore and communicate possible sources of data and data publishers
- Establish procedures to check accuracy of data provided
• Define indicators to be calculated and market analysis procedures to be performed on the basis of data provided
• Define tolerance limits for individual indicators
• Establish regular schedule of communication with data providers (sources of data) and data publishers, and the schedule of market analysis activities
• Draw conclusions with respect to supervisory actions to be taken based on results of market analysis
• Regularly review and modify scope of market analysis and publicly released data, and
• Decide on the scope of additional reporting and analysis in case of particular market-wide events of importance for the market’s financial stability.

6.2 Comments and explanations
As with any work that depends on information, the market analysis will be unsuccessful if the information is incomplete, delayed, or not properly used. Indeed, the supervisors themselves (among others) should supply much of the data for market analysis and also obtain much of the benefit from it!

6.2.1 Appointing a market analysis coordinator
The market analysis coordinator should be a:
• Skilled person with experience in the insurance industry and financial markets
• Good organiser and communicator, and
• Person with mathematical background and good analytical abilities.

Performance of market analysis requires skilled resources, which may not necessarily be immediately available at the supervisor. Therefore, the market analysis coordinator may consider using market analyses from other sources and/or outsourcing some of the required activities. If this is done, confidentiality of information within the particular legal environment must be observed and taken into account. It is expected that over the long-term a supervisor will develop, if it does currently have, sufficient resources to carry out the market analysis internally.
6.2.2 Defining data

Data must be clearly and unambiguously defined to enable market-wide comparison and compatibility. Data inputs will likely include:

- Information required to assess the financial soundness of insurers (that is, data from financial statements of individual insurers)
- Other information collected by the supervisor during reporting and offsite monitoring
- Data collected during on-site inspections
- Data collected from other sources. Please note that a description and analysis of the market, its financial environment, international comparison, and insurance-linked data require numerous sources of diverse data, such as police (statistics of street accidents), financial analysis institutions (development of prices), and firemen (fire statistics), and
- Data describing the general development of the economy (such as GDP, inflation, and interest rates).

Publicly released information should contain not only the currently collected data, but also

- Data from previous periods (to show development trends)
- Results of market analysis (analytical indicators) when appropriate
- References to other information sources
- Verbal comments on the development of the insurance market, and on the economic, legal, and financial sector environments, and
- Evaluation of the period since the previous public release, including the description, comments, and data on particular market-wide events.

The scope of market-wide, publicly available information might be broadly consistent with the information requested for public disclosure by individual insurers.

6.2.3 Exploring data sources

As explained above, diverse data and data sources are needed to enable a comprehensive market analysis and public release of relevant information. Initial contacts must be made and regular communication established with such sources. It is not necessary that the supervisor itself carries out the public release of information. However, even if the release is made by another entity (such as the association of insurers or an independent analyst institution), the supervisor is responsible for ensuring that sufficient market data is available. Therefore,
external publishing may be organised in cooperation with the supervisor and the minimum scope of published information mutually agreed.

6.2.4 Correctness of data

Correctness of data (particularly data used to evaluate the financial soundness of individual insurers) must be checked to ensure that it will provide a proper basis for the supervisory evaluation and reliable information for consumers. Tools and requirements for relevant checking processes are described in other ICPs.

Collected data should be analysed, combined into indicators, and further processed to enable efficient and transparent use in supervisory processes. This thorough processing requires documented, clear and unambiguous definitions and descriptions of indicators, formulas, methods, and processes.

6.2.5 Prompt supervisory intervention

An important purpose of market analysis is to prompt supervisory intervention where needed. This may include taking preventive and corrective measures that are timely, suitable and necessary. To help achieve this end and to act transparently, tolerance limits (limits and thresholds representing “warning level” and/or “action level” of individual indicators and other results of market analysis) can be defined. Exceeding these limits should trigger an appropriate supervisory reaction.

6.2.6 Schedule

To achieve reliable and timely performance of all activities, a detailed schedule (including description of activities, time limits, and responsible persons) should be defined, recorded, and made available for all concerned. This schedule should include not only communication with external partners but also communication and data flow among individual departments of the supervisor, as well as communication with other concerned financial market authorities, both domestic and foreign.

6.2.7 Tolerance limits

Exceeding established tolerance limits can trigger an appropriate (re)action. This does not necessarily imply an immediate automatic intervention activity defined in advance but rather a decision-making process on how to address the current situation. Timeliness, completeness, and availability of information are of highest importance in order for supervisory actions to be effective.
6.2.8 Review

The Supervisor should regularly check and review the appropriateness of market analysis activities and publicly released information in response to the following:

- Changes in the market
- Development of the skills and capacities of the supervisory activity, and
- Changes in the scope of the supervisory mandate and legislation (that is, if a new regime aims at achieving a higher level of consumer protection).
7 Review questions

The following exercises are designed to help you evaluate your understanding of market analysis. Therefore, where an answer requires using words, you are encouraged not to use the exact words and sentences that appear in this module (although the sample answers in Appendix 1 are constructed in this way) but to answer using the key words succinctly.

On the other hand, the exercises that require numerical answers should be accompanied with explanations (words, not mathematical proofs) showing that the correct answer is not a result of guessing but of understanding. Some questions are relatively difficult with respect to numerical calculations, so the preferred way to solve them is to use a computer. It is not the purpose of this module to test your numerical calculation abilities. On the other hand, market analysis is a world of numbers, figures, and tables and figures.

R1 What are the learning objectives of this module? List as many as possible.
R2 What are the essential criteria of this ICP on Market Analysis?
R3 What are the benefits of market analysis for the supervisor?
R4 What are the steps to establish a market analysis function at the supervisor?
R5 What are the methods of checking and improving the sensitivity of market analysis?
R6 What are some possible changes in the environment in which the market operates? How can they influence the market?
R7 The concentration ratios of a market are: CR4 = 56 percent, CR8 = 82 percent. Can we guess something about the number of companies in this market? What is the minimum number of companies in a market with these parameters?
R8 What is the maximum possible value of the Herfindahl Index?
R9 What is the minimum possible value of the Herfindahl Index in a market with 25 participants?
R10 The average claims ratio of an insurance market is 77 percent and the average expense ratio is 26 percent. The combined ratio is thus 103 percent. Does this percent mean that this market is unprofitable?
R11 Insurer A has 1,000,000 clients and on average 1.5 policies per client, and during previous year recorded 50 complaints per month. Insurer B has 30,000,000,000 MU of written premium, average premium 60,000 MU per policy, and 60 outstanding complaints from previous year; 80 percent of the complaints have been already settled. Which company has a lower frequency of complaints?
R12 Given the situation in the previous question, can we conclude that the insurer with a lower frequency of complaints has a better market conduct than the other company?
R13  A market has the following parameters:
   a)  GDP 10,000,000,000,000 MU
   b)  20,000,000 inhabitants
   c)  Insurance penetration 4.5 percent.

   What will be the increase in insurance density (insurance spending per capita) after 5
   years if GDP grows 4 percent per year and population 0.5 percent per year, and the
   insurance penetration ratio at the end of this period is 7.5 percent?

R14  What will be the market growth of the market described in question 15 in nominal
   terms and in real terms (considering 2 percent inflation) over this period of 5 years?
8 Further reading

8.1 General sources

Many texts are available which are relevant to the material in this module. These texts may also go beyond the scope of this module, but usually include introductory chapters on the basic topics.

When reading these texts it is useful to consider the principles being as well as the details of their application in a particular environment. Also, it is important to recognise that as the environment changes the relative importance of issues may also change.

Other sources of information are also available. For example, in many countries there is an insurance institute of some form. The Chartered Insurance Institute (CII), based in England, provides a range of good educational programs and has links to more than 70 other insurance institutes worldwide (see www.cii.co.uk).

In some cases, supervisory websites are also valuable sources of information. This can be particularly the case when supervisors publish explanatory information explaining their requirements and approaches.

In the context of this module, see also, for example, Swiss Re Sigma material (see www.institute.swissre.com) and the interactive materials at the Swiss Re explorer website (www.sigma-explorer.com).
Appendix 1: Answers to Review questions

Answer 1  Compare your answer with the learning objectives in the “This module” section.
Answer 2  Compare your answer with section 2.
Answer 3  Compare your answer with section 2.
Answer 4  Compare your answer with section 6.
Answer 5  Compare your answer with section 2.
Answer 6  Compare your answer with section 4.
Answer 7  We can find the minimum number of companies in the market. The companies in 5th to 8th place have a market share of 26 percent. Therefore, the company in 9th place cannot have more than 6.5 percent (that is, the average of the 5th to 9th place companies, which is valid also for the 10th company). Hence, there are at least 11 companies in the market.
Answer 8  The Herfindahl Index formula is constructed to decrease when the competition improves. It reaches maximum value in the monopoly market: 10,000.
Answer 9  The Herfindahl Index formula is constructed to decrease when the competition improves. In a market with given number of companies, the minimum is reached when the market is split into equal shares; in our case, 25 companies with a market share of 4 percent. In such a situation, the Herfindahl Index equals 400.
Answer 10 No. The negative underwriting result can be balanced by investment income.
Answer 11  In the respective year, insurer A had 1,500,000 policies and 600 complaints, a rate of 40 complaints per 100,000 policies. Insurer B had 500,000 policies and 300 complaints, a rate of 60 complaints per 100,000 policies. Hence, company A has a lower frequency of complaints.

Answer 12  No. This information has only an indicative value. Further analysis must be performed and other factors must be taken into consideration. These factors include line of business, complexity of policies issued by both companies, severity of complaints, and ways in which the complaints were settled. Besides, complaints comprise only one part of the market conduct of companies. Their behaviour in other areas such as advertising, sales, and transparency of their policy conditions also must be taken into account.

Answer 13  The answer is shown in the following table.

<table>
<thead>
<tr>
<th></th>
<th>GDP (MU)</th>
<th>GDP increase (%)</th>
<th>Population</th>
<th>Pop. increase (%)</th>
<th>Insurance penetration (%)</th>
<th>Insurance spending (%)</th>
<th>Insurance density (MU)</th>
</tr>

<td>11,668,585,600,000</td>
<td>4.00</td>
<td>20,403,010</td>
<td>0.50</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>After 5 years</td>
<td>12,106,859,024,000</td>
<td>20,505,025</td>
<td>7.50</td>
<td>912,489,678,800</td>
<td>44,501</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The increase in insurance density is from 22,500 MU to 44,501 MU, a growth of 22,001 MU, or by 97.8 percent.
Answer 14   The answer is shown in the following table.

<table>
<thead>
<tr>
<th></th>
<th>Insurance spending (MU)</th>
<th>Insurance spending at starting position (MU) (inflation adjusted)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting position</td>
<td>450,000,000,000</td>
<td>450,000,000,000</td>
</tr>
<tr>
<td>After 1 year</td>
<td></td>
<td>459,000,000,000</td>
</tr>
<tr>
<td>After 2 years</td>
<td></td>
<td>468,180,000,000</td>
</tr>
<tr>
<td>After 3 years</td>
<td></td>
<td>477,543,600,000</td>
</tr>
<tr>
<td>After 4 years</td>
<td></td>
<td>487,004,472,000</td>
</tr>
<tr>
<td>After 5 years</td>
<td>912,489,678,800</td>
<td>496,836,361,440</td>
</tr>
</tbody>
</table>

The market growth is from 450 billion MU to 912.5 billion MU, which is a nominal growth of 103 percent over the five year period. After inflation adjustment, the growth was 84 percent.
Insurance Core Principles and Common Framework for the Supervision of Internationally Active Insurance Groups

UPDATED NOVEMBER 2019
About the IAIS

The International Association of Insurance Supervisors (IAIS) is a voluntary membership organisation of insurance supervisors and regulators from more than 200 jurisdictions. The mission of the IAIS is to promote effective and globally consistent supervision of the insurance industry in order to develop and maintain fair, safe and stable insurance markets for the benefit and protection of policyholders and to contribute to global financial stability.

Established in 1994, the IAIS is the international standard setting body responsible for developing principles, standards and other supporting material for the supervision of the insurance sector and assisting in their implementation. The IAIS also provides a forum for Members to share their experiences and understanding of insurance supervision and insurance markets.

The IAIS coordinates its work with other international financial policymakers and associations of supervisors or regulators, and assists in shaping financial systems globally. In particular, the IAIS is a member of the Financial Stability Board (FSB), member of the Standards Advisory Council of the International Accounting Standards Board (IASB), and partner in the Access to Insurance Initiative (A2ii). In recognition of its collective expertise, the IAIS also is routinely called upon by the G20 leaders and other international standard setting bodies for input on insurance issues as well as on issues related to the regulation and supervision of the global financial sector.

**History**

The Insurance Core Principles (ICPs) were adopted on 1 October 2011. Since then, amendments have been made to various individual ICPs, the most recent being:

- ICPs 4, 5 and 23 November 2015
- ICPs 13, 18 and 19 November 2017
- ICP 6 November 2018
- ICP Introduction and Assessment Methodology and ICPs 1, 2, 3, 7, 8, 9, 10, 12, 15, 16, 20, 22, 24, 25 November 2019

Former ICP 11 (Enforcement) has been merged with ICP 10. Therefore, there is no longer an ICP 11; however, to avoid confusion, the existing numbering of other ICPs has not changed.

The Common Framework for the Supervision of Internationally Active Insurance Groups (ComFrame) was adopted in November 2019. ComFrame is presented in blue boxes within the ICP Introduction and Assessment Methodology as well as within the following ICPs: 5, 7, 8, 9, 10, 12, 15, 16, 23 and 25.

The [IAIS Glossary](#) has been revised in November 2019, except for terms related to ICPs 14 and 17. These terms will be revised together with the revision of ICPs 14 and 17, which will commence after the agreement of the ICS Version 2.0 for the monitoring period.

Introduction and Assessment Methodology

A) Introduction

1. Established in 1994, the International Association of Insurance Supervisors (IAIS) is a voluntary membership organisation of insurance supervisors and regulators from around the globe. It is the international standard-setting body responsible for developing and assisting in the implementation of supervisory and supporting material for insurance supervision. The IAIS also provides a forum for members to share their experiences and understanding of insurance supervision and insurance markets.

2. The mission of the IAIS is to promote effective and globally consistent supervision of the insurance industry in order to develop and maintain fair, safe and stable insurance markets for the benefit and protection of policyholders and to contribute to global financial stability. In this context, the IAIS has issued the Insurance Core Principles (ICPs), which are comprised of Principle Statements, Standards and Guidance, as a globally accepted framework for insurance supervision. The ICPs seek to encourage the maintenance of consistently high supervisory standards in IAIS member jurisdictions. A sound supervisory system is necessary for the protection of policyholders and promoting the stability of the financial system and should address the broad set of risks within, and posed by, the insurance sector.

Structure

3. The ICP material is presented according to the following hierarchy:

   - Principle Statements – the highest level in the hierarchy which set out the essential elements that must be present in a jurisdiction in order to protect policyholders, promote the maintenance of fair, safe and stable insurance markets and contribute to financial stability. In each ICP, the Principle Statement is numbered and presented in a box with bold font.

   - Standards – the next level in the hierarchy linked to specific Principle Statements. Standards set out key high-level requirements that are fundamental to the implementation of the Principle Statement and should be met for a jurisdiction to demonstrate observance with the particular Principle Statement. Standards are presented in bold font, with the number of the applicable principle statement followed by the Standard number (for example, the second standard under Principle Statement 3 appears as 3.2).

   - Guidance – the lowest level in the hierarchy supporting the Principle Statement and/or Standards. Guidance facilitates the understanding and application of the Principle Statement and/or Standards; it does not represent any requirements. The wording used in Guidance varies to reflect the intended weight of the text; for example, the use of “should” provides more of a recommendation, whereas the use of “may” is more of a suggestion. Where appropriate, Guidance provides examples of ways to implement the Principle Statements and/or Standards. Guidance is presented in regular font, with the number of the Principle Statement and Standard followed by the Guidance number (for example, the first paragraph of guidance under Standard 3.2 appears as 3.2.1).

Overarching Concepts

4. There are a number of important overarching concepts to understand and keep in mind when reading and implementing the ICPs. While an individual ICP may focus on one particular subject, the ICPs need to be considered as a whole with these overarching concepts being relevant throughout.
Applicability

5. The ICPs apply to insurance supervision in all jurisdictions regardless of the level of development or sophistication of insurance markets, and the type of insurance products or services being supervised.

6. The ICPs apply to the supervision of all insurers, whether private or government-controlled insurers that compete with private enterprises, wherever their business is conducted, including through e-commerce.

7. Generally, the ICPs are equally applicable to the business of insurers and reinsurers. Where the ICPs do not apply to reinsurers, this is indicated in the text.

8. The ICPs only apply to the supervision of intermediaries where this is specifically indicated.

Proportionality and risk-based supervision

9. The ICPs establish the minimum requirements for effective insurance supervision and are expected to be implemented and applied in a proportionate manner. Therefore, proportionality underlies all the ICPs. Supervisors have the flexibility to tailor their implementation of supervisory requirements and their application of insurance supervision to achieve the outcomes stipulated in the Principle Statements and Standards.

- Implementation - proportionality allows the ICPs to be translated into a jurisdiction’s supervisory framework in a manner appropriate to its legal structure, market conditions and consumers.

- Application - proportionality allows the supervisor to increase or decrease the intensity of supervision according to the risks inherent to insurers, and the risks posed by insurers to policyholders, the insurance sector or the financial system as a whole. A proportionate application involves using a variety of supervisory techniques and practices which are tailored to the insurer to achieve the outcomes of the ICPs. Such techniques and practices should not go beyond what is necessary in order to achieve their purpose.

10. Risk-based supervision is a related concept but distinct from proportionality; it means more supervisory activities and resources are allocated to insurers, lines of business or market practices that pose the greatest risk to policyholders, the insurance sector, or the financial system as a whole.

Terminology

11. In these ICPs, terms have the same meaning as set out in the IAIS Glossary.

12. The term “supervision” is used to refer to supervision and regulation. Similarly, the term “supervisor” also refers to “regulator”. The expectation is that the Principle Statements and Standards are implemented within a jurisdiction by all authorities in accordance with their respective responsibility in relation to insurance supervision, rather than necessarily by only one authority. Therefore, the term “supervisor” is used to refer collectively to those authorities within a jurisdiction with such responsibility. It is essential that in situations where multiple authorities exist, arrangements be established between them to ensure that the implementation of the Principle Statements and Standards within the jurisdiction occurs within a framework that makes clear which authority is accountable for which functions.
13. The term “policyholder” is used to refer to a person (natural or legal) who holds an insurance policy, and includes, where relevant, other beneficiaries and claimants with a legitimate interest in the policy.

14. The term “legislation” is used to include primary legislation (which generally requires full legislative consent), secondary legislation and legally enforceable rules set by the supervisor. The ICPs do not generally require a specific form of legislation but where they do this is specifically indicated.

15. The term “insurer” means insurance legal entities and insurance groups, including insurance-led financial conglomerates. The Principle Statements and Standards apply to the supervision of insurance legal entities and, unless otherwise specified, to insurance groups, including the head of the insurance group. The application may vary and, where necessary, further guidance is provided.

**Group-Wide Supervision**

16. It is recognised that the implementation of the Principle Statements and Standards relevant to group-wide supervision may vary across jurisdictions depending on the supervisory powers and structure within a jurisdiction. There are direct and indirect approaches to group-wide supervision.

- Under the direct approach, the supervisor has the necessary powers over the parent and other legal entities in the insurance group and can impose relevant supervisory measures directly on such legal entities, including non-regulated legal entities.

- Under the indirect approach, supervisory powers focus on the insurance legal entities and supervisory measures are applied to those insurance legal entities to address the group-wide risks posed by other entities within the group, including non-regulated legal entities.

There may also be different combinations of elements of direct and indirect approaches.

17. Regardless of the approach, the supervisor must be able to deliver effective group-wide supervision, including that all relevant group-wide risks impacting the insurance entities are addressed appropriately.

**Group corporate governance and materiality**

18. The head of an insurance group is ultimately responsible for the group’s sound and prudent management. In doing so, it is important to take into account the risks and activities of the individual legal entities within the group, focusing in particular on those which are material for the group as a whole.

19. While the ultimate responsibility for an insurance group’s corporate governance lies with the head of the group, the legal entities within the group are fully responsible for their own sound and prudent management.

**ComFrame Introduction**

20. In the context of its mission, the IAIS has issued the Common Framework for the Supervision of Internationally Active Insurance Groups (ComFrame), which establishes supervisory standards focusing on the effective group-wide supervision of internationally active insurance groups (IAIGs).

21. ComFrame provides quantitative and qualitative supervisory minimum requirements tailored to the international activity and size of IAIGs. ComFrame seeks to assist supervisors in: addressing group-wide activities and risks; identifying and avoiding
supervisory gaps; coordinating supervisory activities efficiently and effectively between the group-wide and other involved supervisors. ComFrame also aims to provide a basis for comparing IAIG supervision across jurisdictions. However, it does not create a one-size-fits-all approach to IAIG supervision as, ultimately, what is important is that supervisors and IAIGs achieve the outcomes described by ComFrame.

22. As part of ComFrame, the IAIS is developing an insurance capital standard (ICS), which aims to provide a globally comparable risk-based measure of capital adequacy of IAIGs. ICS Version 2.0 is presented in a stand-alone document and is being used during a five-year monitoring period for confidential reporting to group-wide supervisors and discussion in supervisory colleges. The ICS is not used as a group-wide Prescribed Capital Requirement (PCR) during the monitoring period. In the second phase of implementation of ICS Version 2.0, the ICS will be implemented as a group-wide PCR.

Structure

23. The ICPs are applicable to the supervision of all insurers within a jurisdiction, which includes IAIGs. ComFrame provides additional Standards and Guidance applicable only to the supervision of IAIGs. The qualitative requirements of ComFrame material is presented in blue boxes within the relevant ICP material, following a similar hierarchy to the ICPs:

- **ComFrame Standards** – the highest level in the ComFrame hierarchy which build on certain ICP Principle Statements and/or ICP Standards. ComFrame Standards are outcomes-focused, specific requirements for supervisors. ComFrame Standards are presented in bold font, and follow the numbering of the relevant ICP Principle Statement and/or ICP Standard with the addition of “CF” and a letter (for example, the second ComFrame Standard under ICP Standard 7.2 would appear as CF 7.2.b).

- **ComFrame Guidance** – the lowest level in the ComFrame hierarchy which provides support for ComFrame Standards. ComFrame Guidance is intended to facilitate the understanding and application of a ComFrame Standard; it does not represent any requirements. Where appropriate, ComFrame Guidance provides examples of ways to implement a ComFrame Standard. ComFrame Guidance is presented in regular font, with the number and letter of the ComFrame Standard followed by the ComFrame Guidance number (for example, the first paragraph of ComFrame Guidance under ComFrame Standard CF 7.2.b would appear as CF 7.2.b.1).

Overarching Concepts

24. The overarching concepts identified in the ICP Introduction are equally applicable to ComFrame, in particular proportionality. Additionally, there are several, ComFrame-specific overarching concepts to understand and keep in mind when reading and implementing ComFrame.

Allocation of roles

25. The group-wide supervisor takes responsibility for the supervision of the IAIG as a whole, on a group-wide basis. Other involved supervisors are responsible for the supervision of the IAIG’s individual insurance legal entities in their respective jurisdictions and take into account the effect of their supervisory actions on the rest of the IAIG.
Governance structures

26. IAIGs have different models of governance (ie more centralised or more decentralised). ComFrame does not favour any particular governance model and is intended to be read to apply to all models. The organisation of an IAIG can be structured in various ways as long as the outcomes are achieved.

Group-Wide Supervision

27. Similar to the ICPs, ComFrame, for the most part, is neutral as to direct or indirect approaches to group-wide supervision, so long as the intended outcomes of the group-wide supervision are achieved. Where ComFrame uses a direct approach for certain powers, it is indicated in the relevant ComFrame Standards.

B) Assessment Methodology

28. The IAIS strongly encourages implementation of the ICPs as a means to ensure each jurisdiction has a framework for effective insurance supervision. Assessment of a jurisdiction’s observance of the ICPs can facilitate effective implementation by identifying the extent and nature of strengths and weaknesses in a jurisdiction’s supervisory framework – especially those aspects that could affect policyholder protection and financial stability.

29. The framework described by the ICPs is general. When implementing the ICPs in a jurisdiction, it is important to take into account the domestic context, characteristics of the insurance sector and developmental stage of the financial system and overall macroeconomic conditions. How the ICPs are implemented will vary across jurisdictions. While established implementation practices should be kept in mind, there is no mandated method of implementation. When carrying out an assessment, it is important to take into account factors that have shaped the implementation choices made in the jurisdiction.

30. Assessments against the ICPs can be conducted in a number of contexts including:

- self-assessments performed by the jurisdiction itself. These may be performed with the assistance of outside experts and/or followed by peer review and analysis;
- reviews conducted by third parties; or
- reviews in the context of the Financial Sector Assessment Program (FSAP) conducted by the International Monetary Fund (IMF) and World Bank.

31. The methodology that should be followed when carrying out an assessment of a jurisdiction’s observance of the ICPs is set out below. Following the methodology should result in greater consistency between assessments, especially assessments of different jurisdictions performed by different assessors. While the results of an assessment may not always be made public, it is still important for their credibility that similar types of assessments are conducted in a broadly uniform manner from jurisdiction to jurisdiction.

Scope of assessments

32. An assessment may be conducted on a system-wide jurisdictional basis or focus on specific areas. While thematic assessments have a role, the IAIS has designed the ICPs as a comprehensive and holistic framework, with each ICP being integral in the creation of a sound supervisory system.
33. Where more than one authority is involved in a jurisdiction’s insurance supervision process, the allocation and interaction of supervisory roles should be clearly described in the assessment. If an assessment is conducted in the context of an individual authority within a jurisdiction, a Standard may be not applicable if responsibility (either for its implementation or its delivery on a day-to-day basis) lies with another authority within that jurisdiction. However, the authority responsible for the observance of that Standard should be indicated in the report.

34. The ICPs are written to be equally applicable to both life and non-life sectors. However, where there are material differences between the life and non-life sectors, such that it would give rise to different results had they been assessed separately, the assessor may consider assigning separate levels of observance for each sector accordingly. In such cases, the distinction should be clearly identified and explained in any assessment report.

**Use of experts**

35. The process of assessing observance of the ICPs requires a judgmental weighing of numerous elements. It is important, therefore, that assessors are well qualified with relevant background, professional knowledge and practical experience. Assessors not familiar with insurance supervision, the insurance sector or entities and products that may be unique to the jurisdiction being assessed, could come to incorrect or misleading conclusions.

**Access to information**

36. When conducting an assessment, assessors need to have access to a range of information and people. The required information may include published information (such as the legislation and administrative policies) as well as non-published information (such as self-assessments performed and operational guidelines used by the supervisor). The supervisor may provide confidential information to the assessors, provided confidentiality is preserved. Information should be provided to and analysed by the assessors in advance, to the extent possible, to ensure that any on-site visits are efficient and derive the most value. The assessors may need to meet with various individuals and organisations, including the supervisor, other domestic supervisory authorities, relevant government ministries, insurers and insurance industry associations, consumer groups, actuaries, auditors, and other financial sector participants.

**Assessment process**

37. Assessments should be based solely on the legislation and supervisory practices that are in place at the time. As a result, it is important to recognise when an assessment is conducted and to record this in the report. Nevertheless, improvements already proposed or scheduled for implementation by the supervisor should be noted in the assessment report by way of additional comments so as to provide recognition for efforts that are important, but not yet fully implemented. Additionally, the assessment should consider whether supervisory practices adequately meet the outcomes provided for in legislation and whether the supervisor enforces compliance. Having legislation without the necessary corresponding supervisory practices is not sufficient to demonstrate full observance.

38. Performing an assessment is not an exact science. Assessors should perform a comprehensive assessment of the degree and effectiveness of implementation for each Principle Statement and Standard rather than a checklist approach. The goal of the assessment should not be simply to apply a grade to the level of observance but to
identify areas that need attention in order for the jurisdiction to achieve the outcomes identified in the ICPs.

**Assessment of Standards**

39. The Standards set requirements that are fundamental to the implementation of each Principle Statement. They also facilitate assessments that are comprehensive, precise and consistent. In making an assessment, each of the Standards under a Principle Statement has to be considered. As noted in the ICP Introduction, Guidance is intended to facilitate the understanding and application of the Principle Statement and/or Standard and does not prescribe any requirements, therefore it should not be assessed for observance.

40. The Standards should be assessed using five categories:

- **Observed** – for a Standard to be considered observed it is necessary that the supervisor has and exercises, when required, the legal authority and supervisory practices to effectively perform the requirements of the Standard. Having legislation without supervisory practices to implement a Standard is insufficient to be considered observed, except for those Standards that are specifically focused on legislation itself and what it contains. For supervisory practices which may lack explicit legal authority, the assessment should be considered as observed if the practice is clearly substantiated by the supervisor and is generally accepted by stakeholders. Having the necessary resources is essential for the supervisor to implement Standards effectively.

- **Largely observed** – for a Standard to be considered as largely observed, it is necessary that only minor shortcomings exist which do not raise any concerns about the supervisor’s ability to achieve full observance with the Standard within a prescribed period of time. The assessment of largely observed can be used when the jurisdiction does not meet all the criteria, but the overall effectiveness is sufficiently good and no material risks are left unaddressed.

- **Partly observed** – for a Standard to be considered partly observed, there are sufficient shortcomings to raise doubts about the supervisor’s ability to achieve observance.

- **Not observed** – for a Standard to be considered not observed, there is no substantive progress toward achieving observance.

- **Not applicable** – for a Standard to be considered not applicable, the Standard does not apply given the structural, legal and institutional features of a jurisdiction.

**Assessment of Principle Statements**

41. As noted above, the level of observance for each Principle Statement reflects the assessments of its Standards. The Principle Statements should be assessed using five categories:

- **Observed** – for a Principle Statement to be considered observed, all the Standards must be considered observed (except any Standards that are considered not applicable).

- **Largely observed** – for a Principle Statement to be considered largely observed, it is necessary that only minor shortcomings exist which do not raise any concerns about the supervisor’s ability to achieve full observance with the Principle Statement.
• **Partly observed** – for a Principle Statement to be considered partly observed, there are sufficient shortcomings to raise doubts about the supervisor’s ability to achieve observance.

• **Not observed** – for a Principle Statement to be considered not observed, there is no substantive progress toward achieving observance.

• **Not applicable** – for a Principle Statement to be considered not applicable, all the Standards must be considered not applicable.

**Reporting**

42. The IAIS does not prescribe a set format or content of reports that result from an assessment. However, it is recommended that an assessment report should:

- be in writing;
- identify the scope and timing of the assessment;
- identify the assessors;
- provide an assessment of observance;
- refer to the information reviewed and meetings conducted, and note when any necessary information was not provided and the impact that this may have had on the accuracy or completeness of the assessment;
- include any formal comments provided by the supervisor in response to the assessment; and
- include prioritised recommendations for improving observance of the ICPs assessed.

43. While encouraged, it is the jurisdiction’s discretion whether to publish the results of an assessment. Nevertheless, it is important for the credibility of assessments that they are conducted in a broadly uniform manner across jurisdictions.

**ComFrame Assessment Methodology**

44. As with the ICPs, the IAIS strongly encourages implementation of ComFrame as a means to ensure that jurisdictions to which ComFrame is applicable have a framework for effective supervision of IAIGs. In general, the assessment methodology described for the ICPs is applicable to ComFrame. However, given the nature of ComFrame, which provides quantitative and qualitative supervisory requirements tailored to the international activity and size of IAIGs, there are some additional considerations that should be taken into account when assessing observance of ComFrame requirements.

**Role of involved supervisors**

45. ComFrame seeks to assist supervisors in coordinating supervisory activities efficiently and effectively between the group-wide and other involved supervisors, thus a number of ComFrame Standards address coordination. However, it is recognised that having efficient and effective coordination depends on all involved supervisors. The group-wide supervisor relies on the other involved supervisors to do their part and vice versa. Where there are shortcomings with an involved supervisor doing their part for coordination, there are limits to what the other supervisors can do to improve the situation. When assessing parts of ComFrame that focus on coordination, this should be taken into account.
46. The type of assessment of a jurisdiction’s implementation of ComFrame will depend on whether, in that jurisdiction, there is: a group-wide supervisor of an IAIG; an other involved supervisor; or both. Most ComFrame Standards are addressed to the group-wide supervisor and describe the outcomes they are expected to achieve, whereas some ComFrame Standards also include the other involved supervisors. Therefore, an assessment of a jurisdiction’s implementation of ComFrame should reflect the role it has in the supervision of an IAIG. A jurisdiction where there is only an other involved supervisor will not be assessed on the implementation of ComFrame Standards that are addressed only to the group-wide supervisor.

47. For ComFrame Standards that are addressed to both the group-wide supervisor and other involved supervisors, the assessment of those Standards should be based on the role of the jurisdiction’s supervisor. An assessment of a group-wide supervisor jurisdiction should focus on whether it has put in place the necessary legislation and supervisory practices for coordination with the other involved supervisors, whereas an assessment of an other involved supervisor jurisdiction would focus on its role within this context (for example, coordinating with the group-wide supervisor on processes, exchanging information).

**Reporting**

48. Involved supervisors are encouraged to share the results of an assessment within the supervisory college for information.

**Assessment process**

49. As some ComFrame Standards focus on coordination and information exchange between the group-wide supervisor and other involved supervisors, in demonstrating observance of such Standards there may be more emphasis on supervisory practices rather than legislation. While legislation provides the authority to coordinate and exchange information, the supervisor, more importantly, needs to have appropriate supervisory practices for coordination in place that facilitate effective supervision of an IAIG.

**Interaction with assessments of ICPs**

50. The ICPs are applicable to the supervision of all insurers within a jurisdiction, which includes IAIGs. ComFrame provides additional Standards and Guidance applicable only to the supervision of IAIGs. As the ICPs provide the necessary foundation for ComFrame, an assessment of ComFrame Standards cannot be done in isolation. It should be determined in advance of an assessment whether the level of observance of ComFrame Standards is included when assessing the level of observance of the relevant Principle Statements within the ICPs or whether an assessment of the level of observance of ComFrame Standards is treated separately.

**Preconditions for effective insurance supervision**

51. An effective system of insurance supervision requires a number of preconditions to be in place, as they can have a direct impact on supervision in practice. An assessment of a jurisdiction’s observance of the Principle Statements and Standards may involve a review of preconditions for effective insurance supervision.

52. This section provides a number of categories of preconditions and descriptions of how each precondition may be reviewed. The preconditions include:

- sound and sustainable macroeconomic and financial sector policies;
• a well-developed public infrastructure;
• effective market discipline in financial markets;
• mechanisms for providing an appropriate level of protection; and
• efficient financial markets.

53. As these preconditions are normally outside the control or influence of the supervisor, and because they are beyond the scope of the ICPs, an assessment should not evaluate a jurisdiction’s observance of the preconditions. Instead, the objective of a review of preconditions is to help inform an assessment of observance of the ICPs because the preconditions can directly impact the effectiveness of supervision. Where shortcomings exist, the supervisor should make its government aware of these and their actual or potential repercussions for the achievement of supervisory objectives and seek to mitigate the effects of such shortcomings on the effectiveness of supervision.

54. Any report on a review of preconditions should:
• be descriptive and not express an opinion on the adequacy of policies in these areas, other than through reference to analyses and recommendations in existing official documents;
• include an analysis of the linkages between these factors and the resilience of the insurance sector, when relevant;
• give a clear picture of the adequacy of the preconditions within the jurisdiction and the interaction of the preconditions with the assessment of observance with the ICPs; and
• flag any individual ICPs which are most likely to be affected by any material weakness in the preconditions.

**Sound and sustainable macroeconomic and financial sector policies**

55. Sound macroeconomic policies are the foundation of a stable financial system. This is not within the mandate of supervisors, although they will need to react if they perceive that existing policies are undermining the safety and soundness of the financial system. In addition, financial sector supervision needs to be undertaken within a transparent government policy framework aimed at ensuring financial stability, including effective supervision of the insurance and other financial sectors.

56. A review of this precondition should include a review of the relevant government financial sector policies, including whether there is a clear and published framework assigning responsibility to different bodies involved in financial stability and supervisory work.

**Well-developed public infrastructure**

57. A well-developed public infrastructure contains the following elements which, if not adequately provided, can contribute to the weakening of the financial system or frustrate their improvement:
• a system of business laws, including corporate, insolvency, contract, consumer protection and private property laws, which is consistently enforced and provides a mechanism for the fair resolution of disputes;
• an efficient and independent judiciary;
• use of comprehensive and well-defined accounting principles and rules that command wide international acceptance;

• a system of independent audits for companies to ensure that users of financial statements, including insurers, have independent assurance that the accounts provide a true and fair view of the financial position of the company and are prepared according to established accounting principles, with auditors held accountable for their work;

• the availability of skilled, competent, independent and experienced actuaries, accountants and auditors, whose work complies with transparent technical and ethical standards set and enforced by official or professional bodies in line with international standards and is subject to appropriate oversight;

• well defined rules governing, and adequate supervision of, other financial sectors;

• access to a secure payment and clearing system for the settlement of financial transactions where counterparty risks are controlled; and

• the availability to the supervisor, financial services and public of basic economic, financial and social statistics.

58. A review of the public infrastructure should focus on elements relevant to the insurance sector.

**Effective market discipline in financial markets**

59. Effective market discipline depends, in part, on adequate flows of information to market participants, appropriate financial incentives to reward well-managed institutions, and arrangements that ensure investors are not insulated from the consequences of their decisions. Among issues to be addressed are the existence of appropriate corporate governance frameworks and ensuring that accurate, meaningful, transparent and timely information is provided by issuers and borrowers to investors and creditors.

60. A review of the effectiveness of market discipline could cover issues such as:

• the presence of rules on corporate governance;

• transparency and audited financial disclosure;

• appropriate incentive structures for the hiring and removal of managers and Board Members;

• protection of shareholders’ and other stakeholders’ rights;

• adequate availability of market and consumer information; and

• an effective framework for new entrants, mergers, takeovers, and acquisition of equity interests, including those involving foreign entities.

**Mechanisms for providing an appropriate level of policyholder protection**

61. In general, deciding on the appropriate level of policyholder protection is a policy question to be addressed by each jurisdiction. Protection mechanisms could include, for example, a hierarchy of claims or a policyholder protection scheme. Provided such mechanisms are transparent and carefully designed to limit moral hazard, they can contribute to public confidence. For issues such as crisis management or the resolution of an insurer, the supervisor should have a role to play given its in-depth knowledge of the entities involved.

**Efficient financial markets**

Public
IAIS ICPs and ComFrame – November 2019
Page 16 of 390
62. Efficient financial markets are important to provide investment and risk management opportunities for insurers. Insurers benefit by having access to domestic and global financial markets.

63. A review of whether there are efficient financial markets could cover, for example, the range of instruments and issuers (e.g. are there a spread of public sector issues, index-linked as well as conventional government bonds) and the spread of available maturities. A review could take note of how liquidity has been affected in markets in periods of stress. A review should focus on relevant issues for the carrying on of insurance business, taking into account the products offered, such as whether annuities or other long term contracts of insurance are provided.
ICP 1 Objectives, Powers and Responsibilities of the Supervisor

Each authority responsible for insurance supervision, its powers and the objectives of insurance supervision are clearly defined.

Introductory Guidance

1.0 Introductory Guidance

1.0.1 Publicly defined objectives foster transparency. Based on this, government, legislatures and other stakeholders, including insurance industry participants and consumers, can form expectations about insurance supervision and assess how well the supervisor is achieving its objectives and fulfilling its responsibilities.

1.0.2 Responsibilities and objectives of the supervisor should be stable over time. However, when those responsibilities and objectives are updated periodically, it should be done in a manner that avoids creating instability, as a stable business environment is important for the insurance sector and consumer confidence. Objectives and key aspects of the supervisor responsibilities should be defined in primary legislation to the extent that it needs the effect of law. Aspects that should undergo frequent updating due to changing circumstances should be supplemented as needed with updated legally enforceable rules and guidance.

1.1 Primary legislation clearly defines the authority (or authorities) responsible for insurance supervision.

1.1.1 Primary legislation should clearly define responsibilities of each authority involved in insurance supervision at both the insurance legal entity level and the group-wide level.

1.1.2 Institutional frameworks for insurance supervision vary across jurisdictions. For example, there may be separate authorities for prudential and market conduct supervision, for macro and micro prudential supervision, for licensing and ongoing supervision, and resolution.

1.1.3 Where there are multiple authorities responsible for insurance supervision, the institutional framework, the main responsibilities of the respective authorities and a basis for cooperation and coordination should be clearly set out in primary legislation.

1.2 Primary legislation clearly determines the objectives of insurance supervision and these include at least to:

- protect policyholders;
- promote the maintenance of a fair, safe and stable insurance market; and
- contribute to financial stability.

1.2.1 The precise supervisory objectives and their respective priority may vary by jurisdiction depending on the level of development of the insurance markets, market conditions and consumers. Supervisory objectives could also include promoting insurance market development, financial
inclusion, financial consumer education, and contributing to fighting financial crime.

1.2.2 The policyholders to be considered in defining supervisory objectives include past, present and future policyholders.

1.2.3 Depending on the evolution of the jurisdiction’s insurance or financial markets, the supervisor may emphasise temporarily one or more of the objectives. Regardless, the supervisor should take into account the other objectives in fulfilling its function. In such circumstances, this should be explained to stakeholders, including insurance industry participants, consumers and the general public.

1.3 Primary legislation gives the supervisor adequate powers to meet its responsibilities and objectives.

1.3.1 Primary legislation should give the supervisor the necessary powers to achieve its responsibilities and objectives, and the ability to take supervisory action adequately. The supervisor should have the powers needed to implement a framework for effective insurance supervision, which is described by the ICPs in general.

1.3.2 Legislation should clearly address insurance legal entity and group-wide supervision, providing the supervisor with sufficient powers to achieve the respective responsibilities and objectives.

1.3.3 The supervisor should have sufficient powers in place to perform the role of a group-wide supervisor, including coordination and collaboration with other relevant supervisors. Additionally, the legislation should empower the supervisor of an insurance legal entity which is part of a group to contribute to the supervision of that group on a group-wide basis.

1.4 The supervisor initiates or proposes changes in legislation where current responsibilities, objectives or powers are not sufficient to meet the intended supervisory outcomes.

1.4.1 It is important that supervisory responsibilities, objectives and powers are aligned with actual challenges faced by the insurance market to effectively protect policyholders, maintain a fair, safe and stable insurance market and contribute to financial stability.

1.4.2 Market changes can mean that the legislation is no longer adequate for the supervisor to achieve its intended outcomes. The supervisor may identify changes in the economy, society or business environment in general that affect insurance supervisions that are not currently or sufficiently addressed by legislation. When the supervisory outcomes may not be achieved with the current legislation, the supervisor should initiate or propose changes in legislation.

1.4.3 If supervisory responsibilities, objectives or powers assigned by primary legislation become obsolete, the supervisor should initiate or propose changes to the legislation.
2.0

Introductory Guidance

2.0.1 Operational independence, accountability and transparency by the supervisor contribute to the legitimacy and credibility of the supervisory process. As explained in this introductory guidance, the three concepts of independence, accountability and transparency are closely interconnected and mutually dependent.

2.0.2 Operational independence means the supervisor should be able to take actions and make decisions in the exercise of its supervisory responsibilities without interference from any part of the government, including other governmental bodies, the legislature, and the insurance sector. The supervisor should be able to carry out the supervisory process, take supervisory measures and impose sanctions as it deems necessary to fulfil its objectives. However, this independence should be balanced with accountability.

2.0.3 The supervisor should be accountable for the actions it takes in the exercise of its supervisory responsibilities to the government, including other governmental bodies and the legislature, which delegated various responsibilities to the supervisor, as well as to those it supervises and the public at large. Accountability means that the supervisor operates within the bounds of its delegated authority, in a fair and equitable manner that is open to scrutiny and review by the government and the public, and that the actions of the supervisor may be challenged as part of a judicial appeal process. Strong internal governance processes, sufficient and skilled human resources and maintenance of high standards of integrity and professionalism underpin the accountability of the supervisor.

2.0.4 Transparency reinforces accountability. Transparency increases the predictability of supervision and shapes the expectations of supervised entities, which enhances supervisory effectiveness. For these reasons, supervisory requirements, supervisory processes as well as information about the supervisor’s responsibilities should be publicly disclosed, in a manner consistent with any confidentiality requirements imposed on the supervisor.

2.0.5 The structures of supervisors vary across jurisdictions. For example, a supervisor can be structured as a separate independent entity governed by a Board of Directors, as a commission or as a body overseen by one appointed individual. No one single structure is appropriate for all supervisors. Regardless of their structure, all supervisors should have processes and safeguards that allow them to be operationally independent, accountable and transparent.

2.0.6 Given the differences in structures between supervisors, in this ICP, the “governing body” refers to the body of individuals that exercises
oversight of the supervisory organisation, such as a Board or commission, or in the case of a supervisor overseen by an appointed individual, to that individual. The “head of the supervisor” refers to the individual who is an employee of the supervisor and who leads the management team and exercises full management responsibility for the day-to-day functioning and decisions of the supervisor. The head of the supervisor may or may not also be a member of the governing body.

Independence

2.1 The supervisor is operationally independent and free from undue government or industry interference that compromises that independence.

2.1.1 Operational independence of the supervisor includes having the discretion to allocate its resources, including financial and human resources, and to carry out the supervisory process in accordance with its objectives and the risks the supervisor perceives. Having this discretion, which underpins operational independence, should be recognised in primary legislation.

2.1.2 The supervisor should be financed in a manner that does not undermine its independence. A wide variety of financing models exist, such as financing by government, levies imposed on supervised entities and combinations thereof. To help ensure the supervisor’s independence is not compromised, the method in which it is financed should be stable, predictable and transparent, and prevent interference from its funding source.

2.1.3 The institutional relationships and accountability frameworks between the supervisor and the government should be clearly defined in legislation. It is important to specify the circumstances and processes for sharing information, consultation or approval between the supervisor and the government. This may include establishing what information should be provided, how each entity should consult on matters of mutual interest and when approval from relevant authorities is necessary. The daily operations of the supervisor should not be subject to consultation with or approval by the government. In exceptional circumstances, the supervisor may choose to consult with the government in relation to a supervisory decision where there are major socio-economic implications of that decision.

2.1.4 In addition to independence from the government, the supervisor should not permit excessively close relationships, or even the appearance thereof, with industry participants, in particular supervised entities. Such relationships can compromise the supervisor’s ability to enforce the law strictly or to control the behaviour of supervised entities as intended by law. These relationships can also lead the supervisor to make policy or operational decisions to benefit supervised entities, whether a particular entity or supervised entities as a whole, rather than in furtherance of its supervisory objectives. The supervisor’s policies, for example, post-employment, anti-corruption and accountability in decision-making, should seek to avoid such close relationships.

2.1.5 The legislation should define the responsibilities of the governing body. In cases where there are industry representatives or elected officials or government employees on the governing body of the supervisor, the
The composition of the governing body should be sufficiently diverse to prevent such representatives from controlling the supervisor.

2.1.6 The supervisor’s staff and members of its governing body can also experience pressures that could compromise their independence. Generally, the staff of the supervisor should not hold any consultancies, directorships or financial interests, expect any future benefit from, or be involved in any capacity in the entities it supervises, other than in a supervisory role or as a customer, and should not accept gifts or hospitality from these entities in excess of a low monetary value. The supervisor should have policies and processes or a code of conduct to avoid or manage real, potential or perceived conflicts of interests. The supervisor should require its staff and members of its governing body to report conflicts of interests. Staff and members of the governing body of the supervisor should exclude themselves from decisions where they have a conflict of interest.

2.2 Legislation governing the supervisor provides the necessary legal protection from legal action against the supervisor and its staff for actions taken in good faith while discharging their duties. In addition, the supervisor’s staff is adequately protected against the costs of defending their actions.

2.2.1 Having necessary legal protection from legal action promotes the independence of the supervisor by enabling its staff to make decisions and take action against a regulated legal entity even though such action or decision may be contested by that entity.

2.2.2 In this context, legislation should protect the supervisor and its staff from criminal or civil liability for decisions made and actions taken in the course of discharging their supervisory responsibilities, provided that the action or decision was not taken in bad faith or illegally.

2.3 Procedures regarding the appointment and dismissal of the head of the supervisor and members of its governing body (if such a governing body exists) are transparent.

2.3.1 Public procedures regarding the appointment and dismissal of the head of the supervisor enhance independence, as they limit the potential for government interference in the management of the supervisor. Those procedures should be codified in legislation.

2.3.2 Those procedures should disclose, for example, who appoints the head of the supervisor and members of the governing body, the length of those appointments and the reasons for which the head of the supervisor or members of the governing body can be dismissed before the end of their term, if applicable.

2.3.3 Legislation should disclose the general criteria for appointing members of a governing body, including that they possess relevant qualifications, knowledge and experience to oversee the activities of the supervisor, as well as the mechanism for their remuneration (for example, salary, daily allowance or voluntary work). The procedures regarding the appointment of the members of the governing body should result in a balance of skills, knowledge and experience amongst the members of the governing body as a whole.
Accountability

2.4 The supervisor has effective internal governance structures, processes and procedures to preserve the integrity of its actions and decisions and to enable it to account to its stakeholders.

2.4.1 A well-defined internal governance structure and strong internal governance processes support the accountability and integrity of the supervisor. The supervisor’s internal governance includes its organisational structure and management arrangements, lines of responsibility, and systems of risk management and internal controls. In this context, integrity refers to the supervisor always acting with probity, respectability and lawfulness, and within the bounds of its delegated authority.

2.4.2 Regardless of the supervisor’s governance structure, the responsibilities of the governing body, the responsibilities of Senior Management, communication channels and decision making authorities, including delegation thereof, should be documented in writing to facilitate compliance with internal controls, including proper authorisation of actions taken by or on behalf of the supervisor. In addition, well-defined communication channels help ensure prompt escalation of significant issues to appropriate levels within the supervisor.

2.4.3 The supervisor should have a process to develop and implement a strategic plan that sets out its goals and priorities, given the responsibilities and objectives assigned to it by legislation. Such a plan should cover a specific period of time, such as two or three years. The supervisor should report on its performance against that plan to the government and other stakeholders, including insurance industry participants, consumers and the general public.

2.4.4 The supervisor should identify the individual or group of individuals responsible for the implementation and review of the internal governance arrangements. The internal governance processes and procedures should be subject to regular independent review, for example by an internal audit function or a public auditor.

2.5 The supervisor applies requirements and supervisory procedures consistently and equitably.

2.5.1 The supervisor should have internal mechanisms to help ensure that it is consistent in the actions and decisions it takes.

2.5.2 Cases where circumstances are similar should lead the supervisor to take similar actions or decisions. Actions taken in a particular case in the past should be considered in new cases where the circumstances are similar, unless a change in the requirements or supervisory procedures occurred in the time between the two cases.

2.6 There are processes to appeal against supervisory decisions which do not unduly impede the ability of the supervisor to make timely interventions in order to protect policyholders’ interests or contribute to financial stability.

2.6.1 Procedural fairness enhances public confidence in the supervisory process. Parties subject to a decision made by the supervisor should be able to receive the written reasons for the decision and to appeal the
decision to an impartial review body or tribunal. The manner in which the supervisor’s decision could be subject to judicial review, or in which decisions can be appealed, should be defined and transparent, and included in the notification of the decision.

2.6.2 The existence of an appeal or review mechanism helps ensure that the supervisor’s decisions are made within the law as consistently as possible and are well reasoned. Appeal processes should be specific and balanced to preserve supervisory independence and effectiveness. However, these processes should allow the supervisor to exercise its powers quickly in cases where expeditious action is required. In certain cases, these processes may provide that the decision of the supervisor remains in force until the appeal or review mechanism has produced a final decision on the appeal, unless otherwise ordered by a court.

2.7 The supervisor, including its staff and any third party acting on its behalf (presently or in the past), are required by legislation to protect confidential information in the possession of the supervisor.

2.7.1 The type of information that the supervisor is required to keep confidential should be specified in legislation. Generally, any non-public information received relating to a supervised entity would be considered confidential, as well as information received from another supervisor (see ICP 3 Information Sharing and Confidentiality Requirements). Legislation should also specify the circumstances under which the supervisor is allowed to disclose confidential information and to whom it can be disclosed.

2.7.2 The supervisor should protect confidential information. Safeguards should apply to information maintained in any format, including in physical form as well as electronic. The supervisor should assess the sensitivity of various categories of information in its possession, and identify the appropriate data protection requirements applicable to each category, including the duration of the retention period for information in each category.

2.7.3 The supervisor and its staff, including former staff, and all persons acting on its behalf (presently or in the past) should be liable to penalties for unlawful access to, use of, or disclosure of, confidential information. This includes any outside experts hired by the supervisor and persons to which the supervisor outsourced any supervisory function. The penalties for such conduct should be specified in legislation and may include disciplinary actions, up to and including termination of employment, and criminal or legal proceedings. The duty of confidentiality should survive the termination of employment of a staff member or other third party engaged by the supervisor.

Transparency

2.8 The supervisor is transparent to the public, supervised entities and the government about how it exercises its responsibilities.

2.8.1 Transparency reinforces accountability of supervisors. The supervisor should publish information about itself and the insurance sector, including:
• its objectives and responsibilities;
• its goals and priorities for the future;
• its activities in light of its goals and priorities in the previous year;
• its resources, including human, technological and financial;
• data and analysis about the state of the insurance sector; and
• supervisory measures taken in relation to problem or failed insurers, subject to confidentiality considerations and in so far as it does not jeopardise other supervisory objectives or prejudice another case pending before the supervisor.

2.8.2 The supervisor should seek to publish a report at least annually that contains the elements listed above as well as its audited financial statements. This type of report is a key document by which a supervisor accounts to its stakeholders.

2.9 The supervisor publishes its requirements, policies and supervisory procedures. The supervisor consults publicly on significant changes that it makes to requirements, policies and supervisory procedures.

2.9.1 The supervisor publishes and regularly reviews requirements, policies and supervisory procedures to ensure they remain appropriate for the characteristics of the industry, emerging risks and evolving international standards. Some requirements may be contained in primary legislation, while others may be contained in instruments issued by the supervisor, such as guidance and industry advice. The supervisor should ensure these instruments are made available to the public, for example on the supervisor’s website.

2.9.2 A critical element of transparency is for the supervisor to provide the opportunity for meaningful public consultation on proposed requirements and supervisory procedures. Meaningful public consultation benefits from participation by a diversity of stakeholders. Consequently, the supervisor should have methods in place to encourage and solicit stakeholder participation.

2.9.3 The supervisor should have written procedures on the types of documents that are subject to public consultation as well as the process and timelines for consultation. Some documents used in the supervisory process may not be suitable for consultation, such as detailed procedural manuals that are used to guide staff of the supervisor in the performance of their day-to-day duties.

2.9.4 In some jurisdictions, the development and issuance of requirements may be outside of the control of the supervisor; for example, the power to enact legislation may be vested in another government body or supranational bodies that have a direct role in the legislation in force in their member countries. In such cases, the consultation process may also be outside the remit of the supervisor. To the extent possible, the supervisor should be involved in the development of the requirements, for example, by participating in consultations, and the supervisor should keep the public and the industry informed of proposed changes.
**Resources**

2.10 The supervisor has sufficient resources, including human, technological and financial resources, to enable it to conduct effective supervision.

2.10.1 The supervisor’s financial resources and staffing policies should enable it to attract and retain highly skilled, competent and experienced staff with the necessary professional qualifications, where required. The supervisor should have the ability to hire or contract the services of external experts when necessary.

2.10.2 The supervisor should have a process for regularly reviewing its human resources needs, the skills and experience of existing staff and its projected human resource requirements over the short to medium term.

2.10.3 This review could lead the supervisor to implement initiatives to bridge gaps in numbers and/or skills. These could include more flexible hiring policies or schemes for secondment of staff from industry or other supervisory authorities within the jurisdiction or internationally. These initiatives may help in providing access to specialist skills on a temporary basis. Secondments for supervisory staff to industry or other supervisory authorities enhance the skills and experience of staff particularly to better understand industry practices. When implementing such initiatives, the supervisor should have safeguards in place to avoid conflicts of interest and protect confidential information, such as by restricting access to certain information.

2.10.4 The supervisor should provide adequate training opportunities for its staff to ensure that their skills and supervisory practices remain up to date with evolving supervisory and regulatory developments and changes in the industry.

2.10.5 The technological resources available to the supervisor should enable supervisory staff to collect and store securely, quickly access, and efficiently analyse information about the entities it supervises.

2.11 Where the supervisor outsources supervisory activities to third parties, the supervisor:

- sets expectations for their role and work;
- monitors their performance;
- ensures their independence from the supervised entity or any other related party; and
- subjects them to the same confidentiality rules and professional standards as the staff of the supervisor.

2.11.1 Outsourcing of selected supervisory activities to third parties can complement the supervisor’s resources with valuable expertise. However, supervisory activities are primarily the responsibility of the supervisor. The supervisor should retain accountability for and oversight of any outsourced activities to the same degree as non-outsourced activities. Outsourcing should not adversely affect the supervisor’s ability to conduct effective supervision or meet its objectives.

2.11.2 The process used to select third party providers should be fair, open and transparent. All qualified third party providers should have equal access
to information regarding the process. Prior to engaging a third party, the supervisor should assess the proposed provider’s competence and experience and the safeguards for the handling of data, including treatment of confidential information. The decision to select a provider should be made free from conflicts of interest, or where such conflicts cannot be avoided, they should be managed.

2.11.3 A written agreement should govern the relationship between the supervisor and the third party provider. The agreement should describe all material aspects of the outsourcing arrangement, including the services to be provided, remuneration of the third party provider, resolution of disputes and procedures governing the sub-contracting of services.
ICP 3  Information Sharing and Confidentiality Requirements
The supervisor obtains information from, and shares information with, relevant supervisors and authorities subject to confidentiality, purpose and use requirements.

3.1 The supervisor requests information, including non-public information, from relevant supervisors and authorities with respect to insurers.

3.1.1 Information requested by a supervisor from a relevant supervisor or authority may include:

- information on strategy, business activities and business models including prospective and recent acquisitions or disposals of insurance business;
- financial data relating to an insurer;
- organisational structure, both legal and management structure;
- information on the management and operational systems and controls used by insurers;
- information on individuals holding positions of responsibility in insurers such as Board Members, Senior Management, Key Persons in Control Functions and Significant Owners;
- information on individuals or insurers involved, or suspected of being involved, in criminal activities;
- information on any failures to comply with supervisory requirements, regulatory investigations and reviews, and on any restrictions imposed on the business activities of insurers;
- information concerning regulated entities related to the insurance group, whether undertaking insurance business or other financial business which is subject to regulation, and information concerning non-regulated entities related to the insurance group such as service companies or holding companies;
- specific information requested and gathered from a regulated entity; and
- reporting information within groups to meet group supervisory requirements, including subsidiaries and non-regulated holding companies.

3.1.2 Relevant supervisors and authorities, whether in the same or a different jurisdiction, may include:

- other insurance supervisors;
- supervisors responsible for banks and other credit institutions;
- supervisors responsible for investments, securities, pensions, financial markets and other sectors;
• authorities responsible for the recovery or resolution of insurers;
• authorities responsible for anti-money laundering or combating the financing of terrorism; and
• law enforcement agencies.

3.2 The supervisor shares information, including non-public information, with relevant supervisors and authorities at its sole discretion and subject to appropriate safeguards.

**Agreements on information sharing**

3.2.1 Supervisors and authorities are responsible for ensuring the safe handling of confidential information. Although the existence of an agreement or understanding on providing requested information may not be a prerequisite for sharing information, the supervisor is encouraged to use agreements, including memoranda of understanding (MoUs), to facilitate information sharing between relevant supervisors and authorities. Such agreements are important to information sharing among supervisors and authorities to establish a framework to facilitate the efficient exchange of confidential information and document the types of information that may be shared as well as the terms and conditions under which the information can be shared and passed on to other relevant supervisors and authorities. Such agreements may be distinguishable from coordination agreements used in supervisory colleges (see ICP 25 Supervisory Cooperation and Coordination).

3.2.2 The supervisor should use bilateral or multilateral agreements to facilitate information sharing because they provide the basis for a two-way flow of information and the basis for confidential treatment of the information shared. The IAIS MMoU is an example of a multilateral memorandum of understanding for cooperation and exchange of information between supervisors related to the supervision of insurance legal entities and insurance groups. All signatories to the IAIS MMoU undergo a validation of their laws and regulations to demonstrate compliance with the MMoU’s strict confidentiality regime. For this reason, if all relevant parties are signatories to the IAIS MMoU, it is the preferred framework for multilateral information exchange.

**Information Sharing in Supervisory Colleges**

3.2.3 Supervisory colleges can provide a framework for supervisory cooperation and crisis management in which information sharing between involved supervisors occurs on an ongoing basis.

3.2.4 Information sharing is particularly important for the operation of a supervisory college. For a supervisory college to be effective there needs to be mutual trust and confidence among supervisors, particularly in relation to exchange and protection of confidential information.

3.2.5 Each member of the college should take measures necessary to avoid the unintentional divulgence of information or the unauthorised release of confidential information. It is important that appropriate information exchange agreements or other arrangements are in place between the
members of the supervisory college to ensure that information can be exchanged in a secure environment.

3.2.6 Where confidential information exchanged within a supervisory college is communicated to relevant supervisors or authorities who are not involved in the college, supervisors should:

- have a formal mechanism in place between the group-wide supervisor and the other supervisors or authorities to ensure the protection of the confidential information. Such mechanisms could be included in the relevant information sharing agreements; and
- obtain the prior consent of the supervisor having provided such information.

3.3 The supervisor requesting confidential information (the requesting supervisor) has a legitimate interest and valid supervisory purpose related to the fulfilment of its supervisory functions in seeking information from another relevant supervisor or authority.

3.3.1 A legitimate interest is derived from the powers and responsibilities the requesting supervisor has in relation to the subject matter of the request. For example:

- if the requesting supervisor only has the power and responsibility to supervise intermediaries and not insurers, it may not have a legitimate interest in requesting information relating to an insurer; or
- if the requesting supervisor requests information relating to an insurer that has no current or planned operations or other connections to the requesting supervisor’s jurisdiction, it may not have a legitimate interest in requesting such information.

3.3.2 A valid supervisory purpose is relevant to the requesting authority’s performance of a supervisory task. Valid supervisory purposes may include information requested for the purposes of:

- licensing;
- suitability criteria;
- intra-group transactions such as loans and extensions of credit, parental guarantees, management agreements, service contracts, cost-sharing arrangements, reinsurance agreements, dividends and distributions;
- prevention of financial crime, such as fraud, anti-money laundering or combating the financing of terrorism;
- ongoing supervision, including preventive and corrective measures and sanctions; and
- exit from the market and resolution.

3.3.3 A supervisor may voluntarily provide information to other relevant supervisors so as to better enable the supervisors’ fulfilment of their supervisory functions. In such cases, the supervisor providing
information should adhere to the same requirements as though the information had been requested by a requesting supervisor.

3.4 The supervisor that has received a request for confidential information (the requested supervisor) from another relevant supervisor or authority:

- assesses each request for information on a case-by-case basis; and
- responds to requests in a timely and comprehensive manner.

3.4.1 In principle, the requested supervisor is expected to share information with a requesting supervisor with a legitimate interest and for a valid supervisory purpose.

3.4.2 In deciding whether and to what extent to fulfil a request for information, the requested supervisor may take into account matters including:

- the nature of the information to be provided;
- the purpose for which the information will be used;
- the ability of the requesting supervisor or authority to maintain the confidentiality of any information received, taking account of the IAIS MMoU or other existing agreements in each jurisdiction;
- whether, in the context of supervisory college or otherwise, the request is covered by a coordination agreement;
- whether it would be contrary to the interest of the jurisdiction of the requested supervisor; and
- relevant laws and regulations in each jurisdiction (in particular those relating to confidentiality and professional secrecy, data protection and privacy, and procedural fairness).

3.4.3 While requests for information should normally be made in writing, the requested supervisor should not insist on written requests in an emergency situation, and should not unreasonably delay a response to an oral request for information made for a valid supervisory purpose by a requesting supervisor.

3.4.4 The requested supervisor may receive a request for information which is not already in their possession. In such circumstances, the requested supervisor should, if it considers it reasonable, obtain that information from the insurer or other entities from which it has the power to obtain information.

3.4.5 If the requested supervisor denies a request, it should explain its reason for the denial to the requesting supervisor or authority.

3.4.6 Lack of strict reciprocity should not be used by the requested supervisor as the reason for not sharing information that would otherwise be appropriate to share, particularly in an emergency or other crisis situation. Strict reciprocity in terms of the level, format and detailed characteristics of information requested is not required.

3.5 The requesting supervisor uses confidential information received from the requested supervisor or authority only for the purposes specified when the
information was requested. Unless otherwise agreed, before using the information for another purpose or passing it on to others, the requesting supervisor obtains agreement of the requested supervisor or authority.

3.5.1 The requesting supervisor should specify the intended purposes of the information sought. Additionally, MoUs may address purposes for which the requested information may be used by the requesting supervisor.

3.5.2 The requesting supervisor first obtains agreement with the requested supervisor or authority before passing on requested information. Supervisors and authorities are encouraged to request information directly from the requested supervisor, rather than from the requesting supervisor, to provide an opportunity for direct dialogue and further consultation. Requesting supervisors should ensure that appropriate confidentiality requirements are in place and the information is only passed on to another relevant supervisor or authority with a legitimate interest and – in case of a supervisory authority – for valid supervisory purposes.

3.5.3 There are specified circumstances within the IAIS MMoU where signatories are expected to consent to the passing on of information to other relevant supervisors and authorities. This includes situations where passing on information will assist:

- other IAIS MMoU signatories in the fulfilment of their supervisory functions; and
- other relevant domestic financial sector bodies such as central banks, law enforcement agencies, relevant courts and other authorities (see Annex B of the IAIS MMoU).

3.5.4 Conditions imposed by the requested supervisor on the passing on of information to third parties should not prevent the requesting supervisor or authority from being able to use the information for its own valid supervisory purposes.

3.6 In the event the requesting supervisor has received notice of proceedings, which may legally compel it to disclose confidential information which it has received from the requested supervisor, the requesting supervisor:

- to the extent permitted by law, promptly notifies the requested supervisor; and
- where consent to disclosure is not given, uses all reasonable means to resist the demand and to protect the confidentiality of the information.

3.6.1 Where allowed by the laws and practices of the jurisdiction, a requesting supervisor required to disclose confidential information by legal compulsion should place, or seek to place, protections from disclosure on that information. Such protections could include:

- a protective order placing restrictions on use or further distribution of the confidential information; or
- limitations on the means and location of the disclosure of the confidential information.
ICP 4 Licensing

A legal entity which intends to engage in insurance activities must be licensed before it can operate within a jurisdiction. The requirements and procedures for licensing must be clear, objective and public, and be consistently applied.

Introductory Guidance

4.0.1 Licensing contributes to efficiency and stability in the insurance sector. Strict conditions governing the formal approval through licensing of insurance legal entities are necessary to protect consumers. The relevant licensing criteria should be applied to prospective entrants consistently to promote a level playing field at point of admission to the insurance sector. Licensing requirements and procedures should not be used inappropriately to prevent or unduly delay access to the market.

4.0.2 The role of the supervisor in licensing is to assess whether insurance legal entities are able to fulfil their obligations to policyholders on an ongoing basis. The licensing procedure is the first step towards achieving this objective.

4.0.3 Licensing is distinct from approval granted in terms of general domestic company, trade or commercial law. Apart from applying for a supervisory licence, other requirements pertaining to company, trade or commercial law should be met (eg filing incorporation documents or applying to the registrar of commerce).

Licensing requirements

4.1 The insurance legislation:

- includes a definition of insurance activities which are subject to licensing;
- prohibits unauthorised insurance activities;
- defines the permissible legal forms of domestic insurance legal entities;
- allocates the responsibility for issuing licences; and
- sets out the procedure and form of establishment by which foreign insurers are allowed to conduct insurance activities within the jurisdiction.

4.1.1 Jurisdictions may decide to exclude some activities from the definition of insurance activities subject to licensing. Any such activities should be explicitly stated in the legislation. Jurisdictions may do this for various reasons, such as:

- the insured sums do not exceed certain amounts;
- losses are compensated by payments in kind;
- activities are pursued following the idea of solidarity between policyholders (eg, small mutuals, cooperatives and other
community-based organisations, especially in the case of microinsurance); or

- the entities’ activities are limited to a certain geographical area, limited to a certain number or class of policyholders and/or offer special types of cover such as products not offered by licensed domestic insurance legal entities.

4.1.2 Given the principle that all entities engaged in insurance activities must be licensed, the exclusion of limited insurance activities from licensing requirements should give due regard to having appropriate alternative safeguards in place to protect policyholders.

4.1.3 Similarly, jurisdictions may allow a simplified process for non-significant entities (e.g., limited geographic scope, limited size, and limited lines of business) for the purposes of licensing. In such situations, the legislation should state clearly the applicability, requirements, and process for such authorisation.

4.1.4 In jurisdictions where an authority other than the insurance supervisor is responsible for issuing licences, the insurance supervisor should be able to give input and recommend conditions or restrictions (including refusal) on a licence where appropriate to the licensing authority.

4.2 A jurisdiction controls through licensing which entities are allowed to conduct insurance activities within its jurisdiction.

4.2.1 Entities should neither be allowed to present themselves nor act as licensed insurance legal entities without or before having been granted a licence.

4.2.2 Depending on the legal forms that are permitted in a jurisdiction, foreign insurers may be allowed to conduct insurance activities within the jurisdiction by way of a local branch or subsidiary or on a cross-border provision of services basis. A subsidiary is a domestically established legal entity that needs to be licensed. A branch is not separate from the insurance legal entity, and can be established in a jurisdiction other than the insurance legal entity's home jurisdiction. A host jurisdiction may require that branches of foreign insurance legal entities be licenced or otherwise authorised by the host supervisor. Cross-border provision of services does not require a local establishment but may require authorisation from the host supervisor.

4.2.3 In some regions, a number of jurisdictions have agreed to a system of passporting as a manner of acknowledging each other's licences. This provides the opportunity for insurance legal entities established in one of the jurisdictions to open branches or provide insurance services across borders on the basis of their home jurisdiction authorisation to conduct insurance activities. Where a foreign insurer may be allowed to operate through a branch or cross-border provision of services without a licence or other authorisation from the host supervisor, it is important that bilateral or multilateral agreements are in place which ensure that the insurer:

- is subject to supervision in its home jurisdiction which has been recognised as adequate by the host jurisdiction; and
may be subject to sanction or other supervisory measures if it does not meet the legal provisions of the host jurisdiction. In such circumstances, the home supervisor should be informed.

4.3 Licensing requirements and procedures are clear, objective and public, and are consistently applied. The applicant is required at least to:

- have sound business and financial plans;
- have a corporate or group structure that does not hinder effective supervision;
- establish that the applicant’s Board Members, both individually and collectively, Senior Management, Key Persons in Control Functions and Significant Owners are suitable;
- have an appropriate governance framework; and
- satisfy capital requirements.

4.3.1 In addition to being publicly available, licensing requirements should also be easily accessible. Supervisors should issue guidelines on how to file an application for a licence, which include advice on the required format of documents and the expected time it would take to process an application upon the receipt of all relevant documents.

4.3.2 Supervisors should assess the applicant’s business and financial plans to ascertain that the proposed business lines will be soundly managed and adequately capitalised. Business and financial plans should be projected for a minimum of three years by the applicant and include information such as the products to be offered, distribution methods and channels to be used, risk profile, projected setting-up and development costs by business line, capital requirements and solvency margins. Information regarding insurance and reinsurance should also be provided.

4.3.3 Where the applicant is part of a group, the applicant should submit its corporate and group structure, indicating all of the material entities within the group (including both insurance legal entities and other entities, including non-regulated entities). Information on the type of related party transactions and/or relationships between all material entities within the group should also be provided.

4.3.4 The applicant should also provide information to demonstrate the appropriateness of its systems of risk management and internal controls, including contracts with affiliates, outsourcing arrangements, information technology systems, policies and processes.

4.3.5 If applying to be licensed to underwrite both life insurance business and non-life insurance business (where such is allowed), the applicant should demonstrate to the satisfaction of the supervisor that its systems of risk management and internal controls are adequate to manage the risks separately for each business stream.

4.3.6 Further guidance on suitability, governance and capital requirements can be found in ICP 5 (Suitability of Persons), ICP 7 (Corporate Governance), ICP 8 (Risk Management and Internal Controls) and ICP 17 (Capital Adequacy).
Requirements on the supervisor

4.4 The supervisor assesses applications, makes decisions and informs applicants of the decision within a reasonable time, which is clearly specified, and without undue delay.

4.4.1 The supervisor should require a legal entity to submit an application if it proposes to conduct insurance activities. The application should include information on the types of business to be written and contain all the documents and information required by the legislation to confirm that the licensing requirements are met.

4.4.2 In instances where the application is deemed not complete, the supervisor should inform the applicant without delay, and the applicant should be given the opportunity to provide additional information to complete the application.

4.4.3 In assessing the application, the supervisor could rely on audits by external bodies, actuarial reports, or in the case of branches or foreign subsidiaries on the opinion of other supervisors. Supervisors should consider the reports or opinions from these various sources carefully and apply their own judgment in making the final decision on the application. Before placing reliance on reports from external auditors or actuaries, supervisors should consider:

- whether the external auditors and actuaries have the necessary expertise and experience to perform the roles; and
- their independence from the legal entity and the consideration they give to the protection of policyholders’ interests.

4.4.4 The supervisor should make its assessment and finalise its decision within a reasonable timeframe and without undue delay. A time period should be indicated to the applicant for the assessment procedure, commencing from the date on which all complete application documentation has been submitted to the supervisor. Within this period, the supervisor should decide on the acceptability of the application for a licence. However, this does not preclude the supervisor from conducting additional due diligence if necessary. If the supervisor has not come to a decision within the indicated timeframe and the licence cannot be granted, the supervisor should communicate the reason for the delay to the applicant.

4.5 The supervisor refuses to issue a licence where the applicant does not meet the licensing requirements. Where the supervisor issues a licence, it imposes additional requirements, conditions or restrictions on an applicant where appropriate. If the licence is denied, conditional or restricted, the applicant is provided with an explanation.

4.5.1 In general, requirements, conditions or restrictions that are imposed on an applicant at the point of issue of the licence deal with the scope of activities that an insurance legal entity is permitted to conduct or the nature of its customers (eg retail versus sophisticated customers). If necessary, the supervisor should impose additional requirements, conditions or restrictions on an applicant not only at the point of issue of the licence, but also as part of its ongoing supervision of the insurance
legal entity (see ICP 9 (Supervisory Review and Reporting) and ICP 10 (Preventive Measures, Corrective Measures and Sanctions).

4.5.2 The denial of a licence or conditions or restrictions on a licence should be confirmed in writing to the applicant. The explanation should be provided to the applicant in a transparent manner. Supervisors should convey their concerns with regard to an applicant's proposed insurance activities and explain the reasons for imposing licensing conditions or restrictions.

4.6 A licence clearly states its scope.

4.6.1 A licence should clearly state the classification of insurance activities that the insurance legal entity is licensed to conduct. Regarding classification, legislation should categorise insurance business into types and classes of insurance (at least into life and non-life).

4.6.2 Before adding new classes of insurance to the list of classes already granted to the insurance legal entity, the supervisor should consider all of the above mentioned licensing requirements, as applicable.

4.7 The supervisor publishes a complete list of licensed insurance legal entities and the scope of the licences granted.

4.7.1 The supervisor should publish the complete list of licensed insurance legal entities and clearly state the scope of licence that has been granted to each insurance legal entity. This would provide clarity to the public as to which entities are licensed for specific classes of business.

4.7.2 If the conditions or restrictions to the license would impact the public or any person dealing with the insurance legal entity, the supervisor should either publish these conditions or restrictions or require the insurance legal entity to disclose these conditions or restrictions accordingly. Conditions or restrictions that would impact the public could include, for example, the lines or classes of insurance business an insurance legal entity is permitted to conduct.

Foreign operations

4.8 In deciding whether and if so on what basis, to license or continue to license a branch or subsidiary of a foreign insurer in its jurisdiction, the supervisor consults the relevant supervisor(s) as necessary.

4.8.1 As part of the consultation, supervisors should use the modes available for supervisory cooperation, in particular, the ability to exchange information relevant for the application (eg check of suitability of directors and owners) with domestic or foreign authorities. The exchange of information may be governed by law, agreement or memorandum of understanding, especially if the information is deemed confidential. Having such arrangements in place is important so as to not unduly delay the processing of an application.

4.8.2 Before making a decision to grant the licence, the host supervisor should have an understanding of how the home supervisor supervises the insurer on an ongoing basis.

4.8.3 Host supervisors should consult home supervisors on relevant aspects of any licensing proposal, but in any event they should always consider
checking that the home supervisor of the insurance legal entity has no objection before granting a licence. The home supervisor should assess the risks posed to the insurer of establishing an insurance legal entity in a foreign jurisdiction and highlight any material reservations or concerns to the host supervisor as soon as practicable. The host supervisor should inform the home supervisor of the scope of the licence, including any restrictions or prohibitions imposed on the licence.

4.8.4 Host supervisors should reject applications for a licence from foreign entities which are not subject to regulation and supervision in the home jurisdiction. In the case of joint ventures, if there is lack of clear parental responsibility, the supervisor should reject such applications.

4.9 Where an insurance legal entity is seeking to conduct cross-border insurance activities without a physical presence in the jurisdiction of the host supervisor, the host supervisor concerned consults the home supervisor, as necessary, before allowing such activities.

4.9.1 Jurisdictions or regions may have a system or cooperation agreements in place whereby such consultation is not necessary or required.

4.9.2 Information exchanged as part of a consultation should include:

- confirmation from the home supervisor that the insurance legal entity is authorised to conduct the proposed types of insurance activities; and
- confirmation from the home supervisor that the insurance legal entity meets all the insurance regulatory requirements in the home jurisdiction.
ICP 5  

Suitability of Persons

The supervisor requires Board Members, Senior Management, Key Persons in Control Functions and Significant Owners of an insurer to be and remain suitable to fulfil their respective roles.

5.1 Legislation identifies which persons are required to meet suitability requirements. The legislation includes at least Board Members, Senior Management, Key Persons in Control Functions and Significant Owners.

5.1.1 Suitability requirements may extend to other individuals (eg financial controllers and treasurers) to account for the roles of such individuals that may differ depending on the jurisdiction and the legal form and governance structure of the insurer.

5.2 The supervisor requires that in order to be suitable to fulfil their roles:

- Board Members (individually and collectively), Senior Management and Key Persons in Control Functions possess competence and integrity; and
- Significant Owners possess the necessary financial soundness and integrity.

Suitability requirements for Board Members, Senior Management and Key Persons in Control Functions

5.2.1 Competence is demonstrated generally through the level of an individual’s professional or formal qualifications and knowledge, skills and pertinent experience within the insurance and financial industries or other businesses. Competence also includes having the appropriate level of commitment to perform the role. Refer to ICP 7 (Corporate Governance) with regard to competence and commitment and to ICP 8 (Risk Management and Internal Controls) with regard to control functions.

5.2.2 Integrity is demonstrated generally through character, personal behaviour and business conduct.

5.2.3 The supervisor should require the insurer to take the necessary measures to ensure that these requirements are met by setting high internal standards of ethics and integrity, promoting sound corporate governance and requiring that these individuals have pertinent experience, and maintain a sufficient degree of knowledge and decision making ability.

5.2.4 To ensure an appropriate level of suitability, Board Members, Senior Management and Key Persons in Control Functions should acquire, maintain and enhance their knowledge and skills to fulfil their roles, for example, by participating in induction and ongoing training on relevant issues. Sufficient time, budget and other resources should be dedicated for this purpose, including external expertise drawn upon as needed. More extensive efforts should be made to train those with more limited financial, regulatory or risk-related experience.
CF 5.2.a The group-wide supervisor requires the IAIG Board Members (individually and collectively), Senior Management, and Key Persons in Control Functions, to have the necessary competence to fulfil their role, taking into account the complexity and international nature of the IAIG, any specific features of the jurisdictions where the IAIG operates, and the risks to which it is exposed.

CF 5.2.a.1 Appropriate competencies include, for example, knowledge of and experience with international business and processes, as well as with different business models.

Suitability requirements for Significant Owners

5.2.5 The necessary qualities of a Significant Owner relate at least to:

- financial soundness demonstrated by sources of financing/funding and future access to capital; and
- integrity demonstrated in personal or corporate behaviour.

5.3 The supervisor requires the insurer to demonstrate initially and on an ongoing basis, the suitability of Board Members, Senior Management, Key Persons in Control Functions and Significant Owners. The suitability requirements and the extent of review required by the supervisor depend on the person's role.

5.3.1 The supervisor should assess the suitability of Board Members, Senior Management, Key Persons in Control Functions and Significant Owners of an insurance legal entity as part of the licensing procedure before the insurance legal entity is permitted to operate (see ICP 4 Licensing).

5.3.2 The supervisor should assess the suitability of Board Members, Senior Management, Key Persons in Control Functions and Significant Owners of insurers either prior to changes in the positions or as soon as possible after appointment. The supervisor should also require the insurer to perform internal suitability assessments of Board Members, Senior Management and Key Persons in Control Functions on an ongoing basis, for example on an annual basis or when there are changes in the circumstances of the individuals. The supervisor may require the insurer to certify that it has conducted such assessments and demonstrate how it reached its conclusions.

5.3.3 With regard to Control Functions, the individual(s) to be assessed should be the Key Persons in Control Functions.

5.3.4 The supervisor should have sufficient and appropriate information to assess whether an individual meets suitability requirements. The information to be collected and the supervisor’s assessment of such information may differ depending on the role.

5.3.5 For the purpose of the assessment, the supervisor should require the submission of a résumé or similar indicating the professional qualifications as well as previous and current positions and experience of the individual and any information necessary to assist in the assessment, such as:
• evidence that the individual has sufficient relevant knowledge and pertinent experience within the insurance and financial industries or other businesses; and
• evidence that the individual has the appropriate level of commitment to perform the role.

5.3.6 The application of suitability requirements relating to competence for Board Members, Senior Management and Key Persons in Control Functions of an insurer may vary depending on the degree of their influence and on their roles. It is recognised that an individual considered competent for a particular position within an insurer may not be considered competent for another position with different responsibilities or for a similar position within another insurer. When assessing the competence of the Board Members, regard should be given to respective duties allocated to individual members to ensure appropriate diversity of qualities and to the effective functioning of the Board as a whole.

5.3.7 In assessing the integrity of an individual Board Member, Senior Management, Key Person in Control Functions and Significant Owner, the supervisor should consider a variety of indicators such as:

• Legal indicators: These provide information on possible legal misconduct. Such indicators could include civil liability, criminal convictions or pending proceedings:
  o for breaches of law designed to protect members of the public from financial loss, eg dishonesty, or misappropriation of assets, embezzlement and other fraud or other criminal offences (including anti-money laundering and the combating of the financing of terrorism.
  o against the individual in his/her personal capacity;
  o against a legal entity in which the individual is or was a Board Member, a member of the Senior Management, a Key Person in Control Functions or a Significant Owner; or
  o incurred by the individual as a consequence of unpaid debts.

• Financial indicators: These provide information on possible financial misconduct, improper conduct in financial accounting, or negligence in decision-making. Such indicators could include:
  o financial problems or bankruptcy in his/her private capacity; or
  o financial problems, bankruptcy or insolvency proceedings of a legal entity in which the individual is or was a Board Member, a member of the Senior Management or a Key Person in Control Functions.

• Supervisory indicators: These provide information gathered by or that comes to the attention of supervisors in the performance of their supervisory duties. These supervisors could also be authorities with supervisory responsibility in sectors other than insurance. Such indicators could include:
the withholding of information from public authorities or submission of incorrect financial or other statements;

- conduct of business transgressions;

- prior refusal of regulatory approval for key positions;

- preventive or corrective measures imposed (or pending) on entities in which the individual is or was a Board Member, a member of the Senior Management, or a Key Person in Control Functions; or

- outcome of previous assessments of suitability of an individual, or sanctions or disciplinary actions taken (or pending) against that individual by another supervisor.

- Other indicators: These may provide other information that could reasonably be considered material for the assessment of the suitability of an individual. Examples include:

  - suspension, dismissal or disqualification of the individual from a position as a Board Member or a member of the Senior Management of any company or organisation;

  - disputes with previous employers concerning incorrect fulfilment of responsibilities or non-compliance with internal policies, including code of conduct, employment law or contract law;

  - disciplinary action or measures taken against an individual by a professional organisation in which the individual is or was a member (e.g., actuaries, accountants or lawyers); or

  - strength of character, such as the ability and willingness to challenge, as an indicator of a person’s integrity as well as competence to perform the respective role.

The presence of any one indicator may, but need not in and of itself, determine a person’s suitability. All relevant indicators, such as the pattern of behaviour, should be considered in a suitability assessment. Consideration should also be taken to the lapse of time since a particular indicator occurred and its severity, as well as the person’s subsequent conduct.

5.3.8 For Significant Owners, the supervisor sets out minimum standards of financial soundness. If the Significant Owner that is to be assessed is a legal person or a corporate entity, the supervisor should collect sufficient and appropriate information such as:

- the nature and scope of its business;

- its ownership structure, where relevant;

- its source of finance/funding and future access to capital;

- the group structure, if applicable, and organisation chart; and

- other relevant factors.

5.3.9 In determining the financial soundness of Significant Owners, the supervisor should assess their source of financing/funding and future
access to capital. To do so, the supervisor may consider financial indicators such as:

- Financial statements and exhibits. If the Significant Owner is a legal person, financial statements may include annual financial statements; for a natural person, it may include financial information (such as tax accounts or personal wealth statements) that are reviewed by an independent public accountant; and

- Transactions and agreements such as: loans; investments; purchase, sale or exchange of securities or other assets; dividends and other distributions to shareholders; management agreements and service contracts; and tax allocation agreements.

5.3.10 Additionally the supervisor should also consider matters such as, whether:

- Significant Owners understand their role as potential future sources of capital, if needed;
- there are any indicators that Significant Owners will not be able to meet their debts as they fall due;
- appropriate prudential solvency requirements are met if the Significant Owner is a financial institution;
- Significant Owners have been subject to any legally valid judgment, debt or order that remains outstanding or has not been satisfied within a reasonable period;
- Significant Owners have made arrangements with creditors, filed for bankruptcy or been adjudged bankrupt or had assets sequestered; and
- Significant Owners have been able to provide the supervisor with a satisfactory credit reference.

The presence of any one indicator may, but need not in and of itself, determine a person’s suitability. All relevant indicators, such as the pattern of behaviour, should be considered in a suitability assessment. If the Significant Owner is regulated by another supervisor, the suitability assessment done by the latter may be relied upon to the extent that this assessment reasonably meets the requirements of this standard.

5.4 The supervisor requires notification by insurers of any changes in Board Members, Senior Management, Key persons in Control Functions and Significant Owners, and of any circumstances that may materially adversely affect the suitability of its Board Members, Senior Management, Key Persons in Control Functions and Significant Owners.

5.4.1 Insurers should be required to report promptly any information gained about these persons that may materially affect their suitability, for example, if a Board Member is convicted of a financial crime. See guidance under Standard 5.3 for additional examples of indicators of circumstances that may materially affect the suitability of an individual.
5.5 The supervisor takes appropriate action to rectify the situation when Board Members, Senior Management and Key Persons in Control Functions or Significant Owners no longer meet suitability requirements.

5.5.1 The supervisor should impose measures in respect of Board Members, Senior Management and Key Persons in Control Functions who do not meet the suitability requirements. Examples of such measures include:

- requesting the insurer to provide additional education, coaching or the use of external resources in order to achieve compliance with suitability requirements by an individual in a position as Board Member, member of the Senior Management or Key Person in Control Functions;
- preventing, delaying or revoking appointment of an individual in a position as Board Member, member of the Senior Management or Key Person in Control Functions;
- suspending, dismissing or disqualifying an individual in a position as a Board Member, Senior Management or Key Person in Control Function, either directly or by ordering the insurer to take these measures;
- requiring the insurer to appoint a different person for the position in question who does meet the suitability requirements, to reinforce the sound and proper management and control of the insurer;
- imposing additional reporting requirements and increasing solvency monitoring activities; or
- withdrawing or imposing conditions on the business licence, especially in the case of a major breach of suitability requirements, taking into account the impact of the breach or the number of members of the Board, Senior Management or Key Persons in Control Functions involved.

5.5.2 The supervisor should impose measures of a preventive and corrective nature in respect of Significant Owners who do not meet suitability requirements. Examples of such measures include:

- requiring the Significant Owners to dispose of their interests in the insurer within a prescribed period of time;
- the suspension of the exercise of their corresponding voting rights; or
- the nullification or annulment of any votes cast by the Significant Owners.

5.5.3 There can be circumstances where a Board Member, a member of the Senior Management or a Key Person in Control Functions is unable to carry out his/her role and a replacement needs to be appointed on short notice. In jurisdictions where the supervisor approves the post-licensing appointment of Board Members, Senior Management or Key Persons in Control Functions, it may be appropriate for the supervisor to permit the post to be filled temporarily until the successor’s suitability assessment is affirmed. In such circumstances, a supervisor may require that these
temporary replacements meet certain suitability requirements, depending on his/her position or responsibilities within the insurer. However, such assessment should be conducted and concluded in a timely manner.

5.6 The supervisor exchanges information with other authorities inside and outside its jurisdiction where necessary to check the suitability of Board Members, Senior Management, Key Persons in Control Functions and Significant Owners of an insurer.

5.6.1 Supervisors should use the modes available for supervisory cooperation, in particular, the ability to exchange information relevant to check suitability with domestic or foreign authorities. Having such arrangements in place is important so as to not unduly delay relevant supervisory processes and/or affect the insurers’ ability to satisfy composition requirements for the Board or make necessary changes to its management team (see ICP 3 Information Sharing and Confidentiality Requirements).

5.6.2 The supervisor may use this information as an additional tool to assess effectively the suitability of, or to obtain information about, a Board Member, a member of the Senior Management or a Key Person in Control Functions.

5.6.3 If a Significant Owner that is to be assessed is a legal person or a corporate entity regulated in another jurisdiction, the supervisor should seek confirmation from the relevant authority that the entity is in good standing in that other jurisdiction.
ICP 6  
Change of Control and Portfolio Transfers

The supervisor assesses and decides on proposals:

- to acquire significant ownership of, or an interest in, an insurer that results in a person (legal or natural), directly or indirectly, alone or with an associate, exercising control over the insurer; and
- for portfolio transfers.

**Introductory Guidance**

6.0.1 The supervision of change of control and portfolio transfers supports supervisory objectives, in particular:

- licensing regimes are not undermined by control being obtained or retained by those who would not get a licence ordinarily; and
- insurers should continue to be held in corporate or other arrangements that allow them to be effectively supervised.

6.0.2 To assist in understanding the content of this ICP, it is emphasised that:

- change of control extends beyond the immediate controlling interest, such as the ownership of equity in an insurer, and includes other actions that have the potential to change the exercise of control over the insurer;
- change of control is relevant, both at the insurance legal entity and intermediate and ultimate beneficial owner levels;
- change of control may take place in a variety of forms, such as mergers, acquisitions or (de)mutualisations;
- control includes the exercise of influence over decisions such as those on strategic, operating, investing and financing policies of an insurer. It may also include the power to appoint or remove members, or otherwise influence the composition of, the Board or of Board committees;
- control may be exercised by a person individually, or acting in concert with associates or others, and directly or indirectly through corporate structures or other mechanisms; and
- significant owners and the transactions that determine or change control may be outside of a jurisdiction, but the impact on the ultimate control of the insurer in that jurisdiction means that they remain relevant to effective supervision of control.

6.0.3 Supervisory requirements and practices regarding change of control and portfolio transfers may vary, taking into account the nature, scale and complexity of the transactions and the risk posed to achievement of supervisory objectives. For example, portfolio transfers between reinsurers, internal restructuring transactions within a group that does not change the ultimate beneficial ownership of the entity, and demutualisation, are different types of transactions. Their nature may
warrant different supervisory approaches and/or different levels of intensity of supervision.

6.0.4 There may be transactions where a portfolio transfer or a change of control is cross-border in nature. In such cases, the supervisor should coordinate and exchange information with the relevant supervisors (see ICP 3 Information Sharing and Confidentiality Requirements and ICP 25 Supervisory Cooperation and Coordination).

**Change of Control**

6.1 Legislation addresses change of control of insurers, including:

- having a definition of control; and
- oversight and enforcement of requirements related to change of control.

6.1.1 The definition of "control" should address, at least:

- holding of a defined number or percentage of issued shares or financial instruments above a designated threshold in an insurer or its intermediate or ultimate beneficial owner or the head of the insurance group or head of the financial conglomerate as may be the case; and/or
- having a defined percentage of voting rights attached to shares or financial instruments.

6.1.2 Financial instruments other than shares that should be of interest to the supervisor are those that have the potential to impact the levels of control over an insurer, including those that may convert in the future into an interest that leads to a change of control through that conversion.

6.1.3 The definition of a threshold for control is not necessarily the same as the definition that may apply for accounting consolidation or other purposes.

6.2 The supervisor requires the insurer to provide notification of a proposed change of control of the insurer. The supervisor assesses and decides on proposals for change of control.

**Notification**

6.2.1 The supervisor should require notification of proposals that would lead to increased (or decreased) control.

6.2.2 The supervisor should establish thresholds for notification. Such thresholds may improve transparency and compliance with related requirements while avoiding immaterial notifications. The supervisor typically establishes lower thresholds (such as between 5 and 10 percent) for initial notification of acquiring control, and a higher percentage for approval and for increased control also requiring approval.

6.2.3 The supervisor may also be informed by notifications made to other authorities such as corporate law supervisors or under rules for publicly traded companies.
6.2.4 Notifications should be submitted to the supervisor in a reasonable time. Changes that arise because of actions of the insurer should be subject to advance notification. Actions of others are usually made “subject to” relevant approvals so are not effective until approved.

Assessment

6.2.5 The supervisor should assess both actions that lead to new controlling interests and those that lead to material increases in existing controlling interests. Material increases may arise, for example, when existing significant owners increase their interest, when associates increase their interest, or when a significant owner acquires a new associate who has a plan to acquire an interest (directly or indirectly) in the insurer.

6.2.6 The supervisor should obtain the information necessary to assess the change of control. The supervisor may seek such information from the insurer, its significant owners, shareholders or other relevant persons. The information obtained should be proportionate to the complexity of the change of control. Regardless, the supervisor should have sufficient information to understand the impact of the change of control on the insurer and be able to identify the ultimate beneficial owner.

6.2.7 When considering whether to approve a change of control that leads to a new significant owner, the supervisor should verify that the approval would not lead to a control arrangement that would not have been approved as part of the jurisdiction’s licensing requirements in similar circumstances (see ICP 4 Licensing).

6.2.8 The supervisor should assess whether a new significant owner is suitable to fulfil its role. A significant owner should possess at least the necessary qualities relating to financial soundness and integrity (see ICP 5 Suitability of Persons).

6.2.9 The supervisor should be able to deny a change of control when, for example, it would be prejudicial to the interests of policyholders, the resulting structure would not allow for effective supervision, or the ultimate beneficial owner cannot be identified.

(De)Mutualisation

6.3 A change of a mutual company to a stock company, or vice versa, is subject to the supervisor’s approval.

6.3.1 In jurisdictions where mutual ownership of insurers is possible, legislation should provide a process for mutual insurers to demutualise at their own discretion or if directed to do so by the supervisor.

6.3.2 The process for (de)mutilisation may vary by jurisdiction. For example, the ultimate approval may be provided by authorities other than the supervisor, such as courts or votes of member policyholders. Regardless, the supervisor should be consulted and should have the right to object to a (de)mutilisation.

6.3.3 In assessing a (de)mutilisation, the supervisor should consider the impact on the financial condition of the insurer and the ongoing expectations of policyholders, including those that will continue as participating policyholders. The supervisor should also assess whether
the new governing organisational document of the company adequately protects current and future policyholders.

**Portfolio Transfer**

6.4 The supervisor assesses and decides on the transfer of all or a part of an insurer's business portfolio taking into account at least the financial condition of the transferee and the transferor and whether the interests of the policyholders of both the transferee and transferor will be protected.

6.4.1 Insurance policies are legal contracts between an insurer and its policyholders. As such, an insurer should not be able unilaterally to alter the terms of a contract by merging with another insurer, (de)mutualising, or transferring some of its business to another insurer.

6.4.2 In order to protect the interests of policyholders and to safeguard the financial condition of the insurers involved, legislation should address the conditions for a portfolio transfer. Policyholders' benefit expectations and existing policy values should not normally be lessened as a result of a portfolio transfer.

6.4.3 The process for a portfolio transfer may vary by jurisdiction. For example, the ultimate approval may be provided by authorities other than the supervisor, such as courts. Regardless, the supervisor should be consulted and should have the right to object to a portfolio transfer.

6.4.4 When assessing a transfer, the supervisor should consider the impact on the transferring policyholders, as well as on those that are not transferring, and those that are current policyholders of the company to which the policyholders are being transferred. This should apply whether the portfolio transfer is considered a part of normal business, a merger or part of a resolution where the insurer is no longer viable (see ICP 12 Exit from the Market and Resolution).
ICP 7  Corporate Governance
The supervisor requires insurers to establish and implement a corporate governance framework which provides for sound and prudent management and oversight of the insurer’s business and adequately recognises and protects the interests of policyholders.

Introductory Guidance
7.0.1 The corporate governance framework of an insurer:
- promotes the development, implementation and effective oversight of policies that clearly define and support the objectives of the insurer;
- defines the roles and responsibilities of persons accountable for the management and oversight of an insurer by clarifying who possesses legal duties and powers to act on behalf of the insurer and under which circumstances;
- sets requirements relating to how decisions and actions are taken including documentation of significant or material decisions, along with their rationale;
- provides sound remuneration practices which promote the alignment of remuneration policies with the long term interests of insurers to avoid excessive risk taking;
- provides for communicating with the supervisor, as appropriate, matters relating to the management and oversight of the insurer; and
- provides for corrective actions to be taken for non-compliance or weak oversight, controls or management.

7.0.2 An effective corporate governance framework enables an insurer to be flexible and transparent; to be responsive to developments affecting its operations in making timely decisions and to ensure that powers are not unduly concentrated. The corporate governance framework supports and enhances the ability of the key players responsible for an insurer’s corporate governance; ie the Board, Senior Management and Key Persons in Control Functions to manage the insurer's business soundly and prudently.

Organisational structures
7.0.3 The insurer should establish a transparent organisational structure which supports the strategic objectives and operations of the insurer. The Board and Senior Management should know and understand the structure and the risks that it poses.

The ways in which an insurer chooses to organise and structure itself can vary depending on a number of factors such as:
• jurisdictional corporate law, which may allow or require different Board structures (such as one-tier or two-tier Boards);
• organisational structure such as stock companies, mutuals or co-operatives; and
• group, branches, or solo legal entity operations.

These considerations can affect how an insurer establishes and implements its corporate governance framework and are explained in more detail below. It is important for supervisors to understand these different considerations in order to be able to adequately assess the effectiveness of an insurer’s corporate governance framework.

| CF 7.0.a | The group-wide supervisor requires the Head of the IAIG to document the legal and management structures of, and inter-relationships within, the IAIG to enable an understanding of its structure to help identify risks and how they are managed. |
| CF 7.0.a.1 | The documentation should mainly support the IAIG Board and Senior Management in discharging their responsibilities, but can also be useful for the group-wide supervisor. |
| CF 7.0.a.2 | The documentation covers legal entities within the IAIG and, where relevant, the wider group of which the IAIG is part, and includes items such as: |
| | • home jurisdiction of the Head of the IAIG; |
| | • the jurisdictions of legal entities within the IAIG, including branches; |
| | • off-balance sheet entities; |
| | • materiality of legal entities or business lines within the IAIG; |
| | • financial ties (such as commercial contracts) and non-financial ties (such as common directors); |
| | • details of the shareholding structure and significant shareholdings, including controlling shareholders; |
| | • governance structure, including Boards and their committee structure and key responsibilities; and |
| | • management structure, including the division of authority and decision making between business line management, local management, and Board oversight. |

7.0.4 The standards on corporate governance are designed with sufficient flexibility to apply to supervision of insurers regardless of any differences in the corporate structures and legal systems.

7.0.5 The term Board includes its management and oversight roles, regardless of Board structure.

Mutuals and co-operatives

7.0.6 Governance of insurers formed as mutuals or co-operatives is different from that of insurers formed as joint stock companies (ie, bodies
corporate). These standards are nevertheless sufficiently flexible to be adapted to mutuals and co-operatives to promote the alignment of actions and interests of the Board and Senior Management with the broader interests of policyholders. Where there are references to shareholders or stakeholders, they should be generally treated as references to policyholders in mutuals, unless otherwise indicated.

**Insurance Groups**

7.0.7 Insurance groups should ensure that the corporate governance framework is appropriate to the structure, business and risks of the insurance group and its legal entities. The corporate governance framework should include policies, processes and controls which address risks across the insurance group and legal entities, and clear reporting lines between the head of the group and the legal entities within the group.

7.0.8 When setting up or monitoring their corporate governance framework, insurance groups should evaluate the specific challenges which may arise from the organisational model adopted by a group (e.g. more centralised or more decentralised model). The main factors underlying the challenges are:

- the division of authorities and responsibilities between the key players at the insurance group and legal entity level;
- effective group-wide direction and coordination;
- proper consideration of the legal obligations, governance responsibilities and risks both at the insurance group and legal entity level; and
- effective communication within the group and adequate information at all levels (see Issues Paper on Approaches to Group Corporate Governance; Impact on Control Functions).

7.0.9 The supervisor should take the organisational structure of the group into consideration in evaluating its governance. Particularly when the management structure differs from the legal entity structure, it is not sufficient to assess governance only at the legal entity level. In such a case, it is important that appropriate governance exists across the group and that the supervisor assesses it on a group-wide basis.

| CF 7.0.b | The group-wide supervisor requires the Head of the IAIG to ensure that the group-wide corporate governance framework is appropriate to the structure, business and risks of the IAIG including its legal entities. |
| CF 7.0.c | The group-wide supervisor requires the Head of the IAIG to establish clear reporting lines between the legal entities within the IAIG and the Head of the IAIG. |

**Branch operations**

7.0.10 If an insurer is a branch, these standards would generally apply to the legal entity in its home jurisdiction. However, the host supervisor may require designated oversight and/or management accountabilities and structures to be maintained at the branch, including in some cases a
designated representative responsible for the management of the branch. In such cases, these standards should also apply, as appropriate, to the oversight and management roles maintained within the branch taking due account of the governance structures and arrangements as determined by the host supervisor.

**Appropriate allocation of oversight and management responsibilities**

7.1 The supervisor requires the insurer’s Board to:

- ensure that the roles and responsibilities allocated to the Board, Senior Management and Key Persons in Control Functions are clearly defined so as to promote an appropriate separation of the oversight function from the management responsibilities; and

- provide oversight of the Senior Management.

7.1.1 The Board should ensure that the insurer has a well-defined governance structure which provides for the effective separation between oversight and management functions. The Board is responsible for providing the overall strategy and direction for the insurer and overseeing its proper overall management, while leaving the day-to-day management of the insurer to Senior Management. The separation of the roles of the Chair of the Board and the Chief Executive Officer (CEO) reinforces a clear distinction between accountability for oversight and management.

7.1.2 The Board should also ensure that there is a clear allocation of roles and responsibilities to the Board as a whole, to committees of the Board where they exist, and to the Senior Management and Key Persons in Control Functions to ensure proper oversight and sound management of the insurer. The allocation of roles and responsibilities should clearly identify the individual and collective accountabilities for the discharge of the respective roles and responsibilities. The organisational structure of the insurer and the assignment of responsibilities should enable the Board and Senior Management to carry out their roles in an adequate and objective manner and should facilitate effective decision making.

7.1.3 The allocation of responsibilities to individual Board Members (for example the membership of Board committees such as the audit or remuneration committee) should take due account of whether the relevant member has the degree of independence and objectivity required to carry out the functions of the particular committee. The effective oversight of the executive functions should be performed by the non-executive members of the Board, because they are not involved in the day-to-day management of the insurer. Within a group the allocation and division of the oversight and management responsibilities at different levels should be transparent, appropriate for, and aligned with, the organisational model of the group. Where individuals undertake functions for more than one legal entity within a group, the group should have in place appropriate measures so that conflicts of interest between the different roles to be performed by such individuals are avoided, or where such conflicts cannot be avoided, they should be managed.

7.1.4 In order to provide effective oversight of the Senior Management, the Board should:
• ensure that there are adequate policies and processes relating to the appointment, dismissal and succession of the Senior Management, and be actively involved in such processes;

• ensure that Senior Management’s knowledge and expertise remain appropriate given the nature of the business and the insurer’s risk profile;

• monitor whether the Senior Management is managing the affairs of the insurer in accordance with the strategies and policies set by the Board, and the insurer’s risk appetite, corporate values and corporate culture;

• set appropriate performance and remuneration standards for Senior Management consistent with the long-term strategy and the financial soundness of the insurer and monitor whether the Senior Management is meeting the performance goals set by the Board;

• regularly meet with the Senior Management to discuss and review critically the decisions made, information provided and any explanations given by the Senior Management relating to the business and operations of the insurer; and

• have regular interaction with any committee it establishes as well as with other key functions, proactively request information from them and challenge that information when necessary.

7.1.5 As a part of its regular monitoring and review of the insurer’s operations, the Board should review whether the relevant policies and processes, as set by the Board, are being properly implemented by Senior Management and are operating as intended. Particular attention should be paid as to whether the responsibilities for managing and implementing the policies of the Board have been effectively discharged by those responsible. The Board should obtain reports at least annually for this purpose and such reports may include internal or external independent reports as appropriate.

CF 7.1.a The group-wide supervisor requires the IAIG Board to establish a well-defined group-wide governance structure, which promotes effective oversight of the group-wide operations independent of day-to-day management.

Corporate culture, business objectives and strategies of the insurer

7.2 The supervisor requires the insurer’s Board to set and oversee the implementation of the insurer’s corporate culture, business objectives and strategies for achieving those objectives, in line with the insurer’s long term interests and viability.

7.2.1 The Board should adopt a rigorous process for setting, approving, and overseeing the implementation of the insurer’s overall business objectives and strategies, taking into account the long term financial safety and soundness of the insurer as a whole, the interests of its
policyholders and other stakeholders, and the fair treatment of customers. The Board ensures that the Senior Management has adequately documented and communicated these objectives and strategies to the Key Persons in Control Functions and all other relevant staff.

7.2.2 The effective implementation of objectives and strategies should be supported by the corporate culture and by clear and objective performance goals and measures, taking due account of, among other things, the insurer’s long term interests and viability and the interests of policyholders and other stakeholders. The Board should review the appropriateness of the goals and measures set.

7.2.3 A corporate culture reflects the fundamental corporate values and includes norms for responsible and ethical behaviour applicable to all employees of the insurer. The Board should take the lead in setting the appropriate tone at the top. This includes adherence to the corporate values by the Board and a strong risk culture avoiding excessive risk taking. The corporate values, norms and supporting policies should be communicated throughout the insurer. These are also reflected in the insurer’s business objectives and strategies, and supported by professional standards and codes of ethics that set out what the insurer considers to be acceptable and unacceptable conduct. In this regard, the Board should take account of the interests of policyholders and other relevant stakeholders. In setting the tone at the top the Board should ensure that employees are aware that appropriate disciplinary or other actions will follow unacceptable behaviours.

7.2.4 The Board should ensure that the corporate culture promotes timely and frank discussion and escalation of problems to Senior Management or itself. The Board should set and oversee the implementation of transparent policies and processes which promote and facilitate that employees can communicate concerns or information about illegal or unethical behaviour confidentially and without reprisal directly or indirectly to the Board (e.g. whistle blower policy). The Board should determine how and by whom legitimate concerns shall be investigated and addressed (Senior Management, Board or an external party).

7.2.5 The Board should define and oversee the implementation of norms for responsible and ethical behaviour. It should not allow behaviour that would be incompatible with the protection of policyholders and that could lead to reputational risks or improper or illegal activity, such as financial misreporting, fraud, money laundering, bribery and corruption. The norms for responsible and ethical behaviour should also make clear that employees are expected to conduct themselves ethically in addition to complying with laws, regulations and the insurer’s policies.

7.2.6 The Board should ensure that the insurer’s corporate governance framework and overall business objectives and strategies are reviewed at least annually to ensure that they have been properly implemented and that they remain appropriate in light of any material changes in the organisational structure, activities, strategy, and regulatory and other external factors. The Board should ensure more frequent reviews, for instance when an insurer embarks on a significant new business initiative (e.g. a merger or acquisition, or a material change in the direction
with respect to the insurer’s product portfolio, risk or marketing strategies), upon the introduction of a new type or class of risk or product or a decision to market products to a new class or category of clients, or following the occurrence of significant external or internal events which may potentially have a material impact on the insurer (including its financial condition, objectives and strategies) or the interests of its policyholders or other stakeholders.

**CF 7.2.a** The group-wide supervisor requires the IAIG Board to ensure that the group-wide business objectives, and strategies for achieving those objectives, take into account at least the following:

- applicable laws and regulations of, and the risks which may arise from doing business in, the jurisdictions in which the IAIG operates;
- long term financial safety and soundness of the IAIG;
- the interests of policyholders and other stakeholders;
- fair treatment of customers; and
- the interests and objectives of the insurance legal entities within the IAIG.

**CF 7.2.a.1** The IAIG Board should establish processes for identifying and addressing risks to the proper implementation of the IAIG’s objectives and strategies for achieving those objectives, including any emerging risks.

**CF 7.2.a.2** The group-wide supervisor should cooperate and coordinate with the other involved supervisors to compare the consistency of the interests and objectives of the IAIG with those of the insurance legal entities within the IAIG.

**CF 7.2.b** The group-wide supervisor requires the Head of the IAIG to provide to the group-wide supervisor, at least annually, an explanation of the strategy that the IAIG Board has set for the IAIG.

**CF 7.2.b.1** An explanation of the strategy provides the group-wide supervisor with information useful for understanding of the IAIG’s corporate governance framework. The explanation of the strategy should include matters such as:

- the overall business model and its rationale;
- material business lines and how they are likely to develop;
- non-insurance business activities the IAIG is likely to pursue;
- the geographic emphasis of the IAIG and any likely changes;
- anticipated changes in market share(s);
- the consequences (financial or otherwise) of achieving, or not achieving, the strategy; and
- how the strategy ensures the IAIG will have the ability to fulfil its obligations to policyholders.
Structure and governance of the Board

7.3 The supervisor requires the insurer’s Board to have, on an ongoing basis:

- an appropriate number and mix of individuals to ensure that there is an overall adequate level of competence at the Board level commensurate with the governance structure;

- appropriate internal governance practices and procedures to support the work of the Board in a manner that promotes the efficient, objective and independent judgment and decision making by the Board; and

- adequate powers and resources to be able to discharge its duties fully and effectively.

Board composition

7.3.1 The Board of an insurer should have a sufficient number of members who have relevant expertise among them as necessary to provide effective leadership, direction and oversight of the insurer’s business to ensure it is conducted in a sound and prudent manner. For this purpose, the Board should collectively and individually have, and continue to maintain, including through training, necessary skills, knowledge and understanding of the insurer’s business to be able to fulfil their roles. In particular, the Board should have, or have access to, knowledge and understanding of areas such as the lines of insurance underwritten by the insurer, actuarial and underwriting risks, finance, accounting, the role of control functions, investment analysis and portfolio management and obligations relating to fair treatment of customers. While certain areas of expertise may lie in some, but not all, members, the collective Board should have an adequate spread and level of relevant competencies and understanding as appropriate to the insurer's business.

CF 7.3.a The group-wide supervisor requires that the collective competence of the IAIG Board includes an understanding of at least:

- the group-wide corporate governance framework and corporate structure;
- the activities of the legal entities within the IAIG, including associated risks;
- the supervisory regimes applicable to the IAIG;
- the issues that arise from cross-border business and international transactions; and
- the risk management, compliance, audit, actuarial and related areas.

CF 7.3.a.1 The IAIG Board should be capable of understanding and describing the purpose, structure, strategy, material operations, and material risks of the IAIG, including those of legal entities in other financial sectors and unregulated legal entities that are part of the group.
7.3.2 Board Members should have the commitment necessary to fulfil their roles, demonstrated by, for example, a sufficient allocation of time to the affairs of the insurer and reasonable limits on the number of Board Memberships held within or outside the insurance group.

Board effectiveness

7.3.3 The Board should review, at least annually, its own performance to ascertain whether members collectively and individually remain effective in discharging the respective roles and responsibilities assigned to them and identify opportunities to improve the performance of the Board as a whole. The Board should implement appropriate measures to address any identified inadequacies, including any training programmes for Board Members. The Board may also consider the use of external expertise from time to time to undertake its performance assessment where appropriate in order to enhance the objectivity and integrity of that assessment process.

Internal governance

7.3.4 The Board should have appropriate practices and procedures for its own internal governance, and ensure that these are followed and periodically reviewed to assess their effectiveness and adequacy. These may be included in organisational rules or by-laws, and should set out how the Board will carry out its roles and responsibilities. They should also cover a formal and documented process for nomination, selection and removal of Board Members, and a specified term of office as appropriate to the roles and responsibilities of the Board member, particularly to ensure the objectivity of decision making and judgment. Appropriate succession planning should also form part of the Board’s internal governance practices.

Chair of the Board

7.3.5 While the Board as a whole remains collectively responsible for the stewardship of the insurer, the Chair of the Board has the pivotal role of providing leadership to the Board for its proper and effective functioning. The role of the Chair of the Board should generally encompass responsibilities such as setting the Board’s agenda, ensuring that there is adequate time allocated for the discussion of agenda items, especially if they involve strategic or policy decisions of significant importance, and promoting a culture of openness and debate by facilitating effective participation of non-executive and executive members and communication between them and also with the Senior Management and Key Persons in Control Functions. To promote checks and balances, it is good practice for the Chair of the Board to be a non-executive Board member and not serve as chair of any Board committee. In jurisdictions where the Chair of the Board is permitted to assume executive duties, the insurer should have measures in place to mitigate any adverse impact on the insurer’s checks and balances.

Board committees

7.3.6 To support the effective discharge of the responsibilities of the Board, the Board should assess whether the establishment of committees of the Board is appropriate. Committees that a Board may commonly establish
include audit, remuneration, ethics/compliance, nominations and risk management committees. Where committees are appointed, they should have clearly defined mandates and working procedures (including reporting to the Board), authority to carry out their respective functions, and a degree of independence and objectivity as appropriate to the role of the committee. The Board should consider occasional rotation of members and of the chairs of committees, or tenure limits to serve on a committee, as this can help to avoid undue concentration of power and promote fresh perspectives. If the functions of any committees are combined, the Board should ensure such a combination does not compromise the integrity and/or effectiveness of the functions combined.

In all cases, the Board remains ultimately responsible for matters delegated to any such committees.

**Independence and objectivity**

7.3.7 To promote objectivity in decision making by the Board, the formal and perceived independence of Board Members should be ensured. To that end, Board Members should avoid personal ties or financial or business interests which conflict with that of the insurer. Where it is not reasonably possible to avoid conflicts of interests, such conflicts should be managed. Documented procedures and policies should be in place to identify and address conflicts of interests which could include disclosure of potential conflicts of interests, requirements for arm’s length transactions, abstention of voting and, where appropriate, prior approval by the Board or shareholders of professional positions or transactions.

7.3.8 Besides policies on conflicts of interests, the insurer should ensure objectivity in decision making by establishing clear and objective independence criteria which should be met by an adequate number of members of the Board (ie non-executive Board Members). For this purpose, the independence criteria should also take account of group structures and other applicable factors. Meeting such criteria is particularly important for those Board Members undertaking specific roles (such as members of the remuneration and audit committees) in which conflicts of interests are more likely to arise.

7.3.9 Objectivity in decision making is also promoted by independence of mind of the individual Board Members. This means that a Board member should act without favour; provide constructive and robust challenge of proposals and decisions; ask for information when the member judges it necessary in the light of the issues; and avoid “group-think”.

7.3.10 Board Members should also bear in mind the duties of good faith and loyalty applicable to them at the individual level, as set out in Standard 7.4.

**CF 7.3.b** The group-wide supervisor requires the IAIG Board to ensure that the group-wide corporate governance framework includes policies and processes to identify and avoid, or manage, conflicts of interest that may adversely affect the IAIG as a whole or any of its legal entities.

**CF 7.3.b.1** Conflicts of interest within an IAIG could arise:
### Board powers

#### 7.3.11 To be able to discharge its role and responsibilities properly, the Board should have well-defined powers, which are clearly set out either in legislation and/or as part of the constituent documents of the insurer (such as the constitution, articles of incorporation, by-laws or internal/organisational rules). These should, at least, include the power to obtain timely and comprehensive information relating to the management of the insurer, including direct access to relevant persons within the organisation for obtaining information, such as Senior Management and Key Persons in Control Functions.

### Access to resources

#### 7.3.12 Adequate resources, such as sufficient funding, staff and facilities, should be allocated to the Board to enable the Board Members to carry out their respective roles and responsibilities efficiently and effectively. The Board should have access to services of external consultants or specialists where necessary or appropriate, subject to criteria (such as independence) and due procedures for appointment and dismissal of such consultants or specialists.

### Delegations

#### 7.3.13 The Board may delegate some of the activities or tasks associated with its own roles and responsibilities. (Delegations in this context are distinguished from outsourcing of business activities by the insurer, which is dealt with in ICP 8 Risk Management and Internal Controls.) Notwithstanding such delegations, the Board as a whole retains the ultimate responsibility for the activities or tasks delegated, and the decisions made in reliance on any advice or recommendations made by the persons or committees to whom the tasks were delegated.

#### 7.3.14 Where the Board makes any delegations, it should ensure that:

- the delegation is appropriate. Any delegation that results in the Board not being able to discharge its own roles and responsibilities effectively would be an undue or inappropriate delegation. For example, the duty to oversee the Senior Management should not be delegated to a Board committee comprised mostly or solely of executive members of the Board.

</tr>
</tbody>
</table>
who are involved in the day-to-day management of the insurer;

- the delegation is made under a clear mandate with well-defined terms such as those relating to the powers, accountabilities and procedures relating to the delegation, and is supported by adequate resources to effectively carry out the delegated functions;

- there is no undue concentration of powers giving any one person or group of individuals an unfettered and inappropriate level of powers capable of influencing the insurer’s business or management decisions;

- it has the ability to monitor and require reports on whether the delegated tasks are properly carried out; and

- it retains the ability to withdraw the delegation if it is not discharged properly and for due purposes by the delegate, and, for this purpose, have appropriate contingency arrangements in place.

Duties of individual Board Members

7.4 The supervisor requires that an individual member of the Board:

- act in good faith, honestly and reasonably;

- exercise due care and diligence;

- act in the best interests of the insurer and policyholders, putting those interests ahead of his/her own interests;

- exercise independent judgment and objectivity in his/her decision making, taking due account of the interests of the insurer and policyholders; and

- not use his/her position to gain undue personal advantage or cause any detriment to the insurer.

7.4.1 The specific duties identified above are designed to address conflicts of interests that arise between the interests of the individual members of the Board and those of the insurer and policyholders. The insurer should include these duties as part of the terms of engagement of the individual Board Members.

7.4.2 The supervisor should be satisfied that individual Board Members understand the nature and scope of their duties and how they impact on the way in which the member discharges his/her respective roles and responsibilities. A Board member should consider his/her ability to discharge the roles and responsibilities in a manner as would be expected of a reasonably prudent person placed in a similar position. He/she should act on a fully informed basis, and for this purpose continually seek and acquire information as necessary.

7.4.3 Where a member of the Board of an insurer has common membership on the Board of any other entity within or outside the insurer’s group, there should be clear and well defined procedures regarding the member’s duty of loyalty to the insurer. These may include appropriate
disclosure and in some instances shareholder approval of such overlapping roles. In the event of a material conflict with the interests of the insurer, the member should disclose such conflicts promptly to the Board of the insurer and its stakeholders as appropriate, and be required to decline to vote or take any decisions in any matters in which he/she has an interest.

Duties related to risk management and internal controls

7.5 The supervisor requires the insurer’s Board to provide oversight in respect of the design and implementation of risk management and internal controls.

7.5.1 It is the Board’s responsibility to ensure that the insurer has appropriate systems and functions for risk management and internal controls and to provide oversight to ensure that these systems and the functions that oversee them are operating effectively and as intended. The responsibilities of the Board are described further in ICP 8 (Risk Management and Internal Controls).

Duties related to remuneration

7.6 The supervisor requires the insurer’s Board to:

- adopt and oversee the effective implementation of a written remuneration policy for the insurer, which does not induce excessive or inappropriate risk taking, is in line with the corporate culture, objectives, strategies, identified risk appetite, and long term interests of the insurer, and has proper regard to the interests of its policyholders and other stakeholders; and

- ensure that such a remuneration policy, at least, covers those individuals who are members of the Board, Senior Management, Key Persons in Control Functions and other employees whose actions may have a material impact on the risk exposure of the insurer (major risk–taking staff).

7.6.1 Sound remuneration policy and practices are part of the corporate governance framework of an insurer. This standard and guidance are neither intended to unduly restrict nor reduce an insurer’s ability to attract and retain skilled talent by prescribing any particular form or level of individual remuneration. Rather, they aim to promote the alignment of remuneration policies with the long term interests of insurers to avoid excessive risk taking, thereby promoting sound overall governance of insurers and fair treatment of customers.

Overall remuneration strategy and oversight

7.6.2 As a part of effective risk management, an insurer should adopt and implement a prudent and effective remuneration policy. Such a policy should not encourage individuals, particularly members of the Board and Senior Management, Key Persons in Control Functions and major risk-taking staff, to take inappropriate or excessive risks, especially where performance-based variable remuneration is used.

7.6.3 The Board, particularly members of the remuneration committee where one exists, should collectively have the requisite competencies to make informed and independent judgments on the suitability of an insurer’s remuneration policy. Such competencies include skills, such as a
sufficient understanding of the relationship between risk and remuneration practices. The remuneration committee, where established, should have an adequate representation of non-executive members to promote objectivity in decision-making.

7.6.4 In order to satisfy itself about the effectiveness of the remuneration policy and practices, the Board should consider at least:

- the components of the overall remuneration policy, particularly the use and balance of fixed and variable components;
- the performance criteria and their application for the purposes of determining remuneration payments;
- the remuneration of the members of the Board, Senior Management and major risk-taking staff; and
- any reports or disclosures on the insurer’s remuneration practices provided to the supervisor or the public.

7.6.5 The Board should ensure that in structuring, implementing and reviewing the insurer’s remuneration policy, the decision-making process identifies and manages conflicts of interests and is properly documented. Members of the Board should not be placed in a position of actual or perceived conflicts of interests in respect of remuneration decisions.

7.6.6 The Board should also ensure that the relevant Key Persons in Control Functions are involved in the remuneration policy-setting and monitoring process to ensure that remuneration practices do not create incentives for excessive or inappropriate risk taking, are carried out consistently with established policies and promote alignment of risks and rewards across the organisation. Similarly, the remuneration and risk management committees of the Board, if such committees exist, should interact closely with each other and provide input to the Board on the incentives created by the remuneration system and their effect on risk-taking behaviour.

7.6.7 The potential for conflicts of interests that may compromise the integrity and objectivity of the staff involved in control functions should be managed. This can be achieved by a variety of means, such as making their remuneration:

- predominantly based on the effective achievement of the objectives appropriate to such control functions. Performance measures for staff in control functions should represent the right balance between objective assessments of the control environment (eg the conduct of the relationship between the control functions and executive management) and outputs delivered by the control functions, including their impact, quality and efficiency in supporting the oversight of risks. Such output measures may include recommendations made and implemented to reduce risks, reduction in number of compliance breaches and measures adopted to promptly rectify identified breaches, results of external quality reviews and losses recovered or avoided through audits of high risk areas;
• not linked to the performance of any business units which are subject to their control or oversight. For example, where risk and compliance functions are embedded in a business unit, a clear distinction should be drawn between the remuneration policy applicable to staff undertaking control functions and other staff in the business unit, such as through the separation of the pools from which remuneration is paid to the two groups of staff; and

• adequate as an overall package to attract and retain staff with the requisite skills, knowledge and expertise to discharge those control functions effectively and to increase their competence and performance.

7.6.8 Where any control function is outsourced, the remuneration terms under the agreement with the service provider should be consistent with the objectives and approved parameters of the insurer’s remuneration policy.

Variable remuneration

7.6.9 Variable remuneration should be performance-based using measures of individual, unit or group performance that do not create incentives for inappropriate risk taking.

7.6.10 To better align performance-based incentives with the long term value creation and the time horizon of risks to which the insurer may be exposed, due consideration should be given to the following:

• There should be an appropriate mix of fixed and variable components, with adequate parameters set for allocating cash versus other forms of remuneration, such as shares. A variable component linked to performance that is too high relative to the fixed component may make it difficult for an insurer to reduce or eliminate variable remuneration in a poor financial year;

• The reward for performance should include an adjustment for the material current and future risks associated with performance. Since the time horizon of performance and associated risks can vary, the measurement of performance should, where practicable, be set in a multi-year framework to ensure that the measurement process is based on longer term performance;

• If the variable component of remuneration is significant, the major part of it should be deferred for an appropriate specified period. The deferral period should take account of the time frame within which risks associated with the relevant performance (such as the cost of capital required to support risks taken and associated uncertainties in the timing and the likelihood of future revenues and expenses) may materialise. The deferral period applied may vary depending on the level of seniority or responsibility of the relevant individuals and the nature of risks to which the insurer is exposed;
• The award of variable remuneration should contain provisions that enable the insurer, under certain circumstances, to apply malus or claw back arrangements in the case of subdued or negative financial performance of the insurer which is attributed to the excessive risk taking of the staff concerned and when risks of such performance have manifested after the award of variable remuneration; and

• Guaranteed variable remuneration should generally not be offered, as they are not consistent with sound risk management and performance-based rewards.

7.6.11 The variable component should be subject to prudent limits set under the remuneration policy that are consistent with the insurer’s capital management strategy and its ability to maintain a sound capital base taking account of the internal capital targets or regulatory capital requirements of the insurer.

7.6.12 The performance criteria applicable to the variable components of remuneration should promote a complete assessment of risk-adjusted performance. For this purpose, due consideration should be given to the need for performance criteria to:

• be clearly defined and be objectively measurable;

• be based not only on financial but also on non-financial criteria as appropriate (such as compliance with regulation and internal rules, achievement of risk management goals, adequate and timely follow up of internal audit recommendations as well as compliance with market conduct standards and fair treatment of customers;

• take account of not only the individual’s performance, but also the performance of the business unit concerned where relevant and the overall results of the insurer and the group; and

• not treat growth or volume as a criterion in isolation from other performance criteria.

Share-based components

7.6.13 Where share-based components of variable remuneration (such as shares, share options or similar instruments) are used, appropriate safeguards should be implemented to align incentives and the longer-term interests of the insurer. Such safeguards may include that:

• shares do not vest for a minimum specified period after their award (“vesting restrictions”);

• share options or other similar rights are not exercisable for a minimum specified period after their award (“holding restrictions”); and

• individuals are required to retain an appropriate proportion of the shares awarded until the end of their employment or other specified period beyond their employment (“retention restrictions”).
7.6.14 Subject to any applicable legal restrictions, it is appropriate that future vesting and holding restrictions for share-based remuneration remain operative even upon cessation of employment (i.e., there should be no undue acceleration of the vesting of share-based payments or curtailing of any holding restrictions).

Severance payments

7.6.15 Where an insurer provides discretionary pay-outs on termination of employment ("severance payments", sometimes also referred to as "golden parachutes"), such payment should be subject to appropriate governance controls and limits. In any case, such pay-outs should be aligned with the insurer's overall financial condition and performance over an appropriate time horizon. Severance payments should be related to performance over time; should not reward failure and should not be payable in the case of failure or threatened failure of the insurer, particularly to an individual whose actions have contributed to the failure or potential failure of the insurer.

Reliable and transparent financial reporting

7.7 The supervisor requires the insurer's Board to ensure there is a reliable financial reporting process for both public and supervisory purposes that is supported by clearly defined roles and responsibilities of the Board, Senior Management and the external auditor.

7.7.1 The Board is responsible for overseeing the insurer's systems and controls to ensure that the financial reports of the insurer present a balanced and accurate assessment of the insurer's business and its general financial condition and viability. The Board carries out functions including:

- overseeing the financial statements, financial reporting and disclosure processes;
- monitoring whether accounting policies and practices of the insurer are operating as intended;
- overseeing the internal audit process (reviews by internal audit of the insurer's financial reporting controls) and reviewing the internal auditor's plans and material findings; and
- reporting to the supervisor on significant issues concerning the financial reporting process, including actions taken to address or mitigate identified financial reporting risks.

7.7.2 The Board should ensure that significant findings and observations regarding weaknesses in the financial reporting process are promptly rectified. This should be supported by a formal process for reviewing and monitoring the implementation of recommendations by the external auditor.

External Audit

7.8 The supervisor requires the insurer's Board to ensure that there is adequate governance and oversight of the external audit process.
7.8.1 The Board should ensure that the insurer:

- applies robust processes for approving, or recommending for approval, the appointment, reappointment, removal and remuneration of the external auditor;
- applies robust processes for monitoring and assessing the independence of the external auditor and to ensure that the appointed external auditor has the necessary knowledge, skills, expertise, integrity and resources to conduct the audit and meet any additional regulatory requirements;
- monitors and assesses the effectiveness of the external audit process throughout the audit cycle;
- investigates circumstances relating to the resignation or removal of an external auditor, and ensuring prompt actions are taken to mitigate any identified risks to the integrity of the financial reporting process, and
- reports to the supervisor on circumstances relating to the resignation or removal of the external auditor.

7.8.2 The Board should oversee the external audit process and safeguard and promote an effective relationship with the external auditor. For this purpose the Board should ensure that:

- the terms of engagement of the external auditor are clear and appropriate to the scope of the audit and resources required to conduct the audit and specify the level of audit fees to be paid;
- the auditor undertakes a specific responsibility under the terms of engagement to perform the audit in accordance with relevant local and international audit standards;
- the external auditor complies with internationally accepted ethical and professional standards and, where applicable, the more stringent requirements applicable to audits of listed entities and public interest entities;
- there are adequate policies and a process to ensure the independence of the external auditor, including:
  - restrictions and conditions for the provision of non-audit services which are subject to approval by the Board;
  - periodic rotation of members of the audit team and/or audit firm as appropriate; and
  - safeguards to eliminate or reduce to an acceptable level identified threats to the independence of the external auditor.
- there is adequate dialogue with the external auditor on the scope and timing of the audit to understand the issues of risk, information on the insurer’s operating environment which is relevant to the audit, and any areas in which the Board may request for specific procedures to be carried out by the
external auditor, whether as a part or an extension of the audit engagement; and

- there is unrestricted access by the external auditor to information and persons within the insurer as necessary to conduct the audit.

7.8.3 In order to establish the degree of assurance that the Board can draw from the external auditor’s report, the Board should also understand the external auditor’s approach to the audit. This includes the assessment of the external auditor’s ability to:

- identify and assess the risks of material misstatement in the insurer’s financial statements, taking into consideration the complexities of insurance activities and the need for insurers to have a strong control environment;

- respond appropriately to the risks of material misstatement in the insurer’s financial statements; and

- develop appropriate relationships with the internal audit function and the actuarial function.

The Board should take appropriate actions where doubts arise as to the reliability of the external audit process.

7.8.4 In order to enable the Board to carry out its oversight responsibilities and to enhance the quality of the audit, the Board should have an effective communication with the external auditor. This should include:

- regular meetings between the Board and the external auditor during the audit cycle, including meetings without management present; and

- prompt communication of any information regarding internal control weaknesses or deficiencies of which the external auditor becomes aware.

The Board should require the external auditor to report to it on all relevant matters.

7.8.5 The supervisor and the external auditor should have an effective relationship that includes appropriate communication channels for the exchange of information relevant to carrying out their respective statutory responsibilities.

7.8.6 Reports prepared by the external auditor for the insurer (eg management letters) should be made available to the supervisor by the insurer or the external auditor.

7.8.7 The supervisor should require the external auditor to report matters that are likely to be of material significance. This would include material fraud, suspicion of material fraud and regulatory breaches or other significant audit findings identified in the course of the audit. Such information should be provided to the supervisor without the need for prior consent of the insurer and the external auditor should be duly protected from liability for any information disclosed to the supervisor in good faith.
7.8.8 The supervisor should require a further audit by a different external auditor where necessary.

Communications

7.9 The supervisor requires the insurer's Board to have systems and controls to ensure appropriate, timely and effective communications with the supervisor on the governance of the insurer.

7.9.1 Communications with the supervisor should promote effective engagement of the supervisor on the governance of the insurer to enable informed judgments about the effectiveness of the Board and Senior Management in governing the insurer.

7.9.2 Subject to any reasonable commercial sensitivities and applicable privacy or confidentiality obligations, the insurer's communication policies and strategies should include providing to the insurer's stakeholders information such as the following:

- the insurer's overall strategic objectives, covering existing or prospective lines of business and how they are being or will be achieved;
- the insurer’s governance structures, such as allocation of oversight and management responsibilities between the Board and the Senior Management, and organisational structures, including reporting lines;
- members of the Board and any Board committees, including their respective expertise, qualifications, track-record, other positions held by such members, and whether such members are regarded as independent;
- processes in place for the Board to evaluate its own performance and any measures taken to improve the Board’s performance;
- the general design, implementation and operation of the remuneration policy;
- major ownership and group structures, and any significant affiliations and alliances; and
- material related-party transactions.

7.9.3 In addition to information publicly available, the supervisor may require more detailed and additional information relating to the insurer's corporate governance framework for supervisory purposes, which may include commercially sensitive information, such as assessments by the Board of the effectiveness of the insurer's governance system, internal audit reports and more detailed information on the remuneration structures adopted by the insurer for the Board, Senior Management, Key Persons in Control Functions and major risk-taking staff. The insurer’s communication policies and strategies should enable such information to be provided to the supervisor in a timely and efficient manner. Supervisors should safeguard such information having due regard to the confidentiality of commercially sensitive information and applicable laws.
The group-wide supervisor requires the IAIG Board to ensure that the Head of the IAIG reports to the group-wide supervisor, through regularly scheduled or ad hoc reporting, material changes related to at least the following:

- location of legal entities;
- legal structures;
- management structures;
- governance structure and processes of the IAIG Board;
- affiliations with other groups;
- strategy;
- risk appetite; and
- business activities.

The group-wide systems and controls for communications should give the Head of the IAIG the ability to inform the group-wide supervisor of governance issues concerning the IAIG.

Disclosure of information on remuneration should be sufficient to enable stakeholders to evaluate how the remuneration system relates to risk and whether it is operating as intended. Relevant information may include:

- the operation of risk adjustments, including examples of how the policy results in adjustments to remuneration for employees at different levels;
- how remuneration is related to performance (both financial and personal business conduct) over time; and
- valuation principles in respect of remuneration instruments.

Appropriate quantitative information should also be made available to enable supervisors to evaluate the financial impact of the remuneration policy. Such information may include:

- the total cost of remuneration awarded in the period, analysed according to the main components such as basic salary, variable remuneration and long-term awards;
- the total amount set aside in respect of deferred variable remuneration;
- adjustment to net income for the period in respect of variable remuneration awarded in previous periods;
- the total costs of all sign-on payments in the period and number of individuals to whom these relate; and
- the total costs of all severance payments in the period and number of individuals to whom these relate.
7.9.6 These amounts should be analysed by type of instrument (e.g. cash, shares, share options etc.) as applicable, and in a manner consistent with the key elements of the remuneration policy.

7.9.7 Disclosure of information on governance should be made on a regular (for instance, at least annually) and timely basis.

Duties of Senior Management

7.10 The supervisor requires the insurer to ensure that Senior Management:

- carries out the day-to-day operations of the insurer effectively and in accordance with the insurer’s corporate culture, business objectives and strategies for achieving those objectives in line with the Insurer’s long term interests and viability;
- promotes sound risk management, compliance and fair treatment of customers;
- provides the Board adequate and timely information to enable the Board to carry out its duties and functions including the monitoring and review of the performance and risk exposures of the insurer, and the performance of Senior Management; and
- maintains adequate and orderly records of the internal organisation.

7.10.1 Senior Management should implement appropriate systems and controls, in accordance with the established risk appetite and corporate values and consistent with internal policies and processes.

7.10.2 Such systems and controls should provide for organisation and decision-making in a clear and transparent manner that promotes effective management of the insurer. Senior Management’s systems and controls should encompass:

- processes for engaging persons with appropriate competencies and integrity to discharge the functions under Senior Management, which include succession planning, ongoing training and procedures for termination;
- clear lines of accountability and channels of communication between persons in Senior Management and Key Persons in Control Functions;
- proper procedures for the delegation of Senior Management functions and monitoring whether delegated functions are carried out effectively and properly, in accordance with the same principles that apply to delegations by the Board (see Guidance 7.3.13 and 7.3.14);
- standards of conduct and codes of ethics for the Senior Management and other staff to promote a sound corporate culture, and the effective implementation on an ongoing basis of standards and codes (see ICP 8 Risk Management and Internal Controls for conflicts of interest provisions);
- proper channels of communications, including clear lines of reporting, as between the individuals performing the functions.
of the Senior Management and the Board, including provisions dealing with whistleblower protection, and their effective implementation; and

- effective communication strategies with supervisors and stakeholders that include the identification of matters that should be disclosed, and to whom such disclosure should be made.

7.10.3 Adequate procedures should be in place for assessing the effectiveness of Senior Management’s performance against the performance objectives set by the Board. For this purpose, annual assessments of their performance against set goals should be carried out at least annually, preferably by an independent party, a control function, or the Board itself. Any identified inadequacies or gaps should be addressed promptly and reported to the Board.

7.10.4 Senior Management should also promote strong risk management and internal controls through personal conduct and transparent policies. Senior Management should communicate throughout the insurer the responsibility of all employees in this respect. It should not interfere with the activities that control functions carry out in the rightful exercise of their responsibilities, including that of providing an independent view of governance, risk, compliance and control related matters.

**Supervisory review**

7.11 The supervisor requires the insurer to demonstrate the adequacy and effectiveness of its corporate governance framework.

7.11.1 The supervisor plays an important role by requiring the Board and Senior Management of the insurer to demonstrate that they are meeting the applicable corporate governance requirements, consistent with these standards, on an ongoing basis. The onus for demonstrating, to the satisfaction of the supervisor, that the corporate governance framework is effective and operates as intended rests with the insurer.

7.11.2 The Supervisor should assess through its supervisory review and reporting processes whether the insurer’s overall corporate governance framework is effectively implemented and remains adequate (see ICP 9 Supervisory Review and Reporting).

7.11.3 To help facilitate the supervisory review and reporting processes, the supervisor should establish effective channels of communication with the insurer, and have access to relevant information concerning the governance of the insurer. This may be obtained through periodic reports to the supervisor and any information obtained on an ad hoc basis (see also Standard 7.7). Communication may also be facilitated by the supervisor having regular interaction with the Board, Senior Management and Key Persons in Control Functions.

7.11.4 The supervisor should assess the governance effectiveness of the Board and Senior Management and determine the extent to which their actions and behaviours contribute to good governance. This includes the extent to which the Board and Senior Management contribute to setting and following the “tone at the top”; how the corporate culture of the insurer is communicated and put into practice; how information flows to and from
the Board and Senior Management; and how potential material problems are identified and addressed throughout the insurer.

7.11.5 To ascertain the ongoing effectiveness of the Board and Senior Management, the supervisor may also consider the use of measures such as the following, where appropriate:

- ongoing mandatory training that is commensurate with their respective duties, roles and responsibilities of the Board and Senior Management within the insurer;
- a review of the periodic self-evaluation undertaken by the Board as referred to in Guidance 7.3.3 and 7.11.1;
- meetings and/or interviews with the Board and Senior Management, both collectively and individually as appropriate, particularly to reinforce expectations relating to their performance and to get a sense of how informed and proactive they are; and
- attending and observing Board proceedings.

7.11.6 Where remuneration policies of an insurer contain more high risk elements, closer supervisory scrutiny of those policy and practices may also be warranted, including requests for additional information as appropriate to assess whether those practices are having an adverse impact on the ongoing viability of the insurer or commissioning an independent assessment of the insurer’s remuneration policy and practices.

**ICP 8  Risk Management and Internal Controls**

The supervisor requires an insurer to have, as part of its overall corporate governance framework, effective systems of risk management and internal controls, including effective functions for risk management, compliance, actuarial matters and internal audit.

---

*Introductory Guidance*

8.0.1 As part of the overall corporate governance framework and in furtherance of the safe and sound operation of the insurer and the protection of policyholders, the Board is ultimately responsible for ensuring that the insurer has in place effective systems of risk management and internal controls and functions to address the key risks it faces and for the key legal and regulatory obligations that apply to it. Senior Management effectively implements these systems and provides the necessary resources and support for these functions.

8.0.2 In some jurisdictions, risk management is considered a subset of internal controls, while other jurisdictions would see it the other way around. The two systems are in fact closely related. Where the boundary lies between risk management and internal controls is less important than achieving, in practice, the objectives of each.

8.0.3 The systems and functions should be adequate for the insurer’s objectives, strategy, risk profile, and the applicable legal and regulatory requirements. They should be adapted as the insurer’s business and internal and external circumstances change.

8.0.4 The nature of the systems that the insurer has is dependent on many factors. The systems typically include:

- strategies setting out the approach of the insurer for dealing with specific areas of risk and legal and regulatory obligation;
- policies defining the procedures and other requirements that members of the Board and employees need to follow;
- processes for the implementation of the insurer’s strategies and policies; and
- controls to ensure that such strategies, policies and processes are in fact in place, are being observed and are attaining their intended objectives.

8.0.5 An insurer’s functions (whether in the form of a person, unit or department) should be properly authorised to carry out specific activities relating to matters such as risk management, compliance, actuarial matters and internal audit. These are generally referred to as control functions.

*Special considerations for groups*

8.0.6 Group-wide risks may affect insurance legal entities within a group, while risks at the insurance legal entity level could also affect the group as a
whole. To help address this, groups should have strong risk management and compliance culture across the group and at the insurance legal entity level. Thus, in addition to meeting group governance requirements, the group should take into account the obligations of its insurance legal entities to comply with local laws and regulations.

8.0.7 How a group's systems of risk management and internal controls are organised and operate will depend on the governance approach the group takes, i.e., a more centralised or a more decentralised approach (see Issues Paper on Approaches to Group Corporate Governance; impact on control functions). Regardless of the governance approach, it is important that effective systems of risk management and internal controls exist and that risks are properly monitored and managed at the insurance legal entity level and on a group-wide basis.

8.0.8 Additionally, a group's governance approach will also affect the way in which its control functions are organised and operated. Coordination between the insurance legal entity and group control functions is important to help ensure overall effective systems of risk management and internal controls. Regardless of how the group control functions are organised and operated, the result should provide an overall view of the group-wide risks and how they should be managed.

8.0.9 Supervisors should require the establishment of comprehensive and consistent group governance and assess its effectiveness. While the group-wide supervisor is responsible for assessing the effectiveness of the group's systems of risk management and internal controls, the other involved supervisors undertake such assessments on a legal entity basis. Appropriate supervisory cooperation and coordination is necessary to have a group-wide view and to enhance the assessment of the legal entities.

**Systems for risk management and internal controls**

8.1 The supervisor requires the insurer to establish, and operate within, an effective and documented risk management system, which includes, at least:

- a risk management strategy that defines the insurer's risk appetite;
- a risk management policy outlining how all material risks are managed within the risk appetite; and
- the ability to respond to changes in the insurer's risk profile in a timely manner.

**Basic components of a risk management system**

8.1.1 The risk management system is designed and operated at all levels of the insurer to allow for the identification, assessment, monitoring, mitigation and reporting of all risks of the insurer in a timely manner. It takes into account the probability, potential impact and time horizon of risks.

8.1.2 An effective risk management system should:
• take into account the insurer’s overall business strategy and business activities (including any business activities which have been outsourced);

• provide that the insurer’s risk appetite, expressed in a risk appetite statement, be aligned with the insurer’s business strategy and embedded in its day-to-day activities;

• provide relevant objectives, key principles and proper allocation of responsibilities for dealing with risk across the business areas and business units of the insurer;

• provide explanations of the methodologies, key assumptions and limitations of risk management; for groups this would include the rationale as to the risk appetite for different individual insurance legal entities within the group;

• provide a documented process defining the Board approval required for any deviations from the risk management strategy or the risk appetite and for settling any major interpretation issues that may arise;

• define and categorise material risks (by type) to which the insurer is exposed, at both insurance legal entity and group level where applicable, and the levels of acceptable risk limits for each type of these risk;

• include documented policies that describe how categories of risks are managed and the specific obligations of employees and the insurer in dealing with risk, including risk escalation and risk mitigation tools;

• provide suitable processes and tools (including stress testing and, where appropriate, models) for identifying, assessing, monitoring and reporting on risks. Such processes should also cover contingency planning;

• provide for regular reviews of the risk management system (and its components) to help ensure that necessary modifications and improvements are identified and made in a timely manner; and

• appropriately address other matters related to risk management for solvency purposes set out in ICP 16 Enterprise Risk Management for Solvency Purposes.

Scope and embedding of the risk management system

8.1.3 The risk management system should cover at least the following risks: underwriting and reserving, asset-liability management, investments, liquidity, concentration, operational and conduct, as well as reinsurance and other risk mitigation techniques.

8.1.4 The risk management system should be aligned with the insurer’s risk culture and embedded into the various business areas and units with the aim of having the appropriate risk management practices and procedures embedded in the key operations and structures.
CF 8.1.a  The group-wide supervisor requires the Head of the IAIG to ensure that the group-wide risk management system encompasses the levels of the Head of the IAIG and legal entities within the IAIG and covers, at least, the:

- diversity and geographical reach of the activities of the IAIG;
- nature and degree of risks of individual legal entities and business lines;
- aggregation of risks from the legal entities within the IAIG that arises at the level of the Head of the IAIG, including cross-border risks;
- interconnectedness of the legal entities within the IAIG;
- level of sophistication and functionality of information and reporting systems in addressing key group-wide risks; and
- applicable laws and regulations of the jurisdictions where the IAIG operates.

CF 8.1.a.1  The group-wide risk management system should:

- be integrated with its organisational structure, decision-making processes, business operations, and risk culture;
- be integrated within its legal entities; and
- measure the risk exposure of the IAIG against the risk limits on an ongoing basis in order to identify potential concerns as early as possible.

CF 8.1.b  The group-wide supervisor requires the Head of the IAIG to reflect, in the documentation of its group-wide risk management system, material differences in risk management that may apply to different legal entities within the IAIG and their associated risks.

CF 8.1.c  The group-wide supervisor requires the Head of the IAIG to ensure that the IAIG has in place policies and processes for promoting a sound risk culture.

CF 8.1.c.1  Policies and processes for promoting a sound risk culture should include risk management training, address independence, and create appropriate incentives for staff.

CF 8.1.c.2  The IAIG’s risk culture should support timely evaluation and open communication of emerging risks that may be significant to the IAIG and its legal entities.

Identification and Assessment

8.1.5  The risk management system should take into account all reasonably foreseeable and relevant material risks to which the insurer is exposed, both at the insurer and the individual business unit levels. This includes current and emerging risks.

8.1.6  Insurers should assess material risks both qualitatively and, where appropriate, quantitatively. Appropriate consideration should be given to
a sufficiently wide range of outcomes, as well as to the appropriate tools and techniques to be used. The interdependencies of risks should also be analysed and taken into account in the assessments.

8.1.7 The insurer’s risk assessment should be documented including detailed descriptions and explanations of the risks covered, the approaches used, and the key judgements and assumptions made.

8.1.8 Insurers should have in place adequate processes, controls and systems to assess the risks of new products and carry out a risk assessment before entering into new business lines and products. Significant new or changed activities and products that may increase an existing risk or create a new type of exposure should be approved by Senior Management and/or by the Board.

Monitoring

8.1.9 The risk management system should include processes and tools for monitoring risk, such as early warnings or triggers that allow timely consideration of, and adequate response to, material risks.

Mitigation

8.1.10 The risk management system should include strategies and tools to mitigate against material risks. In most cases an insurer will control or reduce the risk to an acceptable level. Another response to risk is to transfer the risk to a third party. If risks are not acceptable within the risk appetite and it is not possible to control, limit or transfer the risk, the insurer should cease or change the activity which creates the risk.

Reporting

8.1.11 Risks, the overall assessment of risks and the related action plans should be reported to the Board and/or to Senior Management, as appropriate, using qualitative and quantitative indicators and effective action plans. The insurer’s documented risk escalation process should allow for reporting on risk issues within established reporting cycles and outside of them for matters of particular urgency.

8.1.12 The Board should have appropriate ways to carry out its responsibilities for risk oversight. The risk management policy should therefore cover the content, form and frequency of reporting that it expects on risk from Senior Management and each of the control functions. Any proposed activity that would go beyond the Board-approved risk appetite should be subject to appropriate review and require Board approval.

Risk Management Policy

8.1.13 The insurer’s risk management policy should be written in a way to help employees understand their responsibilities regarding risk management. It should also reflect how the risk management system relates to the insurer’s overall corporate governance framework and its corporate culture. Regular internal communications and training within the insurer on the risk management policy and risk appetite may help in this regard.

8.1.14 For insurance groups, a risk management policy addresses the way in which the group manages risks that are material at the insurance group level, including risks that arise from the insurance group being part of a
wider group. For an insurance legal entity that is part of a group, the risk management policy of that entity should address management of risks material at the entity level as well as additional risk it faces as a result of its membership in a group, which can encompass the widest group of which the insurance legal entity is a member and not only the entity’s insurance group. Within an insurance group, the head of the group and the legal entities should ensure appropriate coordination and consistency between the head of the group and the legal entities when setting the risk management policy.

Changes to the risk management system

8.1.15 Both the Board and Senior Management should be attentive to the need to modify the risk management system in light of changes in the insurer’s risk profile as well as other new internal or external events and/or circumstances. The risk management system should include mechanisms to incorporate new risks and new information related to risk already identified on a regular basis. The risk management system should also be responsive to the changing interests and reasonable expectations of policyholders and other stakeholders.

8.1.16 Material changes to an insurer’s risk management system should be documented and subject to approval by the Board. The reasons for the changes should be documented. Appropriate documentation should be available to internal audit, external audit and the supervisor for their respective assessments of the risk management system.

8.1.17 As part of its responsiveness to changes in the insurer’s risk profile, the risk management system should incorporate a feedback loop based on appropriate information, management processes and objective assessment. A feedback loop provides a process of assessing the effect of changes in risk leading to changes in risk management policy, risk limits and risk mitigating actions. This may help ensure that decisions made by the Board and Senior Management are implemented and their effects monitored and reported in a timely and sufficiently frequent manner.

8.1.18 Within an insurance group, there should be sufficient coordination and exchange of information between the head of the insurance group and its insurance legal entities as part of their respective feedback loops to ensure relevant changes in risk profiles can be taken into account.

CF 8.1.d The group-wide supervisor requires the Head of the IAIG to:

- review, at least annually, the group-wide risk management system to ensure that existing and emerging risks as well as changes in the IAIG’s structure and/or business strategy, are taken into account; and
- identify and make the necessary modifications and improvements in a timely manner.

CF 8.1.d.1 The Head of the IAIG should assess whether a change occurring in one or more legal entities may affect the IAIG’s risk profile overall,
because the impact on a group-wide basis may not be immediately apparent.

CF 8.1.d.2 The group-wide risk management system should take account of all material changes at a legal entity level that may have an impact on how the IAIG measures and mitigates risk at a group level.

8.2 The supervisor requires the insurer to establish, and operate within, an effective and documented system of internal controls.

Basic components of an internal controls system

8.2.1 The internal controls system should ensure effective and efficient operations, adequate control of risks, prudent conduct of business, reliability of financial and non-financial information reported (both internally and externally), and compliance with laws, regulations, supervisory requirements and the insurer's internal rules and decisions. It should be designed and operated to assist the Board and Senior Management in the fulfilment of their respective responsibilities for oversight and management of the insurer. Some insurers have a designated person or function to support the advancement, coordination and/or management of the overall internal controls system on a more regular basis.

8.2.2 The internal controls system should cover all units and activities of the insurer and should be an integral part of the daily activities of an insurer. The controls should form a coherent system, which should be regularly assessed and improved as necessary. Each individual control\(^1\) of an insurer, as well as all its controls cumulatively, should be designed for effectiveness and operate effectively.

8.2.3 An effective internal control system requires an appropriate control structure with control activities defined at every business unit level. Depending on the organisational structure of the insurer, business or other units should own, manage and report on risks and should be primarily accountable for establishing and maintaining effective internal control policies and processes. Control functions should determine and assess the appropriateness of the controls used by the business or other units. The internal audit function should provide independent assurance on the quality and effectiveness of the internal controls system.\(^2\)

8.2.4 An effective internal controls system typically includes:

Segregation of duties and prevention of conflicts of interest

- appropriate segregation of duties and controls to ensure such segregation is observed. This includes, amongst others, having sufficient distance between those accountable for a

---

\(^1\) Individual controls may be preventive (applied to prevent undesirable outcomes) or detective (to uncover undesirable activity). Individual controls may be manual (human), automated, or a combination and may be either general or process or application specific.

\(^2\) This division of responsibilities between business, risk management and compliance and internal audit is typically referred to as the three lines of defence. The business is considered as the first line of defence, the control functions (other than internal audit) as the second line of defence, and internal audit as the third line of defence. The business is deemed to "own" the controls, and the other lines of defence are there to help ensure their application and viability. Whatever approach is used, it is important that responsibilities be clearly allocated to promote checks and balances and avoid conflicts of interest.
process or policy and those who check if for such a process or policy an appropriate control exists and is being applied. It also includes appropriate distance between those who design a control or operate a control and those who check if such a control is effective in design and operation;

- up-to-date policies regarding who can sign for or commit the insurer, and for what amounts, with corresponding controls, such as practice that key decisions should be taken at least by two persons and the practice of double or multiple signatures. Such policies and controls should be designed, among other things, to prevent any major transaction being entered into without appropriate governance review or by anyone lacking the necessary authority and to ensure that borrowing, trading, risk and other such limits are strictly observed. Such policies should foresee a role for control functions, for example by requiring for major matters the review and sign-off by Risk Management or Compliance, and/or approval by a Board level committee;

**Policies and processes**

- appropriate controls for all key business processes and policies, including for major business decisions and transactions (including intra-group transactions), critical IT functionalities, access to critical IT infrastructure by employees and related third parties, and important legal and regulatory obligations;

- policies on training in respect of controls, particularly for employees in positions of high trust or responsibility or involved in high risk activities;

- a centralised documented inventory of insurer-wide key processes and policies and of the controls in place in respect of such processes and policies, that also may introduce a hierarchy among the policies;

**Information and communication**

- appropriate controls to provide reasonable assurance over the accuracy and completeness of the insurer’s books, records, and accounts and over financial consolidation and reporting, including the reporting made to the insurer’s supervisors;

- adequate and comprehensive internal financial, operational and compliance data, as well as external market information about events and conditions that are relevant to decision making. Information should be reliable, timely, accessible, and provided in a consistent format;

- information processes that cover all significant activities of the insurer, including contingency arrangements;

- effective channels of communication to ensure that all staff fully understand and adhere to the internal controls and their
duties and responsibilities and that other relevant information is reaching the appropriate personnel;

- policies regarding escalation procedures;

**Monitoring and review**

- processes for regularly checking that the totality of all controls forms a coherent system and that this system works as intended; fits properly within the overall corporate governance framework of the insurer; and provides an element of risk control to complement the risk identification, risk assessment, and risk management activities of the insurer. As part of such review, individual controls are monitored and analysed periodically to determine gaps and improvement opportunities with Senior Management taking such measures as are necessary to address these; and

- periodic testing and assessments (carried out by objective parties such as an internal or external auditor) to determine the adequacy, completeness and effectiveness of the internal controls system and its utility to the Board and Senior Management for controlling the operations of the insurer.

---

**CF 8.2.a** The group-wide supervisor requires the Head of the IAIG to ensure that the group-wide internal controls system at the group-wide level covers, at least, the:

- diversity and geographical reach of the activities of the IAIG;
- intra-group transactions;
- interconnectedness of the legal entities within the IAIG; and
- applicable laws and regulations of the jurisdictions where the IAIG operates.

**CF 8.2.b** The group-wide supervisor requires the Head of the IAIG to ensure annual testing and assessments carried out by an independent external or internal party to assess the coherence, completeness and effectiveness of the internal controls system within the IAIG and its utility to the IAIG Board and Senior Management.

**Responsibilities of the Board**

8.2.5 The Board should have an overall understanding of the control environment across the various entities and businesses, and require Senior Management to ensure that for each key business process and policy, and related risks and obligations, there is an appropriate control.

8.2.6 In addition, the Board should ensure there is clear allocation of responsibilities within the insurer, with appropriate segregation, including in respect of the design, documentation, operation, monitoring and testing of internal controls. Responsibilities should be properly documented, such as in charters, authority tables, governance manuals or other similar governance documents.
8.2.7 The Board should determine which function or functions report to it or to any Board Committees in respect of the internal controls system.

Reporting

8.2.8 Reporting on the internal controls system should cover matters such as:

- the strategy in respect of internal controls (such as responsibilities, target levels of compliance to achieve, validations and implementation of remediation plans);
- the stage of development of the internal controls system, including its scope, testing activity, and the performance against annual or periodic internal controls system goals being pursued;
- an assessment of how the various business units are performing against internal control standards and goals;
- control deficiencies, weaknesses and failures that have arisen or that have been identified (including any identified by the internal or external auditors or the supervisor) and the responses thereto (in each case to the extent not already covered in other reporting made to the Board); and
- controls at the appropriate levels so as to be effective, including at the process or transactional level.

Control functions (general)

8.3 The supervisor requires the insurer to have effective control functions with the necessary authority, independence and resources.

8.3.1 As part of the effective systems of risk management and internal controls, insurers have control functions, including for risk management, compliance, actuarial matters and internal audit. Control functions add to the governance checks and balances of the insurer and provide the necessary assurance to the Board in the fulfilment of its oversight duties.

CF 8.3.a The group-wide supervisor requires the Head of the IAIG to ensure that:

- the tasks and responsibilities of the group-wide control functions, whether located at the level of the Head of the IAIG or within another legal entity of the IAIG, are clearly defined; and
- these group-wide control functions do not duplicate, limit or restrict the tasks and responsibilities of control functions at the insurance legal entity level.

CF 8.3.b The group-wide supervisor requires the Head of the IAIG to ensure that the group-wide control functions:

- coordinate with the control functions at the insurance legal entity level; and
- ensure effective group-wide management reporting.
8.3.2 The existence of control functions does not relieve the Board or Senior Management of their respective governance and related responsibilities.

8.3.3 The control functions should be subject to periodic review either by the internal audit function (for control functions other than internal audit) or an objective external reviewer.

**Appointment and dismissal of heads of control functions**

8.3.4 The appointment, performance assessment, remuneration, discipline and dismissal of the head of control functions should be done with the approval of, or after consultation with, the Board or the relevant Board committee. For the head of the internal audit function, the appointment, performance assessment, remuneration, discipline and dismissal should be done by the Board, its Chair or the Audit Committee.

8.3.5 The insurer should notify the supervisor of the reasons for dismissals of heads of control functions.

**Authority and independence of control functions**

8.3.6 The Board should approve the authority and responsibilities of each control function to allow each control function to have the authority and independence necessary to be effective.

8.3.7 The authority and responsibilities of each control function should be set out in writing and made part of, or referred to in, the governance documentation of the insurer. The head of each control function should periodically review such document and submit suggestions for any changes to Senior Management and the Board for approval, where appropriate.

8.3.8 A control function should be led by a person of appropriate level of authority. The head of the control function should not have operational business line responsibilities.

8.3.9 Insurers should organise each control function and its associated reporting lines into the insurer’s organisational structure in a manner that enables such function to operate and carry out their roles effectively. This includes direct access to the Board or the relevant Board committee.

8.3.10 Notwithstanding the possibility for insurers to combine certain control functions, a control function should be sufficiently independent from Senior Management and from other functions to allow its staff to:

- serve as a component of the insurer’s checks and balances;
- provide an objective perspective on strategies, issues, and potential violations related to their areas of responsibility; and
- implement or oversee the implementation of corrective measures where necessary.

8.3.11 Each control function should avoid conflicts of interest. Where any conflicts remain and cannot be resolved with Senior Management, these should be brought to the attention of the Board for resolution.

8.3.12 Each control function should have the authority to communicate on its own initiative with any employee and to have unrestricted access to information in any business unit that it needs to carry out its
responsibilities. The control functions should have the right to conduct investigations of possible breaches and to request assistance from specialists within the insurer, eg legal and internal audit, or engage external specialists to perform the task. The control functions should be free to report to Senior Management or the Board on any irregularities or possible breaches disclosed by its investigations, without fear of retaliation or disfavour from management.

**Resources and qualifications of the control functions**

8.3.13 Each control function should have the resources necessary to fulfil its responsibilities and achieve the specific goals in its areas of responsibility. This includes qualified staff and appropriate IT/management information processes. The function should be organised in an appropriate manner to achieve its goals.

8.3.14 The head of each control function should review regularly the adequacy of the function's resources and request adjustments from Senior Management as necessary. Where the head of a control function has a major difference of opinion with Senior Management on the resources needed, the head of the control function should bring the issue to the Board or relevant Board Committee for resolution.

8.3.15 Persons who perform control functions should be suitable for their role and meet any applicable professional qualifications and standards. Higher expectations apply to the head of each control function. Persons who perform control functions should receive regular training relevant to their role to remain up to date on the developments and techniques related to their areas of responsibility.

**Board access and reporting by the control functions; Board assessment of control functions**

8.3.16 The Board should grant the head of each control function the authority and responsibility to report periodically to it or one of its committees. The Board should determine the frequency and depth of such reporting so as to permit timely and meaningful communication and discussion of material matters. The reporting should include, among other things:

- information as to the function’s strategy and longer term goals and the progress in achieving these;
- annual or other periodic operational plans describing shorter term goals and the progress in achieving these; and
- resources (such as personnel, budget, etc.), including an analysis on the adequacy of these resources.

8.3.17 In addition to periodic reporting, the head of each control function should have the opportunity to communicate directly and to meet periodically (without the presence of management) with the Chair of any relevant Board committee (eg Audit or Risk Committee) and/or with the Chair of the full Board. The Board should periodically assess the performance of each control function. This may be done by the full Board, by the Chair of the Board, by the relevant Board committee or by the Chair of the relevant Board committee.
CF 8.3.c The group-wide supervisor requires the IAIG Board to ensure that the group-wide control functions:

- are not combined, unless exceptional circumstances apply;
- are subject to periodic review either by the group-wide internal audit function (for control functions other than internal audit) or an independent external party;
- have unrestricted access and periodically report to the IAIG Board or one of its committees; and
- have access to people and information, on a group-wide or legal entity level, to carry out their responsibilities.

CF 8.3.c.1 The group-wide supervisor should assess on a case-by-case basis whether the exceptional circumstances justify a combination of group-wide control functions on a time-limited basis.

CF 8.3.c.2 When assessing whether to allow for a combination of group-wide control functions, the group-wide supervisor should consider at least whether:

- the combination would give rise to potential conflicts of interest and how they could be resolved – either for affected individuals and/or the combined group-wide control functions (for example, where one group-wide control function has responsibilities for reviewing another);
- the individuals in charge of combined group-wide control functions would have the necessary availability or resources to perform efficiently the tasks related to both functions; and
- the combined group-wide control functions would undermine the ability of either function to fulfil its responsibilities in assisting the IAIG Board and Senior Management in maintaining adequate oversight across the IAIG. This risk is likely to be greater where control functions across different lines of defence are combined.

Risk management function

8.4 The supervisor requires the insurer to have an effective risk management function capable of assisting the insurer to:

- identify, assess, monitor, mitigate and report on its key risks in a timely way; and
- promote and sustain a sound risk culture.

8.4.1 A robust risk management function that is well positioned, resourced and properly authorised and staffed is an essential element of an effective risk management system. Within some insurers, and particularly at larger or more complex ones, the risk management function is typically led by a Chief Risk Officer.

Access and reporting to the Board by the risk management function
8.4.2 The risk management function should have access and provide written reports to the Board as required by the Board, typically on matters such as:

- an assessment of risk positions and risk exposures and steps being taken to manage them;
- an assessment of changes in the insurer's risk profile relative to risk appetite;
- where appropriate, an assessment of pre-defined risk limits;
- where appropriate, risk management issues resulting from strategic affairs such as corporate strategy, mergers and acquisitions and major projects and investments;
- an assessment of risk events and the identification of appropriate remedial actions.

8.4.3 The head of the risk management function should have the authority and obligation to inform the Board promptly of any circumstance that may have a material effect on the risk management system of the insurer.

Main activities of the risk management function

8.4.4 The risk management function should establish, implement and maintain appropriate mechanisms and activities including to:

- assist the Board and Senior Management in carrying out their respective responsibilities, including by providing specialist analyses and performing risk reviews;
- identify the individual and aggregated risks (actual, emerging and potential) the insurer faces;
- assess, aggregate, monitor and help manage and otherwise address identified risks effectively; this includes assessing the insurer’s capacity to absorb risk with due regard to the nature, probability, duration, correlation and potential severity of risks;
- gain and maintain an aggregated view of the risk profile of the insurer both at a legal entity and/or group-wide level;
- establish a forward-looking assessment of the risk profile;
- evaluate the internal and external risk environment on an ongoing basis in order to identify and assess potential risks as early as possible. This may include looking at risks from different perspectives, such as by territory or by line of business;
- consider risks arising from remuneration arrangements and incentive structures;
- conduct regular stress testing and scenario analyses as defined in ICP 16 (Enterprise Risk Management for Solvency Purposes);
- regularly provide written reports to Senior Management, Key Persons in Control Functions and the Board on the insurer’s
risk profile and details on the risk exposures facing the insurer and related mitigation actions as appropriate;

- document and report material changes affecting the insurer’s risk management system to the Board to help ensure that the system is maintained and improved; and

- conduct regular self-assessments and implement or monitor the implementation of any needed improvements.

**CF 8.4.a** The group-wide supervisor requires the Head of the IAIG to ensure that the group-wide risk management function, at least:

- coordinates and monitors consistent and effective implementation of risk management mechanisms and activities at the group-wide level and at the legal entity level;

- sets out expectations relating to the group-wide responsibilities and reporting of the risk management function of each legal entity within the IAIG, as applicable;

- sets policies and processes for effective interaction between the risk management functions of the Head of the IAIG and of the legal entities within the IAIG;

- assesses the group-wide risk management strategy, which is approved by the IAIG Board, and ensures that this risk management strategy, including supporting processes, is implemented at the group-wide level;

- annually plans and conducts an assessment of risks at the group-wide level, including those that arise from the legal entity and material business line level; and

- provides at least quarterly risk management reports to the IAIG Board or one of its committees.

**CF 8.4.b** The group-wide supervisor requires the group-wide risk management function to be independent from risk taking activities.

**Compliance function**

8.5 The supervisor requires the insurer to have an effective compliance function capable of assisting the insurer to i) meet its legal, regulatory and supervisory obligations and ii) promote and sustain a compliance culture, including through the monitoring of related internal policies.

8.5.1 The compliance function has a broader role than merely monitoring compliance with laws, regulations and supervisory requirements; monitoring compliance with internal policies and promoting and sustaining a compliance culture within the insurer are equally important aspects of this control function.

8.5.2 Compliance starts at the top. The Board is ultimately responsible for establishing standards for honesty and integrity throughout the insurer and for creating an effective corporate culture that emphasises them. This should include a code of conduct or other appropriate mechanism as evidence of the insurer’s commitment to comply with all applicable
laws, regulations, supervisory requirements and internal policies, and conduct its business ethically and responsibly.

8.5.3 As part of this commitment, the insurer has in place a robust and well positioned, resourced and properly authorised and staffed compliance function. Within some insurers, particularly larger or more complex ones, such a function is typically led by a Chief Compliance Officer.

Board access and reporting of the compliance function

8.5.4 The compliance function should have access and provide written reports to Senior Management, Key Persons in Control Functions and the Board on matters such as:

- an assessment of the key compliance risks the insurer faces and the steps being taken to address them;
- an assessment of how the various parts of the insurer (e.g., divisions, major business units, product areas) are performing against compliance standards and goals;
- any compliance issues involving management or persons in positions of major responsibility within the insurer, and the status of any associated investigations or other actions being taken;
- material compliance violations or concerns involving any other person or unit of the insurer and the status of any associated investigations or other actions being taken; and
- material fines or other disciplinary actions taken by any regulator or supervisor in respect of the insurer or any employee.

8.5.5 The head of the compliance function should have the authority and obligation to inform promptly the Chair of the Board directly in the event of any major non-compliance by a member of management or a material non-compliance by the insurer with an external obligation if in either case he or she believes that Senior Management or other persons in authority at the insurer are not taking the necessary corrective actions and a delay would be detrimental to the insurer or its policyholders.

Main activities of the compliance function

8.5.6 The compliance function should establish, implement and maintain appropriate mechanisms and activities including to:

- promote and sustain an ethical corporate culture that values responsible conduct and compliance with internal and external obligations; this includes communicating and holding training on an appropriate code of conduct or similar that incorporates the corporate values of the insurer, aims to promote a high level of professional conduct and sets out the key conduct expectations of employees;
- identify, assess, report on and address key legal and regulatory obligations, including obligations to the insurer's supervisor, and the risks associated therewith; such analyses should use risk and other appropriate methodologies;
• ensure the insurer monitors and has appropriate policies, processes and controls in respect of key areas of legal, regulatory and ethical obligation;

• hold regular training on key legal and regulatory obligations particularly for employees in positions of high responsibility or who are involved in high risk activities;

• facilitate the confidential reporting by employees of concerns, shortcomings or potential or actual violations in respect of insurer internal policies, legal or regulatory obligations, or ethical considerations; this includes ensuring there are appropriate means for such reporting;

• address compliance shortcomings and violations, including ensuring that adequate disciplinary actions are taken and any necessary reporting to the supervisor or other authorities is made; and

• conduct regular self-assessments of the compliance function and the compliance processes and implement or monitor needed improvements.

CF 8.5.a The group-wide supervisor requires the Head of the IAIG to ensure that the group-wide compliance function at least:

• coordinates and monitors consistent and effective implementation of compliance mechanisms and activities at the group-wide level and at the legal entity level;

• sets appropriate policies and processes regarding the legal and regulatory obligations of the IAIG and its legal entities;

• assesses the material legal and regulatory obligations and compliance risks of the IAIG, and the steps being taken to fulfil or address them, at least annually and as required by the Board;

• supports the IAIG Board in fostering an effective corporate culture throughout the IAIG;

• assesses how the IAIG itself is, and the legal entities within the IAIG are, performing against group-wide compliance standards and goals; and

• provides at least quarterly written reports on its activities to the IAIG’s Board or one of its committees.

Actuarial function

8.6 The supervisor requires the insurer to have an effective actuarial function capable of evaluating and providing advice regarding, at least, technical provisions, premium and pricing activities, capital adequacy, reinsurance and compliance with related statutory and regulatory requirements.
8.6.1 A robust actuarial function that is well positioned, resourced and properly authorised and staffed is essential for the proper operation of the insurer. It plays a key role as part of the insurer’s overall systems of risk management and internal controls.

Board access and reporting of the actuarial function

8.6.2 The actuarial function should have access to and periodically report to the Board on matters such as:

- any circumstance that may have a material effect on the insurer from an actuarial perspective;
- the adequacy of the technical provisions and other liabilities;
- distribution of profits to participating policyholders;
- stress testing and capital adequacy assessment with regard to the prospective solvency position of the insurer; and
- any other matters as determined by the Board.

8.6.3 Written reports on actuarial evaluations should be made to the Board, Senior Management, or other Key Persons in Control Functions or the supervisor as necessary or appropriate or as required by legislation.

Main activities of the actuarial function

8.6.4 The actuarial function evaluates and provides advice to the insurer on matters including:

- the insurer’s insurance liabilities, including policy provisions and aggregate claim liabilities, as well as determination of reserves for financial risks;
- asset liability management with regard to the adequacy and the sufficiency of assets and future revenues to cover the insurer’s obligations to policyholders and capital requirements, as well as other obligations or activities;
- the insurer’s investment policies and the valuation of assets;
- an insurer’s solvency position, including a calculation of minimum capital required for regulatory purposes and liability and loss provisions;
- an insurer’s prospective solvency position by conducting capital adequacy assessments and stress tests under various scenarios, and measuring their relative impact on assets, liabilities, and actual and future capital levels;
- risk assessment and management policies and controls relevant to actuarial matters or the financial condition of the insurer;
- the fair treatment of policyholders with regard to distribution of profits awarded to participating policyholders;
- the adequacy and soundness of underwriting policies;
• the development, pricing and assessment of the adequacy of reinsurance arrangements;
• product development and design, including the terms and conditions of insurance contracts and pricing, along with estimation of the capital required to underwrite the product;
• the sufficiency, accuracy and quality of data, the methods and the assumptions used in the calculation of technical provisions;
• the research, development, validation and use of internal models for internal actuarial or financial projections, or for solvency purposes as in the ORSA; and
• any other actuarial or financial matters determined by the Board.

8.6.5 Where required, the actuarial function may also provide to the supervisor certifications on the adequacy, reasonableness and/or fairness of premiums (or the methodology to determine the same) and certifications or statements of actuarial opinion.

8.6.6 The supervisor should clearly define when such certifications or statements of actuarial opinion need to be submitted to the supervisor. When these are required to be submitted, the supervisor should also clearly define both the qualifications of those permitted to certify or sign such statements and the minimum contents of such an opinion or certification.

---

**CF 8.6.a** The group-wide supervisor requires the Head of the IAIG to ensure that the group-wide actuarial function performs an overview of the group-wide actuarial activities, functions and risks emanating from insurance legal entities within the IAIG. This overview includes, at least:

- risk assessment and management policies and controls relevant to govern the activities of the group-wide actuarial function or financial condition;
- actuarial concerns related to any insurance legal entity within the IAIG, or the IAIG as a whole, as applicable;
- the IAIG’s solvency position, based on calculations of group-wide regulatory capital requirements and technical provisions;
- the IAIG’s prospective solvency position, based on capital adequacy assessments and stress tests, under various scenarios, and their relative impact on assets, liabilities, and actual and future capital levels;
- the adequacy of the IAIG’s reinsurance arrangements; and
- actuarial-related risk modelling in the IAIG’s Own Risk and Solvency Assessment (ORSA) and use of internal models.
CF 8.6.b The group-wide supervisor requires the Head of the IAIG to ensure that
the group-wide actuarial function:

- works with the actuarial functions at the insurance legal entity
  level to review actuarial information; and
- provides independent advice and at least annually reports to
  the IAIG Board or one of its committees on the insurance
  activities and risks posed to the IAIG.

Appointed actuary

8.6.7 Some jurisdictions may require an “appointed actuary”, “statutory
actuary”, or “responsible actuary” (referred to here as an “Appointed
Actuary”) to perform certain functions, such as determining or providing
advice on an insurer’s compliance with regulatory requirements for
 certifications or statements of actuarial opinion. The tasks and
responsibilities of the Appointed Actuary should be clearly defined and
should not limit or restrict the tasks and responsibilities of other
individuals performing actuarial functions.

8.6.8 The insurer should be required to report the Appointed Actuary’s
appointment to the supervisor.

8.6.9 The Appointed Actuary should not hold positions within or outside of the
insurer that may create conflicts of interest or compromise his or her
independence. If the Appointed Actuary is not an employee of the
insurer, the Board should determine whether the external actuary has
any potential conflicts of interest, such as if his or her firm also provides
auditing or other services to the insurer. If any such conflicts exist, the
Board should subject them to appropriate controls or choose another
Appointed Actuary.

8.6.10 If an Appointed Actuary is replaced, the insurer should notify the
supervisor and give the reasons for the replacement. In some
jurisdictions, such a notification includes statements from both the
insurer and the former Appointed Actuary as to whether there were any
disagreements with the former Appointed Actuary over the content of the
actuary’s opinion on matters of risk management, required disclosures,
scopes, procedures, or data quality, and whether or not any such
disagreements were resolved to the former Appointed Actuary’s
satisfaction.

8.6.11 In some jurisdictions, the Appointed Actuary also has the obligation to
notify the supervisor if he or she resigns for reasons connected with his
or her duties as an Appointed Actuary or with the conduct of the insurer’s
business and give the reasons for resigning. The Appointed Actuary
should also notify the supervisor and provide an explanation if his or her
appointment is revoked by the insurer.

8.6.12 The supervisor should have the authority to require an insurer to replace
an Appointed Actuary when such person fails to adequately perform
required functions or duties, is subject to conflicts of interest or no longer
meets the jurisdiction’s eligibility requirements.

Internal audit function
8.7 The supervisor requires the insurer to have an effective internal audit function capable of providing the Board with independent assurance in respect of the quality and effectiveness of the insurer’s corporate governance framework.

8.7.1 One of the oversight roles of the Board is to ensure that the information provided by the internal audit function allows the Board to effectively validate the effectiveness of the internal control system.

8.7.2 The internal audit function should provide independent assurance to the Board through general and specific audits, reviews, testing and other techniques in respect of matters such as:

- the overall means by which the insurer preserves its assets and those of policyholders, and seeks to prevent fraud, misappropriation or misapplication of such assets;
- the reliability, integrity and completeness of the accounting, financial and risk reporting information, as well as the capacity and adaptability of IT architecture to provide that information in a timely manner to the Board and Senior Management;
- the design and operational effectiveness of the insurer’s individual controls in respect of the above matters, as well as of the totality of such controls (the internal controls system);
- other matters as may be requested by the Board, Senior Management, the supervisor or the external auditor; and
- other matters which the internal audit function determines should be reviewed to fulfil its mission, in accordance with its charter, terms of reference or other documents setting out its authority and responsibilities.

Authority and independence of the internal audit function

8.7.3 To help ensure objectivity, the internal audit function is independent from management and other control functions and is not involved operationally in the business. The internal audit function’s ultimate responsibility is to the Board, not management. To help ensure independence and objectivity, the internal audit function should be free from conditions that threaten its ability to carry out its responsibilities in an unbiased manner. In carrying out its tasks, the internal audit function forms its judgments independently. If necessary, the internal audit function should consider the need to supplement its own assessment with third party expertise in order to make objective and independent decisions.

8.7.4 The Board should grant suitable authority to the internal audit function, including the authority to:

- access and review any records or information of the insurer which the internal audit function deems necessary to carry out an audit or other review;
- undertake on the internal audit function’s initiative a review of any area or any function consistent with its mission;
require an appropriate management response to an internal audit report, including the development of a suitable remediation, mitigation or other follow-up plan as needed; and

decline doing an audit or review, or taking on any other responsibilities requested by management, if the internal audit function believes this is inconsistent with its mission or with the strategy and audit plan approved by the Board. In any such case, the internal audit function should inform the Board or the Audit Committee and seek their guidance.

Board access and reporting of the internal audit function

8.7.5 The head of the internal audit function reports to the Board (or to any member who is not part of the management) or to the Audit Committee if one exists (or its Chair). In its reporting, the internal audit function should cover matters such as:

- the function’s annual or other periodic audit plan, detailing the proposed areas of audit focus, and any significant modifications to the audit plan;
- any factors that may be adversely affecting the internal audit function’s independence, objectivity or effectiveness;
- material findings from audits or reviews conducted; and
- the extent of management’s compliance with agreed upon corrective or risk mitigating measures in response to identified control deficiencies, weaknesses or failures, compliance violations or other lapses.

8.7.6 In addition to periodic reporting, the head of internal audit should be authorised to communicate directly, and meet periodically, with the head of the Audit Committee or the Chair of the Board without management present.

Main activities of the internal audit function

8.7.7 The audit function should carry out such activities as are needed to fulfil its responsibilities. These activities include:

- establishing, implementing and maintaining a risk-based audit plan to examine and evaluate alignment of the insurer's processes with their risk culture;
- monitoring and evaluating the adequacy and effectiveness of the insurer’s policies and processes and the documentation and controls in respect of these, on a legal entity and group-wide basis and on an individual subsidiary, business unit, business area, department or other organisational unit basis;
- reviewing levels of compliance by employees, organisational units and third parties with laws, regulations and supervisory requirements, established policies, processes and controls, including those involving reporting;
• evaluating the reliability, integrity and effectiveness of management information processes and the means used to identify, measure, classify and report such information;
• monitoring that identified risks are effectively addressed by the internal control system;
• evaluating the means of safeguarding insurer and policyholder assets and, as appropriate, verifying the existence of such assets and the required level of segregation in respect of insurer and policyholder assets;
• monitoring and evaluating the effectiveness of the insurer's control functions, particularly the risk management and compliance function; and
• coordinating with the external auditors and, to the extent requested by the Board and consistent with applicable law, evaluating the quality of performance of the external auditors.

8.7.8 In carrying out the above tasks, the internal audit function should ensure all material areas of risk and obligation of the insurer are subject to appropriate audit or review over a reasonable period of time. Among these areas are those dealing with:

• market, underwriting, credit, liquidity, operational, conduct of business, as well as reputational issues derived from exposure to those risks;
• accounting and financial policies and whether the associated records are complete and accurate;
• extent of compliance by the insurer with applicable laws, regulations and supervisory requirements from all relevant jurisdictions;
• intra-group transactions, including intra-group risk transfer and internal pricing;
• adherence by the insurer to the insurer’s remuneration policy;
• the reliability and timeliness of escalation and reporting processes, including whether there are confidential means for employees to report concerns or violations and whether these are properly communicated, offer the reporting employee protection from retaliation, and result in appropriate follow up; and
• the extent to which any non-compliance with internal policies or external legal or regulatory obligations is documented and appropriate corrective or disciplinary measures are taken including in respect of individual employees involved.

8.7.9 Subject to applicable laws on record retention, the internal audit function should keep records of all areas and issues reviewed so as to provide evidence of these activities over time.
CF 8.7.a The group-wide supervisor requires the IAIG Board to ensure that the group-wide internal audit function provides independent assessment and assurance to the IAIG Board regarding, at least, the:

- group-wide policies, processes, and controls;
- overall means by which the IAIG preserves its assets, and those of policyholders, and seeks to prevent fraud, misappropriation or misapplication of such assets;
- reliability, integrity and completeness of the accounting, financial, management, information technology systems and risk reporting information;
- capacity and adaptability of information technology systems to provide information in an accurate and timely manner to the IAIG Board and Senior Management; and
- design and operational effectiveness of the group-wide risk management and internal controls systems, both individually and overall.

CF 8.7.a.1 The group-wide internal audit function coordinates with the internal audit functions and external auditors of the legal entities within the IAIG when providing assessment and assurance to the IAIG Board.

Outsourcing of material activities or functions

8.8 The supervisor requires the insurer to retain at least the same degree of oversight of, and accountability for, any outsourced material activity or function (such as a control function) as applies to non-outsourced activities or functions.

8.8.1 Outsourcing should not materially increase risk to the insurer or materially adversely affect the insurer’s ability to manage its risks and meet its legal and regulatory obligations.

8.8.2 The Board and Senior Management remain responsible in respect of functions or activities that are outsourced.

8.8.3 The supervisor should require the Board to have review and approval processes for outsourcing of any material activity or function and to verify, before approving, that there was an appropriate assessment of the risks, as well as an assessment of the ability of the insurer’s risk management and internal controls to manage them effectively in respect of business continuity. The assessment should take into account to what extent the insurer’s risk profile and business continuity could be affected by the outsourcing arrangement.

8.8.4 The supervisor should require insurers which outsource any material activity or function to have in place an appropriate policy for this purpose, setting out the internal review and approvals required and providing guidance on the contractual and other risk issues to consider. This includes considering limits on the overall level of outsourced activities at the insurer and on the number of activities that can be outsourced to the same service provider. Because of the particularly important role that
control activities and control functions play in an insurer’s corporate governance framework, the supervisor should consider issuing additional requirements for their outsourcing or dedicating more supervisory attention to any such outsourcing.

8.8.5 Outsourcing relationships should be governed by written contracts that clearly describe all material aspects of the outsourcing arrangement, including the rights, responsibilities and expectations of all parties. When entering into or varying an outsourcing arrangement, the Board and Senior Management should consider, among other things:

- how the insurer’s risk profile and business continuity will be affected by the outsourcing;
- the service provider’s governance, risk management and internal controls and its ability to comply with applicable laws and regulations;
- the service providers’ service capability and financial viability; and
- succession issues to ensure a smooth transition when ending or varying an outsourcing arrangement.

8.8.6 In choosing an outsourcing provider, the Board or Senior Management should be required to satisfy themselves as to the expertise, knowledge and skills of such provider.

8.8.7 Outsourcing arrangements should be subject to periodic reviews. Periodic reports should be made to management and the Board.

### CF 8.8.a
The group-wide supervisor requires the Head of the IAIG to have:

- a policy which takes into account the potential impact on the IAIG of outsourcing of any material group-wide activity or function, sets out the internal review and approvals required, and provides guidance on the contractual and other risk issues to consider; and
- written contracts that describe all material aspects of the outsourcing arrangement, including the rights, responsibilities and expectations of all parties.

### CF 8.8.b
When choosing a service provider (either internal or external) for a material group-wide activity or function that is to be outsourced, the group-wide supervisor requires the Head of the IAIG to:

- assess the potential service provider’s ability and capacity to deliver the outsourced activities or functions;
- perform due diligence on the service provider with respect to explicit or potential conflicts of interest that would jeopardise the fulfilment of the needs of the IAIG; and
- ensure that the service provider has the necessary resources to perform the outsourced activities or functions in a proper and reliable way, as well as adequate contingency plans in
place to deal with emergency situations or business disruptions.

**CF 8.8.b.1** Activities or functions may be outsourced to an internal service provider (i.e., a legal entity which is part of the IAIG) or an external service provider. In the case of an internal service provider, the assessment and due diligence process may be different from the case of an external service provider. For example, if the internal service provider has already been assessed recently, some aspects of the assessment may not need to be repeated. Even though the assessment process used may vary between an internal or external service provider, it should be equally robust.

**CF 8.8.c** The group-wide supervisor requires the Head of the IAIG to ensure that outsourcing (either internal or external) of a group-wide activity or function does not impede effective supervision of the Head of the IAIG.

**CF 8.8.d** The group-wide supervisor requires the Head of the IAIG to carry out a periodic review of the cumulative risks of outsourced activities and functions and address identified risks.
ICP 9 Supervisory Review and Reporting

The supervisor uses off-site monitoring and on-site inspections to: examine the business of each insurer; evaluate its financial condition, conduct of business, corporate governance framework and overall risk profile; and assess its compliance with relevant legislation and supervisory requirements. The supervisor obtains the necessary information to conduct effective supervision of insurers and evaluate the insurance market.

Introductory Guidance

9.0.1 This ICP focuses on the general processes and procedures supervisors should have in place with respect to supervisory review and reporting. For the purpose of this ICP, off-site monitoring and on-site inspections are collectively referred to as “supervisory review”. Aspects of what supervisors may require or assess as part of supervisory review and reporting on specific areas (such as solvency, governance, conduct of business) are dealt with in other ICPs with respect to those ICPs’ specific areas of focus.

9.0.2 Supervision is a dynamic process that includes:

- developing and implementing a framework for supervisory review and reporting;
- developing and executing supervisory plans for insurers;
- analysis of reported and other relevant information;
- feedback and dialogue between the supervisor and insurers;
- intervention, including any preventive/corrective measures or sanctions, where necessary;
- follow-up (including updating the supervisory framework and/or adjusting the frequency and intensity of assessment under supervisory plans); and
- cooperation and coordination with other relevant supervisors and authorities where necessary.

CF 9.0.a The group-wide supervisor engages with the Head of the IAIG and, in cooperation with other involved supervisors, carries out a supervisory review to assess the IAIG’s compliance with relevant legislation and supervisory requirements applicable at the level of the Head of the IAIG.

CF 9.0.a.1 This supervisory review may be conducted within the supervisory college (see ComFrame material under ICP 25 Supervisory Cooperation and Coordination).

CF 9.0.a.2 Cooperation with other involved supervisors includes them providing relevant information concerning the insurance legal entities within the IAIG that they supervise. It is the responsibility of the group-wide supervisor to assess the IAIG’s compliance with the relevant
9.1 The supervisor has a documented framework which outlines its approach for supervisory review and reporting. The supervisor reviews periodically that this framework remains effective and adequate.

9.1.1 While the framework should encompass all insurers within a jurisdiction, it should be sufficiently flexible with varying supervisory review and reporting requirements that allow for taking a risk-based approach. For example, the supervisory processes and activities which are appropriate for a complex, internationally active insurer may be different than those for a small, local insurer.

9.1.2 The supervisor should have documented procedures and/or guidelines for consistent and regular supervisory review and reporting at an appropriate level of depth.

9.1.3 The supervisor should be able to process data in a timely and effective way and have processes and procedures to collect and store reported data securely in an electronic format. The framework should have the necessary protections for confidential information in the possession of the supervisor and for the sharing of information (see ICP 2 Supervisor and ICP 3 Information Sharing and Confidentiality Requirements).

9.1.4 The framework should enable the supervisor to coordinate on-site inspection and off-site monitoring activities. The supervisor should document the results of these activities in such a way that they are accessible and comprehensible to all involved staff.

9.1.5 The supervisor should establish both qualitative and quantitative methods for assessing insurers, in a consistent manner and on an ongoing basis. The supervisor should develop monitoring tools to identify potential risks within or affecting the insurer or its customers in a timely manner.

9.1.6 The framework should enable the supervisor to evaluate the insurer’s business, financial condition, conduct of business and corporate governance framework to determine the insurer’s overall risk profile. In order to achieve this objective, the supervisor should have an understanding of at least the insurer’s:

- current and prospective solvency, including assets and liabilities and off-balance sheet commitments;
- capital resources management;
- technical operations (eg actuarial methods, underwriting policy, reinsurance policy);
- treatment of customers and whether any activities being engaged in are not fair, lawful or proper;
- corporate culture, business objectives and strategies and business models;
- the systems of risk management and internal controls;
• organisational structure; and

• compliance with supervisory requirements.

9.1.7 The supervisor should assess the insurer’s enterprise risk management framework for the identification and quantification of risks, and evaluate whether business activities and/or internal practices/processes reflect the insurer’s risk assessment. The supervisor should compare the risk profile of the insurer with its risk-carrying capacity and seek to detect issues that may adversely affect its capacity to meet obligations towards policyholders. The framework should enable the supervisor to analyse trends and compare risk assessments including against any stress test outcomes.

9.1.8 The framework should include assessments of the risks to which insurers are exposed and the risks which insurers may pose to policyholders, the insurance sector and financial stability. These assessments should include risks which may lead to an insurer’s distress or disorderly failure or which may be transmitted through collective activities or exposures of a number of insurers and that may have a serious negative impact on financial stability (see ICP 24 Macroprudential Supervision).

9.1.9 The framework should include sufficiently comprehensive and regular communication between the supervisor and insurers. This communication should involve senior level representatives as well as specialised areas within both the supervisor and insurers, and for insurance groups, may include contact with non-regulated and parent entities. Additionally, there should be appropriate communication channels between the supervisor and the external auditors for the exchange of information relevant to carrying out their respective statutory responsibilities.

9.1.10 The framework should promote pro-active and early intervention by the supervisor, in order to enable the insurer to take appropriate action to mitigate risks and/or minimise current or future problems.

Review of the Framework

9.1.11 The supervisor’s review of its framework should pay due attention to the evolving risks which may be posed by insurers and to risks to which insurers may be exposed.

9.1.12 As part of the framework review, the supervisor should confer regularly internally as well as externally with other relevant authorities and stakeholders so that all relevant information is being appropriately assessed and analysed, and to facilitate the identification of potential new risks or emerging market trends that the framework may need to address. While the framework should be updated accordingly, the supervisor should be mindful that such updates are not done so frequently or in a manner that causes unnecessary disruption to the supervisory process and/or excessive costs to the supervisor and insurers.

9.1.13 The framework should be suitably flexible so that it may adapt easily and in a timely manner to domestic and global developments in, for example, legislation, the insurance and broader financial markets, or international standards.
9.1.14 The framework of the group-wide supervisor should take into account all entities identified within the scope of the insurance group (see ICP 23 Group-wide Supervision). While insurance groups may have different approaches to governance structures – either more centralised or more decentralised – the framework should include appropriate tools for supervisory review and reporting for all relevant entities (see Issues Paper on Approaches to Group Corporate Governance).

9.1.15 Although the group-wide supervisor may not have the power to conduct supervisory review and reporting of non-regulated entities, it should assess, at least, the potential adverse impact of such non-regulated entities on the group.

9.1.16 Similarly, where the group-wide supervisor does not have the power to conduct supervisory review and reporting of a group legal entity in another jurisdiction, it should communicate and coordinate with the other involved supervisor accordingly. For example, the group-wide supervisor could approach the other involved supervisor to propose a joint on-site inspection or recommend that the other involved supervisor undertake such an inspection, when deemed necessary.

9.2 As part of the supervisory framework, the supervisor develops supervisory plans which set priorities and determine the appropriate depth and level of off-site monitoring and on-site inspection activity.

9.2.1 A supervisory plan is a tool for supervisors to determine the frequency, scope and depth of supervisory review activities. It could be generic (e.g. addressing categories or groups of insurers) or specific (addressing individual insurers).

9.2.2 In establishing a supervisory plan, the supervisor should assess and determine the key areas of risk to which insurers are exposed or risks which insurers may pose, using its judgement and the information, methodologies and tools at its disposal.

9.2.3 The circular nature of the supervisory framework provides a variety of inputs to help develop and/or adjust supervisory plans. For example, market analyses, internal models, insurers’ own risk and solvency assessments (ORSA), horizontal reviews, stress/scenario testing, previous risk and conduct assessments, work of external auditors and information gathered as a result of supervisory reporting requirements provide information the supervisor should use as input in determining the scope and frequency of off-site monitoring and on-site inspections.

**Group-wide supervisory plan and risk assessment**

CF 9.2.a The group-wide supervisor’s supervisory plan for an IAIG includes a group-wide risk assessment that is conducted at least annually.

CF 9.2.a.1 The group-wide risk assessment of an IAIG should be conducted with inputs from the supervisory process.

CF 9.2.a.2 The group-wide supervisor should consider the results of the IAIG’s enterprise risk management framework including its ORSA assessment, as part of the group-wide risk assessment.
CF 9.2.a.3  The group-wide supervisor should use information gathered on legal entities within the IAIG from other involved supervisors as another basis for the assessment of group-wide risk. Where other involved supervisors identify risks that may be relevant to the supervision of the IAIG at the group level, they should share their individual risk assessment.

CF 9.2.a.4  The group-wide supervisor should consider inputs from other relevant supervisors not involved in the direct supervision of the IAIG such as macro-prudential analysis, anti-money laundering or combatting the financing of terrorism.

**Peer-group analysis**

CF 9.2.a.5  To the extent practicable and where useful, the group-wide supervisor should conduct an analysis of the IAIG’s peers as part of the group-wide risk assessment, in cooperation with group-wide supervisors of other IAIGs. Information in the public domain should be used for the purposes of the peer-group analysis. The group-wide supervisor may also use non-public information provided by other supervisors. If sharing non-public information for the purpose of the peer-group analysis, the group-wide supervisor should be conscious of the risk of sharing information that in certain situations could compromise the competitive advantage of the IAIG’s peers. The group-wide supervisor should consider whether it is appropriate to anonymise information shared.

CF 9.2.a.6  In conducting peer group analysis, the group-wide supervisor should consider issues such as:

- the similarity of business models and geographical scope of IAIGs;
- the size, type and structure of IAIGs; and
- internal IAIG practices and governance, including risk management.

CF 9.2.a.7  It is the group-wide supervisor’s responsibility to decide to what extent the outcomes of peer-group analysis are shared with other involved supervisors. Peer-group analysis is subject to confidentiality requirements (see ICP 3 Information Sharing and Confidentiality Requirements).

CF 9.2.b  The group-wide supervisor includes in its group-wide risk assessment of an IAIG, at least, an evaluation of the following:

- the complexity of the IAIG’s group structure and the resulting risks to effective group-wide supervision;
- the capital adequacy and the availability of capital to meet group-wide capital requirements taking into account the regulatory capital requirements for each insurance legal entity within the IAIG; and
• the impact of the complexity of the IAIG’s group structure on the effectiveness of its group-wide corporate governance framework.

CF 9.2.b.1 In conducting the group-wide risk assessment, the group-wide supervisor should consider:

- the alignment between the IAIG's competitive position, business plans and strategy, risk appetite, and risk-carrying capacity;
- the IAIG’s approach to its legal and regulatory obligations, its product distribution model and its proposals for dealing with specific areas of risk;
- non-regulated and non-financial legal entities within the IAIG;
- the adequacy and outcomes of the IAIG’s stress testing and scenario analysis (see ICP 16 Enterprise Risk Management for Solvency Purposes);
- the IAIG’s ability to meet policyholder obligations in both the near and long-term within the context of the risks arising from the macro environment in which the IAIG’s operates; and
- the potential impact that the IAIG’s distress or disorderly failure would have on policyholders, the insurance sector, and financial stability, as well as the impact from the IAIG’s contribution to collective activities or exposures that may have a serious negative impact on financial stability.

Complexity

CF 9.2.b.2 In conducting the group-wide risk assessment, the group-wide supervisor should consider:

- aggregated risk exposures that the IAIG has towards external counterparties, which can arise from direct and indirect exposures, on-balance and off-balance sheet items, regulated and non-regulated legal entities within the IAIG, the same or different financial sectors across the IAIG, or a combination or interaction of such exposures. The group-wide supervisor should evaluate if the Head of the IAIG has adequate oversight and has implemented an adequate risk management system to assess its aggregated credit, market, insurance and liquidity risk concentrations. Such risk concentrations should be viewed in the context of single or closely related drivers of risk that may have material impact on the IAIG;
- increased operational risk where the IAIG relies on significant cross-border services or support. Such cross-border activity may also increase the complexity of recovery and resolution planning. The group-wide supervisor should evaluate the effectiveness of the IAIG’s
policies, processes and systems, and assess whether the IAIG has adequate business continuity plan arrangements to mitigate such cross-border operational risk; and

• significant intra-group transactions which can give rise to contagion effects within the IAIG, or result in a circumvention of sectoral regulatory requirements. The group-wide supervisor should evaluate whether the Head of the IAIG has adequate oversight over all material intra-group transactions.

Capital adequacy

CF 9.2.b.3 In conducting the group-wide risk assessment, the group-wide supervisor should assess the adequacy of an IAIG’s capital position against group capital standards applicable at the level of the Head of the IAIG. The role of the group-wide supervisor in conducting and coordinating this assessment is particularly important in cases where the IAIG has a mixture of insurance, banking and securities sector operations.

CF 9.2.b.4 In conducting the group-wide risk assessment, the group-wide supervisor should identify situations that may give rise to double or multiple gearing. Such situations may occur within IAIGs which are not fully consolidated and when one legal entity holds regulatory capital issued by another entity within the IAIG, where the issuer is permitted to include the capital in meeting its own regulatory requirements. These situations can result in an overstatement of group capital. The group-wide supervisor should require that the capital adequacy assessments of the IAIG exclude intra-group holdings of regulatory capital if not performed on a fully consolidated basis.

CF 9.2.b.5 In conducting the group-wide risk assessment, the group-wide supervisor, in cooperation with other involved supervisors, should assess the fungibility of capital (its ability to absorb losses arising anywhere in the IAIG as needed). The group-wide supervisor should take into account regulatory, legal and other requirements that may affect the IAIG’s ability to transfer capital between entities, sectors and jurisdictions, both in normal circumstances and in a crisis.

Non-regulated and non-financial legal entities

CF 9.2.b.6 In conducting the group-wide risk assessment, the group-wide supervisor should consider the activities undertaken by non-regulated legal entities within the IAIG by assessing issues such as:

• the potential contagion risks arising from the activities of non-regulated legal entities due to interdependencies or exposures between the insurance legal entities and the non-regulated legal entities within the IAIG;

• the competence of the IAIG Board and Senior Management in understanding and managing the risks arising from the non-regulated legal entities, particularly if these entities are significant to the group;
• the strength of the group capital adequacy to support the insurance legal entities. Non-regulated legal entities’ contribution to the group capital adequacy could be assessed by calculation of a proxy capital requirement as if the legal entity were regulated or through deduction of the group’s interest in the non-regulated legal entity; and
• where risk has been transferred from regulated to non-regulated legal entities within the IAIG, the group-wide supervisor in cooperation with supervisors of the regulated entities should look through to the overall quantum and quality of assets in the non-regulated entities. The risk assessment should address third party participations and minority interests.

**Stress testing**

CF 9.2.b.7 In conducting the group-wide risk assessment, the group-wide supervisor should evaluate the results of group-wide stress tests that the IAIG performed.

**Macroprudential analysis**

CF 9.2.b.8 In conducting the group-wide risk assessment, the group-wide supervisor, with input from other involved supervisors, should consider the current and forecasted business and the macroeconomic environment in the material jurisdictions in which the IAIG operates. The group-wide supervisor should assess the cumulative potential impact from this on the operations of the IAIG as well as the impact of the IAIG’s distress, disorderly failure, or its contribution to collective activities or exposures, on financial stability. This analysis by the group-wide supervisor should also be incorporated into forward-looking stress testing to identify possible events or changes in market conditions.

### 9.3 The supervisor reviews outsourced material activities or functions to the same level as non-outsourced material activities or functions.

9.3.1 The supervisor should review outsourced material activities or functions through the insurer itself, but should also obtain information from, and conduct on-site inspections of, entities engaged in providing outsourced activities or functions for the insurer, where necessary.

9.3.2 The supervisory review process for outsourced material activities or functions may differ from the process used for non-outsourced activities or functions, provided that the supervisory outcomes are met.

9.3.3 Agreements between the insurer and entities providing the outsourced material activities or functions should be drawn up in such a way that the supervisor’s ability to conduct its review is not restricted.

**Supervisory reporting**

### 9.4 The Supervisor:

• establishes documented requirements for the regular reporting of qualitative and quantitative information from all insurers licensed in its jurisdiction;
• defines the scope, content and frequency of the information to be reported;
• sets out the relevant accounting and auditing standards to be used;
• requires that an external audit opinion is provided on annual financial statements;
• requires insurers to report on any material changes or incidents that could affect their condition or customers;
• requires insurers to correct inaccurate reporting as soon as possible; and
• requires more frequent reporting and/or additional information from insurers as needed.

9.4.1 Supervisory reporting requirements should apply to all insurers licensed in a jurisdiction, and form the general basis for off-site monitoring. Supervisory reporting requirements are a reflection of the supervisor’s needs and will thus vary by jurisdiction according to overall market structure and conditions and by insurer according to its nature, scale and complexity.

9.4.2 In setting supervisory reporting requirements, the supervisor may make a distinction for foreign insurers who are allowed to conduct insurance activities within the jurisdiction by way of a local branch or subsidiary or on a cross-border provision of services basis.

9.4.3 The supervisor should require insurers to report both quantitative and qualitative information, including at least:

• financial reports, which include at least a balance sheet and income statement as well as a statement of comprehensive income if appropriate;
• an external audit opinion on annual financial statements;
• off-balance sheet exposures;
• material outsourced functions and activities;
• a description of the insurer’s organisational structure, corporate governance framework and risk management and internal control systems; and
• information on complaints, claims, surrenders and lapses.

9.4.4 The supervisor should require insurers to utilise a consistent and clear set of instructions and definitions for any element in required reports that is not self-evident, in order to maximise comparability.

9.4.5 The supervisor may require that certain reports and information, such as solvency ratios or technical provisions, are subject to independent (internal or external) review, including audit and/or actuarial review.

9.4.6 While the supervisor sets out the relevant accounting and auditing standards to be used for supervisory reporting, the actual standards are generally established by a party other than the supervisor. To help
accounting and auditing standards reflect the nature of insurance business, the supervisor could provide guidance and practices to be used for areas such as fair value estimations and technical provisions.

9.4.7 The external audit of the annual financial statements should be conducted in accordance with auditing standards that are generally accepted internationally.

9.4.8 The supervisor should consider using the work of external auditors in order to support the supervisory review process. For example, the supervisor may utilize the external audits to identify: internal control weaknesses and possible audit material risks; issues resulting from regulatory and accounting changes; changes in insurance and financial risks; and issues encountered in applying the audit approach.

9.4.9 The supervisor should require the external auditor to report matters that are likely to be of material significance without delay. Such matters would include (indication of) material fraud and regulatory breaches or other significant findings identified in the course of the audit. Such information should be provided to the supervisor without the need for prior consent of the insurer and the external auditor should be duly protected from liability for any information disclosed to the supervisor in good faith.

9.4.10 Depending on the nature, scale and complexity of the insurer, more frequent reporting and/or additional information may be requested from specific insurers on a case-by-case basis.

9.4.11 The supervisor should require that information on changes that could materially impact the insurer’s risk profile, financial position, organisational structure, governance or treatment of its customers is provided by the insurer in a timely manner.

9.4.12 The supervisor periodically reviews its reporting requirements to ascertain that they still serve their intended objectives and to identify any gaps which need to be filled. Assessing the results of off-site monitoring and on-site inspections may help inform such a review.

**Group Perspectives**

9.4.13 The supervisor should require an insurance legal entity which is part of an insurance group to describe its group reporting structure, and to provide timely notification of any material changes to that structure and significant changes or incidents that could affect the soundness of the insurance group. The description of the reporting structure should include information on the relationships between entities within the insurance group, and on the nature and volume of material intra-group transactions. The supervisor may require information on the impact on the insurance legal entity of being part of an insurance group.

9.4.14 The supervisor may request and obtain relevant information about any entity within an insurance group, subject to applicable legal provisions and coordination with the supervisors of affected jurisdictions.

9.4.15 The group-wide supervisor should establish its supervisory reporting requirements on a group-wide basis in coordination with the other involved supervisors. Such coordination may help the group-wide supervisor understand what information is being reported and avoid any
gaps as well as facilitate the submission of information on group entities in other jurisdictions.

9.4.16 In order to better understand the group and its risks, the group-wide supervisor should require the group to submit information on the group structure, business operation and financial position of material entities within the insurance group and relationship among entities within the insurance group, including participation in other group entities and material intra-group transactions.

CF 9.4.a The group-wide supervisor requires the Head of the IAIG to report the reference ICS and, at the option of the group-wide supervisor, any additional reporting related to the ICS.

CF 9.4.a.1 Reporting to the group-wide supervisor should be on a confidential basis for the purpose of discussion in the supervisory college.

Off-site monitoring

9.5 The supervisor monitors insurers on an ongoing basis, based on communication with the insurer and analysis of information obtained through supervisory reporting as well as market and other relevant information.

9.5.1 The supervisor should be proactive and forward-looking in conducting effective off-site monitoring, and not rely only on historical data. The supervisor should analyse information obtained in a timely manner.

9.5.2 The results of off-site monitoring should influence the supervisory plan and help determine the content, nature, timing and frequency of on-site inspections. Off-site monitoring may also enable the early detection of problems so that prompt and appropriate supervisory responses can be taken before such problems become more serious.

9.5.3 Analysis by the supervisor may provide a deeper understanding of developing trends affecting an insurer and its customers. Analysis by business lines, customer grouping and/or distribution channels may provide insights into the insurer’s overall risk profile.

9.5.4 The supervisor should establish and follow documented procedures for the analysis and monitoring of the supervisory reporting that it receives. These may be conducted by individual supervisory staff using monitoring tools and/or specialised resources, as appropriate.

9.5.5 Examples of ways in which this Standard and its corresponding guidance can be pursued include the following [see text in Annex].

On-site inspection

9.6 The supervisor sets the objective, scope and timing for on-site inspections of insurers, develops corresponding work programmes and conducts such inspections.

9.6.1 On-site inspections help the supervisor to identify strengths and weaknesses within an insurer, and to assess and analyse the risks to which an insurer and its customers are exposed.
9.6.2 On-site inspections may supplement the analysis from off-site monitoring and provide the supervisor with the opportunity to verify information it has received. On-site inspection may also help detect problems that may not be apparent through off-site monitoring. It is important that on-site inspections are coordinated with off-site monitoring to increase efficiency and avoid duplication of work.

9.6.3 On-site inspections should be tailored to the particular insurer and its risks. However, an on-site inspection work programme should remain flexible since new priorities might arise.

9.6.4 The on-site inspection work programme should take account of the insurer’s distribution model, the nature, size and profile of its customer base and its relative importance in the market. On-site inspections should be more frequent and more in-depth for insurers which are in a difficult financial position or where there is concern that their business practices pose a high risk of negative customer outcomes.

9.6.5 The supervisor may use independent experts (see ICP 2 Supervisor) to conduct part of an on-site inspection, for instance when additional resources or specific expertise is needed.

9.6.6 The supervisor can conduct on-site inspections on either a broad or targeted basis. The purpose of a broad on-site inspection is to assess the overall condition, activities and risk-profile of the insurer. A targeted on-site inspection is focused on a specific area or areas of an insurer, such as a particular key activity or process. Targeted on-site inspections can also be carried out across a number of insurers based on a specific theme, activity or risk (sometimes called “thematic reviews”). Targeted on-site inspections can be very effective in focusing supervisory resources quickly on those areas requiring immediate attention. If a targeted on-site inspection leads to other areas of supervisory concern, the supervisor may determine that a broad on-site inspection is necessary.

9.6.7 Advance notice is normally given to the insurer before the supervisor conducts an on-site inspection so that both parties may plan accordingly. However, the supervisor may decide not to provide advance notice in certain circumstances.

9.6.8 Examples of ways in which this Standard and its corresponding guidance can be pursued include the following [see text in Annex].

| CF 9.6.a | The group-wide supervisor performs on-site inspections at the level of the Head of the IAIG. |
| CF 9.6.a.1 | The group-wide supervisor’s on-site inspections should consider group-wide activities and major risks that impact legal entities within the IAIG. |
| CF 9.6.a.2 | During on-site inspections, the group-wide supervisor should have access to the IAIG Board, Senior Management and Key Persons in Control Functions responsible for the group-wide functions wherever these functions are performed. Where the group-wide functions are performed by an insurance legal entity within the IAIG, which is outside the jurisdiction of the group-wide supervisor, the group-wide... |
supervisor should inform the relevant other involved supervisor prior to approaching this insurance legal entity as part of the on-site inspection carried out at the level of the Head of the IAIG.

CF 9.6.a.3 Other involved supervisors should inform the group-wide supervisor of significant planned on-site inspections and communicate the main findings to the supervisory college where they are material to the IAIG or to another insurance legal entity within the IAIG.

CF 9.6.b Where appropriate, the group-wide supervisor, or other involved supervisors with reasonable supervisory interest, join on-site inspections of an insurance legal entity in another jurisdiction, coordinated by the relevant involved supervisor, with prior consent from that supervisor.

CF 9.6.b.1 Relevant involved supervisors should consider organising a joint on-site inspection to address issues that are material to the IAIG or to another insurance legal entity within the IAIG. The relevant involved supervisor should share the main outcomes of a joint on-site inspection within the supervisory college.

### Supervisory feedback and follow-up

9.7 The supervisor discusses with the insurer as soon as practical any relevant findings of the supervisory review and the need for any preventive or corrective measures.

9.7.1 The supervisor should provide appropriate feedback in a timely manner to the insurer during the ongoing supervisory review process. The supervisor should issue in writing the findings of the review and the actions required. In many circumstances, the supervisor’s initial action will be to discuss the issue with the insurer, which may resolve the issue and require no further action. However some issues may require preventive or corrective measures, and in some cases imposing sanctions (see ICP 10 Preventive Measures, Corrective Measures and Sanctions).

9.7.2 Whether and how the insurer has subsequently addressed issues identified by the supervisor should be considered in the evaluation of the insurer and should be factored into the ongoing supervisory plan.

CF 9.7.a The group-wide supervisor communicates the results of the group-wide supervisory review of the IAIG, including the group-wide risk assessment, to the supervisory college and, as appropriate, to the Head of the IAIG.
Annex: Examples of ways in which Standards 9.5 and 9.6 and their corresponding guidance can be pursued include the following:

**A) The evaluation of the effectiveness of the insurer’s corporate governance framework, including its risk management and internal control systems, can be done through:**

- reviewing and analysing the minutes of the Board and its committees;
- examining communications provided by the auditors to the Board and/or the Audit Committee, such as the auditors’ reports;
- analysing information obtained from and/or received through direct engagement with the external auditor on substantial insights into the insurer’s corporate governance framework, control environment, and financial reporting;
- evaluating the suitability of significant owners by analysing the ownership structure and sources of finance/funding;
- evaluating the independence of the Board Members, the suitability of the Board Members, Senior Management and Key Persons in Control Functions, their effectiveness, and their ability to acknowledge improvement needs and correct mistakes (especially after such needs or mistakes have been identified by the insurer, its auditors, or the supervisor and after changes of management and in the Board);
- testing the insurer's internal policies, processes and controls in order to assess compliance with regulations and/or adequacy of these in light of the insurer's risk profile;
- testing the accounting procedures in order to assess accuracy of the financial and statistical information periodically sent to the supervisor and its compliance with the regulations; and
- evaluating the organisational structure and the management of the insurer.

**B) Analyses of the nature of the insurer’s activities can be done through:**

- analysing business lines, the type of products offered, policyholders and location of business;
- analysing the distribution model(s) used;
- meeting with the management to get information and a deeper understanding about current and future business plans;
- analysing material contracts;
- analysing the sales and marketing policies of the insurer, in particular, policy conditions and remuneration paid to the intermediaries; and
- evaluating the reinsurance cover and its security. In particular, the reinsurance cover should be appropriate with regard to the financial means of the insurer and the risks it covers.

**C) Analyses of the relationships with external entities can be done through:**

- analysing organisational charts, the group structures and the intragroup links;
- analysing the relationships with major investors and among branches and subsidiaries;
- analysing intragroup transactions, fees and other arrangements, including identifying instances of cross-subsidisation of businesses within a group or non-arm’s length fees and charges;
• analysing agreements with external service providers;
• identifying financial problems originating from an entity in the group to which the insurer belongs; and
• identifying of conflicts of interest arising from intra-group relationships or relationships with external entities.

D) Evaluation of the insurer’s financial condition can be done through:
• analysing audited financial statements and off-balance sheet commitments;
• analysing the settlement of claims and the calculation of technical provisions according to current regulations;
• analysing the operations and financial results by line of business;
• analysing the investment policy (including derivatives policy) and the assets held to cover the technical provisions;
• valuation of the insurer’s investments;
• assessing litigation in which the insurer is a party; and
• analysing the forecasted balance sheets and profit and loss accounts in relation to the most recent results and the management plans.

E) Assessment of the insurer’s fair treatment of customers can be done through:
• assessing the culture of the insurer in relation to customer treatment, including the extent to which the insurer’s leadership, governance, performance management and recruitment, complaints handling policies and remuneration practices demonstrate a culture of fair treatment to customers;
• assessing how conflicts of interests with customers are identified, managed and mitigated;
• reviewing how products are designed and distributed to ensure they fulfil the customers’ demands and needs;
• checking the adequacy, appropriateness and timeliness of the information and advice given to customers;
• reviewing the handling and timing of claims and other payments;
• reviewing the handling, frequency and nature of customer complaints, disputes and litigation; and
• reviewing any customer experience reports used by the insurer or from other sources, such as an ombudsman.
**ICP 10 Preventive Measures, Corrective Measures and Sanctions**

The supervisor:

- requires and enforces preventive and corrective measures; and
- imposes sanctions

which are timely, necessary to achieve the objectives of insurance supervision, and based on clear, objective, consistent, and publicly disclosed general criteria.

---

**Introductory Guidance**

10.0.1 The supervisor should initiate escalating measures to prevent a breach of regulatory requirements by an insurer, respond to a breach of regulatory requirements by an insurer, and enforce those measures to ensure that the insurer responds to the supervisor's concerns. Preventive measures should be used to prevent a breach of regulatory requirements and corrective measures should be used to respond to a breach of regulatory requirements. Functionally, supervisors may take similar or identical actions as preventive or corrective measures. In addition, where a regulatory requirement has been violated, supervisors may use sanctions.

10.0.2 The supervisor should promptly and effectively deal with insurer non-compliance with regulatory requirements or supervisory measures that could put policyholders at risk, could pose a threat to financial stability, or could impinge on any other supervisory objectives. The more significant the threat to policyholders' interests or to financial stability, then the quicker the supervisor will need to act and to require action from the insurer, and the more significant the measures that may be required. By mitigating certain risks, preventive and corrective measures that are primarily intended to protect policyholders may also contribute to financial stability, by decreasing the probability and magnitude of any negative systemic impact.

10.0.3 Circumstances may arise when preventive or corrective measures are insufficient to prevent an insurer from being no longer viable, or likely to become no longer viable, and therefore need to exit the market or be resolved (see ICP 12 Exit from the Market and Resolution).

10.0.4 As part of the supervisory framework (see ICP 9 Supervisory Review and Reporting), the supervisor should consider in advance how to use preventive and corrective measures, enforcement of those measures, and the imposition of sanctions. A supervisor's framework should be documented to assist in the delivery of consistent supervision over time. It is crucial that the framework leaves room for the exercise of supervisory judgement and discretion, so flexibility should be allowed in the use of preventive measures, corrective measures and sanctions. In addition to general criteria, other parts of the framework on preventive measures, corrective measures and sanctions can also be released publicly, particularly where the supervisor feels that this additional transparency will lead to the market functioning more effectively. The decision-making processes that underpin the supervisory framework
should function in a way that allows the supervisor to take immediate action when necessary.

10.0.5 In some instances, the supervisor will need to work with other authorities or bodies in order to take or enforce supervisory measures or sanctions against an insurer. For example, some measures or sanctions will require the approval of a judicial body.

10.0.6 There are different methods by which supervisory outcomes can be achieved. The method chosen may vary depending on the jurisdiction’s legal framework. In some jurisdictions, one method is to accept an enforceable written agreement to do, or not to do, some thing or things from the insurer in question. The potential advantages of achieving an outcome by this route are that it can be quicker and less costly. This option can be used to achieve outcomes related to preventive or corrective measures or to sanctions.

**Group perspectives**

10.0.7 Measures or sanctions targeted at non-insurance legal entities within an insurance group may require the supervisor to work with other regulatory authorities.

10.0.8 The supervisor for an insurance legal entity within an insurance group should inform other involved supervisors when taking supervisory measures against or imposing sanctions on that insurance legal entity, where those sanctions are material or otherwise relevant to those supervisors.

---

**CF 10.0.a** The group-wide supervisor applies supervisory measures directly to the Head of the IAIG. If the Head of the IAIG is not within the group-wide supervisor’s jurisdiction, other involved supervisors apply supervisory measures to assist the group-wide supervisor.

- **CF 10.0.a.1** The group-wide supervisor should have flexibility in how it applies supervisory measures, which may need to vary according to the legal structure of the group, the jurisdiction in which the legal entities in the group are established, and the supervisory authority over relevant parts of the group.

- **CF 10.0.a.2** If the Head of the IAIG is not located in the jurisdiction of the group-wide supervisor, the group-wide supervisor should use indirect powers to apply supervisory measures.

- **CF 10.0.a.3** Other involved supervisors should assist the group-wide supervisor to apply supervisory measures to the Head of the IAIG or to insurance legal entities if they have direct supervisory powers to do so.

**CF 10.0.b** An involved supervisor coordinates with other involved supervisors before requiring a specific preventive or corrective measure if that measure will have a material effect on the supervision of the IAIG as a whole, or on the supervision of an insurance legal entity within the IAIG, unless exceptional circumstances preclude such coordination.

- **CF 10.0.b.1** The supervisory college provides a forum for the group-wide supervisor and other involved supervisors to coordinate preventive and corrective measures. In addition to supervisory colleges,
coordination can take place through a crisis management group (see ComFrame material under ICP 25 Supervisory Coordination and Cooperation).

CF 10.0.b.2 Supervisory measures that should be preceded by coordination between involved supervisors include: restricting the transfer of assets between entities within the IAIG; requiring an increase in capital; and suspending or revoking the licence of an insurance legal entity.

CF 10.0.b.3 There may be exceptional circumstances where an involved supervisor that wishes to act cannot coordinate in advance with the other involved supervisors. In such circumstances, the involved supervisor should inform the other involved supervisors of the decision made, or action taken, and the supporting rationale, as soon as possible.

CF 10.0.b.4 An involved supervisor does not need to coordinate with the other involved supervisors if the preventive or corrective measure will not materially affect the IAIG as a whole or another insurance legal entity. For example, an involved supervisor may not need to coordinate with the other involved supervisors before requiring the insurance legal entity to enhance its regulatory reporting as a preventive measure to monitor the legal entity’s specific business.

CF 10.0.b.5 If an involved supervisor requires an insurance legal entity within the IAIG to take preventive or corrective measures that are long-term and material in nature, that supervisor should provide periodic updates to the supervisory college.

CF 10.0.b.6 The requirement to coordinate action (other than in exceptional circumstances) does not imply that the supervisor taking action needs the consent of other involved supervisors to take action which is necessary to discharge its duties under the law in its jurisdiction.

10.1 The supervisor acts against individuals or entities that conduct insurance activities without the necessary licence.

10.1.1 The supervisor should have in place mechanisms to identify when unlicensed insurance activity is being carried out. Examples of such mechanisms include monitoring of media and advertising, review of consumer complaints or encouraging industry and other stakeholders to notify the supervisor of suspicious activity.

10.1.2 Where unlicensed activity is identified, the supervisor should act to address the issue. Examples include requiring the unlicensed entity to apply for a licence, seeking court orders to require the unlicensed entity to stop the activity, informing law enforcement authorities of criminal and/or civil concerns, imposing sanctions on the individual/entity or publicising the fact that the individual and/or entity is/are not licensed to conduct insurance activities.

10.2 The supervisor requires preventive measures if the insurer seems likely to operate in a manner that is inconsistent with regulatory requirements.

10.2.1 Determining when an insurer seems likely to operate in a manner that is inconsistent with regulatory requirements will require a degree of discretion on the part of the supervisor. Nevertheless, concerns that
necessitate preventive measures should be well founded based on the supervisor’s assessment.

10.2.2 If the insurer operates in a manner that is likely to impact its ability to protect policyholders’ interests or pose a threat to financial stability, the supervisor should act more urgently in requiring preventive measures.

10.2.3 The supervisor should communicate concerns to the insurer with a promptness that reflects the significance of the concern. Some concerns, such as relating to insurer solvency, policyholder protection, or financial stability, will be sufficiently significant to require immediate communication to the insurer. Other concerns, although significant, may not require such rapid communication, but should still be communicated appropriately. For example, it is unlikely to be appropriate for a supervisor to wait for the next on-site visit to an insurer before communicating a significant concern.

10.2.4 The supervisor should promptly bring significant concerns to the attention of the Board because it has ultimate responsibility for the insurer and that such concerns are resolved. In addition, the supervisor should also communicate with Senior Management and with Key Persons in Control Functions to bring significant concerns to their attention.

10.2.5 The supervisor should have available a range of preventive measures broad enough to address insurers of all sizes and complexities. Preventive measures should be chosen to address the severity of the insurer’s problems.

10.2.6 The supervisor should have the power to issue, and enforce:

- restrictions on business activities, such as:
  - prohibiting the insurer from issuing new policies or new types of product;
  - requiring the insurer to alter its sales practices or other business practices;
  - withholding approval for new business activities or acquisitions;
  - restricting the transfer of assets;
  - prohibiting the insurer from continuing a business relationship with an intermediary or other outsourced provider, or requiring the terms of such a relationship to be varied;
  - restricting the ownership of subsidiaries; and
  - restricting activities of a subsidiary where, in its opinion, such activities jeopardise the financial situation of the insurer;

  - directions to reinforce the insurer’s financial position, such as:
    - requiring measures that reduce or mitigate risks (for example, restricting exposures, through either hard or soft limits, to individual counterparties, sectors, or asset classes);
• requiring an increase in capital;
• restricting or suspending dividend or other payments to shareholders; and
• restricting purchase of the insurer’s own shares; and

• other directions, including:
  • requiring the reinforcement of governance arrangements, internal controls or the risk management system;
  • requiring the insurer to prepare a report describing actions it intends to undertake to address specific activities the supervisor has identified, through macroprudential surveillance, as potentially posing a threat to financial stability (see ICP 24 Macroprudential Supervision);
  • facilitating the transfer of obligations under the policies from a failing insurer to another insurer that accepts this transfer;
  • suspending the licence of an insurer; and
  • baring individuals acting in key roles from such roles in future.

10.2.7 The supervisor may also have other powers available, including:

• temporarily delaying or suspending, in whole or in part, the payments of the redemption values on insurance liabilities or payments of advances on contracts;
• lowering the maximum rate of guarantees for new business or introducing additional reserving requirements; or
• incentivising the use of a system-wide lending facility, when available, for market-wide liquidity issues extending to insurers.

10.2.8 The supervisor should take steps to address problems arising from Board Members, Senior Management, Key Persons in Control Functions, significant owners, external auditors and any other person who plays a significant role within the insurer. For example, the supervisor should require the insurer to replace or restrict the power and role of those involved (listed above) in the governance processes if the supervisor has material concerns with management or governance.

10.2.9 The supervisor should reject, rescind and/or request a court to revoke the appointment of an external auditor who is deemed to have inadequate expertise or independence, or is not subject to, or does not adhere to, established professional standards.

10.2.10 Supervisors should take action to address insurer audit quality concerns, including, where possible, requiring replacement or appointment of a supplementary auditor and the sanctioning of an external auditor if necessary. Supervisors should watch for indicators of potential major audit quality concerns, such as when:

• the auditor does not have adequate insurance industry knowledge and competence;
• there is an identified issue with auditor objectivity and independence;
• the auditor does not disclose to the supervisor matters that it is required to disclose;
• clear audit quality concerns are identified, such as if the auditor fails to test internal control systems sufficiently, the auditor is not appropriately sceptical, or does not appropriately challenge the insurer's management regarding the major accounting figures; or
• the auditor’s system of internal quality control appears ineffective.

<tr>
<th>CF 10.2.a</th>
<th>The group-wide supervisor requires the Head of the IAIG to take preventive measures if:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• a legal entity within the IAIG seems likely to operate in a manner that would have a material adverse effect on the IAIG as a whole; or</td>
<td></td>
</tr>
<tr>
<td>• the IAIG as a whole seems likely to operate in a manner that is inconsistent with regulatory requirements.</td>
<td></td>
</tr>
</tbody>
</table>

| CF 10.2.a.1 | The situation described in the first part of the Standard could arise, for example, where one regulated legal entity in the group seems likely to fail to meet its capital requirement, causing the IAIG as a whole to be likely to fail to meet a group capital requirement to which it is subject. |
| CF 10.2.a.2 | The group-wide supervisor should not require the Head of the IAIG to take additional preventive measures if the supervisor of an insurance legal entity within the IAIG has already required that entity to take preventive measures and the group-wide supervisor has assessed that the preventive measures adequately mitigate the risk to the IAIG as a whole. |
| CF 10.2.a.3 | The situation described in the second part of the Standard could arise, for example, where every regulated legal entity in the IAIG meets its capital requirement, but the group as a whole seems unlikely to meet a group capital requirement to which it is subject. |

10.3 The supervisor requires corrective measures if the insurer fails to operate in a manner that is consistent with regulatory requirements.

10.3.1 The Guidance under Standard 10.2 is equally applicable when considering corrective measures.

10.3.2 In addition to the supervisory tools set out in 10.2.6, when considering corrective measures the supervisor may find it necessary, in cases of serious breach of regulatory requirements, to revoke the licence of an insurer. The supervisor should be able to enforce this decision.

10.4 The supervisor:
• requires the insurer to take actions that address the supervisor's identified concerns;
• periodically checks that the insurer is taking action; and
• assesses the effectiveness of the insurer’s actions.

10.4.1 The supervisor should require the insurer to prepare a plan to resolve the concerns within an acceptable timeframe. The plan should include actions proposed by the insurer or preventive or corrective measures required by the supervisor. What is acceptable as a timeframe will depend on the circumstances of the concerns raised.

10.4.2 If the insurer does not prepare an acceptable plan in a specified timeframe to respond to the supervisor’s concerns, the supervisor should impose such a plan on the insurer.

10.4.3 The supervisor should review the results of the actions that the insurer has taken. The supervisor should review both whether the actions have been taken and, if so, the effectiveness of the actions.

10.4.4 The supervisor may require assurance from an independent reviewer regarding adequate resolution of significant concerns. In such cases the supervisor may also require that such an independent reviewer be appointed at the expense of the insurer.

10.5 The supervisor escalates, including enforcing, preventive or corrective measures if its concerns are not addressed by the insurer’s actions.

10.5.1 The supervisor should require further measures if its concerns with the insurer become worse, including if the insurer fails to take the actions in a plan.

10.5.2 Supervisory measures should escalate in line with the supervisor’s concerns about the insurer. If the insurer’s inaction leads to an increased risk to policyholders, then the supervisor should respond by requiring stronger measures to mitigate this risk.

10.5.3 Enforcement of preventive or corrective measures could involve the supervisor issuing a formal direction to an insurer to take particular actions or to cease conducting particular activities. It could also involve the supervisor seeking the assistance of other authorities, or the courts, to enforce a measure.

10.6 The supervisor imposes sanctions on insurers and individuals proportionate to the breach of regulatory requirements or other misconduct.

10.6.1 The supervisor should be able to impose a range of sanctions, which could be administrative, civil or criminal in nature. These can include the
ability to impose fines, the ability to bar individuals acting in key roles from holding similar roles in future, and the ability to require remediation (such as requiring compensation of policyholders in cases of mis-selling). It is recognised that supervisors will not always be able to take a full range of legally binding actions themselves and may need to act in conjunction with, or refer matters to, other authorities, in particular, in the case of criminal penalties.

10.6.2 In some cases it may be appropriate to apply sanctions against insurers or individuals when justified by their actions, or inactions.

10.6.3 The supervisor should, in particular, be able to impose sanctions against insurers and individuals who:

- fail to provide information to the supervisor in a timely fashion;
- withhold information from the supervisor;
- provide information that is intended to mislead the supervisor;
- deliberately misreport to the supervisor; or
- do not act in accordance with orders or directions imposed on the insurer.

10.6.4 The sanctions imposed by the supervisor should be commensurate with the nature and severity of the insurer’s non-compliance with regulatory requirements. Administrative or procedural breaches will generally attract less severe sanctions than breaches arising from an insurer’s intentional disregard of regulatory requirements. The sanction imposed should be sufficiently dissuasive so that the insurer, or other insurers, do not commit a similar breach in the future.

10.6.5 The supervisor should impose more severe sanctions relative to the gravity of the breach where an insurer’s history demonstrates a pattern of non-compliance with regulatory requirements.

10.6.6 The supervisor may impose sanctions on insurers or individuals in addition to supervisory measures or in the absence of supervisory measures.

10.6.7 The imposition of sanctions against an insurer or an individual typically should not delay either supervisory measures or insurer action taken in response to supervisory measures. However, in some instances, the nature of the sanctions may delay supervisory measures. For example, where a supervisor sanctions an insurer by requiring a number of Senior Managers to be replaced with new individuals, supervisory measures intended to improve the governance of the insurer may not be practical until after the new individuals are appointed.

10.6.8 The supervisor, or another responsible authority in the jurisdiction, should take action to enforce sanctions that have been imposed.

10.6.9 The supervisor should sanction insurers and individuals within a consistent framework, so that similar violations and weaknesses attract similar sanctions. Supervisors should consider how proposed sanctions relate to previous cases. The supervisor should identify precedents where the supervisor has sanctioned an insurer or individual for similar actions/inactions. Where the supervisor has sanctioned an insurer or
individual for similar actions/inactions, then the supervisor should consider carefully whether a comparable sanction is appropriate. If the supervisor concludes that a very different sanction is appropriate, the supervisor should be prepared to explain why it reached this conclusion.

10.6.10 In order for sanctions to have a deterrent effect on other insurers, the fact of the sanction, and sufficient details of the breach, should in general be published. However, the supervisor should retain the discretion to take a different course of action (for example, not to publish, or to delay publication) where this would further the achievement of supervisory objectives or it is otherwise in the public interest to do so.

<td></td>
</tr>
</tbody>
</table>

if the sanction will have a material effect on the supervision of the IAIG as a whole or a material effect on the supervision of another insurance legal entity within the IAIG, unless exceptional circumstances preclude such communication.

| CF 10.6.b.1 | The involved supervisor should communicate the need for sanctions to other involved supervisors at the earliest opportunity. Where an involved supervisor must act before communicating the need for sanctions, that supervisor should inform the group-wide supervisor and other involved supervisors of the sanction, and the supporting rationale, as soon as possible. |
ICP 11
There is no longer an ICP 11
ICP 12  Exit from the Market and Resolution

Legislation provides requirements for:
- the voluntary exit of insurers from the market; and
- the resolution of insurers that are no longer viable or are likely to be no longer viable, and have no reasonable prospect of returning to viability.

Introductory Guidance

12.0.1 An orderly process for an insurer’s withdrawal from the business of insurance helps to protect policyholders, and contributes to the stability of the insurance market and the financial system. Jurisdictions should have transparent and effective regimes for an insurer’s exit from the market and the resolution of an insurer.

12.0.2 In this ICP, “resolution” refers to an action taken by a resolution authority towards an insurer that is no longer viable, or is likely to be no longer viable, and has no reasonable prospect of returning to viability. Resolution actions include portfolio transfer, run-off, restructuring, and liquidation.

12.0.3 In this ICP, the term “resolution authority” refers to authorities that are responsible for exercising resolution powers over insurers. Depending on the jurisdiction, this term may include supervisors, other governmental entities or private persons (including administrators, receivers, trustees, conservators, liquidators, or other officers), or courts authorised by law to exercise resolution powers. Thus in this ICP:
- “supervisor” is used when the standard and/or guidance involves responsibilities and/or roles of the day-to-day supervisor of the insurer;
- “resolution authority” is used when the standard and/or guidance involves resolution powers and/or processes after resolution has been instituted: this includes supervisors acting under their resolution powers; and
- “supervisor and/or resolution authority” is used when the standard and/or guidance involves responsibilities for planning and/or initiation of resolution and encompasses supervisors acting in their pre-resolution roles (eg before a supervisor or resolution authority institutes resolution and/or obtains any necessary administrative and/or judicial approvals to do so).

12.0.4 The structure and roles of resolution authorities vary across jurisdictions. In some jurisdictions, the resolution authority and the supervisor may be one single authority; in other jurisdictions, resolution of insurers may be the responsibility of one or more separate authorities. In some jurisdictions certain resolution powers may be exercised or overseen by the court. Whatever the allocation of responsibilities, a transparent and effective resolution regime should clearly delineate the responsibilities
and powers of each authority involved in the resolution of insurers (see ICP 1 Objectives, Powers and Responsibilities of the Supervisor). Where there are multiple authorities responsible for the resolution of insurers, the resolution regime should empower the relevant authorities to cooperate and coordinate with each other.

12.0.5 Exit from the market refers to cessation of the insurer’s business, in part or in whole. Insurers that meet regulatory requirements may decide to exit from the market on a voluntary basis for business and/or strategic reasons. This is often referred to as ‘voluntary exit from the market’.

12.0.6 Insurers may also be required by the supervisor to exit from the market. For example, supervisory measures and/or sanctions may result in an insurer exiting from the market (ie involuntary exit from the market) (see ICP 10 Preventive Measures, Corrective Measures and Sanctions).

12.0.7 Jurisdictions may need to have mechanisms in place to determine whether the continuity of insurance cover is necessary when insurers exit from the market. Any such continuity should preferably be on the same contract terms, but when necessary, on amended terms. Such mechanisms need to be proportionate to the unique nature and structure of the insurance market in each jurisdiction. Continuity of insurance cover may be facilitated by transferring insurance portfolios to a succeeding insurer, including a bridge institution. Continuity of some insurance contracts, particularly for some non-life products, may be necessary for only a short period (for example 30 or 60 days) so that the policyholder has sufficient time to find another insurer. Facilitating continuity of insurance cover might not be necessary for certain types of insurance products, such as those that are offered by many insurers in a market and which are highly substitutable.

12.0.8 Where an insurer exits from the market and there is no succeeding insurer or no similar insurance products available in the market, mechanisms that facilitate the availability of alternate cover may need to be explored by the supervisor, such as when the exiting insurer delivers insurance contracts that cover risks that may be important to a particular jurisdiction’s economy and/or are compulsory insurance in legislation.

12.0.9 Insurers that are no longer viable or likely to be no longer viable and have no reasonable prospect of becoming so through their recovery action or supervisory measures, should be resolved. Figure 12.1 illustrates in a stylised way the relationship between solvency, viability and the nature of actions to be taken. No uniform, single fixed point of non-viability can be defined that will be appropriate for the application of resolution measures in all circumstances. Whether to apply resolution measures, and the type of measures implemented, will depend upon the factual circumstances of the particular resolution scenario.

Figure 12.1. Stylised relationship between solvency, viability and actions to be taken
12.0.10 A resolution regime should make it possible for any losses to be absorbed by: i) shareholders; ii) general creditors; and iii) policyholders, in a manner that respects the jurisdiction’s liquidation claims hierarchy. Policyholders should absorb losses only after all lower ranking creditors have absorbed losses to the full extent of their claims. Mechanisms, such as policyholder protection schemes (PPSs), may mitigate the need for the absorption of losses by policyholders.

12.0.11 Depending on the circumstances, appropriate resolution measures may be applied to one or more separate entities in an insurance group, such as: i) the head of the insurance group; ii) an intermediate holding company below the head of the insurance group; iii) an insurance legal entity within the group; iv) a branch of an insurance legal entity within the group; or v) other regulated (eg banks) or non-regulated entities within the group. For other regulated entities within the group (eg banks), a resolution regime relevant to their sector may apply.

12.0.12 Some insurers operate on a cross-border basis through subsidiaries or branches in another jurisdiction, or through providing insurance services on a cross-border basis without setting up a physical presence outside their home jurisdiction. Also, where an insurance legal entity is a member of a group, there could be intra-group transactions and guarantees among insurance legal entities and/or other group entities in different jurisdictions. Cross-border coordination and cooperation, including exchange of information, is necessary for the orderly and effective resolution of insurers that operate on a cross-border basis.

**Voluntary exit from the market**

12.1 Legislation provides a framework for voluntary exit from the market that protects the interests of policyholders.

12.1.1 Voluntary exit from the market is initiated by the insurer.

12.1.2 The supervisor should require the insurer which voluntarily exits from the market to make appropriate arrangements for the voluntary exit (eg, run-off or portfolio transfer), including ensuring adequate human and financial resources to fulfil all its insurance obligations.

12.1.3 The supervisor should require the insurer which voluntarily exits from the market through run-off to submit a run-off programme to the supervisor. The programme should include at least the following information:
expected timeframe;
projected financial statements;
human and material resources that will be available;
governance and risk management of the process;
communication with policyholders about the insurer’s exit from the market; and
communication to the public.

12.1.4 Insurers that exit from the market on a voluntary basis should continue to be subject to supervision until all insurance obligations are either discharged or transferred to succeeding insurers. Legislation should provide for appropriate requirements for these exiting insurers.

Objectives of the resolution of insurers

12.2 Legislation provides a framework for resolving insurers which:

- protects policyholders; and
- provides for the absorption of losses in a manner that respects the liquidation claims hierarchy.

12.2.1 The legislation should support the objective of protecting policyholders. This however does not mean that policyholders will be fully protected under all circumstances and does not exclude the possibility that losses be absorbed by policyholders, to the extent they are not covered by PPSs or other mechanisms. A jurisdiction may have additional resolution objectives in the legislation, such as contributing to financial stability.

12.2.2 The legislation should provide a scheme for prioritising the payment of claims of policyholders and other creditors in liquidation (liquidation claims hierarchy). Resolution powers should be exercised in a way that respects the hierarchy of creditors’ claims in liquidation. In a resolution action other than a liquidation, creditors should be entitled to compensation if they receive less than they would have received if the insurer was liquidated (ie the “no creditor worse off than in liquidation” (NCWOL) principle). The NCWOL principle may require funding to provide compensation to creditors so that they receive at least as much as they would have received in a liquidation.

12.2.3 Resolution should seek to minimise reliance on public funding. In principle, any public funding used for the resolution of the insurer should be recouped from the insurance sector in a transparent manner. The phrase “reliance on public funding” does not refer to the use of funds from policyholder protection schemes to support the implementation of resolution actions.

CF 12.2.a.1 In addition to the resolution objectives in Standard 12.2, the framework for resolving IAIGs should also include as an objective the contribution to financial stability, where applicable. A jurisdiction may, at its discretion, choose to rank these resolution objectives with respect to IAIGs.
Planning

12.3 The supervisor and/or the resolution authority requires, as necessary, insurers to evaluate prospectively their specific operations and risks in possible resolution scenarios and to put in place procedures for use during a resolution.

12.3.1 The supervisor may identify risks, specific to an insurer’s circumstances, that would arise in resolution and which may impact achieving the resolution objectives of the jurisdiction. For example, such risks may relate to the insurer’s provision of relevant information to the supervisor or resolution authority, the continuity of certain business operations, and/or the orderly implementation of a jurisdiction’s PPS.

12.3.2 The supervisor should require the insurer to consider such risks and where appropriate, prepare contingency plans to mitigate the risk.

12.3.3 The supervisor should require that the insurer have procedures in place to provide necessary information (e.g., policyholders’ names, types of their contracts, and the value of each contract) to a relevant organisation (such as a PPS) in a timely manner when the insurer enters into resolution.

CF 12.3.a Resolution plans are in place for IAIGs where the group-wide supervisor and/or resolution authority, in consultation with the crisis management group of the IAIG (IAIG CMG), deems necessary.

CF 12.3.a.1 The group-wide supervisor and/or resolution authority should decide, in consultation with members of the IAIG CMG (see ComFrame material under ICP 25), whether a resolution plan is needed for an IAIG, considering at least the following:

- the IAIG’s activities and its lines of business;
- the number of jurisdictions where the IAIG operates;
- the complexity of the IAIG’s group structure; and
- the potential impact of failure of the IAIG on the financial system and real economy in the jurisdictions in which the IAIG operates.

Other issues that may also be taken into consideration are, for example:

- the IAIG’s risk management mechanisms; and
- expected costs, benefits and outcomes of the resolution planning requirement.

CF 12.3.a.2 The group-wide supervisor and/or resolution authority should lead the development of the group-wide resolution plan, in coordination with members of the IAIG CMG, and involve the IAIG as appropriate. To facilitate its implementation, the resolution plan should identify, in particular:
- financial and economic functions that need to be continued to achieve the resolution objectives for the IAIG;
- suitable resolution options to preserve such functions or wind them down in an orderly manner;
- data requirements for the IAIG’s business operations, structures and financial and economic functions;
- potential barriers to effective resolution and actions to mitigate those barriers; and
- actions to protect policyholders.

**CF 12.3.a.3** Other involved supervisors and/or resolution authorities may deem it appropriate to have their own resolution plan for the IAIG’s insurance legal entity in their jurisdictions when, for instance:

- the insurance legal entity’s presence in the jurisdiction is large in scope and/or scale;
- the insurance legal entity provides critical and/or non-substitutable insurance coverages; and/or
- its resolution may impact that jurisdiction’s financial system and real economy.

Host jurisdiction resolution plans should be established in cooperation with the group-wide supervisor and/or resolution authority to ensure that the plan is as consistent as possible with the group-wide resolution plan for the IAIG.

**CF 12.3.a.4** Resolution plans should be reviewed on a regular basis, or when there are material changes to the IAIG’s business or structure or any other change that could have a material impact on the resolution plan, and be updated when necessary. These plans should also be subject to regular reviews within the IAIG CMG.

**CF 12.3.b** Where a resolution plan is required, the group-wide supervisor and/or resolution authority, in coordination with the IAIG CMG:

- requires relevant legal entities within the IAIG to submit necessary information for the development of resolution plan;
- regularly undertakes resolvability assessments to evaluate the feasibility and credibility of resolution strategies, in light of the possible impact of the IAIG’s failure on policyholders and the financial system and real economy in the jurisdictions in which the IAIG operates; and
- requires the IAIG to take prospective actions to improve its resolvability.

**CF 12.3.b.1** Resolvability assessments should be conducted at the level of those entities where it is expected that resolution actions would be taken, in accordance with the resolution strategies for the IAIG, as set out in the resolution plan.

**CF 12.3.b.2** Resolvability assessments should consider if it is feasible and credible for the resolution authority to resolve the IAIG in a way that protects...
policyholders and contributes to financial stability while minimising reliance on public funds.

CF 12.3.b.3 Resolvability assessments should be undertaken on a regular basis, or when there are material changes to the IAIG’s business or structure, or any other change that could have a material impact on the resolvability assessment. These assessments should also be subject to regular reviews within the IAIG CMG.

CF 12.3.b.4 When the resolution plan and/or resolvability assessment identifies potential barriers to effective resolution, the IAIG may be given the opportunity to propose its own prospective actions to improve its resolvability by mitigating these barriers.

CF 12.3.c The group-wide supervisor and/or resolution authority, in coordination with the IAIG CMG, requires the Head of the IAIG to have and maintain group-wide management information systems (MIS) that are able to produce information on a timely basis, for supervisors and/or resolution authorities, for the purposes of resolution planning and actions.

CF 12.3.c.1 Information should be available at the Head of the IAIG and the legal entity level.

CF 12.3.c.2 The IAIG may rely on its existing information system, so long as it fulfils the objectives of producing information on a timely basis for the purposes of resolution planning and actions.

CF 12.3.c.3 The IAIG should:

- maintain a detailed inventory, including a description and location, of the key MIS used in material legal entities of the IAIG, mapped to core services and critical functions;
- identify and take steps to address legal constraints on the exchange of management information among material entities of the IAIG (for example, as regards the information flow from individual entities of the group to/from the Head of the IAIG);
- demonstrate, as part of the resolution planning process, that it is able to produce the essential information needed to implement plans within an appropriate period of time; and
- maintain specific information at a legal entity level, including, for example, information on intra-group guarantees booked on a back-to-back basis, or information on the assets supporting policyholder liabilities.

Cooperation and coordination

12.4 The roles and responsibilities of relevant authorities within a jurisdiction that are involved in exit of insurers from the market or their resolution are clearly defined.

12.4.1 The jurisdiction should have a designated authority or authorities empowered to exercise powers for the resolution of an insurer. Where
there are multiple authorities within a jurisdiction, their respective mandates, roles and responsibilities are clearly defined and coordinated.

12.4.2 Where different authorities within a single jurisdiction are in charge of the resolution of an insurer, a lead authority that coordinates the resolution of the insurer should be identified.

12.4.3 An example where a lead resolution authority should be identified is where the insurer has insurance and other financial operations (such as banking), and the authority responsible for the resolution of the other financial operations is different from the authority responsible for the resolution of the insurance operations in the jurisdiction.

12.4.4 Coordination agreements may be established where multiple authorities may be involved in the resolution of an insurer.

12.5 The supervisor and/or resolution authority shares information, cooperates and coordinates with other relevant authorities for the exit of insurers from the market or their resolution.

12.5.1 Relevant authorities in this context may include the group-wide supervisor and/or resolution authority, other involved supervisors and/or resolution authorities and others that may need to be involved in the resolution of insurers, such as PPS and supervisors in other financial sectors.

12.5.2 When an insurer voluntarily exits from the market, the supervisor should cooperate and coordinate with other relevant supervisors as necessary.

12.5.3 Cooperation and coordination should include matters, among others, such as consulting with or informing other relevant authorities of etc.

12.5.4 When consulting, authorities should seek to determine if coordinated action on the resolution of an insurance group is necessary to avoid or minimise adverse impact on other group entities.

12.5.5 The supervisor and/or resolution authority should seek to achieve a cooperative solution with authorities in other jurisdictions who are concerned with the resolution of the insurance group.

12.5.6 Cooperation and coordination would be crucial when considering resolution action such as ordering the insurer to cease business (for example, when the insurer has overseas branches), freezing the insurer’s assets, and/or removing management of overseas branches, subsidiaries, or holding companies.

12.5.7 Information sharing, cooperation and coordination should be undertaken in a manner that do not compromise the prospect of successful exit or resolution.

12.5.8 Cross-border coordination agreements may need to be established between relevant authorities.

Triggers
12.6 Legislation provides criteria for determining the circumstances in which the supervisor and/or resolution authority initiates resolution of an insurer.

12.6.1 Resolution should be initiated where an insurer is no longer viable, or is likely to be no longer viable and has no reasonable prospect of becoming so, even if the entity is solvent in light of financial reporting standards. Criteria that determine or help determine when the supervisor and/or resolution authority initiates resolution should be considered in light of the insurer and the circumstances of its resolution. Criteria for determining whether resolution processes should be initiated may include:

- the insurance legal entity is in breach of the minimum capital requirement (MCR) and there is no reasonable prospect of restoring compliance with MCR;
- the consolidated own funds of the insurance group are lower than the sum of the proportional shares of the MCRs, or minimum capital requirements of the regulated legal entities belonging to the insurance group (eg due to double-gearing);
- the insurer is in breach of other material prudential requirements (such as a requirement on assets backing technical provisions) and there is no reasonable prospect of compliance being restored;
- there is a strong likelihood that policyholders and/or other creditors will not receive payments as they fall due;
- intra-group transactions impede or are likely to impede the ability of the insurer to meet policyholder and/or creditor obligations as they fall due; or
- measures attempting the recovery of the insurer have failed, or there is a strong likelihood that such proposed measures will: i) not be sufficient to return the insurer to viability; or ii) cannot be implemented in a reasonable timeframe.

Powers

12.7 Legislation provides an appropriate range of powers to resolve insurers effectively. These powers are exercised proportionately and with appropriate flexibility.

12.7.1 Powers to resolve insurers should be exercised in a proportionate manner that resolves the insurer most effectively in light of the circumstances and objectives of resolution. Some powers may not be needed for all insurers but only for insurers that are, for example, of systemic importance in the jurisdiction. Some powers may only affect the insurer, while others may impact contractual rights of third parties (such as a suspension of policyholders' rights or restructuring of policies).

12.7.2 Some resolution powers are exercised with the aim to stabilise or restructure an insurer and avoid liquidation. Liquidation can be used in conjunction with other resolution powers. Creditors should have a right to compensation where they do not receive at a minimum what they would have received in a liquidation of the insurer under the applicable insolvency regime (NCWOL principle).
12.7.3 If a court order is required for the resolution authority to exercise resolution powers, the time required for court proceedings should be taken into consideration for the effective implementation of resolution actions.

12.7.4 Powers to resolve insurers that may be exercised, subject to adequate safeguards, should include the following. This list is not exhaustive and the resolution authority should have discretion to apply other available powers. The order of presentation of the powers is not an indication of the sequence in which these powers could be exercised.

- prohibit the payment of dividends to shareholders;
- prohibit the payment of variable remuneration to, and allow the recovery of monies from, Members of the Board, Senior Management, Key Persons in Control Functions and major risk taking staff, including claw-back of variable remuneration;
- prohibit the transfer of the insurer’s assets without supervisory approval;
- retain, remove or replace the Board, Senior Management and Key Persons in Control Functions;
- take control of and manage the insurer, or appoint an administrator or manager to do so;
- withdraw the license to write new business and put all or part of the insurance business contracts into run-off;
- sell or transfer the shares of the insurer to a third party;
- restructure, limit or write down liabilities (including insurance liabilities), and allocate losses to creditors and policyholders, where applicable and in a manner consistent with the liquidation claims hierarchy and jurisdiction’s legal framework;
- override rights of shareholders of the insurer in resolution, including requirements for approval by shareholders of particular transactions, in order to permit a merger, acquisition, sale of substantial business operations, recapitalisation or other measures to restructure and dispose of the insurer’s business or its liabilities and assets;
- terminate, continue or transfer certain types of contracts, including insurance contracts;
- transfer or sell the whole or part of the assets and liabilities of the insurer to a solvent insurer or third party;
- transfer any reinsurance associated with transferred insurance policies without the consent of the reinsurer;
- temporarily restrict or suspend the policyholders’ rights of withdrawing their insurance contracts;
• stay rights of the reinsurers of the ceding insurer in resolution to terminate or not reinstate coverage relating to periods after the commencement of resolution;
• impose a temporary suspension of payments to unsecured creditors and a stay on creditor actions to attach assets or otherwise collect money or property from the insurer; and
• initiate the liquidation of the whole or part of the insurer.

12.7.5 The choice and application of the powers set out above should take into account whether an insurer’s disorderly failure would potentially cause significant disruption to the financial system and real economy, the types of business the insurer is engaged in, and the nature of its assets and liabilities.

12.7.6 Where the resolution authority takes action which leads to another person taking control of an insurer with a view to restoring, restructuring or running off the business, the resolution authority should continue to be responsible for the orderly resolution of the insurer. In particular, the resolution authority should continue to exercise functions which ensure that the objectives of resolution are met, notwithstanding any additional responsibilities which the person appointed may have to the insurer or to the courts.

12.7.7 Resolution powers should be exercised in a manner that does not discriminate between creditors on the basis of their nationality, the location of their claim, or the jurisdiction where it is payable.

12.7.8 Mechanisms should be in place to (i) enable continuity of cover for policyholders where this is needed and (ii) ensure timely payment of claims to policyholders of the insurer in resolution, with the aim to minimise disruption to the timely provision of benefits to policyholders. A PPS can be one of the mechanisms that can help ensure timely payments to policyholders and minimise disruption.

12.7.9 When requiring contracts to be transferred to another insurer, the resolution authority should satisfy itself that the interests of the policyholders of the transferor and of the transferee are safeguarded. In some cases this may be achieved through varying, reducing or restructuring the transferred liabilities.

12.7.10 Portfolio transfers and transfers of other types of contracts of the insurer in resolution should not require the consent of each policyholder or party to the contract.

12.7.11 Consistent with the liquidation claims hierarchy, insurance liabilities should be written down only after equity and all liabilities that rank lower than insurance liabilities have absorbed losses, and only if the resolution authority is satisfied that policyholders are no worse off than in liquidation after compensation, where necessary.

12.7.12 Information on the period during which policyholders are prohibited from withdrawing from their insurance contracts should be available to policyholders in a transparent manner for the purposes of policyholder protection.
12.7.13 The exercise of stay powers, their scope of application and the duration of the stays should be designed to address the specific situation of the insurer in resolution. For example, the duration of the stay could depend on the type of the insurance or financial contract.

Group and Branch Perspectives

12.7.14 There may be circumstances where resolution powers will need to be exercised at the level of the head of the insurance group and/or non-regulated entities. Resolution authorities should have the capacity to exercise resolution powers directly on such entities within their jurisdiction to the extent necessary and appropriate. Where resolution powers need to be exercised on entities outside of their jurisdiction or legal authority, the resolution authority should cooperate and coordinate with relevant supervisors and resolution authorities in the relevant jurisdictions, to the extent necessary and appropriate.

12.7.15 Unless otherwise specified by the resolution authority, resolution powers exercised on an insurance legal entity (for instance to cease writing business) should also apply to the legal entity’s branches. However, the resolution authority responsible for a branch can also exercise powers toward the branch. In either case, the resolution authorities responsible for the branch and the insurance legal entity should consult and cooperate with one another.

12.7.16 The resolution authority may choose which power, or which combination of powers, is applied to which entity within the group. Different types of powers may be applied to different parts of the entity’s business.

liquidation claims hierarchy and jurisdiction's legal framework;

- override rights of shareholders of the IAIG in resolution, including requirements for approval by shareholders of particular transactions, in order to permit a merger, acquisition, sale of substantial business operations, recapitalisation, or other measures to restructure and dispose of the IAIG’s business or its liabilities and assets;

- terminate, continue or transfer certain types of contracts, including insurance contracts;

- transfer or sell the whole or part of the assets and liabilities of the IAIG to a solvent insurer or third party;

- transfer any reinsurance associated with transferred insurance policies without the consent of the reinsurer;

- temporarily restrict or suspend the policyholders' rights of withdrawing their insurance contracts;

- stay rights of the reinsurers of the ceding insurer in resolution to terminate, or not reinstate, coverage relating to periods after the commencement of resolution;

- impose a temporary suspension of payments to unsecured creditors and a stay on creditor actions to attach assets or otherwise collect money or property from the IAIG;

- establish a bridge institution;

- take steps to provide continuity of essential services and functions including:
  - requiring other legal entities within the IAIG (including non-regulated entities) to continue to provide these essential services to the entity in resolution, any successor, or an acquiring entity;
  - ensuring that the residual entity in resolution can temporarily provide such services to a successor or an acquiring entity; or
  - procuring necessary services from unaffiliated third parties;

- temporarily stay early termination rights associated with derivatives and securities financing transactions; and

- initiate the liquidation of the whole or part of the IAIG.

CF 12.7.a.1 In some jurisdictions, PPSs can be utilised as a bridge institution to which insurance contracts of the IAIG are transferred.

CF 12.7.a.2 Essential services mentioned under CF12.7a include, in particular, IT.

Liquidation
12.8 Legislation provides that the supervisor is involved in the initiation of the liquidation of an insurance legal entity (or a branch of a foreign insurer in its jurisdiction).

12.8.1 Legislation should define the involvement of the supervisor in a liquidation, which promotes the protection of policyholders. The supervisor should be authorised to initiate, or should be involved in the liquidation of an insurance legal entity, or a branch of a foreign insurer in its jurisdiction.

12.8.2 In many jurisdictions, all resolution actions, including liquidation, may only be initiated by the supervisor and/or resolution authority. However, in some jurisdictions, the liquidation process can be initiated by another person (such as a creditor of the insurance legal entity, the insurance legal entity itself, or the court). If legislation permits another person to initiate liquidation, it should: i) require prior approval of the supervisor, or ii) at a minimum, require prior coordination with the supervisor. If legislation permits another person to initiate liquidation without such prior approval or coordination, it should provide that the supervisor may challenge the person’s action.

12.9 Legislation provides a high legal priority to policyholders’ claims within the liquidation claims hierarchy.

12.9.1 Policyholders should receive high legal priority in the liquidation of an insurance legal entity (or of a branch) so that policyholders rank above ordinary unsecured creditors. However, it is common in many jurisdictions that a higher priority is given to a limited number of other categories of claims. These may include claims:

- by liquidators, such as claims corresponding to expenses arising from the liquidation procedure;
- by employees;
- by tax or fiscal authorities;
- by social security systems; and
- claims on assets subject to rights in rem (e.g., through collateral, lien, mortgage).

12.9.2 In some jurisdictions, policyholders receive higher priority but only on a determined part of the insurance legal entity’s assets (e.g., the assets covering technical provisions). In such jurisdictions, with respect to this portion of the insurer's assets, policyholders’ claims are generally subordinate only to liquidation expenses.

12.9.3 Mechanisms facilitating timely payment and, when needed, continuity of contracts should be in place. In some jurisdictions, a PPS or other protection mechanisms can contribute to a resolution and ensure timely payment of claims to policyholders. Where a bridge institution is available, this can ensure continuity of insurance products in cases where no insurer present in the market takes over the insurance portfolio of the insurance legal entity that would otherwise be liquidated. A PPS or other protection mechanisms could also ensure compliance with NCWOL principle by providing compensation to policyholders so that
none are worse off than in liquidation. In some jurisdictions, a PPS can only pay claims after liquidation has been initiated.

**Safeguards**

12.10 The resolution authority exercises resolution powers in a way that respects the liquidation claims hierarchy and adheres to the NCWOL principle. If the resolution authority departs from the general principle of equal treatment of creditors of the same class (pari passu), the resolution authority substantiates the reasons for such departure to all affected parties.

12.10.1 While respecting the liquidation claims hierarchy, the resolution authority could treat certain types of creditors differently from others in the same class of creditors’ hierarchy. In such cases, the reasons for such a treatment should be transparent and clearly explained. Concerned creditors should be protected by the NCWOL principle and where they do not receive at a minimum what they would have received in a liquidation of the entity they should have a right to compensation.

12.10.2 For instance, different types of creditors could be:

- two categories of policyholders ranking pari passu where one is covered by a PPS while the other is not; or
- two categories of creditors ranking pari passu but the creditors are different in nature (e.g., direct policyholders versus cedants).

12.10.3 For instance, different treatment of a creditor could be:

- settling contracts ranking pari passu at a different pace; or
- reducing (writing down) contracts ranking pari passu at a different rate.

12.10.4 These options could be used provided this does not infringe the NCWOL principle. For instance, Figure 12.2 illustrates the insurance liabilities (ILs) of an insurance legal entity consisting of two portfolios (A and B), where the total assets amount to 120 but the ILs of each portfolio amount to 100. Assuming that these two portfolios rank pari passu, each policyholder would receive 60% of their credit in liquidation. The resolution authority could reduce the ILs of A to 80 and the ILs of B to 70 (for instance, in the event where a sound insurer or sound insurers accepted to fund part of but not the whole shortfall). However, if the resolution authority reduces the ILs of B to 40, the resolution authority will need to provide compensation to policyholders of portfolio B (in the amount of 20) in order to meet the NCWOL principle. This simplified example does not take account of potential PPSs which could pay some claims.
12.10.5 The resolution authority could take actions which could worsen the position of some creditors, provided that said creditors receive compensation sufficient to meet the NCWOL principle. Figure 12.3 illustrates this approach – it would be beneficial to policyholders in portfolio B to have their policies transferred, but the portfolio transfer worsens the position of policyholders in portfolio A. Policyholders in portfolio A therefore should receive appropriate compensation to ensure that they are not worse off compared to a liquidation scenario prior to the portfolio transfer. This example does not take account of potential PPSs which could pay some claims.

12.11 Legislation provides whether insurance liabilities may be restructured and whether policyholders may absorb losses.

12.11.1 In some jurisdictions, insurance liabilities may be restructured. Restructuring, limiting or writing down insurance liabilities may include:

- suspending or postponing payments to policyholders;
• amending terms of insurance contracts;
• terminating or restructuring options provided to policyholders;
• reducing the value of current and future benefits;
• early settling of contracts by payment of a proportion of the insurance liabilities to provide a more rapid and cost-effective resolution. This can apply to future determined benefits but also, and in particular in the case of inward (accepted) reinsurance, to future contingent claims; or
• restructuring reinsurance contracts to allow losses to be imposed on cedants as appropriate.

12.11.2 In most cases, approval from the court is required for the restructuring, while in some jurisdictions the resolution authority is empowered to restructure all or part of insurance liabilities without court approval. Restructuring should only occur if it adheres to the NCWOL principle.

12.11.3 Where insurance liabilities may be subject to restructuring in resolution, the resolution authority should clearly communicate information (for example, the processes through which such restructuring is undertaken and the extent that policyholders may be forced to absorb losses) to interested stakeholders.

Issues specific to groups and branches

12.12 Where the insurance legal entity belongs to a group and the head of the insurance group is located in the same jurisdiction as the legal entity, mechanisms are in place through which the head of the insurance group is able to be resolved.

12.12.1 When an insurance legal entity is resolved, the resolution of, or the application of some resolution powers to, the head of the group may support or aid the orderly resolution of the insurance legal entity and best ensure the protection of policyholders.

CF 12.12.a.1 ICP 12 and the ComFrame material integrated in ICP 12 may be applicable, where appropriate, to the resolution of:
• the Head of the IAIG, and any intermediate holding company within the IAIG;
• non-regulated operational entities within the IAIG that are significant to the business of the group;
• non-insurance financial institutions within the IAIG; and
• branches of insurers within the IAIG.

This guidance is not intended to override any existing sectoral requirement (eg for banks).

CF 12.12.a.2 Resolution actions should be taken for legal entities and branches within the IAIG, that fall within the scope stipulated above, as necessary and appropriate.
12.13 The resolution authority has the authority to resolve a branch of a foreign insurer located in its jurisdiction and, in such circumstance, coordinates and cooperates with the supervisor and/or resolution authority responsible for the insurance legal entity.

12.13.1 The resolution authority responsible for a branch should have the ability to support a resolution carried out by the resolution authority of the insurance legal entity which owns the branch or by the resolution authority responsible for the resolution of the insurance group to which the branch belongs.

12.13.2 The resolution process may differ in the jurisdiction of the branch and in that of the insurance legal entity, due, among other things, to different insolvency laws and creditor hierarchies.

12.13.3 Where the resolution authority of the insurance legal entity which owns the branch or the resolution authority responsible for the resolution of the insurance group to which the branch belongs are not taking action, or are acting in a manner that does not take sufficient account of the objectives of resolution in the branch jurisdiction, the resolution authority responsible for the branch may need to take actions of its own initiative.

12.13.4 Where the resolution authority for a branch takes resolution action of its own initiative, it should give prior notification and consult the supervisor or resolution authority of the insurance legal entity which owns the branch and/or the supervisor or resolution authority of the insurance.
Reinsurance and Other Forms of Risk Transfer

The supervisor requires the insurer to manage effectively its use of reinsurance and other forms of risk transfer. The supervisor takes into account the nature of reinsurance business when supervising reinsurers based in its jurisdiction.

Introductory Guidance

13.0.1 Reinsurance refers to insurance purchased by an insurer (the ceding insurer) to provide protection against certain risks, primarily underwriting risks of the insurance policies issued by the insurer. Reinsurers assume these risks in exchange for a premium. Other forms of risk transfer include alternative reinsurance arrangements, such as risk transfer to the capital markets. For simplicity, this ICP uses “reinsurance” to refer to both mainstream reinsurance and other forms of risk transfer.

13.0.2 Geographical diversification of risk, which typically involves risk transfer across jurisdictional borders, is a key element of ceding insurer’s and reinsurer’s capital and risk management. Geographical diversification can also have an impact in the jurisdiction of the ceding insurer, in particular jurisdictions exposed to catastrophes. By ceding insurance risk across borders, ceding insurers in the jurisdiction, and the jurisdiction as a whole, can benefit from a reduced concentration of insurance risk exposures at the ceding insurer and jurisdiction level respectively. This may also contribute to the financial stability of the jurisdiction.

13.0.3 Ceding insurers and reinsurers may face external limitations to geographical diversification, for example, in the form of constraints to cross-border risk transfer. The supervisor should be aware of and take into account the potential impacts of such limitations on individual ceding insurers and reinsurers as well as on the soundness and efficiency of the insurance market.

13.0.4 A reinsurance contract is one of indemnity between the reinsurer and ceding insurer and does not constitute a legal transfer of part of the underlying risk in the same way as, for example, a novation. Nonetheless, reinsurance contracts have the effect of transferring part of the underlying risk in an economic sense. The supervisor should remain aware that while reinsurance transfers insurance risk from the ceding insurer to the reinsurer, it also creates other risks. In a standard transaction, the ceding insurer reduces its insurance risk and assumes other risks such as credit, operational and basis risk; the reinsurer assumes risks such as insurance, timing, operational and credit risk.

13.0.5 A reinsurance contract is by nature a business-to-business transaction, made between professional counterparties as part of a wider risk and capital management approach. For this reason, the sort of asymmetry of expertise and knowledge associated with insurance contracts involving general consumers is usually not an issue in the reinsurance sector, although some asymmetry of bargaining power can exist, depending on the precise dynamics of the market. Thus, typically, it is not necessary for the supervisor to seek the same level of protection for ceding insurers as it does for general consumers (see ICP 19 Conduct of Business).
13.0.6 The supervisor should be able to assess whether ceding insurers make effective use of reinsurance. This involves gaining an understanding of, and comfort with, at least:

- the ceding insurer’s reinsurance strategy and reinsurance programme;
- the systems of risk management and internal controls put in place in order to implement the reinsurance strategy and execute the reinsurance programme;
- the economic impact of the risk transfer originating from the ceding insurer’s reinsurance programme; and
- the impact of reinsurance on the ceding insurer’s liquidity management.

13.0.7 The standards and guidance under this ICP are applicable to insurers and reinsurers, thus throughout this ICP:

- references to ceded reinsurance should be taken to include ceded retrocession (ie the reinsurance ceded by reinsurers);
- references to ceding insurers should be taken to include ceding reinsurers (ie retrocedents); and
- references to reinsurers should be taken to include retrocessionaires (ie reinsurers that assume reinsurance from ceding reinsurers).

13.1 The supervisor requires ceding insurers to have a reinsurance programme that is appropriate to their business and part of their overall risk and capital management strategies.

13.1.1 A ceding insurer’s risk and capital management strategies should clearly articulate the part played by reinsurance, in particular:

- the objectives that are pursued by using reinsurance;
- the risk concentration levels and ceding limits as defined by the ceding insurer’s risk appetite; and
- the mechanisms to manage and control reinsurance risks.

13.1.2 When articulating the part played by reinsurance in the overall risk and capital management strategies, the ceding insurer should take into account its business objectives, levels of capital and business mix, with particular reference to:

- risk appetite (both gross limit and net retention);
- peak exposures and seasonality in the insurance book;
- levels of diversification in the insurance book; and
- appetite for credit risk posed by reinsurers.

13.1.3 The reinsurance programme comprises the detailed implementation of the reinsurance related elements of the risk and capital management strategies in terms of coverage, limits, deductibles, layers, signed lines and markets used. It should reflect the ceding insurer’s overall risk
appetite, comparative costs of capital and liquidity positions determined in the reinsurance strategy. Therefore, reinsurance programmes can vary significantly in complexity, levels of exposure and number of participants.

13.1.4 In some instances, an insurer may have a business strategy and risk appetite to retain all risk and therefore a reinsurance programme would not be necessary.

13.1.5 Senior Management develops the reinsurance related elements of the risk management strategy as well as the reinsurance programme. Senior Management is also responsible for establishing appropriate systems and controls to ensure that these are complied with. The Board is responsible for approving the strategy and ensuring an appropriate oversight and consistent implementation of the reinsurance programme.

13.1.6 Senior Management of the ceding insurer should regularly review the performance of its reinsurance programme, to ensure that it functions as intended and continues to meet its strategic objectives. It is likely that such a review would take place as part of the feedback loop that is part of the risk management framework.

13.1.7 The supervisor should understand the ceding insurer’s business objectives and strategies, how reinsurance fits into these, and assess the extent to which objectives and strategies are adequately reflected in the reinsurance programme. The supervisor should challenge the ceding insurer where it identifies inconsistencies between the objectives and strategies and the reinsurance programme.

13.1.8 The supervisor’s assessment of a ceding insurer’s reinsurance programme should be based on a number of factors, such as the:

- structure of the programme, including any alternative risk transfer mechanisms;
- proportion of business ceded so that the net risks retained are commensurate with the ceding insurer’s financial resources and risk appetite;
- financial condition and claims payment record of the reinsurers in question (both in normal and stressed conditions);
- levels of exposure to a single reinsurer or different reinsurers being part of the same group;
- extent of any credit risk mitigation in place;
- expected resilience of the reinsurance programme in stressed claims situations, including stress related to the occurrence of multiple and/or catastrophic events;
- cession limits, if any, applicable in the jurisdiction;
- the supervisory regime in place in the jurisdiction of the reinsurer;
- level of effective risk transfer; and
Group perspectives

13.1.9 The group-wide supervisor should require a reinsurance strategy for the insurance group that includes the following issues:

- its interaction with the group-wide risk and capital management strategies;
- how the risk appetite is achieved, on both a gross limit and net retention basis;
- the appetite for reinsurer credit risk, including approved security criteria for reinsurance transactions and aggregate exposure criteria to individual or related reinsurers;
- the autonomy afforded to individual insurance legal entities to enter into “entity specific” reinsurance arrangements, and the management and the aggregation of these exposures in the group-wide context;
- procedures for managing reinsurance recoverables, including required reporting from insurers;
- intra-group reinsurance strategy and practice; and
- use of alternative risk transfer, including capital markets risk transfer products.

13.2 The supervisor requires ceding insurers to establish effective internal controls over the implementation of their reinsurance programme.

13.2.1 Control of the reinsurance programme should be part of the ceding insurer’s overall system of risk management and internal controls (see ICP 8 Risk Management and Internal Controls). The supervisor should require that the controls and oversight in place are suitable in the context of the ceding insurer’s business.

13.2.2 The ceding insurer should ensure that the characteristics of its reinsurance programme, including the credit risk posed by the reinsurer, are reflected in its capital adequacy assessment as well as its ORSA (see ICP 16 Enterprise Risk Management for Solvency Purposes).

Credit risk posed by the reinsurer

13.2.3 When developing the reinsurance programme the ceding insurer should consider its appetite for reinsurer credit risk. Reinsurers may face solvency issues, leading to delayed payment or default, and this can have significant consequences for the solvency and liquidity of the ceding insurer.

13.2.4 In practice, ceding insurers have various options to mitigate reinsurer credit risk, for example:

- establishing criteria on the financial condition and claims payment record of eligible reinsurers;
• setting limits on risks ceded to a single reinsurer;
• ensuring a spread of risk amongst a number of reinsurers;
• incorporating rating downgrade or other special termination clauses into the reinsurance contract;
• requiring the reinsurer to post collateral (the ability to require this may depend upon the relative commercial strengths of the ceding insurer and reinsurer);
• proactively monitoring reinsurance claims recoveries; and
• withholding reinsurer’s funds.

Approved security criteria

13.2.5 The ceding insurer should have in place procedures for identifying reinsurers that meet its security requirements. If a ceding insurer develops a pre-approved list of reinsurers, there should also be processes for dealing with situations where there is a need to assess reinsurers outside any pre-approved list. Ceding insurers may have their own credit committees to make their own assessment of the risk.

13.2.6 In line with other approaches to identifying appropriate reinsurers, any approved security criteria should be derived from a high level statement of what reinsurance security will be acceptable to the ceding insurer, which may be based on:

• external opinions;
• the ceding insurer’s own view of the reinsurer;
• minimum levels of capital;
• duration and quality of relationship;
• expertise of the reinsurer;
• levels of retrocession;
• reinsurance brokers’ security criteria; or
• a mixture of these and other factors.

Aggregate exposure limits or guidelines

13.2.7 A ceding insurer should set prudent limits or guidelines reflecting security and size of the reinsurer, in relation to its maximum aggregate exposure to any one reinsurer or to a group of related reinsurers, which would be complementary to any supervisory limits or guidelines.

13.2.8 The ceding insurer should have in place procedures for monitoring this aggregate exposure to ensure that these limits or guidelines are not breached. The ceding insurer should also have procedures to manage excess concentrations going forward, such as bringing them back within limits or guidelines.

Matching of underlying underwriting criteria

13.2.9 The ceding insurer should give due consideration to the risk posed by a mismatch in terms and conditions between reinsurance contracts and
the underlying policies. The ceding insurer may bear a greater net exposure than it initially intended because of this gap.

**Criteria and procedures for purchasing facultative cover**

13.2.10 The ceding insurer should have appropriate criteria in place for the purchase of facultative coverage. Any facultative reinsurance coverage bought should be linked to the procedures for aggregations and recovery management.

13.2.11 The ceding insurer should have a specific process in place to approve, monitor and confirm the placement of each facultative risk. If facultative reinsurance is necessary to ensure that acceptance of a risk would not exceed maximum net capacity and/or risk limits, such reinsurance should be secured before the ceding insurer accepts the risk.

**Operational risk related to contract documentation**

13.2.12 In order to reduce the risk and scope of future disputes, the ceding insurer and the reinsurer should have in place processes and adequate controls to document the principal economic and coverage terms and conditions of reinsurance contracts clearly and promptly.

13.2.13 Ceding insurers and reinsurers should finalise the formal reinsurance contract without undue delay, ideally prior to the inception date of the reinsurance contract.

13.2.14 All material reporting due to and from reinsurers should be timely and complete, and settlements should be made as required by the reinsurance contract.

13.2.15 The ceding insurer should consider how its reinsurance contracts will operate in the event of an insolvency of itself or its reinsurer.

13.2.16 The supervisor should have access, on request, to material reinsurance documentation. In case of indications of significant uncertainties in terms of reinsurance documentation, the supervisor should take into account the resulting underwriting, operational and legal risks when considering the effects of reinsurance on the ceding insurer’s solvency.

**13.3 The supervisor requires ceding insurers to demonstrate the economic impact of the risk transfer originating from their reinsurance contracts.**

13.3.1 The supervisor should regard as a reinsurance contract an agreement that transfers sufficient insurance risk to be considered insurance under jurisdictional rules.

13.3.2 In general, a contract should be considered as a loan or deposit if, during its development, the ceding insurer has the unconditional obligation to indemnify the reinsurer for any negative balances that may arise out of the contractual relationship. This characteristic does not result in risk transfer. All liabilities of the ceding insurer should be contingent on the proceeds of the underlying insurance business.

13.3.3 Upon request from the supervisor, the ceding insurer should provide sufficient information about its reinsurance contracts to allow the
supervisor to make informed judgments about the substance of the risk transfer (ie, the degree of risk transfer in an economic sense).

13.3.4 Where there are concerns of inappropriate reporting with respect to the degree of risk transfer, the supervisor should assess the substance of the reinsurance contract entered into by the ceding insurer and how it has been reported by the ceding insurer. Further, the supervisor should be able to assess the impact that the ceding insurer’s reinsurance contracts have on the ceding insurer’s capital requirements. The supervisor should challenge Senior Management of the ceding insurer on the purpose of individual contracts where appropriate.

Finite reinsurance

13.3.5 Finite reinsurance is a generic term that, for the purposes of this ICP, is used to describe a spectrum of reinsurance arrangements that transfer limited risk relative to aggregate premiums that could be charged under the contract.

13.3.6 Finite reinsurance transactions are legitimate forms of reinsurance arrangements; however, it is essential that they are accounted for appropriately. In particular, only contracts that transfer sufficient insurance risk in order to meet the requirements of the relevant accounting standards in force in each jurisdiction can be accounted for as reinsurance.

13.3.7 The supervisor should pay particular attention to reinsurance contracts that have, or appear to have, limited levels of risk transfer which may change over the duration of the contract. Only the amount of risk transferred under finite reinsurance contracts should be included in the regulatory capital calculations of the ceding insurer.

13.4 When supervising ceding insurers purchasing reinsurance across borders, the supervisor takes into account the supervision performed in the jurisdiction of the reinsurer.

13.4.1 The cross-border nature of reinsurance transactions, together with the relative sophistication of the market participants involved in reinsurance, are key elements that the supervisor should consider when supervising ceding insurers.

13.4.2 Taking into account the supervision performed in the jurisdiction of the reinsurer may help the supervisor to assess the overall risk profile of the ceding insurer. This can be done, for example, by reviewing the supervisory framework and practices in the jurisdiction of the reinsurer, or by engaging in supervisor-to-supervisor dialogue.

Supervisory recognition

13.4.3 The supervisor can benefit from relying on supervision performed in the jurisdiction of the reinsurer. Benefits may include, for example, strengthened supervision as well as a more efficient use of resources by the supervisor of the ceding insurer.

13.4.4 Where supervisors choose to recognise aspects of the work of other supervisory authorities, they should consider putting a formal supervisory recognition arrangement in place (see ICP 3 Information Sharing and Confidentiality Requirements).
13.4.5 Supervisory recognition can be conducted through unilateral, bilateral and multilateral approaches to recognition. All three approaches recognise the extent of equivalence, compatibility or, at least, acceptability of a counterparty’s supervisory system. Bilateral and multilateral approaches typically incorporate a mutuality component to the recognition element, indicating that this is reciprocal.

13.5 The supervisor requires the ceding insurer to consider the impact of its reinsurance programme in its liquidity management.

13.5.1 Given the nature and direction of cash flows within a ceding insurer, liquidity risk historically has not been considered to be a major issue in the insurance sector. However, there can be liquidity issues within an individual ceding insurer which could arise specifically from the ceding insurer’s reinsurance programme.

13.5.2 Reinsurance contracts do not remove the ceding insurer’s underlying legal liability to its policyholders. The ceding insurer remains liable to fund all valid claims under contracts of insurance it has written, regardless of whether they are reinsured or not. For this reason, a large claim or series of claims could give rise to cash flow difficulties if there are delays in collecting from reinsurers or in the ceding insurer providing proof of loss to reinsurers.

13.5.3 The supervisor should require ceding insurers to take appropriate measures to manage their liquidity risk, including funding requirements in adverse circumstances. As with all risks, the insurer should develop its own response to the level of risk it faces and the supervisor should assess these responses. There are a number of ways in which liquidity risk may be mitigated. For example, some insurers choose to arrange a line of credit from a bank in order to deal with short-term liquidity issues.

13.5.4 Ceding insurers may make arrangements with their reinsurers in order to mitigate their liquidity risk. These arrangements, if used, may include clauses that trigger accelerated payment of amounts due from reinsurers in the event of a large claim and/or the use of collateral or deposit accounts, giving ceding insurers access to funds as needed. Use of such arrangements is a commercial matter between the ceding insurer and reinsurer.

13.5.5 External triggers can give rise to liquidity issues, especially where reinsurers have retroceded significant amounts of business. If a reinsurance contract contains a downgrade clause that gives the ceding insurer the right to alter the contract provisions, or obliges the reinsurer to post collateral with a ceding insurer to cover some or all of its obligations to that ceding insurer, such action may cause liquidity issues among reinsurers and may be pro-cyclical. Therefore, the supervisor should be aware of the potential consequences of such triggers for the overall efficiency and stability of the market.

13.6 In jurisdictions that permit risk transfer to the capital markets, the supervisor understands and assesses the structure and operation of such risk transfer arrangements, and addresses any issues that may arise.
A wide range of techniques has been developed to allow the transfer of insurance risk to the capital markets, resulting in a diversity and complexity of risk transfer arrangements.

In general, arrangements used to enable risk transfer to the capital markets operate like mainstream reinsurance. For example, risk is transferred via a reinsurance contract with similar terms and conditions to any other reinsurance contract. Further, the risk assuming entity is a reinsurer subjected to licensing conditions like any other reinsurer. The defining feature of these risk transfer arrangements is the direct funding of the reinsurance risk exposure with funds raised, often exclusively, in the capital markets.

Insurance risk transfer to the capital markets can occur by making use of a wide variety of arrangements. Arrangements in the non-life sector are often broadly classified into four groups: (1) catastrophe bonds (cat bonds); (2) collateralised reinsurance; (3) industry loss warranties (ILWs); and (4) sidecars. These four groups, which are not mutually exclusive, focus on different elements of the risk transfer arrangements:

- cat bonds take the name from the financial instrument (ie a debt security) issued to fund an insurance exposure, usually a catastrophe;
- collateralised reinsurance is generally used to highlight a credit risk mitigation feature of certain insurance transactions (ie the collateralisation of the insurance exposure);
- ILWs refer to a range of financial instruments used by counterparties, who may or may not be insurers, to buy or sell protection related to insurance risks; and
- sidecars refer to a legal entity created ‘on the side’ of an insurer that is used to transfer insurance risk, usually to the capital markets.

To illustrate that these are not mutually exclusive, there could be a sidecar that underwrites insurance risk via an ILW and funds the exposure through an issuance of cat bonds, the proceeds of which are used to collateralise the reinsurance risk assumed.

In the life sector, some arrangements are similar to the non-life sector (for example, mortality bonds, which operate like cat bonds). Other life insurance arrangements have specific features that are not used in non-life insurance, such as the funding of certain portions of the ceding insurer’s reserves.

Despite the many similarities with mainstream insurance, transactions transferring insurance risk to the capital markets have special features that the supervisor should bear in mind in order to assess the appropriateness and effectiveness of their use by ceding insurers and reinsurers.

Initial assessment

Insurance risk transfer to the capital markets usually entails the creation of a dedicated entity or a legally ring-fenced arrangement, specifically constituted to carry out the transfer of risk. These are referred to by a
variety of names, such as special purpose vehicles, special purpose reinsurance vehicles, or special purpose insurers; for the purpose of the ICPs, they are collectively referred to as special purpose entities (SPEs).

13.6.7 The main purpose of an SPE is to assume insurance risk, funding the exposure by raising funds in the capital markets, and to be dismantled once its purpose has been fulfilled. Importantly, as SPEs conduct insurance business, the supervisor should consider licensing them as insurers (see ICP 4 Licensing). Licensing of SPEs should be appropriately tailored to take into consideration the unique characteristics of SPEs. In this respect, close collaboration among those supervising ceding insurers and those supervising SPEs before authorisation of the SPE and on an ongoing basis can be particularly helpful.

13.6.8 Key elements of any SPE structure include:

- the insurance risk that it assumes is “fully funded” (ie, that the exposure taken by the SPE is funded across a range of foreseeable scenarios from the time the SPE goes on risk to the time it comes off risk);
- the claims of any investors in the SPE are subordinate to those of the ceding insurer; and
- the investors in the SPE have no recourse to the ceding insurer in the event of an economic loss.

13.6.9 In order to be able to understand and assess whether an SPE structure meets the criteria above, the supervisor should take the following into account:

- ownership structure of the SPE;
- suitability of the Board and Senior Management of the SPE;
- the SPE’s management of credit, market, underwriting and operational risks;
- investment and liquidity strategy of the SPE;
- ranking and priority of payments;
- extent to which the cash flows in the SPE structure have been stress tested;
- arrangements for holding the SPE’s assets (eg trust accounts) and the legal ownership of the assets;
- extent to which the SPE’s assets are diversified; and
- use of derivatives, especially for purposes other than risk reduction and efficient portfolio management.

13.6.10 Understanding the role of all the parties to the SPE arrangement is critical to understanding the underlying risks, particularly as these may be fundamentally different from those involved in a traditional reinsurance transaction. The supervisor should understand and assess, among other things, the:
• extent to which key parties have been fully disclosed (eg sponsor, (re)insured, investors, advisors, counterparties) and are known to the supervisor;
• extent to which potential conflicts of interest between all parties to the SPE have been adequately disclosed and addressed (such as situations where sponsors also take a managing role);
• credit risk associated with key service providers, including financial guarantors used to protect the position of investors;
• degree of basis risk that is assumed by the ceding insurer and to what extent this could have immediate ramifications for the ceding insurer’s financial position in case of a loss;
• details of the SPE’s management arrangements and key personnel;
• third party assessments of the SPE structure (eg by credit rating agencies);
• expertise of the legal advisors involved;
• robustness of any financial or actuarial projections, if applicable (eg if triggers are indemnity based); and
• disclosure of outsourcing agreements.

13.6.11 As many SPEs are designed to operate with a minimum of day-to-day management, the supervisor should understand and assess the extent to which the systems of risk management and internal controls are adequate and proportionate to the nature of the underlying risks and to the complexity and expected lifespan of the SPE structure.

13.6.12 The systems of risk management and internal controls of the SPE should ensure that, at least:

• investment restrictions are not breached;
• interest payments, dividends, expenses and taxes are properly accounted for;
• movements above established thresholds in assets and collateral accounts are reported;
• assets are legally existent and technically identifiable; and
• liabilities can be determined on a timely and accurate basis and obligations satisfied in accordance with the underlying contracts.

13.6.13 The supervisor should understand and assess:

• the systems of risk management and internal controls of the SPE, particularly the extent to which these are sufficient to ensure effective operation in compliance with the SPE’s legal and supervisory obligations; and
• operational risks within the SPE structure and any mitigation arrangements.
Basis risk

13.6.14 The supervisor should understand and assess the extent to which SPE arrangements give rise to basis risk. This arises where the trigger for indemnity under the SPE arrangement is different from the basis on which underlying protected liabilities can arise.

13.6.15 Where SPEs contain indemnity triggers (ie, recovery from the SPE is based on the actual loss experience of the ceding insurer) basis risk is unlikely to be an issue. However, many SPEs contain non-indemnity triggers, such as parametric triggers (driven by objectively measurable events) or modelled triggers (driven by the outcome of modelled, industry-wide losses). In such cases, there may be events where the ceding insurer will remain exposed to its underlying policyholders without having recourse to the SPE.

13.6.16 Basis risk should be considered with reference either to the amount of credit given by the supervisor of the ceding insurer for the SPE arrangement or in the capital requirement of the ceding insurer, where such mechanisms are used.

13.6.17 Additionally, in some jurisdictions the accounting and regulatory treatment of insurance risk transfer that uses non-indemnity triggers may be different from the accounting treatment of indemnity-based insurance. The supervisor should understand these accounting differences and the impact these may have on the financial statements of the ceding insurer and the reinsurer.

Ongoing Supervision

13.6.18 The supervisor should understand the various issues that emerge in the ongoing supervision of SPEs and their use. Consideration should be given to the following areas:

- measures to be taken by the supervisor if any of the licensing or authorisation conditions are breached;
- level of capital and ability of the SPE to continue to respond adequately should covered events occur;
- level of reporting required by the supervisor in order to understand and assess whether the SPE is complying with its obligations;
- the SPE’s response in the event of fluctuations in the values of invested assets (eg match/mismatch between collateral account and exposure, flow of premiums, fees, commissions);
- arrangements put in place in the SPE to ensure that the “fully funded” condition is maintained in the case that the insurance risks assumed are rolled over from one risk period to another; and
- where the SPE undertakes multiple transactions, arrangements put in place in the SPE to ensure that the funds corresponding to each transaction are appropriately segregated and legally insulated.

Unwinding of SPE arrangements
13.6.19 The unwinding of SPEs is often influenced by the dynamics of insurance losses. The supervisor should understand and gain comfort with the provisions in place to require orderly unwinding of SPEs. In particular, the supervisor should understand the process related to the generation, mitigation and management of any residual risk emerging from the unwinding of the SPE.

13.6.20 In addition, the supervisor should understand the process and stages that the SPE goes through when it comes to a natural end and its obligations have been fulfilled and the SPE is liquidated. There is a distinction between unwinding in the event of a loss and unwinding a transaction reaching legal maturity (without a loss having occurred). While the latter case is usually simple and straightforward, unwinding in a full or partial loss situation deserves close attention. Consideration should be given to the following areas:

- issues relating to share buy-back and conditions to its materialisation;
- issues relating to disposal of the investment portfolio;
- “dismantling” of the SPE and residual risks;
- where the SPE undertakes multiple transactions, issues relating to the segregation and legal insulation of assets per transaction; and
- supervisory issues relating to risks which revert to the ceding insurer on termination of the arrangement.

Considerations for supervisors of insurers ceding risks to SPEs

13.6.21 Although in many jurisdictions insurance risk transfer to the capital markets is not permitted, the supervisor should consider that some of the insurers in its jurisdiction may be transferring insurance risk to SPEs located in another jurisdiction that permits insurance risk transfer to the capital markets. In this case, the supervisor of the ceding insurer should consider, among other things:

- whether the risk transfer taking place involves an SPE that is licensed in the jurisdiction where the insurance risk is assumed;
- the supervisory regime to which the SPE is subject in its jurisdiction; and
- the extent to which the ceding insurer has adequately provided for the identification, assessment and management of the risks associated with transferring insurance risk to an SPE (eg credit risk, basis risk).
ICP 14   Valuation
The supervisor establishes requirements for the valuation of assets and liabilities for solvency purposes.

Introductory Guidance

Application

14.0.1 The IAIS considers it is most desirable that the methodologies for calculating items in general purpose financial reports can be used for, or are substantially consistent with, the methodologies used for regulatory reporting purposes, with as few changes as possible to satisfy regulatory requirements. However, the IAIS also recognises that this may not be possible or appropriate in all respects, considering the differing purposes. The IAIS believes it is essential that differences between general purpose financial reports and published regulatory reports are publicly explained and reconciled.

14.0.2 The IAIS considers that differences between technical provisions for general purpose financial reports and published regulatory reports should be publicly explained and reconciled in terms of differences in data, discount rate, methodology and assumptions used together with the rationale for why any different approach is appropriate for solvency purposes.

14.0.3 To the extent that financial reporting standards, including IFRS, are consistent with the standards in this ICP, valuations that are in accordance with those financial reporting standards may be regarded as compliant with this ICP.

14.0.4 The context and purpose of the valuation of assets or liabilities of an insurer are key factors in determining the values that should be placed on them. This ICP considers the valuation requirements that should be met for the purpose of the solvency assessment of insurers within the context of IAIS risk-based solvency requirements that reflect a total balance sheet approach on an economic basis and address all reasonably foreseeable and relevant risks.

14.0.5 Standard 17.1 states that the supervisor requires a total balance sheet approach to be used in the assessment of solvency to recognise the interdependence between assets, liabilities, regulatory capital requirements and capital resources and to require that risks are appropriately recognised. Such an approach ensures that the determination of available and required capital is based on consistent assumptions for the recognition and valuation of assets and liabilities for solvency purposes.

14.0.6 To achieve consistency with this approach to setting capital requirements in the context of a total balance sheet approach, capital

---

3 An economic basis may include amortised cost valuations and market-consistent valuations that comply with this ICP.

4 The total balance sheet approach is an overall concept rather than one which implies the use of a particular methodology such as a cost of capital method or a percentile method.
resources should broadly be regarded as the difference between assets and liabilities, but on the basis of their recognition and valuation for solvency purposes.

Solvency purposes

14.0.7 The valuation "for solvency purposes" referred to in this ICP is the valuation of the assets and liabilities used within the broad concept of a risk-based solvency assessment of insurers.

14.0.8 Solvency assessment results from the application of supervisory judgment to various measures and estimates of an insurer’s current financial position and future financial condition which serve to demonstrate the insurer’s ability to meet its policyholder obligations when they fall due. Useful in this regard is a set of financial statements which may differ from those used for general purpose financial reporting. To distinguish them, this ICP refers to the financial statements used for solvency assessment as “regulatory financial statements”. Such statements include a regulatory balance sheet and regulatory capital requirements. For the purposes of this ICP, “valuation for solvency purposes” refers to valuation of assets and liabilities in the regulatory financial statements. The overall solvency assessment may use information additional to the regulatory financial statements such as:

- stress and scenario testing;
- the insurer’s own risk and solvency assessment; and
- relevant disclosure.

14.0.9 Technical provisions are a significant component of valuation for solvency purposes. They include a margin for risk appropriate for solvency purposes. Regulatory capital requirements are another component of the solvency assessment, and they include further allowance for risk so that when taken together, they are sufficient to ensure that policy obligations are satisfied with the probability of sufficiency required by the supervisor.

14.0.10 In adverse circumstances, certain assets may be considered to have reduced or nil value. Consequently, in the capital adequacy assessment such assets may be excluded from or have reduced value in capital resources. Alternatively, a capital requirement may be set to cover the potential shortfall in value. Such adjustments are part of the process of determining capital requirements and/or capital resources and are covered by ICP 17 Capital Adequacy. These adjustments are shown separately from asset values in the regulatory financial statements. This enables improved transparency, consistency and comparability.

14.1 The valuation addresses recognition, derecognition and measurement of assets and liabilities.

14.1.1 Assets and liabilities should be recognised and derecognised to the extent necessary for risks to be appropriately recognised. Such recognition/derecognition principles may differ from those used for general purpose financial reporting in a jurisdiction.

14.1.2 Recognition of insurance contracts as part of the valuation of technical provisions is a significant issue for insurers and supervisors. There are
two key possible points of recognition – on entering into a binding contract (the bound date) and the inception date of the contract. In principle, the bound date is the date at which an economic obligation arises. However, in practice, these dates are only likely to be significantly different for certain classes of non-life insurance.

14.1.3 Contracts for ceded reinsurance should be recognised and valued so as to correspond to the recognition of the risks which they are mitigating. Where a current reinsurance policy is contracted to cover future direct policies, the value of the reinsurance policy should not include any amount in respect of future direct policies that have not been recognised.

14.1.4 An insurance contract liability (or a part of an insurance contract liability) within technical provisions should be derecognised when, and only when, it is extinguished – ie when the obligation specified in the insurance contract is discharged or cancelled or expires.

14.1.5 The purchase of reinsurance should not result in the derecognition of technical provisions unless the purchase of that reinsurance results effectively in the extinguishment or novation of the insurance contracts.

14.2 The valuation of assets and liabilities is undertaken on consistent bases.

14.2.1 Solvency assessment based on consistent valuation of assets and liabilities is a prerequisite for obtaining a meaningful insight into the asset-liability positions of an insurer and an understanding of the financial position of an insurer relative to other insurers. It provides reliable information on which to base the actions that are taken by insurers and their supervisors in respect of those positions.

14.2.2 The overall financial position of an insurer should be based on the consistent measurement of assets and liabilities, the explicit identification and consistent measurement of risks and their potential impact on all components of the balance sheet. This consistency should apply to all assets and liabilities, including assets in excess of the liabilities, and extend across insurers and time periods so as to achieve comparability.

14.2.3 Undertaking valuation on consistent bases means that differences in values of assets and liabilities can be explained in terms of the differences in the nature of the cash flows including their timing, amount and inherent uncertainty, rather than differences in methodology or assumptions. Such consistency may be applied at different levels such as segment within a company, a company or a group.

14.2.4 Observed market valuations or amortised cost valuations may be used for some assets and liabilities, while valuation models, such as discounted cash flow models, may be used for other assets and liabilities. Calibration of such discounted cash flow models to market valuations or amortised cost of other assets and liabilities can be of assistance in achieving consistency.

14.2.5 The specific characteristics of insurance contracts, financial instruments and data available may vary within and across jurisdictions. Consistency in the valuation of assets and liabilities means that such variations can be explained in terms of the differences in the nature of the cash flows valued in each jurisdiction.
14.2.6 Regulatory capital requirements are determined using a consistent treatment of the valuation of assets and liabilities. Consistency in the valuation of assets and liabilities for solvency purposes does not necessarily mean that a single valuation basis is used for all assets and liabilities. The balance sheet, when taken together with capital requirements, should result in an appropriate recognition of risks.

14.3 The valuation of assets and liabilities is undertaken in a reliable, decision useful and transparent manner.

Reliability

14.3.1 The values placed on the assets and liabilities of an insurer for solvency purposes should be a reliable measure of their value at the date of solvency assessment.

14.3.2 Objectivity is an important aspect of valuing assets and liabilities in a reliable manner, so that a valuation is not influenced inappropriately by an insurer’s management. The valuation of assets and liabilities typically involves judgment, e.g., expert judgment in assessing the relevance of data and deriving assumptions. Consistent with reliability of outcome, subjectivity in valuation should be reduced as far as practicable. This may be achieved by using information available from effective internal control processes, market valuations and other relevant current or factual information, by applying professional standards and subjecting valuations to independent review. The supervisor should require a valuation methodology which uses information provided by the financial markets and generally available data on insurance technical risks. Company-specific information may be appropriate, for example, where the insurer’s business model and practices are sufficiently substantiated as representative of the portfolio and similar information is used in market valuations.

Decision usefulness

14.3.3 In the context of this standard, ‘decision useful’ means useful in making judgments for solvency purposes. It should be recognised that, in valuing assets and liabilities in a reliable manner, and in reducing the subjectivity in the valuation, it may not be appropriate to eliminate subjectivity completely. A method that provides a single value without the need for judgment may be less decision useful than one that produces a range of reasonable values from which a value is selected by applying judgment. A method that produces a decision useful outcome should take precedence over one that does not.

14.3.4 In some jurisdictions, enforcement actions can only be based on objective calculations. In those jurisdictions, an objective calculation should take precedence over one based on subjective assumptions and methods. Supervisors may need to provide greater specificity on assumptions (e.g., mortality and interest) and methods for regulatory purposes. Specified methodology should include a margin for risk that is appropriate for a valuation done for solvency purposes.

14.3.5 Decision useful values may be derived from a range of sources, including market-consistent valuations, amortised cost valuations and other valuation models, such as discounted cash flow projection models.
14.3.6 Where there is a market for an asset or liability in which prices are quoted publicly and trades are readily available, the quoted prices could provide a decision useful value of the asset or liability in the large majority of situations. Typically, there will be a range of market prices for the same item, and judgment will be needed in determining the final value.

14.3.7 In some circumstances, a market price may not necessarily provide a decision useful basis for a valuation. If the reference market is dysfunctional or anomalous in its operation, a more reliable method of determining value based on more normal conditions may be appropriate. Such circumstances may occur, for example, if there is a high cost in making actual trades, trading is thin, independent pricing sources are not available or are limited, or the market is subject to distorting influences. The supervisor should evaluate such circumstances and as a result may conclude that the use of an alternative economic valuation is appropriate.

14.3.8 Amortised cost could be a decision useful value for assets and liabilities where it is a reflection of the amount the insurer will pay and receive over time, and fluctuations in market values are not indicative of the insurer’s ability to meet its obligations. Amortised cost may provide a pragmatic and decision useful value when other valuation approaches are no more useful or reliable. It is useful to complement such valuations with sensitivity and adequacy testing.

14.3.9 An insurer’s modelling of its assets and liabilities may also provide a decision useful value. The reliability of model results is enhanced through the use of insurers’ and supervisors’ best practices surrounding model governance, controls and independent review. Supervisory comparisons or benchmarking of modelling practices can further enhance the reliability of modelled results. Models can be used to apply common measurement criteria across all risks (eg same methodology, time horizon, risk measure, level of confidence, etc.)

14.3.10 The supervisor should evaluate the extent to which the time value and risk adjustments add decision useful information. Where this is not the case, the disclosure requirements may be relied upon. For liabilities subject to significant litigation uncertainty, it may not be appropriate to include estimates of time value and risk in the reported liability, due to the unreliability of such adjustments.

**Transparency**

14.3.11 The solvency regime should be supported by appropriate public disclosure and additional confidential reporting to the supervisor. For example, explicit determination of the components of the technical provisions supports the objectives of transparency and comparability and facilitates convergence. Standards for public disclosure including the valuation of assets and liabilities for solvency purposes can be found in ICP 20 Public Disclosure.

14.3.12 Insurers should provide sufficient information about the approaches they have taken to the valuation of assets and liabilities, describing how the principles of reliability, decision usefulness and consistency have been addressed. Transparency facilitates understanding and comparability within and across jurisdictions.
14.4 The valuation of assets and liabilities is an economic valuation.

14.4.1 An economic valuation is a valuation such that the resulting assessment of an insurer’s financial position is not obscured by hidden or inherent conservatism or optimism in the valuation. Such an approach is appropriate in the context of risk-based solvency requirements which satisfy these ICPs and standards and shares their objectives of transparency and comparability.

14.5 An economic valuation of assets and liabilities reflects the risk-adjusted present values of their cash flows.

14.5.1 An economic value should reflect the prospective valuation of the future cash flows of the asset or liability allowing for the riskiness of those cash flows and the time value of money. An asset or a liability may have both cash inflows and cash outflows the net effect of which is a positive or negative value. Such a valuation is not necessarily determined directly using a discounted cash flow calculation. A current quoted market value or a current sale or purchase value may also reflect the prospective valuation of cash flows.

14.5.2 Supervisors should take into account all relevant information available about current market assessments of value and risk and the principles, methodologies and parameters used in the relevant markets for assessing the value of an asset or liability.

14.5.3 The historic cost of an asset or liability may not reflect a current prospective valuation of the future cash flows and may therefore not be consistent with the current economic valuation of other assets or liabilities. Historic cost generally does not reflect changes in value over time. However, amortised cost, which adjusts the historic cost of an asset or liability over time, may reliably reflect the value of future cash flows, when used in conjunction with an adequacy or impairment test.

14.5.4 Some jurisdictions utilise a subset of economic valuation known as market-consistent valuation which is described further in Guidance 14.5.5 to 14.5.11. Some jurisdictions use a subset of economic valuation known as amortised cost valuation which is described further in Guidance 14.5.12 to 14.5.15.

**Market-consistent valuation**

14.5.5 It may be appropriate to use market-consistent values for the economic valuation of assets and liabilities. A valuation that is based upon principles, methodologies and parameters that the financial markets would expect to be used is termed a market-consistent valuation. Where a range of assessments and approaches is evident from a market, a market-consistent valuation is one that falls within this range.

14.5.6 It may be well known to financial markets that the approach taken to market assessments for some assets and some insurance liabilities or their components uses modelling based on certain assumptions and techniques and portfolio specific information as well as generally available data on insurance technical risks. A calculation consistent with this approach would be market-consistent.
14.5.7 However, in exceptional circumstances there may be information additional to that on market assessments from the wider economy that should be taken into account eg where a market is anomalous, not operating effectively or is subject to intervention from the relevant authorities. For example, where a government/regulator intervenes in a major way eg by injecting money or taking control. Such action may be in response to or the cause of distortions of supply and demand in relevant markets so that values determined in a market consistent way may also be distorted temporarily.

14.5.8 A market-consistent value may not then be appropriate and a different value, which may, for example, be expected to be market-consistent under more normal market conditions, may need to be determined to arrive at an economic valuation for solvency purposes. The extent to which this is appropriate is likely to vary according to market conditions in different jurisdictions. If such circumstances arise, supervisors should provide guidance as to the appropriate values or adjustments insurers should use for solvency purposes to reflect the risk-adjusted present value of their cash flows and maintain consistency, decision usefulness, relevance and transparency.

14.5.9 A sufficiently active market may exist for an asset or liability that in itself provides a measure of value that is market consistent. For other assets and liabilities or when the market becomes illiquid, there may be no direct measure of value. However, relevant market information may be available regarding the assessment of components of the rights, obligations or risks of the asset or liability. If, for example, a component of the obligations of an insurance liability can be replicated using financial instruments for which there is a reliable market value, that value provides a reliable indication of the value for this component.

14.5.10 The market-consistent value of an asset or liability may be determined using different techniques, or a combination thereof. For example, in valuing technical provisions:

- if the insurance obligations are traded in a sufficiently deep and liquid market the observed prices may be used to arrive at a market consistent value. The availability, decision usefulness and reliability of the prices should be taken into account when deriving the market consistent value;

- if some or all of the cash flows associated with the insurance obligations can be replicated using financial instruments, the market value of the replicating financial instruments may be used as the value of those cash flows;

- if the cash flows associated with the insurance obligations cannot be replicated perfectly, then the remaining cash flows may be valued using a discounted cash flow model. To be market consistent, the methodology used needs to deliver a proxy for market value based on market consistent valuation principles and to reflect the uncertainty or unavailability of market information.

14.5.11 This approach to valuation is sometimes termed the “components approach”, under which risk components are valued at market value
where such a value is ascertainable, decision useful and reliable; other components may need to be valued using marked-to-model methods. Separate components may, for example, be identifiable for insurance contracts which have an investment or deposit component and an insurance risk component. The components approach helps to improve market consistency and reduce modelling error. It should be noted that where there is no sufficiently deep liquid market from which to determine a market consistent value for a risk component, the additional liquidity risk needs to be considered.

Amortised cost valuation

14.5.12 It may be appropriate to use an amortised cost method for economic valuation of assets and liabilities. Amortised cost methods determine the value of an asset or liability at any point in time as the present value of future cash flows discounted at an appropriate interest rate, with an appropriate adjustment for risk.

14.5.13 The discount rate used in valuing assets under an amortised cost method equates the present value of expected contractual cash flows with the amount paid to acquire the asset. The price paid for an asset usually equals the market value at time of purchase. Since the price paid reflects the risk of the instrument at the time of purchase, an adjustment for the risk assessed at that time is automatically included in the discount rate.

14.5.14 When valuing both assets and liabilities under an amortised cost method, there is a close relationship between the discount rate and the provision for risk. The discount rate used may be based on the expected yield, after making allowance for default, of the supporting asset portfolio. Other combinations of discount rate and risk adjustment are possible.

14.5.15 When an amortised cost method is used, the values produced should be evaluated for adequacy at least annually. For assets, when the asset has been impaired to a significant degree, the carrying value of that asset should be adjusted to reflect that impairment. For liabilities, the value should be tested at least annually. When the liability value is found to be inadequate, it should be strengthened. Adjustments should also be made to reduce any significant, undue conservatism identified by the adequacy test.

14.6 The value of technical provisions and other liabilities does not reflect the insurer’s own credit standing

14.6.1 To achieve consistent and reliable economic values of insurance portfolios for solvency purposes, the value of technical provisions should not reflect an insurer’s own credit standing. Insurance obligations are required to be met to the same level of confidence by all insurers in a jurisdiction and the value of an identical portfolio held by different insurers should not depend on the insurer’s credit standing. This also applies to the technical provisions of a reinsurer.

14.6.2 However, the credit standing of a reinsurer should be taken into account when considering the solvency of a ceding (re)insurer even if the contractual cash flows are the same. The risk of reinsurer default could be covered either by the regulatory capital requirements or adjustments made to the value of assets in determining available capital.
Alternatively, some allowance for the credit default risk could be made in valuing the reinsurance asset directly.

14.6.3 The valuation of liabilities, other than technical provisions, should also not reflect the insurer’s own credit standing.

14.6.4 Where the terms of the debt make it subordinate to the insurer’s obligations in respect of insurance contracts, the value of the debt may reflect the lower probability of repayment under subordinated debt and the lower capital needed to cover the risk of non-payment.

14.7 The valuation of technical provisions exceeds the Current Estimate by a margin (Margin over the Current Estimate or MOCE).

14.7.1 Technical provisions are assets or liabilities that represent the economic value of the insurer fulfilling its insurance obligations to policyholders and other beneficiaries arising over the lifetime of the insurer’s portfolio of insurance policies. This includes a margin (Margin Over the Current Estimate or MOCE) to cover the inherent uncertainty of those obligations.

14.7.2 The cash flows associated with fulfilling an insurer’s insurance obligations include the premiums receivable, the claims payable under the insurance policies, any other policy cash flows (eg future distributions under participating contracts) and the future expenses of administering the policies.

14.7.3 Acquisition costs are usually a significant component of an insurer’s cash flows. After acquisition costs have been paid future cash inflows may exceed future cash outflows.

14.7.4 Because an insurer’s obligations under an insurance policy are inherently uncertain as to amount and/or timing, the present value of the cash flows associated with fulfilling them has a range of possible values with varying probabilities. The probability-weighted average of these present values is their expected present value (also called the statistical mean) and is termed the “current estimate of the cost of meeting the insurance obligations” (“Current Estimate”). Actuarial and statistical techniques may be used in determining the current estimate, including deterministic, analytical and simulation techniques.

14.7.5 In addition to covering the cash flows associated with fulfilling insurance obligations, an insurer incurs the cost of covering the uncertainty inherent in those cash flows (eg through holding capital, or through hedging, reinsurance or other forms of risk mitigation). Insurers are required to maintain an amount such that the obligations under insurance policies will be fulfilled with the claimant or beneficiary when they fall due. In principle, therefore, an economic value of the technical provisions exceeds the current estimate of the cost of meeting the insurance obligations by an amount covering this uncertainty. This excess is the MOCE.

14.7.6 Where, for example, capital is required to give the level of confidence required by the solvency regime, the technical provisions should at least also cover the cost of holding that capital. In these circumstances, the MOCE might be seen as a provision for rewarding the capital committed to the business over the outstanding lifetime of the policy. As the
uncertainty reduces over time, so the MOCE will also reduce, gradually releasing it from the technical provisions. Equally, as uncertainty reduces, the required capital would also reduce in line with the revised risk profile.

14.7.7 It may not be necessary, in practice, to determine the current estimate and the MOCE separately. The solvency regime should require any method by which technical provisions are valued to be such that the value includes an explicit or implicit margin over the current estimate. For example, a reliable market valuation by reference to a sufficiently deep and liquid market may be expected automatically to include a MOCE.

14.7.8 A model which includes in its calculations an allowance for uncertainty up to the level of confidence required by the solvency regime is also capable of calculating the technical provisions directly. However, in this case, supervisors should consider whether the current estimate and MOCE should be separately reported to help ensure that technical provisions are consistent and reliable.

14.7.9 A change in underlying data or assumptions generating a change in current estimate and MOCE should be disclosed and justified so that consistency, reliability and relevance may be maintained and arbitrary changes over time are avoided.

14.8 The Current Estimate reflects the expected present value of all relevant future cash flows that arise in fulfilling insurance obligations, using unbiased, current assumptions.

14.8.1 The current estimate should reflect all future cash flows under an existing insurance contract to the extent that they are integral to the fulfilment of the obligations under that contract. This encompasses all cash flows, including non-guaranteed optional or discretionary cash flows, where they are established as stemming from the contractual relationship between the insurer and the policyholder. This reflects the commercial substance of the contract and therefore reflects economic reality.

14.8.2 An insurance contract should be considered as a whole. In particular, where the contract provides for the payment of future premiums, such premiums are integral to the fulfilment of the obligations under that contract. Neither the company nor the policyholder is able to deal with one without simultaneously dealing with the other. To recognise one, the other must also be recognised. Valuation of the insurance liability requires consideration of all of the associated cash flows, including the contractual, premium inflows. The uncertainty associated with those cash flows along with that of the other relevant cash flows are reflected in the probability weightings applied in calculating the current estimate.

14.8.3 To give clarity as to what constitutes an insurance contract for solvency purposes, the supervisory regime should specify the boundaries for insurance contracts which define the relevant cash flows to be included in determining the current estimate. The insurance contracts are subject to the following boundary constraints, if they exist:5

---

5 For certain types of long-duration life policy with an indefinite term, these would be evaluated through the potential life of the policyholder, allowing for lapse or surrender in the probabilities attached to each cash flow.
• contractual termination as extended by any unilateral option available to the policyholder, or
• the insurer having a unilateral right to cancel or freely re-underwrite the policy, or
• both the insurer and policyholder being jointly involved in making a bilateral decision regarding continuation of the policy.

14.8.4 The first boundary constraint excludes new business arising from the “rolling-over” of the existing contract, except where such “roll-over” is due to the exercising of an explicit option available to the policyholder under the current contract. Contractual cash flows arising from policyholders’ unilateral in-the-money options to extend the contractual termination date should be included. The current estimate should allow for the expected rate of exercising such options. This boundary constraint also excludes additional voluntary contributions premiums, except where provided for as a unilateral option under the contract. For insurance contracts with variable premiums (such as universal life contracts), the cash-flows should include voluntary contributions above the minimum required to the extent that there are guarantees, under the current contract eg no-lapse and premium rate guarantees. The current estimate should reflect the expected rate of payment of additional contributions and the expected level of such contributions.

14.8.5 The second boundary constraint clarifies that future cash flows arising from events beyond the point where the insurer can unilaterally cancel the contract – for example, by re-underwriting are not included in the valuation. This is the case with most non-life insurance contracts which are typically written for only one year. Although there might be a high expectation that they would be renewed, the insurer is not bound to do so, and accordingly only cash flows arising in respect of the currently in-force or in run-off contracts, are included for valuation purposes, whereas the impact of new business might be considered in capital requirements or capital resources by the solvency regime. By contrast, future cash flows under a life or disability contract which the insurer cannot unilaterally cancel should be included, even if the future premiums under such a contract are planned to increase, or able to be varied by the insurer in respect of the entire class of contracts without individual underwriting.

14.8.6 The third boundary constraint clarifies that even if the policyholder has an option to continue or increase the contract, if it requires the insurer’s consent then cash flows arising from events beyond that point should not be included for valuation purposes, whereas the impact of new business might be considered in capital requirements or capital resources by the solvency regime.

Discretionary payments

14.8.7 Some insurance contracts give the policyholder both guaranteed benefits (eg a minimum amount payable on death and/or maturity or any insured event) and for example, a right to participate in the performance of the relevant class of contracts, related assets or both. The insurer has
some discretion over the amount or timing of the resulting distributions to policyholders, but there are often constraints over that discretion.

14.8.8 When establishing the future cash flows to include in the determination of technical provisions for solvency purposes, consideration should therefore be given to all payments whether or not these payments are contractually guaranteed under an insurance contract. For example, future discretionary bonuses which the insurer expects to make should be included.

14.8.9 In view of the wide variety of participating contracts and legal frameworks in different jurisdictions, supervisors should establish criteria appropriate to their jurisdictions for the allowance of discretionary elements associated with participating contracts in the valuation of technical provisions. These should nonetheless reflect the principles of a consistent, reliable and economic valuation and those that apply more specifically to technical provisions, as discussed in this ICP.

14.8.10 In many jurisdictions, accumulated profits attributable to a class of policyholders are accounted for separately by the insurer. Where such accumulated profits can be used to absorb losses to protect policyholder interests in a period of stress, they may possess all the characteristics of capital and may hence be recognised in the determination of capital resources for solvency purposes. In such a case, it is important to ensure that the criteria established by the solvency regime for the allowance of future discretionary benefits in the valuation of technical provisions are compatible with the criteria for determining capital resources in order to achieve a consistent overall assessment of the solvency position of the insurer.

Unbiased current assumptions

14.8.11 Unbiased current assumptions are derived from a combination of relevant, credible experience as well as judgment about its expected future development, eg improving mortality rates, inflation of expenses that neither deliberately overstates nor understates the expected outcome. Reconsideration of data and assumptions should occur every time the technical provisions are valued, with revisions made as appropriate to ensure data and assumptions remain appropriate to current conditions.

14.8.12 Observable data, such as interest rates, financial market prices and inflation rates may be expected to be different each time the current estimate is determined. In particular, cash flows are sensitive to inflation rates. Where assumptions are derived from observed values in the market, these should be the observed values current at the date of the valuation.

14.8.13 Regular experience analysis, considering the individual entity and relevant industry experience where appropriate, should be undertaken to support the assumptions used for insurance technical risks. Where assumptions depend on the results of such experience analyses, the most recent experience for the portfolio need not necessarily represent the most credible current assumption for that portfolio. Greater credibility may be achieved by the analysis of several years’ experience, smoothing out fluctuations in experience and allowing appropriately for any trends.
in experience that may be evident. However, care should also be taken that historical experience remains relevant to current conditions.

14.8.14 Where the credibility of an insurer’s own experience is low, for example for a small or new portfolio of insurance contracts, assumptions based on the relevant industry experience are likely to be more decision useful as a basis for projecting its cash flows.

14.8.15 The assumptions used should, in principle, reflect the characteristics of the portfolio rather than those of the particular insurer holding that portfolio. However, it is important to note that, in practice, the characteristics of the portfolio underwritten by an insurer may reflect aspects of an insurer’s specific business practices, particularly with regard its underwriting, claims handling and expenses. Company-specific information may be appropriate, for example, where the insurer’s business model and practices are sufficiently substantiated as representative of the portfolio and similar information is used in market valuations.

14.8.16 With respect to expenses, the insurer’s own expense experience in managing a portfolio is likely to be relevant in determining an economic value.

14.8.17 Acquisition costs are typically a major component of an insurer’s expenses. For most insurance contracts, acquisition costs will already have been incurred so that future cash flows include only maintenance and claims costs. An appropriate analysis of the insurer’s expense experience is needed to separate out acquisition costs in order to model future expenses. Care is needed to allow for expenses that do not vary directly with the level of new business so that expenses that will continue to be incurred for a period if new business ceases are taken into account.

14.9 The MOCE reflects the inherent uncertainty related to all relevant future cash flows that arise in fulfilling insurance obligations over the full time horizon thereof.

14.9.1 Different methods may be used in practice to measure risk. For some risks, observable market prices for risk may be available. In choosing a methodology, due consideration should be given to the nature of the risks being measured. Other approaches being considered around the world include quantile, conditional tail expectation, cost of capital and explicit assumption methods. Where a mixture of appropriate methods is used, a consistency check should be considered. Calibration of the methods used should reduce the effect of methodological differences to a level sufficient to enable reliable solvency assessment to be undertaken. At present, there is no one common methodology. In practice, the results from different methods will not be identical and calibration and consistency checks should be applied so that methodological differences are reduced to an acceptable level for solvency assessment purposes. Once established, the methodology should not be changed from one valuation to the next unless there is a reasonable rationale for change.

14.9.2 The margin over current estimate (MOCE) represents an estimated measure of the uncertainty inherent in the cash flows associated with fulfilling an insurer’s insurance obligations. To achieve a consistent,
reliable and decision useful valuation, the margin over current estimate should consider all of the inherent uncertainty attached to the policy obligations over the full period of those obligations ie the variability of all relevant future cash flows to the extent to which this uncertainty is borne by the insurer and not the policyholder.

14.9.3 Only risk inherent to the policy obligations should be reflected in the MOCE. Other risks should be reflected in regulatory capital requirements. Where risks are reflected in both the MOCE and regulatory capital requirements to provide an overall level of safety, double counting should be avoided as far as practical.

14.9.4 In some jurisdictions it may be considered appropriate, due to inherent uncertainty in policy obligations and profit, that no component of premium related to such considerations should be recognised in profit at the inception of a contract. In those jurisdictions, the inherent uncertainty is effectively represented by the difference between premium received and the Current Estimate. Other jurisdictions may take the view that one of the other methodologies described in this document provides a decision useful separate estimate of the level of uncertainty in determining the MOCE and may therefore allow potential gain at issue to be recognised.

14.9.5 It is important to be clear about the extent to which risk factors should be reflected when valuing the MOCE and to what extent. It is appropriate to differentiate between the risks specific to the portfolio of insurance obligations and the risks associated with the operations of the particular insurer. Risks that are portfolio specific are inherent to the policy obligations and should be taken into account in the MOCE.

14.9.6 In determining the appropriate methodology for determining the MOCE in a solvency regime, the supervisor should consider the extent to which possible methodologies promote transparency and comparability between insurers and insurance markets.

14.9.7 An appropriate method for the determination of the MOCE would be expected to exhibit the following characteristics:

- Insurance obligations with similar risk profiles have similar MOCEs;
- The less that is known about the cash flows; the higher the MOCE;
- For the same level of probability, risks with higher impact have higher MOCEs than those with lower impact;
- Risks with low frequency and high severity will generally have higher MOCEs than risks with high frequency and low severity;
- For risks of the same or a similar nature, contracts that persist over a longer timeframe will have higher MOCEs than those of shorter duration;
- Risks with a wide probability distribution have higher MOCEs than those risks with a narrower distribution; and
• To the extent that emerging experience reduces uncertainty, MOCEs should decrease, and vice versa.

14.9.8 In establishing appropriate criteria or methods for determining the MOCE, the supervisor should consider the diversification of the inherent risk factors reflected in the MOCE.

14.9.9 Consideration should be given to the segmentation of the insurance policies of the insurer into separate portfolios and the impact this has on the diversification of inherent risk factors that is taken into account. Segmentation, eg by line of business, may be undertaken for calculation purposes and may mean that diversification within portfolios is taken into account in the MOCE but diversification across portfolios is left out of account. The calculation method may also mean that diversification within portfolios is only partially taken into account. Any residual diversification within portfolios and all diversification across portfolios could for example be addressed as an offset to regulatory capital requirements, if appropriate. The MOCEs for the total business of the insurer would simply be the sum of the MOCEs of its portfolios.

14.9.10 Where an element of an insurance liability, ie an insurance obligation or risk in whole or in part, can be replicated or hedged by a financial instrument which has a reliable value, the value of that instrument provides a reliable value for that element of the liability including an implicit MOCE. In practice, such hedging is rarely perfect in all scenarios and there are some differences between the insurance cash flows and those of the replicating instrument which need to be valued separately. Where a model is used for this valuation, calibration of the model to the value of hedging instrument used is likely to assist in achieving overall consistency and reliability. Such practice should be encouraged by supervisors.

14.10 The valuation of technical provisions allows for the time value of money. The supervisor establishes criteria for the determination of appropriate rates to be used in the discounting of technical provisions.

14.10.1 The solvency regime allows for the time value of money to be recognised in the determination of technical provisions and should establish criteria for the determination of appropriate interest rates to be used in the discounting of technical provisions (discount rates). In developing these criteria, the supervisor should consider the following:

• the economics of the insurance obligations in its jurisdiction including their nature, structure and term; and

• the extent (if any) to which benefits are dependent on underlying assets.

14.10.2 The criteria for determining appropriate interest rates to be used in the discounting of technical provisions should recognise that the appropriate interest rates may not be directly observable and apply adjustments based on observable economic and market data of a general nature as appropriate.

14.10.3 To the extent that a risk is provided for elsewhere in the balance sheet by alternative means, there should be no allowance for that risk in the chosen discount rates.
14.10.4 As the discount rates should reflect the economics of the insurance obligations, any observed yield curve should be adjusted to account for differences between the economics of the observed instrument with those of the insurance obligations.

14.10.5 The criteria should also allow appropriate interpolation and extrapolation for non-observable market data and maturities. To provide for consistent, reliable, economic values, the criteria for discount rates should utilise the entire interest rate term structure.

14.10.6 In principle, if an investment has a reliable market value and fully replicates or hedges an element of the insurance obligations or risks, such a value is presumed to reflect the time value of money.

14.11 The supervisor requires the valuation of technical provisions to make appropriate allowance for embedded options and guarantees.

14.11.1 The determination of the current estimate and MOCE should make explicit allowance for any options of the policyholder or insurer and for guarantees embedded in the insurance contract, such as guaranteed minimum benefits and interest rate guarantees. The method used to value embedded options and guarantees should be appropriate to the nature, scale and complexity of risk and may include stochastic simulation or simplified methods as appropriate.

14.11.2 An important policyholder option is the option to lapse and, for some life products, to receive payment of a surrender value. Explicit allowance for lapses and surrenders should be incorporated in the projections of future cash flows that are used to determine technical provisions. The risks of lapse and surrender need to be considered over the full time horizon of the insurance contract. Historical experience of lapses and surrenders is decision useful in considering the setting of assumptions about future experience used for calculating a current estimate and MOCE. The uncertainty associated with lapses and surrender may not be fully diversifiable across insurance contracts as the level of lapses and surrenders may depend on economic conditions or perceptions about the performance of the insurer which apply generally to policyholders. This is offset by variations in policyholders’ responses to such conditions or perceptions and their personal motivation for lapse and surrender. Such factors should be taken into account when assessing the risk of lapse and surrender.

14.11.3 Technical provisions are not required to be subject to a surrender value floor equal to the total surrender values payable if all policies were to surrender immediately. Such an approach would not be an economic valuation as the effect of surrenders is already allowed for in the technical provisions by incorporating assumptions about the future rate of surrender and associated risks. However, in the determination of the overall financial requirements for solvency assessment purposes, a form of surrender value minimum may be considered appropriate, to provide additional protection in the event of a high level of surrenders. This should be reflected in regulatory capital requirements, as appropriate.
Investments

The supervisor establishes regulatory investment requirements for solvency purposes in order for insurers to make appropriate investments taking account of the risks they face.

Basis for establishing regulatory investment requirements

15.1 The supervisor establishes regulatory investment requirements on the investment activities of the insurer.

15.1.1 The nature of insurance business necessitates the investment in and holding of assets sufficient to cover technical provisions and capital requirements. The quality and characteristics of an insurer’s asset portfolio and the interdependence between the insurer’s assets and its liabilities are central to an assessment of an insurer’s solvency position, and therefore, are important aspects to be addressed by the supervisor and for an insurer to manage.

15.1.2 Quantitative requirements alone are not sufficient to ensure solvency, but should also be complemented with appropriate qualitative requirements on investment risk. Having both kinds of requirements helps to guard against the possibility that the regulatory capital requirements do not fully cover the risks inherent in those investment activities.

15.1.3 Factors to consider in establishing regulatory investment requirements may include:

- the overall quality of risk management practices and corporate governance frameworks of insurers;
- the comprehensiveness and transparency of disclosure frameworks in the jurisdiction and the ability for third parties to exercise sufficient scrutiny and market discipline;
- the development of relevant investment and capital markets locally and internationally and the range of available financial instruments;
- the cost of compliance, the impact on innovation and the effect on the efficiency of industry practices; and
- the level of prudence and risk-sensitivity of the regulatory solvency requirements and the risks that they cover.

15.1.4 Additionally, the supervisor should consider requirements applied in other, non-insurance, financial sectors when establishing regulatory investment requirements for insurers. It is important that requirements across financial sectors are as consistent as possible in order to discourage groups from taking advantage of regulatory arbitrage. Consistency of regulation between sectors may assist in maintaining a level playing field and enhancing fairness. However, such requirements should take into account the differences in risk profiles and risk management between sectors.
15.1.5 Openness and transparency of the regulatory investment requirements may help facilitate their effectiveness. The supervisor should be explicit as to the objectives of setting regulatory investment requirements. This is particularly important in order to ensure the consistency of such requirements with other building blocks of the regulatory solvency assessment of the insurer, such as the valuation of assets and liabilities, the calculation of regulatory capital requirements and the determination of available capital resources.

Rules-based and principles-based approaches

15.1.6 Regulatory investment requirements may take many forms and may influence the investment strategies of the insurer. Requirements may be rules-based, setting out specific rules or restrictions on the investment activities of the insurer, or principles-based, where there is no specific restriction on the asset strategy taken by the insurer, as long as defined principles are met.

15.1.7 Regulatory investment requirements may also be a combination of rules-based and principles-based, setting out some specific rules or restrictions and some principles with which the insurer’s investment strategy should comply.

15.1.8 Rules-based requirements may be used to prohibit or limit specific classes of investment. Such rules or restrictions may either be applied directly to the investments or lead to capital charges or deductions from available capital which act as a disincentive to investment in risky assets or high concentrations in particular assets, rather than as a prohibition.

15.1.9 Rules-based requirements may be relatively easy to enforce by supervisors, as there is limited scope for different interpretations of the rules. However, rules-based requirements may inhibit innovation in investment strategies and may restrain insurers from holding assets most appropriate for meeting their financial objectives. Rules-based requirements may also discourage insurers from fully developing their own risk management.

15.1.10 Principles-based requirements may provide more flexibility for the insurer to choose particular investments to best manage its investment risks. It may allow the insurer to follow an investment strategy that it believes is the most appropriate to its risk appetite and overall financial objectives. However, it may also be more difficult for the supervisor to determine the need to take supervisory measures as principles-based investment requirements allow some scope for differences in interpretation.

Group perspectives

15.1.11 In addition to meeting the qualitative and quantitative investment requirements at an insurance legal entity level, the insurance group should monitor investment risk exposures on an aggregate basis for the group as a whole.

15.1.12 For insurance groups, regulatory investment requirements may specify how investment exposures should be aggregated for the purposes of determining investment risk at a group level. Such requirements should provide for appropriate mitigation of risks associated with intra-group
transactions, for example, to limit contagion or reputational risk. Issues
to be considered may include exposures to related counterparties and
other interests over which the insurer has some influence (for example,
through a minority interest). In stress situations there will tend to be
greater restrictions on movements and realisation of investments across
the group. The regulatory investment regime may require contractual
evidence of the ability to access assets for solvency purposes before
allowing their inclusion for aggregation at the group level.

15.1.13 The regulatory investment requirements that apply at the insurance legal
entity and group levels, as well as the objectives of such requirements
should be explicit. Such requirements should include issues specific to
groups, such as requirements for liquidity, transferability of assets and
fungibility of capital within the group.

15.1.14 Regulatory investment requirements should be set having regard to the
possibility of losses from investments made by entities of an insurance
group weakening another entity or the group as a whole (for example, if
there is explicit or implicit support from another entity).

**Regulatory investment requirements regarding the asset portfolio**

15.2 The supervisor requires the insurer to invest assets so that, for its portfolio
as a whole:

- assets are sufficiently secure and are held in the appropriate
  location for their availability;

- payments to policyholders or creditors can be made as they fall
  due; and

- assets are adequately diversified.

**Security**

15.2.1 The insurer's investments should be sufficiently secure for the portfolio
as a whole, which is essential in ensuring obligations to policyholders
can be met. Regulatory investment requirements may restrict the
insurer’s selection of, or exposure to, investments that have low security
or whose security is difficult to assess reliably. There should be
appropriate measures in place to recognise and mitigate aggregations of
exposure across the insurer's portfolio, having particular regard to
concentrations of low security assets or those whose security is difficult
to assess reliably.

15.2.2 The security of an investment is related to the protection of its value and
can be affected by credit risk and market risks (including currency risk).
The security of an investment is also affected by safekeeping,
custodianship or trusteeship. Assets should be held in an appropriate
location so they are available to meet policyholder claims where
policyholder payments are made.

15.2.3 External credit ratings can assist the insurer in determining the credit risk
of an investment. However, the insurer should be aware of the limits of
using external credit ratings and conduct its own due diligence to assess
credit risk. The supervisor may establish requirements for the
appropriate use of external credit ratings. The supervisor may also
require the insurer to conduct a credit analysis independent of the
external credit rating, which may help in assessing the security of an investment.

15.2.4 To assess the security of its investments, it is important that the insurer is capable of assessing the nature, scale and complexity of the associated risks. This may be difficult in cases where there is a lack of transparency as to the underlying risk profile of an investment, such as indirect investments through a collective investment fund or for investments in complex financial instruments such as structured assets. Some markets may also suffer from a lack of transparency or clarity in terms of the applicable regulatory and legal systems and the degree of protection that they provide.

15.2.5 For assets lacking in transparency, the risk profile should be carefully analysed by the insurer. The insurer should look through to the underlying exposure of the investment as far as possible, considering the additional risks that are due to the investment structure. For example, additional legal risks may arise if investments are located outside of the insurer’s operating jurisdiction(s).

15.2.6 The insurer should evaluate the security of derivative products by taking into account the underlying exposures, as well as the security of the derivative counterparty, the purpose for which the derivative is held, and the cover (such as collateral) the insurer has for derivative exposures. In some cases, derivative counterparties may improve the security by giving the insurer the right to collateral if the counterparty fails. Similarly, the security of investments may be improved by guarantees from third parties.

15.2.7 When engaging in securities lending or repurchase agreements, an insurer should consider counterparty risk and reinvestment risk. The insurer should ensure the transactions are appropriately collateralised (with suitably frequent updating) and should recognise that these transactions do not mitigate the market or credit risk in the security, since the security is returned to the insurer at the end of the transaction. Care should be taken by the insurer when investing the collateral it holds to ensure that the transactions are covered even under adverse market conditions.

Security – group perspectives

15.2.8 The supervisor should consider the possibility that aggregation of exposures in an insurance group may result in heightened security issues which may be less important at the insurance legal entity level. The supervisor should closely monitor a group investing in assets that are not secure, and which could be distributed around the group to avoid investment restrictions.

CF 15.2.a. The group-wide supervisor requires the Head of the IAIG to ensure that the IAIG conducts its own due diligence to avoid placing undue reliance on assessments by credit rating agencies with regard to investment selection and risk management process.

CF 15.2.a.1 The IAIG should conduct due diligence to check the appropriateness of credit rating assessments, using various sources of information,
and should conduct its own credit assessments on its larger or more complex exposures.

CF 15.2.a.2 Undue reliance generally refers to unchallenged acceptance of the ratings provided by credit rating agencies.

**Liquidity**

15.2.9 The insurer should have assets that generate sufficient cash flows to pay policyholder claims when due, as well as all other obligations. The cash generated from investments includes disposals, maturity, and coupon or dividend payments.

15.2.10 The ability of the insurer to remain liquid may be adversely impacted for a variety of reasons. For example, the insurer:

- pledges or hypothecates its assets;
- experiences an unexpectedly large claim;
- experiences an event resulting in many claims;
- experiences significant shifts in market conditions; or
- has a derivative that needs to be serviced (for example, due to collateralisation or posting of margins).

15.2.11 The ability to realise or liquidate a sufficient amount of investments to meet policyholder claims, as well as all other obligations, at any point in time is important. For example, where an investment is made in a closed fund, a resale is usually not possible. This would impede the security of the investment in terms of its ability to settle obligations towards policyholders. Similar considerations would need to be given for property used by the insurer which might be hard to liquidate without an operational disruption.

**Liquidity – group perspectives**

15.2.12 The insurer and group-wide and other involved supervisors should consider the nature of the potential legal and practical impediments to cross-border transfer of assets as well as any potential effect those impediments might have, particularly in a resolution.

15.2.13 Group issues are relevant when managing liquidity risk, both in terms of the availability of additional liquidity and the possible need to provide liquidity support to other parts of the group.

15.2.14 Entities within a group frequently engage in intra-group transactions (eg swaps, inter-company loans) in order to manage risks that exist in different parts of the group or to have more mature businesses support growing businesses within the group. Such transactions should be done using appropriate transfer pricing based on current market conditions so that there is appropriate recognition of the impact of these transactions for each of the entities involved and the group as a whole.

15.2.15 Liquidity of assets and fungibility of capital are especially important if the group relies on diversification between entities without each entity being fully capitalised on a stand-alone basis (where allowed by the supervisor). The insurers should consider their liquidity needs,
transferability of assets and fungibility of their capital in a stressed environment when determining the minimum criteria for liquidity of their investment portfolio.

**CF 15.2.b** The group-wide supervisor requires the Head of the IAIG to consider the effect of potential legal and operational impediments to the IAIG’s ability to transfer capital and assets on a cross-border basis.

**CF 15.2.b.1** The Head of the IAIG should document specific restrictions that apply to the transfer of capital and assets from one jurisdiction to another, and what, if any, additional restrictions apply in the case of the resolution of a legal entity (see ICP 12 Exit from the Market and Resolution). The IAIG should have documented procedures on actions required for cross-border transfer of capital and assets in normal and stressed times.

### Diversification

15.2.16 Diversification and pooling of risks is central to the functioning of insurance business. To mitigate the risk of adverse financial events, it is important that the insurer’s overall investment portfolio is adequately diversified and that its asset and counterparty exposures are kept to prudent levels.

15.2.17 There is a distinction between diversification within a risk category and diversification between risk categories. Diversification within a risk category occurs where risks of the same type are pooled (eg shares relating to different companies). Diversification between risk categories is achieved through pooling different types of risk. For example, where the insurer combines two asset portfolios whose performances are not fully correlated, the exposure to the aggregated risks will generally be lower than the sum of the exposures to the risks in the individual portfolios.

15.2.18 With respect to its investment portfolio, the insurer should ensure that it is diversified within and between risk categories, taking into account the nature of the liabilities. Diversification between investment risk categories could, for example, be achieved through spreading the investments across different classes of assets and different markets. For diversification within a risk category, the investments are sufficiently uncorrelated so that – through pooling of individual assets – there is a sufficient degree of diversification of the portfolio as a whole.

15.2.19 To ensure that its investment portfolio is adequately diversified, the insurer should avoid overreliance on, for example, any specific asset type, issuer, counterparty, group, or market and any excessive concentration or accumulation of risk in the portfolio as a whole. The insurer may also consider its asset concentration by type of investment product, by geographical dispersion or by credit rating. Additionally the insurer may consider its aggregate exposure to related entities (such as joint ventures) and different types of exposure to the same entity or group (such as equity investment in a reinsurer which is also providing its reinsurance cover).
Diversification – group perspectives

15.2.20 Having risk management processes to monitor investments on a group-wide basis is more likely to make Senior Management aware of issues (e.g., asset concentrations) that could be overlooked if only the individual legal entities are monitored. Groups that are unaware of their global exposures could face an inappropriate level of exposure to certain investments, which may create financial difficulties within the group if the value or liquidity of these investments decreases.

Group perspectives

15.2.21 The assets of an entity within an insurance group may include participations or investments in another entity within the same group. Appropriate investment requirements should apply to such investments or participations, particularly due to liquidity concerns. Relatively small holdings in another legal entity, within the same insurance group that does not give the investor control over the issuer may, for example, be subject to the same requirements that apply to investments in entities external to the group. On the other hand, for larger holdings which give the investor control or significant influence over the issuer, consideration should be given to aggregating the assets of the issuer with those of the investor for the purposes of applying investment requirements. This is done so that adequate security, liquidity, and diversification are maintained and that the investor, using its control over the issuer, ensures the issuer’s investment activities are consistent with its own investment policy.

Regulatory investment requirements relating to the nature of the liabilities

15.3 The supervisor requires the insurer to invest in a manner that is appropriate to the nature and duration of its liabilities.

15.3.1 Assets that are held to cover policyholder liabilities and those covering regulatory capital requirements should be invested in a manner which is appropriate to the nature of the liabilities, as the insurer needs to use the proceeds of its investments to make payments to policyholders and other creditors when due. The insurer’s investment strategies should take into account the extent to which the cash flows from investments match the liability cash flows in terms of timing, amount and currency, and how this changes in varying conditions. In this context, the insurer should specifically consider investment guarantees and embedded options that are contained in its insurance policies.

15.3.2 Insurers are not necessarily required to employ an investment strategy which matches the assets and the liabilities as closely as possible. However, to the extent that assets and liabilities are not well matched, movements in financial variables (e.g., interest rates, market values and exchange rates) may affect the value of the assets and the liabilities differently and result in an adverse economic impact for the insurer.

15.3.3 As liability cash flows are often uncertain, or there are not always assets with appropriate cash flow characteristics, the insurer is usually not able to adopt a completely matched position. Additionally, the insurer may wish to adopt a mismatched position deliberately in an attempt to optimise the return on its business. In such circumstances, the
supervisor may require the insurer to hold additional technical provisions and/or capital to cover the mismatching risk. The regulatory investment requirements may also constrain an insurer’s ability to mismatch its assets and liabilities as the extent of mismatching should not expose policyholders to risks that cannot be effectively managed by the insurer.

15.3.4 Nevertheless, close matching of assets and liabilities is often possible and should be considered as a potential requirement in the case of unit-linked or universal life policies where there is a direct link between policyholder benefits and investment funds or indices. It may not be possible for the mismatching risk to be covered effectively by capital. Where the supervisor requires assets to be closely matched to such liabilities, other restrictions on investments may be appropriate to contain the investment fund risk being borne directly by policyholders.

15.3.5 The insurer should manage conflicts of interest (eg between the insurer’s corporate objectives and disclosed insurance policy objectives) to ensure assets are invested appropriately. For example, for with-profits liabilities, an insurer should invest appropriately to meet policyholders’ reasonable expectations.

Group Perspectives

15.3.6 Investments that back liabilities including those covering regulatory capital requirements within one of a group’s insurance legal entities should be tailored to the characteristics of the liabilities and the needs of the insurance legal entity and not be subject to undue influence from the wider objectives of the group.

Regulatory investment requirements regarding risk assessability

15.4 The supervisor requires the insurer to invest only in assets where it can properly assess and manage the risks.

15.4.1 The insurer should have sufficient information about its investments, including those in collective investment funds, to ensure that its asset risks can be properly managed.

15.4.2 The insurer should understand the risks involved, and determine how material the risk from a proposed investment is, before undertaking any investments. Assessment of risks should take into account the maximum possible loss, including losses that may occur in situations where assets, such as derivatives, become liabilities for the insurer.

15.4.3 Where the insurer is able to look through the structure of the investments to the underlying assets, the insurer should consider the risk characteristics of the underlying assets and how this affects the risk characteristics of the investments itself. However, where such a look through is not possible, appropriate techniques should be developed to assess the risks associated with the investment including assessing the investment manager of an investment fund.

15.4.4 Investments that are not traded on a regulated financial market should be kept to prudent levels, as an objective assessment of the risks is likely to be difficult and costly. This is particularly relevant in jurisdictions where standardised approaches to determining regulatory capital requirements are used, since such approaches will often be designed to be not unduly
complex and thus feasible in practice for all insurers. Moreover, by its very nature a standardised approach may not be able to fully and appropriately reflect the risk profile of the investment portfolio of each individual insurer.

15.4.5 The insurer should have access to the requisite knowledge and skills to assess and manage the risks of its investments. When an external investment advisor or manager is used, the insurer should retain adequate investment expertise in-house, as it has the ultimate responsibility for its investments.

**Group Perspectives**

15.4.6 Investments held by entities within a group are sometimes managed centrally by an investment management function, with the entities relying on its expertise. In such arrangements, the investment management function should have the requisite knowledge and skills to assess and manage the risks of these investments and manage the investments with due regard to the needs of individual entities in addition to the group as a whole.

**Regulatory investment requirements relating to specific financial instruments**

15.5 The supervisor establishes quantitative and qualitative requirements, where appropriate, on:

- the use of more complex and less transparent classes of assets; and
- investments in markets or instruments that are subject to less governance or regulation.

15.5.1 Complex investments may have a higher risk of large, sudden or unexpected losses due to the nature of the underlying risks and volatilities. Similarly, there are some assets in which investment is permitted by the regulatory investment regime (because the risk is generally sufficiently assessable), but are less transparent compared to other investments. Other assets could be less well governed in terms of the systems and controls in place for managing them or the market regulation that applies to them. Such assets may present operational risks, particularly in adverse conditions that are difficult to assess reliably. In terms of market regulation, investments in an unregulated market or a market that is subject to less regulation (such as the Professional Securities Market of the London Stock Exchange) need to be given special consideration.

15.5.2 The supervisor should therefore establish quantitative or qualitative requirements or restrictions on such investments, as necessary. For example, regulatory investment requirements may include the pre-approval of an insurer’s derivative use plan, whereby the insurer has to describe its controls over and testing of the derivative investment process before it is used in a live environment.

15.5.3 The investments described below are examples of investments that may necessitate quantitative and qualitative requirements; however, this is not an exhaustive list and regulatory investment requirements should be flexible and/or sufficiently broad to take account of the changing
environment. The solvency position and the sophistication of an insurer should also be considered. The amount of available capital an insurer has could provide additional flexibility to the supervisor in particular cases.

**Off-balance sheet structures**

15.5.4 When deciding whether to invest in off-balance sheet structures, the insurer should take into account their unique characteristics and risk exposures. For example, special purpose entities (SPEs) (see ICP 13 Reinsurance and Other Forms of Risk Transfer) are generally more complex than other forms of investments.

15.5.5 An investment strategy that uses an off-balance sheet structure may have an impact on the ability of the insurer to pay policyholder claims and all other obligations, especially under stressed circumstances.

**Investments in structured credit products**

15.5.6 An insurer may invest in securities or other financial instruments which have been packaged by an SPE and which may originate from other financial institutions (including banks or other insurers). Examples of such instruments are asset backed securities (ABS), credit linked notes (CLN) or insurance linked securities (ILS). In these cases, it may be very difficult for the insurer to assess the risk inherent in the investment, and in particular the risk profile of the underlying reference instruments, which in some cases may be of particularly poor quality (e.g. sub-prime mortgages). Where the originator is another insurer, the investment may also carry insurance related risks (such as non-life catastrophe risks in the case of a non-life catastrophe bond securitisation) which may not be transparent to the insurer or else difficult to assess.

15.5.7 If the supervisor is concerned that the insurer is exposed to an undue level of risk in such cases, it may consider establishing qualitative or quantitative requirements which may relate directly to the insurer investing in such assets, or which may relate to the originator of the packaged instrument.

15.5.8 In establishing such requirements, the supervisor may recognise that some structured credit products are higher risk than others and consider, for example:

- the treatment of such investment in other financial sectors;
- the extent to which the originator has retained an interest in a proportion of the risk being distributed to the market;
- the definition and soundness of criteria applied by the originator in extending the original credit and in diversifying its credit portfolio;
- the transparency of the underlying instruments; and
- the procedures the insurer has in place to monitor exposures to securitisations, including consideration of securitisation tranches, and reporting them to the insurer's Board and Senior Management and supervisor.
15.5.9 Restrictions or prohibitions may be applied to investments in structured products where appropriate conditions are not satisfied.

*Use of derivatives and similar commitments*

15.5.10 An insurer choosing to engage in derivative activities should clearly define its objectives, ensuring that these are consistent with any supervisory requirements.

15.5.11 When used appropriately, derivatives may be useful tools in the management of portfolio risk of insurers and in efficient portfolio management. In monitoring the activities of insurers involved in derivatives, the supervisor should satisfy itself that the insurer has the ability to recognise, measure and prudently manage the risks associated with their use. The supervisor should obtain sufficient information on the insurer’s policies and processes on the use of derivatives and may request information on the purpose for which particular derivatives are to be used and the rationale for undertaking particular transactions.

15.5.12 Given the nature of insurance operations, derivatives should preferably be used as a risk management mechanism rather than for speculation. The supervisor may restrict the use of derivatives (particularly derivatives that involve the possibility of unlimited loss) to the reduction of investment risk or efficient portfolio management. This means that where derivatives are used, it is for the purpose of reducing risk and costs or generating additional capital or income with an acceptable level of risk. Restrictions may also be applied to require the suitability of derivative counterparties, the derivative collateral, the tradability of the derivative and, in the case of over-the-counter derivatives, the ability to value and to close out the position when needed. Derivatives should be considered in the context of a prudent overall asset-liability management strategy.
**ICP 16 Enterprise Risk Management for Solvency Purposes**

The supervisor requires the insurer to establish within its risk management system an enterprise risk management (ERM) framework for solvency purposes to identify, measure, report and manage the insurer's risks in an ongoing and integrated manner.

**Introductory Guidance**

16.0.1 ERM for solvency purposes is the coordination of risk management, strategic planning, capital adequacy, and financial efficiency in order to enhance sound operation of the insurer and ensure the adequate protection of policyholders. Capital adequacy measures the insurer's assessment of residual risk of its business, after overlaying the mitigating financial effect of the insurer's established risk management system. Any decision affecting risk management, strategic planning or capital would likely necessitate a compensating change in one or both of the other two. Successful implementation of ERM for solvency purposes results in enhanced insight into an insurer's risk profile and solvency position that promotes an insurer's risk culture, earnings stability, sustained profitability, and long-term viability, as well as the insurer's ability to meet obligations to policyholders. Collectively practiced in the industry, ERM for solvency purposes supports the operation and financial condition of the insurance sector. These aspects of ERM should therefore be encouraged from a prudential standpoint.

16.0.2 The ERM framework for solvency purposes (ERM framework) is an integrated set of strategies, policies and processes, established by the insurer for an effective implementation of ERM for solvency purposes.

16.0.3 Components of the ERM framework that are covered in this ICP:

- Risk identification (including group risk and relationship between risks);
- Quantitative techniques to measure risk;
- Inter-relationship of risk appetite, risk limits and capital adequacy;
- Risk appetite statement;
- Asset-liability management, investment, underwriting and liquidity risk management policies;
- Own risk and solvency assessment (ORSA); and
- Recovery planning.

16.0.4 The ERM framework should be integrated within the insurer’s risk management system (see ICP 8 Risk Management and Internal Controls).

16.0.5 The ERM framework should enhance an insurer’s understanding of material risk types, their characteristics, interdependencies, and the
sources of the risks, as well as their potential aggregated financial impact on the business for a holistic view of risk at enterprise level. Senior Management should exhibit an understanding of the insurer’s enterprise risk issues and show a willingness and ability to address those issues. A fundamental aspect of ERM is the development and execution of a consistent, transparent, deliberate, and systematic approach to manage risks, both individually and in aggregate, on an ongoing basis to maintain solvency and operation within the risk appetite and risk limits. ERM should be embedded in an insurer’s corporate culture to ensure that the whole organisation contributes to risk awareness, feedback loops and coordinated responses to risk management needs.

16.0.6 The objective of ERM is not to eliminate risk. Rather, it is to manage risks within a framework that includes self-imposed limits. In setting limits for risk, the insurer should consider its solvency position and its risk appetite. Risk limits should be set after careful consideration of strategic objectives, business plans and circumstances and should take into account the projected outcomes of scenarios run using a range of plausible future business assumptions which reflect sufficiently adverse scenarios. A risk limits structure is used to establish guardrails on an insurer’s risk profile to optimise its returns without endangering the ability of the insurer to meet its commitments to policyholders.

16.0.7 Some insurers may utilise internal models as part of their ERM process in order to generate sophisticated risk metrics to inform management actions and capital needs. Internal models may enhance risk management and embed risk culture in the insurer. They may provide a common measurement basis across all risks (eg same methodology, time horizon, risk measure, level of confidence) and strengthened risk-based strategic decision-making across the organisation. Such an approach typically adopts a total balance sheet approach whereby the impact of the totality of material risks is fully recognised on an economic basis. A total balance sheet approach reflects the interdependence between assets, liabilities, capital requirements and capital resources, and identifies the capital allocation sufficient to protect the insurer and its policyholders, as well as to improve capital efficiency.

16.0.8 The insurer should have adequate governance and internal controls in place for models used in the ERM framework. The calculation of risk metrics should be transparent, supportable, and repeatable.

16.0.9 An insurer should have contingency plans that describe in advance the necessary actions and resources to limit business disruption and losses resulting from an adverse financial event (such as risk exposures exceeding risk limits), or an operational event (such as a natural disaster). Contingency planning may include a recovery plan, when deemed necessary.

**Enterprise risk management framework - risk identification**

16.1 The supervisor requires the insurer’s ERM framework to provide for the identification of all reasonably foreseeable and relevant material risks and risk interdependencies for risk and capital management.

**Risk identification**
16.1.1 The scope of risk identification and analysis of risk interdependencies should cover, at least: insurance risk, market risk, credit risk, concentration risk, operational risk and liquidity risk. Other risks may be included, such as conduct risk, legal risk, political risk, reputational risk, strategic risk and group risk.

Sources of risk and the relationship between risks

16.1.2 An insurer should consider the sources of different risks and their impacts and assess the relationship between risk exposures. By doing so, an insurer can better identify both strengths and weaknesses in governance, control functions and business units. The insurer should use and improve risk management policies, techniques and practices and change its organisational structure to make these improvements where necessary. The insurer should also assess external risk factors which, if they were to crystallise, could pose a significant threat to its business.

16.1.3 In assessing the relationship between risk exposures, consideration should be given to correlations between the tails of risk profiles. For example, risks that show no strong dependence under normal economic conditions (such as catastrophe risks and market risks) could be more correlated in a stress situation.

16.1.4 Assessments of risk exposures should consider macroeconomic exposures. For example, an insurer should consider interdependencies between guarantees and options embedded in its products, the assets backing those products, financial markets and the real economy.

16.1.5 Sources of risks may include catastrophes, downgrades from rating agencies or other events that may have an adverse impact on the insurer’s financial condition and reputation. These events can result, for example, in an unexpected level of claims, collateral calls or policyholder terminations and may lead to serious liquidity issues. The ERM framework should adequately address the insurer’s options for responding to such events.

Group risk

16.1.6 Group risk is the risk that the financial condition of a group or a legal entity within the group may be adversely affected by a group-wide event, an event in a legal entity, or an event external to the group. Such an event may either be financial or non-financial (such as a restructuring).

16.1.7 Group risk may arise, for example, through contagion, leveraging, double or multiple gearing, concentrations, large exposures and complexity. Participations, loans, guarantees, risk transfers, liquidity, outsourcing arrangements and off-balance sheet exposures may all give rise to group risk. Many of these risks may be borne by stand-alone insurance legal entities and are not specific to being a legal entity that is part of a group. However, the inter-relationships among legal entities within a group including aspects of control, influence and interdependence alter the impact of risks on the legal entities and should therefore be taken into account in managing the risks of an insurance legal entity within the insurance group and in managing the risks of that insurance group as a whole.
Group perspectives

16.1.8 The ERM framework of an insurance group should address the direct and indirect interrelationships between legal entities within the insurance group. The more clearly-defined and understood such relationships are, the more accurately they can be allowed for in the group-wide solvency assessment. For example, legally enforceable capital and risk transfer instruments between legal entities within a group may help with the effectiveness of its ERM framework for group-wide solvency assessment purposes. To be effective, the management of insurance group risk should take into account risks arising from all parts of an insurance group, including non-insurance legal entities (regulated or unregulated) and partly-owned entities.

16.1.9 Assumptions that are implicit in the solvency assessment of an insurance legal entity may not apply at an insurance group level because of separation of legal entities within the insurance group. For example, there may be few, if any, constraints on the fungibility of capital and the transferability of assets within an individual insurance legal entity. However, such constraints may feature much more prominently for an insurance group and may restrict the degree to which benefits of diversification of risks across the group can be shared among legal entities within the insurance group. Such constraints should be taken into account in both the insurance group’s and the insurance legal entity’s ERM frameworks.

CF 16.1.a The group-wide supervisor requires:

- the group-wide ERM framework to be as consistent as possible across its legal entities; and
- material differences in the group-wide ERM framework to be transparent and explicitly linked to legal and supervisory requirements in the jurisdictions where the IAIG operates, and the risks associated with business conducted in those jurisdictions.

CF 16.1.b The group-wide supervisor requires the group-wide ERM framework to include strategies, policies, and processes to manage effectively at least the following risks and to address these risks in a cross-border context:

- insurance risk;
- market risk;
- credit risk;
- liquidity risk;
- concentration risk;
- operational risk;
- group risk; and
- strategic risk.

CF 16.1.b.1 While these risks should be recognised and managed in the group-wide ERM framework, each risk category does not have to be
managed separately. Some risk types, such as strategic or concentration risk, may be included in other risk categories.

CF 16.1.c The group-wide supervisor requires the group-wide ERM framework to take into account intra-group transactions (IGT) including:

- the mechanisms to keep track of intra-group transactions that are of substantial importance to, and have a significant consequence for, the IAIG;
- the risks arising from intra-group transactions; and
- the qualitative and quantitative restrictions on such risks.

CF 16.1.c.1 Intra-group transactions may include:

- loans;
- guarantees;
- issuance of contingent capital;
- payment of dividends;
- cost sharing structures;
- service contracts;
- management arrangements and outsourcing;
- reinsurance;
- transactions across different financial services entities within the IAIG; and
- equity holdings.

CF 16.1.c.2 On a consolidated basis, or other aggregated basis, the risks to the IAIG arising from IGT may not be evident. The IAIG’s risk assessment of its IGT should consider, among other factors:

- fungibility of capital and transferability of assets (such as capital or equity injections from one legal entity into another);
- currency effects such as if there are cost sharing or service contracts between legal entities located in different jurisdictions;
- correlation or concentration of risk;
- practical issues, including the time needed to reallocate risk and risk mitigants among legal entities; and
- contagion risk within the group.

CF 16.1.c.3 The IAIG should take account of, the risk of support being withdrawn from one part of the IAIG to another due to adverse publicity, poor results, operational inefficiencies, or supervisory measures.

CF 16.1.c.4 The group-wide ERM framework should address any financial or other activities (eg maturity transformation, securities lending) being undertaken by individual legal entities that may change the risk profile.
of the group. For example, in securities lending transactions, the group-wide ERM framework may provide that high quality assets not be swapped with low quality assets, that appropriate arrangements for the provisioning of collateral are in place, or that the maturity of the swapped assets does not significantly alter the risk profile of the IAIG.

Enterprise risk management framework – quantitative techniques to measure risk

16.2 The supervisor requires the insurer’s ERM framework to:

- provide for the quantification of risk and risk interdependencies under a sufficiently wide range of techniques for risk and capital management; and
- as necessary, include the performance of stress testing to assess the resilience of its total balance sheet against macroeconomic stresses.

Measuring, analysing and modelling the level of risk

16.2.1 The level of risk is a combination of the impact that the risk will have on the insurer and the probability of that risk materialising. The insurer should assess regularly the level of risk it bears by using appropriate forward-looking quantitative techniques (such as risk modelling, stress testing, including reverse stress testing, and scenario analysis). An appropriate range of adverse circumstances and events should be considered, including those that pose a significant threat to the financial condition of the insurer, and management actions should be identified together with the appropriate timing of those actions. Risk measurement techniques may also be used in developing long-term business and contingency plans.

16.2.2 Different approaches to measuring risk may be appropriate depending on the nature, scale and complexity of a risk and the availability of reliable data on the behaviour of that risk. For example, a low frequency but high impact risk where there is limited data (such as catastrophe risk) may require a different approach from a high frequency, low impact risk for which there is substantial amounts of experience data available. Stochastic risk modelling may be appropriate to measure some risks (such as non-life catastrophe), whereas relatively simple calculations may be appropriate in other circumstances.

16.2.3 The measurement of risks should be based on a consistent economic assessment of the total balance sheet as appropriate to ensure that appropriate risk management actions are taken. In principle, an insurer’s ERM framework should take into consideration the distribution of future cash flows to measure the level of risks. The insurer should be careful not to base decisions purely on accounting or regulatory measures that involve non-economic considerations and conventions although the constraints on cash flows that they represent should be taken into account.

Group perspectives

16.2.4 An insurance group should clarify whether data used in risk assessments is based on a consolidated, aggregated or other method. The insurance group should take into account the implications and
inherent risks of the selected methodology when developing its ERM framework. For example, intra-group transactions may be eliminated in consolidation and thus may not be reflected in the consolidated financial statement of the insurance group at the top level. In using the consolidation basis for the ERM framework, the insurance group may be able to account, and take credit, for diversification of risk. Conversely, using another aggregation method may facilitate a more granular recognition of risk.

Use of models for ERM

16.2.5 Measurement of risks undertaken at different valuation dates should be produced on a broadly consistent basis overall, which may make variations in results easier to explain. Such analysis also aids the insurer in prioritising its risk management.

16.2.6 Regardless of how sophisticated they are, models cannot exactly replicate the real world. Risks associated with the use of models (modelling and parameter risk), if not explicitly quantified, should be acknowledged and understood as the insurer implements its ERM framework, including by the insurer’s Board and Senior Management.

16.2.7 Models may be external or internal. External models may be used to assess catastrophes or market risks. Internal models may be developed by an insurer to assess specific material risks or to assess its risks overall.

16.2.8 Internal models can play an important role in facilitating the risk management process and the supervisor should encourage insurers to make use of such models for parts or all of their business, where it is appropriate.

16.2.9 An insurer may consider that the assessment of current financial resources and the calculation of regulatory capital requirements would be better achieved through the use of internal models, where permitted.

16.2.10 If used, an internal model may provide an important strategic and operational decision-making tool and should be used to enable the insurer to integrate its risk and capital management processes. In particular, the internal model used for ORSA should be consistent with models for other processes within the ERM framework. These include: assessment of the risks faced within the insurer’s business; construction of risk limits structure; and the determination of the economic capital needed, where appropriate, to meet those risks.

16.2.11 To be effective, an internal model should address all the identified risks within its scope, and their interdependencies, and assess their potential impact on the insurer’s business given the possible situations that could occur. The methods by which this analysis could be conducted range from simple stress testing of events to more complex stochastic modelling, as appropriate.

16.2.12 The insurer’s internal model should be calibrated on the basis of defined modelling criteria that the insurer believes will determine the level of capital appropriate and sufficient to meet its business plan and strategic objectives. These modelling criteria may include the basis for valuation of the assets and liabilities, the confidence level, risk measure and time
horizon, as well as other business objectives (for example, aiming to achieve a certain minimum investment rating).

16.2.13 In constructing its internal model, an insurer should adopt risk modelling techniques and approaches that are appropriate to its risk strategy and business plans. An insurer may consider various inputs to the modelling process, such as economic scenarios, asset portfolios and liabilities from in-force or past business, and regulatory constraints on the transfer of assets.

16.2.14 An internal model used to determine economic capital may enable the insurer to allocate sufficient financial resources to ensure it continues to meet its policyholder liabilities as they fall due, at a confidence level appropriate to its business objectives. To fully assess policyholder liabilities in this way, all liabilities that should be met to avoid putting policyholder interests at risk need to be considered, including any liabilities for which a default in payment could trigger the winding up of the insurer.

16.2.15 If an insurer uses its own internal model as part of its risk and capital management processes, the insurer should validate it and review it on a regular basis. Validation should be carried out by suitably experienced individuals in a different department or persons other than those who created the internal model, in order to facilitate independence. The insurer may wish to consider an external review of its internal model by appropriate specialists; for example, if the internal review cannot be performed with sufficient independence, an external review may be warranted.

16.2.16 Where a risk is not readily quantifiable (for instance some operational risks or where there is an impact on the insurer’s reputation), the insurer should make a qualitative assessment that is appropriate to that risk and sufficiently detailed to be useful for risk management. The insurer should analyse the controls needed to manage such risks to ensure that its risk assessments are reliable and consider events that may result in high operational costs or operational failure. Such analysis should inform the insurer’s judgments in assessing the size of the risks and enhancing overall risk management.

16.2.17 It may be appropriate for internal models to be used for a group even where the use of an internal model is not an approach appropriate at the insurance legal entity level due to, for example, lack of sufficient data.

| CF 16.2.a | The group-wide supervisor requires the Head of the IAIG to ensure that the IAIG measures all reasonably foreseeable, quantifiable, and relevant material risks using an economic capital model taking into account the risks that the IAIG faces in different sectors, jurisdictions and economic environments. |
| CF 16.2.a.1 | The IAIG should prioritise its risks in a consistent and reliable manner using appropriate means, including the use of an economic capital model. |
| CF 16.2.a.2 | The economic capital model should be based on techniques that estimate the amount of capital needed in reasonably foreseeable adverse situations to which the IAIG is or may be exposed. |
The economic capital model, in conjunction with other relevant capital measures (for example, regulatory capital requirements), should support major management decisions by focusing attention on capital adequacy.

**CF 16.2.a.3** The IAIG should consider the output of its economic capital model and regulatory capital requirements as inputs to its capital planning, which covers at least the IAIG’s business planning period.

---

**Stress testing, scenario analysis and reverse stress testing**

16.2.18 Stress testing measures the financial impact of stressing one or more factors which could severely affect the insurer. Scenario analysis considers the impact of a combination of circumstances to reflect historical or other scenarios which are analysed in the light of current conditions. Scenario analysis may be conducted deterministically using a range of specified scenarios or stochastically, using models to simulate many possible scenarios, to derive statistical distributions of the results.

16.2.19 Stress testing and scenario analysis should be carried out by the insurer to validate and understand the limitations of its models. They may also be used to complement the use of models for risks that are difficult to model or where the use of a model may not be appropriate from a cost-benefit perspective. For example, these techniques can be used to investigate the effect of proposed management actions.

16.2.20 Scenario analysis may be particularly useful as an aid to communicate risk management issues to the Board, Senior Management, business units and control functions. As such, scenario analysis can facilitate the integration of the insurer’s ERM framework within its business operations and establish a sound risk culture.

16.2.21 Reverse stress testing may help identify scenarios that could result in failure or cause the financial position of an insurer to fall below a predefined level. While some risk of failure is always present, such an approach may help to ensure adequate focus on the management actions that are appropriate to avoid undue risk of business failure. The focus of such reverse stress testing is on appropriate risk management actions rather than the assessment of its financial condition and so may be largely qualitative in nature although broad assessment of associated financial impacts may help in deciding the appropriate action to take.

16.2.22 Stress testing is intended to serve the insurer as an aid to sound risk management, including by identifying residual macroeconomic exposure.

16.2.23 Macroeconomic exposure in the insurance sector can accumulate through certain types of insurance liabilities or may be created through non-insurance activities. Examples are:

- savings-oriented products (or protection-oriented products with a savings component) that offer unmatched guarantees on policyholders’ premium payments, often combined with embedded options for policyholders;
• products embedding features such as automatic asset sales triggered by asset value decreases or that require dynamic hedging; and
• derivatives contracts such as financial guarantee products including credit default swaps (CDS) that are not used to hedge risk.

16.2.24 In deciding whether it is necessary to require stress testing, and the frequency, scope and type of such stress testing, the supervisor should take into account, for example:

• the nature, scale and complexity of: the insurer, its activities, business model and products, including the characteristics of the guarantees it provides;
• the characteristics of any automatic asset reallocation mechanisms;
• the use of dynamic hedging and the extent to which such guarantees are matched or hedged; and
• its activity in derivatives markets.

Group perspectives

16.2.25 The risks identified and the techniques that are appropriate and adequate for measuring them (including stress testing, scenario analysis, risk modelling and reverse stress testing) may differ at insurance group and insurance legal entity level. Where an insurance legal entity’s ERM framework is an integral part of the insurance group’s ERM framework, the techniques used to measure risks at group level should consider those that are appropriate and adequate at the insurance legal entity level.

| CF 16.2.b | The group-wide supervisor requires the IAIG’s risk measurement to include:
| | • stress and reverse stress testing and scenario analysis the IAIG deems relevant to its risk profile; and
| | • the resilience of its total balance sheet against macroeconomic stresses.

CF 16.2.b.1 Stresses should include (but may not be limited to) those in the risk transfer markets that may have an adverse effect on the IAIG’s risk profile. For example, when developing its scenarios for stress testing, the IAIG should consider reinsurance capacity and related risk transfer costs in future periods after a catastrophic event.

CF 16.2.b.2 The IAIG’s assessment of macroeconomic stresses should pay particular attention to the impact of stresses on the value of guarantees and options embedded in insurance products and on the assets backing them.

| CF 16.2.c | The group-wide supervisor requires the group-wide ERM framework to be independently reviewed at least once every three years, in order to ascertain that it remains fit for purpose. |
CF 16.2.c.1 The group-wide ERM framework review may be carried out by an internal or external body as long as the reviewer is independent and not responsible for, nor been actively involved in, the part of the group-wide ERM framework that it reviews.

CF 16.2.c.2 It may be necessary for the IAIG to perform an ad hoc review after a major change has occurred, such as a change in its risk profile, structure or business strategy.

Enterprise risk management framework - Inter-relationship of risk appetite, risk limits and capital adequacy

16.3 The supervisor requires the insurer’s ERM framework to reflect the relationship between the insurer’s risk appetite, risk limits, regulatory capital requirements, economic capital and the processes and methods for monitoring risk.

16.3.1 An insurer’s ERM framework should reflect how its risk management coordinates with strategic planning and its management of capital (regulatory capital requirement and economic capital).

16.3.2 As an integral part of its ERM framework, an insurer should also reflect how its risk management links with corporate objectives, strategy and current circumstances to maintain capital adequacy and solvency and to operate within the risk appetite and risk limits described in the risk appetite statement.

16.3.3 An insurer’s ERM framework should use reasonably long time horizon, consistent with the nature of the insurer’s risks and the business planning horizon, so that it maintains relevance to the insurer’s business going forward. This can be done by using methods (such as scenario models) that produce a range of outcomes based on plausible future business assumptions which reflect sufficiently adverse scenarios. The analysis of these outcomes may help the Board and Senior Management in strategic business planning.

16.3.4 Risks should be monitored and reported to the Board and Senior Management, in a regular and timely manner, so that they are fully aware of the insurer’s risk profile and how it is evolving and make effective decisions on risk appetite and capital management.

16.3.5 Where internal models are used for business forecasting, the insurer should perform back-testing, to the extent practicable, to validate the accuracy of the model over time.

16.3.6 The insurer’s ERM framework should note the insurer’s reinsurance arrangements and how they:

- reflect the insurer’s risk limits structure;
- play a role in mitigating risk; and
- impact the insurer’s capital requirements.

The use of any non-traditional forms of reinsurance (eg finite reinsurance) should also be addressed.

Enterprise risk management framework - risk appetite statement
16.4 The supervisor requires the insurer to have a risk appetite statement that:

- articulates the aggregate level and types of risk the insurer is willing to assume within its risk capacity to achieve its financial and strategic objectives, and business plan;

- takes into account all relevant and material categories of risk and their interdependencies within the insurer’s current and target risk profiles; and

- is operationalised in its business strategy and day-to-day operations through a more granular risk limits structure.

16.4.1 An insurer’s risk appetite statement should include qualitative statements as well as quantitative measures expressed relative to earnings, capital, risk measures, liquidity and other relevant measures as appropriate.

16.4.2 Qualitative statements should:

- complement quantitative measures;

- set the overall tone for the insurer’s approach to risk taking; and

- articulate clearly the motivations for taking on or avoiding certain types of risks, products, jurisdictional/regional exposures, or other categories.

16.4.3 Risk appetite may not necessarily be expressed in a single document. However the way it is expressed should provide the insurer’s Board with a coherent and holistic, yet concise and easily understood, view of the insurer’s risk appetite.

16.4.4 The supervisor should require risk capacity of the insurer to include the consideration of regulatory capital requirements, economic capital, liquidity and operational environment.

16.4.5 The risk appetite statement should give clear guidance to operational management on the level of risk to which the insurer is prepared to be exposed and the limits of risk to which they are able to expose the insurer. It should also be communicated across and within the insurer to facilitate entrenching the risk appetite into the insurer’s risk culture.

16.4.6 An insurer should consider how to embed these limits in its ongoing operations. This may be achieved by expressing limits in a way that can be measured and monitored as part of ongoing operations. Stress testing may provide an insurer with a tool to help ascertain whether the limits are suitable for its business.

Group perspectives

16.4.7 An insurance legal entity’s risk appetite statement should define risk limits taking into account all of the group risks it faces to the extent that they are relevant and material to the insurance legal entity.

16.4.8 When creating a risk limits structure at the insurance legal entity level, the entity’s Board and Senior Management should take into account risk limits at the group level.
The group-wide supervisor requires the group-wide ERM framework to establish and maintain processes to communicate its risk appetite internally and externally.

The granularity of disclosure may differ between internal and external communication.

Asset-liability management, investment, underwriting and liquidity risk management policies

The supervisor requires the insurer’s ERM framework to include an explicit asset-liability management (ALM) policy which specifies the nature, role and extent of ALM activities and their relationship with product development, pricing functions and investment management.

As appropriate, the ALM policy should set out how:

- the investment and liability strategies allow for the interaction between assets and liabilities;
- the liability cash flows will be met by the cash inflows; and
- the economic valuation of assets and liabilities will change under a range of different scenarios.

ALM does not imply that assets should be matched as closely as possible to liabilities, but rather that mismatches are effectively managed. Not all ALM needs to use complex techniques. For example, simple, low risk or short term business may call for less complex ALM techniques.

The insurer’s ALM policy should recognise the interdependence between all of the insurer’s assets and liabilities and take into account the correlation of risk between different asset classes as well as the correlations between different products and business lines, recognising that correlations may not be linear. The ALM policy should also take into account any off-balance sheet exposures that the insurer may have and the contingency that risks transferred may revert to the insurer.

Different strategies may be appropriate for different categories of assets and liabilities. One possible approach to ALM is to identify separate homogeneous segments of liabilities and obtain investments for each segment that would be appropriate if each liability segment was a stand-alone business. Another possible approach is to manage the insurer’s assets and liabilities together as a whole. The latter approach may provide greater opportunities for profit and management of risk than the former. If ALM is practised for each business segment separately, this is likely to mean that the insurer may not benefit as much from the benefits of scale, hedging, diversification and reinsurance.

However, for some types of insurance business it may not be appropriate to manage risks by combining liability segments. It may be necessary for the insurer to devise separate and self-contained ALM policies for particular portfolios of assets that are ring-fenced or otherwise not freely available to cover obligations in other parts of the insurer.
16.5.5 Assets and liabilities may be ring-fenced to protect policyholders. For example, non-life insurance business is normally ring-fenced from life insurance business, and likewise, participating business is separated from non-participating. Supervisory requirements or the insurer’s ERM framework may require some liabilities to be closely matched with the supporting assets. For example, equity-linked or indexed-linked benefits may be closely matched with corresponding assets, and annuities’ cash outflows may be closely matched with cash inflows from fixed income instruments.

16.5.6 Some liabilities may have particularly long durations, such as certain types of liability insurance and whole-life policies and annuities. In these cases, assets with sufficiently long duration may not be available to match the liabilities, introducing a significant reinvestment risk, such that the present value of future net liability cash flows is particularly sensitive to changes in interest rates. There may also be gaps in the asset durations available. An ALM policy should address the risks arising from duration or other mismatches (for example, by holding adequate capital or having appropriate risk mitigation in place). The ERM framework should reflect the insurer’s capacity to bear ALM risk, according to the insurer’s risk appetite and risk limits structure.

Group perspectives

16.5.7 The group-wide ALM policy should take into account any legal restrictions that may apply to the treatment of assets and liabilities within the jurisdictions in which the group operates.

16.6 The supervisor requires the insurer’s ERM framework to include an explicit investment policy that:

- addresses investment risk according to the insurer’s risk appetite and risk limits structure;
- specifies the nature, role and extent of the insurer’s investment activities and how the insurer complies with regulatory investment requirements; and
- establishes explicit risk management procedures with regard to more complex and less transparent classes of asset and investments in markets or instruments that are subject to less governance or regulation; and
- as necessary, includes a counterparty risk appetite statement.

16.6.1 An investment policy may set out the insurer’s strategy for optimising investment returns and specify asset allocation strategies and authorities for investment activities and how these are related to the ALM policy.

16.6.2 The investment policy should address the safe-keeping of assets including custodial arrangements and the conditions under which investments may be pledged or lent.

16.6.3 Credit risk should be considered in the investment policy.

16.6.4 The investment policy should consider excessive asset concentration based on certain characteristics, including:
• type of asset;
• credit rating;
• issuer[counterparty or related entities of an issuer[counterparty;
• financial market;
• sector; and
• geographic area.

16.6.5 It is important for the insurer to understand the source, type and amount of investment risk. For example, it is important to understand who has the ultimate legal risk or basis risk in a complex chain of transactions. Similar questions arise where the investment is via external funds, especially when such funds are not transparent.

16.6.6 A number of factors may shape the insurer's investment strategy. For insurers in many jurisdictions concentration risk arising from the limited availability of suitable domestic investment vehicles may be an issue. By contrast, international insurers' investment strategies may be complex because of a need to manage or match assets and liabilities in a number of currencies and different markets. In addition, the need for liquidity resulting from potential large-scale payments may further complicate an insurer's investment strategy.

16.6.7 Where appropriate, the investment policy should outline how the insurer deals with inherently complex financial instruments such as derivatives, hybrid instruments that embed derivatives, private equity, hedge funds, insurance linked instruments and commitments transacted through special purpose entities. Complex or less transparent assets may present operational risks that are difficult to assess reliably, especially in adverse conditions.

16.6.8 An effective investment policy and ERM framework should provide for appropriately robust models reflecting relevant risks of complex investment activities (including underwriting guarantees for such complex securities). There should be explicit procedures to evaluate non-standard risks associated with complex structured products, especially new forms of concentration risk that may not be obvious.

16.6.9 For complex investment strategies, the insurer's investment policy and ERM framework may incorporate the use of stress testing and contingency planning to handle hard-to-model risks such as liquidity and sudden market movements. Trial operation of procedures may also be appropriate in advance of ‘live’ operation.

16.6.10 The insurer’s investment policy and ERM framework should be clear about the purpose of using derivatives and address whether it is appropriate for it to prohibit or restrict the use of some types of derivatives where, for example:

• the potential exposure cannot be reliably measured;
• closing out of a derivative is difficult considering the illiquidity of the market;
• the derivative is not readily marketable as may be the case with over-the-counter instruments;
• independent (ie external) verification of pricing is not available;
• collateral arrangements do not fully cover the exposure to the counterparty;
• the counterparty is not suitably creditworthy; and
• the exposure to any one counterparty exceeds a specified amount.

These factors are particularly important for unregulated over-the-counter derivatives. The effectiveness of clearing facilities available may be a relevant consideration in assessing the counterparty risk associated with some types of over-the-counter derivatives, such as credit default swaps.

16.6.11 A counterparty risk appetite statement sets out the level of risk the insurer is willing to accept that a counterparty will be unable to meet its obligations as they fall due. This may impact the insurer’s financial position through, for example, reductions in fair value or impairment of investments, loss of reinsurance cover, open market exposures or the loss of securities that have been loaned.

16.6.12 In deciding whether it is necessary to require a counterparty risk appetite statement, the supervisor should take into account the size of the insurer’s counterparty exposures, both in absolute terms and relative to the insurer’s portfolio, according to the characteristics outlined in Guidance 16.6.4, as well as the complexity and form of these exposures. Particular attention should be paid to financial sector counterparties, as these counterparties may be more likely to contribute to the build-up of systemic risk. Attention should also be paid to off-balance sheet exposures or commitments, as these may be more likely to materialise during stress.

**CF 16.6.a** The group-wide supervisor requires the Head of the IAIG to establish and maintain a group-wide investment policy that sets criteria for investment quality and addresses the selection of, and exposure to, low-quality investments or investments whose security is difficult to assess.

**CF 16.6.a.1** The group-wide investment policy should take into account the different regulatory investment requirements of the jurisdictions in which the IAIG operates.

**CF 16.6.b** The group-wide supervisor requires the Head of the IAIG to:

- set limits, or other requirements, in the group-wide investment policy so that assets are properly diversified and asset concentration risk is mitigated; and

- have a counterparty risk appetite statement.

**CF 16.6.b.1** The IAIG should avoid excessive concentrations in any particular:

- type of asset;
• credit rating;
• issuer/counterparty or related entities of an issuer/counterparty;
• financial market;
• sector; or
• geographic area.

CF 16.6.b.2 To support the assessment of concentrations, the IAIG should analyse aggregate exposures to individual counterparties and to groups of related counterparties both at the legal entity level and group-wide level.

CF 16.6.c The group-wide supervisor requires the Head of the IAIG to establish criteria on intra-group investments in the group-wide investment policy.

CF 16.6.c.1 Criteria on intra-group investments should take into account, when appropriate:

• liquidity;
• contagion or reputational risk;
• valuation uncertainty;
• impact on capital resources;
• nature of the IAIG’s business; and
• financial condition of the individual legal entities.

The fact that intragroup investments may be subject to supervisory approval, in certain jurisdictions, does not remove the requirement for the Head of the IAIG to set its own criteria.

CF 16.6.d The group-wide supervisor requires the Head of the IAIG to monitor investments on a group-wide basis to identify levels of investment exposure that do not comply with the group-wide investment policy.

CF 16.6.d.1 Group-wide investment exposures that exceed limits, or any other non-compliance, should be reported to the IAIG Board and Senior Management upon identification. Reports to the IAIG Board and Senior Management should include material exposures that, even if within limits, could create financial difficulties within the IAIG if the value or liquidity of the investments decreases.

16.7 The supervisor requires the insurer’s ERM framework to include an underwriting policy that addresses the:

• insurer’s underwriting risk according to the insurer's risk appetite and risk limits structure;
• nature of risks to be underwritten, including any material relationship with macroeconomic conditions; and
• interaction of the underwriting strategy with the insurer's reinsurance strategy and pricing.
16.7.1 An underwriting policy should cover the underwriting process, pricing, claims settlement and expense control (where applicable and relevant to the expenses of the underwriting process). Such a policy may include:

- the terms on which contracts are written and any exclusions;
- the procedures and conditions that need to be satisfied for risks to be accepted;
- additional premiums for substandard risks; and
- procedures and conditions that need to be satisfied for claims to be paid.

16.7.2 Control of expenses associated with underwriting and payment of claims is an important part of managing risk especially in conditions of high general rates of inflation. Inflation of claim amounts also tends to be high in such conditions for some types of risk. Insurers should have systems in place to control their expenses. These expenses should be monitored by the insurer on an ongoing basis.

16.7.3 The underwriting policy should take into account the effectiveness of risk transfer. This includes ensuring that:

- the insurer’s reinsurance programme provides coverage appropriate to its level of capital, the profile of the risks it underwrites, its business strategy and risk appetite; and
- the risk will not revert to the insurer in adverse circumstances.

16.7.4 In addressing the nature and amount of risks to be underwritten the underwriting policy should cover, at least:

- product classes the insurer is willing to write;
- relevant exposure limits (e.g. geographical, counterparty, economic sector); and
- a process for setting underwriting limits.

16.7.5 The underwriting policy should address the potential impact on the insurer’s financial position from material correlations between macroeconomic conditions and the insurance portfolio (for example by assessing the potential impact stemming from certain insurance products with embedded guarantees and options).

16.7.6 The underwriting policy should address:

- how an insurer analyses emerging risks in the underwritten portfolio; and
- how emerging risks are considered in modifying underwriting practices.

16.7.7 The underwriting policy should describe interactions with the reinsurance strategy and associated credit risk, and should include details of the reinsurance cover of certain product classes or particular risks.
CF 16.7.a The group-wide supervisor requires the Head of the IAIG to ensure that the IAIG implements its group-wide ERM framework by establishing procedures and monitoring practices for the use of sufficient, reliable and relevant data for its underwriting, pricing, reserving and reinsurance processes.

Group-wide claims management policy

CF 16.7.b The group-wide supervisor requires the Head of the IAIG to establish and maintain a group-wide claims management policy, as part of the group-wide ERM framework, that includes procedures for:

- claims estimation and settlement;
- feedback into the group-wide underwriting policy and reinsurance strategy; and
- claims data reporting for group analysis.

CF 16.7.b.1 The group-wide claims management policy may establish procedures for:

- delegations of authority for claims settlement;
- criteria for accepting or rejecting claims; and
- escalating claims.

CF 16.7.b.2 A group-wide claims management policy should allow insurance legal entities to establish individual claims management policies and processes, adjusted to supervisory requirements and circumstances in their jurisdictions.

CF 16.7.b.3 Escalating claims may include information about sudden increases in claim activity, delays in settlements and increased rejections.

Group-wide strategy for reinsurance and other forms of risk transfer

CF 16.7.c The group-wide supervisor requires the Head of the IAIG to establish and maintain a group-wide strategy for reinsurance and other forms of risk transfer as part of the group-wide ERM framework that considers the following issues, as applicable:

- the interaction with the group-wide risk and capital management strategies;
- how the risk appetite is achieved, on both a gross limit and net retention basis;
- the appetite for reinsurer credit risk, including approved security criteria for reinsurance transactions and aggregate exposure criteria to individual or related reinsurers;
- the autonomy afforded to individual insurance legal entities to enter into “entity specific” reinsurance arrangements, and the management and the aggregation of these exposures in the group-wide context;
- procedures for managing reinsurance recoverables, including required reporting from insurers;
• intra-group reinsurance strategy and practice;
• use of alternative risk transfer, including capital markets risk transfer products; and
• effectiveness of risk transfer in adverse circumstances.

CF 16.7.c.1 A strategy for other forms of risk transfer may include the use of capital markets risk transfer products (for example, insurance linked securities). Strategic considerations may include factors like the maturity of the capital markets offering such risk transfer products, regulatory approaches regarding the use of such risk transfer products, and overall mix of traditional reinsurance with other forms of risk transfer.

Group-wide actuarial policy

CF 16.7.d The group-wide supervisor requires the Head of the IAIG to establish and maintain a group-wide actuarial policy, as part of the group-wide ERM framework, that consists of a set of group-wide practice standards, covering at least:

• the process to assess the appropriateness, at the group-wide level, of the data, methodologies and underlying models used, as well as the assumptions made in the calculation of technical provisions;
• the process to calculate reinsurance recoverable assets taking into account the design of the reinsurance programme under the reinsurance strategy of the IAIG; and
• model risk management of internal models that generate actuarial and financial projections for solvency purposes.

CF 16.7.d.1 The group-wide practice standards comprising the group-wide actuarial policy should:

• be compliant with applicable laws and regulations, accounting regime, and professional actuarial standards;
• formalise materiality thresholds to trigger higher levels of management actions to ensure well-governed activities;
• provide for a data validation process that supports actuarial activities to ensure data quality, comprehensiveness, granularity and timeliness;
• provide a framework for determining assumptions used in valuations, including a process of incorporating the experience of the IAIG and its insurance legal entities, as well as a process of developing assumptions if the IAIG does not have enough experience in a particular business line or market;
• articulate model validation and maintenance procedure to ensure that model usage and model modifications align with the risk appetite and risk limits structure; and
• create consistent management information requirements from in-depth reviews and monitoring of actuarial activities.

**CF 16.7.d.2** The group-wide actuarial policy should contain practice standards to raise awareness of matters that have, or are likely to have, a materially adverse effect on the solvency, reserves or financial condition of one of the insurance legal entities, or the IAIG as a whole. Such standards would prompt the group-wide actuarial function to inform the relevant Board, Senior Management or Key Persons in Control Functions, as appropriate, for suitable action (see ICP 8 Risk Management and Internal Controls).

**CF 16.7.d.3** Differences in reporting may exist at the insurance legal entity level to comply with jurisdictional requirements. The group-wide actuarial policy should focus on group-wide reporting requirements, both for internal management purposes and for reporting and disclosure purposes. The group-wide reporting should reflect jurisdictional differences.

**CF 16.7.d.4** The group-wide actuarial policy should require an assessment of the consistency of the base assumptions used to derive technical provisions compared to those used to derive capital requirements, economic capital models, or the forward-looking view in the ORSA. Such an assessment of consistency may provide insight as to the coherence of the base assumptions and those applied in stress conditions.

**CF 16.7.e** The group-wide supervisor requires the group-wide actuarial function, as part of the group-wide ERM framework, to report (whether certified or not) to the IAIG Board annually on at least the following:

- a prospective actuarial analysis of the financial condition of the IAIG which goes beyond the current balance sheet of the IAIG;
- the reliability and sufficiency of the technical provisions;
- the adequacy of reinsurance credit for technical provisions; and
- consideration of non-insurance legal entities and non-regulated legal entities.

**CF 16.7.e.1** The group-wide actuarial function should provide the IAIG Board an actuarial analysis of the current and future financial condition of the IAIG given recent experience and the group-wide policies for underwriting, claims management and investment and the group-wide reinsurance strategy.

**CF 16.7.e.2** The group-wide actuarial function may use the underlying actuarial reports submitted by the individual insurance legal entities as input to its annual reporting to the IAIG Board. Further examples of issues that could be addressed include:
• the assumptions used by all of the insurance legal entities in the group and the consolidation/aggregation method applied at the group level;
• the methodologies used to determine current estimates by each insurance legal entity and the consolidation/aggregation method applied at the group level;
• the methodologies used to determine the margin over current estimate by each insurance legal entity and the consolidation/aggregation method applied at the group level;
• the availability and appropriateness of data used in valuations;
• back-testing of assumptions and valuations;
• uncertainty in current estimates used by both insurance legal entities and at the consolidated/aggregated group level;
• the adequacy of pricing, taking into account the underwriting policies, at the appropriate unit level, the insurance legal entity level and the group level;
• the performance of the IAIG’s insurance portfolios and analysis of any changes in business volumes, exposures, claims experience, mix of business and pricing during the year;
• asset-liability management under the group-wide investment policy;
• suitability and adequacy of reinsurance or other forms of risk transfer arrangements, taking into account the strategies for underwriting and claims management, as well as the overall financial condition and risk appetite of the IAIG; and
• the extent of reliance on the values provided by non-insurance legal entities.

16.8 The supervisor requires the insurer’s ERM framework to address liquidity risk and to contain strategies, policies and processes to maintain adequate liquidity to meet its liabilities as they fall due in normal and stressed conditions.

16.8.1 When analysing its liquidity profile, the insurer should assess the liquidity of both its assets and liabilities. The insurer should consider, where applicable, issues such as:
• market liquidity in normal and stressed conditions, quality of assets and its ability to monetise assets in each situation;
• characteristics of insurance contracts that may affect policyholder behaviour around lapse, withdrawal or renewal;
• adverse insurance events that may trigger short-term liquidity needs, including catastrophes;
• non-insurance activities such as marging or posting collateral for derivatives contracts, securities lending or repurchase agreements; and
• contingent sources of liquidity (including committed lines of credit or future premium income) and whether these would be available in stressed conditions.

16.8.2 An insurer should have well-defined processes and metrics in place, which may be simple or more advanced depending on its activities, to assess its liquidity position at different time horizons on a regular basis. An insurer’s liquidity analysis should cover both normal and stressed market conditions. The insurer should assess the results of such analysis in light of its risk appetite.

16.8.3 Upon the supervisor’s request, the insurer should report its liquidity risk management processes and analysis, including key assumptions or metrics.

Group perspectives

16.8.4 An insurance group’s assessment should result in a coherent view of liquidity risk across legal entities within the group. For example, where an individual legal entity relies on the head of the group for funding, this should be accounted for in both the individual legal entity’s and the head of the group’s liquidity analysis.

16.8.5 When analysing its liquidity position, an insurance group may use different scenarios and analyses on a legal entity level and group-wide level where appropriate. Such scenarios should take into account that circumstances may differ between individual legal entities and the group as a whole.

16.9 The supervisor requires, as necessary, the insurer to establish more detailed liquidity risk management processes, as part of its ERM framework, that include:

• liquidity stress testing;
• maintenance of a portfolio of unencumbered highly liquid assets in appropriate locations;
• a contingency funding plan; and
• the submission of a liquidity risk management report to the supervisor.

16.9.1 Liquidity risk increases as the imbalance between liquidity sources and needs grows, for instance due to liquidity transformation. Unexpected liquidity needs could be generated by, for example:

• derivatives, particularly any collateral or margin that needs to be posted for mark-to-market declines in the value of the contract;
• securities financing transactions, including repurchase agreements and securities lending;
• insurance products that contain provisions that allow a policyholder to withdraw cash from the policy with little notice or penalty; and
• insurance products covering natural catastrophes.

These activities may contribute to systemic risk when not properly managed, for instance when funds received from short-term securities lending or repurchase agreements or balances from more liquid insurance products are invested in illiquid assets.

16.9.2 Some insurers are required to establish more detailed liquidity risk management processes as compared to those processes set out in Standard 16.8. More detailed liquidity risk management processes are intended to help the insurer with its risk management. Additionally, the measures may provide the supervisor with a view on vulnerabilities that may cause funding shortfalls in stress.

16.9.3 Liquidity stress testing is a forward looking risk management tool to reveal vulnerabilities in the insurer’s liquidity profile and provide information on its ability to meet liabilities as they fall due. A portfolio of unencumbered highly liquid assets may provide a source of liquidity for the insurer to meet its liabilities as they fall due. A contingency funding plan, describing the strategies for addressing liquidity shortfalls in stress situations, may assist the insurer in addressing an unforeseen stress situation, where its liquid assets are insufficient or unexpectedly become illiquid. A liquidity management report could assist the insurer and the supervisor to address shortcomings in the insurer’s risk management by laying out details of its liquidity risk management in an accessible format.

16.9.4 In deciding whether it is necessary to require more detailed liquidity risk management processes, and the intensity of such processes, the supervisor should take into account the nature, scale and complexity of the insurer’s activities that lead to increased liquidity risk exposure as well as the risk amplification effects related to the size of the insurer. Increased liquidity risk exposure may depend on, for example, the magnitude of potential collateral or margin calls from derivatives or other transactions, the use of securities financing transactions or the characteristics of insurance contracts that may affect policyholder behaviour around lapse, withdrawal or renewal.

16.9.5 The supervisor may increase or decrease the intensity of these requirements by, for example, varying the frequency, scope and granularity of liquidity stress testing, the proportion of various types of highly liquid assets allowed in the portfolio or the form and level of detail in the contingency funding plan and liquidity risk management report.

16.9.6 Where an insurer is required to establish more detailed liquidity risk management processes, the supervisor should assess the effectiveness of their implementation, including the interaction with existing control mechanisms. Additionally, the supervisor should evaluate the quality and quantity of the assets that the insurer includes in its portfolio of highly liquid assets in light of the liquidity characteristics of its activities. The supervisor may develop its own, general, criteria for highly liquid assets.
CF 16.9.a The group-wide supervisor requires the Head of the IAIG to assess the IAIG’s resilience against severe but plausible liquidity stresses to determine whether current exposures are within the IAIG’s liquidity risk appetite.

CF 16.9.a.1 Forward-looking risk assessments should be done through scenario analysis or stress testing to reveal vulnerabilities in an IAIG’s liquidity profile and should be performed for material legal entities and the IAIG as a whole.

CF 16.9.a.2 Depending on its business model, an IAIG may be vulnerable to different liquidity stresses than other insurers. Certain activities may contribute to larger or less predictable liquidity needs. The group-wide supervisor should therefore consider the nature, scale, and complexity of the IAIG’s activities that lead to increased liquidity risk exposure as well as the risk amplification effects related to the size of the IAIG when setting its expectations of the IAIG’s stress testing. The group-wide supervisor may, based on these considerations, vary the frequency, scope and granularity of liquidity stress testing.

CF 16.9.a.3 The group-wide supervisor may suggest the IAIG include in its assessment certain stresses that have been informed by the group-wide supervisor’s macroprudential surveillance (ICP 24 Macroprudential Supervision).

CF 16.9.a.4 The IAIG may consider the following when designing severe but plausible stresses:

- exposure to insurable events;
- withdrawals from, and run-offs of, insurance policies;
- contingent off-balance sheet exposures;
- the impact of a deterioration in the IAIG’s credit rating;
- the ability to transfer liquidity between legal entities and between jurisdictions;
- currency convertibility and access to foreign exchange markets;
- reductions in the ability to access secured and unsecured wholesale funding; and
- the correlation and concentration of funding sources.

CF 16.9.a.5 The IAIG may consider the impact of chosen stresses on the appropriateness of its assumptions relating to:

- correlations between funding markets;
- the effectiveness of diversification across its chosen sources of funding;
- additional margin calls and collateral requirements;
- reliance on committed lines of credit;
• estimates of future balance sheet growth and premium income;
• the continued availability of market liquidity, including in currently highly liquid markets;
• ability to access secured and unsecured funding; and
• currency convertibility.

CF 16.9.a.6 The IAIG should evaluate its cash inflows (sources) and cash outflows (needs) under stress scenarios and determine its stressed liquidity position, i.e., its net stressed cash outflows.

CF 16.9.b The group-wide supervisor requires the Head of the IAIG to establish and maintain an adequate level of unencumbered highly liquid assets in appropriate locations.

CF 16.9.b.1 The IAIG should maintain adequate liquidity to meet its liabilities as they fall due in normal and stressed conditions. Where stress scenarios reveal stressed cash outflows that exceed stressed cash inflows, the IAIG should hold unencumbered highly liquid assets, with appropriate haircuts, of sufficient value to meet excess stressed cash outflows.

CF 16.9.b.2 The group-wide supervisor should consider the results of the IAIG’s stress testing or scenario analysis when assessing the quality and quantity of the assets that the IAIG considers to be highly liquid assets. Where an IAIG is subject to significant short-term liquidity needs (for example daily or weekly) the supervisor may require higher quality assets than an IAIG subject to longer-term needs. The group-wide supervisor may also require an IAIG with larger or less predictable stressed liquidity needs to hold a larger amount of highly liquid assets than an IAIG with smaller and more consistent liquidity needs.

CF 16.9.b.3 The IAIG should be able to demonstrate to the group-wide supervisor the liquidity of any assets it considers highly liquid assets in its liquidity risk management report.

CF 16.9.b.4 To promote their usability, assets that the IAIG relies on for liquidity should be free of legal, regulatory, contractual or other restrictions on the ability of the IAIG to liquidate, sell, transfer, or assign the assets (i.e., unencumbered).

CF 16.9.b.5 The Head of the IAIG should ensure that its portfolio of highly liquid assets is sufficiently diversified. This may include looking through to the underlying assets to determine the extent of concentration risk. The Head of the IAIG should also consider whether it holds a substantial share of the market for a particular instrument, counterparty or asset class to assess if the market would be able to bear the IAIG’s sales and whether market reaction would not adversely impact the IAIG’s ability to monetise its assets as planned.

CF 16.9.b.6 The Head of the IAIG should consider the marketability and realisability, including as acceptable collateral, of its highly liquid assets by taking into account factors such as market depth and access, monetisation timelines (for example delays in finding a willing buyer, time to settlement) and the likelihood and extent of forced-sale
losses. In stressed market conditions, it may not be feasible to value properly or sell some types of assets or to do so without a significant loss in value.

CF 16.9.b.7 Liquidity is not always freely transferable within a group when needed. The Head of the IAIG should ensure that liquidity is available to legal entities within the group when needed, subject to any applicable legal, regulatory or operational constraints, including cross-border constraints.

CF 16.9.b.8 The minimum criteria for determining asset liquidity may be addressed in the group-wide investment policy or a separate liquidity policy.

CF 16.9.c The group-wide supervisor requires the Head of the IAIG to maintain a contingency funding plan to respond to liquidity stress events.

CF 16.9.c.1 The group-wide supervisor should consider the nature, scale, and complexity of the IAIG’s activities that lead to increased liquidity risk exposure, as well as the risk amplification effects related to the size of the IAIG, when setting its expectations of the IAIG’s contingency funding plan requirements. This includes the form and level of detail of the contingency funding plan and the frequency for reviewing and updating the plan. The group-wide supervisor’s expectations may be informed by the IAIG’s liquidity stress testing or scenario analysis, which may reveal funding sources most likely to be impacted during stress and those on which the IAIG is most reliant. The group-wide supervisor may consider requiring a more detailed or frequently updated plan from an IAIG with more unpredictable cash inflows and outflows or where cash inflows and outflows are more significantly impacted by the IAIG’s liquidity stress tests or scenario analysis.

CF 16.9.c.2 A contingency funding plan describes the strategies for addressing liquidity shortfalls in stress situations, including the methods that the IAIG would use to access alternative sources of funding.

CF 16.9.c.3 A contingency funding plan should include quantitative metrics that the IAIG would use to identify a liquidity stress event, including the level and nature of the effect it would have on the IAIG’s liquidity position and on sources of available funding.

CF 16.9.c.4 A contingency funding plan should outline the strategies, policies and processes to manage a range of stresses. The plan should establish a clear allocation of roles and clear lines of management responsibility. The plan should define procedures for identifying early warning indicators for potential liquidity stress events that are based on the features of the IAIG’s business.

CF 16.9.c.5 The supervisor may allow the IAIG’s contingency funding plan to be developed as part of a recovery plan.

CF 16.9.d The group-wide supervisor requires the Head of the IAIG to report, at least annually, on its management of liquidity risk. The report includes at least the following:

- a liquidity risk appetite statement;
- established liquidity risk limits;
• a discussion of the current liquidity position of the IAIG in relation to its liquidity risk appetite and limits;
• a summary of strategies, policies and processes that the IAIG has in place to manage liquidity risk;
• a discussion of potential vulnerabilities in the IAIG’s liabilities as well as the means of enhancing the liquidity position; and
• the IAIG’s approach to, and results of, liquidity stress testing.

CF 16.9.d.1 The group-wide supervisor should consider the nature, scale, and complexity of the IAIG’s activities that lead to increased liquidity risk exposure as well as the risk amplification effects related to the size of the IAIG when setting liquidity reporting requirements, including the level of detail of the report and the frequency for reviewing and updating the report. The supervisor may determine that the reporting requirement is satisfied by reference to other risk management policies, risk reporting and/or the ORSA report.

CF 16.9.d.2 The summary of strategies, policies and processes should discuss any metrics the IAIG uses to identify, measure, monitor, and control liquidity risk as well as how the results from the liquidity stress testing are incorporated into day-to-day management of the IAIG. The Head of the IAIG should have a process in place to discuss the results and take the necessary actions.

Own risk and solvency assessment (ORSA)

16.10 The supervisor requires the insurer to perform regularly its own risk and solvency assessment (ORSA) to assess the adequacy of its risk management and current, and likely future, solvency position.

16.10.1 The insurer should document the main outcomes, rationale, calculations and action plans arising from its ORSA.

16.10.2 ORSAs should be largely driven by how an insurer is structured and how it manages itself. The performance of an ORSA at the insurance legal entity level does not exempt the group from conducting a group-wide ORSA.

16.11 The supervisor requires the insurer’s Board and Senior Management to be responsible for the ORSA.

16.11.1 The Board should adopt a rigorous process for setting, approving, and overseeing the effective implementation by Senior Management of the insurer’s ORSA.

16.11.2 Where appropriate, the effectiveness of the ORSA should be validated through internal or external independent overall review by a suitably experienced individual.

16.12 The supervisor requires the insurer’s ORSA to:

• encompass all reasonably foreseeable and relevant material risks including, at least, insurance, credit, market, concentration, operational and liquidity risks and (if applicable) group risk; and
• identify the relationship between risk management and the level and quality of financial resources needed and available;

and, as necessary:

• assess the insurer’s resilience against severe but plausible macroeconomic stresses through scenario analysis or stress testing; and

• assess aggregate counterparty exposures and analyse the effect of stress events on material counterparty exposures through scenario analysis or stress testing.

16.12.1 The insurer should consider in its ORSA all material risks that may have an impact on its ability to meet its obligations to policyholders, including in that assessment a consideration of the impact of future changes in economic conditions or other external factors. The insurer should undertake an ORSA on a regular basis so that it continues to provide relevant information for its management and decision making processes. The insurer should regularly reassess the sources of risk and the extent to which particular risks are material. Significant changes in the risk profile of the insurer should prompt it to undertake a new ORSA. Risk assessment should be done in conjunction with consideration of the effectiveness of applicable controls to mitigate the risks.

16.12.2 The ORSA should explicitly state which risks are quantifiable and which are non-quantifiable.

16.12.3 In deciding whether it is necessary to require scenario analysis or stress testing as part of the ORSA, and the frequency, scope and type of such scenario analysis or stress testing, the supervisor should take into account, for example, the nature, scale and complexity of the insurer, its business model and products and the size of the insurer’s exposures, both in absolute terms and relative to the insurer’s portfolio. For macroeconomic exposure, relevant factors may include the characteristics of the guarantees the insurer provides and the extent to which such guarantees are matched or hedged, the characteristics of any (automatic) asset reallocation mechanisms, the use of dynamic hedging, the insurer’s activity in derivatives markets or other drivers of volatility in the sources or uses of cash. For counterparty exposure, particular attention should be paid to financial sector counterparties, as these may be more likely to contribute to the build-up of systemic risk, and to off-balance sheet exposures or commitments, as these may be more likely to have an impact during stress.

Group perspectives

16.12.4 An insurance group’s ORSA should:

• include all reasonably foreseeable and relevant material risks arising from every legal entity within the insurance group and from the widest group of which the insurance group is part;

• take into account the fungibility of capital and the transferability of assets within the group; and
• ensure capital is not double counted.

16.12.5 Similarly, an insurance legal entity’s ORSA should include all additional risks arising from the widest group to the extent that they impact the insurance legal entity.

16.12.6 In the insurance legal entity’s ORSA and the insurance group’s ORSA, it may be appropriate to consider scenarios in which a group splits or changes its structure in other ways. Assessment of current capital adequacy and continuity analysis should include consideration of relevant possible changes in group structure and integrity in adverse circumstances and the implications this could have for group risks, the existence of the group and the support or demands from the group to or on its insurance legal entities.

16.12.7 Given the level of complexity at insurance group level compared with that at an insurance legal entity level, additional analysis and information is likely to be needed for the group's ORSA in order to address comprehensively the range of insurance group level risks. For example, it may be appropriate to apply a contagion test by using stress testing to assess the impact of difficulties in each legal entity within the insurance group on the other insurance group entities.

16.12.8 In conducting its group-wide ORSA, the group should be able to account for diversification in the group. Moreover, the group should be able to demonstrate how much of the diversification benefit would be maintained in a stress situation.

CF 16.12.a The group-wide supervisor requires the Head of the IAIG to perform a group-wide ORSA, using both quantitative and qualitative approaches, which takes into account at least:

• the legal and management structures of the group;
• group-wide economic capital models;
• risk aggregation;
• the fungibility of capital and the transferability of assets within the group; and
• the outputs of the economic capital model and the regulatory capital requirements.

CF 16.12.a.1 In conducting its group-wide ORSA, the IAIG should consider all material risks arising from its legal entities including non-regulated ones. In particular, political and reputational risks should be considered.

CF 16.12.b The group-wide supervisor requires the Head of the IAIG, as part of the group-wide ORSA, to:

• assess the IAIG’s resilience against severe but plausible macroeconomic stresses through scenario analysis or stress testing; and
- assess aggregate counterparty exposures and analyse the effect of stress events on material counterparty exposures through scenario analysis or stress testing.

CF 16.12.b.1 Scenario analysis of material counterparty exposures should assess the potential impact on the IAIG’s financial position of the deterioration of the credit-worthiness or of the default of individual legal entities, sectors or geographic areas.

**ORSA - economic and regulatory capital**

16.13 The supervisor requires the insurer to:

- determine, as part of its ORSA, the overall financial resources it needs to manage its business given its risk appetite and business plans;
- base its risk management actions on consideration of its economic capital, regulatory capital requirements, financial resources, and its ORSA; and
- assess the quality and adequacy of its capital resources to meet regulatory capital requirements and any additional capital needs.

16.13.1 It is important that an insurer has regard for how risk management and capital management relate to and interact with each other. Therefore, an insurer should determine the overall financial resources it needs, taking into account its risk appetite, risk limits structure and business plans, based on an assessment of its risks, the relationship between them and the risk mitigation in place. Determining economic capital may help an insurer to assess how best to optimise its capital base, whether to retain or transfer risk and how to allow for risks in its pricing.

16.13.2 Although the amounts of economic capital and regulatory capital requirements and the methods used to determine them may differ, an insurer should be aware of, and be able to analyse and explain, these differences. Such analysis helps to embed supervisory requirements into an insurer's ORSA and risk and capital management, so as to ensure that obligations to policyholders continue to be met as they fall due.

16.13.3 As part of the ORSA, the insurer should perform its own assessment of the quality and adequacy of capital resources both in the context of determining its economic capital and in demonstrating that regulatory capital requirements are met having regard to the quality criteria established by the supervisor and other factors which the insurer considers relevant.

**Re-capitalisation**

16.13.4 If an insurer suffers losses that are absorbed by its available capital resources, it may need to raise new capital to meet ongoing regulatory capital requirements and to maintain its business strategies. It cannot be assumed that capital will be readily available at the time it is needed. Therefore, an insurer’s own assessment of the quality of capital should also consider the issue of re-capitalisation, especially the ability of capital to absorb losses on an ongoing basis and the extent to which
the capital instruments or structures that the insurer uses may facilitate or hinder future re-capitalisation. For example, if an insurer enters into a funding arrangement where future profits are cashed immediately, the reduced future earnings potential of the insurer may make it more difficult to raise capital resources in the future.

16.13.5 For an insurer to be able to recapitalise in times of financial stress, it is critical to maintain market confidence at all times, through its solvency and capital management, investor relationships, robust governance structure/practices and fair conduct of business practices. For example, where an insurer issues preferred stock without voting rights, this may affect the robustness of the governance structure and practice of that insurer. The voting rights attached to common stock can provide an important source of market discipline over an insurer’s management. Other insurers may issue capital instruments with lower coupons and fees, sacrificing the economic value of the existing shareholders and bondholders.

16.13.6 When market conditions are good, many insurers should be readily able to issue sufficient volumes of high quality capital instruments at reasonable levels of cost. However, when market conditions are stressed, it is likely that only well capitalised insurers, in terms of both the quality and quantity of capital resources held, will be able to issue high quality capital instruments. Other insurers may only be able to issue limited amounts of lower quality capital and at higher cost. Therefore, the supervisor should make sure that insurers have regard for such variations in market conditions and manage the quality and quantity of their capital resources in a forward looking manner. In this regard, it is expected that high quality capital instruments (such as common shares) should form the substantial part of capital resources in normal market conditions as that would enable insurers to issue capital instruments even in stressed situations. Such capital management approaches also help to address the procyclicality issues that may arise, particularly in risk-based solvency requirements.

Group perspectives

16.13.7 An insurance group should determine, as part of its ORSA, the overall financial resources it needs to manage its business given its risk appetite and business plans and demonstrate that its supervisory requirements are met. The insurance group’s risk management actions should be based on appropriate risk limits and consideration of its economic capital, regulatory capital requirements and financial resources. Economic capital should thus be determined by the insurance group as well as its insurance legal entities, and appropriate risk limits and management actions should be identified for both the insurance group and the insurance legal entities.

16.13.8 Key group-wide factors to be addressed in the insurer’s assessment of group-wide capital resources include multiple gearing, intra-group creation of capital and reciprocal financing, leverage of the quality of capital and fungibility of capital and free transferability of assets across group entities.

**ORSA - continuity analysis**
16.14 The supervisor requires:

- the insurer, as part of its ORSA, to analyse its ability to continue in business, and the risk management and financial resources required to do so over a longer time horizon than typically used to determine regulatory capital requirements; and

- the insurer’s continuity analysis to address a combination of quantitative and qualitative elements in the medium and longer-term business strategy of the insurer and include projections of its future financial position and analysis of its ability to meet future regulatory capital requirements.

**Capital planning and forward-looking perspectives**

16.14.1 An insurer should be able to demonstrate an ability to manage its risk over the longer term under a range of plausible adverse scenarios. An insurer’s capital management plans and capital projections are therefore key to its overall risk management strategy. These should allow the insurer to determine how it could respond to unexpected changes in market and economic conditions, innovations in the industry and other factors such as demographic, legal and regulatory, medical and social developments.

16.14.2 Where appropriate, the supervisor should require an insurer to undertake periodic, forward-looking continuity analysis and modelling of its future financial position including its ability to continue to meet its regulatory capital requirements in future under various conditions. Insurers should ensure that the capital and cash flow projections (before and after stress) and the management actions included in their forecasts are approved at a sufficiently senior level.

16.14.3 In carrying out its continuity analysis, the insurer should also apply reverse stress testing to identify scenarios that would be the likely cause of business failure (eg where business would become unviable or the market would lose confidence in it) and the actions necessary to manage this risk.

16.14.4 As a result of continuity analysis, the supervisor should encourage insurers to maintain contingency plans and procedures. Such plans should identify relevant countervailing measures and off-setting actions they could realistically take to restore/improve the insurer’s capital adequacy or cash flow position after some future stress event and assess whether actions should be taken by the insurer in advance as precautionary measures.

**Projections**

16.14.5 A clear distinction should be made between the assessment of the current financial position and the projections, stress testing and scenario analyses used to assess an insurer’s financial condition for the purposes of strategic risk management, including maintaining solvency. The insurer’s continuity analysis should help to ensure sound, effective and complete risk management processes, strategies and systems. It should also help to assess and maintain on an ongoing basis the amounts, types and distribution of financial resources needed to cover the nature and level of the risks to which the insurer is or may be exposed to and
to enable the insurer to identify and manage all reasonably foreseeable and relevant material risks. In doing so, the insurer assesses the impact of possible changes in business or risk strategy on the level of economic capital needed as well as the level of regulatory capital requirements.

16.14.6 Such continuity analysis should have a time horizon needed for effective business planning (for example, 3 to 5 years), which is longer than typically used to determine regulatory capital requirements. It should also place greater emphasis than may be considered in regulatory requirements on new business plans and product design and pricing, including embedded guarantees and options, and the assumptions appropriate given the way in which products are sold. The insurer's current premium levels and strategy for future premium levels are a key element in its continuity analysis. In order for continuity analysis to remain meaningful, the insurer should also consider changes in external factors such as possible future events including changes in the political or economic situation.

Link with business strategy

16.14.7 Through the use of continuity analysis an insurer should be better able to link its current financial position with future business plan projections and ensure its ability to maintain its financial condition in the future. This may help the insurer to further embed its ERM framework into its ongoing and future operations.

16.14.8 An internal model may also be used for the continuity analysis, allowing the insurer to assess the capital consequences of strategic business decisions in respect of its risk profile. For example, the insurer may decide to reduce its capital requirement through diversification by writing different types of business in order to reduce the capital that is needed to be held against such risks, potentially freeing up resources for use elsewhere. This process of capital management may enable the insurer to change its capital exposure as part of its long-term strategic decision making.

16.14.9 As a result of such strategic changes, the risk profile of an insurer may alter, so that different risks should be assessed and quantified within its internal model. In this way, an internal model may sit within a cycle of strategic risk and capital management and provide the link between these two processes.

Group perspectives

16.14.10 An insurance group should analyse its ability to continue in business and the risk management and financial resources it requires to do so. The insurance group’s analysis should consider its ability to continue to exist as an insurance group, potential changes in group structure and the ability of its legal entities to continue in business.

16.14.11 An insurance legal entity’s continuity analysis should assess the ongoing support from the group including the availability of financial support in adverse circumstances as well as the risks that may flow from the group to the insurance legal entity. The insurance legal entity and the insurance group should both take into account the business risks
they face including the potential impact of changes in the economic, political and regulatory environment.

16.14.12 In their continuity analysis, insurance groups should pay particular attention to whether the insurance group will have available cash flows (eg from surpluses released from long-term funds or dividends from other subsidiaries) and whether they will be transferable among legal entities within the group to cover any payments of interest or capital on loans, to finance new business and to meet any other anticipated liabilities as they fall due. Insurance groups should outline what management actions they would take to manage the potential cash flow implications in stressed conditions (eg reducing new business or cutting dividends).

16.14.13 The insurance group’s continuity analysis should also consider the distribution of capital in the insurance group after stress and the possibility that subsidiaries within the insurance group may require recapitalisation (either due to breaches of local regulatory requirements, a shortfall in economic capital, or for other business reasons). The assessment should consider whether sufficient sources of surplus and transferable capital would exist elsewhere in the insurance group and identify what management actions may need to be taken (eg intra-group movements of resources, other intra-group transactions or group restructuring).

16.14.14 The insurance group should also apply reverse stress testing to identify scenarios that could result in failure or cause the financial position of the insurance group to fall below a predefined level and the actions necessary to manage this risk.

Recovery Planning

16.15 The supervisor requires, as necessary, insurers to evaluate in advance their specific risks and options in possible recovery scenarios.

16.15.1 The supervisor may require an insurer to produce a recovery plan that identifies in advance options to restore the financial position and viability if the insurer comes under severe stress (see Application Paper on Recovery Planning). In deciding whether it is necessary to require a recovery plan, and the form, content and level of detail of such recovery planning, the supervisor should take into account, for example, the insurer’s complexity, systemic importance, risk profile and business model. A recovery plan is intended to serve the insurer as an aid to sound risk management. Additionally, if the insurer comes under severe stress, a plan may serve the supervisor as valuable input to any necessary supervisory measures.

16.15.2 The supervisor should require the insurer to provide the necessary information to enable the supervisor to assess the robustness and credibility of any recovery plan required. If the supervisor identifies material deficiencies in the plan, it should provide feedback and require the insurer to address these deficiencies.

16.15.3 The supervisor should require the insurer to review any recovery plan required on a regular basis, or when there are material changes to the insurer’s business, risk profile or structure, or any other change that
could have a material impact on the recovery plan, and to update it when necessary.

**CF 16.15.a** The group-wide supervisor requires the Head of the IAIG to:

- develop a recovery plan that identifies in advance options to restore the financial position and viability;
- review and update the recovery plan on a regular basis, or when there are material changes; and
- take actions for recovery if the IAIG comes under severe stress.

**CF 16.15.a.1** The group-wide supervisor should consider the IAIG’s nature, scale, and complexity when setting recovery plan requirements, including the form, content and detail of the recovery plan and the frequency for reviewing and updating the plan.

**CF 16.15.a.2** Recovery planning is the responsibility of the IAIG. The IAIG should be able to take timely actions for recovery, in particular when any predefined criteria are met that trigger the activation of the recovery plan.

**CF 16.15.a.3** A recovery plan developed by the IAIG should cover all material legal entities within the group.

**CF 16.15.a.4** A recovery plan should serve as a guide for the IAIG to plan and manage severe stress scenarios, although the actual nature and timing of recovery actions will depend on the circumstances.

**CF 16.15.a.5** The IAIG should ensure that:

- it has a robust governance structure and sufficient resources to support the recovery planning process, which includes clear allocation of responsibilities; and
- recovery planning is integrated into the IAIG’s overall governance processes.

**CF 16.15.a.6** A recovery plan is an integral part of the risk management process of an IAIG, aimed at identifying actions to be taken in severe stress scenarios that pose a serious risk to the viability of the IAIG, or any material part of its insurance business. A recovery plan describes if and how the IAIG would:

- discontinue or divest certain portfolios, business lines, legal entities, or other services; and/or
- continue operating certain lines of insurance business while restructuring or running off its discontinued business lines in an orderly fashion.

**CF 16.15.a.7** A recovery plan should include:

- a description of the legal entities covered by the plan, including their legal structures, interdependencies, core business lines and main risks;
- a description of functions and/or services that are significant for the continuation of the IAIG (for example,
shared services, such as information technology services and outsourced functions);

- pre-defined criteria with quantitative and qualitative trigger points, governance, escalation mechanisms and supporting processes;

- a range of severe stress scenarios, including both idiosyncratic and market-wide stress;

- credible options to respond to severe stress scenarios, including actions to address capital shortfalls and liquidity pressures, and to restore the financial condition of the IAIG, taking into account intra-group transactions;

- assessment of the necessary steps, costs, resources and time needed to implement the recovery actions, including the risks associated with the implementation of the actions; and

- strategies for communication with stakeholders.

CF 16.15.a.8 Pre-defined criteria should be well-defined and aligned with contingency plans. They should include qualitative and quantitative criteria, such as a potential breach of a prescribed capital requirement (PCR). Criteria may also include triggers based on: liquidity, market conditions, macro-economic conditions, and the insurer’s operational conditions.

CF 16.15.a.9 Possible actions for recovery include:

- strengthening the IAIG’s capital position, such as recapitalisations;

- capital conservation, such as cost containment and suspension of dividends and of payments of variable remuneration;

- reorganisation of corporate structure and divestitures, such as sales of legal entities or portfolios;

- voluntary restructuring of liabilities, such as debt-to-equity conversion; and

- securing sufficient diversified funding and adequate availability of collateral in terms of volume, location and quality.

CF 16.15.a.10 As a recovery plan may not be able to cover every possible scenario, the IAIG may take, or the group-wide supervisor may require the IAIG to take, measures for recovery other than those contemplated in the IAIG’s recovery plan.

CF 16.15.a.11 The group-wide supervisor should regularly review the recovery plan, including the predefined criteria, the assumptions and severe stress scenarios underlying the plan, to assess its credibility and likely effectiveness. Where necessary, the group-wide supervisor should
provide feedback and require the IAIG to address any material deficiencies.

**CF 16.15.b** The group-wide supervisor requires the Head of the IAIG to have and maintain group-wide management information systems that are able to produce information relevant to the recovery plan on a timely basis.

- **CF 16.15.b.1** The IAIG may rely on an existing information system, so long as it fulfils the objectives of producing information relevant to the recovery plan on a timely basis.
- **CF 16.15.b.2** It is important that the IAIG has available the information necessary for executing recovery actions when needed. Some of this information may be similar to the information needed for resolution; however, recovery may also require other information (see ComFrame material under ICP 12 Exit from the Market and Resolution).

---

**Role of supervision in ERM for solvency purposes**

**16.16** The supervisor undertakes reviews of the insurer’s ERM framework, including the ORSA. Where necessary, the supervisor requires strengthening of the insurer’s ERM framework, solvency assessment and capital management processes.

- **16.16.1** The output of an insurer’s ORSA should serve as an important tool in the supervisory review process by helping the supervisor to understand the risk exposure and solvency position of the insurer.
- **16.16.2** The insurer’s ERM framework and risk management processes (including internal controls) are critical to solvency assessment. The supervisor should therefore assess the adequacy and soundness of an insurer’s framework and processes by receiving regularly the appropriate information, including the ORSA report.
- **16.16.3** In assessing the soundness, appropriateness and strengths and weaknesses of the insurer’s ERM framework, the supervisor should consider questions such as:
  - What are the roles and responsibilities within the ERM framework?
  - Is the insurer within its stated risk appetite?
  - What governance has been established for the oversight of outsourced elements of the ERM framework?
  - What modelling and stress testing (including reverse stress testing) is done?
  - Has the model risk management been applied in the ERM framework?
  - How does the insurer maintain a robust risk culture that ensures active support and adjustment of the insurer’s ERM framework in response to changing conditions?

- **16.16.4** The supervisor should review an insurer’s internal controls and monitor its capital adequacy, requiring strengthening where necessary. Where internal models are used to calculate the regulatory capital...
requirements, particularly close interaction between the supervisor and insurer is important. In these circumstances, the supervisor may consider the insurer’s internal model, its inputs and outputs and the validation processes, as a source of insight into the risk exposure and solvency position of the insurer.

16.16.5 The supervisor should monitor the techniques employed by the insurer for risk management and capital adequacy assessment and take supervisory measures where weaknesses are identified. The supervisor should not take a one-size-fits-all approach to insurers’ risk management but rather base their expectations on the nature, scale and complexity of its business and risks. In order to do this, the supervisor should have sufficient and appropriate resources and capabilities. For example, the supervisor may have a risk assessment model or programme with which it can assess insurers’ overall condition (e.g. risk management, capital adequacy and solvency position) and ascertain the likelihood of insurers breaching supervisory requirements. The supervisor may also prescribe minimum aspects that an ERM framework should address.

16.16.6 The supervisor should require the insurer to provide appropriate information on the ERM framework and risk and solvency assessments. This should provide the supervisor with a long-term assessment of capital adequacy to aid in the assessment of insurers, as well as encourage insurers to have an effective ERM framework. This may be achieved also by, the supervisor requiring or encouraging insurers to provide a solvency and financial condition report. Such a report may include information such as:

- a description of the relevant material categories of risk that the insurer faces;
- the insurer’s risk appetite and risk limits structure;
- the insurer’s overall financial resource needs, including its economic capital and regulatory capital requirements, as well as the capital available to meet these requirements; and
- projections of how such factors will develop in future.

16.16.7 The supervisor should be flexible and apply their skills, experience and knowledge of the insurer in assessing the adequacy of the risk appetite statement. The supervisor may be able to assess the quality of a particular risk appetite statement by discussing with the Board and Senior Management how the insurer’s business strategy is related to the risk appetite statement, as well as how the risk appetite had an impact on the insurer’s decisions. This includes reviewing other material, such as strategy and planning documents and Board reports in the context of how the Board determines, implements, and monitors its risk appetite so as to ensure that risk-taking is aligned with the Board-approved risk appetite statement.

16.16.8 The supervisor should be provided access to the material results of stress testing, scenario analysis and risk modelling and their key underlying assumptions to be reported to them and have access to other results, if requested. Where the supervisor considers that the calculations conducted by an insurer should be supplemented with
additional calculations, it should be able to require the insurer to carry out those additional calculations. The supervisor should also consider available reverse stress tests performed by insurers where they wish to assess whether appropriate action is being taken to manage the risk of business failure.

16.16.9 While insurers should carry out stress testing, scenario analysis and risk modelling that are appropriate for their businesses, the supervisor may also develop prescribed or standard tests and require insurers to perform them when warranted. One purpose of such testing may be to improve consistency of testing among a group of similar insurers. Another purpose may be to assess the financial condition of the insurance sector to economic, market or other stresses that apply to a number of insurers simultaneously (such as pandemics or major catastrophes). Such tests may be directed to be performed by selected insurers or all insurers. The criteria the supervisor uses for scenarios for standard tests should reflect the jurisdiction’s risk environment.

16.16.10 Forward-looking stress testing, scenario analysis and risk modelling of future capital positions and cash flows whether provided by the insurer’s own continuity analysis or in response to supervisory requirements is a valuable tool for the supervisor in assessing the financial condition of insurers. Such testing informs the discussion between the supervisor and insurers on appropriate planning, comparing risk assessments against stress test outcomes, risk management and management actions. The supervisor should consider the dynamic position of insurers and form a high-level assessment of whether the insurer is adequately capitalised to withstand a range of standardised and bespoke stresses.

16.16.11 Where an internal model, including an economic capital model, is used in an insurer’s ORSA, the supervisor should obtain an understanding of the underlying assumptions used. The supervisor should review the outputs of the internal model, at least from the following viewpoints:

- scope of risk categories of the internal model;
- the insurer’s prioritisation of risks in its risk appetite; and
- the insurer’s use of the outputs in making major management decisions on capital planning for meeting regulatory capital requirements.

16.16.12 By reviewing the insurer’s ORSA continuity analysis, the supervisor may be able to learn about the robustness of an insurer’s future financial condition and the information on which the insurer bases decisions and its contingency planning. Such information should enable the supervisor to assess whether an insurer should improve its ERM framework by taking additional countervailing measures and off-setting actions, either immediately, as a preventive measure, or including them in future plans. Objectives of such supervisory measures may be to reduce any projected financial inadequacies, improve cash flows and/or increase an insurer’s ability to restore its capital adequacy after stress events.

16.16.13 Publicly disclosing information on risk management may improve the transparency and comparability of existing solvency requirements. There should be an appropriate balance regarding the level of
information to disclose about an insurer's risk management against the level of sufficient information for external and internal stakeholders which is useful and meaningful. Therefore, the requirements for public disclosure of information on risk management, including possible disclosure of elements of a solvency and financial condition report, should be carefully considered by the supervisor taking into account the proprietary nature of the information.

16.16.14 Where an insurer's risk management and solvency assessment are not considered adequate by the supervisor, the supervisor should take appropriate measures. This could be in the form of further supervisory reporting or additional qualitative and quantitative requirements arising from the supervisor's assessment. Additional quantitative requirements should only be applied in appropriate circumstances and be subject to a transparent supervisory framework. Otherwise, if routinely applied, such measures may undermine a consistent application of standardised approaches to regulatory capital requirements.

Group perspectives

16.16.15 In assessing the soundness, appropriateness and strengths and weaknesses of the group’s ERM framework, the group-wide supervisor should consider questions such as:

- How well is the group’s ERM framework tailored to the group?
- Are decisions influenced appropriately by the group’s ERM framework outputs?
- How responsive is the group’s ERM framework to changes in individual businesses and to the group structure?
- How does the framework bring into account intra-group transactions; risk mitigation; and constraints on fungibility of capital, transferability of assets, and liquidity?

16.16.16 The group-wide supervisor should review the risk management and financial condition of the insurance group. Where necessary, the group-wide supervisor should require strengthening of the insurance group’s risk management, solvency assessment and capital management processes, as appropriate to the nature, scale and complexity of risks at group level. The group-wide supervisor should inform the other involved supervisors of any action required.

16.16.17 The group-wide supervisory review and assessment of the insurance group’s ERM framework should consider the framework’s suitability as a basis for group-wide solvency assessment. The arrangements for managing conflicts of interest across an insurance group should be a particular focus in the supervisory review and assessment of an insurance group’s ERM framework.

16.16.18 The supervisory assessment of the group’s ERM framework may affect the level of capital that the insurance group is required to hold for regulatory purposes and any regulatory restrictions that are applied. For example, the group-wide supervisor may require changes to the recognition of diversification across the insurance group, the allowances
made for operational risk and the allocation of capital within the insurance group.

16.16.19 Although it is not a requirement in general for an insurance legal entity or an insurance group to use internal models to carry out its ORSA, the supervisor may consider it appropriate in particular cases that the ORSA should use internal models in order to achieve a sound ERM framework. The quality of an insurance group’s ORSA is dependent on how well integrated its internal capital models, the extent to which it takes into account constraints on fungibility of capital and its ability to model changes in its structure, the transfer of risks around the insurance group and insurance group risk mitigation. These factors should be taken into account by the group-wide supervisor in its review of the insurance group’s ORSA.

16.16.20 The supervisor may wish to specify criteria or analyses as part of the supervisory risk assessments to achieve effective supervision and consistency across insurance groups. This may, for example, include prescribed stress tests that apply to insurance groups.
ICP 17  Capital Adequacy
The supervisor establishes capital adequacy requirements for solvency purposes so that insurers can absorb significant unforeseen losses and to provide for degrees of supervisory intervention.

Introductory Guidance

17.0.1 This ICP does not directly apply to non-insurance entities (regulated or unregulated) within an insurance group, but it does apply to insurance legal entities and insurance groups with regard to the risks posed to them by non-insurance entities.

Capital adequacy in the context of a total balance sheet approach

17.1 The supervisor requires that a total balance sheet approach is used in the assessment of solvency to recognise the interdependence between assets, liabilities, regulatory capital requirements and capital resources and to require that risks are appropriately recognised.

17.1.1 The overall financial position of an insurer should be based on consistent measurement of assets and liabilities and explicit identification and consistent measurement of risks and their potential impact on all components of the balance sheet. In this context, the IAIS uses the term total balance sheet approach to refer to the recognition of the interdependence between assets, liabilities, regulatory capital requirements and capital resources. A total balance sheet approach should also require that the impacts of relevant material risks on an insurer’s overall financial position are appropriately and adequately recognised.\(^6\)

17.1.2 The assessment of the financial position of an insurer for supervision purposes addresses the insurer’s technical provisions, required capital and available capital resources. These aspects of solvency assessment (namely technical provisions and capital) are intrinsically inter-related and cannot be considered in isolation by a supervisor.

17.1.3 Technical provisions and capital have distinct roles, requiring a clear and consistent definition of both elements. Technical provisions represent the amount that an insurer requires to fulfil its insurance obligations and settle all commitments to policyholders and other beneficiaries arising over the lifetime of the portfolio.\(^7\) In this ICP, the term regulatory capital requirements refers to financial requirements that are set by the supervisor and relates to the determination of amounts of capital that an insurer must have in addition to its technical provisions.

17.1.4 Technical provisions and regulatory capital requirements should be covered by adequate and appropriate assets, having regard to the nature and quality of those assets. To allow for the quality of assets, supervisors

---

\(^6\) It is noted that the total balance sheet approach is an overall concept rather than implying use of a particular methodology.

\(^7\) This includes costs of settling all commitments to policyholders and other beneficiaries arising over the lifetime of the portfolio of policies, the expenses of administering the policies, the costs of hedging, reinsurance, and of the capital required to cover the remaining risks.
may consider applying restrictions or adjustments (such as quantitative limits, asset eligibility criteria or “prudential filters”) where the risks inherent in certain asset classes are not adequately covered by the regulatory capital requirements.

17.1.5 Capital resources may be regarded very broadly as the amount of the assets in excess of the amount of the liabilities. Liabilities in this context includes technical provisions and other liabilities (to the extent these other liabilities are not treated as capital resources - for example, liabilities such as subordinated debt may under certain circumstances be given credit for regulatory purposes as capital – see Guidance 17.10.8 - 17.10.11). Assets and liabilities in this context may include contingent assets and contingent liabilities.

17.1.6 In considering the quality of capital resources the supervisor should have regard to their characteristics, including the extent to which the capital is available to absorb losses (including considerations of subordination and priority), the extent of the permanent and/or perpetual nature of the capital and the existence of any mandatory servicing costs in relation to the capital.8

Additional guidance for insurance groups and insurance legal entities that are members of groups

17.1.7 The capital adequacy assessment of an insurance legal entity which is a member of an insurance group needs to consider the value of any holdings the insurance legal entity has in affiliates. Consideration may be given, either at the level of the insurance legal entity or the insurance group, to the risks attached to this value.

17.1.8 Where the value of holdings in affiliates is included in the capital adequacy assessment and the insurance legal entity is the parent of the group, group-wide capital adequacy assessment and legal entity assessment of the parent may be similar in outcome although the detail of the approach may be different. For example, a group-wide assessment may consolidate the business of the parent and its subsidiaries and assess the capital adequacy for the combined business while a legal entity assessment of the parent may consider its own business and its investments in its subsidiaries.

17.1.9 There are various possible approaches for group-wide supervision. More specifically, undertaking a capital adequacy assessment of an insurance group falls into two broad sets of approaches:

- group level focus; and
- legal entity focus.

“Hybrid” or intermediate approaches which combine elements of approaches with a group and a legal entity focus may also be used.

17.1.10 The choice of approach would depend on the preconditions in a jurisdiction, the legal environment which may specify the level at which the group-wide capital requirements are set, the structure of the group

---

8 More detailed guidance on the determination of capital resources is given below.
and the structure of the supervisory arrangements between the supervisors.

17.1.11 To further describe and compare the various approaches to group-wide capital adequacy assessment, a two dimensional continuum may be considered; on one axis – the organisational perspective – consideration is given to the extent to which a group is considered as a set of interdependent entities or a single integrated entity; on the other axis – the supervisory perspective – consideration is given to the relative weight of the roles of insurance legal entity supervision and group-wide supervision, without implying that the latter can replace the former in any way. It is recognised that supervisors around the world have adopted approaches corresponding to many points of this continuum. The continuum may be split into four quadrants as shown in Figure 17.1 below.

Figure 17.1

Additional guidance for insurance groups and insurance legal entities that are members of groups - group level focus

17.1.12 Under a group-wide capital adequacy assessment which takes a group level focus, the insurance group is considered primarily as a single integrated entity for which a separate assessment is made for the group as a whole on a consistent basis, including adjustments to reflect constraints on the fungibility of capital and transferability of assets among group members. Hence under this approach, a total balance sheet approach to solvency assessment is followed which is (implicitly
or explicitly) based on the balance sheet of the insurance group as a whole. However, adjustments may be necessary appropriately to take into account risks from non-insurance members of the insurance group, including cross-sector regulated entities and non-regulated entities.

17.1.13 Methods used for approaches with a group level focus may vary in the way in which group capital requirements are calculated. Either the group’s consolidated accounts may be used as a basis or an aggregation method may be used. The former is already adjusted for intra-group holdings and further adjustments may then need to be made to reflect the fact that the group may not behave or be allowed to behave as one single entity. This is particularly the case in stressed conditions. The latter method may sum surpluses or deficits (i.e., the difference between capital resources and capital requirements) for each insurance legal entity in the group with relevant adjustments for intra-group holdings in order to measure an overall surplus or deficit at group level. Alternatively, it may sum the insurance legal entity capital requirements and insurance legal entity capital resources separately in order to measure a group capital requirement and group capital resources. Where an aggregation approach is used for a cross-border insurance group, consideration should be given to consistency of valuation and capital adequacy requirements and of their treatment of intra-group transactions.

Additional guidance for insurance groups and insurance legal entities that are members of groups - legal entity focus

17.1.14 Under a group-wide capital adequacy assessment which takes a legal entity focus, the insurance group is considered primarily as a set of interdependent legal entities. The focus is on the capital adequacy of each of the parent and the other insurance legal entities in the insurance group, taking into account risks arising from relationships within the group, including those involving non-insurance members of the group. The regulatory capital requirements and resources of the insurance legal entities in the group form a set of connected results but no overall regulatory group capital requirement is used for regulatory purposes. This is still consistent with a total balance sheet approach, but considers the balance sheets of the individual group entities simultaneously rather than amalgamating them to a single balance sheet for the group as a whole. Methods used for approaches with a legal entity focus may vary in the extent to which there is a common basis for the solvency assessment for all group members and the associated communication and coordination needed among supervisors.

17.1.15 For insurance legal entities that are members of groups and for insurance sub-groups that are part of a wider insurance or other sector group, the additional reasonably foreseeable and relevant material risks arising from being a part of the group should be taken into account in capital adequacy assessment.

Establishing regulatory capital requirements

---

9 Consolidated accounts may be those used for accounting purposes or may differ (e.g., in terms of the entities included in the consolidation).
17.2 The supervisor establishes regulatory capital requirements at a sufficient level so that, in adversity, an insurer’s obligations to policyholders will continue to be met as they fall due and requires that insurers maintain capital resources to meet the regulatory capital requirements.

Purpose and role of regulatory capital requirements and resources

17.2.1 An insurer’s Board and Senior Management have the responsibility to ensure that the insurer has adequate and appropriate capital to support the risks it undertakes. Capital serves to reduce the likelihood of failure due to significantly adverse losses incurred by the insurer over a defined period, including decreases in the value of the assets and/or increases in the obligations of the insurer, and to reduce the magnitude of losses to policyholders in the event that the insurer fails.

17.2.2 From a regulatory perspective, the purpose of capital is to ensure that, in adversity, an insurer’s obligations to policyholders will continue to be met as they fall due. Regulators should establish regulatory capital requirements at the level necessary to support this objective.

17.2.3 In the context of its own risk and solvency assessment (ORSA), the insurer would generally be expected to consider its financial position from a going concern perspective (that is, assuming that it will carry on its business as a going concern and continue to take on new business) but may also need to consider a run-off and/or winding-up perspective (eg where the insurer is in financial difficulty). The determination of regulatory capital requirements may also have aspects of both a going concern and a run-off or winding-up perspective. In establishing regulatory capital requirements, therefore, supervisors should consider the financial position of insurers under different scenarios of operation.

17.2.4 From a macro-economic perspective, requiring insurers to maintain adequate and appropriate capital enhances the safety and soundness of the insurance sector and the financial system as a whole, while not increasing the cost of insurance to a level that is beyond its economic value to policyholders or unduly inhibiting an insurer’s ability to compete in the marketplace. There is a balance to be struck between the level of risk that policyholder obligations will not be paid with the cost to policyholders of increased premiums to cover the costs of servicing additional capital.

17.2.5 The level of capital resources that insurers need to maintain for regulatory purposes is determined by the regulatory capital requirements specified by the supervisor. A deficit of capital resources relative to capital requirements determines the additional amount of capital that is required for regulatory purposes.

17.2.6 Capital resources protect the interests of policyholders by meeting the following two objectives. They:

- reduce the probability of insolvency by absorbing losses on a going concern basis or in run-off; and/or

---

10 In this context, “run-off” refers to insurers that are still solvent but have closed to new business and are expected to remain closed to new business.
• reduce the loss to policyholders in the event of insolvency or winding-up.

17.2.7 The extent to which elements of capital achieve the above outcomes will vary depending on their characteristics or “quality”. For example, ordinary share capital may be viewed as achieving both of the above, whereas subordinated debt may be viewed largely as only protecting policyholders in insolvency. Capital which achieves both of the above is sometimes termed “going concern capital” and capital which only reduces the loss to policyholders in insolvency is sometimes termed “wind-up capital” or “gone concern” capital. It would be expected that the former (ie going concern capital instruments) should form the substantial part of capital resources.

17.2.8 For an insurer, the management and allocation of capital resources is a fundamental part of its business planning and strategies. In this context, capital resources typically serve a broader range of objectives than those in Guidance 17.2.6. For example, an insurer may use capital resources over and above the regulatory capital requirements to support future growth or to achieve a targeted credit rating.

17.2.9 It is noted that an insurer’s capital management (in relation to regulatory requirements and own capital needs) should be supported and underpinned by establishing and maintaining a sound enterprise risk management framework, including appropriate risk and capital management policies, practices and procedures which are applied consistently across its organisation and are embedded in its processes. Maintaining sufficient capital resources alone is not sufficient protection for policyholders in the absence of disciplined and effective risk management policies and processes (see ICP 16 Enterprise Risk Management for Solvency Purposes).

Additional guidance for insurance groups and insurance legal entities that are members of groups

17.2.10 The supervisor should require insurance groups to maintain capital resources to meet regulatory capital requirements. These requirements should take into account the non-insurance activities of the insurance group. For supervisors that undertake group-wide capital adequacy assessments with a group level focus this means maintaining insurance group capital resources to meet insurance group capital requirements for the group as a whole. For supervisors that undertake group-wide capital adequacy assessments with a legal entity focus this means maintaining capital resources in each insurance legal entity based on a set of connected regulatory capital requirements for the group’s insurance legal entities which fully take the relationships and interactions between these legal entities and other entities in the insurance group into account.

17.2.11 It is not the purpose of group-wide capital adequacy assessment to replace assessment of the capital adequacy of the individual insurance legal entities in an insurance group. Its purpose is to require that group risks are appropriately allowed for and the capital adequacy of individual insurers is not overstated, eg as a result of multiple gearing and leverage of the quality of capital or as a result of risks emanating from the wider
group, and that the overall impact of intra-group transactions is appropriately assessed.

17.2.12 Group-wide capital adequacy assessment considers whether the amount and quality of capital resources relative to required capital is adequate and appropriate in the context of the balance of risks and opportunities that group membership brings to the group as a whole and to insurance legal entities which are members of the group. The assessment should satisfy requirements relating to the structure of group-wide regulatory capital requirements and eligible capital resources and should supplement the individual capital adequacy assessments of insurance legal entities in the group. It should indicate whether there are sufficient capital resources available in the group so that, in adversity, obligations to policyholders will continue to be met as they fall due. If the assessment concludes that capital resources are inadequate or inappropriate then corrective action may be triggered either at a group (eg authorised holding or parent company level) or an insurance legal entity level.

17.2.13 The quantitative assessment of group-wide capital adequacy is one of a number of tools available to supervisors for group-wide supervision. If the overall financial position of a group weakens it may create stress for its members either directly through financial contagion and/or organisational effects or indirectly through reputational effects. Group-wide capital adequacy assessment should be used together with other supervisory tools, including in particular the capital adequacy assessment of insurance legal entities in the group. A distinction should be drawn between regulated entities (insurance and other sector) and non-regulated entities. It is necessary to understand the financial positions of both types of entities and their implications for the capital adequacy of the insurance group but this does not necessarily imply setting regulatory capital requirements for non-regulated entities. In addition, supervisors should have regard to the complexity of intra-group relationships (between both regulated and non-regulated entities), contingent assets and liabilities and the overall quality of risk management in assessing whether the overall level of safety required by the supervisor is being achieved.

17.2.14 For insurance legal entities that are members of groups and for insurance sub-groups that are part of a wider insurance or other sector group, capital requirements and capital resources should take into account all additional reasonably foreseeable and relevant material risks arising from being a part of any of the groups.

Structure of regulatory capital requirements - solvency control levels

17.3 The regulatory capital requirements include solvency control levels which trigger different degrees of intervention by the supervisor with an appropriate degree of urgency and requires coherence between the solvency control levels established and the associated corrective action that may be at the disposal of the insurer and/or the supervisor.

Establishing solvency control levels

17.3.1 The supervisor should establish control levels that trigger intervention by the supervisor in an insurer’s affairs when capital resources fall below
these control levels. The control level may be supported by a specific framework or by a more general framework providing the supervisor latitude of action. A supervisor’s goal in establishing control levels is to safeguard policyholders from loss due to an insurer’s inability to meet its obligations when due.

17.3.2 The solvency control levels provide triggers for action by the insurer and supervisor. Hence they should be set at a level that allows intervention at a sufficiently early stage in an insurer’s difficulties so that there would be a realistic prospect for the situation to be rectified in a timely manner with an appropriate degree of urgency. At the same time, the reasonableness of the control levels should be examined in relation to the nature of the corrective measures. The risk tolerance of the supervisor will influence both the level at which the solvency control levels are set and the intervention actions that are triggered.

17.3.3 When establishing solvency control levels it is recognised that views about the level that is acceptable may differ from jurisdiction to jurisdiction and by types of business written and will reflect, amongst other things, the extent to which the pre-conditions for effective supervision exist within the jurisdiction and the risk tolerance of the particular supervisor. The IAIS recognises that jurisdictions will acknowledge that a certain level of insolvencies may be unavoidable and that establishing an acceptable threshold may facilitate a competitive marketplace for insurers and avoid inappropriate barriers to market entry.

17.3.4 The criteria used by the supervisor to establish solvency control levels should be transparent. This is particularly important where legal action may be taken in response to an insurer violating a control level. In this case, control levels should generally be simple and readily explainable to a court when seeking enforcement of supervisory action.

17.3.5 Supervisors may need to consider different solvency control levels for different modes of operation of the insurer - such as an insurer in run-off or an insurer operating as a going concern. These different scenarios and considerations are discussed in more detail in Guidance 17.6.3 - 17.6.5.

17.3.6 In addition, the supervisor should consider the allowance for management discretion and future action in response to changing circumstances or particular events. In allowing for management discretion, supervisors should only recognise actions which are practical and realistic in the circumstances being considered.

17.3.7 Other considerations in establishing solvency control levels include:

- the way in which the quality of capital resources is addressed by the supervisor;
- the coverage of risks in the determination of technical provisions and regulatory capital requirements and the extent

---

11 The supervisor should carefully consider the appropriateness of allowing for such management discretion in the particular case of the MCR as defined in Standard 17.4.
of the sensitivity or stress analysis underpinning those requirements;

- the relation between different levels (for example the extent to which a minimum is set at a conservative level);

- the powers of the supervisor to set and adjust solvency control levels within the regulatory framework;

- the accounting and actuarial framework that applies in the jurisdiction (in terms of the valuation basis and assumptions that may be used and their impact on the values of assets and liabilities that underpin the determination of regulatory capital requirements);

- the comprehensiveness and transparency of disclosure frameworks in the jurisdiction and the ability for markets to exercise sufficient scrutiny and impose market discipline;

- policyholder priority and status under the legal framework relative to other creditors in the jurisdiction;

- overall level of capitalisation in the insurance sector in the jurisdiction;

- overall quality of risk management and governance frameworks in the insurance sector in the jurisdiction;

- the development of capital markets in the jurisdiction and its impact on the ability of insurers to raise capital; and

- the balance to be struck between protecting policyholders and the impact on the effective operation of the insurance sector and considerations around unduly onerous levels and costs of regulatory capital requirements.

Additional guidance for insurance groups and insurance legal entities that are members of groups

17.3.8 While the general considerations in Guidance 17.3.1 to 17.3.7 above on the establishment of solvency control levels apply in a group-wide context as well as a legal entity context, the supervisory actions triggered at group level will be likely to differ from those at legal entity level. As a group is not a legal entity the scope for direct supervisory action in relation to the group as a whole is more limited and action may need to be taken through co-ordinated action at insurance legal entity level.

17.3.9 Nevertheless, group solvency control levels are a useful tool for identifying a weakening of the financial position of a group as a whole or of particular parts of a group, which may, for example, increase contagion risk or impact reputation which may not otherwise be readily identified or assessed by supervisors of individual group entities. The resulting timely identification and mitigation of a weakening of the financial position of a group may thus address a threat to the stability of the group or its component insurance legal entities.

17.3.10 Group-wide solvency control levels may trigger a process of coordination and cooperation between different supervisors of group entities which
will facilitate mitigation and resolution of the impact of group-wide stresses on insurance legal entities within a group. Group-wide control levels may also provide a trigger for supervisory dialogue with the group’s management.

**Structure of regulatory capital requirements - triggers for supervisory intervention in the context of legal entity capital adequacy assessment**

17.4 In the context of insurance legal entity capital adequacy assessment, the regulatory capital requirements establish:

- a solvency control level above which the supervisor does not intervene on capital adequacy grounds. This is referred to as the Prescribed Capital Requirement (PCR). The PCR is defined such that assets will exceed technical provisions and other liabilities with a specified level of safety over a defined time horizon.

- a solvency control level at which, if breached, the supervisor would invoke its strongest actions, in the absence of appropriate corrective action by the insurance legal entity. This is referred to as the Minimum Capital Requirement (MCR). The MCR is subject to a minimum bound below which no insurer is regarded to be viable to operate effectively.

17.4.1 A range of different intervention actions should be taken by a supervisor depending on the event or concern that triggers the intervention. Some of these triggers will be linked to the level of an insurer’s capital resources relative to the level at which regulatory capital requirements are set.

17.4.2 In broad terms, the highest regulatory capital requirement, the Prescribed Capital Requirement (PCR), will be set at the level at which the supervisor would not require action to increase the capital resources held or reduce the risks undertaken by the insurer. However if the insurer’s capital resources were to fall below the level at which the PCR is set, the supervisor would require some action by the insurer to either restore capital resources to at least the PCR level or reduce the level of risk undertaken (and hence the required capital level).

17.4.3 The regulatory objective to require that, in adversity, an insurer’s obligations to policyholders will continue to be met as they fall due will be achieved without intervention if technical provisions and other liabilities are expected to remain covered by assets over a defined period, to a specified level of safety. As such, the PCR should be determined at a level such that the insurer is able to absorb the losses from adverse events that may occur over that defined period and the technical provisions remain covered at the end of the period.

---

12 Note that this does not preclude the supervisor from intervention or requiring action by the insurer for other reasons, such as weaknesses in the risk management or governance of the insurer. Nor does it preclude the supervisor from intervention when the insurer’s capital resources are currently above the PCR but are expected to fall below that level in the short term. To illustrate, the supervisor may establish a trend test (a time series analysis). A sufficiently adverse trend would require some supervisory action. The trend test would support the objective of early regulatory intervention by considering the speed at which capital deterioration is developing.

13 To the extent these liabilities are not treated as capital resources.
17.4.4 The Minimum Capital Requirement (MCR) represents the supervisory intervention point at which the supervisor would invoke its strongest actions, if further capital is not made available. Therefore, the main aim of the MCR is to provide the ultimate safety net for the protection of the interests of policyholders.

17.4.5 These actions could include stopping the activities of the insurer, withdrawal of the insurer’s licence, requiring the insurer to close to new business and run-off the portfolio, transfer its portfolio to another insurer, arrange additional reinsurance, or other specified actions. This position is different from the accounting concept of insolvency as the MCR would be set at a level in excess of that at which the assets of the insurer were still expected to be sufficient to meet the insurer’s obligations to existing policyholders as they fall due. The PCR cannot be less than the MCR, and therefore the MCR may also provide the basis of a lower bound for the PCR, which may be especially appropriate in cases where the PCR is determined on the basis of an insurer's internal model approved for use in determining regulatory capital requirements by the supervisor.

17.4.6 In establishing a minimum bound on the MCR below which no insurer is regarded to be viable to operate effectively, the supervisor may, for example, apply a market-wide nominal floor to the regulatory capital requirements, based on the need for an insurer to operate with a certain minimal critical mass and consideration of what may be required to meet minimum standards of governance and risk management. Such a nominal floor might vary between lines of business or type of insurer and is particularly relevant in the context of a new insurer or line of business.

17.4.7 Regulatory capital requirements may include additional solvency control levels between the level at which the supervisor takes no intervention action from a capital perspective and the strongest intervention point (that is, between the PCR and MCR levels). These control levels may be set at levels that correspond to a range of different intervention actions that may be taken by the supervisor itself or actions which the supervisor would require of the insurer according to the severity or level of concern regarding adequacy of the capital held by the insurer. These additional control levels may be formally established by the supervisor with explicit intervention actions linked to particular control levels. Alternatively, these additional control levels may be structured less formally, with a range of possible intervention actions available to the supervisor depending on the particular circumstances. In either case the possible triggers and

14 Note that this does not preclude such actions being taken by the supervisor for other reasons, and even if the MCR is met or exceeded.

15 The term “internal model” refers to “a risk measurement system developed by an insurer to analyse its overall risk position, to quantify risks and to determine the economic capital required to meet those risks”. Internal models may also include partial models which capture a subset of the risks borne by the insurer using an internally developed measurement system which is used in determining the insurer's economic capital. The IAIS is aware that insurers use a variety of terms to describe their risk and capital assessment processes, such as “economic capital model”, “risk-based capital model”, or “business model”. The IAIS considers that such terms could be used interchangeably to describe the processes adopted by insurers in the management of risk and capital within their business on an economic basis. For the purposes of consistency, the term “internal model” is used throughout.

16 In this context, a market-wide nominal floor may, for example, be an absolute monetary minimum amount of capital required to be held by an insurer in a jurisdiction.
range of intervention actions should be appropriately disclosed by the supervisor.

17.4.8 Possible intervention actions include:

- measures that are intended to enable the supervisor to better assess and/or control the situation, either formally or informally, such as increased supervision activity or reporting, or requiring auditors or actuaries to undertake an independent review or extend the scope of their examinations;
- measures to address capital levels such as requesting capital and business plans for restoration of capital resources to required levels, limitations on redemption or repurchase of equity or other instruments and/or dividend payments;
- measures intended to protect policyholders pending strengthening of the insurer’s capital position, such as restrictions on licences, premium volumes, investments, types of business, acquisitions, reinsurance arrangements;
- measures that strengthen or replace the insurer’s management and/or risk management framework and overall governance processes;
- measures that reduce or mitigate risks (and hence required capital) such as requesting reinsurance, hedging and other mechanisms; and/or
- refusing, or imposing conditions on, applications submitted for regulatory approval such as acquisitions or growth in business.

17.4.9 In establishing the respective control levels, consideration should be had for these possibilities and the scope for an insurer with capital at this level to be able to increase its capital resources or to be able to access appropriate risk mitigation tools from the market.

Figure 17.2 below illustrates the concept of solvency control levels in the context of establishing regulatory capital requirements:
17.5 In the context of group-wide capital adequacy assessment, the regulatory capital requirements establish solvency control levels that are appropriate in the context of the approach to group-wide capital adequacy that is applied.

17.5.1 The supervisor should establish solvency control levels that are appropriate in the context of the approach that is adopted for group-wide capital adequacy assessment. The supervisor should also define the relationship between these solvency control levels and those at legal entity level for insurers that are members of the group. The design of solvency control levels depends on a number of factors. These include the supervisory perspective, i.e. the relative weight placed on group-wide supervision and legal entity supervision, and the organisational perspective, i.e. the extent to which a group is considered as a set of interdependent entities or a single integrated entity. The solvency control levels are likely to vary according to the particular group and the supervisors involved. (see Figure 17.1). The establishment of group-wide solvency control levels should be such as to enhance the overall supervision of the insurers in the group.

17.5.2 Having group-wide solvency control levels does not necessarily mean establishing a single regulatory capital requirement at group level. For example, under a legal entity approach consideration of the set of capital...
requirements for individual entities (and interrelationships between them) may enable appropriate decisions to be taken about supervisory intervention on a group-wide basis. However, this requires the approach to be sufficiently well developed for group risks to be taken into account on a complete and consistent basis in the capital adequacy assessment of insurance legal entities in a group. To achieve consistency for insurance legal entity assessments, it may be necessary to adjust the capital requirements used for insurance legal entities so they are suitable for group-wide assessment.

17.5.3 One approach may be to establish a single group-wide PCR or a consistent set of PCRs for insurance legal entities that are members of the group which, if met, would mean that no supervisory intervention at group level for capital reasons would be deemed necessary or appropriate. Such an approach may assist, for example, in achieving consistency of approach towards similar organisations with a branch structure and different group structures eg following a change in structure of a group. Where a single group-wide PCR is determined, it may differ from the sum of insurance legal entity PCRs because of group factors including group diversification effects, group risk concentrations and intra-group transactions. Similarly, where group-wide capital adequacy assessment involves the determination of a set of PCRs for the insurance legal entities in an insurance group, these may differ from the insurance legal entity PCRs if group factors are reflected differently in the group capital assessment process. Differences in the level of safety established by different jurisdictions in which the group operates should be considered when establishing group-wide PCR(s).

17.5.4 The establishment of a single group-wide MCR might also be considered and may, for example, trigger supervisory intervention to restructure the control and/or capital of the group. A possible advantage of this approach is that it may encourage a group solution where an individual insurer is in financial difficulty and capital is sufficiently fungible and assets are transferable around the group. Alternatively, the protection provided by the supervisory power to intervene at individual entity level on breach of an insurance legal entity MCR may be regarded as sufficient.

17.5.5 The solvency control levels adopted in the context of group-wide capital adequacy assessment should be designed so that together with the solvency control levels at insurance legal entity level they represent a consistent ladder of supervisory intervention. For example, a group-wide PCR should trigger supervisory intervention before a group-wide MCR because the latter may invoke the supervisor's strongest actions. Also, if a single group-wide PCR is used it may be appropriate for it to have a floor equal to the sum of the legal entity MCRs of the individual entities in the insurance group. Otherwise, no supervisory intervention into the operation of the group would be required even though at least one of its member insurers had breached its MCR.

17.5.6 Supervisory intervention triggered by group-wide solvency control levels should take the form of coordinated action by relevant group supervisors. This may, for example, involve increasing capital at holding company level or strategically reducing the risk profile or increasing capital in insurance legal entities within the group. Such supervisory action may
be exercised via the insurance legal entities within a group and, where insurance holding companies are authorised, via those holding companies. Supervisory action in response to breaches of group-wide solvency control levels should not alter the existing division of statutory responsibilities of the supervisors responsible for authorising and supervising each individual insurance legal entity.

Structure of regulatory capital requirements - approaches to determining regulatory capital requirements

17.6 The regulatory capital requirements are established in an open and transparent process, and the objectives of the regulatory capital requirements and the bases on which they are determined are explicit. In determining regulatory capital requirements, the supervisor allows a set of standardised and, if appropriate, other approved more tailored approaches such as the use of (partial or full) internal models.

17.6.1 Transparency as to the regulatory capital requirements that apply is required to facilitate effective solvency assessment and supports its enhancement, comparability and convergence internationally.

17.6.2 The supervisor may develop separate approaches for the determination of different regulatory capital requirements, in particular for the determination of the MCR and the PCR. For example, the PCR and MCR may be determined by two separate methods, or the same methods and approaches may be used but with two different levels of safety specified. In the latter case, for example, the MCR may be defined as a simple proportion of the PCR, or the MCR may be determined on different specified target criteria to those specified for the PCR.

17.6.3 The PCR would generally be determined on a going concern basis, ie in the context of the insurer continuing its operations. On a going concern basis, an insurer would be expected to continue to take on new risks during the established time horizon. Therefore, in establishing the regulatory capital level to provide an acceptable level of solvency, the potential growth in an insurer’s portfolio should be considered.

17.6.4 Capital should also be capable of protecting policyholders if the insurer were to close to new business. Generally, the determination of capital on a going concern basis would not be expected to be less than would be required if it is assumed that the insurer were to close to new business. However, this may not be true in all cases, since some assets may lose some or all of their value in the event of a winding-up or run-off, for example, because of a forced sale. Similarly, some liabilities may actually have an increased value if the business does not continue (eg claims handling expenses).

17.6.5 Usually the MCR would be constructed taking into consideration the possibility of closure to new business. It is, however, relevant to also consider the going concern scenario in the context of establishing the level of the MCR, as an insurer may continue to take on new risks up until the point at which MCR intervention is ultimately triggered. The supervisor should consider the appropriate relationship between the PCR and MCR, establishing a sufficient buffer between these two levels (including consideration of the basis on which the MCR is generated) within an appropriate continuum of solvency control levels, having regard
for the different situations of business operation and other relevant considerations.

17.6.6 It should be emphasised that meeting the regulatory capital requirements should not be taken to imply that further financial injections will not be necessary under any circumstances in future.

17.6.7 Regulatory capital requirements may be determined using a range of approaches, such as standard formulae, or other approaches, more tailored to the individual insurer (such as partial or full internal models), which are subject to approval by the relevant supervisors. Regardless of the approach used, the principles and concepts that underpin the objectives for regulatory capital requirements described in this ICP apply and should be applied consistently by the supervisor to the various approaches. The approach adopted for determining regulatory capital requirements should take account of the nature and materiality of the risks insurers face generally and, to the extent practicable, should also reflect the nature, scale and complexity of the risks of the particular insurer.

17.6.8 Standardised approaches, in particular, should be designed to deliver capital requirements which reasonably reflect the overall risk to which insurers are exposed, while not being unduly complex. Standardised approaches may differ in level of complexity depending on the risks covered and the extent to which they are mitigated or may differ in application based on classes of business (e.g., life and non-life). Standardised approaches should be appropriate to the nature, scale and complexity of the risks that insurers face and should include approaches that are feasible in practice for insurers of all types including small and medium sized insurers and captives taking into account the technical capacity that insurers need to manage their businesses effectively.

17.6.9 By its very nature a standardised approach may not be able to fully and appropriately reflect the risk profile of each individual insurer. Therefore, where appropriate, a supervisor should allow the use of more tailored approaches subject to approval. In particular, where an insurer has an internal model (or partial internal model) that appropriately reflects its risks and is integrated into its risk management and reporting, the supervisor should allow the use of such a model to determine more tailored regulatory capital requirements, where appropriate. The use of the internal model for this purpose would be subject to prior approval by the supervisor based on a transparent set of criteria and would need to be evaluated at regular intervals. In particular, the supervisor would need to be satisfied that the insurer’s internal model is, and remains, appropriately calibrated relative to the target criteria established by the supervisor (see Guidance 17.12.1 to 17.12.18).

17.6.10 The supervisor should also be clear on whether an internal model may be used for the determination of the MCR. In this regard, the supervisor

---

17 A more tailored approach which is not an internal model might include, for example, approved variations in factors contained in a standard formula or prescribed scenario tests which are appropriate for a particular insurer or group of insurers.

18 It is noted that the capacity for a supervisor to allow the use of internal models will need to take account of the sufficiency of resources available to the supervisor.
should take into account the main objective of the MCR (ie to provide the ultimate safety net for the protection of policyholders) and the ability of the MCR to be defined in a sufficiently objective and appropriate manner to be enforceable (refer to Guidance 17.3.4).

17.7 The supervisor addresses all relevant and material categories of risk in insurers and is explicit as to where risks are addressed, whether solely in technical provisions, solely in regulatory capital requirements or if addressed in both, as to the extent to which the risks are addressed in each. The supervisor is also explicit as to how risks and their aggregation are reflected in regulatory capital requirements.

Types of risks to be addressed

17.7.1 The supervisor should address all relevant and material categories of risk - including at least underwriting risk, credit risk, market risk, operational risk and liquidity risk. This should include any significant risk concentrations, for example, to economic risk factors, market sectors or individual counterparties, taking into account both direct and indirect exposures and the potential for exposures in related areas to become more correlated under stressed circumstances.

Dependencies and interrelations between risks

17.7.2 The assessment of the overall risk that an insurer is exposed to should address the dependencies and interrelationships between risk categories (for example, between underwriting risk and market risk) as well as within a risk category (for example, between equity risk and interest rate risk). This should include an assessment of potential reinforcing effects between different risk types as well as potential “second order effects”, ie indirect effects to an insurer’s exposure caused by an adverse event or a change in economic or financial market conditions. It should also consider that dependencies between different risks may vary as general market conditions change and may significantly increase during periods of stress or when extreme events occur. “Wrong way risk”, which is defined as the risk that occurs when exposure to counterparties, such as financial guarantors, is adversely correlated to the credit quality of those counterparties, should also be considered as a potential source of significant loss eg in connection with derivative transactions. Where the determination of an overall capital requirement takes into account diversification effects between different risk types, the insurer should be able to explain the allowance for these effects and ensure that it considers how dependencies may increase under stressed circumstances.

Allowance for risk mitigation

17.7.3 Any allowance for reinsurance in determining regulatory capital requirements should consider the possibility of breakdown in the effectiveness of the risk transfer and the security of the reinsurance counterparty and any measures used to reduce the reinsurance

---

19 For example, a change in the market level of interest rates could trigger an increase of lapse rates on insurance policies.
counterparty exposure. Similar considerations would also apply for other risk mitigants, for example derivatives.

**Transparency of recognition of risks in regulatory requirements**

17.7.4 The supervisor should be explicit as to where risks are addressed, whether solely in technical provisions, solely in regulatory capital requirements or if addressed in both, as to the extent to which the risks are addressed in each. The solvency requirements should also clearly articulate how risks are reflected in regulatory capital requirements, specifying and publishing the level of safety to be applied in determining regulatory capital requirements, including the established target criteria (refer to Standard 17.8).

**Treatment of risks which are difficult to quantify**

17.7.5 The IAIS recognises that some risks, such as strategic risk, reputational risk, liquidity risk and operational risk, are less readily quantifiable than the other main categories of risks. Operational risk, for example, is diverse in its composition and depends on the quality of systems and controls in place. The measurement of operational risk, in particular, may suffer from a lack of sufficiently uniform and robust data and well developed valuation methods. Jurisdictions may choose to base regulatory capital requirements for these less readily quantifiable risks on some simple proxies for risk exposure and/or stress and scenario testing. For particular risks (such as liquidity risk), holding additional capital may not be the most appropriate risk mitigant and it may be more appropriate for the supervisor to require the insurer to control these risks via exposure limits and/or qualitative requirements such as additional systems and controls.

17.7.6 However, the IAIS envisages that the ability to quantify some risks (such as operational risk) will improve over time as more data become available or improved valuation methods and modelling approaches are developed. Further, although it may be difficult to quantify risks, it is important that an insurer nevertheless addresses all material risks in its own risk and solvency assessment.

17.8 The supervisor sets appropriate target criteria for the calculation of regulatory capital requirements, which underlie the calibration of a standardised approach. Where the supervisor allows the use of approved more tailored approaches such as internal models for the purpose of determining regulatory capital requirements, the target criteria underlying the calibration of the standardised approach are also used by those approaches for that purpose to require broad consistency among all insurers within the jurisdiction.

17.8.1 The level at which regulatory capital requirements are set will reflect the risk tolerance of the supervisor. Reflecting the IAIS’s principles-based approach, this ICP does not prescribe any specific methods for determining regulatory capital requirements. However, the IAIS’s view is that it is important that individual jurisdictions set appropriate target criteria (such as risk measures, confidence levels or time horizons) for their regulatory capital requirements. Further, each jurisdiction should outline clear principles for the key concepts for determining regulatory capital requirements, considering the factors that a supervisor should
take into account in determining the relevant parameters as outlined in this ICP.

17.8.2 Where a supervisor allows the use of other more tailored approaches to determine regulatory capital requirements, the target criteria established should be applied consistently to those approaches. In particular, where a supervisor allows the use of internal models for the determination of regulatory capital requirements, the supervisor should apply the target criteria in approving the use of an internal model by an insurer for that purpose. This should achieve broad consistency among all insurers and a similar level of protection for all policyholders, within the jurisdiction.

17.8.3 With regards to the choice of the risk measure and confidence level to which regulatory capital requirements are calibrated, the IAIS notes that some supervisors have set a confidence level for regulatory purposes which is comparable with a minimum investment grade level. Some examples have included a 99.5% VaR calibrated confidence level over a one year timeframe,20 99% TVaR over one year and 95% TVaR over the term of the policy obligations.

17.8.4 In regards to the choice of an appropriate time horizon, the determination and calibration of the regulatory capital requirements needs to be based on a more precise analysis, distinguishing between:

- the period over which a shock is applied to a risk – the “shock period”; and
- the period over which the shock that is applied to a risk will impact the insurer – the “effect horizon”.

17.8.5 For example, a one-off shift in the interest rate term structure during a shock period of one year has consequences for the discounting of the cash flows over the full term of the policy obligations (the effect horizon). A judicial opinion (eg on an appropriate level of compensation) in one year (the shock period) may have permanent consequences for the value of claims and hence will change the projected cash flows to be considered over the full term of the policy obligations (the effect horizon).

17.8.6 The impact on cash flows of each stress that is assumed to occur during the shock period will need to be calculated over the period for which the shock will affect the relevant cash flows (the effect horizon). In many cases this will be the full term of the insurance obligations. In some cases, realistic allowance for offsetting reductions in discretionary benefits to policyholders or other offsetting management actions may be considered, where they could and would be made and would be effective in reducing policy obligations or in reducing risks in the circumstances of the stress. In essence, at the end of the shock period, capital has to be sufficient so that assets cover the technical provisions (and other liabilities) re-determined at the end of the shock period. The re-determination of the technical provisions would allow for the impact of

---

20 This is the level expected in Australia for those insurers that seek approval to use an internal model to determine their MCR. It is also the level used for the calculation of the risk-based Solvency Capital Requirement under the European Solvency II regime.
the shock on the technical provisions over the full time horizon of the policy obligations.

17.8.7 Figure 17.3 summarises key aspects relevant to the determination of regulatory capital requirements:

Figure 17.3: Illustration of determination of regulatory capital requirements

Valuation date

Financial position

Risk impact

17.8.8 For the determination of the technical provisions, an insurer is expected to consider the uncertainty attached to the policy obligations, that is, the likely (or expected) variation of future experience from what is assumed in determining the current estimate, over the full period of the policy obligations. As indicated above, regulatory capital requirements should be calibrated such that assets exceed the technical provisions (and other liabilities) over a defined shock period with an appropriately high degree of safety. That is, the regulatory capital requirements should be set such that the insurer’s capital resources can withstand a range of predefined shocks or stress scenarios that are assumed to occur during that shock period (and which lead to significant unexpected losses over and above the expected losses that are captured in the technical provisions).

Calibration and measurement error

17.8.9 The risk of measurement error inherent in any approach used to determine capital requirements should be considered. This is especially important where there is a lack of sufficient statistical data or market information to assess the tail of the underlying risk distribution. To mitigate model error, quantitative risk calculations should be blended with qualitative assessments, and, where practicable, multiple risk measurement tools should be used. To help assess the economic appropriateness of risk-based capital requirements, information should be sought on the nature, degree and sources of the uncertainty.
surrounding the determination of capital requirements in relation to the established target criteria.

17.8.10 The degree of measurement error inherent, in particular, in a standardized approach depends on the degree of sophistication and granularity of the methodology used. A more sophisticated standardized approach has the potential to be aligned more closely to the true distribution of risks across insurers. However, increasing the sophistication of the standardized approach is likely to imply higher compliance costs for insurers and more intensive use of supervisory resources (for example, in validating the calculations). The calibration of the standardized approach therefore needs to balance the trade-off between risk-sensitivity and implementation costs.

Procyclicality

17.8.11 When applying risk-based regulatory capital requirements, there is a risk that an economic downturn will trigger supervisory interventions that exacerbate the economic crises, thus leading to an adverse "procyclical" effect. For example, a severe downturn in share markets may result in a depletion of the capital resources of a major proportion of insurers. This in turn may force insurers to sell shares and to invest in less risky assets in order to decrease their regulatory capital requirements. A simultaneous massive selling of shares by insurers could, however, put further pressure on the share markets, thus leading to a further drop in share prices and to a worsening of the economic crises.

17.8.12 However, the system of solvency control levels required enables supervisors to introduce a more principles-based choice of supervisory interventions in cases where there may be a violation of the PCR control level and this can assist in avoiding exacerbation of procyclicality effects: supervisory intervention is able to be targeted and more flexible in the context of an overall economic downturn so as to avoid measures that may have adverse macroeconomic effects.

17.8.13 It could be contemplated whether further explicit procyclicality-dampening measures would be needed. This may include allowing a longer period for corrective measures or allowance for the calibration of the regulatory capital requirements to reflect procyclicality dampening measures. Overall, when such dampening measures are applied, an appropriate balance needs to be achieved to preserve the risk sensitivity of the regulatory capital requirements.

17.8.14 In considering the impacts of procyclicality, the influence of external factors (for example, the influence of credit rating agencies) should be given due regard. The impacts of procyclicality also heighten the need for supervisory cooperation and communication.

Additional guidance for insurance groups and insurance legal entities that are members of groups

17.8.15 Approaches to determining group-wide regulatory capital requirements will depend on the overall approach taken to group-wide capital adequacy assessment. Where a group level approach is used, either the group’s consolidated accounts may be taken as a basis for calculating group-wide capital requirements or the requirements of each insurance
legal entity may be aggregated or a mixture of these methods may be used. For example, if a different treatment is required for a particular entity (for example, an entity located in a different jurisdiction) it might be disaggregated from the consolidated accounts and then included in an appropriate way using a deduction and aggregation approach.

17.8.16 Where consolidated accounts are used, the requirements of the jurisdiction in which the ultimate parent of the group is located would normally be applied, consideration should also be given to the scope of the consolidated accounts used for accounting purposes as compared to the consolidated balance sheet used as a basis for group-wide capital adequacy assessment to require, for example, identification and appropriate treatment of non-insurance group entities.

17.8.17 Where the aggregation method is used (as described in Guidance 17.1.13), or where a legal entity focus is adopted (as described in Guidance 17.1.14), consideration should be given as to whether local capital requirements can be used for insurance legal entities within the group which are located in other jurisdictions or whether capital requirements should be recalculated according to the requirements of the jurisdiction in which the ultimate parent of the group is located.

Group-specific risks

17.8.18 There are a number of group-specific factors which should be taken into account in determining group-wide capital requirements including diversification of risk across group entities, intra-group transactions, risks arising from non-insurance group entities, treatment of group entities located in other jurisdictions and treatment of partially-owned entities and minority interests. Particular concerns may arise from a continuous sequence of internal financing within the group, or closed loops in the financing scheme of the group.

17.8.19 Group specific risks posed by each group entity to insurance members of the group and to the group as a whole are a key factor in an overall assessment of group-wide capital adequacy. Such risks are typically difficult to measure and mitigate and include notably contagion risk (financial, reputational, legal), concentration risk, complexity risk and operational/organisational risks. As groups can differ significantly it may not be possible to address these risks adequately using a standardised approach for capital requirements. It may therefore be necessary to address group specific risks through the use of more tailored approaches to capital requirements including the use of (partial or full) internal models. Alternatively, supervisors may vary the standardised regulatory capital requirement so that group-specific risks are adequately provided for in the insurance legal entity and/or group capital adequacy assessment.21

17.8.20 Group specific risks should be addressed from both an insurance legal entity perspective and group-wide perspective ensuring that adequate allowance is made. Consideration should be given to the potential for duplication or gaps between insurance legal entity and group-wide approaches.

---

21 See Standard 17.9.
Diversification of risks between group entities

17.8.21 In the context of a group-wide solvency assessment, there should also be consideration of dependencies and interrelations of risks across different members in the group. However, it does not follow that where diversification effects exist these should be recognised automatically in an assessment of group-wide capital adequacy. It may, for example, be appropriate to limit the extent to which group diversification effects are taken into account for the following reasons:

- Diversification may be difficult to measure at any time and in particular in times of stress. Appropriate aggregation of risks is critical to the proper evaluation of such benefits for solvency purposes.
- There may be constraints on the transfer of diversification benefits across group entities and jurisdictions because of a lack of fungibility of capital or transferability of assets.
- Diversification may be offset by concentration/aggregation effects (if this is not separately addressed in the assessment of group capital).

17.8.22 An assessment of group diversification benefits is necessary under whichever approach used to assess group-wide capital adequacy. Under a legal entity approach, recognition of diversification benefits will require consideration of the diversification between the business of an insurance legal entity and other entities within the group in which it participates and of intra-group transactions. Under an approach with a consolidation focus which uses the consolidated accounts method, some diversification benefits will be recognised automatically at the level of the consolidated group. In this case, supervisors will need to consider whether it is prudent to recognise such benefits or whether an adjustment should be made in respect of potential restrictions on the transferability or sustainability under stress of surplus resources created by group diversification benefits.

Intra-group transactions

17.8.23 Intra-group transactions may result in complex and/or opaque intra-group relationships which give rise to increased risks at both insurance legal entity and group level. In a group-wide context, credit for risk mitigation should only be recognised in group capital requirements to the extent that risk is transferred outside the group. For example, the transfer of risk to a captive reinsurer or to an intra-group insurance special purpose entity should not result in a reduction of overall group capital requirements.

Non-insurance group entities

17.8.24 In addition to insurance legal entities, an insurance group may include a range of different types of non-insurance legal entity, either subject to no financial regulation (non-regulated entities) or regulated under other financial sector regulation. The impact of all such entities should be taken into account in the overall assessment of group-wide solvency but the extent to which they can be captured in a group-wide capital adequacy measure as such will vary according to the type of non-insurance legal
entity, the degree of control/influence on that entity and the approach taken to group-wide supervision.

17.8.25 Risks from non-regulated entities are typically difficult to measure and mitigate. Supervisors may not have direct access to information on such entities but it is important that supervisors are able to assess the risks they pose in order to apply appropriate mitigation measures. Measures taken to address risks from non-regulated entities do not imply active supervision of such entities.

17.8.26 There are different approaches to addressing risks stemming from non-regulated entities such as capital measures, non-capital measures or a combination thereof.

17.8.27 One approach may be to increase capital requirements in order that the group holds sufficient capital. If the activities of the non-regulated entities have similar risk characteristics to insurance activities (eg certain credit enhancement mechanisms as compared to traditional bond insurance) it may be possible to calculate an equivalent capital charge. Another approach might be to deduct the value of holdings in non-regulated entities from the capital resources of the insurance legal entities in the group, but this on its own may not be sufficient to cover the risks involved.

17.8.28 Non-capital measures may include, for example, limits on exposures and requirements on risk management and governance applied to insurance legal entities with respect to non-regulated entities within the group.

**Cross-jurisdictional entities**

17.8.29 Group-wide capital adequacy assessments should, to the extent possible, be based on consistent application of ICPs across jurisdictions. In addition, consideration should be given to the capital adequacy and transferability of assets in entities located in different jurisdictions.

**Partial ownership and minority interests**

17.8.30 An assessment of group-wide capital adequacy should include an appropriate treatment of partially-owned or controlled group entities and minority interests. Such treatment should take into account the nature of the relationships of the partially-owned entities within the group and the risks and opportunities they bring to the group. The accounting treatment may provide a starting point. Consideration should be given to the availability of any minority interest’s share in the net equity in excess of regulatory capital requirements of a partially-owned entity.

**Variation of regulatory capital requirements**

17.9 Any variations to the regulatory capital requirement imposed by the supervisor are made within a transparent framework, are appropriate to the nature, scale and complexity according to the target criteria and are only expected to be required in limited circumstances.

17.9.1 As has already been noted, a standardised approach, by its very nature, may not be able to fully and appropriately reflect the risk profile of each individual insurer. In cases where the standardised approach established for determining regulatory capital requirements is materially inappropriate for the risk profile of the insurer, the supervisor should have the flexibility to increase the regulatory capital requirement calculated by
the standard approach. For example, some insurers using the standard formula may warrant a higher PCR and/or group-wide regulatory capital requirement if they are undertaking higher risks, such as new products where credible experience is not available to establish technical provisions, or if they are undertaking significant risks that are not specifically covered by the regulatory capital requirements.

17.9.2 Similarly, in some circumstances when an approved more tailored approach is used for regulatory capital purposes, it may be appropriate for the supervisor to have some flexibility to increase the capital requirement calculated using that approach. In particular, where an internal model or partial internal model is used for regulatory capital purposes, the supervisor may increase the capital requirement where it considers the internal model does not adequately capture certain risks, until the identified weaknesses have been addressed. This may arise, for example, even though the model has been approved where there has been a change in the business of the insurer and there has been insufficient time to fully reflect this change in the model and for a new model to be approved by the supervisor.

17.9.3 In addition, supervisory requirements may be designed to allow the supervisor to decrease the regulatory capital requirement for an individual insurer where the standardised requirement materially overestimates the capital required according to the target criteria. However, such an approach may require a more intensive use of supervisory resources due to requests from insurers for consideration of a decrease in their regulatory capital requirement. Therefore, the IAIS appreciates that not all jurisdictions may wish to include such an option for their supervisor. Further, this reinforces the need for such variations in regulatory capital requirements to only be expected to be made in limited circumstances.

17.9.4 Any variations made by the supervisor to the regulatory capital requirement calculated by the insurer should be made in a transparent framework and be appropriate to the nature, scale and complexity in terms of the target criteria. The supervisor may, for example, develop criteria to be applied in determining such variations and appropriate discussions between the supervisor and the insurer may occur. Variations in regulatory capital requirements following supervisory review from those calculated using standardised approaches or approved more tailored approaches should be expected to be made only in limited circumstances.

17.9.5 In undertaking its ORSA, the insurer considers the extent to which the regulatory capital requirements (in particular, any standardised formula) adequately reflect its particular risk profile. In this regard, the ORSA undertaken by an insurer can be a useful source of information to the supervisor in reviewing the adequacy of the regulatory capital requirements of the insurer and in assessing the need for variation in those requirements.

Identification of capital resources potentially available for solvency purposes

17.10 The supervisor defines the approach to determining the capital resources eligible to meet regulatory capital requirements and their value, consistent
with a total balance sheet approach for solvency assessment and having regard to the quality and suitability of capital elements.

17.10.1 The following outlines a number of approaches a supervisor could use for the determination of capital resources in line with this requirement. The determination of capital resources would generally require the following steps:

- the amount of capital resources potentially available for solvency purposes is identified (see Guidance 17.10.3 - 17.10.21);
- an assessment of the quality and suitability of the capital instruments comprising the total amount of capital resources identified is then carried out (see Guidance 17.11.1 - 17.11.29); and
- on the basis of this assessment, the final capital resources eligible to meet regulatory capital requirements and their value are determined (see Guidance 17.11.30 - 17.11.44).

17.10.2 In addition, the insurer is required to carry out its own assessment of its capital resources to meet regulatory capital requirements and any additional capital needs (see Standard 16.14).

**Capital resources under total balance sheet approach**

17.10.3 The IAIS supports the use of a total balance sheet approach in the assessment of solvency to recognise the interdependence between assets, liabilities, regulatory capital requirements and capital resources so that risks are appropriately recognised.

17.10.4 Such an approach requires that the determination of available and required capital is based on consistent assumptions for the recognition and valuation of assets and liabilities for solvency purposes.

17.10.5 From a regulatory perspective, the purpose of regulatory capital requirements is to require that, in adversity, an insurer’s obligations to policyholders will continue to be met as they fall due. This aim will be achieved if technical provisions and other liabilities are expected to remain covered by assets over a defined period, to a specified level of safety.\(^{22}\)

17.10.6 To achieve consistency with this economic approach to setting capital requirements in the context of a total balance sheet approach, capital resources should broadly be regarded as the difference between assets and liabilities on the basis of their recognition and valuation for solvency purposes.

\(^{22}\) Refer to Guidance 17.3.1 - 17.9.5.
17.10.7 When regarding available capital resources as the difference between assets and liabilities, the following issues should be considered:

- the extent to which certain liabilities other than technical provisions may be treated as capital for solvency purposes (Guidance 17.10.8 - 17.10.10);
- whether contingent assets could be included (Guidance 17.10.11);
- the treatment of assets which may not be fully realisable in the normal course of business or under a wind-up scenario (Guidance 17.10.12 - 17.10.19); and
- reconciliation of such a “top down” approach to determining capital resources with a “bottom up” approach which sums up individual items of capital to derive the overall amount of capital resources (Guidance 17.10.20).

### Treatment of liabilities

17.10.8 Liabilities include technical provisions and other liabilities. Certain items such as other liabilities in the balance sheet may be treated as capital resources for solvency purposes.

17.10.9 For example, perpetual subordinated debt, although usually classified as a liability under the relevant accounting standards, could be classified as
a capital resource for solvency purposes.\textsuperscript{23} This is because of its availability to act as a buffer to reduce the loss to policyholders and senior creditors through subordination in the event of insolvency. More generally, subordinated debt instruments (whether perpetual or not) may be treated as capital resources for solvency purposes if they satisfy the criteria established by the supervisor. Other liabilities that are not subordinated would not be considered as part of the capital resources; examples include liabilities such as deferred tax liabilities and pension liabilities.

17.10.10 It may, therefore, be appropriate to exclude some elements of funding from liabilities and so include them in capital to the extent appropriate. This would be appropriate if these elements have characteristics which protect policyholders by meeting one or both of the objectives set out in Guidance 17.2.6 above.

Treatments of contingent assets

17.10.11 It may be appropriate to include contingent elements which are not considered as assets under the relevant accounting standards, where the likelihood of payment if needed is sufficiently high according to criteria specified by the supervisor. Such contingent capital may include, for example, letters of credit, members’ calls by a mutual insurer or the unpaid element of partly paid capital and may be subject to prior approval by the supervisor.

Treatments of assets which may not be fully realisable on a going concern or wind-up basis

17.10.12 Supervisors should consider that, for certain assets in the balance sheet, the realisable value under a wind-up scenario may become significantly lower than the economic value which is attributable under going concern conditions. Similarly, even under normal business conditions, some assets may not be realisable at full economic value, or at any value, at the time they are needed. This may render such assets unsuitable for inclusion at their full economic value for the purpose of meeting required capital.\textsuperscript{24}

17.10.13 Examples of such assets include:

- own shares directly held by the insurer: the insurer has bought and is holding its own shares thereby reducing the amount of capital available to absorb losses under going concern or in a wind-up scenario;
- intangible assets: their realisable value may be uncertain even during normal business conditions and may have no significant marketable value in run-off or winding-up; Goodwill is a common example;

\textsuperscript{23} However, adequate recognition should be given to contractual features of the debt such as embedded options which may change its loss absorbency.

\textsuperscript{24} In particular, supervisors should consider the value of contingent assets for solvency purposes taking into account the criteria set out in Guidance 17.11.21.
• future income tax credits: such credits may only be realisable if there are future taxable profits, which is improbable in the event of insolvency or winding-up;

• implicit accounting assets: under some accounting models, certain items regarding future income are included, implicitly or explicitly, as asset values. In the event of run-off or winding-up, such future income may be reduced;

• investments\textsuperscript{25} in other insurers or financial institutions: such investments may have uncertain realisable value because of contagion risk between entities; also there is the risk of “double gearing” where such investments lead to a recognition of the same amount of available capital resources in several financial entities; and

• company-related assets: certain assets carried in the accounting statements of the insurer could lose some of their value in the event of run-off or winding-up, for example physical assets used by the insurer in conducting its business which may reduce in value if there is a need for the forced sale of such assets. Also, certain assets may not be fully accessible to the insurer eg surplus in a corporate pension arrangement.

17.10.14 The treatment of such assets for capital adequacy purposes may need to reflect an adjustment to its economic value. Generally, such an adjustment may be effected either:

• directly, by not admitting a portion of the economic value of the asset for solvency purposes (deduction approach); or

• indirectly, through an addition to regulatory capital requirements (capital charge approach).

\textit{Deduction approach}

17.10.15 Under the deduction approach, the economic value of the asset is reduced for solvency purposes. This results in capital resources being reduced by the same amount. The partial (or full) exclusion of such an asset may occur for a variety of reasons, for example, to reflect an expectation that it would have only limited value in the event of insolvency or winding-up to absorb losses. No further adjustment would normally be needed in the determination of regulatory capital requirements for the risk of holding such assets.

\textit{Capital charge approach}

17.10.16 Under the capital charge approach, an economic value is placed on the asset for the purpose of determining available capital resources. The risk associated with the asset – ie a potential deterioration of the economic value of the asset due to an adverse event which may occur during the defined solvency time horizon - would then need to be reflected in the determination of regulatory capital requirements. This

\textsuperscript{25} These investments include investment in the equity of, loans granted to, deposits with and bonds issued by the related parties.
should take into account the estimation uncertainty\textsuperscript{26} inherent in the determination of the economic value.

**Choice and combination of approaches**

17.10.17 As outlined above, an application of the deduction approach would lead to a reduction in the amount of available capital resources, whereas an application of the capital charge approach would result in an increase in regulatory capital requirements. Provided the two approaches are based on a consistent economic assessment of the risk associated with the relevant assets, they would be expected to produce broadly similar results regarding the overall assessment of the solvency position of the insurer.

17.10.18 For some asset classes, it may be difficult to determine a sufficiently reliable economic value or to assess the associated risks. Such difficulties may also arise where there is a high concentration of exposure to a particular asset or type of assets or to a particular counterparty or group of counterparties.

17.10.19 A supervisor should choose the approach which is best suited to the organisation and sophistication of the insurance sector and the nature of the asset class and asset exposure considered. It may also combine different approaches for different classes of assets. Whatever approach is chosen, it should be transparent and consistently applied. It is also important that any material double counting or omission of risks under the calculations for determining the amounts of required and available regulatory capital is avoided.

**Reconciliation of approaches**

17.10.20 The approach to determining available capital resources as broadly the amount of assets over liabilities (with the potential adjustments as discussed above) may be described as a “top-down” approach - i.e., starting with the high level capital as reported in the balance sheet and adjusting it in the context of the relevant solvency control level. An alternative approach which is also applied in practice is to sum up the amounts of particular items of capital which are specified as being acceptable. Such a “bottom-up” approach should be reconcilable to the “top-down” approach on the basis that the allowable capital items under the “bottom-up approach” should ordinarily include all items which contribute to the excess of assets over liabilities in the balance sheet, with the addition or exclusion of items as per the discussion in Guidance 17.10.8 - 17.10.19.

**Other considerations**

17.10.21 A number of factors may be considered by the supervisor in identifying what may be regarded as capital resources for solvency purposes, including the following:

\textsuperscript{26} This refers to the degree of inaccuracy and imprecision in the determination of the economic value where observable values are not available, and estimation methodologies need to be applied. Sources for this estimation uncertainty are for example the possibility that the assumptions and parameters used in the valuation are incorrect, or that the valuation methodology itself is deficient.
• the way in which the quality of capital resources is addressed by the supervisor, including whether or not quantitative requirements are applied to the composition of capital resources and/or whether or not a categorisation or continuum-based approach is used;

• the coverage of risks in the determination of technical provisions and regulatory capital requirements;

• the assumptions in the valuation of assets and liabilities (including technical provisions) and the determination of regulatory capital requirements, eg going concern basis or wind-up basis, before tax or after tax, etc;

• policyholder priority and status under the legal framework relative to other creditors in the jurisdiction;

• overall quality of risk management and governance frameworks in the insurance sector in the jurisdiction;

• the comprehensiveness and transparency of disclosure frameworks in the jurisdiction and the ability for markets to exercise sufficient scrutiny and impose market discipline;

• the development of the capital market in the jurisdiction and its impact on the ability of insurers to raise capital;

• the balance to be struck between protecting policyholders and the impact on the effective operation of the insurance sector and considerations around unduly onerous levels and costs of regulatory capital requirements;

• the relationship between risks faced by insurers and those faced by other financial services entities, including banks.

Additional guidance for insurance groups and insurance legal entities that are members of groups

17.10.22 The considerations set out in Guidance 17.10.3 - 17.10.21 above apply equally to insurance legal entity and group-wide supervision. The practical application of these considerations will differ according to whether a legal entity focus or a group level focus is taken to group-wide supervision. Whichever approach is taken, key group-wide factors to be addressed in the determination of group-wide capital resources include multiple gearing, intra-group creation of capital and reciprocal financing, leverage of the quality of capital and fungibility of capital and free transferability of assets across group entities. There may be particular concerns where such factors involve less transparent transactions eg because they involve both regulated and non-regulated entities or where there is a continuous sequence of internal financing within the group, or closed loops in the financing of the group.

Criteria for the assessment of the quality and suitability of capital resources

17.11 The supervisor establishes criteria for assessing the quality and suitability of capital resources, having regard to their ability to absorb losses on both a going concern and wind-up basis.
17.11.1 In view of the two objectives of capital resources set out in Guidance 17.2.6, the following questions need to be considered when establishing criteria to determine the suitability of capital resources for regulatory purposes:

- To what extent can the capital element be used to absorb losses on a going concern basis or in run-off?
- To what extent can the capital element be used to reduce the loss to policyholders in the event of insolvency or winding-up?

17.11.2 Some capital elements are available to absorb losses in all circumstances ie on a going concern basis, in run-off, in winding-up and insolvency. For example, common shareholders' funds (ordinary shares and reserves) allow an insurer to absorb losses on an ongoing basis, are permanently available and rank as the most subordinate instruments in a winding-up. Further, this element of capital best allows insurers to conserve resources when they are under stress because it provides an insurer with full discretion as to the amount and timing of distributions. Consequently, common shareholders' funds are a core element of capital resources for the purpose of solvency assessment.

17.11.3 The extent of loss absorbency of other capital elements can vary considerably. Hence, a supervisor should take a holistic approach to evaluating the extent of loss absorbency overall and should establish criteria that should be applied to evaluate capital elements in this regard, taking into account empirical evidence that capital elements have absorbed losses in practice, where available.

17.11.4 To complement the structure of regulatory capital requirements, the supervisor may choose to vary the criteria for capital resources suitable for covering the different solvency control levels established by the supervisor. Where such an approach is chosen, the criteria relating to capital resources suitable for covering an individual control level should have regard to the supervisory intervention that may arise if the level is breached and the objective of policyholder protection.

17.11.5 For example, considering that the main aim of the MCR is to provide the ultimate safety net for the protection of the interests of policyholders, the supervisor may decide to establish more stringent quality criteria for capital resources suitable to cover the MCR (regarding such resources as a “last line of defence” for the insurer both during normal times and in wind-up) than for capital resources to cover the PCR.

17.11.6 Alternatively, a common set of regulatory criteria for capital resources could be applied at all solvency control levels, with regulatory capital requirements reflecting the different nature of the various solvency control levels.

17.11.7 In assessing the ability of elements of capital to absorb losses, the following characteristics are usually considered:

- the extent to which and in what circumstances the capital element is subordinated to the rights of policyholders in an insolvency or winding-up (subordination);
• The extent to which the capital element is fully paid and available to absorb losses (availability);

• the period for which the capital element is available (permanence); and

• the extent to which the capital element is free from mandatory payments or encumbrances (absence of encumbrances and mandatory servicing costs).

17.11.8 In the first bullet of Guidance 17.11.7 above, this characteristic is inherently linked to the ability of the capital item to absorb losses in the event of insolvency or winding-up. The characteristics of permanence and availability are relevant for loss absorbency under both going concern and winding-up; taken together, they could be described as being able to absorb losses when needed. The fourth characteristic is related to the degree to which the capital is conserved until needed, and in the case of absence of mandatory serving costs is primarily relevant for ensuring loss absorbency on a going concern basis.

17.11.9 The relationship between these characteristics is illustrated below:

Figure 17.5
17.11.10 In the following Guidance, we examine how the characteristics of capital resources described above may be used to establish criteria for an assessment of the quality of capital elements for regulatory purposes. It is recognised that views about the specific characteristics that are acceptable may differ from jurisdiction to jurisdiction and will reflect, amongst other things, the extent to which the pre-conditions for effective supervision exist within the jurisdiction and the risk tolerance of the particular supervisor.

Subordination

17.11.11 To require that a capital element is available to protect policyholders, it must be legally subordinated to the rights of policyholders and senior creditors of the insurer in an insolvency or winding-up. This means that the holder of a capital instrument is not entitled to repayment, dividends or interest once insolvency or winding-up proceedings have been started until all obligations to the insurer’s policyholders have been satisfied.

17.11.12 In addition, there should be no encumbrances that undermine the subordination or render it ineffective. One example of this would be applying rights of offset where creditors are able to set off amounts they owe the insurer against the subordinated capital instrument.\(^{27}\) Further, the instrument should not be guaranteed by either the insurer or another related entity unless it is clear that the guarantee is available subject to the policyholder priority. In some jurisdictions subordination to other creditors may also need to be taken into account.

17.11.13 Each jurisdiction is governed by its own laws regarding insolvency and winding-up. Common equity shareholders normally have the lowest priority in any liquidating distribution of assets, immediately following preferred shareholders. In some jurisdictions, insurers can issue subordinated debt that provides protection to policyholders and creditors in insolvency. While policyholders are often given a legal priority above other creditors such as bondholders, this is not always the case; some jurisdictions rank obligations to bondholders and other creditors equally. Some jurisdictions rank obligations to the government (e.g., taxes) and obligations to employees, ahead of policyholders and other creditors. Where creditors have secured claims, they may rank before policyholders. The determination of suitable capital elements for solvency purposes is critically dependent upon the legal environment of the relevant jurisdiction.

17.11.14 The supervisor should evaluate each potential capital element in the context that its value and suitability, and hence an insurer’s solvency position may change significantly in a wind-up or insolvency scenario. In most jurisdictions the payment priority in a wind-up situation is clearly stated in law.

Availability

17.11.15 In order to satisfy the primary requirement that capital resources are available to absorb unforeseen losses, it is important that capital elements are fully paid.

\(^{27}\) Rights of offset will vary according to the legal environment in a jurisdiction.
17.11.16 However, in some circumstances, a capital element may be paid for “in kind” ie issued for non-cash. The supervisor should define the extent to which payment other than cash is acceptable for a capital element to be treated as fully paid without prior approval by the supervisor and the circumstances where payment for non-cash consideration may be considered as suitable subject to approval by the supervisor. There may, for example, be issues about the valuation of the non-cash components or the interests of parties other than the insurer.

17.11.17 It may also be appropriate to treat certain contingent elements of capital as available capital resources in cases where the probability of payment is expected to be sufficiently high (for example, the unpaid part of partly paid capital, contributions from members of a mutual insurer or letters of credit, see Guidance 17.10.11).

17.11.18 Where a supervisor allows contingent elements of capital to be included in the determination of capital resources, such inclusion would be expected to be subject to meeting specific supervisory requirements or prior supervisory approval. When assessing the appropriateness of inclusion of a contingent element of capital, regard should be had to:

- the ability and willingness of the counterparty concerned to pay the relevant amount;
- the recoverability of the funds, taking into account any conditions which would prevent the item from being successfully paid in or called up; and
- any information on the outcome of past calls which have been made in comparable circumstances by other insurers, which may be used as an indication of future availability.

17.11.19 The availability of capital instruments may also be impaired when capital is not fully fungible within an insurer to cover losses arising from the insurer’s business. Whereas the fungibility of capital and transferability of assets is primarily an issue in the context of group solvency assessment, it may also be relevant for the supervision of an insurer as a legal entity.

17.11.20 For example, this is the case where – as applies to certain forms of with-profit business in life insurance – part of the assets or surplus of the insurer is segregated from the rest of its operations in a ring-fenced fund. In such cases, assets in the fund may only be able to be used to meet obligations to policyholders with respect to which the fund has been established. In these circumstances, the insurer’s available capital resources relating to the ring-fenced fund can only be used to cover losses stemming from risks associated with the fund (until transferred out of that fund) and cannot be transferred to meet the insurer’s other obligations.

**Permanence**

17.11.21 To provide suitable protection for policyholders for solvency purposes, a capital element must be available to protect against losses for a sufficiently long period to ensure that it is available to the insurer when needed. Supervisors may want to determine a minimum period that
capital should be outstanding to be regarded as capital resources for solvency purposes.

17.11.22 When assessing the extent of permanence of a capital element, regard should be had to:

- the duration of the insurer’s obligations to policyholders;\(^{28}\)
- contractual features of the capital instrument which have an effect on the period for which the capital is available, eg lock-in clauses, step-up options or call options;
- any supervisory powers to restrict the redemption of capital resources; and
- the time it might take to replace the capital element on suitable terms as it approaches maturity.

17.11.23 Similarly, if a capital element has no fixed maturity date, the notice required for repayment should be assessed against the same criteria.

17.11.24 It is important to take into account incentives to redeem a capital element prior to its maturity date which may exist in a capital element and may effectively reduce the period for which the capital is available. For example, a capital instrument which features a coupon rate which increases from its initial level at a specified date after issue, may give rise to an expectation that the instrument will be paid back at that future specified date.

**Absence from mandatory servicing requirements or encumbrances**

17.11.25 The extent to which capital elements require servicing in the form of interest payments, shareholder dividend payments and principal repayments should be considered, as it will affect the insurer’s ability to absorb losses on a going concern basis.

17.11.26 Capital elements that have a fixed maturity date may have fixed servicing costs that cannot be waived or deferred before maturity. The presence of such features also affects the insurer’s ability to absorb losses on a going concern basis and may accelerate insolvency if the payment of a servicing cost results in the insurer breaching its regulatory capital requirements.

17.11.27 A further consideration is the extent to which payments to capital providers or redemption of capital elements should be restricted or subject to supervisory approval. For example, the supervisor may have the ability to restrict the payment of dividends or interest and any redemption of capital resources where considered appropriate to preserve the solvency position of the insurer. Insurers may also issue capital instruments for which payments and redemptions are fully discretionary or subject to supervisory approval according to the contractual terms.

17.11.28 Some capital instruments are structured so as to restrict the payment of dividends or interest and any redemption of capital resources where

\(^{28}\) The duration of the insurer’s obligations to policyholders should be assessed on an economic basis rather than strict contractual basis.
an insurer is breaching or near to breaching its regulatory capital requirements and/or is incurring loss. The payment of dividends or interest may also be subordinated to policyholder interests in case of winding-up or insolvency. Such features will contribute to the ability of the capital instrument to absorb losses on a wind-up basis provided that any claims to unpaid dividends or interest are similarly subordinated.

17.11.29 It should also be considered whether the capital elements contain encumbrances which may restrict their ability to absorb losses, such as guarantees of payment to the capital provider or other third parties, hypothecation or any other restrictions or charges which may prevent the insurer from using the capital resource when needed. Where the capital element includes guarantees of payment to the capital provider or other third parties, the priority of that guarantee in relation to policyholders’ rights should be assessed. Encumbrances may also undermine other characteristics such as permanence or availability of capital.

Determination of capital resources to meet regulatory capital requirements

17.11.30 Based on the assessment of the quality of the capital elements comprising the total capital resources potentially available to the insurer, the final capital resources suitable to meet the regulatory capital requirements can be determined.

17.11.31 Capital elements that are fully loss absorbent under both a going concern and a wind-up perspective would generally be allowed to cover any of the different levels of regulatory capital requirements. However, the supervisor may choose to restrict the extent to which the stronger solvency control levels (ie control levels which trigger more severe supervisory interventions) may be covered by lower quality capital resources or to establish minimum levels for the extent to which these stronger requirements should be covered by the highest quality capital resources. In particular, this applies to amounts of capital resources which are intended to cover the MCR.

17.11.32 To determine the amount of an insurer’s capital resources, supervisors may choose a variety of approaches:

- approaches which categorise capital resources into different quality classes (“tiers”) and apply certain limits/restrictions with respect to these tiers (tiering approaches);
- approaches which rank capital elements on the basis of the identified quality characteristics (continuum-based approaches); or
- approaches which do not attempt to categorise or rank capital elements, but apply individual restrictions or charges where necessary.

To accommodate the quality of assets and quality of capital elements, combinations of the above approaches have been widely used in various jurisdictions for solvency purposes for insurance and other financial sectors.

Determination of capital resources to meet regulatory capital requirements - tiering approach
17.11.33 To take into account the quality of capital instruments, a tiering approach is commonly used in many jurisdictions and in other financial sectors. Under a tiering approach, the composition of capital resources is based on the categorisation of elements of capital according to the quality criteria set by the supervisor.

17.11.34 In many jurisdictions, capital elements are categorised into two or three distinct levels of quality when considering criteria for, and limits on, those capital elements for solvency purposes. For example, one broad categorisation may be as follows:29

- Highest quality capital - permanent capital that is fully available to cover losses of the insurer at all times on a going concern and a wind-up basis;
- Medium quality capital - capital that lacks some of the characteristics of highest quality capital, but which provides a degree of loss absorbency during ongoing operations and is subordinated to the rights (and reasonable expectations) of policyholders; and
- Lowest quality capital - capital that provides loss absorbency in insolvency/ winding-up only.

17.11.35 Under a tiering approach, the supervisor would set minimum or upper levels for the extent to which required capital should comprise the various categories or tiers (for example, high, medium, low) of capital elements. Where established, the level may be expressed as a percentage of required capital30 (for example, a minimum level of 50%31 of required capital for high quality capital elements and/or an upper limit for lowest quality capital might be 25% of required regulatory capital). There may also be limits set on the extent to which required capital may be comprised of certain specific types of capital elements (for example, perpetual subordinated loan capital and perpetual cumulative preference share capital may be limited to 50% of required capital.)

17.11.36 What constitutes an adequate minimum or upper level may depend on the nature of the insurance business and how the requirement interacts with the various solvency control levels. A separation into tiers as set out above assumes that all elements of capital can clearly be identified as belonging to one of the specified tiers and that elements falling into an individual tier will all be of the same quality. In reality, such distinctions between elements of capital may not be clear cut and different elements of capital will exhibit the above quality characteristics in varying degrees.

17.11.37 There are two potential policy responses to this fact. One is to set minimum quality thresholds on the characteristics the capital must have to be included in the relevant tier - as long as these thresholds are met for a given element then it can be included in the relevant tier of capital without limit. The other approach is to set minimum quality thresholds for

---

29 Capital elements categorised as being of highest quality are often referred to as core capital and lower levels as supplementary capital, or similar.
30 Alternative approaches may also be used in practice, for example, where the levels are expressed as a percentage of available capital.
31 The percentages used may vary for supervisors in different jurisdictions.
limited inclusion in the relevant tier, but to set additional higher quality thresholds for elements to be permitted to be included in that tier without limit. This approach effectively sub-divides the tiers. It permits greater recognition within a given tier for elements of capital which are more likely to fulfil the quality targets specified for that tier.

17.11.38 Where a tiering approach is applied, this should ideally follow the distinction between going concern capital and wind-up capital. Dividing capital into these tiers is an approach that is also used in the context of regulatory capital requirements for the banking sector.

**Determination of capital resources to meet regulatory capital requirements – continuum-based approach**

17.11.39 In other jurisdictions a continuum-based approach may be used in recognising the differential quality of capital elements. Under this approach, elements of capital are not categorised, but rather ranked, relative to other elements of capital on the basis of identified quality characteristics set by the supervisor. The supervisor also defines the minimum acceptable level of quality of capital for solvency purposes and perhaps for different solvency control levels. In this way the capital elements are classified from highest to lowest quality on a continuous basis; only capital elements sitting above this defined minimum level on the continuum, would be accepted as capital resources for solvency purposes. Due consideration should again be given to the quality of capital elements to ensure that there is an appropriate balance of going concern and wind-up capital.

**Determination of capital resources to meet regulatory capital requirements - other approaches on determination of capital resources**

17.11.40 The supervisor may also apply approaches that are not based on an explicit categorisation of capital instruments, but more on an assessment of the quality of individual capital instruments and their specific features. For example, the terms of a hybrid capital instrument may not provide enough certainty that coupon payments will be deferred in times of stress. In such a case, the supervisor’s approach may limit (possibly taking into account further quality criteria) the ability of that instrument to cover the regulatory capital requirements.

**Determination of capital resources to meet regulatory capital requirements - choice and combination of approaches**

17.11.41 Each approach has advantages and disadvantages. Jurisdictions should consider the organisation and sophistication of the insurance sector and choose the best approach appropriate to the circumstances. Whatever approach is used overall, it should be transparent and be consistently applied so that capital resources are of sufficient quality on a going concern and a wind-up basis.

17.11.42 It is recognised that in some markets, only a limited range of instruments (for example, pure equity) may meet the quality criteria set out above. Accordingly, supervisors in such markets may wish to restrict the range of instruments that may be included in capital resources for solvency purposes or to apply procedures for prior approval as appropriate.
17.11.43 It is also important that the approach to the determination of capital resources for solvency purposes is consistent with the framework and principles underlying the determination of regulatory capital requirements. This includes not only the implemented range of solvency control levels but is also relevant with regard to the target criteria underlying the regulatory capital requirements. In particular, the target criteria for regulatory capital requirements and hence the approach to determining capital resources should be consistent with the way in which the supervisor addresses the two broad aims of capital from a regulatory perspective as described in Guidance 17.2.6.

17.11.44 To illustrate this, suppose that in setting regulatory capital requirements the supervisor would consider the maximum probability over a specified time period with which they are willing to let unforeseen losses cause the insolvency of an insurer. In such a case, insurers would need to maintain sufficient capital resources to absorb losses before insolvency or winding-up occurs. Hence the determination of capital resources would need to lay sufficient emphasis on the first objective stated in Guidance 17.2.6 (loss absorbency under going concern), and could not entirely rely on the second objective (loss absorbency solely under insolvency or winding-up).

Additional guidance for insurance groups and insurance legal entities that are members of groups

17.11.45 The considerations set out in Guidance 17.11.1 - 17.11.44 above apply equally to insurance legal entity and group-wide supervision. See Guidance 17.10.22 for additional guidance on the criteria for the assessment of the quality and suitability of capital resources for insurance groups and insurance legal entities that are members of groups.

Multiple gearing and intra-group creation of capital

17.11.46 Double gearing may occur if an insurer invests in a capital instrument that counts as regulatory capital of its subsidiary, its parent or another group entity. Multiple gearing may occur if a series of such transactions exist.

17.11.47 Intra-group creation of capital may arise from reciprocal financing between members of a group. Reciprocal financing may occur if an insurance legal entity holds shares in or makes loans to another legal entity (either an insurance legal entity or otherwise) which, directly or indirectly, holds a capital instrument that counts as regulatory capital of the first insurance legal entity.

17.11.48 For group-wide capital adequacy assessment with a group level focus, a consolidated accounts method would normally eliminate intra-group transactions and consequently multiple gearing and other intra-group creation of capital whereas, without appropriate adjustment, a legal entity focus may not. Whatever approach is used, multiple gearing and other intra-group creation of capital should be identified and treated in a manner deemed appropriate by the supervisor to largely prevent the duplicative use of capital.

Leverage
17.11.49 Leverage arises where a parent, either a regulated company or an unregulated holding company, issues debt or other instruments which are ineligible as regulatory capital or the eligibility of which is restricted and down-streams the proceeds as regulatory capital to a subsidiary. Depending on the degree of leverage, this may give rise to the risk that undue stress is placed on a regulated entity as a result of the obligation on the parent to service its debt.

**Fungibility and transferability**

17.11.50 In the context of a group-wide solvency assessment, excess capital in an insurance legal entity above the level needed to cover its own capital requirements may not always be available to cover losses or capital requirements in other insurance legal entities in the group. Free transfer of assets and capital may be restricted by either operational or legal limitations. Some examples of such legal restrictions are exchange controls in some jurisdictions, surpluses in with-profits funds of life insurers which are earmarked for the benefit of policyholders and rights that holders of certain instruments may have over the assets of the legal entity. In normal conditions, surplus capital at the top of a group can be down-streamed to cover losses in group entities lower down the chain. However, in times of stress such parental support may not always be forthcoming or permitted.

17.11.51 The group-wide capital adequacy assessment should identify and appropriately address restrictions on the fungibility of capital and transferability of assets within the group in both “normal” and “stress” conditions. A legal entity approach which identifies the location of capital and takes into account legally enforceable intra-group risk and capital transfer instruments may facilitate the accurate identification of, and provision for, restricted availability of funds. Conversely an approach with a consolidation focus using a consolidated accounts method which starts by assuming that capital and assets are readily fungible/transferable around the group will need to be adjusted to provide for the restricted availability of funds.

**General provisions on the use of an internal model to determine regulatory capital requirements**

17.12 Where a supervisor allows the use of internal models to determine regulatory capital requirements, the supervisor:

- establishes appropriate modelling criteria to be used for the determination of regulatory capital requirements, which require broad consistency among all insurers within the jurisdiction; and

- identifies the different levels of regulatory capital requirements for which the use of internal models is allowed.

17.12.1 Internal models can be considered in the dual contexts of:
• a method by which an insurer determines its own economic capital\(^{32}\) needs; and
• a means to determine an insurer's regulatory capital resources and requirements, where appropriate.

In either case, the quality of the insurer's risk management and governance is vital to the effective use of internal models. If the insurer has supervisory approval, internal models can be used to determine the amount of the insurer's regulatory capital requirements. However, an insurer should not need supervisory approval, initial or ongoing, for the use of its internal model in determining its own economic capital needs or management.

17.12.2 One of the main purposes of an internal model is to better integrate the processes of risk and capital management within the insurer. Among other uses, internal models can be used to determine the economic capital needed by the insurer and, if an insurer has supervisory approval, to determine the amount of the insurer's regulatory capital requirements. As a basic principle, an internal model that is to be used for regulatory capital purposes should already be in established use for determining economic capital. The methodologies and assumptions used for the two purposes should be consistent, any differences being explainable in terms of the difference in purposes.

17.12.3 Where the supervisor allows a range of standardised and more tailored approaches for regulatory capital purposes, including internal models, an insurer should have a choice as to which approach it adopts,\(^{33}\) subject to satisfying certain conditions established by the supervisor on the use of internal models for regulatory capital purposes.

17.12.4 Where there is a choice of approach allowed by a supervisor, it is inappropriate for an insurer to be able to adopt a process of "cherry-picking" between those approaches\(^{34}\) – for example, by choosing to use its model for regulatory capital purposes only when the model results in a lower capital requirement than a standardised approach. The IAIS supports the use of internal models where appropriate as they can be a more realistic, risk-responsive method of calculating capital requirements, but discourages any "cherry-picking" practices by insurers.

17.12.5 In particular, where the risk profile of an insurer which is using a standardised approach for calculating its regulatory capital requirements is such that the assumptions underlying this approach are inappropriate, the supervisor may use its powers to increase the insurer's capital requirement, or to require the insurer to reduce the risks it bears. However, in such circumstances the supervisor should also consider encouraging the insurer to develop a full or partial internal model which

---

\(^{32}\) Economic capital refers to the capital which results from an economic assessment of the insurer's risks given the insurer's risk tolerance and business plans.

\(^{33}\) There are a number of considerations that the insurer would also have to make before deciding to invest in constructing an internal model, one of which is cost. The IAIS is not advocating that all insurers must have an internal model (although their use is encouraged where appropriate).

\(^{34}\) Refer to Guidance 17.12.14 in relation to "cherry-picking" in the particular context of partial internal models.
might enable its risk profile to be better reflected in its regulatory capital requirements.

17.12.6 Where the supervisor is aware that an insurer has an existing internal model but has not sought approval to use it to calculate the regulatory capital requirement, the supervisor should discuss this decision with the insurer.

17.12.7 Effective use of internal models by an insurer for regulatory capital purposes should lead to a better alignment of risk and capital management by providing incentives for insurers to adopt better risk management procedures which can:

- produce regulatory capital requirements that are more risk sensitive and better reflect the supervisor’s target criteria; and
- assist the integration of the internal model fully into the insurer's strategic, operational and governance processes, systems and controls.

Criteria for the use of an internal model to determine an insurer's regulatory capital requirements

17.12.8 Where a supervisor allows the use of internal models to determine regulatory capital requirements, the supervisor should determine modelling criteria, based upon the level of safety required by the supervisor, to be used by an insurer adopting an internal model for that purpose. These criteria should require broad consistency between all insurers within the jurisdiction being based on the same broad level of safety requirements applied to the overall design and calibration of the standardised approach to determining regulatory capital requirements. Discussions with the insurance industry in a jurisdiction may also assist in achieving consistency. The supervisor should set out for which of the different levels of regulatory capital requirements the use of internal models is allowed and determine the modelling criteria for each level.

17.12.9 In particular, when considering whether an internal model may be used in determining the MCR, the supervisor should take into account the main objective of the MCR (ie to provide the ultimate safety net for the protection of policyholders) and the ability of the MCR to be defined in a sufficiently objective and appropriate manner to be enforceable. If internal models are allowed for determining the MCR, particular care should be taken so that the strongest supervisory action that may be necessary if the MCR is breached can be enforced, for example if the internal model is challenged in a court of law.

17.12.10 The IAIS does not prescribe specific solvency requirements which are compulsory to all IAIS members. Notwithstanding this, the supervisor will need to establish the appropriate modelling criteria to be used by insurers to meet its regulatory capital requirements, and the insurer’s internal models will need to be calibrated accordingly if used for that purpose. The IAIS notes that some supervisors who allow the use of internal models to determine regulatory capital requirements have set a confidence level for regulatory purposes, which is comparable with a minimum investment grade level. Some examples of modelling criteria
include a 99.5% VaR\textsuperscript{35} calibrated confidence level over a one year timeframe,\textsuperscript{36} a 99% TVaR\textsuperscript{37} over one year\textsuperscript{38} and a 95% TVaR over the term of the policy obligations. Different criteria apply for PCR and MCR.

17.12.11 If an internal model is used for regulatory capital purposes, the insurer should ensure that its regulatory capital requirements determined by the model are calculated in a way that is consistent with the objectives, principles and criteria used by the supervisor. For example, the insurer may be able to apply the confidence level specified in the supervisors' modelling criteria directly to the probability distribution forecasts used in its internal model. Alternatively, depending on the insurer's own modelling criteria for its economic capital, an insurer may have to recalibrate its internal model to the modelling criteria required by the supervisor in order to use it for regulatory capital purposes. This will allow internal models to have a degree of comparability to enable supervisors to make a meaningful assessment of an insurer's capital adequacy, without sacrificing the flexibility needed to make it a useful internal capital model in the operation of the insurer's business. Further elaboration is provided in Guidance 17.15.1 - 17.15.2.

17.12.12 It is noted that, due to the insurer-specific nature of each internal model, internal models can be very different from each other. Supervisors, in allowing the use of an internal model for regulatory capital purposes, should preserve broad consistency of capital requirements between insurers with broadly similar risks.

Partial internal models

17.12.13 The IAIS supports the use of partial internal models for regulatory capital purposes, where appropriate. A partial internal model typically involves the use of internal modelling to substitute parts of a standardised approach for the determination of regulatory capital requirements. For example, an insurer could decide to categorise its insurance contracts along business lines for modelling purposes. If the regulatory capital requirements for some of these categories are determined by modelling techniques, while the capital requirements for other categories are determined using a standardised approach, then this would constitute the insurer using a partial internal model to calculate regulatory capital.

17.12.14 Partial internal models are often used to smooth an insurer's transition to full use of an internal model or to deal with instances such as the merger of two insurers, one of which uses an internal model, and the other which uses a standardised approach. Given the potential complexity of a full internal model, use of a partial internal model could be a satisfactory approach provided its scope is properly defined (and

\textsuperscript{35} VaR – Value at Risk – an estimate of the worst expected loss over a certain period of time at a given confidence level.

\textsuperscript{36} This is the level expected in Australia for those insurers that seek approval to use an internal model to determine their MCR. It is also the level used for the calculation of the risk-based Solvency Capital Requirement under the European Solvency II regime.

\textsuperscript{37} TVaR – Tail Value at Risk – the VaR plus the average exceedence over the VaR if such exceedence occurs.

\textsuperscript{38} These are the modelling criteria of the Swiss Solvency Test.
approved by the supervisor). Provided the reduced scope of the internal model is soundly justified, the use of a partial internal model could be allowed as a permanent solution. However, as discussed above, there could be a tendency for an insurer to adopt a “cherry-picking” approach in the use of internal models. This particularly applies where partial modelling is allowed. The supervisor should place the onus on the insurer to justify why it has chosen to only use internal models for certain risks or business lines. Where this justification is not sound enough, the supervisor should take appropriate action eg refuse or withdraw approval of the model or impose a capital add-on until the model has developed to a sufficient degree.

17.12.15 This ICP should be applied to both partial and full internal models. Partial models should therefore be subject, as appropriate, to the full range of tests: the “statistical quality test”, “calibration test” and “use test” (see Guidance 17.13.1 - 17.17.8). In particular, an insurer should assess how the partial internal model achieves consistency with the modelling criteria specified by the supervisor for regulatory purposes. As part of the approval process for regulatory capital use, an insurer should be required to justify the limited scope of the model and why it considers that using partial internal modelling for determining regulatory capital requirements is more consistent with the risk profile of the business than the standardised approach or why it sufficiently matches regulatory capital requirements. The insurer should clearly document the reasons behind its decision to use partial internal models. If, for example, this is to ease transition towards full internal models, the insurer should outline a transitional plan, considering the implications for risk and capital management of the transition. Such plans and use of partial internal models should be reviewed by the supervisor, who may decide to impose certain restrictions on the partial model’s use for calculating regulatory capital (for example, introducing a capital add-on during the transitional period).

Additional guidance for group-wide internal models

17.12.16 Where a supervisor allows the use of group-wide internal models to determine regulatory capital requirements, the supervisor should determine modelling criteria for such models, based upon the level of safety required by the supervisor applicable to an insurance group or an insurance legal entity adopting an internal model for that purpose.

17.12.17 The modelling criteria for internal models for regulatory capital purposes and the process for internal model approval that a supervisor establishes should require broad consistency between group-wide

---

39 A group-wide internal model is a risk measurement system a group uses for its internal purposes to analyse and quantify risks to the group as a whole as well as risks to the various parts of the group, to determine the capital resources needed to cover those risks and to allocate capital resources across the group. Group-wide internal models include partial models which capture a subset of the risks to the group and/or all the risks of a subset of the group. Group-wide internal models also include combinations of models in respect of different parts of the group. An insurer’s internal model may be part of a broader group-wide model rather than a standalone model.
regulatory capital requirements and regulatory capital requirements of individual insurance legal entities.

17.12.18 Group-wide internal models can vary greatly depending on their group-specific nature. In allowing the use of group-wide internal models for regulatory capital purposes, supervisors should preserve broad consistency between insurance groups and insurers with broadly similar risks e.g., insurance legal entities and insurance groups operating through a branch structure in a jurisdiction. The supervisor should design modelling criteria and the process for model approval so as to maintain broad consistency between the regulatory capital requirements determined using internal models and standardised approaches.

17.12.19 The IAIS recognises that modelling criteria may differ among supervisors. For insurance groups operating in multiple jurisdictions, the degree of consistency in regulatory capital requirements across group members may vary.

17.12.20 Each supervisor should set out for which group-wide regulatory capital requirements, corresponding to the solvency control level or levels which apply to an insurance group, the use of group-wide internal models is allowed.

17.12.21 In particular, when the supervisor considers allowing the use of internal models for the purpose of determining group-wide regulatory capital requirements at the MCR level, the issues relating to possible legal challenges may differ from those encountered in respect of individual insurance legal entities. For example, supervisors may need to work together to establish and co-ordinate grounds for legal action in respect of the different insurance legal entities within a group.

Initial validation and supervisory approval of internal models

17.13 Where a supervisor allows the use of internal models to determine regulatory capital requirements, the supervisor requires:

- prior supervisory approval for the insurer’s use of an internal model for the purpose of calculating regulatory capital requirements;
- the insurer to adopt risk modelling techniques and approaches appropriate to the nature, scale and complexity of its current risks and those incorporated within its risk strategy and business objectives in constructing its internal model for regulatory capital purposes;
- the insurer to validate an internal model to be used for regulatory capital purposes by subjecting it, at least, to three tests: “statistical quality test”, “calibration test” and “use test”; and
- the insurer to demonstrate that the model is appropriate for regulatory capital purposes and to demonstrate the results of each of the three tests.

Approval of the use of an internal model for determination of regulatory capital requirements
17.13.1 Where insurers may be permitted to use internal models for calculating regulatory capital requirements, the models used for that purpose should be subject to prior supervisory approval. The onus should be placed on the insurer to validate a model that is to be used for regulatory capital purposes and provide evidence that the model is appropriate for those purposes. The IAIS considers that an insurer should not need supervisory approval for the use of internal models in determining its own economic capital needs.

17.13.2 The supervisor may prescribe requirements which will allow it to assess different models fairly and facilitate comparison between insurers within its jurisdiction. However, overly prescriptive rules on internal model construction may be counter-productive in creating models which are risk-sensitive and useful for insurers. Therefore, although a certain level of comparability can be achieved by the calibration requirements, full and effective comparison across jurisdictions to align best practice may be best achieved by dialogue between supervisors and industry.

17.13.3 The supervisor should require that in granting approval for the use of an internal model to calculate regulatory capital requirements, it has sufficient confidence that the results being produced by the model provide adequate and appropriate measures of risk and capital. Although the supervisor may encourage insurers to develop internal models that better reflect their risks as soon as possible, this should not lead to models being approved until there is confidence that they are calibrated correctly. The supervisor may therefore feel it necessary to evaluate an internal model over a specified period of time, for example a few years, prior to approval. For supervisors, approval of an internal model could require considerable expertise (depending on the sophistication of the model) which may need to be developed. In addition, it may be necessary to introduce different supervisory powers to allow the approval of internal models.

17.13.4 The supervisor should use, at least, the “statistical quality test”, “calibration test” and “use test”, as the basis of its approval process. While a broad range of internal model approaches may be suitable for internal economic capital assessment purposes, and this should not be subject to supervisory approval, supervisors may want to place requirements on the internal model approaches that would be regarded as acceptable for regulatory capital purposes. In approving the use of an internal model for calculating regulatory capital requirements, the supervisor should consider the primary role of the model as part of the insurer's risk management procedures. Any requirements imposed by the supervisor on the approval of a model for use in determining regulatory capital requirements should not prevent the model from being sufficiently flexible to be a useful strategic decision making tool which reflects the insurer's unique risk profile. Consistent standards for the approval of an insurer's internal model should be applied by the supervisor, regardless of whether the model is developed in-house by the insurer or by an external party.

17.13.5 The “statistical quality test” and the “use test” are envisaged to be more insurer-specific measures which should allow the supervisor to gain an understanding of how a particular insurer has embedded its internal
model within its business. The “calibration test” would be used by the supervisor to assess the results from the internal model in comparison to the insurer’s regulatory capital requirements and to those of other insurers.

17.13.6 In addition, the insurer should review its own internal model and validate it so as to satisfy itself of the appropriateness of the model for use as part of its risk and capital management processes. As well as internal review, the insurer may wish to consider a regular independent, external review of its internal model by appropriate specialists.

Additional guidance for group-wide internal models

17.13.7 Each supervisor who permits the use of internal models for regulatory capital purposes at legal entity and/or group level should require prior supervisory approval for that purpose.

If an insurance group wishes to use its group-wide internal model for regulatory capital purposes in more than one jurisdiction in which it operates, the group may be subject to requirements that differ in a number of ways. Examples of some areas of possible variation may include:

- modelling criteria (risk measure, time horizon, level of safety);
- valuation bases for regulatory capital purposes;
- the risks that have to be modelled;
- treatment of intra-group transactions;
- approach to group-wide capital adequacy (eg group level or legal entity focus); and
- recognition of diversification across the group.

A group-wide internal model therefore needs to be sufficiently flexible to meet the differing requirements of each jurisdiction in which it is to be used for regulatory capital purposes.

17.13.8 The involved supervisors of an insurance group that conducts insurance business in more than one jurisdiction may consider their joint and common interests for the joint approval of the use of a group-wide internal model for regulatory capital purposes. If so, it may improve the efficiency and effectiveness of the approval process if the supervisors agree on common requirements for the process eg standardised language or languages for the application process.

17.13.9 Alternatively, the supervisors may independently approve the use of a group-wide internal model. Therefore, an insurance group seeking approval for a group-wide internal model may receive permission from one supervisor to use the model in that jurisdiction, while not receiving approval in another jurisdiction.

17.13.10 Similarly, where an insurance legal entity operates in other jurisdictions through a branch structure, the supervisors in those branch jurisdictions

---

40 Validation should be carried out by a different department or personnel to those that created the internal model to facilitate independence.
will have an interest in the solvency of the insurance legal entity. If local 
branch supervisors in these jurisdictions are not satisfied with the capital 
requirements of the home supervisor, possibly because they are 
determined using internal models, the local branch supervisors may 
impose limitations on the branch operations. The home supervisor, 
however, does not need to have the approval of the local branch 
supervisors in order to approve the use of the insurance legal entity's 
internal model for its own purposes.

17.13.11 The degree of involvement of different supervisors in the approval 
process depends on a number of factors as illustrated in Guidance 
17.13.12 - 17.13.16.

17.13.12 In the simplest case, an insurance group operates in one jurisdiction 
only. Clearly only the supervisor in that jurisdiction needs to be involved 
in the group-wide internal model approval process. Where there is more 
than one supervisor in a jurisdiction, eg where different insurance 
activities of a group are supervised separately, then both may need to 
be involved depending on the scope of the model. Nevertheless, some 
liason with supervisors in other jurisdictions may be mutually beneficial 
to facilitate convergence and comparability across jurisdictions in respect 
of internal model standards and practice.

17.13.13 In the case of an insurance group that operates in more than one 
jurisdiction but only applies to use its group-wide internal model for 
regulatory capital purposes in one jurisdiction, eg the parent's 
jurisdiction, the group does not need group-wide internal model approval 
of other jurisdictions provided that it is using other approaches to meet 
the capital requirements of those other jurisdictions. However, the 
supervisor considering approval of the group-wide internal model may 
wish to consult the other supervisors about the relevant insurance 
markets, the group’s operations in those markets and the standard of 
modelling.

17.13.14 In the case of an insurance group that wishes to use its group-wide 
internal model in more than one jurisdiction (eg to calculate insurance 
legal entity PCRs), the supervisor of each of those jurisdictions should 
consider approval of the specific application of the group-wide internal 
model in its jurisdiction, having regard to the considerations in Guidance 
17.13.15 - 17.13.18 below.

17.13.15 When considering approval of the use of a group-wide internal model 
for group-wide regulatory capital purposes, each supervisor should 
consider:

- its group-wide regulatory capital requirements;
- whether and the extent to which its jurisdiction allows the use 
of internal models for regulatory capital purposes (eg PCR or 
both PCR and MCR);
- how its jurisdiction interacts with the other jurisdictions 
potentially involved when supervisory intervention is being 
considered; and
- the arrangements for collaboration between the supervisors of 
the legal entities within the insurance group.
17.13.16 A supervisor may delegate the approval process to another supervisor or agree to be bound by its decision while retaining supervisory responsibility. Alternatively, a group-wide supervisor may have ultimate decision-making authority over some or all of the supervisors involved. If more than one jurisdiction is concerned, making such authority legally binding may require a treaty between these jurisdictions. To be effective, each arrangement requires a high level of collaboration between supervisors. To require the model appropriately addresses all categories of risk, the supervisor making the decision needs sufficient knowledge of the local circumstances in which the group operates.

17.13.17 Supervisors should require that the approval process for the use of a group-wide internal model for regulatory capital purposes is sufficiently flexible to achieve an approach appropriate to the nature, scale and complexity at each organisational level in an insurance group (group/sub-group/individual insurance legal entity). Risks which may have a large impact at insurance legal entity level may have much smaller significance at insurance group level. Conversely, risks that may have a small impact at insurance legal entity level may aggregate to have a larger impact on risk at the group level. The nature and complexity of risks may also vary at different levels in the insurance group.

17.13.18 Whether the group-wide internal model is appropriate for regulatory purposes given the nature, scale and complexity of the risks depends on the regulatory capital requirements of a jurisdiction. While the risk coverage by an internal model may look reasonable from a group-wide perspective, it may not be reasonable from the point of view of each member of the insurance group. For example, in a group of many non-life insurers and one small life insurer it may be appropriate from an overall perspective to place less emphasis on the modelling of the life insurance risks. However this may not be appropriate from the life insurer's or supervisor’s perspective. In such circumstances, it may be necessary for the group to upgrade its model to include an adequate life insurance risk component or to set up a self-contained internal model for the life insurer in order to gain approval.

**Statistical quality test for internal models**

17.14 Where a supervisor allows the use of internal models to determine regulatory capital requirements, the supervisor requires:

- the insurer to conduct a “statistical quality test” which assesses the base quantitative methodology of the internal model, to demonstrate the appropriateness of this methodology, including the choice of model inputs and parameters, and to justify the assumptions underlying the model; and

- that the determination of the regulatory capital requirement using an internal model addresses the overall risk position of the insurer and that the underlying data used in the model is accurate and complete.

17.14.1 Given the importance of an embedded internal model to an insurer's risk management policy and operations, an internal model would generally be constructed to deliver a probability distribution of the required risk capital rather than a "point estimate". A range of approaches could
constitute an effective internal model for risk and capital management purposes, and supervisors should encourage the use of a range of different approaches appropriate to the nature, scale and complexity of different insurers and different risk exposures. There are several different techniques to quantify risk which could be used by an insurer to construct its internal model. In broad terms, these could range from basic deterministic scenarios to complex stochastic models. Deterministic scenarios would typically involve the use of stress and scenario testing reflecting an event, or a change in conditions, with a set probability to model the effect of certain events (such as a drop in equity prices) on the insurer’s capital position, in which the underlying assumptions would be fixed. In contrast, stochastic modelling often involves simulating very large numbers of scenarios in order to reflect the likely distributions of the capital required by, and the different risk exposures of, the insurer.

17.14.2 The IAIS recognises that there are numerous methodologies which an insurer could use as part of its stress and scenario testing. For example, an insurer may decide to model the effect of various economic scenarios, such as a fall in equity prices or a change in interest rates, on its assets and liabilities. Alternatively, an insurer could consider a run-off approach, where the effect of various scenarios on a specific portfolio of business as it is run-off is examined. The insurer should use scenarios which it regards as most appropriate for its business. Where the internal model is used for regulatory capital purposes, the onus is on the insurer to demonstrate to the supervisor that the chosen methodology is appropriate to capture the relevant risks for its business. This includes testing of the model to require that it can replicate its results on request and that its response to variation in input data is adequate such as that corresponding to changes in base or stress scenarios. Overall capital requirements derived from an internal model can be highly sensitive to assumptions on the effect of diversification across risks. Supervisors and insurers should therefore give particular consideration to aggregation issues. Conducting stress and scenario testing to determine the effect of shocks may be a suitable tool to validate statistical assumptions.

17.14.3 Where an internal model is established to assess risks at a modular level, ie on a risk-by-risk basis, in order to conduct an overall risk assessment, the insurer should aggregate the results for each of these risks both within and across business lines. Several methods exist to aggregate the separate results allowing for diversification effects. The IAIS considers that an insurer would generally be expected to decide how best to aggregate and account for the risks to the whole of its business. The determination of overall regulatory capital requirements by the internal model should consider dependencies within, as well as across, risk categories. Where the internal model allows for diversification effects, the insurer should be able to justify its allowance for diversification effects and demonstrate that it has considered how dependencies may increase under stressed circumstances.

17.14.4 Internal models need high quality data in order to produce sufficiently reliable results. The data used for an internal model should be current and sufficiently credible, accurate, complete and appropriate. Hence, a “statistical quality test” should examine the appropriateness of the underlying data used in the construction of the internal model. A
“statistical quality test” would include the examination of the aggregation of data, the modelling assumptions and the statistical measures used to construct the internal model. This could include an annual (or more frequent) review of the various items that are being measured (claims, lapses, etc.) updated for the additional data available together with a scrutiny of data from previous periods to determine whether this data continues to be relevant. Older data may no longer be relevant possibly due to changes in risks covered, secular trends or policy conditions and guarantees attaching. Similarly, new data may not be of substantive use when modelling items that require a long-term view of experience (such as testing the predictions of cash flows for catastrophic events).

17.14.5 An insurer may not always have sufficient reliable data in-house. In instances where an insurer lacks fully credible data it may rely on industry or other sufficiently credible data sources to supplement its own data. For example, a new company may lack its own historical data and so could use market data sources in constructing its internal model. Some supervisors have published jurisdictional data which may be of some use.

17.14.6 Another possible source of data may be from reinsurers - whose data pool is typically larger and covers a wider spectrum of the market. It is, however, important to consider that such industry data may not be entirely appropriate for all insurers. Reinsurers often only receive data in aggregated form and sometimes are only informed of larger claims or from smaller insurers whose market may not be applicable for all or many insurers. Therefore, any data not specific to the insurer would need to be carefully considered before deciding it was appropriate for use as the basis for an insurer's “statistical quality test”. Even where deemed appropriate, it may still be necessary to adjust the data to allow for differences in features between the data source and the insurer.

17.14.7 In assessing suitability of data and of other inputs, eg assumptions, to the internal model, expert judgment should be applied and supported by proper justification, documentation and validation.

17.14.8 As part of the “statistical quality test”, the insurer should be able to demonstrate that the base quantitative methodology used to construct its internal model is sound and sufficiently reliable to support the model's use, both as a strategic and capital management tool, and to calculate the insurer's regulatory capital requirements, if appropriate. The methodology should also be consistent with the methods used to calculate technical provisions.

17.14.9 A “statistical quality test” should also include a review of the internal model to determine whether the assets and products as represented in the model truly reflect the insurer's actual assets and products. This should include an analysis of whether all reasonably foreseeable and relevant material risks have been incorporated, including any financial guarantees and embedded options. Insurers should also consider whether the algorithms used are able to take into account the action of management and the reasonable expectation of policyholders. Testing should include future projections within the model and to the extent practicable “back-testing” (the process of comparing the predictions from the model with actual experience).
Additional guidance for group-wide internal models

17.14.10 For use in determining the regulatory capital requirements of an insurance legal entity, a group-wide internal model should meet the same standards as applicable to a stand-alone internal model of that insurer.

17.14.11 For use for group-wide regulatory capital requirements, group members should be sufficiently engaged with a group-wide internal model and its application to their businesses (through their input to the model, local Board involvement, capital allocation, performance measurement etc.), even if the insurance group does not use the model to determine the regulatory capital requirements of individual group members.

Calibration test for internal models

17.15 Where a supervisor allows the use of internal models to determine regulatory capital requirements, the supervisor requires the insurer to conduct a “calibration test” to demonstrate that the regulatory capital requirement determined by the internal model satisfies the specified modelling criteria.

17.15.1 As part of a “calibration test”, where an internal model is used for determining regulatory capital, the insurer should assess the extent to which the output produced by its internal model is consistent with the modelling criteria defined for regulatory capital purposes, and hence, confirm the validity of using its internal model for that purpose.

17.15.2 The “calibration test” should be used by the insurer to demonstrate that the internal model is calibrated appropriately to allow a fair, unbiased estimate of the capital required for the particular level of confidence specified by the supervisor. Where an insurer uses different modelling criteria than those specified by the supervisor for regulatory capital purposes, it may need to recalibrate its model to the supervisor's modelling criteria to achieve this.

Additional guidance for group-wide internal models

17.15.3 See Guidance 17.14.10 and 17.14.11 for additional guidance for group-wide internal models.

Use test and governance for internal models

17.16 Where a supervisor allows the use of internal models to determine regulatory capital requirements, the supervisor requires:

- the insurer to fully embed the internal model, its methodologies and results, into the insurer's risk strategy and operational processes (the “use test”);
- the insurer's Board and Senior Management to have overall control of and responsibility for the construction and use of the internal model for risk management purposes, and ensure sufficient understanding of the model's construction at appropriate levels within the insurer's organisational structure. In particular, the supervisor requires the insurer's Board and Senior Management to understand the consequences of the
internal model's outputs and limitations for risk and capital management decisions; and

- the insurer to have adequate governance and internal controls in place with respect to the internal model.

17.16.1 In considering the use of an internal model for regulatory capital purposes by an insurer, the supervisor should not merely focus on its use for that narrow purpose, but should consider the wider use of the internal model by the insurer for its own risk and capital management.

17.16.2 The “use test” is the process by which the internal model is assessed in terms of its application within the insurer's risk management and governance processes. In order for the insurer’s internal model to be most effective it should be genuinely relevant for use within its business for risk and capital management purposes.

17.16.3 Where an insurer decides to adopt a higher confidence level than the level required for regulatory capital purposes for its own purposes, for example, in order to maintain a certain investment grade rating, then “calibration" testing should also be conducted by the insurer to allow the insurer to determine the level of capital needed at this higher level. The insurer should then assess whether holding this amount of capital is consistent with the insurer's overall business strategy.

17.16.4 The insurer should have the flexibility to develop its internal model as an important tool in strategic decision making. An insurer should therefore have the flexibility to use the most appropriate risk measure and modelling techniques in its internal models. It may be beneficial if the insurer is able to demonstrate why it has chosen a particular risk measure, and it should include in its internal model an appropriate recalibration or reconciliation, if necessary, between the modelling criteria used in the model for its own risk and capital management purposes and those set by the supervisor for regulatory capital purposes. Differences between the economic capital and the regulatory capital requirements should be explicit and capable of being explained by the insurer to its Board and the supervisor.

17.16.5 The “use test” is a key method by which the insurer can demonstrate that its internal model is integrated within its risk and capital management and system of governance processes and procedures. As part of the “use test”, an insurer should examine how the internal model is used for operational management purposes, how the results are used to influence the risk management strategy and business plan of the insurer, and how Senior Management are involved in applying the internal model in running the business. An insurer should demonstrate to the supervisor that an internal model used for regulatory capital purposes remains useful and is applied consistently over time and that it has the full support of and ownership by the Board and Senior Management.

17.16.6 The insurer’s Senior Management should take responsibility for the design and implementation of the internal model, in order to ensure full embedding of the model within the insurers' risk and capital management processes and operational procedures. The methodology used in building the model should be compatible with the overall enterprise risk management framework agreed to by the Board and Senior
Management. Although the Board and Senior Management may not be able to de-construct the internal model in detail, it is important that the Board has overall oversight of the model's operation on an ongoing basis and the level of understanding necessary to achieve this. The Board and Senior Management should also ensure that processes are in place to update the internal model to take into account changes in the insurer's risk strategy or other business changes.

17.16.7 Various business units within the insurer may be involved in the construction and operation of the internal model, such as risk management, capital management, finance and actuarial departments, depending on the size of the insurer. The experience and technical ability of staff involved in the construction and operation of the internal model should be an important consideration for the insurer. For a model to pass the “use test” it would be expected that an insurer would have a framework for the model's application across business units. This framework should define lines of responsibility for the production and use of information derived from the model. It should also define the purpose and type of management information available from the model, the decisions to be taken using that information, and the responsibilities for taking those decisions. The “use test” should also ensure the adequacy of systems and controls in place for the maintenance, data feeds and results of the model. The IAIS notes that internal models may require significant IT resources and costs, which should be a consideration for the insurer in developing its models.

17.16.8 The IAIS considers that governance processes and communication in respect of an internal model are as important as its construction. An internal model should be subject to appropriate review and challenge so that it is relevant and reliable when used by the insurer. The key elements and results from the internal model should be understood by the key personnel within the insurer, including the Board, and not only by those who have constructed it. This understanding should ensure that the internal model remains a useful decision-making tool. If the internal model is not widely understood, it will not be achieving its purpose and adding value to the business. The “use test” is key in ensuring the relevance of the internal model to the insurer's business.

Additional guidance for group-wide internal models

17.16.9 See Guidance 17.14.10 and 17.14.11 for additional guidance for group-wide internal models.

Documentation for internal models

17.17 Where a supervisor allows the use of internal models to determine regulatory capital requirements, the supervisor requires the insurer to document the design, construction and governance of the internal model, including an outline of the rationale and assumptions underlying its methodology. The supervisor requires the documentation to be sufficient to demonstrate compliance with the regulatory validation requirements for internal models, including the statistical quality test, calibration test and use test outlined above.

17.17.1 The insurer should document the design and construction of the internal model sufficient for a knowledgeable professional in the field to be able
to understand its design and construction. This documentation should include justifications for and details of the underlying methodology, assumptions and quantitative and financial bases, as well as information on the modelling criteria used to assess the level of capital needed.

17.17.2 The insurer should also document, on an ongoing basis, the development of the model and any major changes, as well as instances where the model is shown to not perform effectively. Where there is reliance on an external vendor/supplier, the reliance should be documented along with an explanation of the appropriateness of the use of the external vendor/supplier.

17.17.3 The insurer should document the results of the “statistical quality test”, “calibration test” and “use test” conducted to enable the supervisor to assess the appropriateness of its internal model for regulatory capital purposes.

Additional guidance for group-wide internal models

17.17.4 In view of the potential complexity of a group-wide internal model, the flexibility required and the potential need for multiple supervisory approvals, it is essential that the group fully document all aspects of the group-wide internal model clearly and unambiguously. This enables supervisors to identify what is approved and what is not approved. Supervisors should require the insurance group to provide thorough documentation of the scope of an internal model, clarifying what falls within and outside of the model boundaries and what parts of the group universe are modelled. Supervisory authorities should know the boundary to the internal model.

17.17.5 The documentation of the group-wide internal model should include at least:

- a full description of the risk profile of the insurance group and how the group models those risks, including the underlying central assumptions and methods;
- the parts, entities and geographical locations of the insurance group and which are included or excluded from the scope of the model submitted for approval;
- specification of which risks are modelled, with particular focus on group-wide risks;
- intra-group transactions such as (subordinated) loans and other hybrid instruments together with their different level of triggers, guarantees, reinsurance, capital and risk transfer instruments, contingent assets and liabilities; off-balance sheet items and special purpose entities;
- the effect of these instruments, either on individual insurance legal entities or on the insurance group considered as one single economic entity or on both, depending on supervisory requirements and how these effects are modelled;
- justifications for specific decisions taken in terms of assumptions, scope, simplifications;
• the flexibility of the model architecture to cope with central assumptions ceasing to be valid;

• more generally the insurance group’s processes for validating, maintaining and updating the model including the use of stress testing and scenario analysis and the results of those tests and analyses;

• how the model allows for and models fungibility of capital, transferability of assets and liquidity issues, the assumptions made especially regarding the treatment of intra-group transactions and the free flow of assets and of liabilities across different jurisdictions, and how the group uses the model for an analysis or a qualitative assessment of liquidity issues; and

• the allocation of capital to insurance legal entities implied by the group-wide model and how this would change in times of stress for insurance groups established in more than one jurisdiction. Such allocation is required by supervisors, even if an insurance group uses a different allocation, eg by region or business line, for management purposes.

17.17.6 If elements are omitted from the group-wide internal model, the supervisors should require an explanation within the required documentation, for example if and why a standardised approach is used for some insurance legal entities, lines of business or risks.

17.17.7 The supervisors should require the insurance group to provide documentation describing whether and how the modelling is consistent over different jurisdictions or insurance legal entities regarding, for example, modelling criteria, risks, lines of business, intra-group transactions or capital and risk transfer instruments (CRTIs) with suitable explanations for any differences in approach.

17.17.8 Diversification/concentration of risks means that some risks or positions are offset or increased by other risks or positions. The supervisors should require, within the framework of the required internal model documentation, a description of how the insurance group:

• incorporates diversification/concentration effects at the relevant different levels within the group-wide internal model;

• measures such effects in normal and in adverse conditions;

• confirms those measurements for reasonableness, and

• allocates diversification effects across the group according to supervisory requirements.

Credit for diversification effects should only be allowed where appropriate having regard to risk correlations in adverse financial conditions.

**Ongoing validation and supervisory approval of the internal model**

17.18 Where a supervisor allows the use of internal models to determine regulatory capital requirements, the supervisor requires:
• the insurer to monitor the performance of its internal model and regularly review and validate the ongoing appropriateness of the model’s specifications. The supervisor requires the insurer to demonstrate that the model remains fit for regulatory capital purposes in changing circumstances against the criteria of the statistical quality test, calibration test and use test;

• the insurer to notify the supervisor of material changes to the internal model made by it for review and continued approval of the use of the model for regulatory capital purposes;

• the insurer to properly document internal model changes; and

• the insurer to report information necessary for supervisory review and ongoing approval of the internal model on a regular basis, as determined appropriate by the supervisor. The information includes details of how the model is embedded within the insurer’s governance and operational processes and risk management strategy, as well as information on the risks assessed by the model and the capital assessment derived from its operation.

17.18.1 Over time an insurer’s business may alter considerably, as a result of internal factors or events (such as a change in insurer strategy) and external factors or events (such as a change in interest rates), so that the internal model may no longer fully capture the risks to which the insurer is exposed unless adapted. The supervisor should reassess an insurer’s internal model and the results that it produces on a regular basis against the criteria of the statistical quality test, calibration test and use test so that it remains valid for use, both as a strategic decision-making tool in the context of the insurer’s own risk and capital management, and as a means of calculating regulatory capital requirements where appropriate. In general only material changes to the model (such as changing the underlying model structure or the risk measure used) or to the risks faced by the insurer should require the model to be reassessed by the supervisor. A “model change policy” could be agreed between the supervisor and the insurer regarding the degree and timing of changes made to the internal model. This would enable the insurer to enact minor changes to its internal model without seeking prior supervisory approval (provided the changes are in accordance with the agreed policy), thereby allowing the model to be updated in a quicker and more flexible way.

17.18.2 The insurer should be required to notify the supervisor of material changes to the internal model and to properly document changes to enable the supervisor to assess, for continued approval, the ongoing validity of the model for use in determining regulatory capital requirements. Following any material changes to an internal model, the supervisor may give the insurer a reasonable amount of time so that the updated model is embedded in its risk strategies and operational processes.

17.18.3 The insurer should demonstrate that the data used in the internal model remains appropriate, complete and accurate for this purpose.

17.18.4 The supervisor should take care that its ongoing validation requirements do not unduly restrict the use of the internal model by the insurer for its
own risk and capital management purposes and thereby reduce its ability to comply with the use test.

Additional guidance for group-wide internal models

17.18.5 The insurance group should adjust the model for material changes in group composition and operations, including mergers, acquisitions and other structural changes of affiliated entities or jurisdictional changes.

17.18.6 The supervisor should require the insurance group to provide documentation of material changes in group operations and the reasons why continued use of the group-wide internal model would remain appropriate following the change. If such reasons cannot be given or are not sufficient the supervisor should require the group to propose appropriate model changes as a result of the material change for reassessment of approval by the supervisor.

Supervisory responsibilities

17.18.7 The IAIS considers that it is essential that supervisors are able to understand fully the insurers' internal models and be able to appraise their quality. To this end, the supervisor should have access to experienced personnel with appropriate technical ability, as well as sufficient resources. It is likely to take time for supervisors to acquire the necessary experience to appraise an insurer’s internal model. Without the experience and resources, the supervisor may be unable to reliably approve the use of an insurer’s internal model for regulatory purposes. The supervisor may wish to use external specialists that are considered to have the appropriate experience, such as actuarial consultants, accountancy firms and ratings agencies, to assist it in reviewing an insurer’s internal models. In such instances, the supervisor should retain the final responsibility for review and approval of the use of the internal model for regulatory purposes.

17.18.8 It may be appropriate for a supervisor to consider transitional measures when permitting insurers to use internal models for regulatory capital purposes for their first time. Such measures will permit the necessary time for both insurers and the supervisor to become familiar with the internal models and their uses. For example, during a transition period, the supervisor could include the use of partial internal modelling, to allow the insurer to move gradually to full use of internal models or the supervisor could require parallel reporting of regulatory capital determined by both the internal model and standardised approach. The supervisor may also consider applying a minimum capital level during the transition period.

17.18.9 The supervisor may need to impose additional capital requirements (capital add-ons) or take other supervisory action to address any identified weaknesses in an internal model, either prior to approving the use of the model, as a condition on the use of the model or in the context of a review of the ongoing validity of an internal model for regulatory capital purposes. It may be necessary to introduce additional supervisory powers, to allow such supervisory actions and measures, when internal models are allowed for regulatory capital purposes by a supervisor.
17.18.10 Where an insurer which is a subsidiary of an insurance group seeks approval for the use of an internal model which itself is part of a broader “group model”, the supervisor of this subsidiary should conduct the approval process in close co-operation with the group-wide supervisor. In particular, the supervisor of the subsidiary should check the status of the “group model” and seek information from the group-wide supervisor about its own approval process.

Supervisory reporting

17.18.11 For supervisory approval purposes, supervisors should require the insurer to submit sufficient information for them to be able to approve the use of the internal model for regulatory capital purposes and to give confidence to the supervisor that the insurer is appropriately carrying out its responsibility to manage its risks and protect the interests of policyholders. This should include the results of analysis conducted under the “statistical quality test”, “calibration test” and “use test”. While supervisors should have the power to determine the exact nature and scope of the information they require, supervisory reporting should be appropriate to the nature, scale and complexity of an insurer’s business.

17.18.12 The level of information on internal models necessary to allow meaningful assessment by supervisors would be expected to include appropriate information regarding the insurer’s risk and capital management strategy – for example, how the model is embedded into the insurer’s governance procedures, overall business strategy, operational procedures and risk processes. An insurer should report details of the risks assessed by the model, including how these are identified and measured, as well as information on the results of the internal model analysis, the economic capital derived from these results and how the results of the internal model compare to those derived from the supervisory standardised approach. 41

---

41 Supervisors may consider that the comparison between the capital requirements from an internal model and a supervisory standardised approach should only be required during a transition period.
ICP 18 Intermediaries
The supervisor sets and enforces requirements for the conduct of insurance intermediaries, in order that they conduct business in a professional and transparent manner.

Introductory Guidance

18.0.1 There is a diverse range of organisations and individuals carrying out insurance intermediation, and channels through which this is undertaken. In order to ensure consumer protection and to promote a level playing field amongst these actors, this ICP applies to the supervision of those conducting the activity of insurance intermediation. Some of the Standards under this ICP apply to the supervision of the individuals providing insurance intermediation services to customers. Other Standards apply to the organisation within which the insurance intermediation is carried out; where this is the case, it is made clear in the corresponding guidance. Where an insurer’s direct sales staff solicit, negotiate or sell insurance as employees of the insurer, the supervisor would apply the relevant Standards to the insurer.

18.0.2 Some intermediaries do not have direct contact with the customer but act with other intermediaries to place business with insurers (such as wholesale intermediaries). Even though they do not necessarily deal directly with the purchaser of insurance, they perform one of the functions in the chain of soliciting, negotiating or selling insurance, and are within the scope of this ICP.

18.0.3 Where the Standards under this ICP apply to the intermediary as an organisation, the supervisor should hold those responsible for the intermediary’s governance to account for implementation of the requirements.

18.0.4 Individuals or organisations which only refer (or introduce) potential customers to an insurer or insurance intermediary, without carrying out insurance intermediation, are excluded from the scope of this ICP. Also excluded from the scope are persons, such as tax advisers or accountants, who in conducting another professional activity provide:

- advice on insurance cover on an occasional basis in the course of that other activity; or
- information of a general nature on insurance products (without advising on the choice of insurance product provider),

provided that the purpose of that professional activity is not to intermediate an insurance contract.

18.0.5 Insurance intermediaries may also perform functions supplemental to insurance intermediation, many of which may be described as outsourced functions of the insurer. These supplemental functions may include underwriting, premium collection, administration, management of insurance claims, loss adjusting and claims appraisal. These functions are excluded from the IAIS definition of insurance intermediation.
However, in some jurisdictions these supplemental functions are included in their definition of insurance intermediation. The outsourcing of processes that are relevant to business conduct is addressed in other ICPs (see ICP 19 Conduct of Business and – for insurers – ICP 8 Risk Management and Internal Controls).

18.0.6 Insurance intermediation involves the interface between insurers and customers. Effective assessment of the quality of insurance intermediation to a large extent requires supervisory consideration of policies, processes and procedures that relate to individual customer relationships and individual transactions.

18.0.7 Where intermediaries are part of a group, the application of appropriate policies and processes on insurance intermediation should be consistent across the group, recognising local requirements and specificities, and should result in the fair treatment of customers on a group-wide basis.

Proportionality with regard to intermediaries

18.0.8 Intermediation systems and practices are closely linked with jurisdictions’ tradition, culture, legal regime and the degree of development of insurance markets. For this reason, supervisory approaches to insurance intermediation also tend to vary. Such diversity should be taken into consideration in implementing this ICP in order to promote the fair treatment of customers.

18.0.9 In implementing this ICP, the supervisor should take into account that there are various business models ranging from sole traders to large enterprises, including specialist wholesale or reinsurance intermediaries.

18.0.10 The nature of the customers with which an intermediary interacts and the complexity of the products offered are also relevant to the supervisory approach. Retail customers, in particular vulnerable consumers, have different needs in terms of consumer protection than professional ones; life products with an investment element are typically more complex than general personal lines products.

18.0.11 In light of market diversity, in implementing this ICP, the supervisor should consider focusing on the activity carried out by the intermediary, to ensure consistency and minimise the opportunity for regulatory arbitrage.

18.0.12 Supervisors are faced with balancing the need for consumers to receive an appropriate level of protection and the benefits of innovation and competition. The supervisor should consider whether its licensing and supervisory requirements impose unreasonable barriers to entry for small or emerging intermediary businesses, or inhibit beneficial innovations, and thereby limit the accessibility of insurance coverage to consumers.

Types of intermediaries

18.0.13 Intermediaries fall into two categories: i) acting primarily on behalf of the insurer; or ii) acting primarily on behalf of the customer:

- Where the intermediary acts primarily on behalf of the insurer and sells products for, and on behalf of, one or more insurers, they are often referred to as “agent” or “producer”.

Intermediaries may act for a single insurer (sometimes referred to as “tied”) or several. The products they can offer may be restricted by agency agreements with the insurer(s) concerned.

- Where the intermediary acts primarily on behalf of the customer, the intermediary is independent of the insurer(s) whose products he sells. Often referred to as “broker”, or “independent financial adviser”, they are able to select products from those available across the market.

18.0.14 Some supervisors do not distinguish between different intermediary categories in legislation and instead supervise according to the activity performed. In some jurisdictions, it may be possible for an intermediary to have a different status depending on the customer relationship and the product or service being offered. In others, an intermediary is prevented from acting in any capacity other than the one in which it has been licensed to do business, in order to avoid conflicts of interest.

18.0.15 Intermediary operations range from large international organisations to local sole traders. Intermediary organisations sometimes operate as independent enterprises or divisions of insurers or other financial institutions, or as part of non-financial organisations. Insurance intermediation may also be performed by digital means, such as website and mobile phone applications.

18.0.16 Insurers use various distribution channels to market and sell insurance products. These can include a variety of partners - such as car dealerships, post offices, mobile phone operators, travel agents, other financial institutions and other retailers - who offer insurance alongside or as an add-on to the primary goods and services in which they trade. In many cases the activities of these distribution channels would constitute intermediation.

Intermediaries' role in promoting public trust and confidence in the insurance sector

18.0.17 In most insurance markets, intermediaries serve as important distribution channels of insurance. Their good conduct and professional competence are essential to promote confidence in insurance markets.

18.0.18 It is in the interests of supervisors, in promoting fair, safe and stable insurance markets, that the public has trust and confidence in the insurance sector. Insurance intermediaries’ interface between consumers and insurers gives them a key role in building and justifying this public trust and confidence.

18.0.19 In some jurisdictions, intermediaries’ duty to act in a professional and transparent manner is supported by professional bodies and other interested organisations. Such organisations encourage, amongst other things, the obtaining of professional qualifications, continuous professional development, ethical behaviour, the fair treatment of customers and better communication with the public. Such measures are aimed at enhancing public confidence in insurance intermediaries through raising professional standards.

Intermediaries' role in promoting financial awareness
18.0.20 Intermediaries can promote consumer protection by assisting consumers to make better informed decisions about the products that they buy. This helps to address a core consumer protection concern about asymmetries of information between financial services product providers and the public to whom the products are sold. The adoption of good conduct of business practices by insurers and insurance intermediaries helps to ensure that customers are sufficiently informed on the insurance products they are considering buying, before concluding a contract.

18.0.21 Enhancing financial awareness is a further means of ensuring that consumers are aware of the types of products available to them and understand their purpose, how they work and their key features, including cost. This understanding helps consumers to compare products and to purchase insurance products that meet their needs. Enhanced financial awareness can be achieved, for example, through formal education initiatives and targeted awareness campaigns led by insurers and intermediaries, individually or jointly.

18.0.22 The promotion of financial awareness may benefit consumers in jurisdictions where consumer protection standards are weak or levels of financial literacy are low. It is also especially important when dealing with more complex financial products, particularly those with an investment element.

18.0.23 Improved understanding by consumers of the terms and benefits they can expect from insurance products may also lead to a reduction in complaints against intermediaries or the insurers whose products they sell.

18.0.24 Insurance intermediaries are not the only stakeholders in promoting the financial awareness of consumers; governments, supervisors, social interest organisations and insurers have a significant role to play in consumer protection. Other stakeholders, using various communication channels, are also able to play a significant role. Nevertheless, intermediaries’ face-to-face dealings with their customers and marketing of products to consumers place them in a position to contribute to strengthening the financial awareness of the public on insurance matters. Supervisors may therefore wish to encourage insurance intermediaries to promote financial awareness.

18.0.25 A variety of means may be used by insurance intermediaries to promote financial awareness, such as:

- explaining face-to-face the features of products in which customers may be interested, which may be particularly important where their interest is in complex or long term contracts;
- providing references to specific websites or other reference material which gives relevant information, or publishing such material themselves;
- making available, or suggesting other sources of, financial tools such as on-line calculators which estimate premiums or coverage levels; or
• participating in educational initiatives such as training seminars.

18.0.26 In undertaking financial education initiatives, intermediaries should ensure that the personnel involved have sufficient knowledge for this purpose and that material or tools provided are up to date, free from error to the extent practicable, and easily understood. Such initiatives may target specific audiences, such as vulnerable groups.

18.0.27 Intermediaries’ initiatives to promote financial awareness, where conducted with professionalism, may help to enhance both their own reputation and that of the insurance sector.

**Additional ICPs applicable to the supervision of intermediaries**

18.0.28 ICP 19 (Conduct of Business) addresses conduct of business supervision in respect of both intermediaries and insurers, whereas this ICP addresses other aspects of supervision that are specific to intermediaries. Other ICPs that apply, generally or in part, to the supervision of intermediaries are:

• ICP 21 Countering Fraud in Insurance; and
• ICP 22 Anti-Money Laundering and Combating the Financing of Terrorism (AML/CFT).

**Supervisory cooperation**

18.0.29 In some jurisdictions, the supervision of insurance intermediaries is the responsibility of a different authority than the insurance conduct of business supervisory authority. Even where the same authority is responsible for conduct of business and intermediary supervision, the supervisory responsibilities are often undertaken within different departments. Where different authorities or departments are involved, the insurance intermediary supervisor should communicate, and cooperate where possible, with other relevant authorities and departments to ensure an understanding of all the risks relevant to their supervision of insurance intermediaries.

**18.1 The supervisor requires insurance intermediaries operating in its jurisdiction to be licensed.**

18.1.1 In some jurisdictions other terminology such as “authorisation” or “registration”, are used in place of “licensing”. For the purposes of this ICP these terms are collectively referred to as “licensing”.

18.1.2 The supervisor may choose to license intermediaries at the legal entity level or the individual level, or both. In some jurisdictions insurance intermediation activities carried out by the insurer’s direct sales staff or its authorised representatives are covered by the insurer’s licence; in others these may require separate intermediary licensing.

18.1.3 Where licensing is at the legal entity level the supervisor may consider whether the legal entity has in place procedures to ensure that the individuals who conduct insurance intermediation under its responsibility meet appropriate standards of professionalism and competence. The supervisor may also wish to set its own requirements for approval of
individuals, within an insurance intermediary, who conduct intermediary business.

18.1.4 Different types of insurance business involve different levels of complexity and risks and may require different levels of skill and experience in their intermediation. The supervisor may wish to specify in the licence the range of intermediation activities that it permits the insurance intermediary to undertake, taking into account, for example, the intermediary’s proposed business plan and areas of expertise.

18.1.5 The licensing process should be designed to enable the supervisor to reject a licence application where it considers that the applicant will be incapable of delivering fair consumer outcomes or where it cannot be effectively supervised. For these purposes the supervisor may require an application, together with additional information that may depend on the type of licence being applied for, and may include items such as:

- details of ownership, including all information necessary to provide a full understanding of the insurance intermediary’s ownership and control structure;
- a business plan, including details of proposed business and financial projections;
- the proposed sources and method of capitalisation;
- information on personnel, in particular on proposed holders of key functions;
- details of any significant third party service providers;
- details of the proposed auditor, where applicable;
- details of professional indemnity insurance cover, including amount and limitations, or comparable guarantee, where applicable;
- business continuity plans;
- if incorporated, relevant information on incorporation such as memorandum and articles of association and certificate of incorporation;
- details of policies, procedures and controls in key areas such as:
  - new business;
  - client money;
  - complaints;
  - conflicts of interest;
  - compliance;
  - combating financial crime (including AML/CFT and fraud); and
  - a copy of the policy and supporting documents that govern the insurance intermediary’s conduct of business, or
The supervisor may require additional information to complete the licensing process, upon request.

18.1.6 The supervisor may set minimum financial resource requirements, for example, to discourage market entrants with insufficient financial resources and to help ensure that existing licensees have sufficient financial resources for business continuity purposes. Where this is the case, such requirements may take into account factors such as the nature of the business to be intermediated, whether the intermediary operates client accounts, the level of any professional indemnity insurance and the level of operating expenses, to ensure that an appropriately risk-based financial resource requirement is set.

18.1.7 The supervisor should only issue a licence if the applicant meets the initial licensing conditions.

18.1.8 In specific and limited circumstances, the supervisor may have the power to make exceptions to certain licensing requirements. The supervisor should ensure that any such exceptions do not encourage regulatory arbitrage or increase the risk to consumers.

18.1.9 The supervisor should consider what licensing requirements are applicable to intermediaries operating on a cross-border basis from outside the jurisdiction. These requirements should be transparent to consumers, as well as to intermediaries, so that they can make an informed decision when choosing to deal with intermediaries from other jurisdictions.

18.1.10 The supervisor may consider the possibility of issuing periodically renewable licences. An advantage of doing so would be to ensure formal periodic reassessment of compliance with the regulatory licensing requirements.

18.2 The supervisor ensures that insurance intermediaries licensed in its jurisdiction are subject to ongoing supervisory review.

18.2.1 The supervisor should require that initial licensing conditions, as applicable, are maintained subsequent to the licence being issued and that ongoing regulatory requirements are met. Where another authority is responsible for setting the licensing requirements, the supervisor should communicate, and cooperate where possible, with this authority.

18.2.2 The supervisor may choose to take a risk-based approach in reviewing on a targeted basis whether insurance intermediaries fulfil their licensing and conduct of business requirements on an ongoing basis. Under such an approach, supervisory review should take into account the differing size of intermediaries, their likely impact on the market and the riskiness and complexity of their business.

18.2.3 In addition to monitoring ongoing compliance, the supervisor should require that any breaches in licensing conditions or other supervisory requirements are reported promptly.

Direct supervision
18.2.4 Direct ongoing supervision may take various forms, both off-site monitoring and on-site inspection, as necessary, as well as other supervisory tools. Further information on this topic is available in ICP 9 Supervisory Review and Reporting, but may require adaptation to make it appropriate for the specific nature of intermediary business. The balance between off-site and on-site approaches will typically be influenced by the number and nature of intermediaries in the market, as well as the supervisor’s resources. The supervisor may take these factors into account when determining the balance between a proactive and reactive approach to ongoing supervision.

18.2.5 Off-site monitoring may include supervisory reporting, analysis of complaints, thematic reviews and other forms of information. The supervisor may specify information to be provided for off-site monitoring purposes, including information to be reported routinely or on an ad hoc basis. Supervisory reporting requirements may include:

- financial statements, audited where applicable, or other certification of the financial soundness of the intermediary;
- auditor’s management letter, where applicable;
- confirmation of professional indemnity cover (including exclusions or limitations) or comparable guarantee;
- information on the sources of and placement of business;
- summary of movements on client money accounts, where applicable;
- changes in key functions and significant owners;
- financial links with insurers and other intermediaries (such as through related party structures or service contracts);
- types of products sold;
- business partners;
- staff compensation policy;
- incentive arrangements;
- claims data;
- complaints data; and
- details of advertising and marketing expenditure relating to particular types of products or distribution channels.

18.2.6 Where the intermediary is an employee of the insurer, the supervisor may determine that information provided by the insurer as part of the insurer’s regular reporting responsibilities is sufficient, without requiring separate reporting in respect of the intermediation activities conducted by the employee of the insurer.

18.2.7 The supervisor may also use regular formal meetings with intermediaries as a means of supplementing these off-site and on-site processes and procedures. Where appropriate, the supervisor may use other tools, such as “mystery shopping”, to evaluate whether the implementation of
intermediaries’ internal policies and processes is resulting in fair outcomes for customers.

18.2.8 Where applicable, the supervisor should apply supervisory review processes and procedures to insurance intermediaries at the level at which licensing takes place (entity or individual level) or at the insurer level. Reporting requirements in respect of an insurer’s direct sales staff would be the responsibility of the insurer.

18.2.9 On-site inspections may consider areas such as:

- corporate governance framework, including internal controls;
- procedures and controls for combating financial crime;
- review of client money accounts where applicable;
- review of customer files;
- review of complaints;
- review of disclosure to customers and terms of business agreements;
- review of documentation of advice given and the reasons for that advice; and
- other relevant elements such as the strategy, business activities and business models, the treatment of customers, and compliance with supervisory requirements.

18.2.10 Analysis of complaints may be a valuable source of information for the supervisor, as well as for insurers and intermediaries, in identifying possible risks of poor conduct in the area of insurance intermediation.

18.2.11 The supervisor may take a risk-based approach, where greater attention is focused on higher risk areas. Examples include where:

- Insurance intermediation includes the provision of advice;
- the nature of the business intermediated is more complex;
- customers are less sophisticated; and
- there is an increased likelihood of conflicts of interest.

*Indirect supervision*

18.2.12 In some jurisdictions intermediaries are supervised indirectly through the supervision of the insurers. The supervisor will need to take into account the extent to which such an approach achieves effective supervision. Regardless of the approach, it is ultimately the supervisor’s responsibility that intermediaries are effectively supervised.

18.2.13 An indirect approach may be more appropriate for agency intermediation rather than the broker model.

18.2.14 Indirect supervision can relate to circumstances where the insurer relies upon an intermediary to perform processes on its behalf. In such cases, written agreements could be checked by the supervisor to assess the respective responsibilities. For example, insurers are expected to obtain appropriate documentation regarding their customers to demonstrate...
that appropriate customer due diligence and/or fact-finding procedures have been carried out. Insurers will be assessed on the adequacy of the processes carried out and documentation obtained, including where the insurer relies upon intermediaries to perform this work and supply the documentation required.

18.2.15 Where the supervision of intermediaries is undertaken indirectly, the supervisor should assess the insurer’s processes to monitor the work undertaken by an intermediary on its behalf.

Self-regulatory organisations

18.2.16 A self-regulatory organisation (SRO) can be described as a non-government organisation that has the power to create and enforce industry or professional regulations and standards. The self-regulatory functions of an SRO can contribute to the supervision of intermediaries through the requirements for, and enforcement of, professional standards for its members.

18.2.17 In jurisdictions with an SRO for intermediaries, the supervisor should assess whether the SRO meets appropriate standards before placing any reliance on the SRO’s self-regulatory functions. The supervisor’s assessment should consider matters such as whether the SRO:

- has sufficient independence;
- has appropriate powers and resources to fulfil its mission and provide effective self-regulation;
- performs its self-regulatory functions adequately;
- establishes and maintains standards that are sufficiently robust; and
- takes appropriate action to deal with any shortcomings.

18.2.18 An SRO’s regulations and standards may not address all the aspects of the supervision of insurance intermediaries for which the supervisor has responsibility. Therefore, whilst the supervisor may choose to place some reliance on the self-regulatory functions of an SRO, the supervisor should retain overall responsibility for supervision.

Other

18.2.19 In addition to direct and indirect supervision of intermediaries, the supervisor may use the supervision of insurers to gather information on and, to some extent, monitor intermediaries’ activities. This may include, for example, identifying whether particular intermediaries or particular matters are the subject of regular or frequent complaints.

18.3 The supervisor requires insurance intermediaries to maintain appropriate levels of professional knowledge and experience, integrity and competence.

Professional knowledge and experience

18.3.1 It is important that individuals carrying out the activity of insurance intermediation have adequate professional knowledge. Professional knowledge can be gained from experience, education and/or training.
The attainment of relevant professional qualifications may demonstrate that a certain level of professional knowledge has been achieved.

18.3.2 The supervisor should require that individuals carrying out the activity of insurance intermediation have professional knowledge and experience appropriate for the business which they intermediate. More complex products or customer needs may require higher or more specialised knowledge and experience. The knowledge and experience of individuals should also be appropriate for the type of business being intermediated. Once professional qualifications have been achieved, it is important that individuals who continue to carry out the activity of insurance intermediation keep their professional knowledge up to date. In some jurisdictions, there are supervisory or statutory requirements that individuals carrying out the activity of insurance intermediation should spend a specified minimum amount of time on continuous professional development. In some jurisdictions, professional bodies impose such a requirement on their members.

18.3.3 The supervisor may consider recognising the qualifications of specified professional bodies. Where a jurisdiction has no such professional body, consideration could be given to encouraging or recognising qualifications obtained through professional bodies in other jurisdictions. The supervisor may also consider recognising such qualifications where these are considered to be equivalent to, or exceed, the qualifications available within the jurisdiction.

18.3.4 Intermediaries should be knowledgeable regarding the status of the insurers whose products they sell. For example, they should be satisfied that the insurer is licensed to sell insurance in the relevant jurisdiction, as a branch or subsidiary, and should be aware of the financial status and credit rating of the insurer and the applicability of any policyholder protection schemes to that insurer’s products.

**Integrity**

18.3.5 It is essential that those carrying out the activity of insurance intermediation act with integrity and high ethical standards. These relate to the behaviour of the individuals concerned, such as:

- being honest, trustworthy and open;
- being reliable, dependable and respectful;
- not taking unfair advantage;
- not accepting or offering gifts where this might imply an improper obligation.

18.3.6 The supervisor may require individuals carrying out the activity of insurance intermediation to be subject either to their organisation’s internal policies and processes, or to the ethical standards of professional bodies, that require integrity.

18.3.7 The supervisor may establish its own expectations on integrity through, for example, the publication of codes of conduct with which such individuals are required to comply. Codes of conduct should be complementary to the relevant legislation and may address any aspect of dealings between insurance intermediaries and their customers.
18.3.8 Intermediary organisations should have procedures to assess the integrity of those intermediating on their behalf. Such procedures should include pre-employment checks as well as ongoing requirements. Pre-employment checks should include, amongst other things, employment history, any civil liability, criminal convictions, administrative actions by regulatory agencies and self-regulatory organisations, or pending legal proceedings.

Competence

18.3.9 The supervisor should require individuals carrying out the activity of insurance intermediation to act only in respect of business for which they have the required competence.

18.3.10 The supervisor should require insurance intermediaries to implement policies and processes to assess the competence of individuals carrying out the activity of insurance intermediation. Assessment would be particularly important in the case of new employees or where staff are assigned different or more challenging responsibilities. Competence should also be monitored as an ongoing process for all relevant staff. This may include actions such as:

- observed interviews with customers;
- review of customer files;
- internal interviews; and/or
- coaching.

18.3.11 An on-site inspection may provide an opportunity for the supervisor to assess competence, such as through file reviews and interviews of selected staff.

Role of professional standards

18.3.12 SROs and other professional bodies can be instrumental in promoting professional standards where they issue standards or codes with which their members are required to comply. Standards required by relevant SROs or other professional bodies may include areas such as:

- acting with high ethical standards and integrity;
- acting in the best interests of each client;
- providing a high standard of service; and
- treating customers fairly.

18.3.13 Members of an SRO or other professional body who are found to be in breach of its professional standards may be subject to disciplinary procedures such as suspension of, or exclusion from, membership.

18.3.14 In jurisdictions where there is reliance on the membership of a professional body, the supervisor may consider confirming that such a body has an effective disciplinary scheme in force. The supervisor may nevertheless decide not to depend on such professional processes entirely and deal with issues of an individual's professional conduct directly.
18.4 The supervisor requires that insurance intermediaries apply appropriate governance.

18.4.1 An insurance intermediary’s governance framework may vary, depending upon the nature and scale of the intermediary and the complexity of its business, and may be subject to general company law. However, each intermediary’s governance framework should be sufficient to provide for sound and prudent management of the business and to support the fair treatment of customers.

18.4.2 In setting relevant governance requirements the supervisor should consider the application of such requirements to sole traders and small businesses operating as insurance intermediaries. Such requirements for sole traders and small businesses will differ from those for larger entities. Key areas where requirements may vary include internal controls, segregation of duties, and compliance functions. Regardless, the supervisor should be satisfied that a sound level of governance is achieved and that there are no unacceptable risks, with the overriding objective that customers are appropriately protected.

18.4.3 Good governance may be promoted by the supervisor, as well as other authorities, professional bodies and SROs, by publishing guidance (for example, a Code of Practice) for insurance intermediaries on their obligations in respect of governance-related matters. Guidance that may help intermediaries meet governance requirements may include matters such as:

- ensuring that those responsible for the intermediary organisation’s governance have the competence and integrity to fulfil their respective roles;
- ensuring appropriate standards for conduct of business;
- ensuring there is regular monitoring of consumer outcomes;
- ensuring that the making of key decisions is subject to sufficient discussion at Board level or with Key Persons in Control Functions as appropriate;
- ensuring adequate human resources to conduct the business;
- ensuring an appropriate level of internal controls of the business;
- ensuring appropriate disciplinary policies and processes for wrongdoing are in place;
- maintaining adequate files and records and ensuring their availability for inspection;
- maintaining appropriate controls over outsourced functions; and
- compliance with all relevant legislation, including non-insurance legislation such as in respect of anti-money laundering, fraud, etc.
18.4.4 Relevant to governance, intermediaries are required to establish and implement policies and processes on the fair treatment of customers that are an integral part of their business culture (see Standard 19.2).

18.4.5 The governance of an insurer’s direct sales staff is the responsibility of the insurer, and the governance of insurers is the subject of ICP 7 (Corporate Governance). Although ICP 7 is otherwise not directly applicable to intermediaries, it may be a useful source of information for intermediary supervisors.

18.5 The supervisor requires insurance intermediaries to disclose to customers, at least:

- the terms and conditions of business between themselves and the customer;
- the relationship they have with the insurers with whom they deal; and
- information on the basis on which they are remunerated where a potential conflict of interest exists.

18.5.1 In addition to disclosing matters relating to intermediaries themselves, intermediaries are required to disclose information on insurance products offered to customers (see Standards 19.5 and 19.6).

18.5.2 In setting disclosure requirements, the supervisor may take into account that there are differences in:

- the nature of different insurance products;
- the level of sophistication of different customers; and
- the way in which different types of insurance are transacted (for example, differences between commercial and personal (retail) lines).

The nature, timing and detail of disclosures may differ according to the circumstances. Nevertheless, disclosure requirements should provide adequate information to customers, taking into account these factors.

*Terms of business*

18.5.3 A terms of business agreement may be a convenient means by which an insurance intermediary can provide important information to a customer and satisfy many of the disclosure requirements. Such a document may include information such as:

- by whom they are licensed and supervised;
- the type of business for which they are licensed;
- whether they are independent or act on behalf of one or more insurers;
- information on the basis on which they are remunerated;
- the services provided, including whether they offer products from a full range of insurers, from a limited range or from a single insurer;
• charging arrangements for the intermediation services;
• cancellation rights in respect of the intermediation services;
• notification of complaints;
• client money arrangements, including treatment of interest;
• confidentiality of information provided; and
• the relevant law governing the agreement.

18.5.4 Insurance intermediaries should provide information on terms of business to customers and do so prior to an insurance contract being entered into. Where there is an ongoing business relationship between an intermediary and a customer, or once terms of business information has initially been provided in the case of policy renewals, the intermediary should review whether reiterating this information is necessary. Further information on terms of business might only be necessary where there are changes to the terms.

18.5.5 When insurance cover needs to be arranged immediately it may not be possible to provide documentation of terms of business at the point of arranging the contract. In such situations the information may be provided orally and followed up with written documentation within a reasonable period of time.

18.5.6 The supervisor may recommend, or require, that a copy of the terms of business, signed by the customer, is retained as part of the insurance intermediary’s records. Where insurance is intermediated over the internet, the customer may be required to acknowledge the terms of business before a policy can be proceeded with. Electronic records should also be retained by the intermediary.

Intermediary status

18.5.7 An insurance intermediary’s status may provide information to a customer on the extent of products from which recommendations are made and provide an indication of potential conflicts of interest. Where the insurance intermediary is only able to select products from a single insurer or from a limited range, the customer may wish to carry out their own research to see whether they can obtain better terms or a more suitable product elsewhere in the market.

18.5.8 It is particularly important that insurance intermediaries provide customers with information on their relationship with the insurers with whom they deal, specifically whether they are independent or act for one or more insurance companies, and whether they are authorised to conclude insurance contracts on behalf of an insurer or not.

18.5.9 Potential conflicts of interest can arise for some intermediaries if the intermediary is part of a wider group or if the intermediary has a financial interest, such as a shareholding, in an insurer or insurance group. Such relationships should be disclosed to customers.

18.5.10 Information on the insurance intermediary’s status may be provided as part of a terms of business agreement or separately. Because of its importance, this information may also be highlighted verbally to the customer.
Remuneration

18.5.11 Insurance intermediaries are generally remunerated by way of fees and commissions, such as:

- fees paid directly by the customer;
- fees or commissions paid indirectly by the customer, by way of deduction from premiums or funds invested; or
- fees or commissions paid by the insurer.

18.5.12 Where insurers’ direct sales staff carry out insurance intermediation as employees of the insurer, they may be salaried as well as receive any applicable commission.

18.5.13 Information on charging structures may be important information to customers. For example, for insurance products with an investment element, information on any fees or other costs deducted from the initial amount invested, as well as on fees or commissions deducted from the investment thereafter will be important.

18.5.14 Information on charging may be provided as part of a terms of business agreement, or separately. As fees and commissions vary by product and between product providers, they may need to be provided separately for each product recommended, often by inclusion in product documentation. Given their significance to some types of product, this information may also be highlighted verbally to the customer.

18.5.15 The supervisor may also require that, upon a customer’s request to the intermediary, the customer is provided with further information on fees and commissions, including the level of fees and commissions. The intermediary should make the customer aware of his/her right to request information on fees and commissions. Communication should be clear and not misleading. In view of the impact of fees and commissions upon insurance products with an investment element, the supervisor may require that disclosure of fees and commissions is provided to customers prior to contracts being entered into in respect of all such products.

18.5.16 Some forms of remuneration of insurance intermediaries potentially lead to a conflict of interest. For example, an intermediary may be tempted to recommend a product which provides higher fees or commissions than another. Potential conflicts of interest for intermediaries may exist in a variety of circumstances (see ICP 19 Conduct of Business).

18.5.17 The supervisor should be satisfied that the intermediary has robust procedures in place to identify and avoid, or manage, conflicts of interest, and deliver outcomes aligned with customers’ best interests. Where they cannot be avoided, or managed satisfactorily, this would result in the intermediary declining to act. Conflicts of interest may be managed or avoided in different ways depending on the nature and severity of the conflict of interest (see Application Paper on Supervising the Conduct of Intermediaries).

18.5.18 Additionally, circumstances in which conflicts of interest may arise may be covered in the codes of conduct issued by SROs or other professional bodies.
18.5.19 The supervisor should be aware of the use of non-monetary benefits, including, for example, “soft” commissions, offered by insurers to intermediaries. These may include less tangible inducements such as professional support, IT support, or corporate entertainment at sporting or cultural events. Such inducements may lead to conflicts of interest and are less transparent than fees or commissions and also need to be avoided, managed or prohibited as appropriate.

18.6 The supervisor requires an insurance intermediary who handles client monies to have safeguards in place to protect these funds.

18.6.1 In the course of carrying out its business, an insurance intermediary may:

- receive monies from a client for the payment of premiums to an insurer; and/or
- receive monies from an insurer in respect of claims or refunded premiums for onward payment to a client.

18.6.2 Some jurisdictions have specific legal requirements in respect of the cash flows where monies are transferred via an intermediary from the customer to the insurer, and vice versa, including in determining whether the customer or the insurer is at risk in respect of such funds.

18.6.3 Where funds are held at the risk of the client, they may be referred to as “client monies” or “client’s money”. The intermediary should have adequate policies and processes in place for the safeguarding of such funds in the interests of their customers.

18.6.4 In some jurisdictions, premiums are deemed to have been paid to the insurer as soon as the customer pays premiums to the intermediary. In these circumstances the insurer, rather than the customer, bears the risk of allowing intermediaries to collect premiums on its behalf.

18.6.5 The supervisor may require that an insurance intermediary’s client money policies and processes cover matters such as the following:

- client accounts are separate and clearly distinguishable from the intermediary’s own bank accounts;
- client accounts are held with licensed banks within the jurisdiction, or specified other jurisdictions;
- disallowing monies other than client monies within the account, except in specific circumstances such as to achieve or maintain a minimum balance, to receive interest, or to receive commission due to the intermediary;
- monies are paid into the account promptly;
- adequate financial systems and controls are maintained, including authorisation of payments from the account;
- adequate books and records are maintained and subject to audit;
- reconciliations are performed on a regular basis and reviewed;
discrepancies on the account are followed up promptly and resolved satisfactorily;

for each client, payments from a client account are not made before sufficient monies paid into the account have cleared, thus ensuring that any balance held in respect of each client is not negative; and

the treatment of interest.

18.6.6 In the interest of safeguarding clients’ money, it is important that client accounts cannot be used to reimburse creditors of the insurance intermediary.

18.6.7 Where insurance intermediaries operate client accounts, the supervisor may require that the terms and conditions of such accounts are disclosed to their customers, including whether funds held in such accounts are at the risk of clients or at the risk of the insurer.

18.7 Where appropriate, the supervisor takes supervisory measures against licensed insurance intermediaries.

18.7.1 The supervisor should initiate measures to prevent or respond to poor conduct or breaches of regulatory requirements by an intermediary, with a view to mitigating adverse outcomes for customers. Where necessary, the supervisor may use sanctions.

18.7.2 The supervisory framework should allow for the exercise of judgement and discretion, and provide flexibility in the use of preventive measures, corrective measure and sanctions.

18.7.3 In some instances, the supervisor may need to work with other relevant authorities or bodies in order to take or enforce supervisory measures or sanctions against an intermediary.

Preventive measures

18.7.4 Where the supervisor assesses that there may be a material risk of an insurance intermediary breaching supervisory requirements or to consumer or policyholder interests in general, it should require insurance intermediaries to take appropriate measures to mitigate both market-wide risks as well as risks from specific entities or individuals.

18.7.5 In this regard, the supervisor may take proactive measures, such as publishing guidance on good practices or warnings to the industry or consumers.

Corrective measures

18.7.6 Where the insurance intermediary fails to meet supervisory requirements, or where consumers may otherwise be at risk, the supervisor should require corrective measures to be taken by the insurance intermediary. This may occur, for example, where:

- there is evidence of unfair treatment;
- required information is not provided to customers;
- policies and processes are inadequate (particularly where this results in inadequate due diligence work);
• internal controls, file keeping or documentation are inadequate;
• conflicts of interest are not adequately identified or managed; or
• there are concerns over business continuity.

18.7.7 Supervisory measures should apply at either the entity level or individual level, as appropriate. These may include, for example:
• requiring the implementation of enhanced policies and processes;
• requiring further training;
• restricting business activities;
• suspending or barring specific individuals from engaging in intermediary business or being responsible for the corporate governance of an intermediary organisation; or
• suspending, revoking or not renewing the licence.

Sanctions

18.7.8 Where appropriate, the supervisor should impose sanctions on entities or individuals. The range of sanctions may include, for example:
• imposing fines;
• barring individuals from acting in key roles or holding similar roles in the future; or
• requiring remediation, including compensation to policyholders where appropriate.

18.7.9 Sanctions imposed should be commensurate with the nature and severity of the shortcomings. Minor offences may be dealt with through oral or written communications with the intermediary’s management and then followed up, whereas more significant deficiencies may warrant immediate or more significant action.

18.7.10 Jurisdictions should provide due process for an intermediary to appeal supervisory measures.

18.8 The supervisor checks that the intermediary is taking the measures required and escalates such measures if its concerns are not being addressed.

18.8.1 The supervisor should review the results of measures that it has required of an intermediary and the effectiveness of the actions taken.

18.8.2 If the action taken by the intermediary does not adequately address the supervisor’s concern, the supervisor should require further measures.

18.8.3 Supervisory measures should be escalated in line with the supervisor’s concern about the intermediary and the risk to consumers.

18.9 The supervisor takes measures against individuals or entities that conduct insurance intermediation without the necessary licence.
18.9.1 The supervisor should have in place mechanisms to identify when unlicensed insurance intermediation is being carried out. Examples of such mechanisms include monitoring media and advertising, review of consumer complaints and encouraging industry and other stakeholders to notify the supervisor of suspicious activity.

18.9.2 When unlicensed insurance intermediation is identified, the supervisor should act to address the issue. Examples include seeking court orders to require the unlicensed individual or entity to stop the activity, informing law enforcement authorities of criminal and/or civil concerns, and publicising the fact that the individual/entity is not licensed to conduct insurance intermediation.
ICP 19  Conduct of Business

The supervisor requires that insurers and intermediaries, in their conduct of insurance business, treat customers fairly, both before a contract is entered into and through to the point at which all obligations under a contract have been satisfied.

Introductory Guidance

19.0  Requirements for the conduct of insurance business help to:

- protect policyholders and promote fair consumer outcomes;
- strengthen public trust and consumer confidence in the insurance sector;
- minimise the risk of insurers and intermediaries following business models that are unsustainable or pose reputational risk, thereby complementing the risk management framework of a solvency regime; and
- support a sound and resilient insurance sector by creating level playing fields in terms of the basis on which insurers and intermediaries can compete while maintaining business practices that support the fair treatment of customers.

19.0.2  Fair treatment of customers encompasses achieving outcomes such as:

- developing, marketing and selling products in a way that pays due regard to the interests and needs of customers;
- providing customers with information before, during and after the point of sale that is accurate, clear, and not misleading;
- minimising the risk of sales which are not appropriate to customers’ interests and needs;
- ensuring that any advice given is of a high quality;
- dealing with customer claims, complaints and disputes in a fair and timely manner; and
- protecting the privacy of information obtained from customers.

19.0.3  Conduct of business, including business practices, is closely linked with jurisdictions’ tradition, culture, legal regime and the degree of development of the insurance sector. For this reason, supervisory approaches to the conduct of business also tend to vary. Such diversity should be taken into consideration in implementing this ICP, and related standards and guidance material, in order to achieve the outcome of fair treatment of customers. The fair treatment of customers encompasses concepts such as ethical behaviour, acting in good faith and the prohibition of abusive practices.

19.0.4  Requirements for the conduct of insurance business may differ depending on the nature of the customer with whom an insurer or intermediary interacts and the type of insurance provided. The scope of
requirements for conduct of insurance business should reflect the risk of unfair treatment of customers, taking into account the nature of the customer and the type of insurance provided.

19.0.5 As part of assessing the fulfilment of requirements for conduct of insurance business, the supervisor should consider the consumer outcomes that are being achieved under these requirements. This includes consumer outcomes that arise due to industry-wide — as well as insurer-specific — factors.

19.0.6 Supervisors may wish to issue guidelines or rules on their expectations to help insurers and intermediaries achieve fair treatment of customers. In addition, the supervisor could support industry guidelines or best practices with this objective.

19.0.7 Detailed conduct of business rules may not be appropriate for reinsurance transactions, where benefits under a policy are not affected by the reinsurance arrangements (see ICP 13 Reinsurance and Other Forms of Risk Transfer). Nonetheless, this does not relieve insurers and reinsurers of their duty to provide each other with complete and accurate information.

Respective responsibilities

19.0.8 The insurer has a responsibility for good conduct throughout the insurance life-cycle, as it is the insurer that is the ultimate risk carrier. However, where more than one party is involved in the design, marketing, distribution and policy servicing of insurance products, the good conduct in respect of the relevant service(s) is a shared responsibility of those involved.

19.0.9 Intermediaries typically play a significant role in insurance distribution but may also be involved in other areas. Their interface between customers and insurers gives them a key role, and their good conduct in performing the services in which they are involved is critical in building and justifying public trust and confidence in the insurance sector.

19.0.10 Insurers sometimes outsource specific processes, such as claims handling, to third parties (including intermediaries). Where an insurer outsources processes, the insurer should only deal with third parties whose policies, procedures and processes are expected to result in fair treatment of customers; the insurer retains ultimately responsibility for those functions.

Cross-border and group considerations

19.0.11 Legislation should provide requirements with which insurers and intermediaries must comply, including foreign insurers and intermediaries selling products on a cross-border basis.

19.0.12 Effective assessment of the quality of conduct of insurance business requires, to a large extent, supervisory consideration of strategies, policies, processes, procedures and controls that apply to the provision of insurance products and services to customers, and which are more easily assessed through supervision at the insurance legal entity, rather than group, level.
19.0.13 Where insurance legal entities are part of an insurance group, the application of appropriate policies and processes on conduct of business should be consistent across the group, recognising local requirements and specificities, and should result in the fair treatment of customers on a group-wide basis. In addition, there are a number of other group-related aspects that are relevant to the supervision of conduct of business by insurers and intermediaries, such as:

- public disclosure by the supervisor of the regulatory requirements in respect of the offering of cross-border insurance;
- disclosure to customers of the group to which an underwriter belongs; and
- the potential risks from group entities that could affect policies being sold or administered.

The supervisor should consider the implications arising from group structures in applying the Standards of this ICP.

Supervisory cooperation

19.0.14 Supervisors should be aware of the conduct of business requirements set by the regulators of other financial services sectors with a view to minimising unnecessary inconsistencies, possible duplication and the potential for regulatory arbitrage.

19.0.15 In some jurisdictions responsibility for the supervision of insurers or intermediaries is shared between more than one authority, or between different departments within a single authority, with different authorities or departments responsible for conduct and prudential supervision. Where this is the case, the relevant authorities or departments should communicate, and cooperate where possible, to ensure that there is an understanding of all the relevant risks.

19.0.16 The supervisor should also consider having in place adequate coordination arrangements to deal with conduct of business issues arising in cross-border business.

Fair treatment of customers

19.1 The supervisor requires insurers and intermediaries to act with due skill, care and diligence when dealing with customers.

19.1.1 The supervisor should require insurers and intermediaries to have policies and processes in place to achieve this outcome, including taking appropriate measures to ensure that their employees and agents meet high standards of ethics and integrity.

19.2 The supervisor requires insurers and intermediaries to establish and implement policies and processes on the fair treatment of customers, as an integral part of their business culture.

19.2.1 Supervisors should require insurers and intermediaries to have policies and processes in place to achieve the fair treatment of customers and should monitor whether such policies and processes are adhered to.
19.2.2 Proper policies and processes dealing with the fair treatment of customers are likely to be particularly important with respect to retail customers, because of the greater asymmetry of information that tends to exist between the insurer or intermediary and the individual retail customer.

19.2.3 Supervisory requirements with respect to fair treatment of customers may vary depending on the legal framework in place in a particular jurisdiction. The desired outcome of fair treatment of customers may be achieved through a variety of approaches, with some jurisdictions favouring a principles-based set of requirements, some favouring a rules-based approach, and others following some combination of approaches.

19.2.4 Ensuring the achievement of fair outcomes for customers will tend to require that insurers and intermediaries adopt the fair treatment of customers as an integral part of their business culture, and that policies and processes to support this objective are properly embedded in the organisation. Embedding a culture of fair treatment of customers may include the following:

- **Strategy:** Fair treatment of customers should be an objective taken into consideration in the design of the business strategy, product design, product distribution, and product performance.

- **Leadership:** Overall responsibility for fair treatment of customers should be at the level of the Board and Senior Management, who should design, implement, and monitor adherence to, policies and processes aimed at ensuring that customers are treated fairly. This sets the tone for the business.

- **Decision making:** All decisions that impact on customers should be subject to particular scrutiny in terms of whether they support the fair treatment of customers.

- **Internal controls:** Monitoring the fair treatment of customers requires relevant management information to be identified, collected and evaluated. Internal reports should include the most useful information and indicators to allow the Board and Senior Management to measure the insurer’s or intermediary’s performance with respect to fair treatment of customers. Mechanisms and controls should be established to ensure that departures from policies and processes as well as other situations that jeopardise the interests of customers, are promptly remedied.

- **Performance management:** Appropriate attention should be paid to the recruitment of staff and agents who meet high standards of ethics and integrity. Relevant staff should be trained to deliver appropriate outcomes in terms of fair treatment of customers. Evaluation of performance should include the contribution made to achieving these outcomes.
There should be appropriate performance management consequences for staff who fail to meet these standards.

- **Reward:** Remuneration and reward strategies should take account of the fair treatment of customers. Reward structures need to reflect quality issues and not encourage or reward the unfair treatment of customers. Remuneration structures that create conflicts of interest may lead to poor customer outcomes.

19.2.5 Insurers’ and intermediaries’ strategies, policies and processes dealing with the fair treatment of customers should be made available to the supervisor. The supervisor should encourage insurers and intermediaries to make relevant policies and processes publicly available as good practice, in particular their claims handling, complaints handling and dispute resolution policies and processes.

19.3 The supervisor requires insurers and intermediaries to avoid or properly manage any potential conflicts of interest.

19.3.1 In their dealings either with each other or with customers, insurers and intermediaries may encounter conflicts of interest.

19.3.2 Where conflicting interests compete with duties of care owed to customers, they can create risks that insurers and intermediaries will not act in customers’ best interests. Conflicts of interest can arise from compensation structures as well as other financial and non-financial incentives.

19.3.3 Where compensation structures do not align the interests of the insurer and intermediary, including those of the individuals carrying out intermediation activity, with the interests of the customer, they can encourage behaviour that results in unsuitable sales or other breach of the insurer’s or intermediary’s duty of care towards the customer.

19.3.4 Other incentives that may create a conflict of interest include performance targets or performance management criteria that are insufficiently linked to customer outcomes. They also include the soliciting or accepting of inducements where this would conflict with the insurer’s or intermediary’s duty of care towards its customers.

19.3.5 An inducement can be defined as a benefit offered to an insurer or intermediary, or any person acting on its behalf, incentivising that firm/person to adopt a particular course of action. This may include cash, cash equivalents, commission, goods and hospitality. Where intermediaries who represent the interests of customers receive inducements from insurers, this could result in a conflict of interest that could affect the independence of advice given by them.

19.3.6 As an insurance intermediary interacts with both the customer and the insurer, an intermediary is more likely than an insurer to encounter conflicts of interest. For an insurance intermediary, examples of where a conflict of interest may occur include:

- where the intermediary owes a duty to two or more customers in respect of the same or related matters – the intermediary
may be unable to act in the best interests of one without adversely affecting the interests of the other;

• where the relationship with a party other than the customer influences the advice given to the customer;

• where the intermediary is likely to make a financial gain, or avoid a financial loss, at the expense of the customer;

• where the intermediary has an interest in the outcome of a service provided to, or a transaction carried out on behalf of, a customer which is distinct from the customer's interest;

• where the intermediary has significant influence over the customer's decision (such as in an employment relationship) and the intermediary's interest is distinct from that of the customer;

• where the intermediary receives an inducement to provide a service to a customer other than the standard or "flat" fee or commission for that service; and

• where the intermediary has an indirect interest in the outcome of a service provided to, or a transaction carried out on behalf of, a customer due to an association with the party that directly benefits (such as soliciting insurance products which are sold together with other financial services in a bancassurance relationship) and where such indirect interest is distinct from the customer's interest (such as the cross-selling or self-placement of business).

19.3.7 The supervisor should require that insurers and intermediaries take all reasonable steps to identify and avoid or manage conflicts of interest, and communicate these through appropriate policies and processes.

19.3.8 Appropriate disclosure can provide an indication of potential conflicts of interests, enabling the customer to determine whether the sale may be influenced by financial or non-financial incentives. It can thus help in managing conflicts of interest where it empowers consumers to identify and challenge or avoid potentially poor advice or selling that may arise through the conflict of interest. However, managing conflicts of interest through disclosure or obtaining informed consent from customers, has limitations, including where the customer does not fully appreciate the conflict or its implications, and could be seen to place an unreasonable onus on the customer.

19.3.9 Where conflicts of interest cannot be managed satisfactorily, this should result in the insurer or intermediary declining to act. In cases where the supervisor may have concerns about the ability of insurers and intermediaries to manage conflicts of interest adequately, the supervisor may consider requiring other measures.

19.4 The supervisor requires insurers and intermediaries to have arrangements in place in dealing with each other to ensure the fair treatment of customers.

19.4.1 The supervisor should require insurers to conduct business only with intermediaries that are licensed, and to verify that the intermediaries
under such arrangements have the appropriate knowledge and ability with which to conduct such business.

19.4.2 The supervisor may require insurers to report any significant issues of which they become aware and have transparent mechanisms to handle complaints against intermediaries. This may include identifying whether particular intermediaries or particular matters are the subject of regular or frequent complaints. Documentation on this will enable insurers to report recurring issues to the supervisor where the matters identified may be relevant to the supervisor’s assessment of the intermediaries concerned.

19.4.3 Supervisory measures to prevent or respond to a breach of regulatory requirements by an intermediary may include action against insurers in the case of direct sales or where an insurer knowingly cooperates with an intermediary that is in breach of its regulatory requirements.

19.4.4 Insurers and intermediaries should ensure that written agreements are established in respect of their business dealings with each other, to clarify their respective roles and promote the fair treatment of customers. Such agreements would include, where relevant, respective responsibilities on matters such as:

- product development;
- product promotion;
- the provision of pre-contractual and point of sale information to customers;
- post-sale policy servicing;
- claims notification and handling;
- complaints notification and handling;
- management information and other documentation required by the insurer;
- remedial measures; and
- any other matters related to the relationship with customers.

Product development and pre-contractual stage

19.5 The supervisor requires insurers to take into account the interests of different types of consumers when developing and distributing insurance products.

19.5.1 This can be achieved through a product approval approach, a “principles-based” approach or a combination of both. In a product approval approach, the supervisor requires insurers to submit insurance product proposals for supervisory review and approval prior to product launch. In a “principles-based” approach, the onus is placed on the insurer’s Board and Senior Management to ensure that products and distribution strategies are developed in accordance with the principles.

19.5.2 In some cases, product development is undertaken by intermediaries on behalf of insurers for whom they act. In such cases, the intermediaries involved are responsible for taking customers’ interests and needs into
account in performing this work. Nevertheless, the insurer should retain oversight of, and remains accountable for, the development of its products and its distribution strategies.

**Product approval approach**

19.5.3 Where supervisors have the power to approve contract conditions or pricing, the approval process should balance the protection of customers against the potential benefits to customers of innovation and choice in insurance products. For example, supervisory approval of contract conditions or pricing is likely to be more appropriate in certain circumstances, such as where the insurer is dealing with less financially-capable or vulnerable customers, where products are new to the market or complex, or insurance contracts that are required by law such as automobile liability insurance or health insurance.

19.5.4 In such situations the supervisor may review products for compliance with things such as:

- mandated policy limits;
- coverage of specified risks, procedures or conditions;
- absence of prohibited exclusions; and
- compliance with specifically required policy language.

**Principles-based approach**

19.5.5 Where supervisors follow a more principles-based approach, supervisors may issue guidance in terms of what is expected of insurers and intermediaries. This may include the following:

- Development of products and distribution strategies should include the use of adequate information to assess the needs of different consumer groups.
- Product development (including a product originating from a third party) should provide for a thorough assessment of the main characteristics of a new product and of the related disclosure documents by every appropriate department of the insurer.
- Before bringing a product or service to the market, the insurer should carry out a diligent review and testing of the product in relation to its business model, the applicable laws and regulations and its risk management approach. In particular, the policies, procedures and controls put into place should enable the insurer to:
  - offer a product that delivers the reasonably expected benefits;
  - target the consumers for whose needs the product is likely to be appropriate, while preventing, or limiting, access by consumers for whom the product is likely to be inappropriate;
ensure that distribution methods are appropriate for the product, particularly in light of the legislation in force and whether or not advice should be provided;

- assess the risks resulting from the product by considering, among other things, changes associated with the environment or stemming from the insurer’s policies that could harm customers; and

- monitor a product after its launch to ensure it still meets the needs of target customers, assess the performance of the various methods of distribution used with respect to sound commercial practices and, if necessary, take the necessary remedial action.

- Insurers should provide relevant information to intermediaries to ensure that they understand the target market (and thus reduce the risk of mis-selling), such as information related to the target market itself, as well as the characteristics of the product.

- The intermediary should, in return, provide information to the insurer on the types of customers to whom the product is sold and whether the product meets the needs of that target market, in order to enable the insurer to assess whether its target market is appropriate and to revise its distribution strategy for the product, or the product itself, when needed.

19.5.6 Supervisors may require insurers to submit specific information relating to the manner in which the development of insurance products complies with the legislated principles at any time, including prior to the launch of the product (pre-notification).

19.6 The supervisor requires insurers and intermediaries to promote products and services in a manner that is clear, fair and not misleading.

19.6.1 The insurer should be responsible for providing promotional material that is accurate, clear and not misleading not only to customers but also to intermediaries who may rely on such information.

19.6.2 Before an insurer or intermediary promotes an insurance product, it should take reasonable steps to ensure that the information provided is accurate, clear and not misleading. Procedures should provide for an independent review of promotional material intended for customers other than by the person or organisation that prepared or designed it. For example, where promotional material is developed by an intermediary on behalf of an insurer, the insurer should verify the accuracy of promotional material before it is used.

19.6.3 If an insurer or intermediary becomes aware that the promotional material is not accurate and clear or is misleading, it should:

- inform the insurer or intermediary responsible for that material;

- withdraw the material; and

- notify any person that it knows to be relying on the information as soon as reasonably practicable.
19.6.4 In addition, to promote products in a fair manner, the information provided by an insurer or intermediary should:

- be easily understandable;
- accurately identify the product provider;
- be consistent with the coverage offered;
- be consistent with the result reasonably expected to be achieved by the customers of that product;
- state prominently the basis for any claimed benefits and any significant limitations; and
- not hide, diminish or obscure important statements or warnings.

19.7 The supervisor requires insurers and intermediaries to provide timely, clear and adequate pre-contractual and contractual information to customers.

19.7.1 The insurer or intermediary should take reasonable steps to ensure that a customer is given appropriate information about a product in order that the customer can make an informed decision about the arrangements proposed. Such information is also useful in helping customers understand their rights and obligations after sale.

19.7.2 Where insurers use intermediaries for the distribution of insurance products, the insurer should be satisfied that the intermediaries involved are providing information to customers in a manner that will assist them in making an informed decision.

Timing of the provision of information to customers

19.7.3 Customers should be appropriately informed before and at the point of sale. Information should enable an informed decision to be made by the customer before entering into a contract. In determining what is “timely”, an insurer or intermediary should consider the importance of the information to the customer’s decision-making process and the point at which the information may be most useful.

Clear delivery of information to customers

19.7.4 Information should be provided in a way that is clear, fair and not misleading. Wherever possible, attempts should be made to use plain language that can easily be understood by the customer.

19.7.5 Mandatory information should be prepared in written format, on paper or in a durable and accessible medium (electronic, for instance).

19.7.6 Focus should be on the quality rather than quantity of information, as there is a risk that if the disclosure becomes too voluminous then the customer may be less likely to read the information.

19.7.7 The quality of disclosure may also be improved by the introduction of a standardised format for disclosure (such as a product information sheet), which will aid comparability across competing products and allow for a more informed choice. Standard formats should be tested to ensure that they help understandability.
19.7.8 There is likely to be an enhanced need for clear and simple disclosure for more complex or “bundled” products, which are difficult for consumers to understand, such as packaged retail insurance-based investment products (PRIIPS), particularly regarding the costs, risks involved and performance.

19.7.9 Insurers and intermediaries should be able to demonstrate to the supervisor that customers have received information necessary to understand the product.

Adequacy of information provided to customers

19.7.10 The information provided should be sufficient to enable customers to understand the characteristics of the product they are buying and help them understand whether and why it may meet their requirements.

19.7.11 The level of information required will tend to vary according to matters such as:

- the knowledge and experience of a typical customer for the policy in question;
- the policy terms and conditions, including its main benefits, exclusions, limitations, conditions and its duration;
- the policy’s overall complexity;
- whether the policy is bought in connection with other goods and services; and
- whether the same information has been provided to the customer previously and, if so, when.

Disclosure of product features

19.7.12 While the level of product information required may vary, it should include information on key features, such as:

- the name of the insurer, its legal form and, where relevant, the group to which it belongs;
- the type of insurance contract on offer, including the policy benefits;
- a description of the risk insured by the contract and of the excluded risks;
- the level of the premium, the due-date and the period for which the premium is payable, the consequences of late or non-payment, and provisions for premium reviews;
- the type and level of charges to be deducted from or added to the quoted premium, and any charges to be paid directly by the customer;
- when the insurance cover begins and ends; and
- prominent and clear information on significant or unusual exclusions or limitations. A significant exclusion or limitation is one that would tend to affect the decision of consumers generally to buy. An unusual exclusion or limitation is one that
is not normally found in comparable contracts. In determining what exclusions or limitations are significant, an insurer or intermediary should, in particular, consider the exclusions or limitations that relate to the significant features and benefits of a policy and factors which may have an adverse effect on the benefit payable under it. Examples of significant or unusual exclusions or limitations may include:

- deferred payment periods;
- exclusion of certain conditions, diseases or pre-existing medical conditions;
- moratorium periods;
- limits on the amounts of cover;
- limits on the period for which benefits will be paid;
- restrictions on eligibility to claim such as age, residence or employment; and
- excesses.

19.7.13 Where a policy is bought in connection with other goods or services, the premium should be disclosed separately from any other prices. It should be made clear whether buying the policy is compulsory and, if so, whether it can be purchased elsewhere.

19.7.14 For investment-based insurance products, information on investment performance is generally provided. Where this includes an indication of past, simulated or future performance, the information should include any limits on upside or downside potential and a prominent warning that past performance is not a reliable indicator of future performance.

19.7.15 A helpful means to ensure that accurate and comprehensible information is provided to the customer is a product information sheet containing information on key product features that are of particular significance to the conclusion or performance of the insurance contract. The product information sheet should be clearly identified as such and it should be pointed out to the customer that the information is not exhaustive. Insofar as the information concerns the content of the contract, reference should be made as appropriate to the relevant provisions of the contract or to the general policy conditions underlying the contract. Insurers, and intermediaries where they are involved, should consider the use of evaluation by third parties, such as consumer testing, in developing product information sheets in order to ensure their understandability.

Disclosure of rights and obligations

19.7.16 Retail customers, in particular, often have only limited knowledge about the legal rights and obligations arising from an insurance contract. Before an insurance contract is concluded, the insurer or intermediary, should inform a retail customer on matters such as:

- General provisions – including applicable law governing the contract;
- Obligation to disclose material facts – including prominent and clear information on the obligation on the customer to disclose
material facts truthfully. Ways of ensuring a customer knows what he or she must disclose include explaining the duty to disclose all circumstances material to a policy and what needs to be disclosed, and explaining the consequences of any failure to make such a disclosure. Alternatively, rather than an obligation of disclosure, the customer may be asked clear questions about any matter material to the insurer;

- Obligations to be complied with when a contract is concluded and during its lifetime, as well as the consequences of non-compliance;

- Obligation to monitor cover – including a statement, where relevant, that the customer may need to review and update the cover periodically to ensure it remains adequate;

- Right to cancel – including the existence, duration and conditions relating to the right to cancel. If there are any charges related to the early cancellation or switching of a policy, this should be prominently disclosed;

- Right to claim benefits – including conditions under which the policyholder can claim and the contact details to notify a claim;

- Obligations on the customer in the event of a claim; and

- Right to complain – including the arrangements for handling policyholders’ complaints, which may include an insurer’s internal claims dispute mechanism or the existence of an independent dispute resolution mechanism.

19.7.17 Where applicable, the customer may also be provided with information on any policyholder protection scheme or compensation scheme in the case of an insurer not being able to meet its liabilities and any limitations on such a scheme.

19.7.18 If the insurance undertaking is a foreign insurer, the insurer or intermediary should be required to inform the customer, before any commitment is entered into, of details such as:

- the home authority responsible for the supervision of the insurer;

- the jurisdiction in which the head office or, where appropriate, the branch with which the contract is to be concluded is situated; and

- the relevant provisions for making complaints or independent dispute resolution arrangements.

Disclosure specific to internet sales or sales through other digital means

19.7.19 Insurers and intermediaries are increasingly using digital distribution channels to market and sell insurance products, including internet and mobile phone solutions

19.7.20 It may be more difficult for consumers to understand from which location the insurer or intermediary is operating, their identity, and by whom and
where they are licensed. This may especially be the case where more than one insurer or intermediary is involved in the distribution chain.

19.7.21 In conducting insurance business through digital channels, insurers and intermediaries should take into account the specificities of the medium used, and use appropriate tools to ensure that customers receive timely, clear and adequate information that helps their understanding of the terms on which the business is conducted.

19.7.22 The supervisor should require that insurers and intermediaries which offer insurance products through digital means disclose relevant business and contact information (eg on their website), such as:

- the address of the insurer’s head office and the contact details of the supervisor responsible for the supervision of the head office;
- contact details of the insurer, branch or intermediary, and of the supervisor responsible for the supervision of the business, if different from the above;
- the jurisdictions in which the insurer or intermediary is legally permitted to provide insurance;
- procedures for the submission of claims and a description of the claims handling procedures; and
- contact information on the authority or organisation dealing with dispute resolution and/or consumer complaints.

19.7.23 The supervisor should apply to digital insurance activities requirements on transparency and disclosure so as to provide an equivalent level of protection to customers as those applied to insurance business conducted through non-digital means.

19.8 Where customers receive advice before concluding an insurance contract the supervisor requires that the advice provided by insurers and intermediaries takes into account the customer’s disclosed circumstances.

19.8.1 Advice goes beyond the provision of product information and relates specifically to the provision of a personalised recommendation on a product in relation to the disclosed needs of the customer.

19.8.2 The insurer or the intermediary should make it clear to the customer whether advice is provided or not.

19.8.3 Insurers and intermediaries should seek the information from their customers that is appropriate for assessing their insurance demands and needs, before giving advice. This information may differ depending on the type of product and may, for example, include information on the customer’s:

- financial knowledge and experience;
- needs, priorities and circumstances;
- ability to afford the product; and
- risk profile.
19.8.4 The supervisor may wish to specify particular types of policies or customers for which advice is not required to be given. Typically, this may include simple to understand products, products sold to customer groups that have expert knowledge of the type of product or, where relevant, mandated coverage for which there are no options. Even if no advice is given the supervisor may require the insurer or intermediary to take into account the nature of the product and the customer’s disclosed circumstances and demands and needs.

19.8.5 In cases where advice would normally be expected, such as complex or investment-related products, and the customer chooses not to receive advice, it is advisable that the insurer or intermediary retains an acknowledgment by the customer to this effect.

19.8.6 The basis on which a recommendation is made should be explained and documented, particularly in the case of complex products and products with an investment element. All advice should be communicated in a clear and accurate manner, comprehensible to the customer. Where advice is provided, this should be communicated to the customer in written format, on paper or in a durable and accessible medium, and a record kept in a “client file”.

19.8.7 The insurer or intermediary should retain sufficient documentation to demonstrate that the advice provided was appropriate, taking into account the customer’s disclosed circumstances.

19.8.8 In addition, insurers and intermediaries should review the “client files” of those under their responsibility to exercise control after the fact on the quality of the advice given, take any necessary remedial measures with respect to the delivery of advice and, if applicable, be in a position to examine fairly any complaints submitted to it.

19.8.9 There should be a responsibility on the insurer and the intermediary to promote quality advice. In order to ensure the delivery of quality advice, the insurer and intermediary should, in particular, establish continuous training programmes that allow the persons giving advice to:

- keep abreast of market trends, economic conditions, innovations and modifications made to the products and services;
- maintain an appropriate level of knowledge about their industry segment, including the characteristics and risks of the products and services;
- know the applicable legal and regulatory requirements;
- know the requirements for the communication of information regarding the products and services and for appropriate disclosure of any situation liable to compromise the impartiality of the advice given or limit such advice; and
- be familiar with the documentation regarding the products and services and answer reasonably foreseeable questions.

This could include insurers providing training to their sales staff and to intermediaries in respect of specific products.
Policy servicing

19.9 The supervisor requires insurers to:

- service policies appropriately through to the point at which all obligations under the policy have been satisfied;
- disclose to the policyholder information on any contractual changes during the life of the contract; and
- disclose to the policyholder further relevant information depending on the type of insurance product.

19.9.1 For the purposes of this standard, “policyholder” refers only to the party to whom a contract of insurance is issued by an insurer (as opposed to the broader IAIS definition).

19.9.2 Supervisors should require insurers to satisfy obligations under a policy in an appropriate manner and in accordance with the contractually agreed terms and legal provisions. This should include fair treatment in the case of switching between products or early cancellation of a policy. To enable them to do so, insurers should maintain a relationship with the customer throughout the policy lifecycle.

19.9.3 Although ongoing policy servicing is traditionally seen as primarily the responsibility of the insurer, intermediaries are often involved, particularly where there is an ongoing relationship between the customer and the intermediary. The insurer should remain ultimately responsible for servicing policies throughout their life-cycle, and ensuring that intermediaries have appropriate policies and processes in place in respect of the policy servicing activities that they perform on the insurer’s behalf.

19.9.4 Policy servicing includes the provision of relevant information to customers throughout the life of the policy.

Information on the insurer

19.9.5 Information to be disclosed by the insurer to the policyholder includes:

- any change in the name of the insurer, its legal form or the address of its head office and any other offices as appropriate;
- any acquisition by another undertaking resulting in organisational changes as far as the policyholder is concerned; and
- where applicable, information on a portfolio transfer (including policyholders’ rights in this regard).

Information on terms and conditions

19.9.6 Insurers should provide evidence of cover (including policy inclusions and exclusions) promptly after inception of a policy.

19.9.7 Information to be provided on an ongoing basis, including changes in policy terms and conditions or amendments to the legislation applicable to the policy, will vary by type of policy and may cover for example:
• main features of the insurance benefits, in particular details on the nature, scope and due-dates of benefits payable by the insurer;

• the total cost of the policy, expressed appropriately for the type of policy, including all taxes and other cost components; premiums should be stated individually if the insurance relationship comprises several independent insurance contracts or, if the exact cost cannot be provided, information provided on its basis of calculation to enable the policyholder to verify the cost;

• any changes to the cost structure, if applicable, stating the total amount payable and any possible additional taxes, fees and costs not levied via or charged by the insurer, as well as any costs incurred by the policyholder for the use of communication methods if such additional costs are chargeable;

• duration of the contract, terms and conditions for (early) termination of the contract and contractual consequences;

• means of payment of premiums and duration of payments;

• premiums for each benefit, both main benefits and supplementary benefits;

• information to the policyholder about the need to report depreciation/appreciation;

• information to the policyholder about other unique circumstances related to the contract;

• information on the impact of a switch option of an insurance contract;

• information on a renewal of the contract; and

• information on the ongoing suitability of the product, if such a service is provided by the insurer or intermediary.

19.9.8 Additional information provided to the policyholder regarding products with an investment element should at least include:

• participation rights in surplus funds;

• the basis of calculation and state of bonuses;

• the current surrender value;

• premiums paid to date; and

• for unit-linked life insurance, a report from the investment firm (including performance of underlying funds, changes of investments, investment strategy, number and value of the units and movements during the past year, administration fees, taxes, charges and current status of the account of the contract).
19.9.9 Where there are changes in terms and conditions, the insurer should notify the policyholder of their rights and obligations regarding such changes and obtain the policyholder’s consent as appropriate.

19.10 The supervisor requires insurers to handle claims in a timely, fair and transparent manner.

19.10.1 Supervisors should require that insurers have fair and transparent claims handling and claims dispute resolution policies and processes in place.

Claims handling

19.10.2 Insurers should maintain written documentation on their claims handling procedures, which include all steps from the claim being raised to its settlement. Such documentation may include expected timeframes for these steps, which might be extended in exceptional cases.

19.10.3 Claimants should be informed about procedures, formalities and common timeframes for claims settlement.

19.10.4 Claimants should be given information about the status of their claim in a timely and fair manner.

19.10.5 Claim-determinative factors such as deprec iations, discounting or negligence should be illustrated and explained in comprehensive language to claimants. The same applies where claims are denied in whole or in part.

19.10.6 Sometimes intermediaries serve as an initial contact for claimants, which may be in the common interest of the policyholder, intermediary and insurer.

19.10.7 A fair claims assessment process requires avoidance of conflicts of interest, as well as appropriate competence and ongoing training of the staff involved.

19.10.8 Competence requirements for claims assessment differ depending on the type of insurance policy and generally include technical and legal expertise.

Claims disputes

19.10.9 In the course of claims settlement, a dispute may arise between the claimant and the insurer on the claims settlement amount, or coverage. Staff handling claims disputes should be experienced in claims handling and be appropriately qualified.

19.10.10 Dispute resolution procedures should follow a balanced and impartial approach, bearing in mind the legitimate interests of all parties involved. Procedures should avoid being overly complicated, such as having burdensome paperwork requirements. Decisions should include the reasoning in clear language relating closely to the specific disputable issues.

19.10.11 Supervisors may encourage insurers to have mechanisms in place to review claims disputes within the insurer to promote fair play and objectivity in the decisions.

Outsourcing
19.10.12 If any of the claims handling processes are outsourced in part or in full, then supervisors should require insurers to maintain close oversight and ultimate responsibility for the provision of fair and transparent claims handling and claims dispute resolution.

19.11 The supervisor requires insurers and intermediaries to handle complaints in a timely and fair manner.

19.11.1 A complaint can be defined as an expression of dissatisfaction about the service or product provided by an insurer or intermediary. It may involve, but should be differentiated from, a claim and does not include a pure request for information.

19.11.2 Insurers and intermediaries should establish policies and processes to deal in a fair manner with complaints which they receive. These should include keeping a record of each complaint and the measures taken for its resolution.

19.11.3 Insurers and intermediaries should make information on their policies and processes on complaints handling available to customers.

19.11.4 Insurers and intermediaries should respond to complaints without unnecessary delay; complainants should be kept informed about the handling of their complaints.

19.11.5 Insurers and intermediaries should analyse the complaints they receive to identify trends and recurring risks. Analysis of what leads to individual complaints can help them to identify, and enable them to correct, common root causes.

19.11.6 Insurers should analyse complaints that they receive against intermediaries in respect of products that the intermediaries have distributed on their behalf, to enable them to assess the complete customer experience and identify any issues that need to be addressed.

19.11.7 Supervisors may choose to have their own complaints monitoring systems in place in order to benefit from the findings resulting from policyholder complaints.

19.11.8 Some insurers and intermediaries may decide to establish a mechanism to review complaints, in order to ensure respective policies on complaint handling are in place.

Independent dispute resolution mechanisms

19.11.9 It is important that there are simple, affordable, easily accessible and equitable mechanisms in place, independent of insurers and intermediaries, to resolve disputes that have not been resolved by the insurer or intermediary. Such mechanisms, collectively referred to here as Independent Dispute Resolution (IDR) mechanisms, may vary across jurisdictions and may include mediation, an independent review organisation, or an ombudsman. These are out of court mechanisms.

19.11.10 IDR mechanisms often operate on the basis of a code of procedure, or in some cases legislative rules, and may be restricted to retail policyholders. They are sometimes free of charge for such policyholders. Decisions are generally non-binding for the policyholder but may be binding for the insurer or intermediary within certain limits. As consumers
may still avail themselves of court processes if the dispute is not satisfactorily resolved, it is usually agreed that the period of limitation is suspended during an IDR procedure.

19.11.11 Mediators serving IDR mechanisms should meet high standards of professional knowledge, integrity and competence. This would be evidenced, for example, where the mediator is qualified to exercise the functions of a judge and is well grounded in the field of insurance law. Although IDR mechanisms are usually financed by insurers and/or intermediaries, their mediators must be independent from them. Doubts over independence may be expected if the mediator:

- is subject to instructions from insurers/intermediaries;
- is a former employee of an insurer/intermediary; or
- simultaneously performs other functions which could affect their independence.

19.12 The supervisor requires insurers and intermediaries to have policies and processes for the protection and use of information on customers.

19.12.1 Insurers and intermediaries collect, hold, use or communicate to third parties information on their customers in the course of their business. It is important that they have in place policies and processes on the appropriate use and, in the case of personal information, the privacy of such data.

Protecting the privacy of personal information

19.12.2 Significant amounts of the information collected, held or processed represent customers’ financial, medical and other personal information. Security over such information is extremely important, regardless of the format of the information (e.g. whether physical or electronic). Hence safeguarding personal information on customers is one of the key responsibilities of the financial services industry.

19.12.3 Legislation identifies the provisions relating to privacy protection under which insurers and intermediaries are allowed to collect, hold, use or communicate personal information on customers to third parties. Generally, the legislation also identifies who is the competent authority.

19.12.4 Although data protection laws vary from jurisdiction to jurisdiction, insurers and intermediaries should have a clear responsibility to provide their customers with a level of comfort regarding the security of their personal information.

19.12.5 In view of the sensitivity of private information and the risks to consumers and to the insurance sector in the event of failures to protect the privacy of such information, the supervisor should be satisfied that insurers and intermediaries have sufficient safeguards in place to protect the privacy of personal information on customers. To achieve this the supervisor should require insurers and intermediaries to have appropriate policies and processes in place. Such policies and processes should seek to embed the importance of protecting the privacy of personal information within the organisation, as well as provide appropriate management of the risks. Examples of areas that may be covered include:
• ensuring that the Board and Senior Management are aware of the challenges relating to protecting the privacy of personal information on customers;

• demonstrating that privacy protection is part of the organisation’s culture and strategy, through measures such as training to employees that promotes awareness of internal and external requirements on this subject;

• implementing policies, procedures and internal control mechanisms that support the objectives of protecting the privacy of personal information on customers and assess the risks associated with potential failure to protect the privacy of personal information;

• assessing the potential impact of new and emerging risks that could threaten the privacy of personal information, such as the risk of cyber attacks, and taking appropriate steps to mitigate these through measures such as internal controls, technology and training; and

• determining the response measures that may be needed where a failure to protect the privacy of personal information occurs, including matters such as timely notification to affected customers and competent authorities.

In assessing policies and processes to protect the privacy of personal information on customers, depending on the jurisdiction, the supervisor may need to liaise with the relevant competent authority.

Protection against the misuse of customer information

19.12.6 Insurers and intermediaries use personal and other information on customers for a variety of purposes within the course of business that include, amongst other things, product development, marketing, product pricing, and claims management.

19.12.7 The supervisor should not allow insurers and intermediaries to use customer information that they collect and hold in a manner that results in unfair treatment. Insurers and intermediaries should have appropriate policies and processes in place. The measures that the supervisor should expect such policies and processes to cover may include:

• ensuring that the appropriate technology is available and in place to manage adequately the personal and other information an insurer or intermediary is holding on a customer;

• implementing policies and processes relating to the use of data, ensuring that the data collected is not used in an unfair manner including when processed through algorithms or other technologies;

• ensuring that such policies and processes provide that customer data will not be abused to circumvent rules on prohibitions on aggressive marketing practices or discrimination;
ensuring that customers have a right to access and, if needed, to correct data collected and used by insurers and intermediaries; and

• ensuring that group structures are not abused to circumvent prohibitions on the sharing of personal information.

In assessing policies and processes to prevent the use of customer information in a manner that results in unfair treatment, depending on the jurisdiction, the supervisor may need to liaise with the relevant competent authority.

**Outsourcing**

19.12.8 Insurers and intermediaries should be aware of outsourcing risk, especially when the outsourcing agreement is reached with firms in another jurisdiction. Insurers and intermediaries should ensure that the firms to which they outsource processes have adequate policies and processes in place for the protection and use of private information on customers they have in their records.

**Data access in the event of reorganisation**

19.12.9 All the necessary data required in the event of restructuring, resolution and liquidation should, subject to data protection requirements, be accessible and readable at the insurer's or intermediary's domicile at any time. This includes all customer-related data, such as claims and policy data.

**Information supporting fair treatment**

19.13 The supervisor publicly discloses information that supports the fair treatment of customers.

19.13.1 The supervisor should publish the policyholder protection arrangements that are in place for insurance contracts sold within its jurisdiction and insurers subject to its supervision, and confirm the position of policyholders dealing with insurers and intermediaries not subject to oversight or supervision within its jurisdiction.

19.13.2 The supervisor should give information to the public about whether and how local legislation applies to the cross-border offering of insurance, such as through digital channels.

19.13.3 The supervisor should issue warning notices to consumers when necessary in order to avoid transactions with insurers or intermediaries that are unlicensed or subject to a suspended or revoked licence.

19.13.4 The supervisor should publish information that promotes consumers’ understanding of insurance contracts as well as steps that consumers can take to protect themselves and make informed decisions.

19.13.5 The supervisor should have requirements regarding the public disclosure by insurers of information on their business activities, performance and financial position, in order to enhance market discipline, consumer awareness, and understanding of the risks to which insurers are exposed (see ICP 20 Public Disclosure).
ICP 20  Public Disclosure

The supervisor requires insurers to disclose relevant and comprehensive information on a timely basis in order to give policyholders and market participants a clear view of their business activities, risks, performance and financial position.

Introductory Guidance

20.0.1 Public disclosure of material information is expected to enhance market discipline by providing meaningful and useful information to policyholders to make decisions on insuring risks with the insurer, and to market participants (which includes existing and potential investors, lenders and other creditors) to make decisions about providing resources to the insurer.

20.0.2 So far as practicable, information should be presented in accordance with any applicable jurisdictional, international standards or generally accepted practices so as to aid comparisons between insurers.

20.0.3 In setting public disclosure requirements, the supervisor should take into account the information provided in general purpose financial statements and complement it as appropriate. The supervisor should note that insurers which provide public general purpose financial reports may largely comply with jurisdictional disclosure standards that are reflective of this ICP. Where a supervisor publishes on a regular and timely basis information received from insurers, the supervisor may decide that those insurers do not need to publicly disclose that same information.

20.0.4 To the extent that there are differences between the methodologies used in regulatory reporting, general purpose financial reporting and any other items for public disclosure, such differences should be explained and reconciled where possible.

20.0.5 The supervisor’s application of disclosure requirements will depend on the nature, scale and complexity of insurers. For example, it may be overly burdensome for a small, private insurer to meet the same requirements developed for large, publicly traded insurers. While disclosure requirements may vary, the outcome should promote market discipline and provide policyholders and market participants with adequate information for their needs.

20.0.6 Additionally, the supervisor may decide not to apply disclosure requirements if there is no potential threat to the financial system, no public interest need for disclosure, and no legitimately interested party is prevented from receiving information. It is expected that such situations would be exceptional, but could be more relevant for certain types of insurers (for example, captive insurers).

20.0.7 Public disclosure may include a description of how information is prepared, including methods applied and assumptions used. Disclosure of methods and assumptions may assist policyholders and market participants in making comparisons between insurers. Accounting and actuarial policies, practices and procedures differ not only between jurisdictions but also between insurers within the same jurisdiction.
Meaningful comparisons can be made only where there is adequate disclosure of how information is prepared.

20.0.8 Similarly, meaningful comparisons from one reporting period to another can be made only if the reader is informed how the methods and assumptions of preparation have changed and, if practicable, the impact of that change. Changes over time may not be seen as arbitrary if the reasons for changes in methods and assumptions are explained. If an insurer uses methods and assumptions in the preparation of information which are consistent from period to period, and discloses these, it will assist in the understanding of trends over time.

20.0.9 Where changes in methods and assumptions are made, the nature of such changes, the reason for them and their effects, where material, should be disclosed. It may be helpful if information is presented in a manner that facilitates the identification of patterns over time, including providing comparative or corresponding figures from previous periods (e.g., by presenting loss triangulations).

20.0.10 In establishing disclosure requirements for its jurisdiction, the supervisor should consider the need for disclosures that deliver key information rather than unnecessary volumes of data. Excessive disclosure requirements will not lead to effective disclosures for policyholders and market participants and will be burdensome for insurers.

20.0.11 In establishing disclosure requirements, the supervisor should take into account proprietary and confidential information. Proprietary information comprises information on characteristics and details of, for example, insurance products, markets, distribution, and internal models and systems that could negatively influence the competitive position of an insurer if made available to competitors. Information about policyholders and insured parties is usually confidential under privacy legislation or contractual arrangements.

20.0.12 Proprietary and confidential information affects the scope of the required disclosure of information by insurers about their customer base and details on internal arrangements (for example, methodologies used or parameter estimates data). The supervisor should strike an appropriate balance between the need for meaningful disclosure and the protection of proprietary and confidential information.

20.0.13 A consolidated group as determined under applicable accounting standards may differ from a group for the purposes of insurance supervision (see ICP 23 Group-wide Supervision). In circumstances where this is the case, the supervisor may require disclosures based on the scope of the group for supervisory purposes. Where an insurer’s scope of the group is different under applicable accounting standards and solvency standards, it may be appropriate if reasons are provided and an explanation given about the basis on which disclosures have been provided.

20.0.14 Disclosures by insurance legal entities may cross-refer to existing public disclosures to avoid duplication.

20.1 **Subject to their nature, scale and complexity, insurers make audited financial statements available at least annually.**
20.1.1 Where audited financial statements are not required by the supervisor given the nature, scale and complexity of an insurer (for example, for a small local branch office of a foreign insurer), the supervisor may require that similar information is made publicly available by other means.

20.2 Insurers disclose, at least annually and in a way that is publicly accessible, appropriately detailed information on their:

- company profile;
- corporate governance framework;
- technical provisions;
- insurance risk exposure;
- financial instruments and other investments;
- investment risk exposure;
- asset-liability management;
- capital adequacy;
- liquidity risk; and
- financial performance.

20.2.1 In developing disclosure requirements, the supervisor may consider whether such disclosures are:

- easily accessible and up-to-date;
- comprehensive, reliable and meaningful;
- comparable between different insurers operating in the same market;
- consistent over time so as to enable relevant trends to be discerned; and
- aggregated or disaggregated so that useful information is not obscured.

20.2.2 Information should be disseminated in ways best designed to bring it to the attention of policyholders and market participants, but taking into account the relative effectiveness and costs of different methods of dissemination (for example, printed versus digital methods).

20.2.3 Information should be provided with sufficient frequency and timeliness to give a meaningful picture of the insurer to policyholders and market participants. The need for timeliness will need to be balanced against that for reliability.

20.2.4 Disclosure requirements may also have to balance the interests of reliability against those of relevance or usefulness. For example, in some long-tail classes of insurance, realistic projections as to the ultimate cost of incurred claims are highly relevant. However, due to uncertainties, such projections are subject to a high degree of inherent errors of estimation. Qualitative or quantitative information can be used to convey to users an understanding of the relevance and reliability of the information disclosed.
20.2.5 Information should be sufficiently comprehensive to enable policyholders and market participants to form a well-rounded view of an insurer’s financial condition and performance, business activities, and the risks related to those activities. In order to achieve this, information should be:

- well-explained so that it is meaningful;
- complete so that it covers all material circumstances of an insurer and, where relevant, those of the group of which it is a member; and
- both appropriately aggregated so that a proper overall picture of the insurer is presented and sufficiently disaggregated so that the effect of distinct material items may be separately identified.

20.2.6 Information should, so far as practicable, reflect the economic substance of events and transactions as well as their legal form. The information should be neutral (i.e., free from material error or bias) and complete in all material respects.

Company Profile

20.3 Disclosures include information about the insurer’s company profile such as:

- the nature of its business;
- its corporate structure;
- key business segments;
- the external environment in which it operates; and
- its objectives and the strategies for achieving those objectives.

20.3.1 The overall aim for the company profile disclosure is for insurers to provide a contextual framework for the other information required to be made public.

20.3.2 Disclosures on the nature of the insurer’s business and its external environment should assist policyholders and market participants in assessing the strategies adopted by the insurer.

20.3.3 Disclosures may include information about the insurer’s corporate structure, which should include any material changes that have taken place during the year. For insurance groups, where provided, such disclosures should focus on material aspects, both in terms of the legal entities within the corporate structure and the business functions undertaken within the group. In the event of differences in the composition of a group for supervisory purposes and for public reporting purposes, it would be useful if a description of the entities constituting those differences was also provided.

20.3.4 Disclosures may include information on the key business segments, main trends, factors and events that have contributed positively or negatively to the development, performance and position of the company.
20.3.5 Disclosures may include information on the insurer’s competitive position and its business models (such as its approach to dealing and settling claims or to acquiring new business) as well as significant features of regulatory and legal issues affecting its business.

20.3.6 Disclosures may include information about company objectives, strategies and timeframes for achieving those objectives, including the approach to risk appetite, methods used to manage risks, and key resources available. To enable policyholders and market participants to assess these objectives, and the insurer’s ability to achieve them, it may be appropriate if the insurer also explains significant changes in strategy compared to prior years.

20.3.7 Key resources available may include both financial and non-financial resources. For non-financial resources the insurer may, for example, provide information about its human and intellectual capital.

**Corporate Governance Framework**

20.4 The supervisor requires that disclosures about the insurer’s corporate governance framework provide information on the key features of the framework, including its internal controls and risk management, and how they are implemented.

20.4.1 Disclosures should include the manner in which key business activities and control functions are organised, and the mechanism used by the Board to oversee these activities and functions, including for changes to key personnel and management committees. Such disclosures should demonstrate how the key activities and control functions fit into an insurer’s overall risk management framework.

20.4.2 Where a material activity or function of an insurer is outsourced, in part or in whole, disclosures may include the insurer’s outsourcing policy and how it maintains oversight of, and accountability for, the outsourced activity or function.

**Technical Provisions**

20.5 The supervisor requires that disclosures about the insurer’s technical provisions are presented by material insurance business segment and include, where relevant, information on:

- the future cash flow assumptions;
- the rationale for the choice of discount rates;
- the risk adjustment methodology where used; and
- other information as appropriate to provide a description of the method used.

20.5.1 Disclosures related to technical provisions should provide information on how those technical provisions are determined. As such, disclosures may include information about the level of aggregation used and the amount, timing and uncertainty of future cash flows in respect of insurance obligations.

20.5.2 Disclosures should include a presentation of technical provisions and reinsurance assets on a gross basis. However, it may be useful to have
information about technical provisions presented on both a net and gross basis.

20.5.3 Information may be disclosed about the method used to derive the assumptions for calculating technical provisions, including the discount rate used. Disclosures may also include information about significant changes in assumptions and the rationale for the changes.

20.5.4 When applicable, information about the current estimate and margin over the current estimate may include the methods used to calculate them, whether or not these components of technical provisions are determined separately. If the methodology has changed since the last reporting period, it would be useful to include the reasons for the change and any material quantitative impact.

20.5.5 It may be useful if the insurer provides an outline of any model(s) used and describe how any range of scenarios regarding future experience has been derived.

20.5.6 Disclosures may include a description of any method used to treat acquisition costs and whether future profits on existing business have been recognised.

20.5.7 Where surrender values are material, disclosures may include the insurer’s surrender values payable.

20.5.8 Disclosure of a reconciliation of technical provisions from the end of the previous year to the end of the current year may be particularly useful.

20.5.9 Disclosure of technical provisions may be presented in two parts:

    • one part that covers claims from insurance events which have already taken place at the date of reporting (claims provisions including incurred but not reported (IBNR) and incurred but not enough reported (IBNER) provisions) and for which there is an actual or potential liability; and
    • another part that covers losses from insurance events which will take place in the future (for example, the sum of provision for unearned premiums and provision for unexpired risks (also termed premium deficiency reserve)).

20.5.10 Providing this disclosure in two parts is particularly important for lines of insurance business where claims may take many years to settle.

Life insurers

20.5.11 It may be useful if the disclosures include key information on the assumed rates, the method of deriving future mortality and disability rates, and whether customised tables are applied. Disclosures may include a life insurer’s significant assumptions about future changes of mortality and disability rates.

20.5.12 It may enhance policyholder and market participant understanding if disclosures include information on the conditions for the amount and timing of the allocation of participation features and how such features are valued in technical provisions. Required disclosures could include whether participation features are based on: the performance of a group of contracts; the realised/unrealised investment returns from a pool of
assets; the profit or loss of the company; or any other element. Disclosures could also be required on the extent to which such features are contractual and/or discretionary.

20.5.13 Disclosures may include quantitative information on the life insurer’s minimum participation features and actual distributions to policyholders. For example, the following quantitative information may be shown by segment:

- guaranteed policyholder benefits paid; and
- additional policyholder benefits paid which arise from profit sharing clauses.

20.5.14 Disclosures may include the assumptions and methodologies employed to value significant guarantees and options, including the assumptions concerning policyholder behaviour.

Non-life insurers

20.5.15 In order to enable policyholders and market participants to evaluate trends, disclosures for non-life insurers may include historical data about earned premiums compared to technical provisions by class of business. To assess the appropriateness of assumptions and methodology used for determining technical provisions, historical data on the run off result and claims development could be disclosed.

20.5.16 To facilitate the evaluation of a non-life insurer’s ability to assess the size of the commitments to indemnify losses covered by the insurance contracts issued, disclosures for non-life insurers may include the run off results over many years, to enable policyholders and market participants to evaluate long-term patterns (for example, how well the insurer estimates the technical provisions). The length of the time period should reflect how long-tailed the distribution of losses is for the insurance classes in question.

20.5.17 Non-life insurers may disclose information on the run off results for incurred losses and for the provisions for future losses.

20.5.18 Disclosures for non-life insurers may include the run off results as a ratio of the initial provisions for the losses in question. When discounting is used, disclosures should include the effect of discounting.

20.5.19 Except for short-tail business, the supervisor may require non-life insurers to disclose information on the development of claims in a claims development triangle. A claims development triangle shows the insurer’s estimate of the cost of claims (claims provisions and claims paid), as of the end of each year, and how this estimate develops over time. This information should be reported consistently on an accident year or underwriting year basis and reconciled to amounts reported in the balance sheet.

Insurance Risk Exposures

20.6 The supervisor requires that disclosures about the insurer’s reasonably foreseeable and material insurance risk exposures, and their management, include information on:
• the nature, scale and complexity of risks arising from its insurance contracts;
• the insurer’s risk management objectives and policies;
• models and techniques for managing insurance risks (including underwriting processes);
• its use of reinsurance or other forms of risk transfer; and
• its insurance risk concentrations.

20.6.1 Disclosures may include a quantitative analysis of the insurer’s sensitivity to changes in key factors both on a gross basis and taking into account the effect of reinsurance, derivatives and other forms of risk mitigation on that sensitivity. For example, disclosures may include a sensitivity analysis by life insurers to the changes in mortality and disability assumptions or sensitivities to increased claim inflation by non-life insurers.

20.6.2 Where an insurance group includes legal entities in other sectors, disclosures may include the risk exposure of the insurance legal entities from those other entities and procedures in place to mitigate those risks.

20.6.3 Disclosures may include a description of the insurer’s risk appetite and its policies for identifying, measuring, monitoring and controlling insurance risks, including information on the models and techniques used.

20.6.4 Disclosures may include information on the insurer’s use of derivatives to hedge risks arising from insurance contracts. This information may include a summary of internal policies on the use of derivatives.

20.6.5 Disclosure of how an insurer uses reinsurance and other forms of risk transfer may enable policyholders and market participants to understand how the insurer controls its exposure to insurance risks.

20.6.6 Quantitative data on an insurer’s reinsurance disclosure may include the insurer’s overall reinsurance programme to explain the net risk retained and the types of reinsurance arrangements made (treaty, facultative, proportional or non-proportional) as well as any risk mitigating devices that reduce the risks arising out of the reinsurance cover.

20.6.7 It may be beneficial if disclosures separately detail the reinsurers’ share of technical provisions and receivables from reinsurers on settled claims. Further quantitative disclosures on reinsurance may include:

• the credit quality of the reinsurers (for example, by grouping reinsurance assets by credit rating);
• credit risk concentration of reinsurance assets;
• the nature and amount of collateral held against reinsurance assets;
• the development of reinsurance assets over time; and
• the ageing of receivables from reinsurers on settled claims.
20.6.8 It may be useful if disclosures include the impact and planned action when the expected level or scope of cover from a reinsurance/risk transfer contract is not obtained.

20.6.9 Description of the insurer’s risk concentrations may include, at least, information on the geographical concentration of insurance risk, the economic sector concentration of insurance risk, the extent to which the risk is reduced by reinsurance and other risk mitigating elements and, if material, the risk concentration inherent in the reinsurance cover.

20.6.10 Disclosures may include the geographical concentration of premiums. The geographical concentration may be based on where the insured risk is located, rather than where the business is written.

20.6.11 If material, disclosures may include the number of reinsurers that it engages, as well as the highest concentration ratios. For example, it would be appropriate to expect an insurer to disclose its highest premium concentration ratios, which shows the premiums ceded to an insurer’s largest reinsurers in aggregate, as a ratio of the total reinsurance premium ceded.

Financial Instruments and Other Investments

20.7 The supervisor requires that disclosures about the insurer’s financial instruments and other investments include information on:

- instruments and investments by class;
- investment management objectives, policies and processes; and
- values, assumptions and methods used for general purpose financial reporting and solvency purposes, as well as an explanation of any differences, where applicable.

20.7.1 For the purposes of disclosure, an insurer may group assets and liabilities with similar characteristics and/or risks into classes and then disclose information segregated by those classes.

20.7.2 Where investment management objectives, policies and processes differ between segments of an insurer’s investment portfolio, disclosures should be sufficient to provide an understanding of those differences.

20.7.3 When providing disclosures around the uncertainty of reported values of financial instruments and other investments, it may be useful if the effect of derivatives on that uncertainty is also disclosed.

Investment Risk Exposures

20.8 The supervisor requires disclosures about the insurer’s material investment risk exposures, and their management.

20.8.1 Disclosures may include quantitative information, about its exposure to:

- currency risk;
- market risk;
- credit risk; and
- concentration risk.
20.8.2 The risks listed above may affect both assets and liabilities. For example, market risk arising from interest rate movement may be reflected in changes in the valuation of an insurer’s fixed income investments as well as changes in the valuation of insurance liabilities if they are discounted using market interest rates. Changes in interest rates may also change the amounts that an insurer has to pay for its variable rate borrowings. Therefore, required disclosure may include the risk exposure arising from both an insurer’s assets and its liabilities.

20.8.3 Disclosures may include the investment return achieved together with the risk exposure and investment objective. Disclosure of risk exposures can provide policyholders and market participants with valuable insight into both the level of variability in performance that one can expect when economic or market conditions change, and the ability of an insurer to achieve its desired investment outcome.

20.8.4 For investment risk exposures, disclosures may include the intra-period high, median and low exposures where there have been significant changes in exposure since the last reporting date. Disclosures may also include the amount bought and sold during a reporting period as a proxy for turnover. Such disclosure of risk exposures may also be required for each asset class.

20.8.5 In jurisdictions that require investment disclosures to be grouped by risk exposure, the disclosures should provide information about the risk management techniques used to measure the economic effect of risk exposure. Such disclosure may include an analysis by type of asset class.

20.8.6 Disclosures may include information on its use of derivatives to hedge investment risks, including a summary of internal policies on the use of derivatives.

20.8.7 Disclosures may include information on whether or not the insurer carries out stress tests or sensitivity analysis on its investment risk exposures (for example, the change in capital resources as a percentage of total assets corresponding to a 100 basis point change in interest rates), and, if so, disclose the model, process and types of assumptions used and the manner in which the results are used as part of its investment risk management practices.

20.8.8 For debt securities, disclosures on the sensitivity of values to market variables including credit spreads may include breakdowns by credit rating of issue, type of issuer (e.g., government, corporate) and by period to maturity.

20.8.9 In addition to breakdowns on ratings and types of credit issuers, the insurer should disclose the aggregate credit risk arising from off-balance sheet exposures.

**Asset-Liability Management**

20.9 Disclosures about the insurer’s asset-liability management (ALM) include information on:

- ALM in total and, where appropriate, at a segmented level;
• the methodology used and the key assumptions employed in measuring assets and liabilities for ALM purposes; and
• any capital and/or provisions held as a consequence of a mismatch between assets and liabilities.

20.9.1 To provide information on its ALM approach, disclosures may include qualitative information explaining how the insurer manages assets and liabilities in a co-ordinated manner. The explanation could take into account the ability to realise its investments quickly, if necessary, without substantial loss, and sensitivities to fluctuations in key market variables (including interest rate, exchange rate, and equity price indices) and credit risks.

20.9.2 Where an insurer’s ALM is segmented (e.g. by different lines of business), disclosures may include information on ALM at a segmented level.

20.9.3 Where derivatives are used, it may be useful if the disclosures include a description of both the nature and effect of their use.

20.9.4 Disclosures may include the insurer’s sensitivity of regulatory capital resources and provisions for mismatching to:
  • changes in the value of assets; and
  • changes in the discount rate or rates used to calculate the value of the liabilities.

Capital Adequacy

20.10 Disclosures about the insurer’s capital adequacy include information on:
  • its objectives, policies and processes for managing capital and assessing capital adequacy;
  • the solvency requirements of the jurisdiction(s) in which the insurer operates; and
  • the capital available to cover regulatory capital requirements. If the insurer uses an internal model to determine capital resources and requirements, information about the model is disclosed.

20.10.1 Information about objectives, policies and processes for managing capital adequacy assist in promoting the understanding of risks and measures which influence the capital calculation and the risk appetite that is applied.

20.10.2 It may be useful if the insurer discloses information to allow market participants to assess the quantity and quality of its capital in relation to regulatory capital requirements.

20.10.3 Disclosures may include qualitative information about its management of capital regarding:
  • instruments regarded as available capital;
  • key risks and measures which influence the capital calculation; and
  • the insurer’s risk appetite.
20.10.4 It may be useful if the disclosures include a description of any variation in the group as defined for capital adequacy purposes from the composition of the group used for general purpose financial reporting purposes.

**Liquidity Risk**

20.11 The supervisor requires that disclosures about the insurer’s liquidity risk include sufficient quantitative and qualitative information to allow a meaningful assessment by market participants of the insurer’s material liquidity risk exposures.

20.11.1 Disclosures on liquidity risk should include:

- quantitative information on the insurer’s sources and uses of liquidity, considering liquidity characteristics of both assets and liabilities; and
- qualitative information on the insurer’s liquidity risk exposures, management strategies, policies and processes.

20.11.2 Disclosures should discuss known trends, significant commitments and significant demands. Disclosures should also discuss reasonably foreseeable events that could result in the insurer's liquidity position improving or deteriorating in a material way.

**Financial Performance**

20.12 Disclosures about the insurer’s financial performance, in total and at a segmented level include information on:

- earnings analysis;
- claims statistics including claims development;
- pricing adequacy; and
- investment performance.

**General financial performance**

20.12.1 Disclosures should help policyholders and market participants better understand how profit emerges over time from new and in-force insurance contracts.

20.12.2 Disclosure may include a statement of changes in equity showing gains and losses recognised directly in equity as well as capital transactions with, and distributions to, shareholders, and profit sharing with policyholders.

20.12.3 Disclosures may include information on its operating segments and how they were determined.

20.12.4 An operating segment is a component of an entity that engages in business activities from which it may earn revenues and incur expenses and whose operating results are regularly reviewed by the entity’s management to make decisions about resources to be allocated. Examples of features by which business is segmented are:

- type of business: life insurance, non-life insurance, investment management; and
• mix of organisational and geographic approach: eg insurance jurisdiction X, insurance jurisdiction Y, insurance (other), asset management jurisdiction Z.

20.12.5 Disclosures may include the impact of amortisation and impairment of intangible assets on financial performance.

Technical performance

20.12.6 The insurer may provide statements of profit and loss that include the results, both gross and net of reinsurance, of their underwriting by broad lines of business.

20.12.7 If the insurer is a ceding insurer, disclosures may include gains and losses recognised in profit or loss on buying reinsurance.

Technical performance for non-life insurers

20.12.8 In order to judge how well insurance premiums cover the underlying risk of the insurance contracts and the administration expenses (pricing adequacy), disclosures may include data on:

• loss ratio;
• expense ratio;
• combined ratio; and
• operating ratio.

20.12.9 These ratios should be calculated from the profit and loss account of the reporting year and be gross of reinsurance in order to neutralise the effect of mitigation tools on the technical performance of the direct business. Gains on reinsurance cannot be expected to continue indefinitely without price adjustments from reinsurers. If the net ratios are materially different from the gross ratios, then both ratios should be disclosed. The ratios should be measured either on an accident year or an underwriting year basis.

20.12.10 When discounting is used, disclosures may include information on the discount rates used and method of discounting to be disclosed. The discount rates should be disclosed at an appropriate level of aggregation by duration, for example, for each of the next five years and the average rate for claims expected to be paid after five years.

20.12.11 Such disclosure should be accompanied by supporting narrative, covering an appropriate period, to enable policyholders and market participants to evaluate long-term trends better. Information relating to previous years should not be recalculated to take into account present information. The length of the period may reflect the historical volatility of the particular class of insurance business.

20.12.12 It may be appropriate in the case of high volume, homogeneous classes, for the supervisor to require insurers to disclose statistical information on claims. For instance, the insurer could describe the trend in the number of claims and the average size of claims. To be relevant, this information should be linked to the level of business (eg number of policies or earned premiums).
20.12.13 In principle, the trend in claims may reflect the development in insurance risks. As it is difficult to point to one good measurement method of insurance risk, several can be considered. However, it would be normal for non-life insurers to be required to disclose historical data accompanied by supporting narrative at least on:

- the mean cost of claims incurred (ie, the ratio of the total cost of claims incurred to the number of claims) in the accounting period by class of business; and
- claims frequency (for example, the ratio of the number of claims incurred in the reporting period to the average number of insurance contracts in existence during the period).

**Source of earnings analysis for life insurers**

20.12.14 Where an applicable jurisdictional standard does not require a similar analysis to be disclosed, it may be useful for disclosures to include expected earnings on in-force business. This represents the earnings on the in-force business that were expected to be realised during the reporting period. Examples of this include expected release of risk margins, net management fees, and earnings on deposits.

20.12.15 Life insurers may disclose the impact of new business. This represents the point-of-sale impact on net income of writing new business during the reporting period. This is the difference between the premium received and the sum of the expenses incurred as a result of the sale and the new technical provisions established at the point of sale. This is also affected by any methodology used to defer and amortise acquisition expenses.

20.12.16 It may be useful for life insurers to disclose experience gains and losses. This represents gains and losses that are due to differences between the actual experience during the reporting period and the technical provisions at the start of the year, based on the assumptions at that date.

20.12.17 Life insurers may disclose the impact on earnings of management actions and changes in assumptions.

20.12.18 An example of a Source of Earnings analysis table for a life insurer is provided below.

Investment performance is one of the key determinants of an insurer’s profitability. For many life insurance policies, returns that policyholders receive are either directly or indirectly influenced by the performance of an insurer’s investments. Disclosure of investment performance is, therefore, essential to policyholders and market participants.

Disclosure of investment performance may be made on appropriate subsets of an insurer’s assets (for example, assets belonging to the insurer’s life insurance business, assets belonging to statutory or notionally segregated portfolios, assets backing a group of investment-linked contracts, assets grouped as the same asset class).

For investment performance related to equity securities, debt securities, properties and loans, the disclosures may include a breakdown of income (e.g., dividend receipts, interest income, rental income), realised gains/losses, unrealised gains/losses, impairments including changes in loan loss provisions and investment expenses.

Non-GAAP Financial Measures

Insurers that publicly disclose non-GAAP financial measures are required to adhere to the specified practices regarding those measures, where applicable.

In many jurisdictions, publicly-listed insurers are expected to adhere to specific practices, for disclosure of non-GAAP financial measures, which have been promulgated by the domestic securities supervisor. The supervisor could consider standards promulgated by the domestic securities supervisor appropriate.

If no such requirements exist from the domestic securities supervisor for non-GAAP financial measures, the supervisor may promulgate requirements for insurers based on considerations of best practices and existing international guidance from key standard setting bodies dealing with financial disclosures.
Countering Fraud in Insurance

The supervisor requires that insurers and intermediaries take effective measures to deter, prevent, detect, report and remedy fraud in insurance.

Introductory Guidance

21.0.1 Fraud in insurance (including reinsurance) is a deceptive act or omission intended to gain advantage for a party committing the fraud (the fraudster) or for other parties. Most jurisdictions have legal provisions against fraud in insurance. In many jurisdictions, instances of fraud are criminal acts.

21.0.2 Fraud in insurance can take many forms and be perpetrated by any party involved in insurance, including insurers, insurers’ managers and staff, intermediaries, accountants, auditors, consultants, claims adjusters, third party claimants and policyholders.

21.0.3 Fraud poses a serious risk to all financial sectors; fraud in insurance results in reputational as well as financial damage and social and economic costs. In the insurance sector, both insurers and policyholders bear the costs. Losses caused by fraudulent activities affect insurers’ profits and potentially their financial soundness. To compensate, insurers raise premiums and this results in higher costs for policyholders. Fraud may also result in the policyholder discovering that they are not insured for risks they believed were covered, which can have a material impact on both customers and businesses. For these reasons, fraud may reduce consumer and shareholder confidence. It can affect the reputation of individual insurers, insurance groups, the insurance sector and, potentially, economic stability more broadly.

21.0.4 Countering fraud is in principle the concern of the individual insurers and intermediaries. Insurers and intermediaries need to understand and take steps to minimise their vulnerability to fraud.

21.0.5 Responsibility for ensuring that insurers and intermediaries have adequate fraud risk management ultimately lies with the Board and Senior Management of the insurer or intermediary.

21.0.6 The supervisor is one of the competent authorities that has an important role to play in countering fraud in insurance in its jurisdiction. There may be jurisdictions where several authorities have a responsibility for deterring, preventing, detecting, reporting and remedying fraud in insurance.

21.0.7 Fraud in insurance is an issue for supervisors if the risk of fraud is not addressed adequately. Therefore, supervisors should pay appropriate attention as to whether insurers and intermediaries have adequate and effective policies, procedures and controls in place to deter, prevent, detect, report and remedy fraud (see Application Paper on Deterring, Preventing, Detecting, Reporting and Remediying Fraud in Insurance).

21.0.8 The increasing integration of financial markets and the growing number of internationally active insurers and intermediaries make fraud and its potential global implications an important issue to address at the
international level. Therefore, it is important that supervisors communicate with one another in addressing fraud across jurisdictions.

21.0.9 The supervisor should consider the application of these standards, particularly for intermediaries, taking into account that there are various business models ranging from sole traders to large enterprises.

21.1 **Fraud in insurance is addressed by legislation which prescribes adequate sanctions for committing such fraud and for prejudicing an investigation into fraud.**

21.1.1 Legislation should contain offences and sanctions for committing fraud and for prejudicing an investigation into fraud. It should also provide the ability:

- to obtain documents and information, together with statements made by relevant individuals, for intelligence and investigation purposes, for disclosure to appropriate authorities;
- to restrain assets which represent, or are believed to represent, the proceeds of fraud; and
- to confiscate assets which are, or are believed to be, the proceeds of fraud.

21.1.2 It may be helpful for anti-fraud legislation to provide appropriate civil and criminal immunity for fraud reporting in good faith, including where no fraud was subsequently found to have occurred.

21.2 **The supervisor has a thorough and comprehensive understanding of the types of fraud risk to which insurers and intermediaries are exposed. The supervisor regularly assesses the potential fraud risks to the insurance sector and requires insurers and intermediaries to take effective measures to address those risks.**

21.2.1 The supervisor should identify the main vulnerabilities in its jurisdiction, taking into account independent risk assessments where relevant, and address them accordingly. These are not static assessments. They will change over time, depending on how circumstances develop, and how threats evolve.

21.2.2 The supervisor should have a thorough and comprehensive understanding of:

- the activities undertaken and products and services offered by insurers and intermediaries; and
- internal, policyholder, claims and intermediary fraud.

21.2.3 The supervisor should consider the potential fraud risks alongside other risk assessments (including governance and market conduct) arising from its wider duties and be aware of the relevance of fraud to the duties it carries out in respect of other ICPs and standards.

21.3 **The supervisor has an effective supervisory framework to monitor and enforce compliance by insurers and intermediaries with the requirements to counter fraud in insurance.**
21.3.1 The supervisor should issue anti-fraud requirements by way of regulations, instructions or other documents or mechanisms that set out enforceable requirements with sanctions for non-compliance with the requirements.

21.3.2 The supervisor should issue guidance to insurers and intermediaries that will assist them to counter fraud effectively and to meet the requirements set by the supervisor.

21.3.3 The supervisor should have sufficient financial, human and technical resources to counter fraud, including the resources needed to be able to issue and enforce sanctions in relation to complex cases where insurers or intermediaries oppose such sanctions.

21.3.4 The staff of the supervisor engaging in anti-fraud activity should be appropriately skilled and provided with adequate and relevant training on countering fraud. Examples of issues to be covered under adequate and relevant training for the staff of the supervisor include fraud legislation (including offences), fraud typologies, techniques to be used by supervisors to ensure that insurers and intermediaries are complying with their obligations, and the issue and enforcement of sanctions. Similarly, insurers and intermediaries should provide relevant training on anti-fraud measures to Board Members, Senior Management and other staff as appropriate.

21.3.5 The supervisor should take account of the risk of fraud at each stage of the supervisory process, where relevant, including the licensing stage.

21.3.6 The supervisor should assess whether insurers and intermediaries have adequate fraud risk management systems in place which are reviewed regularly. Insurers and intermediaries should be able to demonstrate to the supervisor that they have effective management of their fraud risk and possible risks to their solvency or continuity caused by fraud. The supervisor should at least assess whether insurers and intermediaries:

- have effective policies, procedures and controls in place to deter, prevent, detect, report and remedy fraud;
- have an independent internal audit function and periodically carry out fraud-sensitive audits; and
- have allocated appropriate resources to deter, prevent, detect, record and, as required, promptly report fraud to the relevant authorities.

21.3.7 The supervisor should use both off-site monitoring and on-site inspections to:

- evaluate the effectiveness of the internal control system of insurers and intermediaries to manage fraud risks; and
- recommend or require appropriate remedial action where the internal control system is weak and monitor the implementation of such remedial actions.

21.3.8 As particular fraud risks arise from claims, the supervisor should cover claims management processes in its supervision. This may include reviewing and assessing claims data, the quality of client acceptances,
and claims handling processes. Regarding the risks of fraud occurring in the underwriting process, the supervisor should review relevant processes and controls, in particular those concerned with verification of customer information.

21.3.9 The supervisor should have the power to take appropriate corrective and remedial action where insurers and intermediaries do not implement anti-fraud requirements effectively or in cases of fraud committed by the insurer or intermediary. Depending on the severity of the situation and level of supervisory powers, this could include letters to management, directions, fines, the suspension of business, the appointment of alternative management and redress to customers.

21.3.10 Where a supervisor identifies suspected criminal activities in an insurer or intermediary it should ensure that relevant information is provided to the financial intelligence unit (FIU) and appropriate law enforcement agency and any other relevant supervisors.

21.4 The supervisor regularly reviews the effectiveness of the measures insurers and intermediaries and the supervisor itself are taking to deter, prevent, detect, report and remedy fraud. The supervisor takes any necessary action to improve effectiveness.

21.4.1 The review of effectiveness should take risk into account and assess whether established regulations and supervisory practices are being enforced.

21.4.2 This review could cover aspects such as:

- the risks of fraud in the insurance sector and whether these are adequately addressed by the risk-based approach of the supervisor;
- the adequacy of the supervisor’s resources and training;
- whether the number and content of on-site inspections relating to anti-fraud measures are adequate;
- whether off-site supervision of anti-fraud measures is adequate;
- the findings of on-site inspections, including the effectiveness of training and implementation by insurers and intermediaries of anti-fraud measures;
- action taken by the supervisor against insurers and intermediaries;
- input from other authorities with anti-fraud responsibilities, such as information on fraud prosecutions and convictions;
- the number and nature of requests for information from other authorities concerning anti-fraud matters; and
- the adequacy of the requirements, guidance and other information provided by the supervisor to the sector which may vary on the basis of the business undertaken.
Such reviews should enable the supervisor to identify any necessary actions which need to be taken to improve effectiveness.

21.4.3 The supervisor should consider contributing to or promoting anti-fraud initiatives such as:

- working with relevant industry and trade associations to encourage and maintain an industry-wide approach to deterring, preventing, detecting, reporting and remediying fraud;

- the establishment of anti-fraud committees consisting of industry or trade organisations, law enforcement agencies, other supervisors, other authorities and possibly consumer organisations as a platform to address fraud in insurance – for example, by discussing trends, risks, policy issues, profiles and modus operandi;

- the establishment of a fraud database on suspected and/or confirmed fraud attempts; insurers could be requested or required to submit information and statistics with respect to these attempts;

- the exchange of information between insurers and intermediaries on fraud and fraudsters including, as appropriate, through the use of databases to the extent permitted by local legislation;

- the enhancement of consumer/policyholder awareness on insurance fraud and its effects through effective education and media campaigns; and

- cooperation between organisations involved with combating fraud in the insurance sector, such as organisations for accountants, forensic auditors and claims adjustors.

21.4.4 Whenever a supervisor is informed of substantiated suspicious fraudulent activities which may affect insurers, intermediaries or the insurance industry as a whole, it should consider whether to convey warning information to insurers and intermediaries to the extent permitted by local legislation.

21.4.5 The supervisor should maintain records on the number of on-site inspections relating to the combating of fraud measures and on sanctions it has issued to insurers and intermediaries with regard to inadequate anti-fraud measures.

21.5 The supervisor has effective mechanisms in place, which enable it to cooperate, coordinate and exchange information with other competent authorities, such as law enforcement authorities, as well as other supervisors concerning the development and implementation of policies and activities to deter, prevent, detect, report and remedy fraud in insurance.

21.5.1 Mechanisms of cooperation and coordination should normally address:
• operational cooperation and, where appropriate, coordination between supervisors and other anti-fraud competent authorities; and
• policy cooperation and, where appropriate, coordination across all relevant anti-fraud competent authorities.

21.5.2 Where the supervisor identifies suspected fraud in insurers or intermediaries it should ensure that relevant information is provided to the FIU and appropriate law enforcement agency and any other relevant supervisors.

21.5.3 The supervisor should take all necessary steps to cooperate and exchange information with other relevant authorities. There should be contact by the supervisor with the FIU and appropriate law enforcement agency to ascertain any concerns it has and any concerns expressed by insurers and intermediaries and to obtain feedback on trends in reported cases.

21.5.4 The supervisor should consider appointing within its office a contact for anti-fraud issues and for liaising with other competent authorities to promote an efficient exchange of information.

21.5.5 The supervisor should maintain records on the number and nature of formal requests for assistance made by or received from supervisors or law enforcement agencies concerning fraud or potential fraud, including whether the request was granted or refused.
The supervisor requires insurers and intermediaries to take effective measures to combat money laundering and terrorist financing. The supervisor takes effective measures to combat money laundering and terrorist financing.

**Introductory Guidance**

22.0.1 The insurance sector is potentially at risk of being misused for money laundering and terrorist financing. This exposes the insurance sector to legal, operational and reputational risks.

22.0.2 Money laundering (ML) is the processing of criminal proceeds to disguise their illegal origin. When criminal activity generates substantial profits, the individual or group involved must find a way to control and “legitimize” funds without attracting attention to the underlying activity or the persons involved. Criminals do this by disguising the sources, changing the form, or moving the funds to a place where they are less likely to attract attention, and therefore may use the financial sector, including the insurance sector, to do so. Examples of criminal activity which may generate large profits and lead to money laundering include embezzlement, tax evasion, insider trading, bribery, cyber-crimes, illegal arms sales, smuggling, drug trafficking, prostitution, human trafficking, as well as corruption and organised crime.

22.0.3 Terrorist financing (TF) is the financing of terrorist acts, and of terrorists and terrorist organisations. It refers to the wilful provision or collection of funds by any means, directly or indirectly, with the unlawful intention that they should be used, or in the knowledge that they are to be used, in full or in part to carry out a terrorist act by a terrorist organisation or by an individual terrorist, or to support terrorists or terrorist organisations. Terrorist financing offenses may constitute predicate offenses for the crime of money laundering, in accordance with applicable law.

22.0.4 The Financial Action Task Force (FATF) is an inter-governmental body, established to set international standards for anti-money laundering (AML) and combating the financing of terrorism (CFT). The FATF standards are comprised of its individual recommendations together with interpretive notes and the applicable definitions in the FATF glossary. In this ICP the term FATF Recommendations encompasses all of these components of the FATF standards. The FATF Recommendations are directed at jurisdictions and supervisors should therefore reference their own national risk assessment, applicable laws and regulations with respect to AML/CFT.

22.0.5 The IAIS is a FATF Observer Organisation and, accordingly, endorses the FATF Recommendations. This ICP is intended to be consistent with the FATF Recommendations; however, compliance with the FATF Recommendations does not necessarily imply observance of ICP 22 nor does observance of ICP 22 necessarily imply compliance with the FATF Recommendations.
22.0.6 According to the FATF:

- the ML/TF risks associated with the insurance sector are generally lower than those associated with other financial products (such as loans or payment services) or other sectors (such as banking); and
- many life insurance products are not sufficiently flexible to be the first vehicle of choice for money launderers.

However, as with other financial products, there is a risk that the funds used to purchase life insurance may be the proceeds of crime.

22.0.7 This ICP applies to the underwriting and placement of life insurance and other investment-related insurance. Depending upon the jurisdiction's assessment of the ML/TF risk posed by the non-life sector, the jurisdiction should consider whether and to what extent to apply this ICP to that sector as well.

22.0.8 The FATF Recommendations require jurisdictions to designate a “competent authority” or authorities to have responsibility for ensuring that financial institutions (including insurers and intermediaries) adequately comply with the jurisdiction's approach to implementing the FATF Recommendations to combat ML/TF. The AML/CFT competent authority is often designated by a jurisdiction's legislation. There may be jurisdictions where several authorities have AML/CFT responsibilities for the insurance sector. Competent authorities may include supervisors, law enforcement agencies and a financial intelligence unit (FIU) which serves as a jurisdictional centre for receiving and analysing information (such as suspicious transaction reports) and disseminating information regarding potential ML/TF.

22.0.9 In some jurisdictions, the supervisor may not be designated as an AML/CFT competent authority, but nevertheless all supervisors must understand the risk of ML/TF to the insurance sector and take steps to help combat such risk.

22.0.10 The standards and guidance related to ICP 22 are divided into two parts. Part A applies where the supervisor is a designated AML/CFT competent authority, or acts on behalf of such designated competent authority. Part B applies where the supervisor is not a designated AML/CFT competent authority. To demonstrate observance of this ICP the supervisor must meet the requirements of the standards in either Part A or Part B, or both, according to the circumstances of its jurisdiction.

22.0.11 In implementing this ICP, the supervisor may consider as relevant various guidance available from the FATF, including its “Guidance for a Risk-Based Approach for the Life Insurance Sector” (FATF Guidance). The FATF Guidance, which is non-binding, aims to support the design and implementation of a Risk-Based Approach (RBA) to AML/CFT for the life insurance sector, taking into account applicable ML/TF risk assessments and legal and regulatory frameworks to combat money laundering and terrorist financing. The RBA concept is related to, but distinct from, the overarching concept of risk-based supervision that applies to all ICPs.
22.0.12 As described in the ICP Introduction, this ICP applies to the supervision of insurance legal entities and, unless otherwise specified, to insurance groups. The supervisor may also consider FATF Guidance concerning supervision and mitigation of ML/TF risks at the group-wide level.

22.0.13 Certain FATF Recommendations require that supervision be applied to the implementation of targeted financial sanctions (TFS) related to terrorism, terrorist financing and financing of proliferation of weapons of mass destruction. Adherence to TFS is not subject to the RBA described in this ICP and TFS is not further addressed in this ICP. Whether insurance supervisors have responsibilities for TFS will depend upon the particular jurisdictional arrangements in place.

Part A: Where the supervisor is a designated AML/CFT competent authority

22.1 The supervisor:

- has a thorough and comprehensive understanding of the ML/TF risks to which insurers and/or intermediaries are exposed;
- uses available information to assess the ML/TF risks to the insurance sector in its jurisdiction on a regular basis; and
- applies a Risk-Based Approach (RBA) consistent with FATF Recommendations.

22.1.1 Consistent with the FATF Recommendations, RBA refers to:

- the general process by which a supervisor, according to its identification, understanding and assessment of risks, allocates its resources to AML/CFT supervision; and
- the specific process of supervising institutions (ie insurers and intermediaries, as applicable) that apply an AML/CFT RBA.

Understanding ML/TF risks

22.1.2 The supervisor should have a thorough and comprehensive understanding of the ML/TF risks to which insurers and intermediaries are exposed arising from the activities undertaken and products and services offered by insurers and intermediaries.

22.1.3 In the context of ML/TF, “risk” encompasses threats, vulnerabilities, and consequences in relation to products (including services and transactions), geography, customers and delivery channels.

22.1.4 Some of the examples of attributes included below can be expected over the course of a long-term insurance contract and are not necessarily inherently suspicious, but rather should be viewed as factors to consider with respect to AML/CFT RBA.

22.1.5 Product-related risk refers to the vulnerability of a product to ML/TF based on its design. The following are examples of product attributes which may tend to increase the ML/TF risk profile:

- acceptance of very high value or unlimited value payments or large volumes of lower value payments;
• acceptance of non-traceable payments such as cash, money orders, cashier cheques, or virtual assets;
• acceptance of frequent payments outside a normal premium or payment schedule;
• allowance of withdrawals at any time or early surrender, with limited charges or fees;
• products that allow for high cash values;
• products that accept high amount lump sum payments, coupled with liquidity features;
• products with provisions that allow a policy to be cancelled within a stipulated timeframe and the premiums paid to be refunded; and
• products that allow for assignment without the insurer being aware that the beneficiary of the contract has been changed until such time as a claim is made.

22.1.6 Product-related risk also encompasses the vulnerability of a product to use by a third party or to unintended use based on the methods of transactions available (ie service- and transaction-related risk). The following are examples of service and transaction attributes which may tend to increase the ML/TF risk profile:

• products with features or services which make it possible for customers to use the product in a way that is inconsistent with its purpose (for example, an insurance policy intended to provide long term investment opportunity but which allows frequent or low fee deposit / withdrawal transactions);
• customer is not the payer or recipient of the funds;
• products with features that allow loans to be taken against the policy (particularly if frequent loans can be taken and/or repaid with cash);
• acceptance to be used as collateral for a loan and/or written in a discretionary or other increased risk trust;
• payment source or recipient of funds are outside of the jurisdiction (eg insurer in jurisdiction A and payment source in jurisdiction B); and
• significant, unexpected, or unexplained change in customer’s pattern of payment, withdrawal, or surrender.

22.1.7 Geographic-related risk refers to the risk that a market’s or customer’s geographic location or connections will enhance vulnerability to ML/TF. The following are examples of geographic attributes which may tend to increase the ML/TF risk profile:

• jurisdictions identified by credible sources as having weak governance, law enforcement and regulatory regimes,
including jurisdictions identified by FATF statements as having weak AML/CFT regimes;

- jurisdictions identified by credible sources as having significant levels of organised crime, corruption, or other criminal activity, including source or transit countries for illegal drugs, human trafficking, smuggling and illegal gambling; and

- jurisdictions subject to sanctions, embargoes, or similar measures issued by international organisations (such as the United Nations).

22.1.8 Customer-related risk refers to the risk that the insurer is doing business with a customer who is not adequately identified or may be involved with ML/TF. Customer-related risk factors include: customer identity; third-party involvement; customer source of wealth and funds; politically exposed customers; and known criminals or terrorists. The following are examples of customer attributes which may tend to increase the ML/TF risk profile:

- structure of a legal entity that is a customer, policyholder, or beneficiary obscures or makes it difficult to identify the ultimate beneficial owner or controlling interests;

- customer is reluctant to provide identification; exhibits difficulty producing identification; or provides identification documents of questionable authenticity;

- involvement of a gatekeeper or a third party apparently unrelated to the customer;

- higher risk business or occupation (such as those that are cash-intensive);

- mismatch between wealth and income of the customer and proposed premium amounts, deposit amounts or policy limits;

- customer is associated with negative news which may affiliate the customer with allegations of criminal behaviour; or has ties to or is on a designated sanctions list; and

- customer is considered a politically exposed person.

22.1.9 Delivery channel refers to the method offered to or used by a customer to start a new policy or account. Delivery channel-related risk refers to the vulnerability of the delivery channel to ML/TF based on attributes that may make it easier to obscure customer identity or the source of funds. The following are examples of delivery channel attributes which may tend to increase the ML/TF risk profile:

- non face-to-face sales without adequate safeguards for confirmation of identification or to mitigate the risks of identity fraud; and

- payments via intermediary that may obscure the source of payment (eg long chain of intermediaries).
Assessing ML/TF risks

22.1.10 The supervisor should assess the main ML/TF risks to the insurance sector in its jurisdiction. Such risk assessments may provide for recommendations on the allocation of responsibilities and resources at the jurisdictional level based on a comprehensive and up-to-date understanding of the risks. These assessments will change over time, depending on how circumstances develop, and how risks evolve. For this reason risk assessments should be undertaken on a regular basis and kept up to date.

22.1.11 The supervisor should consider the potential ML/TF risks alongside other risk assessments (for example, governance and market conduct) arising from its wider duties.

22.1.12 When a jurisdiction-wide risk assessment has been conducted (for example, during a National Risk Assessment (NRA) process as contemplated in FATF Recommendations, if applicable), the supervisor should have access to the results and take them into account. The supervisor should participate in such an assessment to inform the assessment and to improve its understanding of the risks.

22.2 The supervisor:

- issues to insurers and/or intermediaries enforceable means on AML/CFT obligations consistent with the FATF Recommendations, for matters which are not in primary legislation;
- establishes guidance that will assist insurers and/or intermediaries to implement and comply with their respective AML/CFT requirements; and
- provides insurers and/or intermediaries with adequate and appropriate feedback to promote AML/CFT compliance.

22.2.1 While the FATF Recommendations require the basic obligations of customer due diligence (CDD), record keeping and the reporting of suspicion to be set in primary legislation, the more detailed elements for technical compliance may be set in primary legislation or enforceable means (ie regulations, guidelines, instructions or other documents or mechanisms) that set out enforceable requirements in mandatory language with sanctions for non-compliance.

22.2.2 In some jurisdictions the supervisor, while an AML/CFT competent authority, may not be empowered to issue enforceable means; in that case the supervisor should cooperate and coordinate with the relevant authority holding such power.

22.2.3 The supervisor should require insurers and/or intermediaries to take appropriate steps to identify, assess and understand their ML/TF risks in relation to products (including services and transactions), geography, customers and delivery channels. The supervisor should also require insurers and intermediaries to manage and mitigate the ML/TF risks that have been identified.

22.2.4 The supervisor should promote a clear understanding by insurers and intermediaries of their AML/CFT obligations and ML/TF risks. This may
be achieved by engaging with insurers and intermediaries and by providing information on supervision. For example, the supervisor may provide guidance on issues covered under the relevant FATF Recommendations (as implemented in primary legislation or enforceable means) including possible techniques and methods to combat ML/TF and any additional measures that insurers and/or intermediaries could take to ensure that their AML/CFT measures are effective. Such guidance may not necessarily be enforceable but will assist insurers and/or intermediaries to implement and comply with AML/CFT requirements.

22.2.5 Examples of appropriate feedback mechanisms used by the supervisor may include information on current ML/TF techniques, methods and trends (typologies), sanitised examples of actual ML/TF cases, examples of failures or weaknesses in AML/CFT systems by insurers and intermediaries, and lessons to be learned. It may be appropriate for the supervisor to refer to guidance or contribute to feedback from other sources, for example industry guidance and resources made available by the FATF.

22.3 The supervisor has an effective supervisory framework to monitor and enforce compliance by insurers and/or intermediaries with AML/CFT requirements.

22.3.1 The supervisor should take into account the risk of ML/TF at each stage of the supervisory process, where relevant, including the licensing stage.

22.3.2 The supervisor should have adequate financial, human and technical resources to combat ML/TF. Staff of the supervisor should be appropriately skilled and provided with adequate and relevant training for assessing and combating ML/TF risks, including the necessary skills and knowledge to assess the quality and effectiveness of an insurer’s and intermediary’s AML/CFT systems and controls.

22.3.3 The supervisor should subject insurers and/or intermediaries to supervisory review (off-site monitoring and/or on-site inspection) of their compliance with the AML/CFT requirements and, on the basis of the information arising from such monitoring and any other information acquired, assess the ML/TF risk profile of the insurer or intermediary.

22.3.4 The frequency and intensity of supervisory review should be based on:

- the ML/TF risks present in the jurisdiction including as identified in an NRA, if applicable, or other jurisdiction-wide risk assessment;
- the characteristics of insurers and/or intermediaries, in particular their number and diversity and the degree of discretion allowed to them under the RBA;
- the ML/TF risks and the policies, internal controls and procedures of each insurer and/or intermediary, as identified by the supervisor’s assessment of their ML/TF risk profile; and
• the inherent and residual risks in relation to the particular insurer or intermediary based on the firm’s own RBA of its ML/TF risks.

22.3.5 The supervisor should require insurers and/or intermediaries to undertake AML/CFT assessments on a regular basis, and to develop ML/TF risk profiles of their products (including services and transactions), geography, customers and delivery channels. The supervisor should require insurers and intermediaries to put in place risk management and control measures to effectively address identified risks.

22.3.6 The supervisor should have the power and resources to take proportionate, dissuasive and effective measures (including sanctions and other remedial and corrective measures) where insurers and intermediaries do not implement AML/CFT requirements effectively.

22.3.7 The supervisor should also require insurers and intermediaries to provide regular and timely training in AML/CFT to Board Members, Senior Management and other staff as appropriate, which is supported by a communication strategy which ensures that notification of significant changes in AML/CFT policies are regularly and timely provided.

22.4 The supervisor regularly reviews the effectiveness of the measures that insurers and/or intermediaries and the supervisor itself are taking on AML/CFT. The supervisor takes any necessary action to improve effectiveness.

22.4.1 Reviews should include regular assessment by the supervisor of the effectiveness of implementation by insurers and/or intermediaries of AML/CFT requirements and of its supervisory approach, including the extent to which the supervisor’s actions have an effect on compliance by insurers and/or intermediaries.

22.4.2 These reviews may cover aspects such as:

• the ML/TF risks of a particular insurer and/or intermediary and whether these are adequately addressed by the firm’s RBA;
• the adequacy of resources and training of both the supervisor and the insurance sector;
• whether AML/CFT off-site monitoring is adequate;
• whether the number and content of on-site inspections relating to AML/CFT measures is adequate;
• the findings of off-site monitoring and on-site inspections, including the effectiveness of training and implementation by insurers and intermediaries of AML/CFT measures;
• measures and sanctions taken by the supervisor against insurers and/or intermediaries;
• input from other AML/CFT authorities and the FIU on the insurance sector, such as the number and pattern of
suspicious transaction reports made by insurers and/or intermediaries;

- the number and nature of requests for information from other authorities concerning AML/CFT matters;

- the adequacy of the requirements, guidance and other information provided by the supervisor to the insurance sector and feedback received from the insurance sector; and

- the number and type of ML/TF prosecutions and convictions in the insurance sector.

Such reviews should enable the supervisor to identify any necessary actions which need to be taken to improve effectiveness of the AML/CFT measures being taken by insurers, and/or intermediaries and the supervisor itself.

22.4.3 The supervisor should maintain records on the frequency of off-site monitoring and number of on-site inspections relating to AML/CFT and on any measures it has taken or sanctions it has issued against insurers and/or intermediaries with regard to inadequate AML/CFT measures or non-compliance with AML/CFT requirements.

22.5 The supervisor has effective mechanisms in place which enable it to cooperate, coordinate and exchange information for AML/CFT purposes with other domestic authorities as well as with supervisors in other jurisdictions.

22.5.1 Effective prevention and mitigation of ML/TF is enhanced by close cooperation within a supervisor’s organisation and among supervisors, the FIU, law enforcement agencies and other relevant authorities. Mechanisms of cooperation, coordination and exchange of information among relevant authorities should be documented and normally address:

- Operational cooperation and, where appropriate, coordination; and

- policy cooperation and, where appropriate, coordination.

22.5.2 Where the supervisor identifies suspected ML/TF in insurers or intermediaries, it should ensure that relevant information is provided in a timely manner to the FIU, any appropriate law enforcement agency and other relevant authorities.

22.5.3 The supervisor should take all necessary steps to cooperate, coordinate and exchange information with the other relevant authorities. The supervisor should communicate with the FIU and appropriate law enforcement agency to ascertain any concerns it has and any concerns expressed on AML/CFT compliance by insurers and intermediaries, to obtain feedback on trends in reported cases, and to obtain information regarding potential ML/TF risks to the insurance sector.

22.5.4 To promote an efficient exchange of information, the supervisor should consider identifying within its office a point of contact for AML/CFT issues and to liaise with other relevant authorities.
22.5.5 The exchange of information for AML/CFT purposes is subject to confidentiality considerations (see ICP 3 Information Sharing and Confidentiality Requirements).

Part B: Where the supervisor is not a designated AML/CFT competent authority

22.6 The supervisor is aware of and has an understanding of ML/TF risks to which insurers and/or intermediaries are exposed. The supervisor liaises with and seeks to obtain information from the designated competent authority relating to AML/CFT by insurers and intermediaries.

22.6.1 The supervisor should have an understanding of the ML/TF risks to which insurers and/or intermediaries are exposed arising from activities undertaken in relation to products (including services and transactions), geography, customers and delivery channels, and the jurisdiction’s approach to assessing and mitigating them.

22.6.2 To enhance such understanding, it is helpful if the supervisor has access to the NRA, if applicable, or other jurisdiction-wide risk assessment.

22.6.3 The supervisor should be able to make a more informed evaluation and judgment on the soundness of insurers and intermediaries by receiving information from the designated AML/CFT competent authority. Such information may be relevant to the risk profile of, or to the effectiveness of risk management by, an insurer or intermediary. The contents of this information may include the level of ML/TF risks to which insurers and/or intermediaries are exposed, and the designated competent authority’s views on the corporate governance, risk management and internal control measures of supervised entities relevant to AML/CFT.

22.6.4 The designated AML/CFT competent authority may have information on breaches of AML/CFT requirements that should be taken into consideration by the supervisor in its supervisory activities, such as when evaluating the suitability of the Board, Senior Management and Key Persons in Control Functions, including when reviewing licence applications.

22.7 The supervisor has effective mechanisms in place which enable it to cooperate, coordinate and exchange information for AML/CFT purposes with relevant domestic authorities as well as with supervisors in other jurisdictions.

22.7.1 Effective prevention and mitigation of ML/TF is enhanced by close cooperation within a supervisor’s organisation and among supervisors, the FIU, law enforcement agencies and other relevant authorities. Mechanisms of cooperation, coordination and exchange of information among relevant authorities should be documented and normally address operational cooperation and, where appropriate, coordination.

22.7.2 When the supervisor becomes aware of information on ML/TF risks, it should provide relevant information to the designated AML/CFT competent authority. When the supervisor identifies suspected ML/TF in insurers and/or intermediaries, it should ensure that relevant information is provided to the FIU, appropriate law enforcement agencies and any relevant supervisors.
22.7.3 As part of its cooperation with the designated AML/CFT competent authority, the supervisor should provide input into the effectiveness of the AML/CFT framework. This may help the designated competent authority in its consideration of the framework’s effectiveness.

22.7.4 The exchange of information for AML/CFT purposes is subject to confidentiality considerations (see ICP 3 Information Sharing and Confidentiality Requirements).
ICP 23  Group-wide Supervision

The group-wide supervisor, in cooperation and coordination with other involved supervisors, identifies the insurance group and determines the scope of group supervision.

Introductory Guidance

23.0.1 Involved supervisors should seek agreement amongst themselves on the identification of the insurance group, including the head of the insurance group, and the scope of group-wide supervision to ensure that gaps or duplication in regulatory oversight between jurisdictions do not occur. If agreement cannot be reached in a timely manner, the ultimate responsibility for determining the identification of the insurance group and scope of group-wide supervision rests with the group-wide supervisor. Decisions should be undertaken on a case-by-case basis and may include discussion with the insurance group.

23.0.2 The group-wide supervisor cooperates and coordinates with other involved supervisors, and should be accountable for the appropriateness of the identification of the insurance group and the determination of the scope of group supervision. In particular, in the case of insurance groups that operate on a cross-border basis, the group-wide supervisor should be able to explain the appropriateness of the identification of the insurance group and the determination of the scope of group supervision to involved supervisors in other jurisdictions. The identification of the insurance group and scope of group supervision should be reviewed regularly by the group-wide supervisor, in cooperation and coordination with other involved supervisors.

23.0.3 The group-wide supervisor should require the head of the insurance group to provide information needed on an ongoing basis to identify the insurance group and to determine the scope of group-wide supervision. The head of the insurance group provides the information to the group-wide supervisor, who disseminates it to the other involved supervisors as needed.

CF 23.0.a The group-wide supervisor, in cooperation with other involved supervisors, determines whether an insurance group or an insurance legal entity operating through branches, is an IAIG after considering whether it meets both the following criteria:

- Internationally active:
  - Premiums are written in three or more jurisdictions; and
  - Gross written premiums outside of the home jurisdiction are at least 10% of the group’s total gross written premiums.

- Size (based on a three-year rolling average):
| CF 23.0.a.1 | The criteria should be assessed based on the insurance group’s reported financial statements, either on a consolidated basis when available or as otherwise submitted to the group-wide supervisor. Intra-group transactions should be eliminated when calculating the amount of insurance business written in each jurisdiction and total insurance business written, and when calculating the total assets of the group. |
| CF 23.0.a.2 | “Total assets” are, at least, group assets related to the insurance business of the group. |
| CF 23.0.a.3 | “Gross written premiums” represent a measure of the volume of insurance business being written. Where alternative but similar volume measures are required under the accounting framework applicable to the group, then these alternative measures may be used as a more practical way of deciding if a group meets the criterion for an IAIG. An example of an alternative measure may be “premiums received” as required for disclosure purposes under International Financial Reporting Standard 17. |
| CF 23.0.a.4 | Although an insurance legal entity that has no parent or subsidiaries is not an insurance group, it should be regarded as an IAIG if it operates on a branch basis in foreign jurisdictions and meets the criteria. The supervisor of this entity, in cooperation with other involved supervisors, would determine whether the IAIG criteria are met. References to a ‘group’ in this context would include such entities operating through branches which are identified as IAIGs. |
| CF 23.0.a.5 | For the purposes of assessing groups against the internationally active criterion, the United States of America should be regarded as a single jurisdiction and member states of the European Union should be regarded as separate jurisdictions. |
| CF 23.0.a.6 | Any involved supervisor may prompt the process of identifying an IAIG. If no group-wide supervisor has been determined, the supervisor most demonstrating the characteristics of a group-wide supervisor should invite involved supervisors to participate in the process of determining whether a group is an IAIG. |
| CF 23.0.a.7 | The scope of an insurance group should be determined before considering whether the criteria for determining whether the group is an IAIG are met. |
| CF 23.0.a.8 | If there is already a supervisory college for a group, it should be used to facilitate the determination as to whether the group is an IAIG. |
| CF 23.0.b | In limited circumstances the group-wide supervisor has discretion to determine that a group is not an IAIG even if it meets the criteria or that a group is an IAIG even if it does not meet the criteria. |

- Total assets are at least USD 50 billion, or
- Total gross written premiums are at least USD 10 billion.
CF 23.0.b.1 If discretion has been used, then the reasons for exercising such discretion should be based on verifiable and documented quantitative and qualitative information.

CF 23.0.b.2 Examples of situations where a group-wide supervisor may exercise discretion to determine that a group is an IAIG despite not meeting all the criteria are where:

- an other involved supervisor requests that the group be treated as an IAIG owing to the materiality of the operations in its jurisdiction;
- the group is expected to meet the criteria in the near future owing to mergers or acquisitions;
- the group's international activity or size have decreased owing to some temporary or transitory effect such as an economic shock or exchange rate fluctuations and it would not be reasonable to alter the group's identification as an IAIG for a short period;
- the group has related entities which are not included in the consolidated financial statements, but which are relevant to the risks of the group;
- the group has significant off-balance sheet assets (such as funds under management held on behalf of investors) which arise from insurance operations and so are more appropriately included in the total assets when assessing the group against the size criterion;
- the group changes or rearranges its business activities to avoid meeting the IAIG criteria including by splitting the insurance business into multiple sub-groups with separate operational controllers.

CF 23.0.b.3 Examples of situations where a group-wide supervisor may exercise discretion to determine that a group is not an IAIG despite meeting the criteria are where:

- the group will cease to meet the criteria in the near future owing to, for example, disposals of some or all of its insurance business;
- the group’s international activity or size have increased owing to some temporary or transitory effect such as an economic shock or exchange rate fluctuations and it would be unreasonable to identify the group as an IAIG for a short period; and
- the group’s business outside of the home jurisdiction exceeds 10% in aggregate but its business in any one jurisdiction outside the home jurisdiction is negligible.

CF 23.0.c The group-wide supervisor notifies the group of its decision to identify it as an IAIG and reasons for that decision.
The group-wide supervisor, in cooperation with other involved supervisors, regularly reviews previously made determinations concerning whether a group is an IAIG.

CF 23.0.d.1 Such reviews should take place at least once every three years.

CF 23.0.d.2 An ad hoc assessment should take place in circumstance where a significant change or event may impact the identification of a group as an IAIG.

23.1 The group-wide supervisor, in cooperation and coordination with other involved supervisors, identifies all legal entities that are part of the insurance group.

23.1.1 To ascertain the identity of an insurance group, supervisors should first identify all insurance legal entities within the corporate structure.

23.1.2 Supervisors should then identify all entities which have control over those insurance legal entities in the meaning provided for in the definition in ICP 6 (Changes in Control and Portfolio Transfers). If this results in only one identified entity, this entity is the head of the insurance group. If there is more than one entity with control over the insurance legal entities, supervisors should identify the head of the insurance group such as the entity which has the greatest level of control over the insurance business.

23.1.3 A practical method for determining the entities within the insurance group is often to start with entities included in the consolidated accounts. The head of an insurance group including an insurance-led financial conglomerate is at least one of the following:

- an insurance legal entity; or
- a holding company.

The identified insurance group includes the head of the insurance group and all the legal entities controlled by the head of the insurance group. Legal entities within a group could include:

- operating and non-operating holding companies (including intermediate holding companies);
- other regulated entities such as banks and/or securities companies;
- non-regulated entities; and
- special purpose entities.

In addition to considering the consolidated accounts, the supervisor should consider other relationships such as

- common Directors;
- membership rights in a mutual or similar entity;
- involvement in the policy-making process; and
- material transactions.

The insurance group may be
• a subset/part of a bank-led or securities-led financial conglomerate; or
• a subset of a wider group, such as a larger diversified conglomerate with both financial and non-financial entities.

23.1.4 Examples of the types of group structures that could be captured by the definition of insurance groups are provided in the diagrams below (Figure 23.1, 23.2, 23.3 and 23.4). These examples are for purposes of illustration only, and are not intended to set forth all possible forms of insurance groups.

23.1.5 The ICPs’ definition of “insurance group” may be different from the definitions used in other contexts, such as accounting or tax purposes.

| CF 23.1.a | The group-wide supervisor identifies the Head of the IAIG as the legal entity which controls all of the insurance legal entities within the group and non-insurance legal entities which pose risk to the insurance operations. |
| CF 23.1.b | When identifying the Head of the IAIG, the group-wide supervisor considers both control as defined in ICP 6 (Changes in control and portfolio transfers) and operational control. |
| CF 23.1.b.1 | Operational control means the ability in practice, whether or not a legal right exists, to do some or all of the following: |
| | • select, appoint, or remove Board Members of related entities; |
| | • determine remuneration of Board Members of related entities; |
| | • set or influence capital expenditure and investment plans; |
| | • set a dividend strategy and levels of surplus capital to be retained; |
| | • determine new lines of business to be undertaken; |
| | • set risk management policies and processes; and |
| | • require reporting of management information. |
| CF 23.1.c | When identifying the Head of the IAIG, if there is more than one entity which controls all of the insurance legal entities, the group-wide supervisor determines the Head of the IAIG to be the entity that exercises the greatest level of control over all the insurance legal entities by considering the following factors: |
| CF 23.1.c.1 | Considering the above factors is particularly relevant when an IAIG has a vertical structure with several intermediate holding companies, |
is a financial or industrial conglomerate, or has several insurance sub-groups.

CF 23.1.c.2  Consideration of which entity controls the greatest proportion of insurance business relative to other business may lead the group-wide supervisor to determine that the Head of the IAIG is an intermediate holding company rather than the ultimate parent of the group.

CF 23.1.c.3  Consideration of where operational control is greatest may lead the group-wide supervisor to determine that the Head of the IAIG is an intermediate holding company rather than the ultimate parent of the group. It may also lead the group-wide supervisor to determine that one insurance legal entity is the Head of the IAIG by virtue of its operational control over another insurance legal entity even where it does not own that entity.

CF 23.1.c.4  Consideration of where shareholder control is greatest may lead the group-wide supervisor to determine that the ultimate parent in a conglomerate is the Head of the IAIG rather than an intermediate holding company.

CF 23.1.d  The group-wide supervisor considers that a non-insurance legal entity within the group poses risk to the insurance operations where there is:

- a linkage between the insurance operations and the non-insurance legal entity (other than an investment in or from the non-insurance legal entities) that could adversely affect the insurance operations; and

- a lack of adequate safeguards, including additional capital, to mitigate risks arising from any such linkages.

CF 23.1.d.1  Consideration of the control exerted over non-insurance legal entities within the group may lead the group-wide supervisor to determine that the Head of the IAIG is the ultimate parent of the group rather than an intermediate holding company.

CF 23.1.d.2  A parent of the insurance legal entities is less likely to pose a risk to the insurance operations if the only linkage between it and the insurance legal entities is of the nature of a passive investment and so no operational control is being exerted.

CF 23.1.d.3  The group-wide supervisor should be able to require preventive or corrective measures at the same level at which all the risks to insurance operations in the group (including funding risks) are mitigated by capital.

CF 23.1.e  Where a legal entity controls all insurance legal entities within the group and non-insurance legal entities which pose risks to the insurance operations, the group-wide supervisor has discretion to identify a subsidiary of that entity as the Head of the IAIG if:

- prudential supervision is exercised by another financial sector supervisor over that entity; and

- the group-wide supervisor can rely on the other financial sector supervisor to provide sufficient information concerning
risk that this entity and the legal entities it controls pose to the insurance operations.

CF 23.1.e.1 The Head of an IAIG should not be a bank when:
- that bank is subject to prudential supervision exercised by another financial supervisor; and
- the group-wide supervisor is able to rely on this other financial sector supervisor to obtain information on the wider group and to ensure that the group is adequately capitalised.

CF 23.1.e.2 If this precludes there being a single Head of the IAIG which controls all the insurance legal entities, then the group may be supervised as two or more separate IAIGs even if separately those IAIGs would not meet the size and international activity criteria.

CF 23.1.f The group-wide supervisor provides the supervisory college with the main reasons and judgements it made when identifying the Head of the IAIG.

CF 23.1.f.1 As the supervisory college may qualify as a crisis management group for the IAIG (IAIG CMG), when identifying the Head of the IAIG, the group-wide supervisor should understand where resolution powers are applicable. The Head of the IAIG identified for prudential supervision purposes may not be the same as the entity at the level of which resolution powers will apply.

23.2 The group-wide supervisor, in cooperation and coordination with other involved supervisors, determines the scope of group-wide supervision.

23.2.1 Involved supervisors should consult and agree on the scope of group-wide supervision of the insurance group to ensure that there are no gaps and no unnecessary duplication in supervision among jurisdictions.

23.2.2 A practical method to determine the entities to capture within the scope of group-wide supervision is to start with entities included in the consolidated accounts. Entities that are not included in consolidated accounts should be included if they are relevant from the perspective of risk (non-consolidated entities also subject to supervision) or control. The entities that may be captured within the scope of group-wide supervision may either be incorporated or unincorporated.

23.2.3 In considering the risks to which the insurance group is exposed it is important to take account of those risks that emanate from the wider group within which the insurance group operates.

23.2.4 Individual entities within the insurance group may be excluded from the scope of group-wide supervision if the risks from those entities are negligible or group-wide supervision is impractical.

23.2.5 The exclusion or inclusion of entities within the scope of group-wide supervision should be regularly re-assessed.

23.2.6 It should be noted that the supervisory approach to entities/activities within the insurance group may vary depending on factors such as their types of business, legal status and/or nature, scale and complexity of
risks. Although an insurance group as a whole should be subject to group-wide supervision, not all quantitative and qualitative supervisory requirements applied to an insurance legal entity should necessarily be applied to other entities within the group, to the insurance group as a whole, or to a sub-group collectively.

CF 23.2.a In conducting group-wide supervision, the group-wide supervisor obtains information necessary to apply standards to the Head of the IAIG concerning all the legal entities controlled by the Head of the IAIG (the IAIG) including from:

- the Head of the IAIG;
- with the cooperation of other involved supervisors, insurance legal entities controlled by the Head of the IAIG; and
- other non-insurance legal entities, whether or not controlled by the Head of the IAIG.

The group-wide supervisor decides from which legal entities information should be sought.

CF 23.2.a.1 The group-wide supervisor may need to obtain information about related group entities, such as:

- any intermediate holding company or ultimate parent of the Head of the IAIG;
- any significant owner of the IAIG;
- any person exerting significant influence over the IAIG;
- any financial entity which is subject to supervision by an authority other than an insurance supervisor; or
- entities excluded from the consolidated data used to assess group solvency.

CF 23.2.a.2 Where there are entities related to the Head of the IAIG from which information is necessary for supervisory purposes, then the group-wide supervisor should obtain that information from those entities or from other sources, for example:

- the Head of the IAIG (insofar as the Head of the IAIG can legally procure that information);
- any supervisor of a related non-insurance financial entity; or
- the members of the Board, Senior Management and Key Persons in Control Functions involved in the insurance business, irrespective of the entity employing those persons.

CF 23.2.a.3 The group-wide supervisor should understand how risks in non-regulated related group entities affect, for example, the risk management and capital adequacy of the IAIG. However this does not require the group-wide supervisor to supervise directly such entities.
23.3 The group-wide supervisor and other involved supervisors do not narrow the identification of the insurance group or the scope of group-wide supervision due to lack of legal authority or supervisory power over particular legal entities.

23.3.1 In some jurisdictions, the supervisor may not be granted legal authority or supervisory power for the direct supervision of some entities within the identified insurance group or the scope of group-wide supervision. These may include legal entities regulated in another sector or non-regulated entities within the same jurisdiction.

23.3.2 Where a supervisor has no direct legal power over certain legal entities in the scope of the group-wide supervision, the supervisor will use its power over regulated entities and/or consult with other involved supervisors to obtain similar supervisory outcomes.

ICP 24  Macroprudential Supervision

The supervisor identifies, monitors and analyses market and financial developments and other environmental factors that may impact insurers and the insurance sector, uses this information to identify vulnerabilities and address, where necessary, the build-up and transmission of systemic risk at the individual insurer and at the sector-wide level.

Introductory guidance

24.0.1 This ICP focuses on the general processes and procedures supervisors should have in place with respect to macroprudential supervision, as part of the overall supervisory framework (see ICP 9 Supervisory Review and Reporting). A jurisdiction’s macroprudential supervision processes and procedures should be proportionate to the nature, scale and complexity of its insurance sector’s exposures and activities.

24.0.2 Macroprudential supervision consists of data collection, market and trend analysis, systemic risk assessment, supervisory response and transparency. It identifies and, where necessary, addresses both vulnerabilities of individual insurers and the insurance sector to shocks (inward risks) and the build-up of systemic risk at the individual insurer level or the sector as a whole (outward risks). Inward risks include insurance and financial market developments, which may impact the insurance sector. Outward risks refer to the risks that individual insurers or the insurance sector may pose to the financial system and the real economy. Macroprudential supervision contributes to financial stability by minimising the incidence and impact of externalities on the financial system and real economy generated or amplified through the distress or default of individual insurers or common behaviours.

24.0.3 Macroprudential supervision involves the identification, monitoring and assessment of:

- sector-wide vulnerabilities and common exposures in the insurance sector; and
- the risk of amplification and transmission of shocks to the financial system and real economy caused by:
  - the size, complexity, lack of substitutability and/or interconnectedness of a distressed or failing insurer; or
  - collective actions or distress of a sufficiently large number of insurers undertaking similar activities and thus exposed to common risks.

24.0.4 Systemic risk may be defined as the risk of disruption to financial services that is caused by an impairment of all or parts of the financial system and has the potential to have serious negative consequences for the real economy. Systemic impact may originate from individual or sector-wide exposures to liquidity risk, interconnectedness (macroeconomic and counterparty exposure) or lack of substitutability as well as from other
risks. These risks may spread to other parts of the financial system via asset liquidation, exposures or critical functions.

24.0.5 Macroprudential supervision can help identify the need for supervisory measures. In its macroprudential supervision, the supervisor should also take into account the material risks that non-insurance legal entities and activities may pose to insurance legal entities, insurance groups and the wider financial system.

24.0.6 The supervisory framework should allow the supervisor to respond in a timely manner to findings from the analysis performed as part of its macroprudential supervision.

Data collection for macroprudential purposes

24.1 The supervisor collects data necessary for its macroprudential supervision.

24.1.1 Data collection for macroprudential purposes should take into account the following general aspects:

- Efficiency of data collection: the supervisor should examine costs and benefits when considering data collection. Data collections should be aligned with their respective usage. The supervisor should first make use of all available data sources and then calibrate its data requests and data processing capabilities;

- Data validation: before analysing data and providing recommendations on the findings, the supervisor should validate data used in its assessment;

- Data quality assurance: the supervisor should regularly evaluate the appropriateness of data collected and data needs to capture market developments and address deficiencies in:
  - the type of data collected;
  - its ability to process data in a timely and/or complete way; and
  - its ability to collect ad hoc data in a timely manner.

- Scope: for sector-wide assessments, data collection should cover a representative sample of the respective market or risk;

- Consistency: regular data collections of a standardised set of information should remain consistent over time in order to analyse trends. The supervisor should, however, consider the evolving nature of the relevant exposures; and

- Ad hoc data collection: in order to address emerging risks, the supervisor should have processes in place that allow for ad hoc data collections.

24.1.2 To support the assessment of liquidity risk, the supervisor should collect data that provide sufficient indications on possible liquidity mismatch between assets and liabilities both at individual and sector-wide level. Reporting requirements on liabilities should include, but not be limited to, information on the surrender value of insurance products, product features that increase or decrease the propensity for early pay outs under certain circumstances (such as penalties or delays in the ability to access
the cash value of a policy), and the maturity or redemption structure of non-insurance liabilities. On the asset side information on the degree of liquidity of the assets and on the potential margin call on derivatives should be collected.

24.1.3 To support the assessment of macroeconomic exposure, the supervisor should collect data that is sufficiently granular to enable an analysis of an insurer’s, as well as the insurance sector’s vulnerability to macroeconomic shocks (such as sensitivity to interest rate movements) and general market movements (such as sensitivity to equities and fixed income asset movements).

24.1.4 To support the assessment of counterparty risk, the supervisor should collect data that includes the concentration of the assets and liabilities, with regard to counterparties, markets (such as equity or debt), sectors (such as financial or real estate), and geographical areas.

24.1.5 The supervisor should collect microeconomic data, such as insurance pricing, underwriting, expenses, claims inflation, reinsurance, intra-group transactions, and general developments in the insurance sector (for example, the development of claims, earned and guaranteed interest rates, reserves, pandemics, and changes in morbidity and mortality, longevity, changes in the frequency and severity of catastrophes changes in medical expense inflation and changes in law). In addition, the supervisor may collect data on both the asset and the liability structure of insurers, including those that are related to non-insurance activities. The supervisor should consider having established processes and communication channels on microeconomic data collection with other involved supervisors when an insurer operates in multiple jurisdictions.

24.1.6 The supervisor should collect macroeconomic data to complement information mainly gathered as a result of supervisory reporting. Data may include general domestic and international macroeconomic variables (such as interest rates, exchange rates, inflation or balance of payments, as well as data on market structure and competitiveness) which could identify macroeconomic instabilities and sources of risk both in the domestic and the global economy. Macroeconomic data may be used to assess the exposure of insurers’ portfolios of both assets and liabilities to economy-wide factors. For insurers operating in multiple jurisdictions, the supervisor should consider collecting relevant macroeconomic data for material jurisdictions.

**Insurance sector analysis**

24.2 The supervisor, as part of its macroprudential supervision, performs analysis of financial markets and the insurance sector that:

- is both quantitative and qualitative;
- considers historical trends as well as the current risk environment; and
- considers both inward and outward risks.

24.2.1 To enable macroprudential supervision, the supervisor should have processes and procedures in place that would allow for analysis on insurance sector trends that could potentially result in externalities to the
wider financial system and/or adversely impact the insurance sector. These trends include changes in economic conditions and technology, as well as environmental, social and governance developments. Such processes and procedures should also recognise that changes in the exposures of insurers can potentially have macroprudential risk implications.

Quantitative and qualitative analysis

24.2.2 Quantitative analysis includes identifying trends, outliers, interconnectedness and/or risk concentrations of existing or newly identified vulnerabilities. Typical methods of quantitative analysis may include:

- horizontal reviews;
- descriptive statistics;
- trend analysis; and
- statistical modelling using past data.

24.2.3 Qualitative analysis includes performing assessments based on judgment, experience, information and any other factors that either cannot be measured or quantified with typical methods. Qualitative analysis may be particularly relevant for the assessment of low probability high impact type of events with limited quantifiable data available.

24.2.4 The supervisor should conduct horizontal reviews to reveal the range of practices among insurers relevant to a common subject (for example, the assessment of the appropriateness of insurers' assumptions used for reserving). A horizontal review may help to determine which insurers are outliers, and as such provides the supervisor with a reference for potential further actions. A horizontal review may provide an aggregated view of the risks linked to certain exposures and/or activities and may also help determine whether industry practice as a whole is effective enough to address the risks embedded in the activity.

24.2.5 To make horizontal reviews effective, the following may be taken into account:

- where peer groups are used, the choice of the peer group can have an impact on the outcome of the review. The supervisor should carefully consider the criteria for including insurers in a peer group;
- when reviewing an insurer operating in multiple jurisdictions, the group-wide supervisor should form a group-wide perspective. Such a perspective can build on analyses performed by a peer authority or a third party (including international organisations such as the IAIS, IMF and World Bank);
- the results of horizontal reviews performed within a single jurisdiction can be beneficial to the supervisory community as a whole, especially as they may relate to systemic risk to the insurance sector. The supervisor may also consider suitable fora for the communication of information that is not necessarily insurance or insurer specific; and
horizontal reviews need not always be complex exercises. Simple horizontal outlier analysis on readily available insurer reports can often provide helpful supervisory insight. Simple analysis of some of these reports, including trends and peer comparisons, may help the supervisor to identify areas of potential risk and help it to target future work.

**Historic trends and current risk environment**

24.2.6 The supervisor should have in place an appropriate form of stress testing, which is applied to the insurance sector as a whole or to a significant sub-sample of insurers, selected according to the exposures to specific risks to be assessed. Outcomes of insurance sector and financial market analysis should be considered in the development of severe but still plausible scenarios to be tested in such exercises. Scenarios should reflect the current market environment and potential unfavourable evolutions in terms of changes in markets and insurance specific risk exposures. In order to contextualise the results, the supervisor should take into account the characteristics of the supervisory framework and the structure of the insurer’s assets and liabilities. Following a stress test exercise, the supervisor should discuss potential vulnerabilities and potential mitigating actions with the relevant insurers.

24.2.7 While many data items are backward looking, insurance sector analysis should be forward looking, to the extent possible, when developing scenarios to capture potential future developments. Stress scenarios should take into account ways that market dynamics have changed, which may make historical data less relevant.

24.2.8 The supervisor should use stress tests to identify vulnerabilities and risks and assess the impacts to the insurance sector and for individual insurers. Additionally, stress scenarios should be used to identify how those potential impacts may spread.

**Inward and outward risks**

24.2.9 When assessing both inward and outward risks, the supervisor should assess insurers’ exposures to liquidity risk, interconnectedness (macroeconomic and counterparty exposure), lack of substitutability and other risks. Assessing inward risks refers to the extent insurers may be exposed to, or vulnerable to, a certain risk within the insurance sector, whereas the outward risk refers to the situation in which these vulnerabilities would generate externalities which may then propagate to other financial markets or the real economy.

24.2.10 The supervisor should monitor the liquidity of an insurer’s invested assets relative to its insurance liabilities based on their characteristics. Additionally, the supervisor should analyse the potential that a large insurer’s operations could require it, or a sufficiently large number of insurers, to engage in asset sales of a significant size. The supervisor should assess the funding structure of insurers and their reliance on short term funding.

24.2.11 The supervisor should monitor interconnectedness with the financial system (for example, via intra-financial assets and liabilities or derivatives). As these exposures can be on a cross-jurisdictional and
cross-sectoral basis, the supervisor should cooperate with supervisors in other relevant jurisdictions and sectors.

24.2.12 Macroeconomic exposure in insurance liabilities depends on the characteristics of applicable investment guarantees as well as other contractual provisions and the complexity of the underlying risks. Monitoring of macroeconomic exposure should recognise the relationship between the assets and liabilities of the insurer. Stress tests can be used to support monitoring of this exposure.

Assessing systemic importance

24.3 The supervisor has an established process to assess the potential systemic importance of individual insurers and the insurance sector.

24.3.1 The supervisor should take a total balance sheet approach (see ICP 16 Enterprise Risk Management for Solvency Purposes) when considering the potential systemic importance of an insurer. When analysing systemic risk stemming from the insurance sector, the supervisor should at least consider common exposures and activities.

24.3.2 The supervisor should consider the type of policies underwritten by insurers and the activities insurers are engaged in, such as the degree of engagement in derivatives activity and reliance on short-term market activity. The supervisor should also consider the interconnectedness with other financial institutions, and the role of the insurance sector within the broader financial system.

24.3.3 As part of its assessment, the supervisor should consider emerging developments that may affect the insurance sector’s risk exposures. Additionally, the supervisor should cooperate and coordinate with other financial sector supervisors (such as banking, securities and pension supervisors, central banks and government ministries) to gain additional perspectives on the potential change in the risk exposures of insurers stemming from evolutions of other markets.

24.3.4 The supervisor should communicate the findings of its assessment as appropriate, to either individual insurers or the sector. The supervisor should require insurers to take action necessary to mitigate any particular vulnerabilities that have the potential to pose a threat to financial stability.

Supervisory response

24.4 The supervisor uses the results of its macroprudential supervision, and considers the potential systemic importance of insurers and the insurance sector, when developing and applying supervisory requirements.

24.4.1 A macroprudential perspective in the development and application of supervisory requirements may help limit the build-up of systemic risks and contribute to the resilience of the financial system. The supervisor should ensure that there is an appropriate interaction between its macroprudential analysis and assessment activities, on the one hand, and microprudential supervision, on the other hand.

24.4.2 As part of introducing supervisory requirements into its supervisory framework, the supervisor should consider implementing supervisory measures based on macroprudential concerns. Many macroprudential tools are, in effect, microprudential instruments developed or applied with
a macroprudential perspective in mind. By mitigating risk exposures, some measures that are intended to protect policyholders may also contribute to financial stability by decreasing the probability and magnitude of any negative systemic impact.

24.4.3 The supervisor should determine the depth and level of supervision based on its assessment of the systemic importance of individual insurers or the insurance sector (see ICP 9 Supervisory Review and Reporting). The supervisor should act to reduce systemic risk when identified within its jurisdiction through an appropriate supervisory response. In jurisdictions where one or more insurers have been assessed as systemically important, or a number of insurers are contributing to systemic risk, the supervisor should have supervisory requirements targeted at those insurers to mitigate systemic risk. The supervisor should extend certain requirements as necessary to an insurer and/or a number of insurers that it has assessed to be systemically important.

24.4.4 Specific supervisory responses may relate to:

- requirements on insurers:
  - enterprise risk management (see ICP 16 Enterprise Risk Management for Solvency Purposes);
  - disclosures (see ICP 20 Public Disclosure);
- preventive or corrective measures (see ICP 10 Preventive Measures, Corrective Measures and Sanctions); and
- crisis management and planning:
  - crisis management, including crisis management groups (see ICP 25 Supervisory Cooperation and Coordination); and
  - recovery and resolution planning (see ICP 12 Exit from the Market and Resolution and ICP 16 Enterprise Risk Management for Solvency Purposes).

24.4.5 Supervisory requirements may be intended to mitigate the potential spill-over effects from the distress or disorderly failure of an individual insurer or from the common exposures or behaviours of a group of insurers or across the sector. In the latter case, supervisory requirements may have different effects during different phases of the economic, underwriting or credit cycle. Therefore, the supervisor may develop requirements that are time-varying in nature, depending on the economic environment. The activation of such time-varying requirements could be rules-based (for example triggered automatically given a pre-defined condition) or discretionary (ie upon explicit decision by the supervisor). A rules-based approach may be more transparent but requires regular assessments of its adequacy under changing conditions affecting the insurance business.

**Transparency**

24.5 The supervisor publishes relevant data and statistics on the insurance sector.

24.5.1 The publication of data and statistics by the supervisor may enhance market efficiency by allowing market participants to make more informed
decisions and reducing the cost to the public of acquiring insurance sector information. Moreover, the publication of data may serve as a market disciplining mechanism by facilitating comparisons of an individual insurer to the sector as a whole.

24.5.2 The supervisor may provide access to sufficiently detailed data either by publishing data itself or by providing others with adequate means for publishing data. This could be achieved by engaging a government statistical office or cooperating with the local insurance sector; provided the supervisor is satisfied with the accuracy, completeness, frequency and timeliness of such publication.
25.0.1 Supervisors of the different insurance legal entities within an insurance

group with cross-border activities should coordinate and cooperate in the

supervision of the insurance group as a whole. Supervisors of different

insurance legal entities which are not part of the same group may also

need to cooperate and coordinate particularly where the insurers are

connected through reinsurance treaties or when difficulties in one insurer

may affect the market more generally, such as in resolution situations

(see ICP 12 Exit from the Market and Resolution).

25.0.2 Supervisors may draw upon several supervisory practices to facilitate

cross-border cooperation and coordination. These practices include the

identification of a group-wide supervisor and the use of coordination

arrangements, including supervisory colleges.

25.0.3 The group-wide supervisor is one of the involved supervisors and is

chosen to lead group-wide supervision of an insurance group. The

group-wide supervisor should facilitate and lead the cooperation and

coordination between the other involved supervisors and engage them

in the relevant supervisory decisions regarding the insurance group. The

group-wide supervisor is ultimately responsible for delivering effective

and efficient group-wide supervision. The other involved supervisors

should provide the group-wide supervisor with information regarding

insurance legal entities they supervise and otherwise participate in

group-wide supervision. The procedures for systematic or ad hoc

information exchange should be agreed with the other involved

supervisors. The sharing of information by the group-wide supervisor

and the other involved supervisors should be subject to confidentiality

requirements (see ICP 3 Information Sharing and Confidentiality

Requirements).

25.0.4 The undertaking of cooperation and coordination should not be taken to

imply joint decision making authority or any delegation of an individual

supervisor’s responsibilities. Supervisory decisions remain within the

responsibility of each of the involved supervisors.

Supervisory Recognition

25.0.5 Supervisors wishing to determine whether they can recognise and rely

upon another supervisory regime for the purpose of group-wide

supervision and designation of supervisory tasks should carry out an

assessment of the acceptability of the counterpart’s regime reflecting the

level or objective of supervisory recognition sought. Supervisors may use

different processes to conduct a supervisory recognition assessment.

The form of recognition and the criteria used for assessment will vary

depending on its purpose.
25.0.6 When the assessment has been finalised, the decision as to whether to recognize the supervisor should be communicated to the subject of the assessment. If recognition is not possible, the areas where the criteria were not met should be communicated and the supervisors should discuss how recognition may be achieved in future. A process for reassessment could then be established.

25.0.7 Following recognition, the supervisor should periodically assess whether a recognised supervisor continues to meet the criteria for recognition.

25.0.8 The terms of supervisory recognition, as well as specific roles and responsibilities, may be set out in unilateral statements, bilateral agreements, or multilateral agreements.

25.1 The supervisor discusses and agrees with the involved supervisors which of them is the group-wide supervisor for cross-border insurance groups operating in its jurisdiction.

25.1.1 In principle, the home supervisor of the head of the insurance group should be considered first to take the role of the group-wide supervisor in accordance with its authority and powers in its jurisdiction. In some jurisdictions, the legal or regulatory system may include provisions which allow or require the designation of a group-wide supervisor.

25.1.2 In case a different or several involved supervisors fulfil the conditions to be considered as a group-wide supervisor, factors to consider regarding the identification of a group-wide supervisor should include:

- the location of the insurance group's head office, given that this is where the group's Board and Senior Management is most likely to meet;
- where the registered head office is not the operational head of the insurance group, the location where:
  - the main business activities are undertaken;
  - the main business decisions are taken;
  - the main risks are underwritten; and/or
  - the largest balance sheet total is located; and
- the involved supervisors’ resources, skills, authorities and powers in their jurisdictions.

CF 25.1.a.1 When determining the group-wide supervisor of an IAIG, the involved supervisors should consider which supervisor would have direct powers over the Head of the IAIG (see ComFrame material under ICP 10 Preventive Measures, Corrective Measures and Sanctions).

25.2 As a group-wide supervisor, the supervisor:

- understands the structure and operations of the insurance group; and
- leads group-wide supervision, taking into account assessments made by the other involved supervisors.

Overall responsibilities of a group-wide supervisor
25.2.1 Once identified, the group-wide supervisor should be responsible for coordinating the input of insurance legal entity supervisors in undertaking group-wide supervision as a supplement to the existing insurance legal entity supervision.

25.2.2 Responsibilities of the group-wide supervisor should include:

- chairing of the supervisory college (where one exists), or consider establishing one if not in place yet;
- determination of the scope of group supervision;
- leadership, planning and coordination of group-wide supervisory activities;
- aggregation of group-wide information and dissemination of the relevant information to the other involved supervisors;
- preparation and discussion of group-wide supervisory analysis;
- performing a group-wide supervisory assessment, including assessing group capital management, risk and solvency, risk concentration, intragroup transactions and group governance;
- coordination of information sharing procedures amongst other involved supervisors;
- decision making on group-wide issues in consultation with other involved supervisors, where relevant;
- implementation and coordination of decisions on group-wide issues including preventive and corrective measures and sanctions; and
- identification of gaps in supervision.

25.2.3 The group-wide supervisor should take the initiative in coordinating the roles and responsibilities of, and facilitating communication between, the other involved supervisors. In carrying out its agreed functions, the group-wide supervisor should strive to act with the consensus of the other involved supervisors.

*Information sharing and key contact point function*

25.2.4 The group-wide supervisor should request information from other involved supervisors needed to fulfil its role.

25.2.5 The group-wide supervisor should make relevant information available to the other involved supervisors on a proactive basis and in a timely manner.

25.2.6 The group-wide supervisor functions as a key contact point for all other involved supervisors.

25.3 As an other involved supervisor, the supervisor understands:

- the structure and operations of the group insofar as it concerns the insurance legal entities in its jurisdiction; and
• the way that operations of insurance legal entities of the group in its jurisdiction may affect the rest of the group.

Responsibilities

25.3.1 Responsibilities of other involved supervisors should include:

• actively participating in the group supervision process, such as that facilitated by a supervisory college;
• informing the group-wide supervisor and, if necessary, other involved supervisors, of material findings affecting their insurance legal entity that could affect entities in other jurisdictions;
• sharing all relevant information with the group-wide supervisor to assist with supervision at the group-wide level and discussing findings and concerns at the group level with the group-wide supervisor;
• analysing information received from the group-wide supervisor;
• cooperating in the analysis and decision making as well as implementation and enforcement;
• assisting the group-wide supervisor in carrying out the supervisory process at the group level; and
• identifying gaps in supervision.

Information sharing

25.3.2 Other involved supervisors should provide the group-wide supervisor with relevant information, regarding insurance legal entities within the insurance group, including:

• any granting and withdrawal of a licence;
• location of significant business;
• developments in the legal structure of the insurance group;
• changes in business model;
• changes to the Board or Senior Management;
• changes in the systems of risk management and internal controls;
• significant developments or material changes in the business operations;
• significant developments in the financial position and regulatory capital adequacy;
• significant investments in group legal entities;
• significant financial links;
• the transfer of risks to and from non-regulated legal entities;
• operational risk as well as conduct risk, including mis-selling claims and fraud;

• potential high-risk factors for contagion; and

• events which may endanger the viability of the insurance group or major legal entities belonging to the insurance group.

25.3.3 Other involved supervisors should request information in relation to the group for a timely assessment of an insurance legal entity located in its jurisdiction.

25.4 The group-wide supervisor discusses and agrees with other involved supervisors to establish suitable coordination arrangements for cross-border insurance groups operating in its jurisdiction.

25.4.1 Coordination arrangements, including supervisory colleges, are mechanisms to foster cooperation and coordination between involved supervisors with regard to the supervision of insurance groups, as well as to promote common understanding, communication and information exchange.

25.4.2 The group-wide supervisor should initiate discussions with other involved supervisors about suitable coordination arrangements. Involved supervisors should seek a consensus on the most appropriate form of coordination arrangements.

25.5 The group-wide supervisor sets out the coordination arrangements in a written coordination agreement and puts such arrangements in place.

25.5.1 The scope of coordination arrangements will vary and should reflect the circumstances of the particular insurance group and involved supervisors.

25.5.2 A written coordination agreement should cover activities including:

• information flows between involved supervisors;

• communication with the head of the group;

• convening periodic meetings of involved supervisors;

• the conduct of a comprehensive assessment of the group, including the objectives and process used for such an assessment; and

• supervisory cooperation during a crisis.

25.6 The supervisor discusses and agrees with involved supervisors whether to establish a supervisory college for cross-border insurance groups operating in its jurisdiction, and if so, how to structure and operate the supervisory college.

Establishing a supervisory college

25.6.1 The group-wide supervisor, in cooperation and coordination with other involved supervisors, should consider establishing a supervisory college where, for instance:
• the nature, scale and complexity of the cross-border activities or intra-group transactions are significant and associated risks are high;
• group activities or their cessation could have an impact on the overall stability of the insurance markets in which the insurer operates; and
• the insurance group has significant market share in more than one jurisdiction (see Application Paper on Supervisory Colleges).

Structure and membership of a supervisory college

25.6.2 The group-wide supervisor, in cooperation and coordination with the involved supervisors, should carefully consider the structure of the supervisory college (for example, inclusive, tiered, or regional).

25.6.3 A supervisory college is typically comprised of representatives of each of the supervisors responsible for the day-to-day supervision of the insurance legal entities, including material or relevant branches, which are part of the group and, as appropriate, any supervisors of other material non-insurance entities.

25.6.4 Clear criteria should be established for defining the basis of membership in the supervisory college. Issues which should be considered in establishing these criteria include:

• the relative size and materiality of the insurance legal entity relative to the insurance group as a whole;
• the relative size or materiality of the insurance legal entity relative to its local market;
• the level of risk in a particular insurance legal entity.

25.6.5 The structure of and membership in the supervisory college should be reviewed on a regular basis to reflect changing circumstances in the insurance group.

Coordination agreement for a supervisory college

25.6.6 The purpose of a supervisory college coordination agreement is to establish a framework for the operations of a supervisory college. The agreement is not legally binding and does not create enforceable obligations from one supervisor to another. However, jurisdictions may be subject to an obligation to establish such an agreement.

25.6.7 While recognising the need to allow for flexibility in the operation of a supervisory college, matters covered by the coordination agreement generally should include:

• membership of the supervisory college – including the approach to participation of members in the college;
• the process for appointing a supervisor to chair the college (typically, but not necessarily, the group-wide supervisor);
- roles and functions of the supervisory college and of the members of the supervisory college, including expectations of the chair;
- frequency and locations of meetings (meetings should take place by telephone conference call or other means where an in-person meeting is not practical); and
- scope of the activities of the supervisory college, including ongoing information exchange.

25.6.8 Members of a supervisory college who are not signatories to the IAIS MMoU should enter into a similar long-term agreement covering information exchange and confidentiality, which could be included in the college coordination agreement.

Functions and activities of a supervisory college

25.6.9 The group-wide supervisor, in cooperation and coordination with the other involved supervisors, should establish the appropriate ongoing functions of the supervisory college and clearly allocate those functions among the involved supervisors to avoid unnecessary duplication of supervisory tasks and to ensure no gaps exist in the supervision of the group.

25.6.10 In establishing the functions of a supervisory college, the key activities which should be considered include:
- providing access for involved supervisors to information and knowledge about the group and the environment in which it operates through information sharing;
- assessing group-wide risk exposures, financial position and regulatory capital adequacy and the group-wide corporate governance framework, including risk management, internal control and intra-group relationships such as intra-group transactions and exposures;
- understanding the material operations, solvency and liquidity needs of the material legal entities within the group;
- coordinating supervisory activities such as joint off-site monitoring or on-site inspections or review of one or more entities within the group or of a particular aspect of the group’s functions such as internal audit, actuarial, risk management or compliance;
- coordinating appropriate actions to ensure that the group and relevant entities within the group mitigate identified risks;
- forming special focus teams to evaluate areas of particular concern or importance to the involved supervisors, or to bring together the requisite expertise to examine an aspect of the group’s operations;
- providing a forum for involved supervisors to interact with the insurer’s group-wide Senior Management in order to, for example, inform Senior Management of an identified issue at
an insurance legal entity that affects the whole insurance
group; and

• regularly assessing the effectiveness of the supervisory
college in fulfilling its agreed role and functions. The
assessment should be organised by the group-wide
supervisor and take into account input from the other involved
supervisors and, as appropriate, legal entities.

25.6.11 Aside from group-wide issues, supervisory colleges may also focus on
issues specific to insurance legal entities within the insurance group.

| CF 25.6.a | The group-wide supervisor establishes a supervisory college for the IAIG,
which meets at least annually. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>CF 25.6.a.1</td>
<td>If a supervisory college does not already exist, one should be formed and its first meeting should take place in a timely manner after the identification of the IAIG.</td>
</tr>
</tbody>
</table>
| CF 25.6.a.2 | Priorities for the initial supervisory college meeting should include, at least:
• confirming the group-wide supervisor and the structure of the supervisory college;
• describing the scope of group-wide supervision including, where applicable, an explanation from the group-wide supervisor of its decision to exclude an entity from the scope of group supervision; and
• discussing proposed coordination agreements. |
| CF 25.6.a.3 | When an in-person meeting is not practicable, the meeting should take place by teleconference or other means. |
| CF 25.6.a.4 | The group-wide supervisor should ensure that the IAIG’s supervisory college discusses the most relevant elements of the group-wide supervisory process and the supervisory plan. The agenda set by the group-wide supervisor should provide for discussion of at least the IAIG’s:
• group-wide corporate governance framework;
• enterprise risk management;
• main risks and intra-group transactions;
• financial position; and
• regulatory capital adequacy and compliance with supervisory requirements. |
| CF 25.6.a.5 | When deciding on the topics to be covered in the IAIG’s supervisory college meetings, the group-wide supervisor should cooperate and coordinate with involved supervisors to ensure that matters pertinent at a legal entity level are appropriately raised. |

| CF 25.6.b | The members of the IAIG’s supervisory college communicate and exchange information on an ongoing basis. |
CF 25.6.c  The members of the IAIG’s supervisory college discuss and assess a summary of the reference ICS prepared by the group-wide supervisor, as well as a summary of any additional reporting related to the ICS that has been reported at the option of the group-wide supervisor.

CF 25.6.c.1  The assessment of the reference ICS and, if applicable, any additional reporting should include:

- a comparison with existing group capital standards or calculations that are in development;
- the extent to which material risks of the IAIG are captured;
- the appropriateness and practicality of the calculations required; and
- any difficulties in implementing the measure by the IAIG.

CF 25.6.c.2  The purpose of the supervisory college discussing and assessing the summary of the reference ICS, and of any additional reporting, is to help refine the ICS.

Supervisory cooperation in planning for crisis management

25.7  The group-wide supervisor coordinates crisis management preparations with other involved supervisors and relevant authorities.

Objectives of crisis preparation planning

25.7.1  The main objectives of supervisory crisis management planning should be:

- to protect policyholders; and
- to contribute to domestic or international financial stability to avoid a potential adverse impact on the real economy.

25.7.2  In planning for crisis management the group-wide supervisor and other involved supervisors should seek to:

- promote private sector solutions such as portfolio transfers and run-offs;
- minimise the need to use public support to protect policyholders;
- minimise disruptions to the efficient operation of the insurance sector across jurisdictions; and
- achieve an orderly supervisory response.

Process for crisis management planning

25.7.3  Supervisory actions in planning for crisis management should seek to secure early communication between involved supervisors and relevant authorities in order to maximise time for coordination and cooperation.

25.7.4  The group-wide supervisor should meet regularly with the other involved supervisors and relevant authorities to share and evaluate information relating to the insurance group and to analyse and assess specific issues (including whether there are systemic implications). These meetings may
be held in conjunction with the supervisory college meetings or separately if no supervisory college is in place.

25.7.5 Supervisors should remain aware of potential contagion channels, conflicts of interest and possible barriers to coordinated action in a crisis situation within a specific cross-border insurance group (such as legally required transparency rules in the case of publicly listed companies or particular legislative requirements across jurisdictions).

25.7.6 Effective crisis management should ensure that preparations for and management of a cross-border crisis – including policy measures, crisis response decisions and matters of external communication – are coordinated, timely and consistent. Supervisors and other relevant authorities (e.g., ministries of finance, central banks, other financial sector supervisors and policyholder protection schemes) should exchange information to facilitate effective crisis management.

25.7.7 The group-wide supervisor should share with the other involved supervisors and relevant authorities information relevant to crisis management, including:

- group structure (focusing on legal, financial and operational intragroup dependencies, which may not be always available to the other authorities);
- inter-linkages between the insurance group and the financial system in each jurisdiction where it operates; and
- potential impediments to a coordinated solution to a crisis.

25.7.8 A supervisory college should plan in advance the process for cooperation and coordination during crisis situations in order to benefit from well-established information and cooperation channels and procedures should a crisis occur. The channels for communication with the head of the group, as well as other parts of the group, should be clearly established in case a crisis emerges. The group-wide supervisor should establish close communication channels with the group Board and Senior Management as well as Significant Owners.

---

**CF 25.7.a** The group-wide supervisor establishes a crisis management group for the IAIG with the objective of enhancing preparedness for, and facilitating the recovery and resolution of, the IAIG.

**CF 25.7.a.1** A crisis management group may be established under a different name so long as it fulfils the objectives of a crisis management group for the IAIG (IAIG CMG).

**CF 25.7.a.2** There should be clear conditions as to the membership of the IAIG CMG. Membership of the IAIG CMG should include:

- the group-wide supervisor;
- the other relevant involved supervisors; and
- to the extent possible, relevant resolution authorities.

**CF 25.7.a.3** The supervisory college may qualify as an IAIG CMG if:
• the supervisory college’s coordination arrangements address recovery and resolution; and
• membership includes those authorities which would otherwise be members of the IAIG CMG.

CF 25.7.a.4 The IAIG CMG should keep under active review the:
• progress in coordination and information sharing within the IAIG CMG and with host resolution authorities that are not represented in the IAIG CMG;
• processes for recovery planning and resolution planning (where required) for the IAIG; and
• resolvability of the IAIG.

CF 25.7.b The group-wide supervisor puts in place a written coordination agreement between the members of the IAIG CMG.

CF 25.7.b.1 The coordination agreement should describe, at least:
• roles and responsibilities of the respective members of the IAIG CMG; and
• the process for coordination and cooperation, including information sharing, among members of the IAIG CMG.

CF 25.7.b.2 The coordination agreement may take the form of a memorandum of understanding.

**Supervisory cooperation during a crisis**

25.8 The supervisor:

• Informs the involved supervisors as soon as it becomes aware of a crisis;
• cooperates and coordinates with the involved supervisors and relevant authorities to analyse and assess the crisis situation and its implications to reach a common understanding of the situation; and
• identifies coordinated, timely and effective solutions to a crisis situation.

25.8.1 The group-wide supervisor should coordinate the gathering and analysis of information, as well as coordinate supervisory activities to respond to the crisis.

25.8.2 Such analysis should include:

• implications for policyholder protection in each relevant jurisdiction;
• whether the crisis is of systemic relevance and, if so, the identification of possible sources of systemic risk; and
• processes through which involved supervisors and relevant authorities can respond in a coordinated way.
25.8.3 Such cooperation and coordination takes account of the impact of the crisis on policyholders, financial systems and real economies of all relevant jurisdictions, drawing on information, arrangements and crisis management plans developed beforehand.

25.9 The group-wide supervisor coordinates with other involved supervisors and relevant authorities on public communication and communication with the insurance group during the crisis.

25.9.1 The group-wide supervisor and other involved supervisors, where practicable, share their plans for public communication among themselves and with other authorities to ensure that communication is handled in a coordinated and timely way.

25.9.2 The group-wide supervisor considers when, and to what extent, to communicate with the insurance group and the insurance legal entities that are part of the group, through their respective insurance legal entity supervisors.

Robert W. Klein
Department of Risk Management and Insurance Research, Georgia State University, P.O. Box 4036, Atlanta, GA 30302-4036, U.S.A.

The recent financial crisis and its cascading effects on the global economy have drawn increased attention to the regulation of financial institutions including insurance companies. While many observers would argue that insurance companies were not significant contributors to the crisis, the role of insurance companies in the financial economy and their potential vulnerability to systemic risk have become matters of considerable interest to policy-makers and regulators. In this context, this paper examines the basic economic principles that should govern the regulation of insurance and employs these principles in assessing current regulatory practices and potential reforms. Specifically, it articulates the basic rationale for insurance regulation, which is the remediation of market failures where regulation can enhance social welfare. In insurance, the principal market failures that warrant regulatory intervention are severe asymmetric information problems and principal-agent conflicts that could lead some insurance companies to incur excessive financial risk and/or engage in abusive market practices that harm consumers. This provides an economic basis for the regulation of insurers' financial condition and market conduct. At the same time, the regulatory measures that are employed to correct market failures should be efficient and effective. Judged against these principles, the systems for solvency and market conduct regulation in the United States warrant significant improvement. There appears to be little or no justification for regulating insurance rates in competitive markets and the states should move forward with full deregulation of insurance prices. The EU appears to be much farther ahead in terms of implementing best practices in the regulation of insurers' financial condition under its Solvency II initiative. It is also much closer to the desirable goal of full price deregulation than the United States.

Keywords: insurance regulation; market failures; Solvency II

Introduction

The recent financial crisis and its cascading effects on the global economy have drawn increased attention to the regulation of financial institutions including insurance companies. While many observers would argue that insurance companies were not significant contributors to the crisis, they did feel its effects, particularly in the life sector.¹² A number of life insurers were stressed because of their investments in

¹ See Wang et al. (2009).
² The American International Group (AIG) received prominent attention because of its losses on credit
mortgage-backed securities and other real estate-related assets. As the crisis triggered a severe economic recession and a precipitous fall in stock prices, both life and non-life insurers suffered further asset losses. Some took advantage of government programmes to bolster their capital. Fortunately, these developments did not trigger a wave of insurer insolvencies. Nonetheless, the role of insurance companies in the financial economy and their potential vulnerability to systemic risk have become matters of considerable interest to policy-makers and regulators.

In this context, this paper examines the basic economic principles that should govern the regulation of insurance, and employs these principles in assessing current regulatory practices and potential reforms. This assessment is particularly timely as policy-makers review and restructure the framework for the regulation of financial institutions. It should be noted that insurance regulatory reform has been an ongoing process with initiatives that began before 2008. Still, the recent financial crisis has created a heightened sense of urgency regarding reform and added new issues for policy-makers to consider. Various stakeholders have a vested interest in this process and reasons to advocate for reforms that are economically sound and that will promote viable and efficient insurance markets.

This paper reviews fundamental principles of insurance regulation that should be applicable in various jurisdictions and assesses current practices and potential reforms in light of these principles. The paper is organised as follows. The section “Economic principles for insurance regulation” outlines the basic rationale for the regulation of insurance and the economic principles that can be derived from this rationale. Several key areas of insurance regulation are addressed including solvency, prices and market conduct, with particular emphasis on financial (i.e., solvency) regulation. The section “Evaluation of current practices and potential reforms” then applies these principles in assessing the soundness and efficiency of current regulatory practices and considering how these practices might be improved. This assessment focuses primarily on insurance regulation in the United States with some extension to the European Union (EU) and other countries. The final section summarises and concludes.

**Economic principles for insurance regulation**

*Why insurance should be regulated*

The economic foundation for regulation is based on the presence of market failures. These market failures are judged against the social welfare maximising conditions for perfect competition. Perfect competition requires numerous buyers and sellers in a

---

3 A number of life insurers were also “squeezed” by lower returns on their investments and the guarantees embedded in their variable annuity products.

4 See, for example, Spulber (1989), Viscusi et al. (2000).
market, the lack of barriers to entry and exit, perfect information, and a homogenous product. Under these conditions, the joint surplus or gains from trade of producers and consumers is maximised. Of course, few if any markets satisfy the conditions for perfect competition in the real world. Hence, in assessing the need for and benefits of regulation in an imperfect world, markets are often judged against a standard of “workable competition” that reasonably approximates the conditions for perfect competition to the degree that government intervention cannot improve social welfare.\(^5\) This standard of workable competition has the desirable attribute of focusing attention on the presence of market failures wherein government remedies can improve market efficiency and enhance social welfare.

Potential market failures in insurance include severe asymmetric information problems and principal-agent conflicts that could lead some insurance companies to incur excessive financial risk and/or engage in abusive market practices that harm consumers. Insurance consumers, particularly individuals and households, face significant challenges in judging the financial risk of insurers and properly understanding the terms of insurance contracts. There is also the possibility that insurers could acquire sufficient market power to restrict competition, resulting in barriers to entry, higher prices and excess profits.

The issue of systemic risk has garnered considerable attention due to the recent financial crisis. Systemic risk could be defined as the risk that a market or financial system could experience severe instability, potentially catastrophic, caused by idiosyncratic events or conditions in financial intermediaries. It arises from the links between firms in a system or market in which the failure of one or more firms can have cascading effects that could potentially bring down an entire system or market.\(^6\) Arguably, this is a kind of market failure that can arise from excessive risk-taking by financial institutions whose failure can lead to the failure of other firms in a market or system.

In contrast to market failures, there are a set of circumstances that could be termed “market problems”. These are not failures in the economic sense but constitute “undesirable” market outcomes, for example high prices, the unavailability of insurance coverage, etc., that result from conditions affecting the cost of risk, rather than violations of the conditions for perfect or workable competition. For example, in some markets insurance may be expensive because claim costs are high. One would expect the price of insurance to be commensurate with expected claim costs. While this may cause hardships for consumers, it is a natural result of properly functioning market forces and not a condition that can be remedied by regulation \textit{per se}.

This kind of situation can be contrasted with true market failures in which there is a significant violation of the conditions for workable competition. The rationale for government intervention when market failures occur is based on promoting or restoring economic efficiency. For example, an insurer may take on too much financial risk because its owners would not be required to pay the full costs of its insolvency due to limited liability of the corporate form of the organisation. In many industries, the

\(^5\) Scherer and Ross (1990).

\(^6\) See “Systemic Risk” at \url{www.en.wikipedia.org/wiki/Systemic_risk#cite_note-2}. 
creditors of firms may be able to sufficiently judge the firms’ financial risk and take steps to protect their interests. However, the circumstances for certain financial institutions such as banks and insurance companies are arguably more problematic for creditors. One could make the case that the costs of monitoring are so high for consumers that it is cheaper for the government to undertake this task and take action against insurers that incur excessive financial risk. If it is more efficient for the government to perform this monitoring and employ other compliance/enforcement measures, then regulatory intervention could increase social welfare.

Similarly, if there is collusion among insurers due to market power resulting from the presence of a small number of firms and entry/exit barriers in a particular market, then the government could remedy this market failure through antitrust measures or regulating prices. The assumption here is that the government would ensure that the prices charged would be same as those that would be set in a competitive market. This is an efficiency-based argument that implies that the regulator would attempt to enforce prices equal to marginal costs. If, in contrast, high insurance prices are due to high levels of risk (and not collusion among insurers) then regulation cannot enforce lower prices without causing market distortions. This distinction is important because regulatory intervention and policies often can be motivated by the desire to “fix” or ameliorate market problems rather than remedy legitimate market failures.

Optimal regulation is based upon an ideal set of policies that attempt to replicate the conditions of a competitive market and maximise social welfare. This theoretical model of regulation is based on the premise that regulators seek to remedy market failures and not market problems caused by other external factors. This may include failures that would otherwise cause insurers to incur an excessive risk of insolvency and/or engage in abusive trade practices, for example, misrepresenting insurance products, refusing to pay legitimate claims, etc. This assumes that regulators have perfect information and can determine and implement the correct market solutions, an assumption that may not be valid under some circumstances. Hence, not all market failures can necessarily be remedied by regulation, and the desirability of any particular regulatory intervention must be assessed in terms of regulators’ ability to remedy a specified market failure and any deadweight costs associated with regulatory intervention that may exceed the benefits from intervention. Further, this line of reasoning presumes that regulators will employ “best practices” and the most efficient measures to address market failures.

Solvency regulation
The social welfare argument for the regulation of insurer solvency derives from inefficiencies created by costly information and principal-agent problems.7,8 Owners of

---

7 Munch and Smallwood (1981).
8 Costly information refers to the fact that it is costly for consumers to acquire information about the financial condition of an insurer and the relative value of its products in relation to their prices. Principal-agent problems refer to the difficulty that a consumer (the principal) faces in monitoring and controlling the activities and financial risk of an insurer (the agent), once the consumer has signed a contract with the insurer and paid premiums for coverage of future claims and benefit obligations.
insurance companies have diminished incentives to maintain a high level of safety to the extent that their personal assets are not at risk for unfunded obligations to policy-holders that would arise from insolvency. The argument is that it is costly for consumers to properly assess an insurer’s financial strength in relation to its prices and quality of service. Insurers also can increase their risk after policy-holders have purchased a policy and paid premiums—a “principal-agent” problem that may be very costly and difficult for policy-holders to control.

There are other aspects of excessive insolvency risk that may motivate regulatory intervention. Financial regulators are also concerned about “contagion” and the possibility that a spike in insurer insolvencies could induce a “crisis of confidence” that may have negative effects on the industry. Further, there may be negative externalities associated with excessive insurer insolvency risk as the costs of unpaid claims may be shifted beyond policy-holders to their creditors. Hence, it is common for the regulation of financial institutions to be coupled with some form of insolvency guarantees (e.g., deposit insurance, insurance guaranty associations, etc.) that cover at least a portion of the obligations of bankrupt firms. Note, this phenomenon does not constitute systemic risk as defined above but does reflect the negative externalities associated with the failure of one or more insurance companies.

Arguably, the goal of optimal insurance solvency regulation should not be to minimise insolvencies as the costs of achieving such a goal would likely exceed the perceived benefits. A more reasonable goal would be to minimise or limit the social cost of insurer insolvency within acceptable parameters. The social cost is more than the lost equity of the insurer as it includes the effects on policy-holders and third parties who may be creditors of insurers. Regulators can potentially limit insolvency risk by requiring insurers to meet a set of financial standards and taking appropriate actions if an insurer assumes excessive default risk or experiences financial distress.

Price regulation
There are two potential rationales for regulation of insurance prices. The traditional explanation for regulation of insurance prices involves costly information and solvency concerns. According to this explanation, insurers’ incentive to incur excessive financial risk and even engage in “go-for-broke” strategies may result in inadequate prices. Some consumers might buy insurance from carriers charging inadequate prices without properly considering the greater financial risk involved. In this scenario, poor incentives for solvency safety could induce a wave of “destructive competition” in which all insurers are forced to cut their prices below costs to retain their market

---

9 The costs of determining financial soundness are much lower today than they were in the past, as anyone with knowledge and access to the Internet can check an insurer’s claims paying ability—provided by rating agencies—on the Internet. However, rating agencies cannot engage in enforcement actions (although they may pressure insurers to correct problems) and most countries do not accept the notion that they are an adequate substitute for government regulation.

10 See, for example, Cummins et al. (1995).

11 Joskow (1973), Hanson et al. (1974).
positions. In the United States, the solution offered was uniform prices developed by industry-rating organisations subject to regulatory oversight to prevent excessive prices.

This view essentially governed the regulation of property-casualty insurance prices in the United States until the 1960s, when states began to disapprove or reduce price increases in lines such as personal auto and workers’ compensation insurance. The rationale that some might offer for government restrictions on insurance price increases is that consumer search costs impede competition and lead to excessive prices and profits. It also might be argued that it is costly for insurers to ascertain consumers’ risk characteristics accurately, giving an informational advantage to insurers already entrenched in a market and creating barriers to entry that diminish competition. According to this view, the objective of regulation is to enforce a ceiling that will prevent prices from rising above a competitive level and enabling insurers to earn excess profits.

In addition, the public may express a preference for regulatory policies to lower or cap insurance prices consistent with social norms or objectives. This may not justify insurance price regulation based on the principles asserted above but, nonetheless, explains why insurance prices are regulated in some circumstances when a pure economic justification is not apparent. These circumstances may include government mandates that compel consumers or firms to secure certain types of insurance.

However, the empirical evidence does not tend to support a case for the regulation of insurance prices in most markets in developed countries where the insurance industry is relatively mature. For example, studies of insurance markets in the United States indicate that they are highly competitive in terms of their structure and performance. Entry barriers tend to be low and concentration levels rarely approach a point that would raise concerns about insurers’ market power.

Further support for this assertion is provided by Table 1, which shows the number of insurers and concentration levels in major lines of business in the non-life sector in the United States in 2006. In excess of 1,270 insurer groups (including stand-alone companies) sold property-casualty insurance in 2006, with several hundred insurers competing in each major line. The principal measures of market concentration, the ten-firm concentration ratio (CR10), which is the market share of the top ten insurers, and the Herfindahl-Hirschman Index (HHI), which is the sum of the squared market shares of all insurers, also indicate competitive market structures in these lines. The top ten insurers accounted for less than 65 per cent of the premiums written in any given line and 40–50 per cent in many lines. Similarly, HHI values ranged from 255 to 784, with most lines falling between 300 and 500. These levels of concentration are considerably below levels that most economists consider necessary for firms to begin acquiring market power. Further, profits in both the life and non-life sectors in the

---

12 This view likely stems from the periodic price wars (and subsequent insurer failures) that afflicted property-casualty insurance markets in the United States during the 1800s and early 1900s.

13 Harrington (1992) explains but does not advocate this view. Further, the cost of shopping for insurance has dropped dramatically for personal lines of coverage (see Brown and Goolsbee, 2002).

15 According to the Department of Justice and Federal Trade Commission 2010 Horizontal Merger Guidelines, a market with an HHI below 1,500 is considered to be “unconcentrated.”
United Sectors tend to be in line with or below the rates of return earned in other industries as shown in Figure 1.

Over the last 50 years, the enforcement of uniform rates has eroded in the United States and industry organisations have moved to the promulgation of “advisory” rates or loss costs. This has caused insurer pricing to be much more independent and differentiated. Hence, it is not surprising that studies of the effects of the regulation of

insurance rates have not uncovered significant benefits to consumers from such
regulation.  

In the United States, prices/premiums for life insurance and annuity products
have generally not been subject to direct regulation. Price regulation in the life
sector is imposed indirectly through the regulation of life insurance and annuity
products. In approving such products, regulators consider whether the premiums
charged according to these contracts are commensurate with the benefits offered. In
health insurance, almost all the states impose some form of rating constraints in the
small group market but only 19 states impose rating constraints in the individual
market. 

Market conduct regulation
A stronger case can be made for regulating certain insurer market practices, such as
product design, marketing and claims adjustment. Constraints on consumer choice
and unequal bargaining power between insurers and consumers, combined with
inadequate consumer information, can make some consumers vulnerable to abusive
marketing and claims practices of insurers and their agents. In the United States,
there have been numerous instances in which insurance products have been
misrepresented and insurers or their agents have been found guilty of sales abuses.
For example, a number of life insurers settled legal suits in the late 1980s and early
1990s for agent practices that took customers out of safe policies and put them in
inappropriate (high risk) policies. Although several prominent insurers were
involved in some of these cases, the greater threat probably lies with firms or agents
that are not highly motivated to establish and maintain a strong reputation for fair
dealings with consumers. Hence, regulators need to be especially vigilant for “bad
actors” who seek gains from abusive or fraudulent transactions. The industry has
taken steps to mitigate market conduct problems through self-compliance measures
and the establishment of a voluntary self-regulatory organisation (SRO). At the
same time, regulators have promulgated new rules and bolstered their monitoring
mechanisms.

---

16 See, for example, Harrington (2002).
17 NAIC (2011).
18 It is true that consumers subject to unfair treatment might seek remedies through the courts and
sometimes do so. However, legal remedies may not be feasible for consumers with limited resources
and bills to pay. In addition, it may be difficult to secure financial damages from some fraudulent
insurers.
19 It is interesting to note that the suspect sales practices were not discovered by regulators until after
the initial lawsuits were brought. Some might view this as a regulatory failure but it also under-
scores the issue of regulators’ capacity to proactively uncover and remedy certain market conduct
problems.
20 See Klein (2005) for a more detailed discussion of regulatory efforts to better police marketing and
sales activities. The challenge faced by regulators is that rules tend to be somewhat arbitrary and
cannot fully accommodate the variety of circumstances encountered in insurance transactions.
Further, monitoring compliance with such rules can be difficult and costly given the large volume of
transactions.
An optimal regulatory framework

In sum, optimal regulation should be designed to minimise the cost of insurer insolvencies, promote the pricing of insurance at marginal cost, promote reasonable trade practices, provide appropriate incentives for insurers to police their own practices and those of their agents, and provide the optimal amount of insurance. However, optimal regulation depends upon more than just the approach to regulation. It also depends upon where regulatory authority resides or how it is apportioned among different regulatory jurisdictions and coordinated among those jurisdictions.

The United States is somewhat unique in that insurance regulation has been primarily delegated to the states. In most countries, insurance is regulated at the national level and in a few (e.g., Canada and Australia) regulatory responsibilities are divided between the states/provinces and the national government. In the United States, the National Association of Insurance Commissioners (NAIC) serves as the primarily vehicle for coordinating regulatory policies among the states. The EU constitutes a special case in which there is a formal legal framework designed to establish a common set of standards and harmonise the insurance regulations of its member countries. At an international level, there are advisory organisations (such as the International Association of Insurance Supervisors) that seek to harmonise insurance regulation at a global level through the promulgation of core standards and principles.

The state-based system of insurance regulation in the United States has come under heavy criticism because of the inefficiencies it creates and the additional costs it imposes on insurance transactions across state borders. Large insurers have pushed for the creation of an optional federal charter (OFC) that would allow insurers and agents to choose to be subject to federal regulation and exempt from state regulation. Despite strong opposition from the states and small insurers, the OFC proposal received serious consideration by the Congress until the recent financial crisis refocused its attention on federal regulation of other financial institutions. The Congress is likely to remain preoccupied with reforming the overall structure for the regulation of financial institutions and essentially leave insurance “on hold” for some period of time with some limited exceptions. However, it is reasonable to expect that policy-makers will revisit proposals for the federal insurance regulation as issues concerning the regulation of other financial institutions are resolved and a new financial regulatory framework is established.

In these countries, solvency regulation is handled at the national level and market conduct regulation is delegated to the states or provinces.

In 2010, a Federal Insurance Office was established as one of the provisions of the Dodd-Frank Wall Street Reform and Consumer Protection Act. Its primary responsibilities will be to advise the Secretary of the Treasury on insurance issues, consult with the states on insurance matters of national and international importance, and monitor all aspects of the insurance industry. It will also have the authority to identify issues or gaps in the regulation of insurance that could contribute to a systemic crisis and to make recommendations to the Financial Stability Oversight Council as to whether an insurer should be subject to supervision by the Board of Governors of the Federal Reserve. It will also play a substantial role in coordinating federal efforts and policies on international insurance issues.
Evaluation of current practices and potential reforms

Solvency regulation

Philosophy and approach
The approach to overseeing the financial condition and risk of insurance companies should be foremost in any discussion of regulatory policies. One can contrast two basic approaches to insurance solvency regulation: (1) a “prescriptive” or “rules-based” system; and (2) a “principles-based” system. In the United States, the various states have tended to apply a prescriptive approach to regulating insurers’ financial condition that is heavily influenced by an accounting perspective. This is reflected in a voluminous set of laws, regulations, rules and other measures that govern insurers’ financial structure and actions. Regulators have tended to focus on insurers’ compliance with these prescriptions rather than the prudence of their management and actions and their overall financial risk.

Unlike the United States, many European countries such as the United Kingdom have employed or are moving towards a principles-based approach to insurance regulation. In such a system, emphasis is placed on insurers maintaining an adequate “solvency margin” and the competence and judgement of an insurer’s management and actions with an insurer’s financial risk being the ultimate point of focus for supervisors. Hence, regulators must pay close attention to how well insurers are managed and exercise significant discretion in the actions or interventions they may employ to correct practices or problems as they deem necessary. This approach should allow insurers greater freedom in managing their affairs as long as they use that freedom judiciously, do not engage in excessively hazardous ventures or transactions and ultimately keep their financial risk within reasonable bounds. This philosophy is embodied in the EU’s collective insurance solvency initiatives that set common standards for all EU member countries.

Proponents of the prescriptive approach to insurance solvency regulation might argue that it is preferable to have a detailed set of rules to govern an insurer’s financial structure and actions for which compliance can be readily determined. Their concern might be that too little emphasis on rules and too much emphasis on principles would give insurance companies too much discretion and some might abuse this discretion and take on excessive risk to the detriment of policy-holders and other creditors. The drawback of such an approach is that it potentially establishes a set of constraints that may not be optimal for a given insurer. Further, regulators are compelled to engage in a torturous process of amending and expanding their rules over time as circumstances change and new sources of financial risk arise.

24 See, for example, Eling et al. (2009) for an assessment and comparison of U.S. and EU insurance financial regulation. Work on Solvency II continues as the European Commission and the European Insurance and Occupational Pensions Authority (EIOPA) address outstanding issues and finalise the technical specifications that will underlie Solvency II standards and practices. Associated reports and technical documents are available at www.ec.europa.eu/internal_market/insurance/solvency/index_en.htm and www.eiopa.europa.eu/.
26 See Eling et al. (2007) and Elderfield (2009) for a more detailed review of EU solvency initiatives.
Proponents of a principles-based approach might argue that it gives insurance companies greater flexibility in managing their financial risk according to certain established standards, and regulators can employ greater discretion in taking appropriate actions against insurers that take on excessive financial risk. They might also contend that this approach gives insurance companies greater incentives to manage their financial risk within acceptable parameters and the flexibility to do so. In theory, this approach would seem to be more efficient and properly focused on the overall financial risk of an insurer rather than its mere compliance with an arbitrary set of rules. However, in practice, the success of a principles-based approach depends heavily on the principles and standards that are set and the competence and motivation of regulators to take corrective action when it is warranted. Regulators in the United Kingdom would probably argue that they have met that test, although there have been some criticisms of how its Financial Service Authority has dealt with certain incidents.27 As the Solvency II initiative is implemented, there will be an opportunity to see how well a principles-based approach works when it is employed on a wider scale.

It should be noted that regulators in the United States have taken steps in adopting some aspects of a principles-based approach and are increasing their emphasis on financial risk.28,29 As this process continues to evolve, insurance regulation in the United States may become a hybrid system that employs both elements of a rules-based approach and of a principles-based approach one. It will be interesting to see how well such a hybrid system performs compared to other systems.

Capital standards
Capital requirements constitute the linchpin for the financial regulation of insurance companies as well as banks. The capital requirements for insurance companies can take several forms. Prior to the 1990s, fixed capital requirements were common. During the past 15 years, most of the major developed economies have moved towards some form of risk-based approach to determining how much capital an insurer is required to hold for regulatory purposes.30,31 Using this approach, the regulatory capital requirements may be determined by simple or complex formulas or the use of internal or standard models.

In the United States, insurers are subject to fixed capital requirements set by each state as well as uniform risk-based capital (RBC) standards based on complex formulas promulgated by the NAIC that have been adopted by every state.32 There are different formulas for property-casualty, health and life insurance companies. In RBC formulas, selected factors are multiplied times various accounting values

---

27 See, for example, European Parliament (2007).
28 Vaughan (2009).
29 Vaughan argues that “the optimal structure of insurance supervision is likely to be a combination of a rules-based and principles-based approach”.
31 Also see Holzmüller (2009) for a comparison and critique of capital standards in the United States and European Union (Solvency II).
32 An insurer is required to have capital that meets or exceeds the higher of the two standards.
(e.g., assets, liabilities or premiums) to produce RBC charges or amounts for each item. The charges are summed into several “baskets” and then subjected to a covariance adjustment to reflect the assumed independence of certain risks. An insurer’s calculated RBC amount is compared to its actual total adjusted capital (TAC) to determine its RBC position. Certain company and regulatory actions are required if a company’s TAC falls below a certain level of RBC. Four RBC levels for company and regulatory action have been established, with more severe action required for companies as they reach lower levels.

Arguably, the U.S. approach to determining RBC requirements reflects both the heights and the limits to what can be achieved with a formula-based method. When first adopted, the U.S. system was considered relatively advanced when compared with how regulatory capital requirements were determined in other countries and a significant improvement over fixed capital requirements. However, over time, using static formulas to determine how much capital an insurer hold seems increasingly antiquated in light of the advances that have occurred in dynamic financial analysis (DFA) and the use of models to assess and manage insurers’ financial risk. In addition, accounting values can either be erroneous or manipulated to obtain more favourable regulatory assessments. For example, Cummins et al. observe that the property-casualty formula encourages insurers to lower their loss reserves to reduce the associated RBC charge.

Further, while not all risks can be quantified, the U.S. RBC formula omits some that can be, such as operational risks, using methodological tools now available. It is also important to note that the U.S. RBC formula contains no explicit adjustment for an insurer’s size or its catastrophe exposure. Factors for both were proposed in the initial development of the property-casualty RBC formula but were rejected. The NAIC is currently considering adding a catastrophe component to RBC for property-casualty insurers, but this initiative is bogged down in a debate that is unlikely to be resolved any time soon.

When the EU embarked on its mission to develop a common set of capital standards under its Solvency II initiative, it was positioned to take advantage of the advances in risk analysis and modelling that have occurred. The primary goal of Solvency II is to develop and implement harmonised RBC standards across the EU. The intent is to take an enterprise risk-management (ERM) approach towards capital standards that will provide an integrated solvency framework that covers all significant risk categories and their interdependencies.

Solvency II consists of three pillars: (1) quantitative requirements, (2) qualitative requirements and supervision, and (3) supervisory reporting and public disclosure. The quantitative requirements under Pillar 1 include the valuation of assets and

33 In 2000, the NAIC introduced a model-based component to assess the interest rate risk associated for fixed annuities. In 2005, this approach was extended to assess the market risk, interest rate and expense-recovery risk of variable annuities.

34 Based on the current formulas, an insurer’s RBC requirement increases proportionately with the amount of its premiums, assets and loss reserves. However, arguably, according to the “law of large numbers”, an insurer’s risk does not increase proportionately with its size. With a size adjustment, a small insurer would have a higher relative RBC requirement than a large insurer, all other things equal.
liabilities, technical provisions, own funds, regulatory capital requirements and investments employing a total balance sheet approach with market-consistent valuation of assets and liabilities. There will be two levels of regulatory capital requirements. The first level is the minimum capital requirement (MCR), which is the minimum amount of equity capital that an insurer must hold. An insurer that failed to meet its MCR would be subject to immediate regulatory intervention. The second level is the solvency capital requirement (SCR), also called “target capital”, which is intended to represent the economic capital an insurer needs to conduct its business within a given safety level. In determining SCR, all significant risk categories are covered, including insurance, market, credit and operational risk. Furthermore, risk mitigation techniques applied by insurers (such as reinsurance and securitisation) are considered. An insurer that falls between its MCR and SCR may be subject to regulatory action based on regulators’ determination of whether corrective steps are warranted. MCR will be a fraction of SCR, although the precise value has yet to be determined.

EU regulators are considering the use of both standard and internal models to calculate MCR and SCR. The advantage of a standard model is that it may be less burdensome for insurers because it will not require them to invest the resources that would be needed to develop an internal model that would be specific to each firm. An internal model would be developed by an insurer to better fit its particular circumstances and needs subject to certain parameters established by regulators. Large insurers will probably be more likely to opt for an internal model while small and medium-sized insurers may be more likely to adopt a standard model because of resource considerations. It should be noted that an insurer will need regulatory approval to be allowed to use an internal model to determine its capital requirements.

A model-based approach to determining regulatory capital requirements for insurance companies has the potential of being superior to a formula-based approach. A model-based approach has the desirable attributes of compelling insurers to take a more forward-looking and comprehensive view of their financial risk and determining a regulatory capital amount that is better tailored to fit a particular insurer’s specific needs and circumstances. Many large insurers are already performing capital modelling and incorporating ERM practices in their risk management activities. Hence, a model-based approach would seem most consistent with the regulatory goal of employing best practices to ensure that regulatory policies and standards are effective and efficient.

At the same time, this argument has some qualifiers. Even the most sophisticated approaches to capital modelling are imperfect and their performance is dependent on a number of factors including model inputs and assumptions.35 Further, compelling insurers to use models to determine their capital requirements will require them to invest in additional resources that could be costly, especially for insurers who are not

---

35 Vaughan (2009) asserts that internal models should be an adjunct to a rules-based capital requirement that establishes a floor for the amount of capital that an insurer would be required to hold for regulatory purposes.
currently using capital models. In addition, a model-based approach places additional demands on regulators in terms of developing reasonable standards and evaluating insurers’ model results. Sceptics might argue that some insurers that would be allowed to use internal models might use this freedom to “game the system” and take on excessive risk. Finally, there is the risk that regulators will rely too heavily on capital requirements and not give adequate attention to other components of a sound and comprehensive financial regulatory system.

It also should be noted that while many analysts view that the approach to setting capital standards in the EU’s Solvency II initiative is superior to the current U.S. RBC formulas, the EU approach is not immune to criticism. Holzmüller36 compared and evaluated U.S. RBC, Solvency II and the Swiss Solvency Test based on 11 criteria. She concluded that U.S. RBC only partially satisfied three of the criteria and that Solvency II fully satisfied three of the criteria and partially satisfied the remaining eight criteria. With respect to Solvency II, she highlighted concerns with respect to factor-based calculations within parts of the standard approach (model), the use of the value-at-risk concept, which does not incorporate the distribution of costs in the event of insolvency, and inadequate consideration of management risk.

Investments

Insurers must properly manage their investments (i.e., assets) to support their obligations to policy-holders. This involves a proper balance of risk and return consistent with the mission and appropriate risk profile of an insurance company. While capital requirements consider the risk embedded in an insurer’s asset portfolio, it is prudent for regulators to take additional steps to ensure that insurers are properly managing their investments and are not overly invested in high-risk assets.

The regulation of investments can take two forms that are not mutually exclusive. One approach is to promulgate a set of rules and constraints that deter an insurer from investing too heavily in high-risk assets. A second approach is to require insurers to develop and implement prudent investment policies. One can see both approaches in U.S. regulations governing insurers’ investments.

The NAIC has several model laws/regulations that pertain specifically to investments. One is the Investments of Insurers Model Act (Defined Limits Version). A second is the Investments of Insurers Model Act (Defined Standards Version). The latter is intended to take more of a prudential and principles-based approach to regulating insurers investments while the former is more rules-based or prescriptive in terms of setting specific limits and other rules that govern insurers’ investments.

Both model laws contain provisions concerning insurance company practices in managing its investment portfolio. For example, they require that an insurer’s board of directors adopt a written plan for acquiring and holding investments and related activities. The model acts further stipulate procedures that the board of directors should follow in managing an insurer’s portfolio.

The defined limits model act contains several provisions that are illustrative of a prescriptive approach. Specifically, it prohibits a life insurer from holding more

36 Holzmüller (2009).
than 20 per cent of its admitted assets in medium and lower grade investments with a 10 per cent limit for lower grade investments, a 3 per cent limit for Securities Valuation Office Class 5–6 investments and a 1 per cent limit for Class 6 investments. There are other provisions that set rules and limits with respect to mortgage loans and real estate. Investments in derivatives for “income generation” are limited to 10 per cent of a life insurer’s admitted assets (the limit for property-liability insurers is 7.5 per cent).

The defined standards model act contains fewer specified limits and more provisions concerning how an insurer is expected to manage its investments and the associated risks. Similar to the defined limits act, it stipulates the role and responsibilities of the board of directors in managing an insurer’s investments “prudently”. It goes on to list “prudence evaluation criteria” that regulators may consider in assessing the adequacy of an insurer’s investment management. Interestingly, these criteria include “systemic risk”. It also provides for a “minimum financial security benchmark” (MFSB) that authorises regulators to require an insurer to hold more capital than that required under RBC and fixed minimum capital standards. It also sets a “minimum asset requirement”, which is the sum of MFSB and an insurer’s liabilities. Additionally, it contains limits for specified asset classes that in some cases are the same as in the defined limits act and in other cases appear to be more liberal. The model act does not appear to impose a specific limit on derivative investments other than those implicitly contained in other provisions.

As noted above, those insurers that have been subject to a limit on their holdings of derivative instruments for income generation purposes (either by New York or other states) may have ultimately benefitted from this constraint if it prevented them from investing more heavily in assets exposed to the implosion of the housing market. Looking forward, U.S. regulators may contemplate even stricter limits tied to the type of collateral underlying asset-backed securities. Some may view this as being a more reliable approach than promulgating general principles and standards that further guide an insurer’s investments in these securities. Of course, these approaches are not mutually exclusive and both could be included in revised investment regulations. Regardless, U.S. regulators need to revisit their supervision of insurers’ investment practices in line with the lessons learned from the most recent crisis.

One problem revealed by recent events was over-reliance on credit rating agencies’ assessment of the default risk associated with mortgage-backed and asset-backed securities. Many of the securities backed by subprime mortgages were given investment-grade ratings despite the much higher risk associated with these securities. This underlies the need for regulators and insurers to undertake their own assessment of the risks associated with these types of securities. Regulators should take the initiative and “reclassify” investments as to their credit quality if the rating agencies have underestimated their default risk. This kind of initiative has implications beyond the regulation of investments per se, as the reclassification of the credit quality of certain assets would also affect the capital requirements for an insurer and financial monitoring systems.

Under Pillar 1 of the Solvency II directive, quantitative investment limits and asset eligibility will be eliminated. The rationale given for this step is threefold: (1) the new
valuation standards take due account of the credit and liquidity characteristics of assets; (2) SCR captures all quantifiable risks; and (3) all investments are subject to the “prudent person” principle. If new risks emerge that are not covered by SCR, the European Commission has the authority to adopt temporary investment limits and asset liability criteria while the standard formula is being updated. The elimination of investment restrictions would likely be considered a bold step by U.S. regulators. Critics of such a policy might argue that it relies too heavily on capital models and regulators’ enforcement of “prudent person” principles.

Financial reporting and monitoring
The monitoring of insurers’ financial condition and risk should be an important component of any regulatory system. It is essential to ensure that insurers are complying with the principles, standards and rules that have been promulgated by regulators and that regulators take prompt corrective actions against insurers that incur excessive financial risk or are in financial distress.

Financial monitoring encompasses a broad range of regulatory activities, including financial reporting, early-warning systems, financial analysis, examinations and other measures intended to assess an insurer’s financial condition and the management of its financial risk. In the United States, insurers file annual and quarterly financial statements, which serve as the principal sources of information for the solvency monitoring process, but a number of other special reports are filed and used in regulatory monitoring. Accounting rules take on added importance because accounting values become the principle measures that determine whether an insurer is complying with regulatory standards. Regulators also have broad authority to compel insurers to provide other information deemed necessary to assess their financial condition.

U.S. regulators subject the reports filed by insurers to a “bench” or “desk” audit by an in-house financial analyst or examiner who assesses the information’s accuracy and reasonableness and determines whether an insurer requires further investigation. Typically, an insurer’s domiciliary regulator performs the most extensive review of its financial information, but an insurer must file financial reports with every state where it is licensed, and non-domiciliary regulators also may review these reports. Additionally, the NAIC scrutinises insurers’ financial statements and disseminates its analysis to state insurance departments. This reflects the multilayered nature of financial regulation and monitoring of U.S. insurers—the domiciliary regulator constitutes the first layer, and non-domiciliary regulators and the NAIC constitute successive layers. Some might question whether this multilayered regulation and monitoring is redundant, but in the U.S. system it is viewed as essential to assure that domiciliary regulators are taking appropriate actions against insurers in financial distress.

37 See Klein (2009) for a more detailed discussion of the financial monitoring of insurance companies in the United States.
38 In the United States, insurance companies are subject to Statutory Accounting Principles that are consistent with GAAP in many areas but differ in some respects.
State regulators rely heavily on early-warning systems and other financial analysis tools in their monitoring activities. The fact that U.S. RBC standards are relatively low makes financial monitoring particularly important because an insurer could be in financial distress and still exceed its RBC requirement. For the most part, these systems and tools are based on static, quantitative financial ratios. There is some use of qualitative information, but this appears to be limited and also may vary among the different states. Two principal early warning systems are employed in the United States: the Insurance Regulatory Information System (IRIS) and the Financial Analysis Solvency Tools (FAST) system. IRIS comprises 12–13 financial ratios (depending on the type of insurer), and its results are made available to the public. Normal ranges are set for each ratio. Ratio results that fall outside these ranges and other criteria can trigger further regulatory investigation.

In the early 1990s, U.S. regulators concluded that IRIS was inadequate, which led to the development of the FAST system. In the NAIC’s explanation of its systems, FAST comprises the full array of its solvency monitoring tools (including IRIS), but its heart is a computerised analytical routine called the “scoring system”. The scoring system consists of a series of approximately 20 financial ratios based on annual and quarterly statement data, but, unlike the IRIS ratios, it assigns different point values for different ranges of ratio results. A cumulative score is derived for each company, which is used to prioritise it for further analysis. These scores are provided to all regulators but are not available to the public.

U.S. regulators use additional tools and information in their financial monitoring activities. They can use the NAIC’s “Insurer Profiles System” and may also develop their own customised financial ratios. Both periodic (every three to five years) and targeted company financial examinations are conducted; targeted exams are performed to address specific questions or concerns that arise from bench audits and analysis. Additional sources of information may be tapped, including Securities and Exchange Commission filings, claims-paying ability ratings, complaint ratios, market conduct reports, correspondence from competitors and agents, news articles, and other sources of anecdotal information. While a wide array of information sources are available, it appears that U.S. regulators rely primarily on quantitative data and tools, as well as financial examinations. This is consistent with a prescriptive, rules-based approach as most rules are stated in quantitative terms. Importantly, U.S. regulators tend not to engage in consultations with an insurance company’s management to assess its competence and future plans.

Only three studies have tested the “predictive accuracy” of both the IRIS and FAST systems. Prediction refers to the ability of these systems to identify insurers that ultimately fail (are seized by regulators) and those that do not. These studies also have included insurers’ RBC ratio (i.e., the ratio of Total Adjusted Capital to the Authorised Control Level RBC amount) as an additional explanatory variable, although insolvency prediction is not its purpose. These studies have generally found that the IRIS/FAST systems are reasonably effective in the sense that they contribute significantly to models designed to predict insurer failures. At the same time, these studies have found that these systems could be improved by recalibrating the FAST scoring model and adding more variables and components to these systems, including financial strength ratings and some form of cash flow.
testing.\textsuperscript{39,40} It should be noted that these studies judge the NAIC early warning systems by past performance. Hence, they cannot assess their effectiveness based on new problems or risks that are not reflected in the sample data periods used.

The cash flow simulation used by Cummins \textit{et al.}\textsuperscript{39} comes closest to employing some form of DFA in early warning systems; its significant explanatory power in insolvency prediction tests lends support to its consideration in determining capital adequacy and financial monitoring. It is difficult to estimate the effect of using more qualitative methods and information, as these things do not lend themselves as easily to empirical testing. The predictive value of claims-paying ability ratings comes closest to indicating the potential contribution of qualitative analysis, which is a part of the rating process.

This brings us to the issue of how existing monitoring systems detect the kinds of problems or risks that insurers are now encountering. As discussed above, the IRIS and FAST systems use relatively broad indicators that tend to lag behind actual events. Arguably, a number of these measures address areas generally relevant to the financial crisis but none specifically focus on the most relevant items. For example, both systems contain measures of capital adequacy, leverage, financial performance and investments. The ratio of non-investment grade bonds to assets and investment yield are used to identify concentrations of high-risk assets. However, these measures only crudely indicate insurers’ exposures to losses from mortgage-backed securities or subprime mortgages. If insurers’ reporting requirements are enhanced to provide better information on the credit quality of their assets, the additional data could be used to improve early warning systems.

Regulators may modify or add measures in an effort to fill this gap. Essentially, any figures reported by insurers are fair game in terms of developing new financial structure/risk measures. Because it is a public system, changes to IRIS tend to occur less frequently. In contrast, because FAST is not public, regulators are able to modify it more easily and frequently. Looking more broadly, other methods used for analysing insurers’ financial risk offer additional opportunities for risk assessment. For example, stress testing of life insurers’ policy reserves could be expanded to other areas and risk exposures. Further improvements in the financial monitoring systems used by U.S. regulators are warranted if this component of solvency regulation is to adhere to the principle that regulators should employ the most efficient and effective means to remedy market failures.

It should be noted that the NAIC acknowledges some of these deficiencies and is taking steps to address them. For example, in 2004 it adopted the Risk-Focused Surveillance Framework, which has four components: (1) risk-focused exams; (2) off-site risk-focused financial analysis; (3) examination of internal and external changes in the organisation; and, (4) an annual supervisory plan for each insurer developed by its domiciliary regulator.\textsuperscript{41} While this initiative is laudable in concept, it is difficult for external observers to assess its success. Arguably, it would constitute a significant shift

\textsuperscript{39} Cummins \textit{et al.} (1999).
\textsuperscript{40} Pottier and Sommer (2002).
\textsuperscript{41} See Vaughan (2009) for more discussion of this initiative.
from the paradigm that has characterised the U.S. approach to financial surveillance historically. With time and strong encouragement by the NAIC, its objectives may be fully realised as regulators develop the capacity and mindset necessary for this to happen.

The NAIC is considering other initiatives that might be encompassed under the broad definition of financial monitoring. One of these initiatives would be the introduction of something akin to the Own Risk and Solvency Assessment that is an element of Pillar 2 under Solvency II. Another initiative is to increase the focus on corporate governance. These would be significant enhancements to U.S. financial monitoring and could substantially increase the use of qualitative methods to assess how well an insurer is managing its financial risk.

**Intervention**

Intervention might be viewed as the final step in the regulatory process. Intervention could be broadly defined as any specific action by regulators to force an insurer to alter its behaviour, transactions or structure. This could mean bringing an insurer into compliance with existing regulations or going beyond regulations to achieve some desired outcome.

There are two categories of regulatory actions with respect to troubled companies in the United States: (1) actions to prevent a financially troubled insurer from becoming insolvent; and (2) delinquency proceedings against an insurer for the purpose of conserving, rehabilitating, reorganizing or liquidating the company. Some of these actions may be conducted informally; others require formal measures. Similarly, some actions against companies may be confidential, and others may be publicly announced. Regulators can negotiate sales or mergers of troubled insurers in order to avoid market disruptions. This is often more feasible for life-health insurers because of the embedded value of their long-term contracts.

If preventive regulatory actions are too late or are otherwise unsuccessful and an insurer becomes severely impaired or insolvent, then formal delinquency proceedings will be instituted. These measures can encompass conservation, seizure of assets, rehabilitation, liquidation and dissolution. For many insurers, these actions are progressive. A regulator may first seek to conserve and rehabilitate a company to maintain availability of coverage and to avoid adverse effects on policy-holders and claimants, as well as lower insolvency costs. The regulator, however, ultimately may be forced to liquidate and dissolve the company if rehabilitation does not prove to be feasible. This is often the case with property-casualty insurers that have already dug themselves into a deep hole by the time regulators seize control.

One question that is difficult to answer is how much leverage regulators can exercise in compelling an insurer to lower its financial risk if it greatly exceeds its regulatory capital requirement and complies with all regulations from a quantitative perspective. In theory, U.S. regulators can act against any company deemed to be in “hazardous financial condition”. However, regulators would bear the burden of proof if an insurer resisted corrective action that ultimately would have to be resolved in court. In practice, when regulators initiate formal actions, an insurer’s problems are sufficiently obvious that the courts typically approve such actions. What we cannot observe is
regulators’ power and inclination to impose their will in informal actions that are not subject to public disclosure.

This brings us back to the orientation of regulators and their authority. A greater reliance on rules rather than principles may cause regulators to refrain from actions that go beyond enforcing compliance with specific regulations. In a principles-based system guided by a prudential philosophy, regulators may exercise greater discretion and take actions whenever they believe a company is not properly managing its financial risk. U.S. regulators may believe that they can exercise this kind of discretion if they choose to do so. The questions lie both with their authority and inclinations.

This discussion has some bearing on the role that regulation can play in mitigating insurers’ vulnerability to systemic risk. To the extent that existing or new regulations fail to prevent an insurer from incurring excessive financial risk in its investment decisions, then regulatory discretion could become a key factor. If regulators are authorised and inclined to constrain what they consider to be imprudent or risky behaviour, this could strengthen regulatory enforcement of company risk management practices and reduce their vulnerability to systemic risk. However, some insurers may oppose such regulatory discretion, especially if it is not governed by guiding principles and standards. This issue warrants consideration in contemplating changes to the U.S. regulatory system and how rules and principles will be used.

**Price regulation**

Price or rate regulation is the second area that deserves some discussion. In the United States, the extent and stringency of rate regulation varies significantly by line and by state. The lines subject to the greatest rate regulation are personal auto, homeowners, workers’ compensation and health insurance. The reality is that in most states and markets, at a given point in time, regulators do not attempt to impose severe price constraints. The problem arises when strong cost pressures compel insurers to raise their prices and regulators resist market forces in an ill-fated attempt to ease the impact on consumers.\(^42\) Inevitably, severe market distortions occur. Ultimately, insurance markets can be sucked into a “downward spiral” as the supply of private insurance evaporates and state mechanisms are forced to cover the gap. Rate suppression also can decrease incentives to reduce risk that can lead to rising claim costs that further increases pricing and market pressures. Together, these developments can create major crises in the cost and supply of insurance.

One example of where rate regulation has gone awry is homeowners insurance in Florida where this is a substantial exposure to hurricanes. Florida regulators have imposed tight constraints on homeowners insurance rates since Hurricane Andrew struck the state in 1992. As a consequence, many large national insurers have exited the market or substantially reduced the amount of homeowners insurance they write.

---

\(^42\) Regulators may seek to suppress overall rate levels and/or compress rate differentials between low and high-risk insureds.
They have been replaced by a large number of small, single-state or regional insurers with most of their exposures concentrated in Florida. The number of policies in the residual market for property insurance (the Citizens Property Insurance Corporation) has grown from approximately 400,000 in 1993 to more than 1.3 million in March 2011.

The argument for rate deregulation is fairly straightforward. One would expect that prices in competitive insurance markets would be “actuarially fair” and not excessive. In addition, competition should drive insurers to be efficient and prices should gravitate to the lowest possible level necessary to cover the cost of an efficient insurer, including its cost of capital or a “fair” profit. If one accepts the notion that competitive prices are desirable and insurers will charge such prices in the absence of government intervention, then there is no need for rate regulation if insurance markets are competitive. The empirical research overwhelmingly confirms both the competitive nature of insurance markets and the lack of benefits from rate regulation as discussed in the section “Economic principles for insurance regulation”. Requiring or authorising regulators to regulate rates invites political pressure and interference that can lead to the dismal scenario described above. Hence, the further deregulation of insurance pricing in the United States seems warranted and would enable regulators to allocate more resources to address true market failures.

Rate regulation was common in the EU until 1994 when it was essentially eliminated with the introduction of the Third Generation Insurance Directive. Some member countries, however, still regulate other factors that indirectly affect insurance prices. An example is the automobile insurance bonus-malus system in France. While auto insurance rates are not explicitly regulated, the premiums are adjusted by a bonus-malus coefficient (set by law) that considers a driver’s past experience. This type of regulation of rating factors may be less intrusive than full price regulation, but one might question if it is really necessary in competitive insurance markets. Nonetheless, the EU appears to have moved closer to the desirable goal of full price deregulation than the United States.

Market conduct

As discussed in the section “Economic principles for insurance regulation”, a stronger case can be made for some regulation of market conduct in insurance that involves both insurance companies and their intermediaries. In the United States, the concern lies less with the scope of market conduct regulation and more with the methods used to regulate market conduct. Currently, the states subject insurers to extensive, duplicative and costly examinations that focus too much on minor errors and too little on major patterns of abuse. In other words, regulators “miss the forest for the trees”. Regulators also fail to recognise and encourage insurer self-compliance efforts. Klein and Schacht discuss the problems with the current system and suggest a more effective and efficient approach to market conduct monitoring that would maximise

reliance on self-regulatory mechanisms and target regulatory investigation and enforcement to significant problems.

Summary and conclusions

An effective and efficient regulatory system for insurance should be guided by a set of principles that are well grounded in economic theory. The economic foundation for regulation is based on the presence of market failures. The market failures that are most evident in insurance include severe asymmetric information problems and principal-agent conflicts that could lead some insurance companies to incur excessive financial risk and/or engage in abusive market practices that harm consumers. Insurance consumers, particularly individuals and households, face significant challenges in judging the financial risk of insurers and properly understanding the terms of insurance contracts.

These types of market failures support an argument for regulating insurers’ financial condition and some aspects of their market conduct. With respect to solvency, regulators should seek to prevent insurers from incurring excessive financial risk and limit the cost of insurer insolvencies. As for market conduct, regulators should take steps to discourage and sanction insurers and intermediaries that take unfair advantage of consumers, such as misrepresenting the terms of insurance contracts and failing to pay legitimate claims. There appears to be little justification for the regulation of insurance prices in competitive markets in which entry/exit barriers are low or non-existant.

However, not all market failures can necessarily be corrected by regulation so that the end result will be an increase in social welfare. The desirability of any particular regulatory intervention must be assessed in terms of regulators’ ability to remedy a specified market failure and any deadweight costs associated with regulatory intervention that may exceed the benefits from intervention. Further, regulators should employ “best practices” and the most efficient measures to address market failures. Ultimately, regulators have to balance the benefits and costs of specific regulatory policies and methods to maximise the net gains from any regulatory intervention. Applying these principles in evaluating current regulatory practices leads to the following conclusions.

Both the United States and the EU have fairly robust systems for regulating the financial condition of insurance companies, although they differ in philosophy and approach. Financial regulation in the United States could be improved by adopting more advanced methods. The EU Solvency II initiative embraces more advanced methods and has the potential for creating a more effective and efficient system for regulating insurer solvency. Its success in this endeavour will be determined as it reaches the implementation stage and all the necessary components for a comprehensive regulatory scheme are developed.

It is unlikely that the United States will adopt the kind of regulatory system envisioned in Solvency II in the foreseeable future but there are specific improvements that could be made that are politically feasible. First, U.S. regulators should critically review its prescriptive requirements and consider where it can adopt more principles-based
standards that will not compromise the goal of preventing insurers from incurring excessive risk. The NAIC has indicated a willingness to consider adopting more principles in its regulatory scheme; the issue lies with how fast and far it is willing to go. Regulatory reform in the United States has always been an incremental process and it will need to move forward with “all deliberate speed” if U.S. regulation is going to keep pace with the reforms in other advanced economies.

The United States also needs to significantly revamp its capital standards. As a first step, it needs to update the parameters of its RBC formulas and incorporate elements for catastrophe risk and operational risk. The NAIC also needs to push ahead with its efforts to use models in assessing capital adequacy. Acknowledging that U.S. regulators are uncomfortable with the full-scale replacement of the existing RBC formulas with standard or internal models there are other things that could be done. Specifically, the NAIC could develop and test a standard model as an adjunct to its formula-based capital requirements. Standard model results could be used, along with company internal model results, in financial monitoring. Used in this way, regulators would not be bound by model outcomes for determining whether an insurer has adequate regulatory capital but could use model results to help identify high-risk insurers.

In the area of investments and financial monitoring, U.S. regulators need to fully embrace and implement a risk-based approach to assessing insurers’ financial condition. They should also increase their use of qualitative methods to evaluate corporate governance and how well an insurer is managing its financial risk. An overarching goal of these kinds of initiatives is to encourage insurers to employ good risk management practices. With respect to investments, regulators need to revisit investment limits, prudential standards and the reliance on rating agencies for determining the credit quality of derivative instruments such as mortgage-backed securities.

The states also should deregulate pricing in all competitive markets. This will be a formidable goal as many states believe price regulation is warranted or are under significant political pressure to constrain rate levels and rating factors. The NAIC could play a greater leadership role in this effort by strongly encouraging price deregulation and advocating its benefits.

With respect to market conduct, a good argument can be made for regulatory intervention to prevent insurers and agents from engaging in unfair practices that harm consumers. However, the form in which market conduct regulation must be efficient. Specifically, regulators should avoid excessive reliance on costly and duplicative market conduct exams that focus too much on findings and penalising minor errors. Instead, regulators should focus on detecting major patterns of abuse and outright fraud. They should also encourage and reward self-compliance efforts by insurers.

ABSTRACT

In the light of the rising cost of natural disasters we review the provision of catastrophe insurance by the public sector in the US, France, New Zealand, Spain, the United Kingdom, and its absence in the Netherlands, where flood risk is viewed as a national security concern. We do this in the context of the Australian home insurance market where insurers increasingly employ risk-reflective, multi-peril premiums as new technology allows them to better understand their exposure to risk. Motivations behind government pools vary by country, as do hazard profiles. In the US, for example, pools have usually arisen in the face of market failure of private sector insurance following a significant natural disaster; the initial concern has been the provision of affordable insurance rather than disaster risk reduction. Government pools have certain advantages over the private sector including their ability to raise funds post-event, but face financial unsustainability given political intervention to maintain affordability of cover in high-risk areas. In Australia, it is too early to judge whether risk-based premiums are leading to better land-use planning and increased mitigation spending, but in the case of northern Australia, a region that faces flooding and tropical cyclone risks, rising premiums are causing concern in Government. Nonetheless, the corollary seems self-evident, i.e. in the absence of transparency about the cost of risk, there is no incentive on the part of homeowners, local councils or land developers to improve the 'riskscape'; insurers are the only actors with immediate financial incentives to acknowledge these risks.

1. Introduction

Dealing with the threat of natural perils in ways that increase the resilience of communities poses a difficult policy area for government. Australia, like other jurisdictions, is episodically impacted by natural disasters from a wide range of perils [15]: in fact six different peril categories are responsible for the top 10 normalised insurance losses (Table 1). Much of the damage in such events is self-inflicted in the sense that the outcomes are heavily modulated by where and how we choose to live. If we take the case of flood, for example, on Wednesday, 5 March 1819, in the fledgling years of the Australian colony, the then Governor of New South Wales, Lachlan Macquarie, felt moved to issue a Government and General Order to be read in every church and chapel in Australia for the three ensuing Sundays. This followed large floods in the Hawkesbury River catchment near Sydney, a river system that continues to pose a significant threat to much larger populations today. The Governor criticised new settlers [if it had not been for their]:

- Wilful and wayward Habit of placing their Residences and Stockyards within the Reach of the Flood (as if putting at Defiance that impetuous element which it is not for Man to contend with), many of the deplorable losses which have been sustained within the last few years at least, might have been in Great Measure averted [13].

Essentially there are two primary ways of reducing the direct economic costs of catastrophic events: either by way of mitigation1 measures, or by reducing the financial impact on those directly affected with the sharing of costs among a wider population through government and/or charitable aid, or insurance. Government aid comes often in the form of post-event appropriations that can create budgetary difficulties and disincentives for mitigation [8,34,60,59]. This being the case, most advanced economies rely on insurance to fund a significant portion of disaster recovery and to diversify this risk through international reinsurance markets. Reinsurance, the insurance of insurance companies, has the added benefit of providing financial resources external to the local economy; this has been an important factor in the reconstruction of Christchurch following the destruction due to the 2010-2011 earthquake sequence, an event to which we will return in our discussion of New Zealand’s Earthquake Commission (EQC).

Our study was motivated by questions about the role of government in the provision of catastrophe insurance and the potential for the insurance sector to be a positive actor in reducing the economic costs of natural disasters [50]. Both questions had high currency in Australia after the 2011 Queensland and Victorian floods, events that led to widespread public and political criticism of many insurers for their then failure to cover riverine flood damage [70]. Australian insurers have since responded by broadening coverage, so that as of May 2015 over 90% of homeowner’s policies cover this peril [59]. This change has been possible largely because of the increased disclosure of flood mapping commissioned by local councils and the processing of these data in ways to allow for better risk identification [47,33,59].

The Australian experience in respect of flood insurance is just one manifestation of how advances in the use of Geographic Information Systems, remote sensing and simulation modelling are changing insurers’ ability to understand and price their exposure to risk [52,74,75,29,55]. As a result of improving intelligence, private sector insurers may choose to offer cover only at rates far in excess of what those consumers were paying in the past, or even to withdraw from areas deemed too high risk [7]. At the time of writing this is an issue in northern Australia, a region prone to tropical cyclones and episodic flooding, and where premiums have risen to better reflect these risks [5]; the government has responded to public concern by convening a taskforce (The Northern Australia Insurance Premiums Taskforce: http://jaf.ministers.treas.ury.gov.au/media-release/024-2015/)) to explore how premiums can be reduced; one of the mechanisms under consideration is a government-sponsored tropical cyclone reinsurance pool, like those evaluated in this study.

With this in mind we scrutinise various government-sponsored natural disaster insurance pools (sometimes called residual market mechanisms and hereafter Government pools or pools) in the US, New Zealand, Spain and France, as well as arrangements under consideration in the UK and their absence in The Netherlands. In ignoring pools in Japan, Scandinavia, Switzerland, Taiwan and Turkey, amongst others [see [46]], our survey makes no claim to be exhaustive. However it samples from the spectrum of possible arrangements and highlights certain challenges that beset all of them in dealing with the rising cost of natural disasters [63]. Following a brief overview of the various pools examined, subsequent discussion centres upon three questions: How do the pools price risk? How are deficits funded? Do the pools encourage disaster risk reduction? We then draw upon some illustrative examples from recent Australian experience of the role played by poor land-use planning in amplifying the cost of natural disasters and conclude with some discussion on the capacity of the insurance industry to help overcome this problem.

Lastly by way of introduction, risk in this paper refers to the financial risk defined as a multivariate function of: hazard attributes – for example, the frequency of landfalling tropical cyclones with peak gust speeds in excess of thresholds likely to cause property damage; exposure – the spatial distribution of insured assets and their values; and vulnerability – the cost of damage as a fraction of the insured or replacement value for a given hazard intensity. This conceptual framework underpins all catastrophe loss modelling that is now standard practice in the insurance industry to help inform its purchase of reinsurance, capital needs and increasingly, premium pricing [72]. In other contexts, risk has behavioural dimensions [62] but these are not considered here.

1 Here we refer to mitigation in its traditional sense of precautionary risk-reduction measures rather than reducing greenhouse gas emissions as in the parlance of climate change.

[9,34,35,39,42–45]), the following introductory sketches are kept short. To the degree that their attributes and management shed light on the particular questions of interest to our study, we describe these in more detail in Sections 3 through 5.

With the exception of nationwide flood cover provided by the National Flood Insurance Program (NFIP), it is the individual State (c.f. Federal responsibility) that controls its own catastrophe insurance market. NFIP, administered by the Federal Emergency Management Agency (FEMA), was created in 1968 following the withdrawal of private insurers after large losses incurred during Hurricane Betsy (1965). An important feature of NFIP is that flood cover not only encompasses riverine flood damage but also that caused by hurricane-induced storm surge. It is the latter peril that, in large measure, has been responsible for NFIP’s current large deficit (see later discussion).

The Texas Catastrophe Property Insurance Association was established as a government pool offering last resort windstorm and hail insurance in 1971 following large losses in Hurricane Celia (1970). In 1997, the program was renamed the Texas Windstorm Insurance Association (TWIA). All Texas property and casualty insurers are required to participate and represent eligible property owners in the 14 coastal counties along the Gulf Coast and parts of Harris County. Losses in excess of revenue are paid by the Catastrophe Reserve Trust Fund (CRTF), which was established in 1993 to manage TWIA’s revenue and liability, reinsurance and public securities.

Florida suffered a crisis in the availability of property insurance in the late 1960s at a time when residential property mortgage finance was conditional on insurance cover and many homeowners were threatened with mortgage default. In response the State Legislature mandated in 1970 that insurers participate in the Florida Windstorm Underwriting Association (FWUA) programme to provide affordable (not risk-rated) homeowner cover for catastrophic windstorm events in high-risk areas along the Florida coastline. (The conflict between affordability and high-risk emerges as an issue faced by many of the pools examined in this study.) To increase capacity, the FWUA merged in 2001 with the Joint Underwriting Association (JUA), a temporary programme established by the Legislature to provide short-term cover to policyholders planning repairs for damage incurred during Hurricane Andrew (1992), and from this merger Citizens, an entity with tax-exempt status and securities, was created [14].

Citizens is funded by premiums, regular assessments2 on insurers, government and agency securities, corporate bonds, municipal bonds and private sector securities. Shortfalls are covered by policyholder surcharges, emergency assessments and bond issues. Insurers of private property are also required to participate in the Florida Hurricane Catastrophe Fund (FHCF), which was established in 1993 to provide low-cost reinsurance cover for future hurricane losses [24]. This has the effect of further concentrating Florida’s hurricane risk within the state rather than diversifying it around the world. The FHCF has recently begun to purchase some external risk transfer products such as reinsurance; nonetheless, in the foreseeable future the FHCF will hold a large proportion of its claims paying capacity in the state from accumulated cash and bonding.

In contrast to mortgage lender requirements for windstorm cover in Florida (and for flood nationally for Federally-backed home loan mortgages), earthquake insurance in California has not been a requirement for mortgage finance. Despite the fact that since 1985 residential insurers had been required to offer earthquake cover to all prospective policyholders, only a third of homeowners in the area impacted by the Northridge earthquake (1994) had purchased cover at the time. Insurers were liable for claims of $15 billion despite having received a mere $3.4 billion in premiums over the previous 25 years [39]. To ensure ongoing availability of earthquake cover, the California Earthquake Authority (CEA) was established in 1996 as a tax-exempt, not-for-profit, largely privately-funded pool to cover seismic damage in that State. Insurers had the option of paying an “exit tax” and offering cover, or transferring funds and participating in the pool; 70% agreed to transfer funds, which together with premiums and return on investments provides the total CEA income. It has no recourse to government backup [11]. California continues to have low uptake of earthquake insurance, however, with 88% of homeowners adopting to be self-insured against this threat [10]. High deductibles (10% or 15% of the sum insured) and premiums may be a contributing factor for this low take-up [45].

2.2. Examples of non-US pools

Also prone to earthquakes, New Zealand has adopted a different approach from the CEA to insuring the risk of earthquakes and other natural perils. The Earthquake Commission (EQC) provides automatic first loss cover for valid claims for all policyholders of residential fire insurance. Hazards covered comprise earthquake, natural landslide, tsunami, volcanic eruption, hydrothermal activity, restricted storm or flood damage to residential land, and fire following any of the afore-mentioned events. Premiums are collected through a compulsory levy added to all homeowner policies, and private insurers transfer the levy to the EQC for investment by the Natural Disaster Fund. Owners of non-insured property can expect no help from government.

The maximum cover from EQC is currently NZ$100,000 (plus Goods and Services Tax (GST)) for home and NZ$20,000 (plus GST) for home contents and comes at a cost of 15c per $100 of insurance cover (excluding GST) per annum for damage arising from each natural disaster event, regardless of risk [19]. Until the premium cost was tripled from 5c in 2012, it had been unchanged per dollar of cover since the scheme’s inception in 1945 [65]. EQC has been ‘sorely tested’ by the 2010–2011 Christchurch earthquakes3 with peak ground accelerations in the CBD close to the 500-year Average Recurrence Interval (ARI) building code design level for the September 4, 2010 (Darfield) event, and twice those design levels for the February 22, 2011 event [3]. Many of EQC’s provisions and operations are now under review [65].

In 1941, following the Spanish Civil War, the Consorcio de Compensación de Seguros (CCS) was founded to indemnify Spanish insurance companies against claims arising from unpredictable events including natural disasters. It became a permanent state-run, private-public partnership in 1954 providing nationwide, state-guaranteed cover for extraordinary risks [6]. Extraordinary events cover is a compulsory component of all insurance policies for life, fire and natural perils, motor vehicle damage, property damage and personal accidents. Private insurers may offer this cover themselves, but most opt out adding the CCS surcharge to premiums and transferring the surcharge less a 5% fee.

---

2 Assessments are charges made to private insurers participating in government pools either on a regular basis (regular assessments) to cover operating costs or after an event should losses exceed the capacity of the program to settle claims (emergency assessments).

3 On September 4, 2010, the first of a swarm of earthquakes impacted Christchurch, the largest city in the South Island of New Zealand; it was a Moment Magnitude 7.1 earthquake with its epicentre at Darfield, 40 km west of the city. The third of five quakes designated as ‘insurance’ events occurred on February 22, 2011, centred 5 km southeast of Christchurch; this Moment Magnitude 6.3 event resulted in seismic motions well in excess of those underpinning the building code. 185 people died and damage to the CBD was such that it has now been demolished and large areas of former residential property designated unsuitable for rebuilding due to liquefaction. The cost of recovery is estimated at some SN$240 billion or 20% of annual Gross National Product (GNP) [66; 21].
deduction to cover transaction expenses [48,53]. The costliest year for losses was 1983, when flooding in the Basque Country, Cantabria and Navarra caused insured losses amounting to €623 million [57,6].

The inclusion of natural catastrophe insurance cover in France is also mandatory in all comprehensive home insurance policies. Created in 1982, the French Caisse Centrale de Réassurance (CCR) is a public-private partnership providing government-guaranteed reinsurance. As part of the French Cat. Nat. scheme CCR was founded on the principle of national solidarity, leading to catastrophe insurance available to all at rates set by decree and uniformly priced regardless of risk [51]. Private insurers have the choice of reinsuring either with the state-owned CCR or the private market but contracting with the CCR is the preferred option. Insurers generally transfer 50% of their natural peril risks to CCR and pay that entity 50% of their natural disaster premiums in a quota-share-like arrangement [28].

In the UK, the Government and private sector insurers entered into an unwritten Gentlemen’s Agreement that has led to private sector flood insurance operating in the UK since the early 1960s [32]. This agreement was that no residential property would be refused flood cover, except in areas where flooding was too frequent to be insurable, and on the understanding that the Government provide sufficient flood protection. It was an arrangement tested by widespread flooding in 1998 and 2000. A temporary arrangement called the Statement of Principles, incorporating the Gentlemen’s Agreement was then forged, with the proviso that if Government did not improve flood defences and tighten regulations, insurers would withdraw their guarantee to cover all but exceptional risks [7].

The Statement of Principles was renewed and revised until its expiry drew near in 2013. After much discussion, an in-principle agreement was reached in June 2013 to replace the expiring agreement with a partnership to establish Flood Re as a not-for-profit fund owned and managed by the insurance industry. Flood Re will provide flood cover for an estimated 2% of properties, for whom obtaining flood cover is currently problematic, and do so at premiums that will be capped and subsidised by a levy on all other insured homeowners whose flood risk will continue to be priced by the market. This levy will pass to Flood Re, which will seek reinsurance cover from the global reinsurance market; losses from extreme flooding (with Annual Return Intervals (ARI) greater than 200 years), however, will be the responsibility of government [4]. The scheme is expected to be operational in 2016 and have a 25-year lifetime during which premiums are expected to move towards being fully risk-reflective [7].

With roughly 26% of its land area lying below mean sea level and another 29% prone to riverine flooding (Netherlands Environmental Protection Agency. http://www.pbl.nl/dossiers/klimaatverandering/content/correctie-formuleren-over-overstromingsrisico), the Netherlands faces an existential threat from flooding. Combating this threat is taken as a government responsibility. In response to the 1953 disaster when 1836 people lost their lives, 100,000 were people evacuated and 4500 buildings destroyed, the Government initiated the construction of the Delta Works. This comprises 53 dyke-ring areas, each a closed system consisting of dams, dykes, sluices and storm surge barriers that were completed in 1997. Legislation requires that the Delta Works provide protection to water levels equalising or exceeding an ARI of 10,000 years along the coast, and to 1250 years along the riverbanks. According to Aerts et al. [2], the system will need to be updated to adapt to rising sea levels and anticipated increases in precipitation.

3. Pricing of risk

In few of the government pools examined herein were premiums risk-reflective at the individual property level. The term risk-reflective or risk-based is to be distinguished from actuarially sound, an elusive term usually understood to mean that rate-making includes the expected value of all future obligations: claim settlement expenses, operational and administrative fees, reinsurance and the cost of capital [1]. Of course pools may be actuarially sound from a solvency perspective in the sense of having sufficient reserves and reinsurance arrangements to meet their statutory obligations but nonetheless still choose not to impose risk-reflective premiums upon policyholders. This expressly means that low-risk households are subsidising those more at risk. This is the case, for example, with the policies of CCS in Spain that are based on principles of compensation, solidarity and cooperation [53]. This is also true of CCR in France and EQC in New Zealand where homeowners are charged uniform rates regardless of their individual risk. Hallegate [30] argues that there are rational economic arguments for subsidising insurance in economically important regions, but to our knowledge this notion has not been expressly tested. The Treasury [65] discussion document of EQC post the Christchurch earthquakes argues for continuing use of non-risk reflective pricing on affordability grounds.

NFIP has been criticised for charging below actuarially sound rates because “the program does not collect sufficient premium to build reserves to meet the long-term future expected flood losses including catastrophe losses [and so] it is inevitable that losses from claims and the program’s expenses will exceed the funds available ... in some years and, cumulatively over time” [69]. The annual target for the program’s overall premium is at least the amount of losses and expenses in an average historical year and does not consider the potential for more extreme losses (see next section). In other words, there is a high likelihood of events with costs in excess of the long-term average that cannot be covered out of the current year’s premium. Moreover Congress has authorised subsidised insurance rates for policies covering certain structures to encourage communities to join the programme. Thus in the words of the 2001 report of the Government Accounting Office [69], the scheme is actuarially unsound by design. NFIP losses above its capital or reserve levels are funded by borrowing from the US Treasury and are intended to be repaid over time by policyholder premiums [1].

Historically, Citizen’s premiums in Florida have not been risk-based. In 2009 legislation was passed requiring Citizens to move towards actuarially sound rates by following a “glide-path” of annual increases, but with increases capped at approximately 10% p.a. (“Actuarially sound” in this case means that premium income is sufficient to cover projected claims resulting from a 100-year ARI event for the coming season, without resorting to insurer or policyholder assessments). To decrease exposure, a depopulation program is in place.

More than 10 years has now passed since the last major hurricane made landfall in Florida (Hurricane Wilma in 2005) (http://rogerpilkeljr.blogspot.com.au/2014/06/the-us-hurricane-drought-in-usa-today.html), the longest hurricane ‘drought’ on record, and Citizens has reduced its exposure to less than 1 million policyholders. By 2014 premium rates had risen to a level that Citizens considered actuarially sound, and cash reserves of over $7.66 billion had been accumulated when aggregated across all lines of
business [64]. Some private insurers were authorised to lower rates, and Citizens was considering decreases in 2015. This experience illustrates the sensitivity of disaster insurance schemes to the temporal volatility of event losses, in this case a lower than normal sequence of losses, and the value of government guarantees when the reverse is true.

Some areas of Florida now pay actuarially sound rates, but much of the coastal and other high-risk areas remain significantly under-priced [36]. The state regulator in June of this year, however, approved changes for 2016 that include average rate decreases of 1% for inland (low-risk) multi-peril cover and average increases for coastal residential wind-only policyholders of 8.8% (http://www.sun-sentinel.com/business/consumer/fl-citizens-2016-pricing-20150622-story.html). Citizens suggests that it will then have the potential to fully cover losses to their portfolio from a 100-year ARI hurricane.

As for the CEA, its premiums are required by legislation to be based on modelled estimates of expected losses [35]. However initial premium settings met with political and consumer pressure and so CEA chose to rate at a reasonably coarse spatial resolution using only 19 rating zones for the state and also reduced the overall level of premiums especially in high risk areas. This has created opportunities for non-CEA insurers to offer reduced premiums in low risk areas. TWIA employs catastrophe loss modelling to simulate event losses from landfalling hurricanes to its Book of Business but makes no premium differentiation in respect to geographic location. Properties certified as conforming to more stringent construction codes are, however, subject to premium discounts. TWIA pricing was discussed at the Meeting of the TWIA Underwriting and Actuarial Committee on 30th July, 2015 (https://dl.dropboxusercontent.com/u/53088391/Actuarial%20and%20Underwriting%20Meeting%20TWIA-Axurial%20and%20Underwriting%20Committee%20Meeting.mp3) and at the TWIA Board on 4th August 2015, (https://dl.dropboxusercontent.com/u/53088391/Board%20Meetings/TWIA-Galveston-2015-Tues.mp4). “Actuarial pricing” as adopted by TWIA is defined as premium rates that over the long-term match modelled losses. However there was some confusion about whether as implemented this would meet the pool’s statutory obligations to be able to pay claims on a 100-year ARI event, if repeated in successive seasons. The group actuary acknowledged that TWIA would not have the funds to cover a second event but dismissed that circumstance as “unlikely.” This view completely ignores the likelihood of clustering of events between and within seasons favourable to the development of severe tropical cyclones.

4. Dealing with deficits

Government pools usually contain an inherent contradiction in trying to provide low cost insurance to high-risk properties and so the funding of deficits to which they are inevitably prone becomes important. The fat-tailed nature of catastrophe loss distributions also predisposes pools to deficits because of the possibility of losses very much larger than either previous loss experience [40,41] or the estimated 100-year ARI loss. In what follows we examine the deficit history of the Government pools scrutinised here.

With financial backup of the state, government pools can fall back on resources not available to the private sector: Hurricane Katrina (2005) and Super Storm Sandy (2012), for example, rendered NFIP technically insolvent, but it was able to fall back on its Federal government guarantee to stay in business. Congress increased NFIP’s borrowing authority from the US Treasury from a pre-Katrina level of $1.5 billion to $20.8 billion, and again in 2013 post-Sandy to $30.4 billion; its annual premium income is around $3.5 billion [38]. Policy holders are now very much dependent upon government largesse, a circumstance the scheme was presumably created to avoid.

When Hurricane Andrew made landfall in Florida in 1992, the private insurance industry was grossly undercapitalised due to increased exposure and competitive pricing; several insurers were subsequently rendered insolvent. The vehicle guaranteeing claims payments, the Florida Insurance Guaranty Association, with insufficient resources to cover the shortfall, was forced into a special bond issue resulting in assessments being passed to policyholders for many years [52]. The reinsurance vehicle, the Florida Hurricane Catastrophe Fund, also found itself in the same situation when its surplus was exhausted in the 2004 and 2005 seasons [24].

In the event of catastrophic losses turning its current surplus into deficit, Citizens would need to impose surcharges and emergency assessments on all property and casualty policies issued in Florida. According to the James Madison Institute [36], this would result in 78% of low-risk policyholders subsidising the losses of the remaining under-priced, high-risk properties. In the absence of a pool, private insurers would be required to charge rates sufficient to invest in risk transfer that would cover years of catastrophic loss.

In 2011 the Texas Department of Insurance placed the TWIA on Administrative Oversight whilst reforms were considered to improve its deteriorating financial position. In March 2013 the TWIA Board of Directors met to discuss their options for dealing with its 2012 deficit of $46,337,000 and considered declaring insolvency [67]. The Texas Department of Insurance subsequently amended the terms of Administrative Oversight citing operational improvements since 2011. Included in the reforms is a ‘depopulation’ plan aimed to reduce its exposure by actively encouraging private insurers to assume TWIA policies [58].

In the case of CEA, which enjoys no government guarantee, if its losses were to exceed its capital reserves including reinsurance, then all policyholders would be required to pay a 20% premium surcharge to provide additional funds. Should these total resources still prove insufficient to pay claims, payments to policyholders would be prorated and only paid out in full when sufficient funds, such as from future premiums, became available [35].

Technical insolvency was also the fate of EQC after the 2010–11 Christchurch earthquakes wiped out its reinsurance cover and capital reserves that had accumulated since 1945 [20]. This was also the case for the CCR in France, whose government guarantee was required to recapitalise it after large losses due to flooding in the Aude area in November 1999 and windstorms Lothar and Martin in December of that same year [51]. In 2000, premium rates were increased by around 40% and reinsurance cover was limited to 50% [37].

In contrast to the other schemes surveyed here, the CCS in Spain has a large and growing surplus and its Government guarantee has not been called upon. This may be for a number of reasons: its broad subsidising base; catastrophe insurance being over-priced; or it may just reflect a gentle hazard history to date. We remind readers that this was also true of EQC in New Zealand until the Christchurch earthquakes.

The question of government-funded deficits has not arisen in the UK where the flood risk has to date been covered by the private sector, or in The Netherlands where the government manages flood risk through significant investments in engineering works.
5. Encouraging mitigation

Government pools (and private insurers) can in principle minimise losses over time by encouraging risk mitigation, but, with two significant exceptions, we found limited evidence for this. Of the government pools considered, NFIP and TWIA are exceptions. Flood insurance in the US is mandatory for homes in high-risk flood areas with mortgage loans from federally regulated or insured lenders. FEMA produces maps identifying flood-prone areas; homeowners located in these areas can be eligible for discounts on insurance rates if the community participates in an incentive program, the Community Rating System, and if local government commits to prescribed mitigation and land-use planning guidelines. Of the government pools considered, NFIP and TWIA are the only ones that explicitly undertake mitigation on behalf of the nation.

In Texas, the TWIA has had a big influence on building standards, particularly for houses and other low-rise buildings. The program has been successful in enforcing mitigation measures by requiring buildings meet appropriate weatherproofing specifications of the WPI-8 certification. A Texas Department of Insurance (TDI) windstorm inspector checks buildings to ensure compliance with TWIA building specifications and, if the standards are met, a certificate is issued [68]. Prospective buyers now have an expectation of TDI Certification when viewing any property.

In California, CEA invests in mitigation measures including incentives for those in its programme to retrofit residential buildings but the low uptake of CEA cover limits its ability to materially reduce future losses.

While EQC in NZ has no direct responsibility for mitigation, it has played an important role in supporting research and development related to earthquake mitigation and promoting continuing improvements in building codes and planning regulations. Its national GeoNET programme of strong ground motion sensors has played an important role in understanding the character of the Christchurch earthquake ground motions and resulting damage to buildings and infrastructure. The New Zealand government also acted after these earthquakes by red-lining certain areas from redevelopment and purchasing properties within these zones, thereby reducing the risk in future earthquakes. These zones were mostly residential areas that had suffered widespread liquefaction. Again, however, because premiums are not risk-reflective, EQC provides no incentive for the upgrading of older homes. This is also true of CCR in France, which sets rates by decree and uniformly regardless of risk [51].

In Spain, the CCS policy of charging uniform fees does not encourage risk-reducing measures on the part of policyholders. A directive initiated in 2007 to assess flood risk, produce flood risk maps and subsequent management plans is ongoing [23]. Historically the response to flooding in Spain has been to seek engineering solutions, but the collapse of the Tous dam in the region of Valencia in 1982, with the loss of life of at least 20 persons and many more having to be evacuated, has led to the realisation that flood control measures may encourage development on the floodplain, and the focus has been redirected towards more appropriate land-use planning and improvements in preparedness [61].

The proposed Flood Re programme in the UK is being designed with explicit responsibilities on government for mitigation. Under the new arrangements the government will also be liable for damage costs due to floods with ARIs in excess of 200 years. In practice the definition of what constitutes a 1-in-200 year event or event loss will be critically important.

As discussed earlier, the government of The Netherlands explicitly undertakes mitigation on behalf of the nation.

6. Discussion

In general it is US pools that have received the most academic scrutiny with the catalyst for their creation usually a large event loss that has seen the insurance sector faced with liabilities far in excess of its resources. Threatened with insolvency, companies voiced their intention to withdraw from the market and faced with what was seen as ‘market failure’, governments felt obliged to intervene in the market in order to sustain insurance availability. Thus the initial motivation behind the US pools has been the provision of catastrophe insurance cover, and not risk-reduction per se and there has been a tendency to keep premiums low across the board and to have policyholders in low-risk areas cross-subsidising those at higher risk [18]. In contrast, private insurers operating in a competitive market are increasingly obliged by market forces to set prices based on the risk to the policyholder. This is certainly the case in Australia.

Despite intentions to be the insurer of last resort, at least in the US, political intervention in setting premiums too low has sometimes seen government pools competing with the private sector and becoming the insurer of first resort. For example in 2008 after Hurricane Ike depleted the reserves of the TWIA, legislation was introduced in the following year requiring TWIA to stop pricing competitively and limit eligibility to property owners who had been declined insurance equivalent to basic TWIA cover by at least one private insurer [56]. Premium pricing continued to be actuarially unsound, however, with the undercapitalisation leaving the entity vulnerable to unmanageable losses.

While it is easy to make the case that insurance premiums should reflect actual risk, attempts to implement such practice are inevitably politically difficult. We have already referred to concern about rising premiums in northern Australia arising from a better appreciation by insurers of the tropical cyclone risk to certain classes of buildings. In the US, this tension has played out more dramatically where NFIP’s deficit ultimately led to the introduction of the Biggert-Waters Flood Insurance Reform Act of July 2012. The reforms stipulated that rates should reflect current risk and this meant that rates would have risen tenfold in some cases. They were also to phase out discounted rates for ‘grandfathered’ properties and other repetitive-loss buildings [7]. In 2014, political reaction to the reforms led to the Homeowner Flood Insurance Affordability Act reversing many of Biggert-Waters’ amendments, an
act which will do little to alleviate the $24 billion debt NFIP still has to repay for losses incurred during Hurricane Katrina and Super Storm Sandy.

In the UK, the decision to create a new entity Flood Re, to which will be ceded most of the serious flood risk, took place after long discussions between government, the Association of British Insurers and other industry sector participants [31,7]. The UK is thus in a period of transition and aims to move towards risk-reflective private sector pricing over a 25-year period with the government accepting the ‘tail risk’ (event losses with an ARI greater than 200-years) and responsibility for mitigation. A key attribute of the design of the scheme that may ultimately prove decisive in reducing risk in the long term is the intention that Flood Re not be available for homes constructed after January 1, 2009 [7]. The implication is that homes constructed beyond this date will either be constructed outside of floodplains, or in flood resilient ways if they must be. Over time and provided this measure is enforced, the proportion of high-risk properties should decrease as they are ‘diluted’ by the increasing numbers of new homes built to better standards in respect of flood. This brings us to the issue of land use planning, which we discuss next.

7. Role of insurance in incentivising resilience: Australian examples

When we consider ways to address the increasing trend in disaster losses worldwide it is impossible to overlook the role played by poor land use planning. While this is an issue in most countries, we note here two examples from Australia: the 2009 Victorian bushfires (wildfires) and the 2010/11 Queensland and Victorian floods. In the former, studies undertaken for the 2009 Royal Commission [12,16,17] showed that 25% of destroyed homes were situated within 1m of the bush – effectively within the flame zone and part of the fuel load. Many people died in futile attempts to defend such properties.

Similar observations pertain to the 2011 flooding of Brisbane in an event leading to economic losses of some AU$6 billion and the introduction of a temporary reconstruction tax on the nation. Lost in the ensuing political debate was just how similar the flooding footprint in Brisbane was to that of the 1974 floods, and no doubt those of bigger floods in the 1800s [70]. In 2011 the flooded area was much more heavily developed than had been the case in 1974, with the Brisbane City Council approving between 2005 and 2011 1811 additional development applications in the area subsequently flooded (K. Doss, City Planning & Economic Development, pers. comm.).

It is too soon to judge whether the introduction of risk-reflective premiums is informing land use planning decisions in Australia, but insurers can exert market pressure in other ways. An example in 2012 was the temporary withdrawal of the Suncorp Group, one of the largest general insurers in Australia, from offering and renewing policies in the Queensland towns of Roma and Emerald. The 16-month withdrawal came after Suncorp announced it had paid out AU$150 million in claims and received AU $4 million in premiums after these towns flooded three times in two years [http://insurancenews.com.au/local/suncorp-quits-flood-towns-and-calls-for-mitigation-action]. This outcome was only possible because of Suncorp’s high market share in the region, high local awareness of the threat and the fact that prior to the Brisbane floods it was the only significant company offering flood insurance. Its withdrawal meant that policyholders who had been previously covered were no longer going to be. The decision brought about a rapid response on the part of government and the construction of levees.

The Productivity Commission [59] provides other Australian examples where premiums have been reduced following the construction of levees. It also notes discounted premiums in tropical cyclone-prone parts of the country for newer construction, which reflect their reduced likelihood of structural failure in high winds; McAneney et al. [49] estimate that the introduction of more wind-resilient construction standards post-1980 has reduced insurance losses in tropical cyclones by some 67%. Despite this, and as mentioned already, there is a perception that premiums in Northern Australia are excessive and the government is concerned that this could lead to significant levels of under- and self-insurance (The Northern Australia Insurance Premiums Taskforce: http://jaf.ministers.treasury.gov.au/media-release/024-2015/).

8. Implications for policy

Returning to the central question of this paper, as disaster losses continue to rise and insurers are increasingly able to discriminate risk at a policy level, will there be an increasing demand for government pools and will these stymie risk reduction efforts that risk-based premiums should in theory encourage? The increasing challenge in the future is how to increase societal resilience in the face of future catastrophic events in a fair and affordable manner. At least in the case of those government pools examined here the evidence is mixed: either because of political pressure they are actuarially unsound and end up creating a continuing liability to governments, or in failing to price individual risks correctly they encourage property development in risky locations, e.g. some coastal locations in the US, and fail to provide incentives for retrofitting older properties at high risk.

On the other hand the imposition of risk-reflective premiums by the private sector insurers will inevitably lead to situations where they may choose not to insure certain households or only at costs that many may find unaffordable. Although it would be a mistake to imagine that those, or even most of those, living in vulnerable locations are poor, the reality, given varying socio-economic demographics in vulnerable locations, is that the next major event will likely find significant numbers of impacted homeowners without insurance and with an expectation of emergency financial aid from government. In New Zealand, there has been no succour for those in Canterbury who had chosen to self-insure (uninsured). This is easier politically when most homeowners are insured as is the case in New Zealand and Australia and avoids the tendency of acts of post-event generosity by government to further reduce incentives for homeowners to take out insurance.

The dilemma outlined above is well known, but resolving it is not easy. In fact it does not seem possible to arrive at a definitive conclusion about the merits of government pools vis-à-vis private sector insurance. Although not reviewed here, some cantons in Switzerland operate government schemes while others rely on the private insurance industry for catastrophe cover and each no doubt believes it is doing the best for its inhabitants [71]. Benefits and problems will only emerge in the wake of a major disaster and depend very much upon the details and local implementation of the funding arrangements. In the absence of any obvious solution, we conclude with three observations:

First, a reminder that insurance is primarily about the accurate pricing of risk and risk transfer and, except in a financial sense, is not a risk-reduction mechanism per se. The authors do not see insurance as an instrument of social policy. On this point, we are in agreement with the submissions by Marsh Ltd., an insurance broking company, to a UK parliamentary Environment Committee on household insurance [31]. O’Neill and O’Neill [54] take a contrary position.

Secondly, and despite the last point, risk-reflective insurance
8

premiums can serve as a signal to all actors about natural peril risks.
Insurance premiums are not the only way of providing transparency
on the cost of risk but private insurers are the only ones with an
immediate ﬁnancial incentive to acknowledge such costs. Moreover
insurers are the only entities that can reward policyholders when
risks are reduced. In the absence of legislation, it is difﬁcult to
imagine widespread risk reduction activities taking place without
risk-reﬂective premiums [45].
Lastly, at least in Australia, it is local governments that are ultimately responsible for land use planning decisions and it seems
curious that they remain largely unaccountable for these. In short
it is salutary that Gilbert White's 1945 thesis that “Floods are an
act of God, but ﬂood losses are largely an act of man” [73] still
rings true, and for a wider range of natural perils than just ﬂood.

INTERNATIONALLY ACTIVE INSURANCE GROUP (IAIG)

Last Updated 5/14/20

**Issue:** The supervision of internationally active insurance groups (IAIGs) has garnered considerable discussion following the 2008 global financial crisis. Insurance markets have evolved over the years to become increasingly global and interconnected. In response to the increasing globalization in the insurance sector as well as key lessons learned from the financial crisis, the International Association of Insurance Supervisors (IAIS) (http://www.iaisweb.org/Home-2) began developing a major project called **ComFrame** (https://www.naic.org/cipr_topics/topic_comframe.htm) (Common Framework for the Supervision of Internationally Active Insurance Groups). ComFrame is a set of international standards focusing on the effective group-wide supervision of IAIGs.

**Overview:** ComFrame is built on the premise that IAIGs should be supervised in a collaborative fashion by home and host supervisors, thereby resulting in more effective and efficient supervision. It contains qualitative and quantitative requirements for IAIGs and
for home and host supervisors intended to foster greater cooperation and coordination among supervisors. ComFrame expands upon the high level standards and guidance set out in the IAIS Insurance Core Principles (https://www.naic.org/cipr_topics/topic_insurance_core_principles.htm), which generally apply on both a legal entity and group-wide level. To provide better context for ComFrame with respect to the ICPs, ComFrame is presented under the relevant ICPs.

What is an IAIG?
ComFrame provides the two criteria for an insurance group to be identified as an IAIG: 1) International Activity — premiums are written in three or more jurisdictions, and percentage of gross premiums written outside the home jurisdiction are at least 10% of the group's total gross written premium; and 2) Size — based on a three-year rolling average, total assets of at least $50 billion USD, or gross written premiums of at least $10 billion USD.

Process of Identifying an IAIG
In general, the group-wide supervisor, in cooperation with other involved supervisors through a supervisory college (https://www.naic.org/cipr_topics/topic_supervisory_college.htm), determines whether an insurance group or an insurance legal entity operating through branches is an IAIG after considering whether it meets the criteria outlined above. Supervisory colleges are intended to coordinate oversight of IAIGs at the group level. The process also allows a degree of

Media queries should be directed to the NAIC Communications Division at 816-783-8909 or news@naic.org.

(CIPRNews@naic.org)

CIPR Homepage (/cipr_home.htm)
supervisory discretion on whether a particular group should, or should not, be considered an IAIG, with ComFrame providing guidance on factors that supervisors may want to consider.

**Status:** Over the past decade, the NAIC's international involvement has been increasingly focused on strengthening the supervision of insurers that operate internationally. U.S. state insurance regulators support the objectives of ComFrame to the extent that it results in an outcomes-focused framework that enhances supervision of IAIGs.

While the IAIS is not responsible for identifying IAIGs, in July 2020 it will begin publishing, and will update annually, a register of IAIGs that have been publicly disclosed by their group-wide supervisor. The IAIS expects that approximately 50 IAIGs will be identified by supervisors.

1  Health is a key component of the social and economic agenda

Health expenditures represent an ever-growing part of GDP, ranking from 8% to 10% in OECD countries today. Meanwhile, health care remains predominantly financed through public funds, which part in total health care financing is still increasing in developed countries: on average, 74% of health care are financed by public resources (be it through taxation or social insurance). In the US - the country that relies most on private health insurance- 60% of health expenditures are still financed by public sources. This overwhelming role of public finance is justified by the well-known market failures in the insurance sector aggrivated in the health insurance area, in so far as it can not be considered a fully private good but rather a public good and a need for the population, at least for primary care.

However, technological progress, the new expectations of consumers, population ageing and the reluctance of governments to devote an ever-growing proportion of State budget to health care have led to the present systems coming in for scrutiny. Reform of the health sector is currently under way in the majority of Member countries. Insurers are an integral part of the prospects opened up by these reforms, and they already play a complementary role, which varies in significance, in the majority of Member countries. In some countries they even have partially taken the place of public services. However, no country has so far opted for total substitution.

Private insurance plays its role at two different levels: the financing level, where the insurer reimburses the cost of care or provides compensation, and the care providing level such as in the case of managed care. So private health insurance covers a very extensive range of services, and also brings into play a many different operators. Its characteristics, and in particular the extent of its integration in the various parts of the public systems, differ considerably from one country to another.

In this context, private health insurance now appears amongst the top priorities of the OECD insurance committee. I will therefore introduce the work carried out in this field by the Organisation. I will then present a very general overview of the development of private health insurance in OECD countries - bearing in mind that comparison is a hazardous task in an area where, alike in the pension area, each country has deeply rooted historical and social specificities. To conclude, I will illustrate this presentation with some interesting innovations on insurance products, services and institutions experimented in various OECD countries with a view to improve the private health insurance system. Future trends in the organisation of health insurance systems may well stem from some of the experience of these pilot countries.

2  OECD work on health care

Healthcare has been identified by OECD Member countries as one of the Organisation’s top priorities for the years to come. The IC work in this area is therefore part of an integrated “horizontal project, “ carried out in close co-operation with for instance the Working Party on Social Policy, competent with regard to public health insurance. This IC follows a two-step process. A review of the overall conditions and recent developments in the Member country markets for private health insurance from the economic, social, and regulatory standpoints, has first been conducted, which should be ready for publication in the coming weeks. Constraints and short comings of the development of private health insurance will be examined, as well as regulatory policies adopted to ensure an adequate framework for operations. Best practices will be identified to assist government in their regulatory reform in this area.

A statistical data collection has been launched to support and complement this work.
The Committee also analyses specific issues on which it wishes to pursue the work. Particular attention will for instance be paid to aspects of private health insurance that are tied in with pension systems, such as private disability and long-term care insurance schemes.

3 Recent developments of private health insurance in OECD countries

3.1 The role of private insurance in health care provision

In industrial States, health care financing has historically been inspired by three competing “models”: the first one, implemented by Bismarck in Germany, relied on professional enrolment through compulsory contributions from employers and employees; more recently, Beveridge introduced in the after war UK a public health monopoly, ensuring universal social protection. The last form of organisation is a mix-system, which prevails in the US, where health insurance is not compulsory. Although this model is the only one not offering a right to health care to citizens, leaving 15% of the population with no health care cover, it is widely exported, notably in emerging economies.

The extend and pace of the development of private health insurance in each country has been very dependant on the original pattern of the national health care organisation, even if most countries tend to have now a rather hybrid health care system (mixing elements from the three original models). Amongst OECD member countries, strong contrasts can now be observed in the balance between private and public health insurance. Although, private sector is mainly supplementary to public coverage, in some countries it can substitute to public sector to cover even primary care for all or part of the population. Lastly private health insurance may provide the same level of coverage than the existing public scheme, while giving access to private providers.

- Two countries, the United States and Switzerland have opted for a highly privately financed system, in which private insurance intervenes even in primary care. In the US, 40% of overall health expenditures are covered by private insurance, and above 74% of the population is enrolled in a private scheme, be it a substitute or a complement to public schemes.
- In Germany and in the Netherlands the wealthiest, independent workers and most civil servants are excluded from the social health insurance. Health care insurance is left to their own initiative. In Germany, 20% of the population are insured on a voluntary basis; among these, 7 millions are entirely insured by private insurers.
- Nevertheless, in the majority of OECD countries, private health insurance is supplementary to the public scheme and provides co-payment and deductibles or covers specific services not taken into account by public financing. The majority of the population therefore contracts a co-payment insurance in France, Canada, Japan, Austria and Denmark to some extent.
- In Ireland and Australia, it is possible to “opt out” of the public scheme. In both countries, private health insurance is highly regulated in order to be accessible to the most part of the population, hence 40% have a private coverage that gives access to private providers.
- In other countries with an overwhelming public financing and providing system such as the UK, Sweden, Norway, Finland and Portugal, private health insurance represents a small market covering currently less than 10% of the population, and insuring mainly access to private providers.
- Regarding countries in transition, despite the recent privatisation of health care in Poland, health insurance markets remain narrow, due to a lack of maturity of insurance markets and to an inherited quasi-universal public coverage. Lastly, in middle income countries, like Mexico, Turkey, Korea or even Greece, the role of private insurance also remains marginal (5% of the population enrolled).

In absolute terms, premiums in health insurance markets are growing in every country. They have increased by 4% in Europe in 1997 (marked growth in group insurance policies). Market liberalisation at the European level should allow further growth in the future: even though a first attempt of harmonisation
was achieved through EU third directives on non-life insurance, this was not enough to fully liberalise the European market. Generally speaking, international competition remains low for the time being but could well develop in the future, especially in countries where supply is rather underdeveloped. In transition countries such as Poland, Hungary, but also Turkey, demand for better service and products is increasing, but is not so far satisfied by local providers.

3.2 A wide range of products and services

3.2.1 Characteristics of product and pricing

Health care expenditures can be financed according to three basic models: risk-based calculation of premium, community rating and funding.

- **Risk based calculation** is the most common way for private insurers to provide health products. Two different types of policies may be distinguished: individual and group insurance. These models involve different kind of selectivity and premium calculations.

  - **Individual policies** are scarce in OECD countries (except in Italy and in Denmark). For such policies, individual contract premiums are calculated on risk-based criteria such as age or age at entry, sometimes gender (Luxembourg, Portugal, Switzerland) and often health status. Therefore premiums are higher for older and weaker persons. Moreover, private insurers are allowed in most case to deny the access to high-risked individuals or to impose waiting period (such as in the US, Luxembourg or Switzerland). This is the case in nearly all OECD countries except when policies are aimed at protecting specific categories of persons.

  - **Group insurance policies** are more common. They are widespread in a number of countries such as:
    - **The US**, with more than 70% of the population covered by this type of scheme,
    - **France**, where two thirds of insured are covered by a global contracts through the employer,
    - **Germany**,
    - **The UK**, where three quarters of the population have a supplementary health insurance cover,
    - **Canada**,
    - **And recently Portugal**, in which 90% of contracts are group insurance policies.

    Reasons for this development certainly lie on the particular financial and access facilities of these policies. Actually, since risks are borne by more people, insured enjoy lower premiums based on an experience-rated calculation. Insurers may therefore have fewer incentives to have recourse to risk selection.

- A less widely spread model of financing private health insurance is **community-rating**. In Ireland and Australia, it has expanded on a national basis. Like in public schemes, policyholders pay according to their incomes, disregarding the risk they represent, and receive benefits according to their needs. This allows for a more equitable access to supplementary health insurance. However, an appropriate regulation is necessary, considering that this type of products requires whole-life investments, no selectivity from the part of insurers, and risk-equalisation so that risks may be shared among all insurers in the country.

A last point should be highlighted considering the length and the very financing of private health contracts. Indeed, most of the time, for group insurance and the majority of individual policies, health contracts are understood as short-term non-life insurance policies that last a year at most. These contracts are generally renewable by both parties like in England, or only by the insured like in Portugal. (Australia and Ireland, but also Greece, Austria, Germany and Switzerland to some extent, are however exceptions to this rule.

- Besides, in Austria, Germany and Switzerland, health insurance is not only provided through whole-life contracts: it also involves **funding processes** of financing. For instance in Germany, part of the premiums is accumulated in a fund that allows for no premium adjustment owing to age. Thus this specific pattern of private health insurance is better tailored to an ageing population and provides better protection for older individuals that may find it difficult otherwise to afford supplementary insurance.
3.2.2 The range of benefits provided by private health insurance

- Except for the US, Switzerland and to some extent Germany and the Netherlands, benefits of private health insurance are mainly co-payments of practitioners’ fees and drugs and of a large range of specific treatments not covered by public schemes. These can be specific diseases such as cancer in Korea, particular or luxury services such as private room, and alternative medicines. Coverage may be comprehensive with a variety of different policies like in most western European countries and the US, or narrower like in Turkey or Korea.

- On the other hand, in Sweden, Finland, Denmark, the UK, and above all in Spain, Portugal and Mexico, private health insurance is understood as a way to avoid long-waiting lists of public providers and to gain more freedom of choice for general practitioners and in-care treatments as well as better quality services.

- **Long-term care** has recently developed on private health insurance markets. In Germany, France, Italy, the US but also Denmark, the UK and the Belgium, this benefit has lead to specific ruling allowing private sector to cover this risk. Germany even innovated by establishing an obligation to contract long-term care insurance.

- **Income replacement** in the event of sickness or disability is also currently developing in many OECD member countries including Switzerland, Japan, or the US.

4 Main issues at stake and prospect for future developments.

4.1 Issues at stake in the development of private health insurance

Assessing the performances of health care systems is not an easy task. Two main criteria could be considered to this end:

- **Efficiency**, understood in relation to the achievement of three main goals: improving population health; responsiveness to the legitimate aspirations of consumers; and cost-minimisation, and

- **Equity**, or the fairness of the distribution across the population of each for these three goals.

4.1.1 Advantages

So far private health insurance in OECD Member countries has proved able to achieve some of these goals. It has certainly helped in upgrading the quality of health care provision, even when private health insurance intervenes in primary care.

In the US, where private health insurance covers the population even for primary care, life expectancy of female at birth is close to 80 years. This is almost as much as in the United Kingdom, although the latter mainly implements a public system to finance health care. In Switzerland, life expectancy is even higher (82.5 years at birth for women). Furthermore, these countries have developed high quality treatments for serious diseases like aids or cancer.

As regards to efficiency and satisfaction of consumers, in a context of curtailing expenses and hence benefits in the public sector, private insurance is mainly used as a way to alleviate public burden while insuring tailored and free-choice services to patients.

Accordingly, in Sweden, Norway, but also Portugal or Mexico, there are strong incentives to promote private health insurance, in order to offset the deficiencies of the public system. Similarly, in Greece or Turkey, the high level of discontents regarding their public system has lead to regulatory changes in the 1980s, paving the way for private health insurance development.

Moreover, new medical technologies and treatments create new expectations. A growing number of very specific treatments are more consistent with private choice of financing and coverage. In this regard, high quality services and tailored prevention can be viewed as more of a private good.

These advantages of private health insurance should not mask the risks that need to be addressed if this sector is to expand.
4.1.2 Constraints and problems stemming from the growth of private health insurance

- The major objections addressed by the detractor of private health insurance relate to equity considerations: private health insurance often turns out to be insurance for “good risks”, that is to say for the young and healthy. For instance in Switzerland, since the new Health insurance Law of 1996 has entered into force, premiums become to high for people over a certain age. These individuals however need more than any other age category of the population supplementary coverage and a fortiori primary care insurance. In the United States the situation is even worse, since private health insurance is not mandatory. About one fifth of the population is not covered, part–time job employees. Besides, there are great inequalities in the level of premiums and that of benefits. These discrepancies do not appear only between individual and group policies, but also impact group policies according to the size of firms. Lastly, this linkage of health insurance to professional position may generate distortions in individual labour market decisions.

- More surprisingly the goal of cost-minimisation is far from being achieve through the mere market. The American example is worth considering in this respect: it is at the same time the most privately financed health care system and the most expensive OECD system.13.6% of GDP is spent on health care, against only 6.7% in the United Kingdom, and 8% to 10% on average in OECD countries.

These figures could be considered as less worrying if it corresponded to a specific choice of the population to spend more on health care, or if it results in better products and services. However, the raise in costs owe more to the financing arrangement and asymmetry of information on the health market than to the improvement of services provided. Besides, the competition entails heavy specific expenditures, such as managerial and advertising costs.

Many other issues could also be mentioned among the regulator challenges. I will only name 2 of them:

-- competition: “Traditional” insurers are not the only actors on the private health insurance market, there also being a considerable number of mutual companies and other organisations such as managed care organisations. These various operators are in many cases subject to different prudential and tax regulations. This is raising several problems. Besides, should competition issues be analysed in the context of private health insurance or, more generally, in the broader context of health insurance (in order to take account of the blurring of the distinction between public and private)?

-- Information access: Private health insurance requires that risks be identified and classified. This involves having access to certain types of information and being able to segment risks on the basis of certain criteria. However, access to and divulgation of medical information as well as risk segmentation raises sensitive issues? Preventing abuses in this area is far from an easy task.

4.2 Policy responses to new challenges: OECD countries experience

Several OECD countries have recently initiated regulatory reforms and changes in the design of their health insurance organisation in order to circumvent the major drawbacks entailed by the development of private health insurance.

4.2.1 Innovative regulatory policies to remedy to market failures
With a view to maintain an equilibrium between efficiency and competition on the one hand, and equity on the other hand, OECD member countries are experimenting various paths:

- To avoid major inequities or excessive rise in premiums, group insurance contracts have been favoured by the regulation in the US, as well as in Portugal or Italy more recently. However, as explained above, group policies have also their shortcoming in excluding part of the non-working population or less favoured people. Community rating is another way to avoid major inequalities but it may result in less competitive and rather oligopolistic market.

A second way to tackle the equity issue is to consider private health coverage as a long-term risk. This perspective is consistent with new products sold on the market such as long-term care and may be dealt with using various financial vehicles. In Switzerland proposed reforms concerning health insurance involve that age at issue be the reference age for successive policies taken out with the same insurer. This would prevent insurers from increasing premiums with age and oblige them to support part of the risk for ageing. Private health insurance should be accessible in the same way and at the same price for men and women. Furthermore, this reform would imply that insurers could no longer be allowed to launch a new product providing exactly the same cover, with the sole aim of creating a closed fund of selected policyholders. The improvement of the portability of rights is also high on the political agenda. The US 1996 law (Health Care insurance portability and accountability act) or the Austrian legislation in this regard ensure that previous benefits can be retained after a change of employer in order to avoid job-locks. This problem can also be addressed in preventing insurers to cancel policies or to retain pre-existing conditions and waiting periods for individuals who were already covered by health insurance.

Further on this line, the funding or partial funding of private health insurance, as in Germany or Austria, may appear as a promising solution.

Other new developing trends could briefly be pointed out inter alia:

- the new regulation on compulsory long-term care insurance in Germany
- the surge of new private health insurance products, such as medical savings accounts in the United States,
- the marketing of private health care electronic cards by insurers in Portugal,
- or lastly the establishment of equalisation funds between insurers in Ireland.

### 4.2.2 Curbing the costs through health care?

In a several OECD countries, the unbearable increase in health expenditures has fostered the development of private carriers in charge of controlling providers’ activity. This attempt can range from formal agreements between insurers and specific providers to the so-called managed care mainly developed in the US through Health maintenance Organisations or HMOs. Under this arrangement, the financing and delivery of health services are integrated so as to control costs by managing the recourse to health providers and the providers’ payment level. In the US, more than 80% of the insured population were enrolled in Managed care organisations in 1998. Through HMOs in particular, insured receive a comprehensive benefit package available form a defined network of providers for a fixed payment. Although, these organisations are similar to small private British National Health System, and are thus affected by the same drawbacks: restricted freedom of choice for consumers. Consumers concerns in this respect have led to the promotion of more flexible alternative models. These are the Preferred Provider organisation (PPO) - a kind of agreement contracts between insurers and providers. Both HMOs and PPOs can also be mixed. Latest research for the US suggested that HMOs are able to save 20 to 30 % of expenditures compared to traditional health insurance organisation. However, this results may be more linked to selected low-risk population than real curtailment in unnecessary consumption.
Such types of arrangement are also developing in other OECD countries (*inter alia* in Austria, Greece, France, the United Kingdom or Poland), most of the time in the form of agreements between insurers and providers.

In addition, new forms of private managed care are being experimented in Portugal: managed care companies involve a medically formed call centre that operates 24 hours a day. This structure is aimed at providing a customised service to each policyholder and to direct them to the most appropriate health care service. The new organisation would then insured the follow-up of each patient while reducing administrative costs and unnecessary consumption.

Private health insurance has a crucial role to play in modern health care organisations. Its development is a great opportunity for an enhanced efficiency of health care provision. It is also a serious challenge for policy makers to design an appropriate regulatory framework in order to palliate to the drawbacks induced by the development of private health care systems. The need for regulatory changes will be also a function of the extent to which private health insurance is substituting to public systems. The impact of recent regulatory changes remain to be scrutinized, while the performances of new private managers of health care provision are so far difficult to assess and rather controversial. It is foreseeable that a majority of OECD countries will continue to rely on dual health care systems. Comparative analysis and international information sharing on the results of many recent and promising experiences will become more and more crucial, in an area where demographic, technological and budgetary pressures entail innovative reforms. Through its new horizontal project on health care, the OECD will attempt to provide relevant tools for policy makers, both in member and non-member countries.
Review of Insurance Solvency Standards: Structure and IFRS 17

Publication of submissions:

All information in submissions will be made public unless you indicate you would like all or part of your submission to remain confidential. Respondents who would like part of their submission to remain confidential should provide both a confidential and public version of their submission. Apart from redactions of the information to be withheld (i.e. blacking out of text) the two versions should be identical. Respondents should ensure that redacted information is not able to be recovered electronically from the document (the redacted version will be published as received).

Respondents who request that all or part of their submission be treated as confidential should provide reasons why this information should be withheld if a request is made for it under the Official Information Act 1982 (OIA). These reasons should refer to section 105 of the Reserve Bank of New Zealand Act 1989, section 54 of the Non-Bank Deposit Takers Act, section 135 of the Insurance (Prudential) Supervision Act 2010 (as applicable); or the grounds for withholding information under the OIA. If an OIA request for redacted information is made the Reserve Bank will make its own assessment of what must be released taking into account the respondent’s views.

The Reserve Bank may also publish an anonymised summary of the responses received in respect of this Consultation Paper.

Executive summary

Background

Under the Insurance (Prudential Supervision) Act 2010 ("IPSA"), the Reserve Bank is responsible for the prudential supervision of the insurance industry. We¹ regulate and monitor insurers to ensure that the sector operates in a sound and efficient manner.

A key part of this supervision involves imposing minimum amounts of capital that insurers must hold. These regulatory capital requirements set a minimum likelihood that insurers will be able to pay claims and meet other obligations to policyholders.

We codify our capital requirements for insurers in a set of solvency standards prescribing how regulatory minimum capital is to be calculated. The current standards were published in 2014, with different standards for each sector and variations for specific circumstances.

In October 2020, we announced the start of the Solvency Standards Review ("the Review") alongside the IPSA Review. We feel it is timely to review the standards to ensure that they are robust and fit for purpose. It is also a chance to address the findings from recent reviews of supervision and prepare the standard for the implementation of IFRS 17.

The review will be divided into two stages:

1. The first stage (now underway) will address structural changes and other issues that require immediate attention (including IFRS 17).
2. The second stage will address the determination of individual components of the solvency requirements (asset risks, liability risks, other components).

We will introduce interim standard(s) at the end of the first stage and final standard(s) at the end of the second stage.

In conducting the Review, we will take into account efficiency considerations from both the industry as well as our perspective.

Consultation topics

This consultation document relates to the first stage of the review. It is concerned with the issues that shape the standard’s fundamental structure and nature. These are discussed below and need to be addressed before work begins on more detailed considerations.

Purpose & principles

While IPSA provides general purposes and principles to govern regulation and supervisory activity, and empowers the solvency standards, it provides no specific purpose for holding regulatory capital. We propose that the purpose of holding regulatory capital is to ensure that, in adversity, an insurer’s obligations to policyholders will continue to be met in full as they fall due. This consultation also canvasses your views on two matters of principle:

1. Whether we should adopt a total balance sheet approach to capture second-order effects and balance sheet interactions;

¹ In this document, the pronouns “we”, “us” and “our” refer to the Reserve Bank of New Zealand, unless otherwise specified.
2. Whether there are certain “sectorally important” insurers that are critical to the functioning of New Zealand’s financial system and who should be treated differently for capital purposes compared to “non-sectorally important” insurers.

Applying the standards

IPSA empowers the application of standards to insurers and, for life insurers, to their statutory funds. We have chosen to issue separate standards for life and non-life business, as well as standards for insurers in specific circumstances (non-life insurers in run-off, non-life captives and variable annuity providers). Standards are applied by condition of licence to insurers as a whole and, if applicable, their statutory funds.

In this document we ask if our approaches to applying the solvency standards to industry sectors and sub-entities are as efficient as they could be. In particular, we explore the possibility of having a single framework apply to both life and non-life business.

IFRS 17

The new accounting standard IFRS 17 Insurance Contracts (“IFRS 17”) is expected to have a material impact on an insurer’s balance sheet. In particular, from a New Zealand perspective there is likely to be a number of areas requiring judgement to be exercised, leading to inconsistent results across the industry.

As the solvency requirements are based on the accounting balance sheet, it follows that they may be similarly affected. To minimise any unintended consequences, we must carefully consider how different elements of the balance sheet will be affected, in particular technical insurance elements. One possible way of achieving greater consistency and comparability after the adoption of IFRS 17 is to prescribe methods and assumptions for particular balance sheet elements for solvency purposes (a “standardised balance sheet”).

Ladder of Intervention

A “ladder of intervention” framework is a graduated approach to supervision. The “rungs” of the ladder open up regulatory powers and/or represent triggers for specific supervisory intervention. Above the top rung of the ladder, normal supervision applies. Below the bottom rung, the supervisor would invoke the strongest actions (including potentially winding up the entity or withdrawing its licence). In between these two points, a graduated approach to supervision applies, with supervisory powers and intervention increasing in intensity as the solvency measure approaches the bottom rung.

A ladder of intervention framework may help in early intervention and could maximise the chances of recovery for an insurer in distress. It also provides greater clarity for both the supervisor and the entity, and ensures more proportionate supervisory interventions. The IAIS has endorsed this framework as best practice.

Both Trowbridge and Scholtens, in their report into the supervision of CBL, as well as the IMF’s FSAP, described New Zealand’s current solvency framework as “binary” in that the framework has only one rung. An insurer with a solvency ratio of 100% or greater is considered solvent, while as soon as the solvency ratio falls below 100%, the same insurer is considered insolvent. This triggers a number of powers under IPSA, including the option to liquidate the insurer. In reality, however, a solvency ratio below 100% may not necessarily mean the insurer’s operations are nonviable and should be liquidated. On the other hand, IPSA only releases certain powers when the solvency ratio falls below 100% (allowing for licence conditions), making early intervention and recovery difficult.

---

2 With intensity of monitoring related to the risks presenting in the insurer’s business
We would like to consult on whether a ladder of intervention framework would be appropriate in a New Zealand environment. The diagram below compares the current framework (the bar on the right) to the proposed banking framework (the bar on the left), along with a potential insurance framework (middle bar). The lines representing the rungs in the middle bar are for illustration only, and do not necessarily indicate a top rung that is less or more conservative than the current solvency margin.

At this stage, we are not expressing any specific views relative to the current regime. Nor are we yet considering where specifically the rungs of the ladder should be placed, but rather exploring the theoretical underpinnings of what such a framework could look like: that is, on what basis should the solvency control levels be set? However, we would also be interested in submitters’ views on where the rungs should be set.

Solvency calculation

The solvency standards allow for the fact that certain assets on the balance sheets may not be (fully) recognisable in the event of a wind-up through the use of a deduction from capital. Assets whose value might be questionable if an insurer needs to be wound up are completely deducted from eligible capital. However, a capital charge approach may be more appropriate in some scenarios. This consultation considers which assets should be treated using a capital charge approach and which should be treated using a deduction approach.

Solvency standards also do not perfectly allow for the risk profiles of individual insurers. Where solvency standards do not provide the required level of security, we may occasionally impose an additional requirement through a condition of licence. These extra requirements do not, however, form part of solvency ratios and margins that are publicly disclosed. This document explores the idea of giving us the power to impose supervisory adjustments within the solvency calculation.

In theory, insurers with diverse, partially-related risks should be subject to lower capital requirements than insurers whose risks are concentrated in a particular area. This is because it is less likely that multiple uncorrelated (or imperfectly correlated) risks would crystallise during a period of time than a single risk. This document explores the possibility of including an allowance for diversification in the solvency standards, and of establishing a clear hierarchy of risks to facilitate this.

Another area which could be clarified is the nature of the life insurance risk capital charge. Currently this takes the form of a stressed liability rather than a capital measure. This document proposes amending the calculation in the life standard such that the life insurance risk capital charge becomes a capital measure.

Grouping of policies and the cross-subsidies available between them in the solvency calculation are another area of focus. This document considers a range of options for grouping, together with underlying philosophies and practical outcomes.

3 A capital charge approach involves an addition to regulatory capital requirements, rather than disallowing the asset (or a portion of it) for solvency purposes.
Background to the consultation

Introduction

1. New Zealand’s insurance sector is regulated under the Insurance (Prudential Supervision) Act 2010 (“IPSA”). Prudential supervision of insurance entities focuses on the regulation and monitoring of insurers to ensure the financial system continues to operate in a sound and efficient manner.

2. Part of ensuring the continued soundness and efficiency of the insurance sector involves imposing minimum amounts of capital that insurers must hold. These regulatory capital requirements serve the purpose of increasing the likelihood that insurers will be able to pay claims and meet other obligations to policyholders.

3. The Reserve Bank’s capital requirements for insurers are specified in a set of solvency standards, which prescribe the manner in which regulatory capital is to be calculated. The main standards are the solvency standard for life insurance business 2014 and the solvency standard for non-life insurance business 2014. These are supported by standards dealing with specific situations, e.g. run-off insurers, captive insurers and variable annuities. These standards are empowered by Section 55 of IPSA.

Drivers of change

4. There have been a number of developments since the standards were introduced that require a response from us. These include:
   - The 2016 IMF review of New Zealand’s financial system (FSAP);
   - Our thematic review of the appointed actuary regime;
   - The introduction of new capital regimes in comparator markets; and
   - A new accounting standard for insurance contracts.

5. Supervisory experience over recent years has also provided valuable insight into the operation of the framework. It has identified some areas where the standards could be improved. The events associated with the liquidation of CBL Insurance Ltd. have been particularly illuminating.

The Review

6. Best practice regulatory stewardship⁴ includes monitoring and reviewing existing regulations at appropriate intervals to ensure they are robust and fit-for-purpose.

7. In October 2020, we announced the commencement of a review of the insurance solvency standards (“the Review”) alongside a re-commencement of the review of the Insurance (Prudential Supervision) Act 2010.⁵

8. As part of this announcement, we asked for public submissions on the proposed timelines and on the review’s principles. Following the closure of the consultation on 12 November 2020, we are taking into consideration the feedback received and will publish a formal response at a later date.

9. This consultation document addresses issues relating to the structure of solvency requirements and calculations. Submissions received will inform the development of interim solvency standards later in 2021. The full timeline is shown below. We consider the issues discussed in this paper to be fundamental in nature and needing be resolved before we address issues of detail in a subsequent stage of the review.

---

⁴ https://treasury.govt.nz/information-and-services/regulation/regulatory-stewardship
1. **Principles and purposes**

1.1 **Purpose statement**

10. There is no specific purpose for holding capital expressed in either IPSA or the solvency standards themselves. IPSA does however contain purposes and principles that have some bearing on the issue, for example soundness of and public confidence in the sector, sound governance and effective risk management.

11. It may be helpful for this review to have a clear picture of what the standards are trying to achieve by asking insurers to hold regulatory capital. For example, an explicit purpose statement would reduce ambiguity and provide a clear direction as to the Reserve Bank’s regulatory objectives. It could also encourage better compliance with the standards by increasing understanding.

12. The ICPs provide the following statement:

   “The purpose of capital is to ensure that, in adversity, an insurer’s obligations to policy-holders will continue to be met as they fall due.”

13. “Adversity” is often defined in probabilistic terms, for example as the \( X \)th percentile of a distribution of an insurer’s change in net assets over a period. “Met” implies payment in full.

**Questions for consultation:**

A. Would a purpose statement be a useful addition to the solvency standards? Why or why not?

B. Please comment on the usefulness of the purpose statement above and suggest improvements, if any.

C. How likely should the fulfilment of obligations by an insurer be (recognising that certainty is an impossibility, and that there is a trade-off with efficiency and competition)?

D. Should the solvency risks be assumed to crystallise immediately, in the short-term (say one year) or over the long-term?
1.2 Principles

1.2.1 Total balance sheet

14. The International Association of Insurance Supervisors (“IAIS”) recommends that certain principles should underpin the determination of solvency capital. One of these is the “total balance sheet approach”. ICP 17 defines a total balance sheet approach as recognising the interrelationships between assets, liabilities and capital requirements. Essentially this means that stresses used to determine solvency capital should be applied to all items on the balance sheet, not just those that they primarily influence. It also means taking into account linkages between different parts of the balance sheet. Note that the total balance sheet approach refers to an overall concept, rather than a particular methodology.

15. For example, the interest rate risk charge assumes a step change in the level of market interest rates. The primary effect of this stress is to change the value of items (e.g. bonds, policy liabilities and lease commitments) that make use of interest rates to discount future cash-flows. The stress may also, however, create other effects on the balance sheet, for example through changes in policyholder behaviour (changes in surrender rates for investment-linked and participating products) or in inflation expectations. Under a total balance sheet approach both primary and secondary effects should be taken into account, if material.

16. The current solvency framework is not considered a total balance sheet approach.

1.2.2 Systemic and sectoral importance

17. Following the Global Financial Crisis of 2008-09, there was a push internationally to recognise “systemically important insurers” and require them to hold higher levels of capital due to their importance in the financial system. The IAIS’ assessment of (global) systemic importance centred around five broad indicators – size, global activity, interconnectedness, asset liquidation and substitutability.6

18. As well as recognising the importance of identifying globally systemically important institutions, some national regulators have also identified institutions that are systemically important in a domestic context. For example, in our review of bank capital requirements, we have required domestically systemically important banks (“D-SIBs”) to hold extra capital relative to non-systemically important banks.7

19. With respect to insurers, we are guided by the purposes and principles of both the Reserve Bank Act and IPSA. The former relates to financial stability, while the latter relates to the soundness and efficiency of the insurance sector, and public confidence in the sector.

20. We recognise that New Zealand insurers may not be as interconnected as New Zealand banks and therefore the failure of a large insurer may not have the same impact on financial stability as the failure of a large bank. However, a healthy financial system needs the support of a resilient insurance sector, and so it may be useful to identify sectorally, rather than systemically, important insurers.

21. Resilience generally relates to insurers’ continued ability to operate even after a major adverse event, especially for insurers who play a dominant role in the market. One way to achieve this is potentially by way of higher solvency requirements for those “sectorally important insurers” relative to non-sectorally important insurers.

22. At the same time, we recognise that the benefits of greater resilience of major insurers must be balanced with considerations around efficiency and competition.

6 IAIS, 2016: “Global Systemically Important Insurers: Updated Assessment Methodology”
7 See “Capital Review – Decisions 2019”
Questions for consultation:
E. Should a “total balance sheet approach” be adopted for solvency calculations?
F. Do you think there are insurers that are “sectorally-important”? If so, what would be the advantages and disadvantages of imposing higher capital requirements on them, relative to those that are considered not sectorally-important? Please provide your reasons.

2. Application of the Solvency Standards

2.1 Background and Legal Basis

23. Insurers writing life business are subject to the “Solvency Standard for Life Insurance Business 2014” (“the life standard”), while insurers writing health or general insurance business are subject to the Solvency Standard for Non-Life Insurance Business 2014” (“the non-life standard”). Composite insurers may be subject to both standards simultaneously.

24. There are a number of other complications in the application of the standards:
   - The life standard applies not only to the insurer, but separately to its statutory funds and life funds.
   - Standards that apply to particular types of insurers (for example captives or insurers in run-off, with modified prescribed solvency assumptions).
   - Standards that rely on another standard (for example the Solvency Standard for Variable Annuities 2015 (“the VA Standard”), which relies on many provisions of the Life Standard).
   - For mono-sectoral insurers, capital and free assets are treated by the solvency standard for the sector in which they operate. For composite insurers, selecting a standard to deal with this business is less clear.

25. IPSA governs the application of solvency standards:
   - Section 21(2) allows conditions of licence to require an insurer and/or its statutory funds to maintain solvency margins or minimum capital.
   - Section 55(2) states that a solvency standard can apply to all insurers, to one or more classes of insurer or to specified insurers.

2.2 Industry Sectors

2.2.1 Status

26. At the sectoral level, New Zealand’s approach since solvency standards were introduced in 2011 has been to maintain separate standards for life and non-life insurance business. Health insurance, due to its generally short-term nature, has been accommodated in the non-life standard. Long-term classes of non-life insurance are catered for in the non-life standard by a requirement to have regard to the life standard principles.

27. Other approaches have, from time to time, been followed in other jurisdictions. For example, before the introduction of Solvency II, the UK’s Prudential Regulatory Authority mandated separate approaches for long-term business (whether life, health or non-life) and short-term business. Similarly, Solvency II is an integrated approach covering all types of insurers.

28. Conceivably, it is possible for a New Zealand insurer to be subject to three solvency standards simultaneously – the life standard, the variable annuity standard and the non-life standard. A number of insurers have both life and non-life business on their books, and so are subject to two standards.

—–

8 “Class” is not a defined term.
2.2.2 Issues

29. We have observed a number of issues (or potential issues) with the way the solvency standards address various industry sectors:

- The standards have much in common and would be easier to upgrade if they were a single document with variations only at the component level as required.
- In addition to the contingency (life, disability, non-life), there are other factors that may also be important in directing solvency treatment. One such factor may be for how long the insurer is obligated to the policyholder. It is possible that the current solvency standards do not address the term of the contract appropriately. For example, the non-life standard allows considerable discretion regarding the treatment of contracts with long term risk characteristics.\(^5\)
- The life and non-life standards are inconsistent with respect to some of the capital charges. For example, AA-rated debt with a remaining term of less than one year has a resilience capital factor of 1% in the non-life standard and 2% in the life standard. It may also not be clear which standard governs assets not backing insurance liabilities.
- Health business isn’t specifically addressed in an explicit solvency standard. It is simply allocated to life or non-life as the case may be. This means that health insurance policies sold by life insurers and those sold by non-life insurers may be treated differently. In particular, life insurers may treat health insurance as a long-term product, while non-life insurers may treat it as a short-term product.
- Definitions and use of aggregate solvency measures need clarifying.
- The integration between the VA Standard’s capital charge and the life standard’s Insurance Risk Capital Charge is imperfect. This is because it is unclear whether the former takes the form of a capital stress or a stressed liability.

Questions for consultation

G. Please comment on how effectively existing solvency standards address particular sectors and subsectors of the industry.

H. Should health insurance have its own specific solvency approach? Please provide your reasoning.

I. Please discuss your preferences with respect to how the standards should apply to industry sectors, with reference to the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Sector-differentiated status quo – separate Life and Non-Life Standards</td>
<td>Least cost for industry as would not require the industry to change its calculation methodologies.</td>
<td>Potential inconsistencies and more complex upgrade path.</td>
</tr>
<tr>
<td>2</td>
<td>Single solvency framework covering all sectors and subsectors</td>
<td>Streamlined approach and less potential for inconsistency.</td>
<td>Higher cost to industry as industry would be required to make significant changes to their calculation methodologies.</td>
</tr>
</tbody>
</table>

\(^5\) Paragraphs 41-44 of the non-life standard
Risk that sector-specific risks may not be accurately captured.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Rationalisation – folding the variable annuity standard into the life standard, and the three non-life standards into a single document</td>
<td>Would address some of the issues listed above relating to inconsistency, while still explicitly allowing for sector-specific differences.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Potentially minor costs to affected insurers.</td>
</tr>
</tbody>
</table>

2.3 Statutory and other funds

2.3.1 Status

30. Sections 82-119 of IPSA establish a requirement for insurers to maintain statutory funds for their life insurance business.¹⁰ These funds are designed to specify a pool of assets that support obligations under life insurance policies and prevent them from being misused. They also allow investment performance to be tracked so that linked benefits can be determined correctly.

31. The provisions have rules requiring certain income to be credited to a fund and restricting the expenses that can be paid out of it. This sets up a de-facto minimum asset requirement on an accumulation basis.¹¹ Assets held in statutory funds are generally higher than this requirement, however. This is because the Life Solvency Standard is applied to the fund as well as the insurer, and this standard requires the fund to hold assets against stresses as well as policy liabilities.

32. The life standard refers to statutory funds (as defined in IPSA), which are a type of of ‘life fund’. Business outside of statutory funds also constitutes a life fund. The non-life standard does not address fund structure within the insurer.

33. Both major standards define aggregate solvency measures. For example, the aggregate minimum solvency capital is defined as “the sum of the minimum solvency capital determined for each individual solvency margin required to be maintained by the licensed insurer”.

2.3.2 Issues

34. There are a number of potential issues relating to how the solvency standards are applied to statutory funds and other funds:
   - Health insurance can be treated differently depending on applicable accounting standards and licence conditions.
   - Solvency requirements applicable to life funds other than statutory funds are not necessarily secured by a defined pool of assets.
   - The minimum net asset requirement in Sections 82-119¹² may potentially be different to the solvency standard requirement.
   - Definitions of aggregate measures could be taken to include the insurer’s overall solvency requirements as well as the fund-level requirements.

¹⁰ There are currently no requirements for non-life insurance business to be housed in statutory funds.
¹¹ Refer to Section 83 of IPSA
¹² This is a requirement to accumulate premiums and investment income within the fund, together with restrictions on expenses allowed to be paid by the fund.
Questions for consultation

J. Please comment on how effectively existing solvency standards address statutory and other funds.

K. Should solvency standards applied to statutory funds apply a floor to assets based on the provisions of Sections 82-119?

L. Please discuss your preferences with respect to how the standards should apply to statutory and other funds, with reference to the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Status quo – life insurers have solvency requirements for statutory funds and the insurer as a whole; non-life insurers have requirements only at the insurer level.</td>
<td>No disruption to insurers.</td>
<td>Minimum assets determined at the current level may not be sufficient to resolve all blocks of business for an insurer in distress.</td>
</tr>
<tr>
<td>2</td>
<td>All business allocated to ‘insurance funds’. Solvency requirements are only applied at the insurer level, although these requirements will be a function of fund solvency.</td>
<td>Facilitates resolution of all blocks of business.</td>
<td>May result in increased costs (administrative and capital) for insurers.</td>
</tr>
</tbody>
</table>

2.4 Consolidation

35. The solvency standards apply to licensed insurers and any of their subsidiaries that are also licensed insurers. The requirements apply to each entity individually as well as to the group as a whole. Non-insurance subsidiaries are not captured explicitly under the group solvency requirements, but are treated as either a related party investment, subordinated loan, or other obligations.

36. This treatment may not reflect the economic reality of the non-insurance subsidiary’s contribution to the parent’s balance sheet. As a result, this may distort the solvency position of the insurance group. It may be appropriate to look through to the assets, liabilities and risks of the non-insurance subsidiary.

Questions for consultation

M. In your view, is the current treatment of insurance and non-insurance subsidiaries in the solvency standards appropriate? Please provide your reasons.

N. If your answer to the previous question was “No”, what do you feel would be a better treatment of insurance and non-insurance subsidiaries?

---

13 Insurance funds would include statutory funds and other pools of assets deemed to be providing security for specific types of policy liability.
3. Dealing with the impacts of IFRS 17

3.1 Background

37. In May 2017, the IASB released a final version of a new international accounting standard for insurance contracts, IFRS 17 Insurance Contracts ("IFRS 17"). IFRS 17 replaces the current standard IFRS 4, and is intended to increase transparency and reporting consistency internationally.

38. IFRS 17 will have a significant impact on how insurance liabilities and related assets on the balance sheet are determined. It will also impact on solvency calculations as New Zealand’s solvency standards are based on the accounting balance sheet.

39. From a New Zealand perspective there are likely to be several areas that require judgement. This could in turn lead to financial and solvency results that are inconsistent and not comparable across the industry.

40. Not all parts of the balance sheet will be equally affected – technical provisions are likely to be the most affected, while non-technical insurance and non-insurance specific items may be less affected. We are exploring the possibility of using a "standardised balance sheet" structure as part of our response to IFRS 17.

41. For this discussion, a "standardised balance sheet" is defined as one where adjustments have been applied to ensure as much consistency as possible across the industry. These adjustments may, for instance, take the form of specific requirements for discount rates and other assumptions, or prescribe the method for valuing insurance liabilities.

42. A standardised balance sheet for solvency purposes may or may not be based on the accounting balance sheet. One possible way of achieving greater consistency and comparability after IFRS 17 has been adopted is to prescribe specific methods and assumptions for particular elements of the balance sheet for solvency purposes. However, at the same time, we must balance this with efficiency considerations from both the industry's and our perspective.

43. The discussion will be separated into two sub-sections: the first encompassing the “technical” portions of the balance sheet (that is, insurance liabilities and other related items including deferred acquisition costs and deferred reinsurance expenses), and the next dealing with other components of the balance sheet.

3.2 Insurance liabilities and other technical provisions

3.2.1 Introduction

44. This section will discuss a number of different forms that a standardised balance sheet could take.

45. The scope of this sub-section is the calculation of technical insurance provisions and related assets. This includes:
   - life insurance policy liabilities
   - outstanding claims liabilities
   - premium liabilities including unexpired risk provision
   - deferred acquisition costs
   - reinsurance of the above
46. For the purposes of this section, the following distinction will be used:

<table>
<thead>
<tr>
<th>Balance Sheet Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Accounting Balance Sheet</strong></td>
<td>Balance sheet used for financial reporting purposes. Assets and liabilities on the balance sheet are valued on a Generally Accepted Accounting Principles (“GAAP”) basis.</td>
</tr>
<tr>
<td><strong>Solvency Balance Sheet</strong></td>
<td>Balance sheet used as the starting point for solvency calculations. This is before the application of any stresses. This balance sheet will be used as the base case for solvency stresses.</td>
</tr>
<tr>
<td><strong>Stressed Balance Sheet</strong></td>
<td>Balance sheet after the application of solvency stresses (solvency stresses applied on the solvency balance sheet components, including any adjustments to asset values). This is the basis that will be used to assess the sufficiency of the company’s assets.</td>
</tr>
</tbody>
</table>

47. This discussion will focus on the solvency balance sheet. Throughout this document, any reference to a “standardised balance sheet” will be in relation to the solvency balance sheet. The accounting balance sheet, while important to understand from a regulatory point of view, is not within the regulator’s jurisdiction to specify. The stressed balance sheet will be discussed during a later stage of the solvency standard review.

3.2.2 Solvency balance sheets

48. While solvency capital requirements are a common feature of insurance regulation in most developed jurisdictions, the accounting basis on which the solvency requirements are calculated may vary between jurisdictions.

49. At one end of the spectrum is the regulatory balance sheet. This is where the regulator specifies the valuation method and assumptions for each item on the balance sheet to be used as a starting position for solvency purposes. Under this approach, the solvency balance sheet is completely independent of the accounting (GAAP) balance sheet.
50. In contrast, some regulators use the GAAP balance sheet for solvency purposes. The GAAP approach values assets and liabilities for solvency purposes according to the jurisdictional accounting requirements on an unadjusted (or minimally adjusted) basis. This approach assumes implicitly that the accounting requirements provide a reasonable estimate of the assets and liabilities for solvency purposes.

51. Other regulators opt for a more in-between approach, where the GAAP balance sheet is used as a basis for solvency, but with adjustments for material assets and liabilities. Under this approach, which will be referred to as the "GAAP-adjusted approach", the regulator may specify both the valuation method for these material components as well as the assumptions to be used in the valuation.

52. A comparison of the approaches used under a number of international frameworks has been included in Appendix 1.

53. New Zealand’s solvency standards are currently mostly based on the NZ GAAP balance sheet. The applicable GAAP standard for insurance liabilities in New Zealand is currently NZ IFRS 4. This has a specific requirement that assets backing insurance liabilities be valued under a fair value (or similar) basis. Assets not backing insurance liabilities are valued using the applicable NZ IFRS. However, as most insurers designate all assets as supporting insurance liabilities, all assets on the balance sheet are typically valued using fair value.

54. As mentioned earlier, the introduction of IFRS 17 is expected to have a significant impact on the insurance liabilities and hence on solvency calculations. To minimise any unintended consequences, we must fully consider and understand the extent to which IFRS 17 will impact the solvency position, and the potential avenues available to respond to IFRS 17.

55. The following discussion will describe the main areas of the solvency calculations that are expected to be impacted by IFRS 17. We will then touch upon the international benchmark for solvency valuation as specified by the ICPs, as well as the FSAP’s assessment of New Zealand’s alignment with the benchmark. With these in mind, we will present a number of possible approaches to address the solvency impacts of IFRS 17.

3.2.3 IFRS 17 impacts on solvency

56. The main areas of difference between NZ IFRS 4 and IFRS 17 that may have an impact on solvency calculations have been included in Appendix 2. These issues highlight the importance of a response from us. Without action from us, the solvency standards could cease to provide an accurate reflection of financial strength, as the insurer’s true financial strength would be somewhat disguised by the choice of valuation method and other judgements applied. In addition, the risk charges may need to be recalibrated in order to achieve the target risk criterion.

3.2.4 International benchmark

57. Alignment with international standards is an important consideration when developing solvency standards. At the same time, what is appropriate for the New Zealand environment must be considered. International best practice, as benchmarked by the ICPs, shows that valuation of assets and liabilities for solvency purposes should reflect an economic valuation.

14The choice of international frameworks used in the comparison has been influenced by the frameworks listed in Principle 1 of the review, as outlined in this consultation paper.

15With the exception of non-life premium liabilities – the accounting standards require premium liabilities to be calculated on a retrospective basis, whereas the solvency standards require premium liabilities to be valued using a prospective (projection) approach.
58. ICP 14 defines an economic valuation as "a valuation such that the resulting assessment of an insurer’s financial position is not obscured by hidden or inherent conservatism or optimism in the valuation". To achieve an economic value, the valuation of assets and liabilities on the solvency balance sheet should reflect a current, prospective valuation of the future cash flows, allowing for both the riskiness of those cash flows as well as the time value of money.

59. For assets in a deep and liquid market, the current quoted market value is generally seen as an economic value, as the price is considered to already incorporate any risk premiums. However, for insurance liabilities where there is no active market, an economic value can be achieved by including a margin to allow for uncertainty on top of the best estimate liability. Note that there is no specific guidance in ICP 14 regarding the size or form of the margin for uncertainty.

60. The assessment of New Zealand’s compliance with ICP 14 is covered in the FSAP, but is summarised again here. The FSAP considers that the valuation of assets and liabilities for solvency purposes is largely observant to the ICPs – that is, New Zealand uses a proxy for economic valuation. This conclusion was based on:

- Non-life insurance liabilities are calculated as the sum of the central estimate (the mean) and a risk margin, which the solvency standards have specified to be at a 75% probability of sufficiency. The central estimate represents the present value of future claims cash flows, for both claims that have been incurred (outstanding claims liabilities), and claims that have not yet been incurred (Premium Liabilities).
- Life insurance policy liabilities (including health insurance by life insurers) are valued as the sum of a best estimate liability and the present value of profit margins. The FSAP considered the latter a prudent margin over best estimate (though unlike the risk margin for non-life liabilities this is not calibrated to any sufficiency level).
- Assets backing insurance liabilities are required under NZ IFRS 4 to be valued using a fair value (or similar) basis. As insurers typically allocate most of their assets as backing insurance liabilities, it follows that for most insurers, all assets are valued on a fair value basis. In the solvency calculations, adjustments (in the form of deductions or risk charges) are then applied for assets with reduced or nil value under a stressed scenario.

3.2.5 Options

61. The actions available to us in addressing the areas of IFRS 17 that impact technical insurance liabilities (and related assets) can be grouped into four broad categories:

- **Option 1 (status quo)** – continue to require NZ IFRS 4 for solvency purposes
- **Option 2 (GAAP)** – continue to use the GAAP balance sheet after transition to IFRS 17, and make no changes to the solvency standard.
- **Option 3 (GAAP with adjustments)** – use GAAP where it makes sense, but make adjustments for certain areas/parameters. There are varying degrees of prescription involved with this method.
- **Option 4 (full regulatory balance sheet)** – Ignore GAAP entirely and specify a separate set of regulatory reporting requirements.

62. We consider Options 1 and 2 above (status quo and GAAP) unlikely to be realistic in practice, but have included them as we recognise the importance of acknowledging all the available options. This will allow us to gain a more complete understanding of the impacts of each alternative relative to the status quo.

</tbody>
</table>

16 Especially when dealing with onerous contracts, risk adjustments and the contractual service margin
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
</table>
| **Option 3b:** Specify IFRS 17 insurance liability valuation method | Use an IFRS 17 valuation method for insurance liabilities, but specify which valuation method (and parameters) to use. | • Might be easier from an implementation point of view  
• Comparability across industry  
• Easy to understand from an international perspective. | • Depending on the insurer, this might actually increase cost of implementation to the insurer if the method specified is different to what they are using. This is more likely for insurers with a small and relatively homogeneous range of products.  
• There is still such a large range of products in the market that it might be difficult to find a one-size-fits-all approach. |
| **Option 3c:** Use a non-IFRS 17 insurance liability valuation method | Use IFRS for other parts of the balance sheet where it makes sense, but specify a non-IFRS 17 valuation method for insurance liabilities. An example of this approach would be to require Yearly Renewable Term business to be valued as long-term business rather than one-year contracts. | • Might be a better solution to reflect the economic reality of the products  
• Consistency and comparability across industry, as well as internationally (if we are careful about how we specify the valuation method)  
• Provides a good base for implementing ladder of intervention  
• Robust and future-proofed, in case of future accounting standard changes | • Higher implementation costs for insurers as they have to maintain multiple valuation systems and methods (IFRS valuation methods as well as regulatory valuation methods)  
• Potentially confusing as fragmented requirements  
• May not be comparable to financial statements |
| **Option 4:** Regulatory balance sheet | Ignore GAAP entirely, and specify a new set of regulatory reporting requirements.  
Note that by definition a regulatory balance sheet encompasses the entire balance sheet, not just the technical provisions. | • Structured and tidy as all the requirements are in one place, with no need to reference separate standards (GAAP and solvency) for different assets and liabilities  
• Better harmonisation and consistency across industry can be achieved, while at the same time specifying a set of requirements that are appropriate for NZ, as GAAP may still allow for judgement in some areas  
• Robust and future-proofed, in case of future accounting standard changes  
• Good base for implementing ladders of intervention as it is standardised and consistent. | • May lack international comparability if we choose something too NZ-specific  
• Potentially burdensome for a small market like NZ to maintain multiple sets of accounts, from both the industry as well as the our standpoints  
• Even harder to reconcile to financial statements. While this could be mitigated by requiring insurers to provide a reconciliation, this requirement might be viewed by industry as overly burdensome. |
Note that Options 3b, 3c and 4 are each examples of the standardised balance sheet approach.

Our initial preferred options are Options 3b and 3c. In our view, these options achieve harmonisation of solvency requirements across the industry and a valuation that reflects the economic reality of the products with the most efficiency. Option 3c, while more complex than Option 3b, gives us flexibility in specifying a liability valuation approach that is deemed most appropriate for the New Zealand market.

Option 4, in our view, may be overly burdensome for New Zealand’s small and relatively homogeneous market. However, we will wait for feedback from submitters around the feasibility of each of these options.

**Question for consultation**

O. In the context of solvency requirements, which of the above options do you consider to be the most appropriate for New Zealand? Please give your reasons.

### 3.3 Other (non-technical) items

While the previous sub-section discussed technical insurance items, this sub-section will focus on non-technical insurance and non-insurance items on the balance sheet. However, as will be discussed shortly, the treatment of some non-technical elements cannot be separated from the treatment of the technical provisions.

Currently, gaps exist in our knowledge of the non-technical components of the balance sheet. One way to fill in these gaps is through this public consultation process. Once we have the necessary information, we can form more concrete proposals for change.

As before, it is important to keep in mind international best practice, which for insurance is benchmarked by the Insurance Core Principles (ICPs), published by the IAIS.

This sub-section will be structured as follows: First, there will be a brief discussion on the “total balance sheet” approach, as detailed in ICP 17. Next, we will discuss the non-technical components of the balance sheet, and the interaction with the options presented in the previous section on insurance liabilities.

Under the IAA framework for capital requirements and risk oversight, “the capital requirements and risk oversight processes in two jurisdictions with similar business, legal, economic and demographic environments and supervisory philosophy should be comparable”. A cornerstone of the IAA framework is the total balance sheet approach. This was touched upon briefly earlier in this document.

One implication of a total balance sheet approach is that an insurer’s financial position should be based on a consistent and meaningful measurement of assets and liabilities. This does not necessarily require full matching of assets and liabilities. However, for example, a change in interest rates should be consistently reflected in both the value of assets and liabilities, with the capital requirement changing appropriately in response.

The use of inconsistent methods and assumptions in measuring the assets and liabilities could generate hidden surpluses or deficits, and create the appearance of differing capital positions for otherwise similar insurers.

A typical insurer’s assets and liabilities under IFRS 4 are shown in the table below. The shades show the degree to which the items are likely to be affected by IFRS 17 – darker shades indicate more obvious and direct impacts, while lighter shades indicate a smaller and/or less direct impact. Note that for some insurers NZ IFRS 9 (Financial Instruments) also becomes effective at the same time as NZ IFRS 17, so any changes resulting from IFRS 9 may also need to be taken into account.

---

17 While we have referred to IFRS 17 throughout this document, the form of the standard approved by the External Reporting Board for application in New Zealand is known as NZ IFRS 17. Differences with the international standard are minimal.
### Assets

- Cash & cash equivalents
- Investments
- Premium receivables
- Trade and other receivables
- Reinsurance receivables
- Loans
- Insurance contract assets
- Current tax assets
- Deferred reinsurance expense
- Deferred acquisition costs
- Reinsurance and other recoveries
- Reinsurance in respect of the insurance contract liability
- Deferred tax assets
- Right of use assets
- Property, plant and equipment
- Intangible assets
- Investment in subsidiaries
- Goodwill
- Other assets

### Liabilities

- Trade and other payables
- Reinsurance premium payables
- Claims payable
- Unearned premium liability
- Outstanding claims liability
- Life insurance contract liability
- Life investment contract liability
- Lease liabilities
- Current tax liabilities
- Deferred tax liabilities
- Other liabilities

---

74. The items highlighted in dark grey are technical insurance liabilities and were discussed in the previous sub-section. Here we will discuss the non-technical insurance and non-insurance components, highlighted in the lighter shades.

#### 3.3.1 Non-insurance items

75. In the illustrative balance sheet above, non-insurance items encompass all the items that have not been highlighted (cash, investments, property, etc.).

76. NZ IFRS 4 requires assets backing insurance liabilities to be valued using a fair value or similar basis. The FSAP notes that “many insurers designate all assets as supporting the insurance business and hence use a fair value measurement for all of the assets”. IFRS 17, on the other hand, does not specify any requirements for valuing assets backing insurance liabilities. This raises the question of how the non-technical components of the balance sheet will be affected after transition to IFRS 17.

77. We would like to find out whether insurers, after transition to IFRS 17, will revert to the applicable accounting standard in order to value the assets and liabilities on the balance sheet, which may or may not need the use of a fair value approach. While arguably the solvency treatment of non-insurance assets and liabilities could leverage off the accounting standards, this potentially leads to further areas of uncertainty:

- If accounting standards yield methods that are materially different to the current (fair value) basis, this may result in a change to solvency results that are not reflective of an actual change in an insurer’s financial strength.
- If the accounting standards allow significant areas of judgement, the solvency position may not be comparable across the industry.
- Whether the accounting treatment of assets (and liabilities) is appropriate for solvency purposes.
• Even if there was consistency across the industry and the accounting standard treatment was appropriate for solvency purposes, the solvency position is not immunised against future accounting standard changes.

• How does this fit in with the total balance sheet approach and the requirement for assets and liabilities to be valued on a consistent basis?

78. Following from the discussion above, it appears that a natural alternative would be to require insurers to continue using fair value for solvency purposes. This would have the advantage of achieving similar treatment of the balance sheet pre- and post- IFRS 17, with the least impact from a solvency perspective as a result. Additionally, fair value is consistent with the requirement specified in ICP 14 and ICP 17. At a high level, a fair value requirement also does not appear unreasonable, given that insurers are likely to already have the systems and expertise in place to conduct a fair valuation.

79. However, we then need to consider whether a fair value requirement will impose an unnecessary burden on insurers, and if the rest of the balance sheet (excluding non-technical items) should also be valued using a fair value approach.

80. An important consideration in addressing these questions relates to principle 2 of the Solvency Standard Review Principles which states that the Reserve Bank will adopt a “substance over form” approach, and consider what is most appropriate for the New Zealand market. In particular, we are not restricted to following the treatment of accounting standards where we believe that treatment to be inappropriate.

81. Note that APRA specifies the asset valuation requirements for regulatory reporting purposes under reporting standards LRS and GRS 300, but adjusts all the assets to fair value for solvency purposes, as per reporting standards LRS and GRS 112.\(^{18}\) Solvency II requires assets and non-insurance liabilities to be valued on a fair value basis.

Questions for consultation:

P. How do insurers currently treat non-technical insurance assets and liabilities on the balance sheet? Are all assets currently designated as backing insurance liabilities, and hence valued using the fair value approach? Are there any items (other than technical provisions) on the balance sheet that insurers are not currently measured using fair value?

Q. How, if at all, is the treatment in (P) likely to change after transition to IFRS 17 (and IFRS 9)?

R. Is fair value a reasonable approach to value non-technical assets and liabilities? Would an adjustment to bring all assets and liabilities on the balance sheet to fair value for solvency purposes be appropriate?

3.3.2 Non-technical insurance items

82. In the illustrative balance sheet above, non-technical insurance items refer to the insurance (premiums, claims, reinsurance) receivables and payables. These reflect rights and obligations arising under insurance and reinsurance contracts as defined under NZ IFRS 4. They have been explicitly excluded from NZ IFRS 9 (and NZ IAS 39, the old version of NZ IFRS 9). The financial statements for some insurers show that insurance receivables are sometimes measured using amortised cost with impairment provisions, but at this stage it is not clear if this approach is used consistently by all insurers.

---

\(^{18}\) LRS and GRS are reporting standards that apply to Life and General Insurers respectively.
83. Currently, most insurers account for insurance and reinsurance receivables as assets, and insurance payables as liabilities on the balance sheet, separate to the insurance and reinsurance contract assets and liabilities. Under IFRS 17, it is likely that insurance-related receivables and payables will no longer appear as an explicit item on the balance sheet, but implicitly as part of the insurance contract assets and liabilities. This treatment is shown in the diagram below.\(^\text{19}\) Premium receivables and claims payables will be consolidated as part of insurance contract assets/liabilities, and reinsurance recoveries as part of reinsurance contract assets/liabilities.

![Diagram showing the comparison between today's and IFRS 17's treatment of insurance and reinsurance assets and liabilities.]

84. During the development of IFRS 17, a number of stakeholders expressed concern about combining insurance receivable and payables as a single line item on the balance sheet. They argued that presenting these separately would better reflect the nature of these items, particularly in relation to credit risk. Additionally, they argued that meeting the IFRS 17 requirements presented implementation challenges, in that the systems currently used to record receivables and payables may be separate from the insurance liability valuation system.

85. However, the IASB decided to continue with the existing requirements for the following reasons:

- The principle of IFRS 17 recognises that a group of contracts create a single bundle of rights and obligations. Therefore, measuring insurance receivables and payables separately from insurance contracts would result in internal inconsistencies in IFRS 17 and potentially mislead users of the financial statements into thinking these are separate rights and obligations.
- Reduced comparability as insurers may use different definitions of receivables and payables. While introducing a consistent definition under IFRS 17 was discussed, the IASB decided this would disrupt implementation already underway and lead to unnecessary delays in the effective date of IFRS 17.

86. Solvency standards currently apply a capital charge for unpaid premiums and third party recoveries (by means of the asset risk charge) and reinsurance receivables (by means of the Reinsurance Recovery Risk Charge) to reflect the credit risk associated with these items. As IFRS 17 already requires balance sheet items to reflect credit risk, an adjustment to these capital charges may be required.

87. Although the requirement to use probability-weighted cash flows under the IFRS 17 general measurement model essentially means that any credit risk or impairment will be allowed for implicitly, a number of considerations remain:

---

\(^\text{19}\) Sourced from the IASB Board Paper *Agenda Paper 2A (Dec 18)*
• Without specific guidance on how to allow for credit risk or impairment, insurers may reach a different view on the probability of the cash flows, leading to results that are not comparable across the industry.

• The allowance for impairment and credit risk under the simplified model may be even less transparent than under the general model. This is because the simplified model is based on a cash received basis, and not expected future cash flows.

• Do we consider credit risk associated with unpaid premiums and reinsurance recoveries to be significant? The insurer can lapse a policy after a certain number of missed payments. In addition, overdue premiums generally comprise a relatively small portion of an insurer’s assets. In contrast, reinsurance receivables generally make up a more material portion of an insurer’s balance sheet. Reinsurance also does not relieve the direct insurer’s obligation to the policyholder – the insurer is still contractually bound to pay claims to the policyholder regardless of whether or not the reinsurer fulfils its end of the treaty. The credit risk related to reinsurance receivables is higher for classes of business where the claims take longer to settle.

• There is a possibility that insurers may not implement full system changes in order to combine the receivables/payables system with insurance liability valuation system. Instead, they may use a high-level adjustment to add the payables/receivables into the insurance contract assets/liability. If this is the case, it might be possible to leverage off this treatment and ask insurers to retain information about insurance receivables and payables for solvency purposes.

88. The treatment of insurance payables and receivables is not independent of the treatment of technical provisions, as shown below:

<table>
<thead>
<tr>
<th>Options for valuing technical provisions</th>
<th>Treatment of insurance payables and receivables</th>
</tr>
</thead>
<tbody>
<tr>
<td>3a: Allow insurers choice of valuation method under IFRS 17, but prescribe valuation parameters</td>
<td>No further adjustment needed to make sure that insurance receivables and payables are covered. Under this method it may be possible to standardise the allowances for impairment and credit risk through the prescribed valuation parameters. However, the question still remains as to whether or not the impairment can be easily unwound/unloaded to apply a 1-in-200 year stress.</td>
</tr>
<tr>
<td>3b: Specify which IFRS 17 valuation method and parameters</td>
<td>May require an explicit adjustment to the balance sheet to ensure insurance receivables and payables are accounted for. This approach would require us to come up with a consistent definition for these items. However, this runs the risk of being unduly complex and burdensome for both industry as well as the Bank. An alternative to adding an explicit entry on the balance sheet would be to ensure these items are allowed for in the valuation of technical provisions. However, we run into a similar problem as before, in that unwinding to apply a 1-in-200 year stress may be problematic.</td>
</tr>
<tr>
<td>3c: Specify non-IFRS 17 valuation method</td>
<td></td>
</tr>
<tr>
<td>4: Regulatory balance sheet</td>
<td></td>
</tr>
</tbody>
</table>
As noted earlier, overdue premiums generally comprise only a small part of the balance sheet, and the insurer can also lapse the policy after a certain number of unpaid premiums. On the other hand, reinsurance receivables comprise a larger portion of the balance sheet and do not relieve the insurer from its obligations to policyholders, and therefore arguably expose the insurer to more significant credit risk than overdue policyholder premiums. The difference in materiality also suggests that a different treatment between premium receivables and reinsurance receivables may be warranted. This may, however, come at the cost of inconsistency and additional complexity.

- Is it necessary to have visibility of insurance receivables, and hence the associated credit risk, from a solvency perspective? If not, how do we ensure any material credit risk is properly reflected in the solvency standards?
- How do we balance transparency, complexity and appropriate allowance for risk (materiality)?

Questions for consultation

S. Is it necessary to have visibility of insurance receivables, and hence the associated credit risk, from a solvency perspective? If not, how do we ensure that any material credit risk is properly reflected in the solvency standards?

T. How do insurers currently measure insurance receivables and payables (premium and reinsurance recovery receivables, claims payable)?

U. How are insurers looking at implementing the changes relating to insurance receivables and payables resulting from IFRS 17 from a systems perspective? Are major system changes to collate the receivables/payables system with the valuation system being considered, or will separate systems be maintained, with a high level adjustment being applied to incorporate the receivables/payables into the measurement of insurance contracts?

V. If the measurement of insurance receivables under IFRS 4 currently includes an allowance for impairment, how will insurers change the basis to determine the impairment related to insurance receivables after transition to IFRS 17?

3.3.3 Tax

Tax may be affected to the extent that it affects the recognition of profit. It is likely there will be some change in the profit recognition pattern between IFRS 4 and IFRS 17, which in turn may flow through to the deferred tax asset and liability components of the balance sheet. However, the extent to which these items will be affected is not yet clear to us.

Both the life and non-life solvency standards currently deduct the deferred tax asset ("DTA") from the calculation of actual solvency capital. This means the impact of any changes to the DTA may be mitigated. Nevertheless, understanding the tax effects are important in assessing whether the current treatment remains appropriate or if further adjustments are needed (to tax, as well as to other items). A more complete understanding of tax effects also helps achieve consistency under the total balance sheet approach. For instance, a deferred tax asset or liability that is disproportionate to the insurance liability (before any deductions) will not yield comparable results.

Questions for consultation:

W. How are the tax items on the balance sheet likely to be impacted by IFRS 17 (and IFRS 9)?

X. Will there be any flow on impacts of tax impacts on other insurance and non-insurance items on the balance sheet?
4. **Ladder of intervention framework**

4.1 **Solvency control levels**

92. ICP 17 (Capital adequacy) requires the regulatory capital framework to include at least two solvency control levels. This may trigger different degrees of intervention by the supervisor as the insurer’s capital resources fall below these control levels. The intensity of the supervisor’s actions should be proportional to the insurer’s capital position. Higher levels of solvency are associated with lower supervisory intervention, with the level of supervisory intervention increasing as the insurer’s solvency position deteriorates.

93. This “ladder of intervention” framework acts as an early warning sign and lets the supervisor take action early enough if an insurer falls into difficulty, making recovery more likely.

94. Under the ICP 17 structure, the following solvency control levels are set up:

- **Prescribed capital requirement ("PCR")** – this is the highest solvency control level. Above this level, the supervisor does not intervene on capital adequacy grounds. The PCR means that assets will exceed technical provisions and other liabilities with a specified level of sufficiency over a defined time horizon.

- **Minimum capital requirement ("MCR")** – this is the lowest solvency control level. It acts as an ultimate safety net for policyholders. If the insurer breaches the MCR, the supervisor would invoke its most stringent powers, if the insurer has not taken timely corrective action to strengthen their capital resources. The MCR sets a minimum level below which no insurer is seen as able to operate effectively. The supervisor’s actions increase in intensity as the insurer’s capital position approaches the MCR.

95. These two quantities are illustrated in the diagram below.

96. ICP 17.4.7 allows extra control levels in between the PCR and the MCR, which could correspond to supervisory intervention or actions the supervisor requires the insurer to take. The guidance is flexible about whether or not these extra control levels need to be formally established with explicit intervention actions linked to particular control levels, or less formally with a range of potential intervention actions available to the supervisor.

97. In either case, ICP 17 requires possible triggers and interventions at each control level to be disclosed appropriately. The guidance also suggests the criteria for setting up the solvency control levels should be simple and readily explainable when seeking court enforcement of supervisory action.
4.1.1 Current regulatory environment

98. Insurance solvency standards are issued under Section 55 of IPSA. The current solvency standards specify the calculations for the:

- *Minimum solvency capital* ("MSC") - the minimum amount of capital to be held for solvency purposes. It is intended to ensure that the company can meet its obligations to policyholders in a range of adverse scenarios. MSC is calculated based on stressed assumptions intended to achieve a 99.5% probability of sufficiency (1-in-200) over a period of one year; and

- *Actual solvency capital* ("ASC") - the amount of capital that can be considered as supporting the MSC. The ASC is calculated as the company’s net assets less deductions.

99. The following measures are often used as an indicator of the size of the buffer held by the insurer over and above the capital required by the solvency standards:

- Solvency margin = ASC – MSC;
- Solvency ratio = ASC/MSC

100. When the ASC and MSC are equal, the solvency margin is zero and the solvency ratio is 100%.

101. Many New Zealand insurers currently implement a capital management plan, which may include a plan for addressing a fall in the solvency ratio. These plans, however, are not consistent and comparable across all insurers, and may not be tied to the risk management framework.

4.1.2 IPSA

102. Section 21(2)(b) and (c) enable us to set licence conditions that require insurers to maintain a solvency margin (including solvency margins in respect of statutory funds) in accordance with an applicable solvency standard. Standard conditions of licence set the solvency margin at 100%.

103. We may impose a non-standard licence condition that requires an insurer (or an insurer’s statutory fund) to maintain a solvency ratio higher than 100%. An increase in solvency may also be imposed by a direction given under Section 143, provided that the grounds for imposing a direction are set out.

104. Section 24 of IPSA requires the insurer to let us know if a breach of the solvency margin (that is, a solvency ratio below that set by licence conditions) is likely to occur in the next 3 years.

105. Reasonable cause to suspect failure (or likely failure) to maintain the solvency margin is one of the criteria for using distress management powers under IPSA; for example, investigations under Section 130, the requirement for a recovery plan under Section 138, and directions including to cease to carry on business in accordance with the direction under Sections 143 and 145. In addition, failing to maintain a solvency margin is a ground for us to apply to liquidate the insurer under Section 151. If an insurer is not failing (or is unlikely to fail) to maintain its required solvency margin, then these escalations can only be exercised if other grounds exist, e.g. failure to conduct business in a prudent manner or failing to comply with another condition of licence. IPSA currently does not mandate any particular supervisory action to be taken for insurers failing to maintain solvency – it is fully discretionary.

106. Issues relating to capital adequacy can only be addressed through the exercise of the most intrusive IPSA powers once the insurer’s solvency ratio has fallen (or is at risk of falling) below that set by licence condition (usually set as a solvency margin of 100%). In some circumstances, formal regulatory action may be taken too late, reducing the chances of recovery.

107. As discussed in an earlier section, we have started thinking about how the solvency standards should change in response to IFRS 17, which will likely result in new definitions for MSC and ASC. However, throughout this section we use the current definitions of MSC and ASC in order to minimise confusion.
4.1.3 What’s the problem?

108. As part of the 2016 FSAP, which assessed New Zealand’s compliance with the ICPs, the IMF stated that:

The solvency standards specify only one solvency control level: the Solvency Margin. The Solvency Margin is a minimum capital requirement as envisaged in ICP 17.4, in the sense that RBNZ’s belief on reasonable grounds that “the insurer has failed, is failing, or is likely to fail to maintain a solvency margin” is a ground for requesting a recovery plan [IPSA section 138(1)], or ground for issuing directions [IPSA section 143(1)(a)]. “The insurer is failing to maintain a solvency margin” is a ground for application to the High Court for liquidation [IPSA section 151(2)].

On the other hand, the Solvency Margin has the characteristics of a prescribed capital requirement as envisaged in ICP 17.4, in the sense that RBNZ may allow an insurer not to maintain the Solvency Margin (albeit for a short period of time), as RBNZ recognises that the Solvency Margin is determined on a conservative basis and that the insurer might still be viable when it fails to maintain the solvency margin.

The RBNZ has not yet developed a formal process to determine the appropriate response, if any, relative to the level of Solvency Margin.

109. To increase alignment with the ICPs, the FSAP recommended the following improvements to the solvency framework:

- Having two solvency control levels as specified in ICP 17.3 and 17.4 would enable less intrusive early intervention before the insurer’s condition deteriorates to a critical level.

- Developing internal guidance for what supervisory actions would be taken at each solvency level, with the strongest actions reserved for when the insurer fails to maintain solvency at the lower control level.

110. Trowbridge and Scholtens, in their review of the CBL liquidation process, echoed these recommendations. In particular, the binary approach to solvency (with over 100% - or an alternative figure set by licence conditions - solvency ratio being satisfactory, and unsatisfactory otherwise) was considered too rigid and unhelpful for capital management. Trowbridge and Scholtens argued that “a graduated and more flexible approach” should be adopted, citing the following examples:

- The Internal Capital Adequacy Assessment Process (“ICAAP”) framework that applies to APRA-regulated entities. This is an internal company document prepared by the insurer that places responsibility for capital management on the insurer’s board (subject to approval by APRA). The ICAAP comprises, amongst other things, a triggered capital action plan to reduce the likelihood of breaching the minimum capital requirement. (The APRA framework is discussed in further detail in Appendix 1. The European Central Bank also implements an ICAAP similar to Australia’s framework.)

- The Escalating Supervisory Response (“ESR”) framework for licensed banks in New Zealand (still under development). Trowbridge and Scholtens noted that this is an opportunity to increase alignment between industries regulated by the Reserve Bank. Unlike the ICAAP, which is an internal insurer framework designed to ensure that the minimum capital requirement is not breached, the ESR is a framework maintained by the Reserve Bank to deal with instances where capital falls below the regulatory minimum.

4.1.4 Purpose of framework

111. What purpose should a ladder of intervention framework serve? Does it serve to encourage insurers to maintain adequate buffers above the PCR to minimise the likelihood of a breach, or to provide clarity to supervisors when dealing with a breach of the PCR?
112. Adopting an ICAAP-type framework places the onus on the insurer to maintain capital buffers above the MSC. On the other hand, a pure ladders of intervention framework provides a base under which we may operate once capital falls below the MSC.

113. The insurer’s board should have ultimate responsibility for managing the business and its capital. However, regulatory capital requirements support good capital management practices by insurers and help align incentives for firms and policyholders. A possible way to balance competing objectives would be to formalise the capital management framework under something like an ICAAP framework (dealing with buffers above the top solvency control level). This could complement a ladder of intervention that deals with supervisory action for when capital falls below the top solvency control level.

114. The following diagram shows this framework, alongside the banking ESR and current insurance framework for comparison. Note that the diagram is not to scale. Although we have placed the solvency margin under the current framework in between the top and bottom rungs under the new framework, this is for illustrative purposes only. We have not yet decided where the rungs should be placed.

115. As shown above, the current solvency framework is binary and anchored on the solvency margin. Above the solvency margin specified in the licence condition, normal risk-based supervision applies. As soon as the solvency margin falls below the specified minimum, IPSA releases crisis management powers.

116. The recommended ladder of intervention framework has two (or more) solvency control levels. The top solvency control level acts as a boundary between normal risk-based supervision (possibly alongside an ICAAP-type framework) and increasing supervisory intervention. As solvency levels fall below the top rung and approach the lower rung, supervisory intervention and powers increase. The bottom rung acts as a boundary between increasing supervisory oversight and crisis management.

117. In this document, we would like to explore possible bases on which the risk posed by an insurer could be measured to set appropriate control levels. In particular, on what basis might we decide that an insurer’s operations are no longer viable, triggering a need for crisis management or liquidation? Can this be represented by balance sheet insolvency (i.e. where net assets fall below zero), or should it be set at a point above balance sheet insolvency?

118. And, for the top rung of the ladder, what level and form of increased risk or vulnerability should imply the need to begin subjecting an insurer to enhanced supervisory oversight? What metrics might be used to specify these points and what measures would be best to capture the deterioration of solvency levels between the control levels?

119. The New Zealand banking framework uses the capital ratio (capital as a percentage of risk-weighted assets) as a measure of the bank’s viability. Does it make sense to use the solvency ratio in the same way, or might other measures be better for conceptualising insurers’ risk or of explaining risk levels to the public?
120. To be clear, at this stage we are not looking to determine the points at which the control levels should be placed, as this would require the most appropriate way to measure resilience to be established. However, we invite comments from submitters on what the appropriate points might be.

4.2 Options for operating the ladder

121. While the ICPs provide a broad framework for implementing a ladder of intervention, they recognise jurisdictional differences with regard to the overall level of capitalisation, supervisory risk appetite, nature of the market and the regulatory landscape. The ICPs therefore do not provide any detailed guidance on how the framework is to be established.

122. As mentioned earlier, the focus at this stage is on the quantitative capital-based aspect of a ladder framework (i.e. determining each solvency control level and how to assess the insurer’s performance against these solvency control levels). It is not on where to place those solvency control levels or which specific supervisory interventions will apply at each solvency control level. Specific supervisory intervention proposals will be developed at a later stage.

123. We include a high-level international comparison in Appendix 1. While international frameworks provide a good reference point, it is important that the framework is suitable for the New Zealand environment.

124. The framework’s quantitative aspect can be separated into two components: firstly, how the solvency control levels should be calculated, and secondly, how the insurer’s capital position will be assessed against the solvency control levels.

4.2.1 Solvency control levels

125. Measures that could be used to determine the solvency control levels (i.e. the rungs of the ladder) include:

<table>
<thead>
<tr>
<th>Value-at-Risk (VaR)</th>
</tr>
</thead>
<tbody>
<tr>
<td>For a given confidence level ( p ) and time horizon ( t ), there is a probability of ( (1-p) ) that losses will exceed the VaR. For instance, the top solvency control level could be set at a 99.5% (say) confidence level, and the bottom one at an 85% confidence level. Alternatively, the bottom solvency control level could be set as a simple percentage (say 90%) of the top solvency control level. The VaR method yields a dollar amount.</td>
</tr>
<tr>
<td><strong>Pros</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><strong>Cons</strong></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Scenario-based</th>
</tr>
</thead>
<tbody>
<tr>
<td>Under this approach, the solvency control levels would be determined using a number of prescribed scenarios representing, for example, severe, moderate and mild stresses to insurers. The scenarios could be based on real-life historical events, such as the Christchurch earthquakes, COVID-19 pandemic and the GFC. This approach would also yield a dollar amount, representing the amount of capital required to be sufficient to withstand the stresses resulting from each scenario.</td>
</tr>
<tr>
<td><strong>Pros</strong></td>
</tr>
</tbody>
</table>
Cons

- Severity of scenarios may be subjective and may not allow for full range of extreme scenarios, especially if based on historical events.
- May not be internationally recognised.
- Does not give an indication of probability of failing to meet claims.

NB: If it were decided that this method was not suitable as a basis for solvency control levels, it might still have merit as a supplementary approach, for example in stress testing of insurers’ resilience and for establishing tail correlation factors.

126. To fully implement a ladder of intervention framework with multiple solvency control levels would require a change to IPSA. The results of this consultation will feed into the IPSA review; once a suitable framework has been developed, any changes required to IPSA will be identified and consulted on. The solvency buffers module of the IPSA Review is scheduled for the first half of 2021.20

**Questions for consultation:**

Y. Should we implement a ladder of intervention approach to solvency? Please give your reasons.

Z. At what point should the insurer’s operations be considered to be no longer be viable?

AA. Conversely, what point in an insurer’s solvency level triggers the need to start increasing the intensity of supervisory intervention from normal risk-based supervision?

BB. Should we adopt an ICAAP/ORSA-type approach alongside the solvency requirements? If so, are either of these frameworks a good starting point for New Zealand? Please provide reasons supporting your statements.

4.2.2 Measures of solvency position

127. Measures that could be used to assess the insurer’s performance against the solvency control levels include (i.e. where the insurer sits on the ladder):

**Solvency ratio**

Use the solvency ratio as currently defined, i.e. the actual capital over required capital. Note that “capital” refers to the excess of assets over liabilities.

**Pros**

- Least cost and complexity as no change from current method.
- Broadly comparable to other jurisdictions as most report some form of solvency ratio.

**Cons**

- Solvency ratio may not be the best measure by which to assess solvency. For example, the presence of a large negative policy liability on life insurers’ balance sheets distorts the comparison between life and general insurers.
- Have to consider impacts of how the solvency ratio may change from current after transition to IFRS 17.
- Only an indirect indication of how likely the company is to not be able to meet its obligations to policyholders.

---

**Assets over stressed liabilities**

This measure shows the amount of assets the company has to cover the stressed liabilities. The stressed liabilities may include asset-side stresses for completeness (as assets and liabilities need to be considered together).

**Pros**
- A more direct calculation approach, and therefore might be more easily understood from a communications or policyholder’s perspective.
- May provide a better comparison of solvency positions across industry, as it is less susceptible to distortions due to peculiarities in insurance accounting (e.g. negative policy liabilities).

**Cons**
- May not be comparable to other jurisdictions.
- Have to consider communications impacts transition to IFRS 17 (need to isolate what change is due to IFRS 17 and which change is due to a measurement approach change).
- Only an indirect indication of how likely the company is to not be able to meet its obligations.

**Probability of failure**

The probability that an insurer will not be able to fully meet its obligations to policyholders over a certain time period.

**Pros**
- Policyholders may be more interested in knowing how likely the insurer is to not be able to meet its obligations to policyholders.
- May be a more natural way of describing loss.

**Cons**
- May involve complex modelling (and potentially subjective assumptions) on the part of the insurers to translate the amount of capital held by the insurer to a probability measure.
- As this is a technical concept, there is a danger that it may be misinterpreted by policyholders.

128. Some calculation methods lend themselves more naturally to particular assessment measures, as shown in the following matrix.

<table>
<thead>
<tr>
<th>Measure</th>
<th>VaR</th>
<th>Scenarios</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solvency ratio</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Assets over stressed liabilities</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Probability of failure</td>
<td>✓</td>
<td>✗</td>
</tr>
</tbody>
</table>

129. We currently use the VaR method to specify the MSC and the solvency ratio to assess the insurer’s position relative to the MSC.
Questions for consultation:

CC. Are any of the above measures more or less appropriate to calculate and assess an insurer’s solvency position, from the point of view of implementing an effective ladder of intervention framework? Please give your reasons. If not, what measures do you consider would be more appropriate for this purpose?

4.3 Other considerations

130. The main focus of the current consultation is on the conceptual lens we should be using for thinking about where the solvency control levels should be placed, and the most sensible way to measure and communicate levels of solvency. However, once we have reached a decision on these fundamental issues, two further concerns will need to feed into setting appropriate control levels and corresponding supervisory responses.

131. The framework should be practical, easily understood, and not impose undue burden on the industry or on the Reserve Bank, but there is likely to be a trade-off between flexibility and transparency. While on one hand a more formal framework might provide clarity to both the industry and ourselves (as well as being a sound basis for any decision-making if legal action is required), supervisors may need some degree of discretion to allow for a more flexible and robust framework. For example, an insurer breaching the top rung of the ladder could give supervisors the right, but not the obligation, to use certain tools, while breaches of lower rungs could require certain supervisory actions to be taken.

132. Where we ultimately place the solvency control levels (including how far ‘above’ or ‘below’ the current MSC the levels are placed) and the supervisory actions that correspond to them, should reflect a well-articulated understanding of the Reserve Bank’s risk appetite in relation to the insurance sector.

133. Section 4 of IPSA states that the Act is not intended to lead to a zero-failure regime. This recognises that there may be trade-offs between soundness on the one hand and efficiency or competition on the other. Our risk appetite is risk-based and thus fully aligned with IPSA. This means that the more important for the sector an insurer is, the less appetite there is for risk. The intensity of supervisory engagement may therefore differ depending on entities’ sectoral importance. At the same time, we need consistency and a simple regulatory framework, so major differences in rules are unlikely.

134. We also need to balance soundness and efficiency at a macro level. New Zealand is a comparatively small market and is exposed to natural events such as earthquakes. This means that fostering competition and the availability and coverage of insurance are important considerations. At the same time, it also means that there is a higher potential for concentration of risk and that the sector may find it more difficult to absorb the failure of big players. Our mandate to promote confidence in the insurance sector is also relevant in this context. Large scale insurer failures after an event would undermine confidence and could lead to longer-term underinsurance and shrinkage of the sector. Weighing up these different considerations leads us to the initial conclusion that our regulatory settings should be more conservative than in peer jurisdictions, without undermining the efficiency aspects of our mandate. We acknowledge that there are significant difficulties when it comes to making international comparisons.

Questions for consultation:

DD. What approach would strike the right balance between clarity and discretion when setting out supervisory responses at different levels of the ladder of intervention?

EE. What should our risk appetite be in relation to insurer failure?

21 Note that soundness and efficiency can also be reinforcing and short term trade-offs can become long term synergies if the time frame is extended.
5. **Solvency calculations**

5.1 **Deductions vs Charges**

135. Our current standards require the full deduction of certain assets in determining Actual Solvency Capital. These include items such as intangible assets and deferred tax assets that may not be realisable, and potentially also accounting entries that mask the economic reality of the insurer’s situation.

136. This approach is in line with a “wind-up” valuation of the insurer, and may, therefore, be appropriate for determining an insurer’s minimum solvency requirement (i.e. the bottom rung of a ladder of intervention). A wind-up valuation may not, however, be appropriate for determining higher rungs of the ladder, where it could be assumed that the insurer is still a going concern.

137. To the extent that these items change in value under the operation of solvency stresses, they could also be addressed through the Resilience Risk Capital Charge. This would permit a more nuanced approach, allowing some value to be retained where appropriate.

138. As shown in the diagrams below, the solvency margin is unaffected by replacing deductions with capital charges (contributing to the MSC) of the same amount. The solvency ratio – actual solvency capital divided by minimum solvency capital – decreases, however, as the denominator and numerator increase by the same amount.

139. The Solvency Margin may change, however, if the capital charge is not equal to the deduction.

![Diagram showing solvency calculations with and without capital charges](image)

**Questions for consultation:**

**FF.** Would you be comfortable with handling some deductions from capital through the Resilience Risk Capital Charge? Why or why not?

**GG.** Do you believe that some value should be allowed for these deductible items at higher levels on the ladder of intervention? Is it appropriate to assume a ‘going-concern’ valuation at these levels?

5.2 **Supervisory adjustments**

140. There are a number of situations where it may be appropriate for us to have the power to adjust insurers’ solvency calculations. These include where:

- A material item on an insurer’s balance sheet is held at a value that does not reflect its true economic value.

- An insurer or their appointed actuary has used judgement regarding solvency stresses and discretions. This has the effect that the Minimum Solvency Capital (MSC) no longer aligns with the target solvency criterion (i.e. the 99.5% VaR objective under current standards).

- The insurer is subject to material risks not (fully) assumed by the solvency standards, once again with the result that the MSC is misaligned with the solvency criterion.
141. Since the passage of IPSA, the main tool used to address such matters has been the power to impose a minimum solvency margin/ratio through conditions of licence. This approach has some weaknesses, however, as follows:

- Solvency ratios and margins published by insurers do not incorporate these additional licence condition requirements, distorting the picture presented to policyholders and the public.
- While IPSA Section 21(4) allows licence conditions to be fixed in either dollar or percentage terms, or in any other way, in practice it has been difficult to make conditions responsive to changes in business volumes or insurer risk profiles.

142. We propose introducing “supervisory adjustments” similar to the LAGIC framework as an integral part of the process of determining solvency capital requirements. This supervisory adjustment would then form part of the insurer’s minimum solvency capital, and be captured in any reporting and disclosure requirements.

143. Depending on circumstances, such supervisory adjustments could take the form of, for example:

- fixed dollar amounts
- ratios to balance sheet aggregates (e.g. a percentage of premiums or claims)
- instructions to use certain methods or assumptions in the valuation of balance sheet items

144. The power to impose insurer-specific minimum solvency margins and ratios would remain (but would likely be used more sparingly).

**Questions for consultation:**

HH. Is it appropriate for us to adjust insurer solvency calculations?

II. Does the list in paragraph 140 above cover all circumstances where solvency calculations should be adjusted?

JJ. Do you support introducing supervisory adjustments as an integral part of the determination of capital requirements?

KK. Are there other forms (other than fixed amounts, ratios and valuation instructions) that the supervisory adjustments could take?
5.3 Hierarchy of risks and diversification

145. Solvency II takes a highly systematic approach to analysing and measuring risk. First, a near-exhaustive list of individual risks was developed. Next, these individual risks were allocated to major risk categories - market, default, operations and insurance - which are similar to the Basel categories. Category charges at the category level are determined by assuming certain correlations among the individual risks and combining by formula of the form

\[
\text{Compound Capital Charge} = \sqrt{\sum_{ij} \text{Correlation}_{ij} \times \text{Capital Charge}_i \times \text{Capital Charge}_j}
\]

146. The Basic Solvency Capital Requirement ("BSCR") is determined similarly from the capital charges for the risk categories. The final solvency capital requirement adds an operational risk charge and supervisory adjustments.

Source: Solvency II technical specifications

147. This approach has the obvious advantage of allowing a broad range of material risks to be identified and analysed in a logical framework that recognises relationships between risks. It also allows for somewhat more granular risk information to be collected from Insurers.

148. A further advantage of this approach is that it provides a framework in which an insurer’s degree of risk diversification can be assessed and then rewarded or penalised as appropriate. In simple terms, an insurer subject to a wide variety of uncorrelated risks should have a lower capital requirement than an insurer subject to a single risk of similar intensity. This is because it is highly unlikely that multiple risks would crystallise at the same time.

149. New Zealand solvency standards do not allow for diversification, and accordingly parameters have been modified from the pre-diversification values used in overseas regimes. Well-diversified insurers are subject to the same treatment as poorly diversified providers.

---

23 Many of these risks are also hypothesised in New Zealand’s existing solvency standards, however some (spread, revision, health lapse, expenses) are not. Note also that some of these risks are themselves compound in nature - for example life lapse risk countenances both an immediate mass lapse event and an ongoing permanent change in lapse rates.

24 For example, the Solvency II correlation factor between mortality risk and longevity risk is -0.25, recognising that if mortality rises, longevity tends to fall (and vice-versa).
150. We acknowledge the major criticisms of the use of correlation matrices, namely that they are blunt instruments and that they model ‘peace-time’ relationships rather than conditions that prevail in times of stress. We believe that these issues can be mitigated to some extent by carefully examining the relationships during historic periods of stress. We are not proposing, at this time, the use of more complex approaches to modelling risk relationships.

Questions for consultation:

LL. Should New Zealand adopt a more structured risk hierarchy? Why or why not?

MM. Is it necessary to introduce risk charges for risks currently not hypothesised in solvency standards, for example operational risk? Why or why not?

NN. Should solvency standards allow for a diversification benefit of some form? Is the Solvency II approach to relating risks appropriate for New Zealand conditions?

5.4 Life insurance risk capital charge restructure

151. The life insurance risk capital charge (“Life IRCC”) is different to all the other risk charges in the current solvency standards. It represents a stressed form of the underlying best estimate liability\(^{25}\) rather than a stress on the best estimate liability. This Life IRCC is then combined with other capital charges to derive the solvency requirement (which is also a stressed liability in form). The minimum solvency capital (“MSC”) must be a capital measure, however, as it is compared with actual solvency capital (“ASC”) to determine the solvency margin (“SM”). To derive the MSC from the solvency requirement, we need to, as a final step, deduct the policy liability.\(^{26}\)

152. This treatment can cause confusion, as internationally the term “capital charge” is used to denote an amount of capital that needs to be set aside to support a particular risk (not any form of liability). We propose that New Zealand solvency standards reflect this international usage and redefine the Life IRCC as a true capital charge. This would be effected by deducting the policy liability from the stressed liability within the capital charge module, rather than outside it as is currently the case.\(^{27}\)

153. Note that we are only addressing the structural issue with the Life IRCC in the current document. Inherent issues will be addressed in the “liability charges” consultation cycle, scheduled for the second half of 2022.

Questions for consultation:

OO. Should the deduction for policy and other liabilities be moved inside the Life IRCC?

5.5 Grouping of policies

5.5.1 Background

154. Pooling of risks is a core tenet of insurance, and insurers routinely categorise individual risks (policies) into groups for various purposes, including pricing and analysing experience (claims, persistency, etc). The choice of size and categorisation of groups may vary according to the group’s purpose, as well as the amount of reliable data available in each group.

---

\(^{25}\) The present value of future policy cash-flows on best-estimate assumptions.

\(^{26}\) Note that other (accounting) liabilities are carried through the calculation, being added into the Life IRCC and then deducted out again as a final step. For simplicity these have been ignored in the text.

\(^{27}\) Note that the Variable Annuity Capital Charge and the Solvency Liability Resilience Impact are both linked to the Life IRCC, so may need to be adjusted accordingly.
155. Smaller, more granular groups allow greater visibility of the performance and profitability of particular business classes. Larger groups, on the other hand, allow for more offsetting and cross-subsidisation between products. This may obscure the characteristics of certain classes of business within the larger group.

5.5.2 NZ IFRS 4 vs IFRS 17

156. Under NZ IFRS 4, life insurance policies are organised into related product groups (“RPGs”). These are policies that “have substantially the same contractual terms and are priced on the basis of substantially the same assumptions.”

157. The current life insurance solvency standards rely on NZ IFRS 4 RPGs. For example, in the Life Insurance Risk Charge, solvency liabilities for an RPG are subject to a floor of the total CTV for the RPG. Note, however, that the solvency liability for an individual policy within the group can be less than its CTV, provided that the shortfall can be offset by other policies.

158. Under IFRS 17, however, the existing definition of RPGs will no longer exist. Instead, they will be grouped into a hierarchy as follows. At the top level will be “portfolios”, which are “contracts subject to similar risks and managed together”. Portfolios need to be split into “cohorts” comprising business written in calendar time periods not exceeding one year. Finally, each cohort is split into three “groups” depending on expected profitability – solidly profitable, onerous and marginal.

```
<table>
<thead>
<tr>
<th></th>
<th>Year 1</th>
<th>Year 2</th>
<th>Year 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profitable</td>
<td>Group 1P</td>
<td>Group 2P</td>
<td>Group 3P</td>
</tr>
<tr>
<td>Onerous</td>
<td>Group 1O</td>
<td>Group 2O</td>
<td>Group 3O</td>
</tr>
<tr>
<td>Marginal</td>
<td>Group 1M</td>
<td>Group 2M</td>
<td>Group 3M</td>
</tr>
</tbody>
</table>
```

159. The non-life standard does not rely on this same definition of RPGs. Instead, it applies insurance risk charge stresses to “classes of business” (domestic property, domestic motor, etc.), and is therefore likely to be less affected than the life standard. However, there may be room for more clarity and standardisation in the definition of “classes of business”. Additionally, this could be seen as an opportunity to reconsider whether this level of aggregation for non-life business remains suitable, and whether consistency with the level of aggregation for life business is needed.

5.5.3 Options

160. The question therefore arises: how should policies be grouped for calculating solvency after transition to IFRS 17? IFRS 17 portfolios may be larger than IFRS 4 RPGs given the definitions referenced above, while cohorts and groups are likely to be more granular.

161. We have set out the range of possible options to address the grouping issue in the table below. In choosing an appropriate option, keep in mind that the focus of IFRS 17 is on accurately determining and reporting profit over time. This focus may not be suitable for regulatory purposes.\(^{28}\)

---

\(^{28}\) IFRS 17 BC.15, BC.119
<table>
<thead>
<tr>
<th>Grouping option</th>
<th>Possible theoretical basis</th>
<th>Impact on capital requirement</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
</table>
| Insurer         | Policyholder security is provided by the insurer. | Lowest | • Ease of administration | • Lack of visibility regarding performance of individual products/classes  
• Potentially unequitable if participating products subsidise non-participating products |
| Statutory fund  | Policyholder security is provided by the fund. | Lower | • Reflects that a purpose of statutory funds is for policyholder protection  
• Consistent with LAGIC | • Leads to potential inconsistencies between life and non-life as the latter does not have statutory funds |
| IFRS 17 portfolio | “Similar risks and managed together” | Slightly lower? | • Can leverage off IFRS 17 implementation leading to lower costs for industry  
• Easily reconciled to accounts  
• Easily understood internationally | • Portfolios may not be standardised across insurers |
| Regulatory groupings | Groupings that are appropriate for regulatory purposes, defined by the Reserve Bank – minimum saleable block of business? Product classes (e.g. Lump Sums, Income Protection, Domestic Motor, etc.)? | Slightly higher? | • Flexibility to define a grouping that is more appropriate for regulatory purposes | • Potentially higher implementation costs if insurers have to maintain multiple definitions of groupings (for accounting and regulatory purposes)  
• Difficult to reconcile to accounts |
| IFRS 17 group | Alignment with profitability inspection level in accounting standards | Higher? | • Can leverage off IFRS 17 implementation leading to lower implementation costs for industry | • Definitions that are too granular may not recognise pooling of risks  
• Increased operational complexity in maintaining too many groups |
| Individual policy | No policy should be an asset. | Highest | • Highest level of protection for policyholders | • Does not recognise pooling of risks |
162. Our initial preferred option is to adopt regulatory groupings, as we consider that this is likely to result in greater consistency and comparability across the industry relative to the other methods. It would also allow some degree of cross-subsidy between policies.

**Questions for consultation:**

PP. Are any of the above grouping options appropriate for solvency purposes? Please provide your reasons.

QQ. Are there any other grouping approaches that you consider would be appropriate for solvency purposes? Please provide your reasons.

RR. What are your views on our preferred option of specifying regulatory groupings for solvency purposes? What basis do you think should be used to form the regulatory groupings? Please provide your reasons.

**Have your say**

1. Stakeholders are welcome throughout the Review to provide comment and information to us. At this time we are particularly seeking commentary on the questions set out above, however we would welcome any general comments as well.

2. Use this email - insurancesolvency@rbnz.govt.nz - to provide comments. Please clearly indicate which question or section your comments relate to.

3. Comments or submissions should be received by 18 February 2021. Submissions received after this date will not be considered.

4. As noted earlier in this paper, it is our practice to publish submissions received unless specifically requested not to. We may also publish an anonymised summary of submission received.
List of consultation questions

A. Would a purpose statement be a useful addition to the solvency standards? Why or why not?

B. Please comment on the utility of the purpose statement (“The purpose of capital is to ensure that, in adversity, an insurer’s obligations to policy-holders will continue to be met as they fall due.”) and suggest improvements, if any.

C. How likely should the fulfilment of obligations by an insurer be (recognising that certainty is an impossibility, and that there is a trade-off with efficiency and competition)?

D. Should the solvency risks be assumed to crystallise immediately, in the short-term (say one year) or over the long-term?

E. Should a “total balance sheet approach” be adopted for solvency calculations?

F. Do you think there are insurers that are “sectorally-important”? If so, what would be the advantages and disadvantages of imposing higher capital requirements on them, relative to those that are considered not sectorally-important? Please provide your reasons.

G. Please comment on how effectively existing solvency standards address particular sectors and subsectors of the industry.

H. Should health insurance have its own specific solvency standard? Please provide your reasoning.

I. Please discuss your preferences with respect to how the standards should apply to industry sectors, with reference to the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Sector-differentiated status quo – separate Life and Non-Life Standards</td>
<td>Least cost for industry as would not require the industry to change its calculation methodologies.</td>
<td>Potential inconsistencies and more complex upgrade path.</td>
</tr>
<tr>
<td>2</td>
<td>Single solvency framework covering all sectors and subsectors</td>
<td>Streamlined approach and less potential for inconsistency.</td>
<td>Higher cost to industry as industry would be required to make significant changes to their calculation methodologies. Risk that sector-specific risks may not be accurately captured.</td>
</tr>
<tr>
<td>3</td>
<td>Rationalisation – folding the variable annuity standard into the life standard, and the three non-life standards into a single document</td>
<td>Would address some of the issues listed above relating to inconsistency, while still explicitly allowing for sector-specific differences.</td>
<td>Potentially minor costs to affected insurers.</td>
</tr>
</tbody>
</table>

J. Please comment on how effectively existing solvency standards address statutory and other funds.

K. Should solvency standards applied to statutory funds apply a floor to assets based on the provisions of Sections 82-119?
L. Please discuss your preferences with respect to how the standards should apply to statutory and other funds, with reference to the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Status quo – life insurers have solvency requirements for statutory funds and the insurer as a whole; non-life insurers have requirements only at the insurer level.</td>
<td>No disruption to insurers.</td>
<td>Minimum assets determined at the current level may not be sufficient to resolve all blocks of business for an insurer in distress.</td>
</tr>
<tr>
<td>2</td>
<td>All business allocated to ‘insurance funds’. Solvency requirements are only applied at the insurer level, although these requirements will be a function of fund solvency.</td>
<td>Facilitates resolution of all blocks of business.</td>
<td>May result in increased costs (administrative and capital) for insurers.</td>
</tr>
</tbody>
</table>

M. In your view, is the current treatment of insurance and non-insurance subsidiaries in the solvency standards appropriate? Please provide your reasons.

N. If your answer to the previous question was “No”, what do you feel would be a better treatment of insurance and non-insurance subsidiaries?

O. In the context of solvency requirements, which of the following options do you consider to be the most appropriate for New Zealand? Please give your reasons.

<table>
<thead>
<tr>
<th>Option</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Status Quo</td>
<td>Continue to require NZ IFRS 4 for solvency purposes</td>
</tr>
<tr>
<td>2</td>
<td>GAAP</td>
<td>Continue to use the GAAP balance sheet after transition to IFRS 17, and make no changes to the solvency standard.</td>
</tr>
<tr>
<td>3</td>
<td>GAAP with adjustments</td>
<td>Use GAAP where it makes sense, but make adjustments for certain areas/parameters. There are varying degrees of prescription involved with this method. Sub-options: (a) specify insurance liability valuation parameters, (b) specify insurance liability valuation method, and (c) use a non-IFRS 17 insurance valuation method.</td>
</tr>
<tr>
<td>4</td>
<td>Full regulatory balance sheet</td>
<td>Ignore GAAP entirely and specify a separate set of regulatory reporting requirements.</td>
</tr>
</tbody>
</table>

P. How do insurers currently treat non-technical insurance assets and liabilities on the balance sheet? Are all assets currently designated as backing insurance liabilities, and hence valued using the fair value approach? Are there any items (other than technical provisions) on the balance sheet that insurers are not currently measured using fair value?

Q. How, if at all, is the treatment in (P) likely to change after transition to IFRS 17 (and IFRS 9)?

---

29 Insurance funds would include statutory funds and other pools of assets deemed to be providing security for specific types of policy liability.

<table>
<thead>
<tr>
<th>Sectors</th>
<th>New Zealand</th>
<th>Australia – LAGIC</th>
<th>Europe – Solvency II</th>
<th>IAIS – ICS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Differentiation by sector?</strong></td>
<td>Yes. There are separate standards for life and non-life business, even though IPSA allows composite insurers.</td>
<td>Yes. There are separate, but consistent, standards for life and general insurers. Australian law does not permit composite insurers.</td>
<td>No. Solvency II is a single framework applicable to all insurers.</td>
<td>Entities are split into their insurance and non-insurance components, with the ICS being applied separately to each.</td>
</tr>
<tr>
<td></td>
<td>Whilst the standards are broadly consistent, they differ primarily with respect to treatment of insurance risk.</td>
<td>Life, General and Health business is regulated under separate acts, and composite insurers are not allowed.</td>
<td>Insurance risk is classified as life or non-life and treated differentially.</td>
<td>The ICS is a single framework applicable to all systemically important international insurers.</td>
</tr>
<tr>
<td></td>
<td>Some identical non-insurance risks faced by each sector are treated a little differently.</td>
<td></td>
<td>Non-insurance risks are treated uniformly for all insurers.</td>
<td>Insurance risk is classified as life or non-life and treated differentially.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>NB: Composite insurers are not allowed, although accident and health business can be written by both life and non-life insurers.</td>
<td>There is no prohibition of composite insurers.</td>
</tr>
</tbody>
</table>

| Sub-sectors treated separately | Captive non-life insurers (dovetails with the non-life standard) | New capital standards for health insurance are in the process of development. These will be broadly aligned with the general insurance approach. | While there is no special treatment for captives, the directive asks that methods used be ‘proportional to the nature, scale and complexity of the risks’, and specifically mentions captives in this context. | The solvency shocks in the ICS are instantaneous, so there is no allowance for dynamic hedging. |
| | Non-life insurers in run-off (dovetails with the non-life standard) | Category C (foreign general) insurers are required to maintain assets in Australia that exceed liabilities by the amount of the PCR. | UK run-off insurers must submit a scheme of operations to the BoE. | As the ICS deals with Internationally Active Insurance Groups (“IAIGs”), there are no specific provisions for captives or run-off insurers. |
| | Variable annuity providers (dovetails with the life standard) | Run-off insurers are required to maintain a run-off plan. | Small insurers are exempted from Solvency II (and instead subject to national law). | |

### Sub-sectors treated separately

- Captive non-life insurers (dovetails with the non-life standard)
- Non-life insurers in run-off (dovetails with the non-life standard)
- Variable annuity providers (dovetails with the life standard)

</tr>
<tr>
<td>• IPSA does not specifically empower the application of solvency standards to statutory funds, although it is the RBNZ’s practice to require (by licence condition) that statutory funds maintain a positive solvency margin.</td>
<td>• General insurance – there are no statutory funds and the capital requirement applies to the insurer as a whole.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Other funds | • Under the life standard, the business of an insurer outside of a statutory fund is itself a life fund.  
• Health insurance business issued by a life insurer and accounted for as life business is included in a life fund and has the life standard applied. Other health business should have the non-life standard applied but should still be part of a life fund if issued by a life insurer. | • For life insurance, business outside the statutory fund is referable to the ‘shareholder fund’, which has its own capital requirement under the life standards.  
• National law may allow for the maintenance of ‘ring-fenced funds’ for various purposes, and for the imposition of (non-Solvency II) capital requirements on such funds.  
• Any capital held in a ring-fenced fund and not available for other purposes is deducted from Own Funds (as it is not available to support business outside of the Funds). | • There are deductions from capital for defined benefit pension fund surpluses and for encumbered assets. |
| Non-life | • Insurers not subject to the life standard have no fund structures.  
• Insurers that are only subject to the non-life standard are only required to maintain a positive solvency margin at the level of the insurer as a whole. | • While there are no formal fund structures for general insurers, they are subject to an ‘assets in Australia’ test. This may achieve some of the same objectives as a statutory fund.  
• There is no ‘Assets in Europe’ test; in fact, Member states are prohibited from requiring that assets be located within the EU. | • As the ICS is supra-national, there are no rules relating to asset domicile. |

</thead>
<tbody>
<tr>
<td><strong>Valuation</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **Relationship to GAAP** | • For life insurance policy liabilities, the solvency standard relies on the GAAP balance sheet (NZ IFRS 4).  
  • For general insurance policy liabilities, the solvency standard relies on the GAAP balance sheet for outstanding claims liabilities, but adjusts the premium liabilities to use a prospective approach (similar to LAGIC below). | • For life insurance policy liabilities, the valuation method specified in APRA’s prudential reporting requirements (LPS 340) utilises the method specified in the accounting standards. The value of policy liabilities in the calculation of the capital base is adjusted to only reflect the BEL.  
  • For general insurance policy liabilities, APRA’s specification of outstanding claims liabilities in GPS 340 aligns with the accounting standards. However, the premium liabilities (i.e. the liabilities for claims that have not yet been incurred) is specified differently to the accounting standards. | • Assets and non-insurance liabilities are valued on a fair value basis for solvency purposes, regardless of how they are valued under GAAP.  
  • The ICS capital requirement is based on GAAP accounts, with adjustments to significant components (insurance liabilities, financial investments and instruments, and deferred taxes). |
<table>

**Solvency Control Levels**

<table>
<thead>
<tr>
<th>Upper level</th>
<th>New Zealand</th>
<th>Australia – LAGIC</th>
<th>Europe – Solvency II</th>
<th>IAIS – ICS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Systemically important NZ banks are required to hold total capital equal to 18% (16% for other banks) of RWA. This has been designed to be sufficient to cover a 1-in-200 systemic event.32</td>
<td>• APRA’s Prescribed Capital Amount (“PCA”) as specified under LAGIC (LPS 110 and GPS 110) is designed to achieve a 99.5% probability of sufficiency over one year.</td>
<td>• The Solvency Capital Requirement (“SCR”) under Solvency II is designed to achieve a 99.5% probability sufficiency over one year.</td>
<td>• The ICS capital requirement is a 99.5% Value at Risk (VaR), over a one-year time horizon, of adverse changes in the insurance group’s qualifying capital resources.</td>
<td></td>
</tr>
</tbody>
</table>

---

30 Under IFRS some assets are valued using methods other than fair value (e.g. bonds held to maturity).
31 Refer to section 5.1 of the Level 2 document for more detail.
32 Note that this is different to the criterion applied to NZ insurers, which is that capital should cover a 1-in–200 chance of insurer failure.
<table>
<thead>
<tr>
<th>New Zealand</th>
<th>Australia – LAGIC</th>
<th>Europe – Solvency II</th>
<th>IAIS – ICS</th>
</tr>
</thead>
</table>

- Between 9-18% of RWA, **banks** are still compliant with their conditions of registration but will subject to more intense scrutiny from the RBNZ. The severity of the additional scrutiny and other consequences (e.g. dividend restrictions) will increase as the banks approach 9%.

**Lower level**
- Below 9% of RWA, the **bank** breaches its condition of registration and its operations may be deemed non-viable.
- Alongside the PCA, APRA has also issued a solvency requirement under LPS 100, which is set to be 90% of the PCA. This level of capital triggers a few provisions of the Life Insurance Act 1995, including dividend restrictions and judicial management.
- The Minimum Capital Requirement ("MCR"), which is designed to achieve an 85% probability of sufficiency over one year. The MCR is capped at 25-45% of the SCR.
- The ICS has no lower level. Note, however, that insurance groups subject to the ICS are also subject to local capital requirements.

**Other**
- There is only a single solvency control level for insurers, the minimum solvency margin specified by condition of licence (typically $0).
- The specific details of the escalating supervisory response framework for NZ **banks** are currently still under internal discussion.
- General insurance only has a single solvency control level, while life insurance has two.
- The SCR and MCR form the top and bottom rungs respectively of the ladder of intervention. Increasingly severe actions will be taken as a company’s eligible capital falls below the SCR and approaches the MCR. Below the MCR, the company would lose its authorisation.
- ICP 17.3: The regulatory capital requirements include solvency control levels which trigger different degrees of intervention by the supervisor with an appropriate degree of urgency and requires coherence between the solvency control levels established and the associated corrective action that may be at the disposal of the insurer and/or the supervisor.

<th>New Zealand</th>
<th>Australia – LAGIC</th>
<th>Europe – Solvency II</th>
<th>IAIS – ICS</th>
</tr>
</thead>
</table>
| **ICAAP / ORSA** | • Licensed insurers are not required to complete an ICAAP.  
• Registered banks are required to have an ICAAP process, as per BS12. | • To support the solvency requirements, LAGIC requires that an insurer’s board be responsible for specifying and overseeing an Internal Capital Adequacy Assessment Process (“ICAAP”) that must be submitted to APRA.  
• The ICAAP includes plans for how target levels of capital are to be met and the means available for sourcing additional capital where required.  
• Further guidance, specified in CPG 110, specifies that an insurer is required to have a series of graduated trigger levels above the Prudential Capital Requirement (“PCR”) to minimise the probability of breaching the PCR (with actions of varying degree of intensity as the buffers approach the PCR). | • In addition to the MCR and SCR, each insurer is also required to carry out an Own Risk and Solvency Assessment (“ORSA”). The ORSA requires an insurer to identify all the risks to which it is subject and the related risk management processes and controls, including some quantitative risks that may not have been captured in the MCR and SCR.  
• As part of the ORSA, the insurer must also quantify its ability to continue to meet the MCR and SCR over the defined business planning horizon, allowing for new business.  
• The ORSA is one of the elements used by the supervisor when determining whether a further capital add-on is required. | • ICP 17.3 - The supervisor requires the insurer to:  
  - determine, as part of its ORSA, the overall financial resources it needs to manage its business given its risk appetite and business plans;  
  - base its risk management actions on consideration of its economic capital, regulatory capital requirements, financial resources, and its ORSA; and  
  - assess the quality and adequacy of its capital resources to meet regulatory capital requirements and any additional capital needs.  
• The ICS does not address ICAAP or ORSA processes. |

<tr>
<th>Hierarchy of risks</th>
<th>New Zealand</th>
<th>Australia – LAGIC</th>
<th>Europe – Solvency II</th>
<th>IAIS – ICS</th>
</tr>
</thead>
<tbody>
<tr>
<td>The structure of the risk hierarchy is not clearly communicated. Some disparate risks are combined in a single charge (e.g. credit, equity and property), while some related risks (e.g. insurance and catastrophe) are treated separately.</td>
<td>Asset risks are separately stressed and combined using an aggregation formula. Catastrophe and insurance risks are treated separately.</td>
<td>Solvency II categorises risk into major categories – Market, Default, Insurance, Operational etc. Within each category there are a number of risks – for example Market Risk is split into property, equity and interest rate risks.</td>
<td>ICS uses a hierarchy similar to Solvency II. ICPs: Risk assessment should address the interrelationships between risk categories as well as within a risk category.</td>
<td></td>
</tr>
</tbody>
</table>

| Diversification | There is no allowance for diversification. Parameters within the solvency calculation have been decreased relative to international approaches to compensate. | LAGIC has a diversification allowance which applies a correlation matrix between major risks. | Capital charges are combined using correlation matrices between major risks, and, separately, sub-risks. | The ICS employs a similar approach to Solvency II. ICPs: The insurer should be able to explain the allowance for diversification effects and should consider how dependencies may increase under stressed circumstances. |

| IRCC structure | The Insurance Risk Capital Charge (IRCC) takes the form of a stressed liability. | The capital charge is measured as the difference between adjusted and stressed policy liabilities. | All capital charges are measured as the change in net assets resulting from a specified stress. The insurance charge is a combination of lower-level stresses. | Capital charges are based on the potential adverse changes in qualifying capital resources resulting from unexpected changes, events or other manifestations of the specified risks. |
Appendix 2 – Impacts of IFRS 17

<table>
<thead>
<tr>
<th>Component</th>
<th>Sectors Impacted</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coverage period</td>
<td>Life, Health</td>
<td>The treatment of Yearly Renewable Term (&quot;YRT&quot;) life insurance products[^34] under NZ IFRS 4 (and health insurance provided by life insurers) reflects its long-term economic value. However, under IFRS 17 there is a possibility that YRT life insurance and all health insurance (whether provided by life or non-life insurers) products may be treated as short-term (one-year) products. Treating YRT products as short-term may not be appropriate for solvency purposes as it may not reflect the longer-term viability of the product. In addition, insurers who choose to treat YRT as long-term for practical reasons may be penalised relative to those who select a short-term treatment.</td>
</tr>
</tbody>
</table>
| Grouping       | Life, Non-life   | Under NZ IFRS 4, life insurers currently divide business into Related Product Groups ("RPGs"), a classification that may no longer exist under IFRS 17. This affects the solvency standards in the following ways:  
  - The solvency standard calculates the Insurance Risk Charge at RPG level. While the solvency standards include an explicit definition of RPGs, this definition may not map directly to any group insurers may have under IFRS 17, and therefore impose an unnecessary burden on insurers.  
  - IFRS 17 groups are more granular than IFRS 4 groupings – is this lower level of granularity appropriate for solvency, or should the solvency standards allow for more pooling and cross-subsidisation?  
  The factors specified in the Non-Life Insurance Risk Charge apply to "classes of business" (domestic property, domestic motor, etc.), which needs to be better defined. Additionally, this is an opportunity to reconsider whether or not the level at which business is aggregated for non-life business remains suitable. |
| Reinsurance    | Life, Non-life   | The solvency standards currently apply stresses to the net of reinsurance liability. This is not an issue under NZ IFRS 4 where the gross and reinsurance contracts are valued together. However, under IFRS 17 gross and reinsurance contracts are valued separately, which means that there is a possibility of a mismatch in the treatment of gross and reinsurance liabilities, in particular with relation to the length of the contract. At this stage we think this might be more problematic for life insurance (specifically YRT), but the impacts on the full range of insurance business should be considered when developing a solution. |

[^34]: YRT products are guaranteed renewable policies with premiums that increase each year in line with the policyholder's age (to reflect the increased claims costs associated with older ages). This is currently the most prevalent structure of modern life insurance business in the market.
<table>
<thead>
<tr>
<th>Component</th>
<th>Sectors Impacted</th>
<th>Description</th>
</tr>
</thead>
</table>
| Policy liability | Life, Non-life   | Life insurance liabilities under NZ IFRS 4 Appendix C (including health insurance by life insurers) are calculated on a best estimate basis, i.e. not deliberately overstated or understated. The solvency stresses, designed to achieve a 99.5% probability of sufficiency, have been calibrated based on the assumption that the best estimate corresponds to the mean of the distribution. The general method under IFRS 17 introduces the concept of a “risk adjustment” which is added on top of the best estimate. This has the following implications for solvency:  
Should the stresses be applied on top of the risk adjustment (akin to the current non-life method), or just on the BEL?[^35]  
If the risk adjustment is to be included in the stress, the insurance risk charge stresses may need to be recalibrated to achieve a 99.5% probability of sufficiency.  
What should be the treatment for insurers who choose to use the simplified approach? Under the simplified approach, there is no explicit risk adjustment.  
General insurance liabilities under NZ IFRS 4 Appendix D (including health insurance other than by life insurers) are calculated as the sum of the current estimate (defined in the standard as the mean of the distribution) and a risk margin to represent the inherent uncertainty in the current estimate and future cash flows.[^36] The risk margins at the 75%[^37] probability of sufficiency prescribed in the solvency standard plus the solvency risk charges, together are calibrated to achieve a probability of sufficiency of 99.5%. While this may not be so much of a problem under the IFRS 17 general method, it is likely that most classes of general insurance will be valued using the simplified valuation method. As the simplified method does not include an explicit risk adjustment, the current standard and risk charges may need to be recalibrated. |

[^35]: The Best Estimate Liability (“BEL”) is the net present value of future cash inflows and outflows under a policy. The life insurance policy liability is comprised of the BEL and the Present Value of Future Profit Margins, designed to smooth the recognition of profits over time.  
[^36]: Note that the risk margin under NZ IFRS 4 is not necessarily the same as the risk adjustment under IFRS 17.  
[^37]: 90% for the run-off solvency standard.
<table>
<thead>
<tr>
<th>Component</th>
<th>Sectors Impacted</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deferred Acquisition Costs</td>
<td>Life, Non-life</td>
<td>Under NZ IFRS 4, acquisition costs for life insurance business are amortised across the entire term of the policy, and the deferred acquisition cost asset (&quot;DAC asset&quot;) is implicit within the negative policy liabilities(^{38}). Because of this, there is no explicit allowance for DAC in the life insurance solvency standard. Instead, the DAC is allowed for in the life standard through the application of a CTV minimum(^{39}) in the Insurance Risk Charge. The simplified method under IFRS 17 allows the insurer a choice between expensing acquisition costs, or amortising them over the current contract coverage period and across expected future renewals (on a systematic and rational basis). The latter requires the insurer to set up an explicit asset relating to acquisition costs allocated to future renewals on the balance sheet. The life standard will therefore need to be adjusted to ensure that the DAC is accounted for appropriately. This may also be an issue if insurers choose to treat the underlying policy as single-year contracts, but amortise the DAC across future policy renewals. At this stage we think that the non-life standard is likely to be less affected by the change in treatment of the DAC than the life standard, as the DAC is an explicit item on the balance sheet. However, there may be flow on impacts that need to be considered.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Onerous contracts</td>
<td>Life, Non-life</td>
<td>NZ IFRS 4 has a liability adequacy test (&quot;LAT&quot;), assessed at valuation date, to increase policy or premium liabilities if premiums are inadequate for benefits, claims and certain expenses during the period of future cover. The non-life solvency standard modifies the accounting LAT by specifying a probability of sufficiency and a different period for the calculations. There is also an interaction between the DAC and the LAT in both the accounting and the non-life solvency standards, in that the DAC is to be written off if there is a deficiency(^{40}). IFRS 17 requires onerous contracts to be accounted for separately, but the identification of onerous contracts is typically at inception rather than at valuation date.</td>
</tr>
</tbody>
</table>

---

\(^{38}\) Negative policy liabilities are common for modern life insurance products in New Zealand.

\(^{39}\) The Insurance Risk Charge is calculated as the greater of the CTV and the stressed BEL. If the stressed BEL is negative as is common for many modern life insurance products, the CTV will automatically apply.

\(^{40}\) The life accounting standard requires a write-off of "intangibles".

Notes

Life insurance

- Pandemic risk charge – expected cost of extra claims over following year from a 1‰ increase in mortality rates
- Other extreme event charge – financial impact of an extreme event on the insurer
- RPG = related product group
- Solvency liabilities are subject to a floor of the NZ IFRS Liabilities (Best Estimate Liability + Value of Future Profit Margins). Implicitly, the prudential margins cannot be less than the value of future profit margins

Non-life insurance

- Extreme event exposure is defined as the greater of losses arising from two earthquake scenarios calibrated to a 1000 year return period and a non-earthquake scenario calibrated to a 250 year return period.
- The long-term insurance risk capital charge is to be determined having regard to principles in the life solvency standard.

Other notes

- Cells marked in green are not formally part of the solvency requirement, however, as (a) deductions from capital or (b) balance sheet obligations, have a similar effect.
- Reinsurance Risk Capital Factor is a function of the reinsurer’s credit rating
- In the Risk-Weighted Exposures Charge, “asset exposure” should be taken to include the value of any contingent liabilities. The value of leases is non-negative and is taken to be the value of the right-of-use asset less the value of the lease liability.
- The delta factor is derived from the application of appropriate shocks to the underlying instruments.
IFRS 17 *Insurance Contracts* sets out the accounting requirements for insurance contracts, including reinsurance contracts held. Under IFRS 17, a reinsurance contract held is accounted for as a standalone contract, independent of the accounting for the underlying insurance contracts.

For many entities, IFRS 17 represents a significant change. Common existing practice is to account for reinsurance contracts held using a ‘mirroring approach’, essentially matching reinsurance contract revenue, costs, assets and liabilities to the underlying insurance contracts.

In determining the IFRS 17 approach to reinsurance, the Board took note of existing practice. However, the Board concluded that separate accounting is necessary to truly reflect the economics of an entity’s rights and obligations under insurance contracts it issues and reinsurance contracts it holds. The primary insurer is obligated to pay the full amount of the claims to the policyholder under the insurance contract, irrespective of whether the reinsurer is obliged to perform or able to meet its obligations. Thus, the performance risks for reinsurance contracts held differ from those for underlying insurance contracts even when their terms and cash flows are identical. In addition, few reinsurance contracts have terms and cash flows that are identical to the terms and cash flows of the underlying contracts, making separate accounting even more relevant.

IFRS 17 includes requirements specific to reinsurance contracts held to reflect the fact that the contracts are held rather than issued. This pocket guide is a helpful reference tool on how IFRS 17 applies to reinsurance contracts held and includes useful insights on implementing IFRS 17 from the discussions of the Transition Resource Group for IFRS 17 (TRG).

1. Scope

Requirements

IFRS 17 applies to:

(a) insurance contracts issued (including reinsurance contracts issued);
(b) reinsurance contracts held; and
(c) investment contracts with discretionary participation features issued by an entity that also issues insurance contracts.

A contract is an insurance contract if it transfers significant insurance risk. A contract transfers significant insurance risk only if there is a scenario in which the issuer has a possibility of a loss on a present value basis.

What is significant insurance risk?

Insurance risk is significant if an insured event could cause the issuer to pay additional amounts that are significant in any single scenario even if:

(a) the insured event is extremely unlikely; or
(b) the expected (ie probability-weighted) present value of the contingent cash flows is a small proportion of the expected present value of the remaining cash flows from the insurance contract.

</tr>
</tbody>
</table>

---

2 Applying paragraph B18 of IFRS 17 the scenario must have commercial substance, ie a discernible effect on the economics of the transaction.
Reinsurance contracts held

IFRS 17 requires a reinsurance contract held to be accounted for separately from the underlying insurance contracts to which it relates. This is because an entity that holds a reinsurance contract does not normally have a right to reduce the amounts it owes to the underlying policyholder by amounts it expects to receive from the reinsurer.

Reinsurance contracts often provide coverage for many underlying contracts, and so the issuer (ie the reinsurer) may not be exposed to the possibility of a significant loss even if each individual underlying contract exposes the insurer to significant insurance risk. However, applying IFRS 17, even if a reinsurance contract does not expose the issuer to the possibility of a significant loss, it is still deemed to transfer significant insurance risk if it transfers substantially all the insurance risk relating to the reinsured portion of the underlying insurance contracts to the reinsurer.

Some contracts that are, in legal form, financial reinsurance contracts return all significant risks to the policyholder. Such contracts are normally financial instruments or service contracts and would therefore fall outside the scope of IFRS 17.

TRG insights—separating components of a reinsurance contract held

Reinsurance contracts held can provide coverage for underlying insurance contracts that are included in different groups of insurance contracts.

In February 2018, the TRG discussed an implementation question on whether a reinsurance contract held should be separated into components for measurement purposes to reflect the underlying insurance contracts covered.

TRG members observed that a contract with the legal form of a single contract is generally considered a single contract in substance, however:

(a) in some circumstances, the legal form of a single contract might not reflect the substance of its contractual rights and obligations;

(b) overriding the presumption that the legal form of a single contract reflects the substance of its contractual rights and obligations involves significant judgement and careful consideration of all relevant facts and circumstances; and

(c) the fact that a reinsurance contract held provides cover for underlying insurance contracts that are included in different groups is not, in itself, sufficient to conclude that accounting for the reinsurance contract held as a single contract does not reflect the substance of its contractual rights and obligations.

---

3 Paragraph B19 of IFRS 17 and BC298 of the Basis for Conclusions on IFRS 17.

4 The Transition Resource Group for IFRS 17 (TRG) provides a public forum for stakeholders to follow the discussions of questions raised on the implementation of IFRS 17. Meeting recordings, agenda papers, meeting summaries and a submissions log are available on the TRG page at https://www.ifrs.org/groups/transition-resource-group-for-insurance-contracts/.

5 Groups of insurance contracts are discussed in Section 2 (Level of aggregation).
2. Level of aggregation

Requirements

To recognise and measure insurance contracts, portfolios of insurance contracts are identified and divided into groups of insurance contracts issued no more than one year apart. At a minimum, a portfolio is divided into:

(a) a group of contracts that are onerous at initial recognition, if any;
(b) a group of contracts that at initial recognition have no significant possibility of becoming onerous subsequently, if any; and
(c) a group of remaining contracts in the portfolio, if any.

Reinsurance contracts held

A reinsurance contract held cannot be considered onerous applying IFRS 17. Therefore, the requirements for dividing a portfolio into groups are modified for reinsurance contracts held. For a group of reinsurance contracts held, an insurer expects either to incur a net cost of purchasing the reinsurance or, sometimes, make a net gain from purchasing the reinsurance. As such, applying the grouping requirements to reinsurance contracts held, at a minimum, a portfolio is divided into:

(a) a group of contracts on which there is a net gain at initial recognition, if any;
(b) a group of contracts on which at initial recognition there is no significant possibility of a net gain arising subsequently, if any; and
(c) a group of remaining contracts in the portfolio, if any.

For some reinsurance contracts held, applying the requirements in IFRS 17 will result in a group that comprises a single contract.

---

6 Paragraphs 14–24 of IFRS 17 and paragraphs BC115–BC139 of the Basis for Conclusions on IFRS 17.
7 A portfolio comprises contracts subject to similar risks and managed together.
8 Paragraph 61 of IFRS 17.
9 Gains and losses on reinsurance contracts held are discussed in Section 6 (Measurement—contractual service margin).
3. Recognition

Requirements\(^{10}\)

A group of insurance contracts issued is recognised from the earliest of:

(a) the beginning of the coverage period of the group of insurance contracts;

(b) the date the first payment from a policyholder in the group becomes due; or

(c) for a group of onerous contracts, when the group becomes onerous.

Reinsurance contracts held\(^{11}\)

The requirements on when to recognise a group of reinsurance contracts held are different depending on whether the reinsurance contract held covers the losses of separate insurance contracts on a proportionate basis (proportionate reinsurance contracts) or the reinsurance contract held covers aggregate losses from underlying contracts in excess of a specified amount (non-proportionate reinsurance contracts).

A group of proportionate reinsurance contracts held is recognised at the later of:

(a) the beginning of the coverage period of the group; or

(b) the initial recognition of any underlying insurance contract.

This means an entity will not recognise a group of proportionate reinsurance contracts held until it has recognised at least one of the underlying insurance contracts.

A group of non-proportionate reinsurance contracts held is recognised at the beginning of the coverage period of the group.

---

11 Paragraph 62 of IFRS 17 and paragraphs BC304–BC305 of the Basis for Conclusions on IFRS 17.
4. Measurement—estimates of future cash flows

**Requirements**

The measurement of a group of insurance contracts includes the present value of all future cash flows within the boundary of each contract in the group. The estimates of future cash flows are:

(a) a probability-weighted mean of the full range of possible outcomes;
(b) determined from the perspective of the entity, provided the estimate are consistent with observable market prices for market variables;
(c) current—estimates reflect conditions existing at the measurement date; and
(d) explicit—the risk adjustment for non-financial risk is estimated separately from the other estimates.

**Reinsurance contracts held**

The amount an entity pays for a reinsurance contract held consists of premiums it pays minus any amounts paid by the reinsurer to the entity as compensation for expenses incurred (for example, ceding commissions). The amount an entity recognises for reinsurance contracts held can be viewed as:

(a) the reinsurer’s share of the risk-adjusted expected present value of the cash flows generated by the underlying insurance contracts; and
(b) a contractual service margin (CSM) that makes the initial measurement of the reinsurance asset equal to the amount the entity pays for the reinsurance contract.

Consistent assumptions are used when measuring estimates of the present value of future cash flows for a group of reinsurance contracts held and estimates of the present value of future cash flows for the group(s) of underlying insurance contracts. This includes any associated adjustments for the financial risk and the time value of money arising from the reinsurance contracts held. As a result, the cash flows used to measure the reinsurance contracts held reflect the extent to which those cash flows depend on the cash flows of the underlying contracts that the reinsurance contract held covers.

In addition, the expected present value of future cash flows includes an adjustment for the risk that the reinsurer may fail to satisfy its obligations under the reinsurance contract held. Changes in the fulfilment cash flows that result from changes in the risk of non-performance by the reinsurer do not adjust the contractual service margin. Instead, these changes are reflected in profit or loss when they occur.

---

12 Paragraphs 33–36 and B36–B85 of IFRS 17 and paragraphs BC147–BC205 of the Basis for Conclusions on IFRS 17.
14 See Section 6 (Measurement—contractual service margin).
IFRS 17 specifies which cash flows are within the boundary of an insurance contract. In February 2018 and May 2018, the TRG discussed implementation questions on how the contract boundary requirements in IFRS 17 apply to reinsurance contracts held.

TRG members observed that:

(a) cash flows are within the contract boundary if they arise from substantive rights and obligations of the entity that exist during the reporting period in which the entity is compelled to pay amounts to the reinsurer or in which the entity has a substantive right to receive services from the reinsurer; and

(b) the boundary of a reinsurance contract held might include cash flows related to underlying insurance contracts that are expected to be issued in the future.

TRG members discussed whether including all expected future cash flows within the boundary of reinsurance contracts held, including those relating to future underlying insurance contracts, is consistent with the measurement of the underlying insurance contracts. This is consistent because all expected future cash flows within the contract boundary are included in the measurement of a group of insurance contracts issued. Including expected future cash flows related to underlying insurance contracts that are expected to be issued in the future in the measurement of reinsurance contracts held reflects the entity’s substantive right to receive services from the reinsurer related to those future underlying contracts.
5. Measurement—risk adjustment for non-financial risk

Requirements

The risk adjustment for non-financial risk reflects the compensation an entity requires for bearing the uncertainty about the amount and timing of the cash flows from non-financial risk as the entity fulfils insurance contracts.

Reinsurance contracts held

The requirements in IFRS 17 for the risk adjustment for non-financial risk are modified for reinsurance contracts held. For reinsurance contracts held, the risk adjustment for non-financial risk represents the amount of risk being transferred by the holder of the group of reinsurance contracts to the reinsurer.

The following illustration demonstrates the transfers of risk between the insurer and the reinsurer.

---

15 Paragraphs 37 and B86–B92 of IFRS 17 and paragraphs BC206–BC217 of the Basis for Conclusions on IFRS 17.

16 Paragraph 64 of IFRS 17.
6. Measurement—contractual service margin

Requirements\textsuperscript{17}

The contractual service margin for a group of insurance contracts represents the unearned profit the entity will recognise as it provides services in the future. At initial recognition, the contractual service margin is the amount that results in no income or expenses arising from:

(a) the initial recognition of the fulfilment cash flows;
(b) the derecognition of any asset or liability recognised for insurance acquisition cash flows; and
(c) any cash flows arising from the contracts in the group at that date.

At the end of the reporting period, the carrying amount of the contractual service margin is adjusted to reflect:

(a) the effect of any new contracts added to the group;
(b) interest accreted on the carrying amount of the contractual service margin;
(c) changes in the fulfilment cash flows relating to future service;\textsuperscript{18}
(d) the effect of any currency exchange differences; and
(e) the amount recognised as insurance revenue because of the transfer of services in the period.

The amount of the contractual service margin recognised as insurance revenue because of the transfer of services in the period is determined by the allocation of the contractual service margin remaining at the end of the reporting period over the current and remaining coverage period of the group of reinsurance contracts held based on coverage units. The number of coverage units in a group is the quantity of coverage provided by the contracts in the group, determined by considering for each contract the quantity of benefits and expected coverage period.

For insurance contracts issued, IFRS 17 prohibits the contractual service margin from becoming negative (ie when contracts are in an expected loss position). Therefore, expected losses on a group of insurance contracts issued are recognised immediately in profit or loss. This provides timely information about loss-making groups of insurance contracts.

\textsuperscript{17} Paragraphs 43–46 and B96–B119 of IFRS 17 and paragraphs BC218–BC287 of the Basis for Conclusions on IFRS 17.

\textsuperscript{18} Except to the extent that such increases in the fulfilment cash flows exceed the carrying amount of the contractual service margin, giving rise to a loss; or such decreases in the fulfilment cash flows are allocated to the loss component of the liability for remaining coverage.
Reinsurance contracts held\textsuperscript{19}

The contractual service margin for a reinsurance contract held represents the cost of purchasing reinsurance. This is different from the contractual service margin for underlying insurance contracts which represents unearned profit on those contracts.

The cost of purchasing reinsurance is recognised as services are received under the reinsurance contract held. As an exception, if the reinsurance contract held covers events that have already occurred, the net cost at initial recognition is recognised immediately in profit or loss.

The amount an entity pays for reinsurance typically exceeds the expected present value of cash flows generated from that reinsurance plus the risk adjustment for non-financial risk. As such, the contractual service margin for a group of reinsurance contracts held at initial recognition typically represents a net cost of purchasing reinsurance.

In some cases, the contractual service margin for a group of reinsurance contracts held may represent a net gain on purchasing reinsurance (i.e., the expected cash inflows from the reinsurer are higher than the expected cash outflows to the reinsurer plus the risk adjustment for non-financial risk). In these cases, IFRS 17 treats the apparent gain on initial recognition as a reduction in the cost of purchasing reinsurance, or in other words, as though the entity receives a discount on the reinsurance premiums it expects to pay. Accordingly, the apparent net gain is recognised as services are received under the reinsurance contract held.

In some of these cases, at initial recognition, an entity might expect to make a loss on the underlying insurance contracts issued and a net gain on the reinsurance contract held. The treatment of an expected loss on the underlying contracts and the apparent net gain on initial recognition of a reinsurance contract held is asymmetric:

(a) an expected loss on the underlying insurance contracts is recognised immediately. This provides users of the financial statements with timely information about losses related to those contracts.

(b) the reduction in the cost of purchasing reinsurance is recognised as services are received under the reinsurance contract held. This is consistent with the principle that expenses are recognised when services are received. This treatment results in the appropriate recognition of the net cost or gain on purchasing reinsurance as the reinsurance services are received.

\textit{continued...}

\textsuperscript{19} Paragraphs 65–68 of IFRS 17 and paragraphs BC310–BC315 of the \textit{Basis for Conclusions on IFRS 17}. 
At the end of each reporting period, the carrying amount of the contractual service margin for a group of reinsurance contracts held is adjusted to reflect changes in estimates in the same manner as a group of insurance contracts issued, but with one modification. In some situations, an underlying group of insurance contracts becomes onerous after initial recognition because of adverse changes in estimates of fulfilment cash flows relating to future service and the entity recognises a loss on the group of underlying contracts. In these situations, for reinsurance contracts held, the corresponding changes in cash inflows would not adjust the contractual service margin of the group of reinsurance contracts held. The result is that the entity recognises no net effect of the loss and gain in the profit or loss for the period to the extent that the change in the fulfilment cash flows of the group of underlying contracts is matched with a change in the fulfilment cash flows on the group of reinsurance contracts held.

Applying IFRS 17, reinsurance contracts held cannot be onerous. Accordingly, the requirements on onerous contracts do not apply.

The following illustration demonstrates the contractual service margin of a group of reinsurance contracts held as a net cost on initial recognition and as a net gain on initial recognition.

### Examples—CSM on initial recognition of a group of reinsurance contracts held

TRG insights—identifying coverage units for allocating the CSM

For reinsurance contracts held, an amount of the contractual service margin is recognised in profit or loss as services are received in the period.

In May 2018, the TRG discussed an implementation question on how to determine the quantity of benefits for identifying coverage units. The TRG observed that the principle of coverage units is to reflect the services provided in a period under a group of insurance contracts. The same principle applies to all insurance contracts within the scope of IFRS 17, including reinsurance contracts held. For reinsurance contracts held, the principle relates to services received from the reinsurer rather than services provided by the insurer. In applying this principle for reinsurance contracts held, the terms of the contract should be considered, for example, the existence of an aggregate limit, as well as the relevant facts and circumstances relating to the underlying insurance contracts.
7. Premium allocation approach

Requirements

IFRS 17 allows an entity to simplify the measurement of some groups of insurance contracts by applying the premium allocation approach (PAA). The premium allocation approach can be used to measure a group of insurance contracts only if at inception of the group:

(a) the entity reasonably expects that such simplification would produce a measurement of the liability for remaining coverage for the group that would not differ materially from the one that would be produced applying the general model; or

(b) the coverage period for each contract in the group is one year or less.

The following illustration demonstrates the application of these eligibility criteria.

---

Reinsurance contracts held

An entity may use the premium allocation approach to simplify the measurement of a group of reinsurance contracts held, if at inception of the group:

(a) the entity reasonably expects that the resulting measurement would not differ materially from the measurement applying the general model; or

---

21 Paragraphs 69–70 of IFRS 17 and paragraph BC301 of the Basis for Conclusions on IFRS 17.
the coverage period for each contract in the group of reinsurance contracts held is one year or less.

Because groups of reinsurance contracts held are separate from groups of underlying insurance contracts, the assessment of whether a group of reinsurance contracts meets the conditions for applying the premium allocation approach may differ from the assessment of whether the group(s) of underlying contracts meet(s) those conditions.

The following example demonstrates the premium allocation approach eligibility assessment for a group of underlying insurance contracts and a group of reinsurance contracts held that provide reinsurance coverage on the group of underlying contracts.

### Example—PAA eligibility (underlying contracts and reinsurance contracts held)

1. **Group of underlying insurance contracts**

An entity issues a group of three underlying insurance contracts within a one-year period. These contracts each have a coverage period of one year. The coverage period for the group is two years.

<table>
<thead>
<tr>
<th>Year 1</th>
<th>Year 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Underlying contract</td>
<td>Underlying contract</td>
</tr>
<tr>
<td>Underlying contract</td>
<td>Underlying contract</td>
</tr>
</tbody>
</table>

The coverage period for each contract in the group is one year. Therefore, the group of underlying insurance contracts is eligible for the premium allocation approach (meets criterion b).
2. Group of reinsurance contracts held

The entity purchases reinsurance for the group of underlying contracts. In this example, the single reinsurance contract held is the only contract in the group of reinsurance contracts held.

<table>
<thead>
<tr>
<th>Year 1</th>
<th>Year 2</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Group of reinsurance contracts held</strong></td>
<td><strong>Group of reinsurance contracts held</strong></td>
</tr>
<tr>
<td><strong>Reinsurance contract held</strong></td>
<td><strong>Reinsurance contract held</strong></td>
</tr>
</tbody>
</table>

The coverage period for the contract in the group is two years. Therefore, the group of reinsurance contracts held does not meet the criterion for the premium allocation approach of the coverage period being one year or less. However, it may meet the criterion that the entity reasonably expects the resulting measurement not to differ materially from the measurement applying the general model.

To determine whether this criterion is met, the insurer will need to assess the relevant facts and circumstances. The criterion cannot be met if, at inception of the group, the entity expects significant variability in the fulfilment cash flows that would affect the measurement of the reinsurance asset for remaining coverage during the period before a claim is incurred.
8. Variable fee approach

**Requirements**

The variable fee approach (VFA) applies to insurance contracts with direct participation features (VFA contracts). VFA contracts are substantially investment-related services contracts under which the entity promises an investment return based on underlying items. An insurance contract meets the definition of a VFA contract if, and only if, at inception:

(a) the contractual terms specify that the policyholder participates in a clearly identified pool of underlying items;

(b) the entity expects to pay the policyholder an amount equal to a substantial share of the fair value returns on the underlying items; and

(c) a substantial proportion of any changes in the amounts to be paid to the policyholder vary with the change in fair value of the underlying items.

Under a VFA contract, the entity has an obligation to pay policyholders an amount equal in value to specified underlying items minus a variable fee for service. To reflect the different nature of VFA contracts, returns to the entity from underlying items are viewed as part of the compensation that the entity charges to the policyholder for services provided by the insurance contract, rather than as a share of returns from unrelated investments. This is achieved by adjusting the contractual service margin for more changes than those affecting the contractual service margin for insurance contracts that are not VFA contracts.

**Reinsurance contracts held**

For reinsurance contracts held, the entity and the reinsurer do not share in the returns on underlying items and so the VFA criteria are not met, even if the underlying insurance contracts issued are VFA contracts. The contractual service margin for a group of reinsurance contracts held represents the net cost (or net gain) of purchasing reinsurance, considering the rights and obligations of the entity under the reinsurance contract. The insurer does not receive investment-related services from the reinsurer.

---

22 Paragraph 45 and B101–B118 of IFRS 17 and paragraphs BC238–BC269 of the Basis for Conclusions on IFRS 17.
23 Paragraph BC248 of the Basis for Conclusions on IFRS 17.
9. Presentation

Requirements\(^{24}\)

An entity presents separately in the statement of financial position:

(a) insurance contracts issued that are assets;
(b) insurance contracts issued that are liabilities;
(c) reinsurance contracts held that are assets; and
(d) reinsurance contracts held that are liabilities.

Amounts recognised in the statements of financial performance are disaggregated into:

(a) an insurance service result (comprising insurance revenue and insurance service expenses); and
(b) insurance finance income or expenses.

Reinsurance contracts held\(^{25}\)

An entity is prohibited from offsetting reinsurance contract assets held against related underlying insurance contract liabilities in the statement of financial position.

Consistently with prohibiting offsetting of reinsurance contract assets held and insurance contract liabilities, income or expenses from reinsurance contracts held are presented separately from expenses or income from insurance contracts issued. Income or expenses from a group of reinsurance contracts held, other than insurance finance income or expenses, may be presented either:

(a) as a single amount (net presentation); or
(b) separately as amounts recovered from the reinsurer and an allocation of the premiums paid (gross presentation).

If an entity presents separately amounts recovered from the reinsurer and an allocation of the premiums paid for reinsurance contracts held:

(a) cash flows that are *contingent on claims* on the underlying contracts are treated as part of the claims that are expected to be reimbursed under the reinsurance contract held; and
(b) cash flows that the entity expects to receive from the reinsurer that are *not contingent on claims* of underlying contracts are treated as a reduction in the premiums to be paid to the reinsurer.

\(^{24}\) Paragraphs 78–92 and B120–B136 of IFRS 17 and Paragraphs BC328–BC344 of the *Basis for Conclusions on IFRS 17*.

\(^{25}\) Paragraph 86 of IFRS 17 and paragraphs BC345–BC346 of the *Basis for Conclusions on IFRS 17*.
The allocation of premiums paid on reinsurance contracts held must not be presented as a reduction in revenue.

The following example illustrates presentation of the insurance service result with income or expenses from reinsurance contracts held presented both net and gross.

### Example—presentation of insurance service result

<td><strong>2,500</strong></td>
</tr>
</tbody>
</table>
10. Disclosures

Requirements

The objective of the disclosure requirements is for an entity to disclose information in the notes that, together with the information provided in the financial statements, gives a basis for users of financial statements to assess the effect that contracts within the scope of IFRS 17 have on an entity’s financial position, financial performance and cash flows. Reconciliations are required to provide different types of information about the insurance service result.

Reinsurance contracts held

The objective of the disclosure requirements in IFRS 17 applies to all contracts within the scope of IFRS 17, including reinsurance contracts held.

Separate reconciliations required by IFRS 17 shall be disclosed for insurance contracts issued and reinsurance contracts held. The reconciliation disclosure requirements shall be adapted to reflect the features of reinsurance contracts held that differ from insurance contracts issued; for example, the generation of expenses or reduction in expenses rather than revenue.

Separate information shall be provided for insurance contracts issued and reinsurance contracts held, explaining when an entity expects to recognise the contractual service margin remaining at the end of a reporting period in profit or loss.

Applying IFRS 17, revenue does not arise from reinsurance contracts held. Accordingly, the requirements for revenue, including the related disclosure requirements, do not apply to reinsurance contracts held.

Review

Takaful: An Islamic insurance instrument

Nico P. Swartz¹* and Pieter Coetzer²

¹Unit for Legal Historical Research, Department of Roman Law, Legal History Comparative Law, Faculty of Law, UFS, Bloemfontein, South Africa.
²Penta Securities, 14 Marlyn Court, Graaff Reinet Street, Dan Pienaar, Bloemfontein, South Africa.

Accepted 9 July, 2010

The Takaful concept evolved from individual common interest during the industrial era of the early 1900’s. Only eighty million of the world’s 2.5 billion poor are currently covered by some form of micro-insurance. Only 3% of the poor in India and China are insured, and only 0.3% of the poor in Africa are insured. In 23 of the 100 poorest countries in the world, there is currently no identified micro-insurance activity. The majority of the population is in the low-income bracket. On top of that, society’s awareness regarding the importance of insurance is rather low. In this paper, it will be stressed that efforts still need to be directed towards educating the public on Islamic insurance to appreciate the protection aspects that insurance can offer. Conventional insurance involves the elements of uncertainty, gambling, and interest, all of which are unacceptable under Islamic law. There existed anxiety among Muslims regarding the inconsistency of conventional banking and insurance in compliance with Islamic laws. This allowed the creation of a new industry, takaful, which offered risk protection and savings products to the world’s 1.6 billion Muslims. One of the greatest challenges facing the takaful industry is the misconception that it is exclusively for Muslims. Takaful products have attracted even non-Muslim communities, despite the obvious religious and cultural differences. Nonetheless, the interest shown by non-Muslims and the support of Muslims is not enough to promote the awareness and the growth of takaful and what it has to offer. It is this lack of awareness that presents one of the greatest challenges to the development and growth of the national and global industry.

Key words: Takaful, insurance, kafal, conventional insurance, gambling, interest.

INTRODUCTION

The article aims to stress the preference for takaful above conventional insurance. The conventional model of insurance will be discussed first, followed by the takaful model. After the discussion of these two models of insurance, the article includes an evaluation or comparison between them. This will enable the reader to make a sound choice between these two forms of insurance.

The fact that takaful insurance is available to both Muslims and non-Muslims is of paramount importance. Takaful has an explicit ethical structure which can be marketed to both Muslims and non-Muslims.

The economic recession is fast becoming a worldwide economic catastrophe. This economic crisis is the worst ever since the Great Depression in the United States in 1930. This crisis creates fresh opportunities for the insurance industry. Amidst the impending global economic crisis, takaful is set to continue concentrating on upward business growth. Although facing economic crisis, the low market penetration in the Shari’ah insurance opportunity creates an attractive opportunity for the insurance players to continue to grow and prosper (Ahmad, 2009).

In Islam, the basic principle of investment is that reward must be accompanied by risk. Takaful businesses cannot therefore invest in products which are debt-based, have a guaranteed or minimum return on the investment, or are based on haram practices (casinos and gambling companies) (Anwar, 2008). Takaful is the Islamic answer to the modern concept of insurance. In Islam, insurance is free from gambling and interest (Saleh, 1986).

Under the takaful model, the ethical nature of this...
instrument is prevalent, while the conventional form of insurance lacks this characteristic. This ethical nature of takaful triggers the hegemony of takaful as an Islamic instrument to be discussed in depth. Takaful, however, is not to be confined to Muslims only. There is a need for takaful globally. The ethical structure of takaful serves as an offshoot of the principles of fairness and the sharing of each other’s burden. This will extend protection to the less fortunate members of the community.

CONVENTIONAL INSURANCE

Conventional insurance can be defined as an agreement whereby an insurer undertakes (in return for the agreed premium) to pay a policyholder an amount of money (or its equivalent) on the occurrence of a specified event. The specified event must have some element of uncertainty about it. The uncertainty may either lie in the fact that although the event is bound to happen in the ordinary course of nature, the timing of its occurrence is uncertain; or the fact that the occurrence of the event depends upon accidental causes, and the event, therefore, may never happen at all (Anwar, 2008).

Modern conventional insurance contracts are unacceptable to Islam. Life insurance involves the use of certain elements that directly contradict the rules of Shari’ah. They are: al-maisir—this is also known as gambling; gharar—also known as uncertainty; and riba—known as “interest”, and can be defined as making money on money. Most conventional insurers invest in interest-bearing assets. Takaful is restricted to an interest-free system. A takaful entity must ensure that both its policyholder and shareholder funds are invested in assets which do not have riba and that any bank with which the takaful entity has dealings should not be involved in the practice of riba (Anwar, 2008).

Kahn describes the difference between takaful and the conventional Western model of insurance graphically as shown in Figure 1. In Figure 1, Khan (2008) describes the difference between takaful and the conventional western model graphically.

The fundamental principle of the Islamic economic system is an equitable distribution of wealth. Takaful is a system where people are encouraged to contribute money for mutual help in times of need. The Islamic economic system combats the accumulation of wealth and its concentration in the hands of a small minority. The Islamic law of inheritance provides for the shifting and distribution of wealth. It divides the estate of the deceased over a wide range of beneficiaries, without benefiting a single heir to the exclusion of all others. The nominee in a family takaful scheme is only a trustee and the policy money needs to be distributed to all the heirs (Ali, 1954).

With the takaful scheme, financial responsibilities are shared to assist each other. It provides mutual financial aid and assistance to those who are members of the takaful scheme. It has its origin in the concept of collective sharing of an individual’s loss.

Takaful is being practiced now as an alternative to the conventional insurance system. This is an Islamic way of mutual assistance to deal with uncertainties of life.
it from conventional insurance. If one were to adulterate this spirit underpinning takaful and treat it as a pure

ORIGIN OF TAKAFUL

The concept of takaful, or Islamic insurance, has been familiar for centuries and was practiced by the Muhajirin of Mecca (http://en.wikipedia.org/wiki/Muhajirun) and the Ansar of Medina (http://en.wikipedia.org/wiki/Ansar), following the Hijra of the Prophet Muhammad over 1400 years ago (Anwar, 2008).

Takaful derived from the 'aqilah and diyah systems, whereby people of a given tribe would come to the financial rescue of one of its members should he face an unexpected liability, such as paying for blood money (diyah) (Manjoo, 2007).

MEANING OF TAKAFUL

Takaful is an Arabic word stemming from the verb “kafal”, which means to take care of one another’s needs or “guaranteeing each other” (Stagg-Macey, 2007). According to this scheme, the members or participants in a group jointly agree to guarantee themselves against loss or damage. The entire group would assist the incumbent person to indemnify his loss and to provide financial help. Takaful is a legally binding agreement between all the participants of the scheme to pay any of its members who suffer a loss as specified in the takaful policy document. According to Catherine it is an Islamic system of mutual insurance built around the concept of donation (Stagg-Macey, 2007). The takaful scheme has evolved from the teachings of Islam, on the basis of the Qur’an and the Sunnah. The Holy Qur’an says:

“Help ye one another in righteousness and piety, but help ye not one another in sin and rancour (Ali, 1954, 2008) (Holy Qur’an).”

Takaful literally means “mutual guarantee” or “guaranteeing each other” (Anwar, 2008). Under takaful, resources are pooled for events/losses that individually none of the members of the pool could afford. For example, a group of people collectively use their combined money to pay for events and large expenses such as births or marriages, or if a financial loss occurs to a member of the group. It is a form of mutual insurance and is not dissimilar to the mutual cooperative schemes that exist in Europe and the United States (Anwar, 2008).

Takaful is based on the concept of mutual cooperation, where the insured is also the insurer and therefore shares in the profit or loss of the institution to which they are paying (the contribution) (Anwar, 2008). Takaful exists primarily to spread a risk and to alleviate a financial loss suffered by somebody. Unfortunately, in our contemporary commercial ethos this benevolence has become meaningless. The elements of philanthropy and benevolence should be reflected in takaful to differentiate pure regulated and standardised commercial venture, the Shari'ah spirit may be dishonoured (Manjoo, 2007).

There must be cooperative principles in takaful, but there need not necessarily be Islamic principles in conventional mutual or cooperative insurance (Stagg-Macey, 2007).

For any legal system to survive, especially in an era of globalisation and universalism, one should allow takaful to evolve. This proves the versatility of Islamic law.

EVOLVEMENT OR DEVELOPMENT OF TAKAFUL

In modern-day contexts, the first takaful company - the Islamic Insurance Company of Sudan - was founded in Sudan by the Faisal Islamic Bank in January, 1979 (Anwar, 2008). The Bank’s Shari’ah Supervisory Board approved this endeavour, and in January 1979, the Islamic Insurance Company was established as a public company (under the Companies Act, 1925). In Malaysia, the Islamic Insurance Company was established as a private limited company. The Malaysian government took steps to form a special body known as a “Task Force” on the establishment of Islamic insurance in Malaysia. In its report to the government, the task force suggested that an Islamic insurance company should be established in Malaysia. The Malaysian government then promulgated legislation known as the Takaful Act, 1984, which regulates the Islamic insurance (takaful) of Malaysia (Ali, 2008).

In 1985, the Council of Islamic Scholars in Mecca approved takaful as a Shari’ah-approved alternative to the conventional insurance system. This led to mutual takaful companies being established in different Muslim countries, including Dubai, Bahrain, and Malaysia (Anwar, 2008).

In the Middle East, takaful has developed in Saudi Arabia, Bahrain, Iran, and Qatar, with new operations recently opening in Egypt, the United Arab Emirates, and Kuwait. Steps have also been taken in Europe and the US to establish similar companies. There are no doubt that there are tremendous opportunities for takaful in those Western countries harbouring large Muslim communities. As such, the potential for takaful is enormous.

Currently, Malaysia has the most mature takaful businesses operating alongside conventional banking and insurers (Anwar, 2008).

Modus operandi of takaful

Contributions are made into the risk pool. From this pool, direct and indirect expenses and claims are paid. If there is a surplus, it is shared amongst the participants. Deficits are also made up with additional contributions from participants or with an interest-free loan from the operator.
Takaful generally means joint guarantee. It is an understanding among a group of people who agree to reciprocally guarantee each other financially should any event occur. The basic objective of a takaful contract is to pay from a common fund, which is set up by the participants of the scheme (Ali 2008).

The operation of takaful practices is supervised by an independent body called the Shari’ah Supervisory Board or Council. The establishment of a Shari’ah Supervisory Board is a prerequisite for the commencement of the takaful operation (Ali 2008).

Takaful has emerged as a profit-sharing business venture between the Operator and the individual members of a group of participants who desire to reciprocally guarantee each other against certain loss or damage that may be inflicted. Takaful contracts are based on the principles of mudarabah (limited partnerships), which means profit and loss sharing. Any surplus or deficit of the takaful operation has to be shared by the participants, or the members themselves. It means that when a takaful scheme is operated on a commercial basis, the surplus has to be shared between the operator and the participants in accordance with the principles of mudarabah. The concept of tabarru (donation) is also incorporated in a takaful life scheme. This means a participant will agree to relinquish a certain amount of takaful contributions to fulfill his obligation of mutual help and joint guarantee, should any of the fellow participants suffer a loss. (Ali 2008).

**Advantages of takaful**

Under takaful the up-front costs are minimized. Business can be transacted immediately. In this way, risk is capped and costs become predictable, whereas under the conventional system, the operator has to invest in software licences, hardware, and expensive IT skills. He may have to wait and hope for a number of years while the system is prepared for use. Additional advantages of takaful are the transparent charging of fees and commissions and how these features would assist a Shari’ah Board to decide if a takaful scheme is really operating in a fair, Shari’ah-compliant way in handling deductions from its participants’ contributions. The ability to hold a separate tabarru fund for each class or sub-class of business and the inherent ability to manage risk in real time is regarded as a big advantage (Ferguson, 2008).

The principles of fairness and sharing each other’s burden will undoubtedly extend protection to the less fortunate members of the community. In the takaful model, surpluses can be use for zakat and funds can be channelled into projects which are for the common good, such as a new school or hospital. Based on the principles of fairness, transparency, simplicity and sharing the burden, takaful appeals to the very greatness of the Human Spirit (Ferguson, 2008). On the basis of this ethical dimension, takaful will succeed, because it is bound to succeed (Ferguson, 2008). The takaful business has an explicit ethical structure which can be marketed to both Muslims and non-Muslims. The dramatic rise in the demand for takaful insurance can be attributed to this ethical nature of the product.

Takaful practices are free from the elements of riba and other prohibited elements and are evolved around the elements of mudarabah, tabarru, and other Shari’ah-justified elements. Conventional insurance may involve riba and some other elements which may not be justified by Shari’ah principles (Anwar, 2008). Although both conventional and takaful businesses generate profits for the shareholders, in takaful business the expenses paid to the shareholders are explicitly transparent - in conventional insurance this is not necessarily the case (Anwar, 2008).

**Uses of takaful**

Typical uses of takaful are insuring property, vehicles, goods, valuables, health, accidents and life (Divanna, 2009). Takaful insurance is offered for a wide range of business and personal activities, such as engineering/construction, motor vehicle, property, marine general accident, liability, personal (mortgage, acci-care, credit shield, critical care and comprehensive care), and medical (Divanna, 2009).

**Hitches/bottlenecks in takaful operations**

Takaful products reveal themselves in emerging markets, and as such, they face challenges such as immature banking infrastructure and poor communications infrastructure. On top of this, there is little infrastructure for the new business. Many of the challenges facing takaful operators are strategic as this formative market tries to establish itself. Skills and resources can be borrowed from conventional insurance markets (Stagg-Macey, 2007).

As takaful originates from an Islamic concept, one of the greatest challenges facing the takaful industry is the misconception that it is exclusively for Muslims (Divanna, 2009). For example, in multi-racial Malaysia, takaful products have attracted even the non-Muslim communities, despite the obvious religious and cultural differences. Nonetheless, the interest shown by non-Muslims and the support of Muslims is not enough to promote the awareness and the growth of takaful and what it has to offer. It is this lack of awareness that presents one of the greatest challenges to the development and growth of the national and global industry (Ahmad, 2007).

Another stumbling block that has to be overcome is that the financial strength, stability, and standards of
conventional insurers are established and known. These conventional insurers have been in the industry for many years and their service levels are more obvious than those of *takaful* operators. To overcome this problem a wider range of *takaful* products must be offered as an alternative to those offered in the conventional market. The needs of the lower income groups must also be addressed. *Micro-takaful*, a concept of providing affordable cover to the poor, comes to mind (Ahmad, 2007).

**End purpose of *takaful***

Modern *takaful* practice is similar to insurance in practice whereby the contribution amount is calculated and is fixed for a standard normal person at a certain age for a certain amount of benefit. Through participation in *takaful* schemes, participants are given the chance to assist one another. The *takaful* operator is required to accumulate as much *tabarru* funds as possible to help those in need (Daud, 2009).

When somebody enters into a *takaful* scheme, he is not supposed to have any intention of making money. His intention should be to share his wealth via contributing money or giving his money as *tabarru* towards a fund that is used to help somebody else who requires assistance. He should look beyond worldly rewards in the knowledge that when his time comes to face death, the *takaful* operator who manages the fund shall also ease the burden of his family in the same way as he acted towards others in similar circumstances. The goal is to please God and achieve prosperity in this life and the hereafter (Daud, 2009).

Conventional insurers make use of uncertainty and interest in their business practice. *Takaful* is viewed by Islamic scholars as the acceptable alternative - being guided by *Shari’ah* principles. The social relationships between the scheme members are also significant. Islam promotes cooperation and sharing (Willis, 2007).

**ISLAMIC BANKING AND ISLAMIC INSURANCE***

Insurance in modern trade and commerce provides safety for the people as security against accidents and calamities. Likewise, modern trade and commerce cannot be conceived without involvement of insurance and banking. The conventional systems of insurance and banking, which are based on interest, cannot be adopted by Muslims as a *Shari’ah*-compatible system. There is an intrinsic relationship between Islamic banking and Islamic insurance. The progress of Islamic insurance depends on a healthy growth of Islamic banking.

Islamic banks have already attained considerable success in the banking sector. It is only the beginning of *takaful* and it is likely to flourish in the insurance sector. To attain the desired level by both the Islamic bank and Islamic insurance, a strong relationship needs to be built up between the Islamic bank and Islamic insurance throughout the world (Ali, 11).

Banking and insurance without interest is feasible, viable, competitive, and sustainable in the face of competition from the conventional interest-based system.

The current century is going to be the century of Islamic banking and insurance for the benefit of the people at large, coupled with equity and justice for all. *Takaful*, like Islamic banking, has become a viable reality. *Takaful* is a financially viable and competitive alternative insurance for Muslim countries. Islamic banking cannot be fully *Shari’ah*-based unless there are *takafuls* to take their insurance business (Ali, 12).

Customers now have the choice between typical as well as Islamic insurance products. Similarity of functions between the insurance and *takaful* products cannot be denied and should be expected, given that the concept of mutually helping each other, which is found in insurance, is also a concept applauded by Islam. However, from the conceptual and operational perspective, many differences were noted between *takaful* and insurance, due mainly to elements found in an insurance contract which are prohibited in any Islamic transactions, such as interest (*riba*), uncertainty (*gharar*), and gaming (*maysir*). Hence, *takaful* products are designed to function as any typical insurance product, but operated differently, to avoid the prohibitive elements.

**TAKAFUL AND THE GLOBAL MARKET***

*Takaful* is the fastest-growing area of the world insurance market. It is growing at 20 to 25% *per annum*, compared to the world average growth of conventional insurance at 5 to 5% *per annum*. The validity of this growth was made possible in the demand and the prospects of potential rewards both for the customers and entrepreneurs of Islamic insurance. In a market place, the attraction of *takaful* business may be ascribed to its connection with the Islamic *Shari’ah* as well as its being a better and more just system. This aspect should be attractive to everyone, irrespective of any religious basis upon which the system stands. *Takaful* business has an explicit ethical structure which can be marketed to both Muslims and non-Muslims. The dramatic rise in the demand for *takaful* insurance is due to this ethical nature of the product. It bears stressing once more, as has been done repeatedly throughout these pages, that on the basis of its ethical foundation, *takaful* ought to be attractive to both Muslims and non-Muslims. The *takaful* industry is, however, small in comparison to its conventional insurance counterpart. This market, therefore, needs to gain worldwide brand recognition. This is what this paper aims to do.
The main difference between takaful and conventional insurance

The customers (policyholders) of the takaful business agree to pool their contributions and share the liability of each policyholder. So if one policyholder has to pay a claim, it is paid out of the combined pool of the policyholder’s contributions. This eliminates the principle of gharar (uncertainty) which is not allowed within Islam (Anwar, 2008).

As with mutual insurance, the policyholders share in the profit and loss of the takaful business - that is, the policyholders all share the insurance risk. They do not give the risk to the takaful company (as it occurs in a conventional shareholder insurance company). Consequently, if at the end of a financial year, the takaful business makes a surplus, this is shared between the takaful policyholders (Anwar, 2008).

The assets of the takaful business have to be invested in Shari’ah-compliant assets. For example, investments cannot be made in gambling institutions, businesses that make alcohol, businesses that sell weapons or assets that pay interest (riba) (Anwar, 2008).

The operators of the business are paid explicit fees for setting up and running the company on behalf of the policyholder. These fees should cover all the setting up costs, running costs and profit-loading of the shareholders, and are the only way that the shareholders are remunerated. After the fees are deducted, any surplus arising from the takaful business is shared amongst the policyholders only. These explicit fees are in the takaful contract, which each policyholder signs with the takaful company, and are fully transparent (Anwar, 2008).

The structure of takaful companies on profit basis is totally different from conventional commercial insurers. The central idea for all Islamic insurance models is the segregation between participants and shareholders’ funds as the company role is only to manage participants’ funds on their behalf. Any takaful company is usually called a “takaful operator” instead of an insurer. For the Islamic model, contributions (premiums) should be paid on donation (tabarru) in order to remove the element of gharar from the takaful contract. These two principles are considered essential elements from the Shari’ah point of view, and all Islamic models have to comply with these principles (Tolefat, 2006).

Takaful practices are free from the elements of riba and other prohibited elements and are evolved around the elements of mudarabah, tabarru, and other Shari’ah-justified elements. Conventional insurance may involve riba and some other elements, which may not be justified by Shari’ah principles. In Takaful, the paid premium is treated as both donation (tabarru) and saving (mudarabah). In the conventional system, the paid premiums create an obligation against the insurer on a sale and purchase relation. The underwriting profit in Takaful is distributed to the policyholders. The shareholders’ profit is generated from the return in the investments of the Shareholders capital and expenses paid to the shareholder by the policyholders for (i) managing the company on behalf of the policyholders, and (ii) managing the shareholders’ investment funds on behalf of the policyholders. In the conventional scheme, the policyholders do not get any share of the underwriting profit (except in mutual companies); shareholders’ profit is generated from the company’s underwriting profit plus any investment returns. Under takaful, the policyholder’s funds belong to the policyholders on collective basis and are managed by the shareholders. Under the conventional scheme, all funds belong to the company, though separation of assets may be maintained between shareholders and policyholders for specific insurances (for example, with profits) (Anwar, 2008).

CONCLUSION

One of the greatest challenges - the misconception that takaful is for Muslims only - has been settled in this paper. Due to its explicit ethical structure, takaful can be marketed for both Muslims and non-Muslims. In multi-racial Malaysia, for example, takaful products have attracted even the non-Muslim communities. The belief that takaful is only for Muslims has hopefully been refuted. This is, however, not enough to cultivate a culture of awareness for takaful products. Although takaful products are faced with challenges such as immature banking infrastructure, awareness can be cultivated by offering a wider range of takaful products as an alternative to those offered in the conventional market. The strength of takaful products to announce their awareness lies in its ethical structure. The ethical structure of takaful serves as an offshoot of the principles of fairness and the sharing of each other’s burden. This will extend protection to the less fortunate members of the community. On the basis of this common humanity, takaful products stand a chance to be accepted by both Muslims and non-Muslims, despite the obvious religious and cultural differences. It seems probable that takaful companies will attract new clients from the existing conventional insurance franchises. Takaful is being practiced now as an alternative to the conventional insurance system.

REFERENCES

The Geneva Association

The Geneva Association is the leading international insurance think tank for strategically important insurance and risk management issues.

The Geneva Association identifies fundamental trends and strategic issues where insurance plays a substantial role or which influence the insurance sector. Through the development of research programmes, regular publications and the organisation of international meetings, The Geneva Association serves as a catalyst for progress in the understanding of risk and insurance matters and acts as an information creator and disseminator. It is the leading voice of the largest insurance groups worldwide in the dialogue with international institutions. In parallel, it advances—in economic and cultural terms—the development and application of risk management and the understanding of uncertainty in the modern economy.

The Geneva Association membership comprises a statutory maximum of 90 chief executive officers (CEOs) from the world’s top insurance and reinsurance companies. It organises international expert networks and manages discussion platforms for senior insurance executives and specialists as well as policymakers, regulators and multilateral organisations.

Established in 1973, The Geneva Association, officially the ‘International Association for the Study of Insurance Economics’, has offices in Zurich, Switzerland and is a non-profit organisation funded by its Members.
Modernising Insurance Solvency Regimes—Key Features of Selected Markets

1. Foreword

The primary goal of any insurance solvency regime is to secure the interests of policyholders. One of the key elements to this end is the requirement for insurers to hold capital in order to be able to honour all future payouts to policyholders, also in case that unexpected claim events occur.

Historically, insurance solvency regimes have been specific to local jurisdictions. However, alongside the internationalisation and integration of economies and financial services, including the insurance industry, the marketplace is becoming increasingly global. This raises the issue of how to effectively regulate and supervise insurance activities at local, regional and global levels.

Also, advances in product development, technology and risk management techniques over the latest decades put pressure on regulators to develop solvency regimes to embrace new risks, new products and even supervisory skills.

The International Association of Insurance Supervisors (IAIS) is currently developing its global Insurance Capital Standard (ICS) as part of Its Common Framework for the Supervision of Internationally Active Insurance Groups (ComFrame). This report aims to shed light on key features of solvency regimes in selected jurisdictions and compares new and emerging regimes with more established ones.

The report also provides an overview of commonalities and differences—based on a structured questionnaire—across regimes and looks, amongst others, at the way assets and liabilities are valued, how regulatory capital requirements are set, whether or not internal models are allowed, and criteria for assessing capital resources, etc.

Our study demonstrates that there is much common ground with regard to the main objectives and key elements of existing and developing solvency regimes. It is, however, clear that these common elements are interpreted and applied in different ways. The IAIS will have to take into account these differences as they strive towards the goal to introduce the ICS.
2. Introduction
Insurance regulatory and supervisory regimes aim at the protection of policyholders and supporting financial stability. The regulatory criteria and requirements set for different markets by the responsible regulatory authorities in pursuit of these objectives are similar in structure—but not identical.

On 1 July 2012, the International Association of Insurance Supervisors (IAIS) presented a comprehensive version of the envisaged common framework (ComFrame). ComFrame is a set of international supervisory requirements focusing on the effective group-wide supervision of internationally active insurance groups (IAIGs). As a component of ComFrame, the IAIS is developing a risk-based global insurance capital standard (ICS), on which a consultation paper was published in October 2013, followed by field testing and additional consultation phases. A second consultation paper was released in July 2016 with a consultation period of three months, i.e. until mid-October.

Confidential reporting of results based on ICS Version 1.0 is scheduled to begin in 2017. The IAIS is targeting the adoption of ComFrame, including ICS Version 2.0, by the end of this decade.

Like other global standard setting bodies, the IAIS does not have legal authority to prescribe or enforce its standards, including the ICS, upon any jurisdiction or firm.

The current discussion on the ICS encouraged The Geneva Association to prepare a comparative study of insurance solvency regimes—most of them recently modernized—along selected element characteristics which are deemed to form essential features of insurance solvency regimes. Based on a questionnaire, The Geneva Association conducted a survey with contributions from eleven insurance groups and eight supervisory bodies with a focus on the following states/unions of states: Australia, Brazil, Canada, China, the European Union, Japan, Mexico, Singapore, South Africa, Switzerland and the United States.

The study does not benchmark the developing ICS against the elements chosen for review of the solvency regimes in the above noted jurisdictions because at this early stage of development of the ICS still too many options are being explored through field testing and consultation. The Geneva Association does not through this study aim to take positions on the preferred approach for the ICS. This said, The Geneva Association is sustaining its engagement in the discussion and consultation on the ICS in order to promote an outcome which will establish comparable results across jurisdictions, will respect the need for a level playing field, will not create unintended consequences for insurance markets and consumers nor place unnecessary burdens on the insurance industry.

Hence, the main purpose of this study is to provide an overview of current practices, approaches and methods, focusing on selected elements such as valuation principles, risk sensitivity, risk-based capital and internal models. This study, limited to the selected countries and elements, gives insights and information on the regulatory regime in several countries that have already adopted a risk-based solvency capital approach or are in the process of doing so. It helps to better understand the issues at stake in the current ICS discussion at the IAIS, and thus contributes to its development as well as to the relevant debate.
3. Key Findings
Regulatory capital requirements in the countries concerned are risk-based or developing into being more risk-based over time. Being risk-based means that the solvency regimes aim to reflect all risks with the potential to affect the balance sheet of the insurer. Specific risks such as strategic and reputational risks are generally not accounted for in the capital calculation. As a general conclusion, the regimes examined are characterised by a strengthening over time of the degree of risk sensitivity in regulatory capital requirements.

Other findings are summarised as follows:

• **Assets** are valued in many regimes according to principles which are compatible with International Financial Reporting Standards (IFRS)/Generally Accepted Accounting Principles (GAAP) or according to local statutory accounting rules so prescribed.1 Particular adjustments for intangible assets, goodwill and deferred tax for solvency capital calculation purposes are required in some countries.

• **Liability valuation** is heterogeneous across jurisdictions with regards to, for example, underlying assumptions, applied rules and adequacy tests as well as whether valuation reflects the degree of illiquidity of the liabilities. Valuation in many jurisdictions is based on cash flow projections, discounted by a risk-free rate, with or without an adjustment for credit spread/liability illiquidity. Further, a margin over current estimate is, in many cases, added to the current estimate, whilst explicit countercyclical elements that reflect the degree of illiquidity of the liabilities are rarely considered. Other jurisdictions prescribe conservatism over and above expected obligations and subject companies to annual reserve adequacy assessments.

• **Capital requirements** are in most cases, but not always, set at a predetermined confidence level. It is not common to take account of future management actions in determining the solvency requirements. Capital requirements are specified at ‘solo entity level’, i.e. for individual insurance companies. Capital requirements at group level (for all entities belonging to a group) do not exist in all the countries examined.

• In general, insurance solvency regimes contain provisions for a ‘ladder of intervention’ approach that provides the relevant supervisor with the requisite supervisory tools to intervene in different degrees of intensity connected to the solvency situation of the supervised company/entity and remediate deficiencies as necessary. In some instances, intervention triggers may also be part of the regime. Should intervention be necessary the supervisor can adapt the tools to align with the degree of the severity of the problem. This allows the company to anticipate supervisory actions and can contribute to an orderly means to address the issues raised by the supervisor.

• The use of **internal models** as part of the regulatory capital requirement calculation is subject to specific regulatory criteria and can be applied only upon supervisory approval. The actual use of and reliance on full or partial internal models is high for certain businesses, as in the case of reinsurance, or for certain jurisdictions, as in the case of Switzerland, but on average it is more limited.

• The quality of **capital resources** is assessed based upon specific criteria, applying a subdivision into two or three tiers. The capital classification is generally based on loss absorbency, where Tier 1 is the most and Tier 3 the least loss-absorbent.

• **Qualitative requirements** are imposed in all regimes, mostly regarding governance (especially risk management and internal control).

• An Own Risk and Solvency Assessment (ORSA) is imposed in a large number of the countries examined. Where it is not required yet, the introduction of an ORSA-type requirement is planned.

---

1 The U.S. uses statutory accounting principles (SAP).
4. Choice of Jurisdictions and Methodology
This study represents an analysis of selected elements of solvency regimes from countries representing various geographical areas. The countries were chosen to obtain a broad, geographically representative sampling of countries that have already adopted a risk-based solvency capital approach or are in the process of doing so. They include Australia, Brazil, Canada, China, the European Union, Japan, Mexico, Singapore, South Africa, Switzerland and the United States. The elements were chosen based on the advice of industry and regulatory experts with the aim of supporting the study’s main focus, that is, to look at key issues of solvency regimes which are being modernised in a number of emerging markets.

The Geneva Association developed a questionnaire (see Annex 2: Survey Questionnaire) addressed to one company representative and one supervisory representative in each jurisdiction covered by the study. The questionnaire addressed the following areas: valuation principles, risk sensitivity, calibration, qualitative requirements, group issues, internal models, multi-layer supervisory systems and qualifying capital. The questions asked are relatively broad, aimed at making meaningful, general comparisons possible. Hence, this study does not aim to cover all details of these selected elements, and the comparisons made must be seen in this light.

Unless explicitly stated, the findings in this study are based solely on the replies obtained to the questionnaire developed by The Geneva Association, in certain cases further adapted on the basis of contacts taken with the respondents to clarify some details. This approach does limit the range of possible analysis and comparisons. As a consequence, the conclusions drawn are in line with the overall objective of the study, which is to spur high-level discussions on the development of the ICS.

---

2 A reply to the questionnaire was not obtained from the Chinese market. Hence, the information provided on the Chinese market in this study has been obtained from other sources.
5. Background Information on the Solvency Regimes Included in the Study
The following general information on the subject of jurisdictions gives a short overview of the existing regimes and planned changes.

EUROPE

- In the European Union (EU), the Solvency II (SII) regime, based on a three-pillar supervisory structure, entered into force on 1 January 2016 for insurance companies in all EU (and European Economic Area) member countries. Insurance companies affected by Solvency II have, however, been preparing for the new regime for many years; hence, the actual introduction of the principles is a process which has been long under way. Whilst the requirements set by the Solvency II Framework Directive had to be transposed into national law, the implementing measures came directly into force. The technical standards prepared by the European Insurance and Occupational Pensions Authority (EIOPA) come into force after their approval by the European Commission. Additional guidelines that are binding on a ‘comply or explain’ basis for national competent authorities without further approval are issued by EIOPA. Although such guidelines are addressed to national competent authorities, they do, in effect, set requirements for insurance companies to follow.

- Solvency II comprises quantitative requirements regarding risk-based capital (Pillar 1), supplemented by qualitative requirements concerning governance and the supervisory review process (Pillar 2) and requirements concerning public disclosure and supervisory reporting (Pillar 3).

- Switzerland’s Financial Market Supervisory Authority (FINMA) is mandated to supervise banks, insurance companies, exchanges, securities dealers, collective investment schemes and their asset managers, and fund management companies. FINMA uses a principles-based, risk-oriented approach to its supervision of insurance companies. The intensity of supervision is proportionate to the risk potential of an insurance company. The Swiss Solvency Test (SST) has been developed since 2003, and the legislation entered into force in 2006 with a transitional period of five years. The SST is a risk-based system relying on a market-consistent total balance sheet. Since 2007/2008, insurance companies and groups need to submit a comprehensive SST report to FINMA. Since 2011, SST can be used by FINMA directly to enforce supervisory action based on a ladder of intervention. In 2015, the legal basis for the SST was strengthened and revised. The European Union (Parliament, Commission and Council) have classified SST as fully equivalent to Solvency II. The SST is the only regulatory system that has been granted equivalency from the beginning of Solvency II.

NORTH AMERICA (United States and Canada)

- In the United States (U.S.), the National Association of Insurance Commissioners (NAIC) is the national standard-setting organisation created and governed by the chief insurance regulators from the 50 states, the District of Columbia, and five U.S. territories. It coordinates the work of the state insurance regulators that are responsible for insurance supervision, provides regulatory support to state insurance departments, and coordinates changes to insurance regulatory requirements. Over the past years, the NAIC has, as part of the Solvency Modernization Initiative (SMI) introduced reforms related to group supervision, corporate governance, enterprise risk management, liability valuation for life and annuity products (principle-based reserving) and reinsurance. In addition, as a result of the Dodd–Frank Act, the Federal Reserve has obtained supervisory powers concerning insurers that have been designated as systemically important.

- Canada’s Office of the Superintendent of Financial Institutions (OSFI) develops the solvency requirements for federally registered Canadian insurance companies. In recent years, the guideline on risk management was updated, requiring an enterprise-wide framework and introducing an ORSA requirement in 2014.

LATIN AMERICA (Brazil, Mexico)

- SUSEP (Superintendência de Seguros Privados—National Regulatory Agency for Private Insurance) is responsible for the supervision of all insurance and reinsurance undertakings in Brazil (excluding health insurance) and is working on the development of a risk-based solvency regime to be fully implemented by the end of 2017.

- In Mexico, a new regulatory framework has been developed by the Mexican regulator, Comisión Nacional

---

3 For an overview, see Ernst & Young (2014).
4 The ANS (Agência Nacional de Saúde Suplementar) is responsible for health insurance.
BACKGROUND INFORMATION ON THE SOLVENCY REGIMES INCLUDED IN THE STUDY

de Seguros y Fianzas (CNSF) in cooperation with the Mexican association of insurance companies, aiming at a more sophisticated risk-based capital approach than is currently the case. Approved by the Mexican Congress in April 2013, the regulation with certain quantitative and disclosure requirements will become effective in 2016.

ASIA-PACIFIC (Australia, China, Japan, Singapore)

- In Australia, the Australian Prudential Regulation Authority (APRA) is the supervisory authority in charge of prudential regulation of financial institutions. In January 2013, APRA updated its capital adequacy requirements and implemented the Life and General Insurance Capital Standards (LAGIC), a risk-based solvency capital regime following a three-pillar approach.\(^5\)

- In 2012, The China Insurance Regulatory Commission (CIRC) began an initiative to modernise its solvency requirements and built the so-called China Risk Oriented Solvency System (C-ROSS). C-ROSS is a risk-based solvency regime following a three-pillar approach.\(^6\)

- The regulator in Japan, the Financial Services Agency (FSA), announced an updated financial monitoring policy for financial institutions in 2014. The policy comprises requirements for improving risk management, policyholder protection, claims payment and governance in insurance companies. Further developments of the regulatory framework focus on supervision, capital adequacy and the introduction of an economic value-based solvency regime.

- In Singapore, the RBC framework for insurers was introduced in 2004 by the supervisor, the Monetary Authority of Singapore (MAS). Supported by an industry consultation process in 2012, MAS reviewed the framework and, in 2014, issued details of the new risk based capital regulatory calculations called RBC 2. The final industry consultation is expected for Q2 2016 with potential implementation in 2019.

AFRICA (South Africa)

The South African Reserve Bank (SARB) has the responsibility for the prudential regulation of banks and the Financial Services Board (FSB) for the prudential regulation of insurers. In future, post the enactment of the Financial Sector Regulation Bill, the Prudential Authority, under the auspices of the SARB, will be responsible for the prudential regulation of both banks and insurers.

For the insurance industry, the major change in regulation comes with the implementation of the Solvency Assessment and Management (SAM) framework as of 2017. SAM is a risk-based solvency regime that follows a three-pillar approach. It will be legally introduced through enactment of the Insurance Bill, expected to take effect in 2017.

\(^6\) The information on China provided in the study was obtained from other sources than via the questionnaire.
6. Solvency Regimes: an Analysis of Selected Elements
6.1. REGIME OVERVIEW

The overview in Table 1 of the regimes covered by this study shows that there are quite a number of similarities between the jurisdictions treated regarding the applied framework, valuation principles and accounting standards, risk-based capital requirements, possible use of internal models, and qualitative requirements such as an ORSA process.

Despite such similarities, however, when applying and interpreting principles, differences in detail appear, as the analysis and comparison of specific elements in the following sections show.

| 7 National competent authorities are responsible for insurance supervision, whilst EIOPA has a coordinating role, drafting technical standards for adoption by the EU Commission and developing guidelines which apply on a comply or explain basis. |
| 8 New standards CPS 220 ‘Risk Management’ and CPS 510 ‘Governance’ became effective on 1 January 2015. |
| 9 SUSEP started implementing the Insurance Regulatory Framework step by step from late 2008. In 2015, the Brazilian regime obtained equivalence to Solvency II, with regard to the solvency assessment. |
| 10 Discounted cash flow. |
| 11 In the EU—under Solvency II—the discounting of liabilities involves a number of explicit measures to address excessive short-term volatility and pro-cyclical behaviour as part of the market-consistent framework. |

¹² Tail value-at-risk (TailVaR or TVaR) is a statistical measure which provides the average of a specified ‘tail’ of the distribution, i.e. the portion of a distribution that lies beyond a certain confidence level. For instance, 95 per cent TVaR is the average of the tail of the distribution that lies beyond the 95th percentile. In comparison to value-at-risk measures, which provide the percentile value of a distribution (i.e. the value of a single point in the distribution), TVaR provides information about the shape of the tail of a distribution beyond the specified percentile. TVaR is also known as conditional tail expectation (CTE) and conditional tail value at risk in certain regimes. Hereafter, we will use the term TVaR for consistency when referring to tail value-at-risk measures in this paper, regardless of the official term used within a given regime.

6.2. REGULATORY CAPITAL REQUIREMENT

EUROPE

- The European Union’s Solvency II framework is designed to be risk-sensitive and is based on a prospective (forward-looking) calculation to ensure accurate and timely intervention by supervisory authorities—the Solvency Capital Requirement (SCR) below which the amount of financial resources should not fall—and a minimum level of security—the minimum capital requirement (MCR) below which the amount of financial resources must not fall. Breaching the MCR ultimately results in withdrawal of the authorisation.

Furthermore, the SCR is risk-based, requiring an amount of solvency capital that reflects all quantifiable risks an insurer is exposed to. It can be calculated using a standard formula, or a full or partial internal model developed by the company and approved by the supervisory authority. Basically, a scenario approach is applied to capture the underlying risks and the links between assets, liabilities and risk mitigation. In some cases and subject to approval by the supervisory authority, the scenarios can be approximated by applying a factor-based approach, however, without reducing the confidence (calibration) level. In addition, not directly quantifiable risks such as reputational, strategic and liquidity risk are covered through a more qualitative assessment under Pillar 2. The SCR is calibrated to a 99.5 per cent confidence level, using a VaR measure over a one-year horizon. Solvency II fully supports reinsurance as a risk mitigation instrument. However, there are currently some practical limitations under the standard formula, due to some design insufficiencies.

- In Switzerland, FINMA uses the Swiss Solvency Test (SST) as a supervisory tool, which adopts a risk-based approach using a total—no off-balance sheet items—and market-consistent balance sheet. The SST is designed to capture all material risk to this market-consistent balance sheet of the insurance company or group. It defines available capital resources and sets the required capital benchmark needed to pursue the business planned for the next 12 months. The required capital benchmark is the 1 per cent TailVaR of the change of capital resources over a one-year horizon at a 99.5 per cent confidence level.

As the SST is based on market-consistent values for all assets and liabilities, the impact of changes in business or investment decisions by insurance companies is quantified at prevailing market conditions. The SST thus fosters conscious investment behaviour over the business and investment cycle by creating transparency on real market prices at any time, which in a market-consistent regime, is understood to disincentivise pro-cyclical (investment) behaviour.

Where necessary, the supervisor has the full, unrestricted set of intervention measures available by being able to induce any transaction at prevailing market conditions.

- Insurance companies need to calculate their required capital benchmark appropriately. If needed, they must use an internal model, especially where the FINMA developed standard models (which are generally stochastic models, not formulas) do not sufficiently capture their risk situation.

Residual operational risk is not required to be quantified in the SST capital requirement; instead, operational risks are required to be mitigated. Despite this, for companies that calculate both, the SST ratio could sometimes be lower than the Solvency II ratio.

As part of the technical provisions, the SST provides for a cost of capital margin over the current estimate (MOCE), i.e. the cost to compensate investors for providing appropriate levels of capital resources during the entire run-off of the insurance liabilities.

NORTH AMERICA

- The United States’ solvency regime uses a risk-based capital (RBC) approach, which is intended to be the basis for determining the point at which regulatory intervention is legally permissible and/or required rather than for internal company risk or capital management.17

- The U.S. RBC formula is primarily factor-based and considers all risks that are quantifiable and material for the industry, i.e. the United States framework typically covers all risks to some degree even if they are not explicitly reflected within the calculation of required capital. RBC is a laddered intervention framework that is designed to identify weakly capitalised companies and provide for increasing degree of supervisory intervention based on the company’s RBC level.

---

17 For details, we refer the reader to the EU-U.S. Dialogue Project (2012, 2014).
• Strategic risk, reputational risk and currency risk, for instance, are not explicitly accounted for in the RBC. The factors of the formula are derived from historical industry-wide data, whilst internal models are used for interest rate and market risk only. In particular, the RBC requirements for variable annuities are based on TailVaR measures calculated using stochastic models (RBC C-3 Phase 2). Currently, the NAIC is developing a model-based catastrophe component for P&C insurance and a factor-based method for more explicitly reflecting operational risk in the RBC formula.

• The U.S. RBC requirement is not calibrated to an overarching confidence level or time horizon, i.e. the formula was not designed to produce a minimum level of aggregate RBC at an explicit level representing a certain statistical outcome. However, the components and factors of RBC, such as asset risk or the catastrophe risk charge, do have a statistical calibration base.

• The Dodd–Frank Act required the United States Federal Reserve Board (FRB) to apply consolidated supervision to firms designated as systemically important by the Financial Stability Oversight Council (FSOC) as well as those holding company systems with a bank or thrift included within their structure. The FRB has initiated the development of its capital regime for these firms.

• In January 2016, the National Association of Insurance Supervisors (NAIC) initiated a work stream to develop a group-wide capital calculation. The NAIC plans to complete this exercise by year end 2016.

• The RBC requirements in Canada reflect the quantifiable key risks an insurance company is exposed to. The calculation of RBC is performed via a scenario-based approach for insurance and interest rate risk, and a factor-based approach for credit, market and operational risks. The regulatory framework does not directly account for the following risks: credit spread risk, liquidity risk, legal risk, strategic risk and reputational risk. Canadian RBC is calibrated over a one-year horizon, using TailVaR as a risk measure at a confidence level of 99 per cent.

LATIN AMERICA

• The solvency capital regime in Brazil stipulates specific capital requirements for underwriting, credit and operational risk. Market risk will be included by the end of 2016. The capital requirements for insurers are calculated by standard models established by the supervisor, applying a factor-based formula that is calibrated at a confidence level of above 95 per cent (one-year horizon). The supervisor monitors and re-performs the capital requirement calculation for every company on a monthly basis by using an internal system that accesses a set of information provided on a monthly basis by the insurers.

• In Mexico, the Insurance and Surety Institutions Law (LISF) introduced a new risk-based solvency regulatory capital framework that is being implemented step by step from 2015. In the following two years, the risk-based capital for an insurer is determined according to the standard formula software provided by the supervisor. Internal models can be applied after the transition period. Liquidity, reputational and strategic risks are not quantified in the standard formula. VaR is the risk measure for calibrating the Mexican RBC at a confidence level of 99.5 per cent over a one-year horizon.

ASIA-PACIFIC

• In Australia, insurers are obliged to hold capital according to the Prudential Capital Requirement (PCR). The PCR comprises a set of capital amounts plus any supervisory adjustments for the individual insurer made by APRA. The regulatory capital requirement is obtained by using APRA’s ‘standard method’ or, alternatively, by an approved internal model. The standard method for calculating the capital requirement uses scenario- and factor-based approaches and takes the following risks into account: insurance, insurance concentration, asset risk (including market and credit risk), asset concentration and operational risk. The regulatory capital requirement is based on a ‘1-in-200-year event’ (corresponding to a one-year 99.5 per cent VaR).

• China’s C-ROSS includes insurance, market and credit risk as the major underlying risks faced by insurers in its quantitative capital requirements. Risks such as operational, reputational and strategic risks are included in Pillar 2. For determining the regulatory capital requirement under Pillar 1, a prescribed standard method is in use, supported by a solvency stress test. For life insurers, a scenario approach is under discussion, whilst for

18 The set of information is called the FIP (Formulário de Informações Periódicas—‘Periodic Information Form’).
non-life insurers, the standard method will be factor-based. The conceptual framework adopted a VaR approach for the calculation of the quantitative capital requirements.\textsuperscript{19} The confidence level will be set based on China’s current circumstances, with reference to an industry quantitative impact study (e.g. 99.5 per cent).

- **Japan** has implemented a risk-based solvency regime. The amount of required risk-based capital is calculated at individual and at group level, using a factor-based approach and a one-year VaR. The requirements are set to specific confidence levels for each risk category: A 95 per cent VaR is applied for general underwriting and investment related risks, 99 per cent for other underwriting risks such as general personal insurance (health, accident), 99.5 per cent for natural catastrophe risk from earthquakes and 98.7 per cent for natural catastrophe risk from flood and storm.

- **Singapore** links its capital requirements to insurance, market, credit and asset concentration risk taking into account asset and liability mismatching. New explicit risk charges for operational risk, credit spread risk and insurance catastrophe risk will be introduced under the revised framework, RBC 2. Currently, a factor-based approach to determine the total capital requirements which correspond to a VaR with a 99.5 per cent confidence level over a one-year period as well as usage of internal models in the future is being discussed. The MAS also requires insurers to perform a series of prescribed stress tests on an annual basis to determine the robustness of their capital positions.

**AFRICA** (South Africa)

- The new South African regime\textsuperscript{20} will capture a number of quantifiable risks including market, life underwriting, non-life underwriting, credit and operational risks, whilst liquidity, reputational and strategic risks may not be considered in the calculations. These latter risks, and any other risk that the insurer believes is relevant, should be taken into consideration as part of the ORSA.

The standard formula to calculate the regulatory capital requirement is based on a modular, primarily scenario-based approach, even though a factor-based approach applies for some risks such as operational risk. The scenario calculations are particularly relevant for those risks where the interaction between assets and liabilities is important, such as all market risks apart from concentration risk, all life underwriting risks and non-life lapse risk. Calibration is done at a 99.5 per cent confidence level over one year, applying a VaR of the basic own funds over a one-year time horizon.

### 6.3. VALUATION

#### EUROPE

- Solvency II prescribes a solvency assessment in the **European Union** according to market-adjusted values and a so-called economic balance sheet. Assets and liabilities are to be reflected at the amount at which they could be exchanged between knowledgeable, willing parties in an arm’s length transaction. The Solvency II implementing measures prescribe a hierarchy of valuation methodologies as follows: quoted market prices in active markets for the same assets or liabilities should be used when obtainable or, if no direct prices are available, quoted market prices in active markets for similar assets and liabilities with adjustments to reflect differences. Otherwise, insurers should use a mark-to-model valuation. In general, intangible assets and goodwill are mostly written off in the economic balance sheet on the asset side.

- Technical provisions should correspond to the amount an insurance or reinsurance undertaking would have to pay if it transferred its contractual rights and obligations immediately to another undertaking (transfer value). Technical provisions are valued on a market-consistent basis, comprising the sum of the best estimate and a margin over current estimate. Updated assumptions must be used. The best estimate represents the probability-weighted average of future cash flows discounted using a risk-free rate term structure.\textsuperscript{21} Furthermore, a matching adjustment or volatility adjustment may, under specific conditions, be added to the discount rate. These so-called countercyclical elements are intended to alleviate problems of excessive short-term volatility under the market-consistent valuation approach.

- In **Switzerland** the SST requires a total balance sheet with market-consistent values for all assets and liabilities without adjustments such as for matching assets or liquidity features of liabilities. To avoid deviations from market consistency, the balance sheet for SST purposes is separate from statutory, local or other GAAP

\textsuperscript{19} Van Hulle (2014).
\textsuperscript{20} which is not law yet but will become law once the Insurance Bill has been promulgated.
or IFRS accounting principles. The valuation principles are the same for life and non-life liabilities; up-to-date assumptions are required to determine contingent cash flows. The cash flows are valued by optimally risk reducing replication, giving rise to a best estimate, and by adding a cost of capital MOCE that covers the cost of holding capital for the residual risk during its entire run-off. Where payouts do not depend on market variables, the value of the replicating portfolio is the risk-free discounted expected cash flow. Therefore the valuation approach seamlessly extends risk-free discounting.

The SST in general only allows risk-free discounting without ‘spread adjustment’. As the only exception to this, FINMA has the option to allow for risk-prone discounting for the existing book of business during a phase of exceptionally low interest rates; new business always needs to be discounted risk free. No risk-prone discounting is currently allowed (even though the Swiss franc yield curve is currently negative up to 24 years).

NORTH AMERICA

- In the United States, regulatory reporting is based on statutory accounting principles (SAP) as defined within the NAICs Accounting Practices and Procedures Manual, and to a lesser extent, state law. The NAICs Accounting Practices and Procedures Manual represents a comprehensive basis of accounting, which utilises a maintenance process that requires the NAIC to adopt, reject or adopt with modification every U.S. GAAP standard as it is completed.

- The largest asset on most U.S. insurer’s balance sheets is its investment in bonds and other fixed-income investments. SAP utilises a valuation of such investments that consider the business model of the insurer. For non-life insurers, investment grade bonds are carried at amortised cost whilst non-investment grade bonds are carried at the lower of amortised cost and fair value. However, all bonds are subject to impairment requirements. For life insurers, only bonds of the lowest quality are carried at the lower of amortised cost and fair value. However, in addition to being subject to impairment requirements, life insurers are also required to establish an asset valuation reserve liability designed to serve as a cushion for potential credit losses.

- Life and health insurance liabilities are valued with significant prudence, according to SAP. The discount rate in SAP formula reserves is intended to represent a prudent estimate of the investment earnings of a typical insurer’s investment portfolio over a long time horizon. Statutory reserves for variable annuities are based on TailVaR measures calculated using stochastic models (Actuarial Guideline XLIII). In addition, life insurance reserves are subject to annual asset adequacy testing requirements, which are typically performed through cash-flow testing of assets and liabilities over the life of the insurance liabilities and may result in the establishment of additional actuarial reserves. Most non-life (property/casualty) liabilities are valued according to best estimates of liabilities and are largely consistent with U.S. GAAP. (For life and health liabilities, statutory reserves differ from U.S. GAAP reserves, and both generally differ from company best estimates.) For non-life insurance, discounting is not used, except for qualifying claims in certain defined lines of business (e.g. workers’ compensation and certain long-term disability policies).

- Canadian GAAP is compatible with IFRS and, therefore, applies the related accounting rules for asset valuation. The Canadian Asset Liability Method (CALM) is used to define actuarial reserves. For calculating the required capital, the liability cash flows are based on best-estimate assumptions without additional margins and discounted by regulatory prescribed rates for interest rate and insurance risk.22

LATIN AMERICA

- In Brazil, the recognition and measurement of financial assets and liabilities generally follows the local GAAP standards, prepared in accordance with IAS 39 (‘Financial Instruments’). The valuation of other types of assets follows local GAAP standards that are in compliance with IFRS. On the liabilities side, companies have to perform the liability adequacy test (LAT), which is based on the concept of best estimate, considering market values, for the technical provisions. The LAT considers realistic assumptions and an interest rates curve released by the regulator, without adding a margin over current estimate or accounting for countercyclical elements.

- The Mexican solvency requirements are based on an economic valuation of the whole balance sheet. In particular, the new 2015 LISF introduces a requirement to use market values for asset valuation purposes. Institutions must classify their investments in the following three categories that are compatible with IFRS: securities to finance the operation, to be held to maturity or available for sale.

---

For liability valuation, the value of the technical provisions must correspond to its market value, i.e. to the amount another insurer would pay if all contractual rights and obligations of the insurance portfolio were transferred. In order to comply with this requirement, institutions must value technical provisions by using best estimate of liabilities methodologies (BEL), plus a margin over current estimate. The BEL must reflect the probability-weighted average of the expected present value of future cash flows, using the relevant risk-free interest rate term structure. Countercyclical elements are considered in the valuation approach.

**ASIA-PACIFIC**

- In Australia, valuation is based on the Australian Accounting Standard AASB1038, adjusted according to the Australian Prudential Rules. On the asset side, intangible assets and goodwill as well as assets in excess of specified asset concentration limits are written off. Further, deferred tax assets are written off unless there are offsetting deferred tax liabilities that could be realised in a close-down scenario.

Liabilities are calculated by discounting the best estimate with the risk-free yield curve that is based on government bonds. Margins for future adverse experiences are explicitly allowed. As an element to counter cyclicality, real interest rate shocks are specified in terms of a relative percentage shock to the risk-free yield curve, and equity shocks are specified in terms of an absolute shock to dividend yields.

- The valuation principles are specified in the section technical principles for Pillar 1 in the conceptual framework of China’s C-ROSS: The principles utilise a consistent measurement for assets and liabilities of non-life and life insurance undertakings, minimising the mismatch between assets and liabilities. The actual risk profiles of assets and liabilities should be fully reflected and be based on accounting information.23

- In Japan, assets and liabilities are measured according to the Japanese GAAP principles with some adjustments for the solvency assessment. For most of the assets, a fair value measurement applies, whilst liabilities for life business are measured based on locked-in assumptions combined with a future cash-flow analysis in order to verify whether accumulating additional reserves in addition to existing technical provisions is required. Liabilities for non-life business are not discounted, except for long-term business. Generally, a current estimate for liability valuation is not used, and the discount rate, where applicable, is a statutory-defined, assumed interest rate based on Japanese government bond yields and a safety factor coefficient.

- Singapore’s valuation rules for assets such as debt securities, equity securities, land and buildings, loans, outstanding premium and agents’ balances, reinsurance deposits and reinsurance recoverables are set out in the Insurance (Valuation and Capital) Regulations 2004. The valuation of other types of assets follows local GAAP standards that are in compliance with IFRS.

The liabilities for both life and non-life businesses are calculated based on the expected cash flows of the underlying policies, with appropriate provision for adverse deviation added to the expected current estimate. Discounting of cash-flow projections is used for life insurance (risk-free rate), whilst for general insurance, no discounting is employed.

As part of the RBC 2 review, it is intended to introduce a matching adjustment concept to reflect the illiquid nature of life liabilities. Such adjustment will be added to the risk-free rates for certain life businesses that meet the eligibility criteria.

**AFRICA (South Africa)**

Market consistency is the overriding principle used for the valuation of assets and liabilities. IFRS builds the accounting basis, explicitly set out in the SAM framework, and is mainly applied to assets and liabilities other than technical provisions.

Liability measurement is performed on a current estimate plus margin over current estimate approach:

- The current estimate is a probability-weighted discounted cash-flow calculation of all cash flows that are expected for the insurance contract, based on the best estimates of the insurer as at the valuation date.

- The margin over current estimate is a cost of capital calculation, based on the present value of the cost of capital that an insurer may need to hold for its non-hedgeable risks.

The applied risk-free discount rate is related to the South African Government Bond discount rate, which is computed

23 The information was obtained at http://www.circ.gov.cn/web/site0/tab4566/info3905736.htm.
by the prudential regulator (FSB) on a monthly basis and published on the FSB website.

6.4. INTERNAL MODELS

The possibility for companies to make use of a full or partial internal model is an important element of a jurisdiction’s solvency framework.

In the European Union, the SCR needs to be calculated appropriately as the VaR of the basic own funds over a one-year time horizon. The EU has developed a standard model that aims to yield appropriate result for the SCR for most insurance companies and conservative results for all other insurance companies. Where the standard model is inappropriate (especially if SCR values are much too high), the SCR must be computed by an internal model. An internal model is developed to overcome the shortcomings of the standard formula. The use of an internal model can be requested by the supervisor and by the insurer. The regulatory use of internal models requires supervisory approval. The approval process for an internal model comprises six tests and standards: use test, documentation standard, profit and loss attribution standard, calibration standard, statistical quality standard and validation standard. Particularly, internal models must fulfil specific and demanding requirements, including documentation and integration of the model in risk management and decision-making processes.

The solvency regimes in Brazil, Mexico, China, Singapore, South Africa and Switzerland follow a similar approach, allowing for the use of full or partial internal models, provided the models are approved by the supervisor. Within this analysis, it is not possible to compare the respective approval requirements in the various jurisdictions in detail. This might be an area of future research. In general, internal models are most relevant for large insurance companies, since the costs of developing, monitoring and getting internal models approved are substantial.

In certain cases where the underlying risks are not well captured by the standard model, the regulator may require the use of internal modelling.

Australia also allows the use of an internal model upon the approval of the supervisor.

In Switzerland, currently, a large segment of the market both in terms of the number of companies and the required capital benchmark uses internal models. FINMA aims to reduce the use of internal models going forward.

In the European Union, a few insurance companies—mainly all material reinsurers and most of the bigger insurance groups—currently have an approved full internal model.

In the United States, an ‘internal model’ is typically understood to be a quantitative requirement that employs a company-specific actuarial cash-flow projection and is contrasted with ‘formula reserves’ and factor-based capital charges, which are uniform for all companies. Thus, internal model application, using prescribed parameters and time horizons, is limited to specific products in the life RBC formula and will be utilised in the catastrophe risk module currently under development for P/C insurers.

For the (limited) cases where partial internal models are allowed for life insurance, these models do not require supervisory approval as regulatory minimum/floor scenarios persist.24 However, the regulators review internal models as part of the ongoing solvency surveillance process. The model-based catastrophe component, on the other hand, would have to come from vendors approved by the supervisor.

Following a similar approach, Canada’s supervisor only recognises internal models for variable annuities and segregated fund guarantees, whilst in Japan, the use of an internal model is allowed only for catastrophe and minimum guarantee risks under specific requirements set by the supervisor.

6.5. QUALITATIVE REQUIREMENTS

EUROPE

• Pillar 2 of the European Solvency II framework sets qualitative requirements:
  • for the system of governance including risk management, the prudent person principle, fit and proper requirements, identification of key people and key functions,
  • for outsourcing activities,
  • for the ORSA as well as for the supervisory review process.

Solvency II requires every insurance company to conduct an ORSA. To this end, the insurer must set up processes which enable it to properly identify and assess the risks in the short and long term.

• In **Switzerland** there are specific corporate governance and risk management requirements as well as public disclosure requirements, and ORSA is in force. The requirements are similar to Solvency II.

**NORTH AMERICA**

• In the **United States**, the NAIC adopted the Corporate Governance Annual Disclosure Model Act in 2014, requiring insurers to disclose their corporate governance framework. The annual disclosure includes policies and practices of the insurer’s board and significant committees, policies and practices of senior management, and oversight of critical risk areas.

ORSA is a new requirement for large insurers and insurance groups from 2015 (collectively the entities required to perform an ORSA make up over 90 per cent of the United States premium volume). The ORSA includes an internal assessment of the risks associated with the insurer’s current and projected future business plan, and an assessment is required of the sufficiency of capital resources to support those risks in both the current and stressed environments. At a minimum, three major components are required: 1) a description of the insurer’s risk management framework, 2) the insurer’s assessment of risk exposure and 3) the group risk capital and prospective solvency assessment.

• The **Canadian** regime comprises an ORSA process which includes reporting forms and frequency requirements and sign-off requirements. A guideline issued in 2014 by the OSFI outlines key elements of the ORSA, such as comprehensive identification and assessment of risks, relating risk to capital, board oversight and senior management responsibility, monitoring and reporting, and internal controls and objective review.

**LATIN AMERICA**

• **Brazil’s** regulator, SUSEP, has defined standards regarding requisites of internal control and governance. The enterprise risk management standard was published in 2015. Additionally, insurers are obliged to provide regular statistical data to SUSEP. SUSEP is currently studying ORSA issues and plans to publish general ORSA guidelines in 2016, to be tested and further reviewed in 2017.

• In **Mexico**, the new regulatory framework also covers qualitative requirements in Pillar 2. In general, the governance requirements include rules concerning control functions, outsourcing and compliance. Furthermore, companies must undertake an ORSA, which is intended to provide a multi-year overview of the company’s risks in an integrated risk management approach, covering all relevant risks of the company.

**ASIA-PACIFIC**

• In **Australia**, insurers have to comply with a range of risk management requirements, comprising a documented risk management framework, a formal risk appetite statement, a reinsurance management strategy and an Internal Capital Adequacy Assessment Process (ICAAP).

An ICAAP Summary Statement must be included as part of the process. This describes and summarises capital assessment and management processes. An ICAAP summary report has to be prepared each year and this includes an assessment of the effectiveness of ICAAP.

• In **China**, the solvency-aligned risk management requirements and assessment (SARMRA) is one of CIRC’s supervisory elements in Pillar 2 that has a strong focus on insurance companies’ own solvency management. To this end, CIRC sets the minimum standards of risk management for insurers and periodically evaluates their governance structure, internal controls, management structure and processes. Additionally, insurance companies’ risk management capability and risk profile are to be periodically assessed.

• In **Japan**, the FSA introduced a formal ORSA process in 2015. Other qualitative requirements are not formalised in the current solvency regime.

**AFRICA** (South Africa)

The Solvency Assessment and Management in **South Africa** also includes board functions and composition, the risk
management system, strategy and policies, the internal control system, control functions and outsourcing.

Additionally, insurers will under SAM be required to undertake a formal ORSA, obliging them to take their own view (which may or may not be different from the regulatory view reflected in the regulatory capital requirement) of their risks, the amount of capital that they need to hold for these risks, and to understand how this will affect their business plans. An ORSA report will also have to be carried out on at least an annual basis.

6.6. QUALIFYING CAPITAL

The requirements as to the quality of capital resources in the European Union’s Solvency II regime are issued both via a subdivision in tiers and eligibility criteria. Three tiers are present, each of them defined by different eligibility criteria. The criteria comprise the capital items’ availability, subordination and duration; the ability to cancel distributions; the conditions on repayment/redemptions, loss absorption, etc. Additionally, Solvency II sets limits to each of the tiers in covering the minimum and regulatory capital requirements, depending on their quality.

In Switzerland qualifying capital resources are based on the excess of the market-consistent value of assets over liabilities, corresponding to Tier 1 ‘core capital’, plus Tier 2 ‘supplementary capital’, e.g. hybrid debt. Eligibility criteria apply to Tier 2 supplementary capital, including supervisory approval requirements and quantitative limits.

A subdivision of capital resources into three tiers is also present in the regimes of Mexico, Singapore and South Africa. The tiers also depend on the loss absorption, availability and seniority of the capital, with slight differences in each regime with regard to the definition of criteria and limits on the extent to which the tiers can be used to cover the capital requirements.

The solvency regimes in Australia, Canada and China subdivide the capital into two tiers. Whilst Tier 1 comprises mainly common equity and additional Tier 1 capital such as shareholders’ funds and retained profits, Tier 2 is made up of subordinated debt. Tier 2 capital has to be approved according to various criteria and its contribution to the solvency capital of an insurer is limited.

In the current Brazilian regime, there is no explicit subdivision into capital tiers. Nevertheless, prudential and liquidity criteria exist for the assets that are used for capital coverage. In addition, it is prescribed that companies must have 20 per cent of risk capital in assets with maximum liquidity.

In the United States regime, the quality of capital resources is controlled via eligibility criteria incorporated in the NAIC Accounting Practices and Procedures Manual and prudence in the balance sheet valuation. A tiering system is not applied.

In Japan, instead of a tiering concept, the ‘core solvency margin’ concept (net assets plus eligible reserves) is used to define an upper limit for inclusion of some secondary capital resources such as subordinated loans.
7. Concluding Remarks
Insurance solvency regimes around the globe are currently undergoing significant changes. Jurisdictions in the North and South American, European and Asia-Pacific regions have reviewed or are reviewing their solvency regimes in order to enhance policyholder protection and financial stability.

Whilst many of the solvency regimes covered by this study have similarities, differences relating to the level of sophistication and application do exist. At a high level, the following basic principles are common amongst most of the regimes:

- All regimes examined follow a risk-based approach for deriving the regulatory capital requirements, aiming to comprehensively account for an insurer’s quantifiable risks as exposed to its business activities.

- Required capital is often set at a confidence level of 99 per cent, or 99.5 per cent of the capital resources over a one-year horizon. Mostly VaR and in some cases TailVaR measures are applied.

- Whilst asset values in the solvency balance sheet of many regimes are often directly derived from IFRS (which applies fair value to most asset types), the valuation of liabilities is heterogeneous in terms of the required methodologies and assumptions, conservatism (if any) in base reserves, margins over current estimates (MOCE) and supplemental adequacy testing prescribed. Qualitative requirements including an ORSA are prescribed in most solvency regimes.

The risk-based global insurance capital standard (ICS), which is currently under development by the IAIS, is likely to bear upon these principles whilst attempting to cope with the challenges of harmonising multi-jurisdictional regulations, specific products jurisdiction or corporate law requirements at a global level.

Although this study demonstrates that there is much common ground with regard to the main elements of existing and developing solvency regimes, it is clear that these common elements are interpreted and/or applied in different ways, taking account of differences in regulatory or supervisory practices. To no one’s surprise, the IAIS will have to take into account these differences as they strive towards their goal for a single ICS substantially the same across jurisdictions.

REGULATOR/SUPERVISORY BODY

ACCOUNTING STANDARDS

- Australian GAAP: IFRS-equivalent accounting standards.
- Standards on general insurance: AASB 4 and AASB 1023.

SOLVENCY REGIME

- 2013: Update on capital adequacy requirements and implementation of the Life and General Insurance Capital Standards (LAGIC).
- Use of a three-pillar supervisory approach.
- Prudential Standards CPS 220 ‘Risk Management’ became effective on 1 January 2015.

SOLVENCY ASSESSMENT

- **Regulatory capital requirement**: According to Prudential Standards GPS 110, an insurer must provide available capital in excess of its Prudential Capital Requirement (PCR). The standard method to calculate PCR accounts for the following risks: insurance, insurance concentration, asset, asset concentration and operational risk.
- **Group regulatory capital requirement**: Regulatory capital requirements are calculated at single entity and at group level.

- **Risk measure and confidence level**: The regulatory capital requirements are set at a 99.5 per cent probability of sufficiency over a 12-month period from the reporting date.
- **Internal model/standard formula**: The calculation of the required capital amount is based on APRA’s ‘Standard Method’ or on an internal model approved by APRA.

VALUATION

- **Assets**: Valuation is based on Australian Accounting Board Standards. For SCR calculation purposes, intangible assets and goodwill as well as assets in excess of specified asset concentration limits are written off.
- **Liabilities**: Valuation is based on the Australian Accounting Standard AASB1038 adjusted according to the Australian prudential rules. The calculation is performed by discounting the best estimate with the risk-free yield curve (based on government bonds). Margins for future adverse experience are explicitly allowed and real interest rate shocks may be applied to the risk-free yield curve.

QUALITATIVE REQUIREMENTS

- CPS 510 ‘Governance’ and CPS 220 ‘Risk Management’ commenced on 1 January 2015.
- An ORSA is performed according to Prudential Standards GPS 110, the so-called Internal Capital Adequacy Assessment Process (ICAAP).
BRAZIL

REGULATOR/SUPERVISORY BODY

- Agência Nacional de Saúde Suplementar (ANS—National Regulatory Agency for Private Health Insurance and Plans): regulates, standardises, controls and inspects the private health insurance and plans sector.

ACCOUNTING STANDARDS

- SUSEP Brazilian GAAP (compliant to IFRS).
- ANS GAAP (major part compliant to IFRS, except IFRS 4).

SOLVENCY REGIME

- Evolvement of the regulatory environment over the last three years.
- Development by SUSEP in collaboration with EIOPA of a standard risk-based solvency framework similar to Solvency II.
- Although Brazil has obtained the equivalence to Solvency II model regarding solvency assessment, some actions are under development, such as improving group supervision and ORSA regulation, which are planned to be implemented from 2017.

SOLVENCY ASSESSMENT

- Regulatory capital requirement: The regulatory capital requirement measures introduced by SUSEP are comparable to Pillar 1 of Solvency II, including market (interest rate risk, equity risk, commodities risk and currency risk by December 2016), liquidity, underwriting, credit and operational risk (with loss-data base requirement for companies above a certain premium level). For ANS, solvency capital is not based on risk, but on factors applied on premiums or losses.
- Group regulatory capital requirement: Regulatory capital requirements are calculated for the single company.
- Risk measure and confidence level: Currently, the solvency requirement is not set at a predetermined confidence level. A factor-based approach is in use.
- Internal model/standard formula: Internal models are allowed to substitute the standard formula. The process of internal model approval is not fully defined by SUSEP. For ANS-regulated insurers, there is no standard, defined risk-based capital formula. Internal models are allowed but applied rarely or not at all. It is planned to set the solvency requirement at a specified confidence level.

VALUATION

- Assets: According to local GAAP and similar to IFRS, accrued or market-consistent valuation is used depending on the type of assets. ‘Mark-to-market’, ‘available for sale’ and ‘held to maturity’ assets are distinguished.
- Liabilities: There are technical provisions that are defined in contracts (private pension plans mathematical provisions), provisions defined by accounting rules (premium reserves) and provisions defined in market consistent adjustments. For the provisions that are not defined with market-consistent adjustments and are below the adequate value, the companies must constitute an additional provision, turning the overall constituted value to a market value approach.

QUALITATIVE REQUIREMENTS

- SUSEP and ANS require specific risk disclosures in financials explanation notes.
- Discussion of a new regulation similar to Solvency II Pillar 2 requirements, including an ORSA by SUSEP.
CANADA

REGULATOR/SUPERVISORY BODY

ACCOUNTING STANDARDS
Canadian GAAP (compliant to IFRS).

SOLVENCY REGIME
• In recent years, updated guidelines on regulatory risk management, requiring an enterprise-wide framework.
• ORSA requirement since 2014.
• Continuous evolvement of regulatory capital requirements.

SOLVENCY ASSESSMENT
• Regulatory capital requirement: The risk-based capital requirements in Canada reflect the quantifiable key risks an insurance company is exposed to. The calculation of RBC is performed using a scenario approach for insurance and interest rate risk, and a factor approach for credit, asset and operational risks. The regulatory framework does not directly account for the following risks: credit spread risk, liquidity risk, legal risk, strategic risk and reputational risk.
• Group regulatory capital requirement: The solvency framework is defined as a consolidated group solvency requirement.
• Risk measure and confidence level: The risk-based capital requirement is calibrated over a one-year horizon, using conditional TailVaR measure at confidence level of 99 per cent.
• Internal model/standard formula: The model is prescribed by the regulator as a standard approach. Internal models are only recognised for variable annuities and segregated fund guarantees.

VALUATION
• Assets: Asset valuation is based on the relevant accounting standards.
• Liabilities: The Canadian Asset Liability Method (CALM) is used to define actuarial reserves. For calculating the required capital, the liability cash flows are based on best-estimate assumptions without additional margins and discounted by regulatory prescribed rates for interest rate and insurance risk.

QUALITATIVE REQUIREMENTS
• An ORSA process is prescribed. It includes reporting requirements with forms and frequency and sign-off requirements.
• A guideline, issued in 2014 by OSFI, outlines key elements of the ORSA, such as comprehensive identification and assessment of risks, relating risk to capital, board oversight and senior management responsibility, monitoring and reporting, internal controls and objective review.
CHINA

REGULATOR/SUPERVISORY BODY

ACCOUNTING STANDARDS

Chinese Accounting Standards for Business Enterprises (ASBE).

SOLVENCY REGIME

- The China Risk Oriented Solvency System (C-ROSS) was introduced in 2016.
- C-ROSS is based on a three-pillar supervisory regime with similarities to Solvency II.
- C-ROSS formally came into force on 1 January 2016

SOLVENCY ASSESSMENT

- **Regulatory capital requirement:** Pillar 1 of C-ROSS links its capital requirements to three types of risks: insurance risk, market risk and credit risk. The capital requirements for these three types of risks are calculated using a prescribed standard method. Further, diversification effects between the risks are included when aggregating the risks.

- **Group regulatory capital requirement:** The details are still developing. In principle, the group aggregated capital requirement considers the capital requirements from group companies and subsidiaries, diversification effects, special considerations due to contagion effects, DSII etc.

- **Risk measure and confidence level:** The conceptual framework adopted a VaR approach for the calculation of the quantitative capital requirements. The confidence level will be set based on China’s current circumstances, with reference to industry quantitative impact study (e.g. 99.5 per cent).

- **Internal model/standard formula:** The standard formula is adopted.

VALUATION

- **Assets/liabilities:** China does currently not follow a market-consistent valuation due to the lack of a sophisticated market.

QUALITATIVE REQUIREMENTS

- The risk management requirements and assessment (SARMRA) is one of CIRC’s supervisory elements in Pillar 2 that has a strong focus on the companies’ own solvency management.

- CIRC sets the minimum standards of risk management for insurers and periodically evaluates their practices, such as governance structure, internal controls, management structure and processes. Additionally, insurance companies’ risk management capability and risk profile is periodically assessed.
EUROPEAN UNION (Solveny II)

REGULATOR/SUPERVISORY BODY

- Insurance undertakings in the European Union are supervised by national competent authorities.
- The European Insurance and Occupational Pensions Authority (EIOPA, https://eiopa.europa.eu) plays an important role in coordinating supervisory rules and practice and in developing a common supervisory approach (single European rule book).

ACCOUNTING STANDARDS

The International Financial Reporting Standards (IFRS) must be applied in the consolidated financial statements of listed insurance undertakings.

SOLVENCY REGIME

- Solvency II introduces a new solvency capital regime based on a three-pillar approach:
  - Pillar 1: Quantitative requirements.
  - Pillar 2: Governance requirements and supervisory review process.
  - Pillar 3: Public disclosure and supervisory reporting.

SOLVENCY ASSESSMENT

- **Regulatory capital requirement**: The Solvency Capital Requirement (SCR) must comprise all quantifiable risk an insurer is exposed to. Risks that are not directly quantifiable, such as reputational or strategic risk, are covered through a more qualitative assessment under Pillar 2. The SCR can either be calculated through a standard formula or a full or partial internal model, developed by the company and approved by the supervisor.
- **Group regulatory capital requirement**: The SCR has to be calculated at single level for all entities part of a group and at group level.
- **Risk measure and confidence level**: SCR is calibrated at a 99.5 per cent level of confidence over a period of one year, using a VaR measure.
- **Internal model/standard formula**: The SCR may be computed by internal models for all or some of the risks. Internal models must fulfill specific and demanding requirements, including documentation and integration of the model in risk management and decision-making processes. Internal models are subject to the regulator’s approval.

VALUATION

- **Assets**: A market-consistent valuation is applied for the assets side, utilising a mark-to-market or mark-to-model approach. In the economic balance sheet, intangible assets and goodwill are not recognised.
- **Liabilities**: Technical provisions are valued on a market-consistent basis, comprising the sum of the best estimate and a margin over current estimate. The best-estimate liability represents the probability-weighted average of future cash flows discounted using a risk-free rate term structure. A matching adjustment or volatility adjustment may be included in the discount rate as a countercyclical element.

QUALITATIVE REQUIREMENTS

The qualitative requirements are set out in Pillar 2 of the framework. They include requirements for the system of governance, risk management, internal control, outsourcing activities, and ORSA as well as on the supervisory review process.
MEXICO

REGULATOR/SUPERVISORY BODY

ACCOUNTING STANDARDS

SOLVENCY REGIME

• Evolvement of the regulatory environment over the last years, aiming at a more sophisticated risk-based capital approach than the actual one.
• The Insurance and Surety Institutions Law (LISF) is inspired by Solvency II.
• The new regulation with certain quantitative and disclosure requirements is planned to become effective by 2016.

SOLVENCY ASSESSMENT

• **Regulatory capital requirement:** The Mexican solvency requirements are based on an economic valuation of the whole balance sheet. The risk-based capital for an insurer is determined according to the standard formula software provided by the regulator. Liquidity, reputational and strategic risks are not quantified in the standard formula.

• **Group regulatory capital requirement:** Regulatory capital requirements are calculated for the single company.

• **Risk measure and confidence level:** VaR is the risk measure for calibrating the regulatory capital requirement at a confidence level of 99.5 per cent over a one-year horizon.

• **Internal model/standard formula:** Internal models could be applied after the transition period.

VALUATION

• **Assets:** LISF introduces a requirement to use market values for asset valuation purposes. Institutions should classify their investments in the following three categories that are compatible with IFRS: securities to finance the operation, to be held to maturity, or available for sale.

• **Liabilities:** The value of the technical provisions should correspond to their market value, i.e. to the amount another insurer would pay if all contractual rights and obligations of the insurance portfolio were transferred. In order to comply with this requirement, institutions should value technical provisions by using best-estimate methodologies (BEL), plus a margin over current estimate. The BEL should reflect the probability-weighted average of the expected present value of future cash flows, using the relevant risk-free interest rate term structure. Countercyclical elements are considered in the valuation approach.

QUALITATIVE REQUIREMENTS

• Requirements for the system of corporate governance deal with the control functions, outsourcing, compliance and reporting.

• An ORSA is prescribed which is intended to provide a multi-year overview of the company’s risks in an integrated risk management approach, covering all relevant risks of the company.
JAPAN

REGULATOR/SUPERVISORY BODY

ACCOUNTING STANDARDS

Japanese GAAP.

SOLVENCY REGIME

- Requirements are set in the Insurance Business Act.
- An updated financial monitoring policy for financial institutions was announced in 2014.
- Further evolvements of the regulatory framework focusing on supervision, capital adequacy and the introduction of an economic value-based solvency regime are ongoing.

SOLVENCY ASSESSMENT

- **Regulatory capital requirement:** Regulatory capital requirement reflect the underlying risks of the insurance company.
- **Group regulatory capital requirement:** Regulatory capital requirements have to be calculated at single-entity and at group level.
- **Risk measure and confidence level:** Generally, VaR is used as a risk measure. The confidence level varies in dependence on the risk category: 95 per cent of VaR for general underwriting and investment related risks, 99 per cent for the third underwriting risks (generally health, accident insurance), 99.5 per cent for natural catastrophe risk from earthquakes and 98.7 per cent for natural catastrophe risk from flood and storm.
- **Internal model/standard formula:** The use of an internal model is allowed only for catastrophe and minimum guarantee risks upon specific requirements set by the supervisor.

VALUATION

- **Assets:** Assets and liabilities are measured according to the Japanese GAAP principles with some adjustments for the solvency assessment. For most of the assets a fair value measurement applies.
- **Liabilities:** Liabilities for life business are measured based on locked-in assumptions combined with a future cash-flow analysis in order to verify if accumulating additional reserves in addition to existing technical provisions is required. Liabilities for non-life business are not based on discounted values, except for long-term business. Generally, a current estimate for liability valuation is not used, and the discount rate, where applicable, is a statutory-defined assumed interest rate based on Japanese government bond yields and a safety factor coefficient.

QUALITATIVE REQUIREMENTS

- Insurers are required to undertake a formal ORSA from 2015.
SINGAPORE

REGULATOR/SUPERVISORY BODY

ACCOUNTING STANDARDS

• Singapore Standards, equivalent to IFRS with modifications.

• New financial reporting framework, which is identical to IFRS, is planned to be effective for annual periods beginning on or after 1 January 2018 for Singapore listed companies with voluntary application for non-listed Singapore-incorporated companies.

SOLVENCY REGIME

• The RBC framework for insurers was introduced in 2004 by MAS.

• Supported by an industry consultation process in 2012, MAS reviewed the framework and issued details of the new risk-based capital regulatory calculations, called RBC 2, in 2014. The final industry consultation combined with a Quantitative Impact Study is expected for Q2 2016. An official implementation date has not been communicated yet, but MAS indicated that the industry will be given two years to comply with the new rules making 1 January 2019 a realistic date for introducing RBC2.

SOLVENCY ASSESSMENT

• **Regulatory capital requirement**: Singapore links its regulatory capital requirements to insurance, market, credit and asset concentration risk together with asset and liability mismatching. New explicit risk charges for operational risk, credit spread risk and insurance catastrophe risk will be introduced under the revised framework, RBC 2. The MAS also requires insurers to perform a series of prescribed stress tests on an annual basis to determine the robustness of their capital positions.

• **Group regulatory capital requirement**: Group solvency requirements are applicable to groups where MAS is the group-wide supervisor.

QUALITATIVE REQUIREMENTS

• Singapore has requirements on governance, internal controls, supervisory review and public disclosure.

• Additionally, insurers are required to undertake a formal ORSA, at least annually. The ORSA should encompass all reasonable foreseeable and relevant material risks of the insurer and identify the relationship between the risks, as well as the level and quality of financial resources needed. Tier 1 insurers have to submit their ORSA to MAS annually, whereas for smaller Tier 2 insurers it’s only every three years.
SOUTH AFRICA

REGULATOR/SUPervisory body

- Currently the South African Reserve Bank (SARB, www.resbank.co.za) has the responsibility for prudential regulation of banks and the Financial Services Board (FSB) for the prudential and market conduct regulation of insurers and other non-banking financial institutions. In future (post the enactment of the Financial Sector Regulation Bill) the Prudential Authority, under the auspices of the SARB, will be responsible for the prudential regulation of both banks and insurers and the FSB will become the Financial Sector Conduct Authority responsible for market conduct regulation.

ACCOUNTING STANDARDS

International Financial Reporting Standards.

Solvency Regime

- Major change in insurance regulation with upcoming Solvency Assessment and Management (SAM). SAM is a risk-based regulatory framework on the basis of three pillars that is considered equivalent to Solvency II but adapted to South African circumstances.

  - The framework will be enshrined in legislation by the Insurance Bill and is expected to be effective on 1 January 2017.

Solvency Assessment

- Regulatory capital requirement: The regulatory capital requirement calculation will capture a number of quantifiable risks including market, life underwriting, non-life underwriting, credit and operational risks. Business, liquidity, reputational and strategic risks, and any other risk that the insurer believes is relevant should be taken into consideration as part of the ORSA.

- Group regulatory capital requirement: Regulatory capital requirements are calculated for the single company.

  25 The solvency assessment provided here is based on the future prudential regulatory regime that will be given effect to through the Insurance Bill, which is currently serving before parliament.

- Risk measure and confidence level: Calibration is done at a 99.5 per cent confidence level over one year, applying a VaR of the basic own funds over a one-year time horizon.

- Internal model/standard formula: The standard formula to calculate the SCR is based on a modular approach, primarily using a scenario approach, even though a factor approach applies for some risks such as operational risk. The use of internal models is subject to defined criteria and a supervisor’s approval process.

Valuation

- Assets: Market consistency is the overriding principle used for the valuation of assets and liabilities. IFRS builds the accounting basis, explicitly set out in the SAM framework, and is mainly applied to assets and liabilities other than technical provisions.

- Liabilities: Liability measurement is performed on a current estimate plus margin over current estimate approach. The current estimate is a probability weighted discounted cash-flow calculation of all cash flows that are expected for the insurance contract, based on the best estimates of the insurer as at the valuation date.

Qualitative Requirements

The qualitative requirements provided here are based on the future prudential regulatory regime that will be given effect to through the Insurance Bill, which is currently serving before parliament.

- The SAM framework has a focus on the governance system, including the topics of board functions and composition, the risk management system, strategy and policies, internal control system; control functions and outsourcing.

- Additionally, insurers are required to undertake a formal ORSA process. An ORSA report has to be sent to the regulator on at least an annual basis.
SWITZERLAND

REGULATOR/SUPERVISORY BODY

- FINMA’s (www.finma.ch) mandate is to supervise banks, insurance companies, exchanges, securities dealers, collective investment schemes, and their asset managers and fund management companies. It further regulates distributors and insurance intermediaries.

ACCOUNTING STANDARDS

- Swiss GAAP and IFRS. The SST does not rely on or make reference to these.

SOLVENCY REGIME: SWISS SOLVENCY TEST (SST)

- The regime is principles-based and uses a risk-oriented approach to its supervision of insurance companies.
- The intensity of supervision is proportionate to the risk potential of an insurance company.
- The SST has been developed since 2003 and the legislation has entered into force in 2006, with a transitional period of 5 years. The SST is a fully risk-based system, using a total balance sheet that is fully market-consistent. Since 2007/8 insurance companies and groups need to submit a comprehensive SST report to FINMA.
- Since 2011 SST can be directly used by FINMA to enforce supervisory action based on a ladder on intervention. In 2015, the legal basis for the SST has been strengthened and revised.
- The European Union (Parliament, Commission and Council) have classified SST as fully equivalent to Solvency II. SST is the only regulatory systems that has been granted equivalence from the very beginning of Solvency II.

SOLVENCY ASSESSMENT

- Regulatory capital requirement: FINMA uses the SST as a supervisory tool, which adopts a risk-based approach using a total (i.e. no off-balance sheet items), fully market-consistent balance sheet.
- SST captures all risk to the market-consistent balance sheet of the insurance company or group.
- Operational risk is sometimes not required to be quantified in the SST. Despite this, for companies calculating both, the SST ratio could sometimes be lower than the SI ratio.
- Group regulatory capital requirement: For Swiss-based groups, the requirement is set both at solo and a group level (group SST).
- Risk measure and confidence level: SST sets the Required Capital Benchmark at a level needed to pursue the business planned for the next 12 months. The required capital benchmark is the 1 per cent TailVaR of the capital resources over a one-year time horizon (99 per cent confidence level).
- Internal model/standard formula: Insurance companies need to calculate their Required Capital Benchmark appropriately. If needed, they must use an internal model, especially where the FINMA developed standard models (which generally are stochastic models and not formulas) do not calculate the Required Capital Benchmark correctly. Internal models have to fulfil specific criteria and are subject to approval by the supervisor.

VALUATION

- Assets: Market (consistent) values for all assets
- Liabilities: Uses optimally risk reducing replication (giving rise to a best estimate) and a cost of capital MOCE (to cover the cost of Capital Resources during the entire run-off of the residual risk) for all liabilities. This implies truly risk-free rates and proper valuation of all options and guarantees.
- Supervisors have the full, unrestricted set of interventions available as they can perform any transaction at prevailing market prices.

QUALITATIVE REQUIREMENTS

Qualitative requirements are in line with Solvency II and include an ORSA.
UNITED STATES

REGULATOR/SUPERVISORY BODY

• Insurance companies are supervised by state insurance commissioners.

• The Federal Reserve has obtained supervisory powers for designated systemically important insurers.

• The National Association of Insurance Commissioners (NAIC, www.naic.org) is the national standard-setting organisation created and governed by the chief insurance regulators from the 50 states, the District of Columbia and five U.S. territories. It has an important coordinating function, provides regulatory support for state insurance departments and develops model acts, which are taken up by individual states.

ACCOUNTING STANDARDS

• U.S. statutory accounting principles.

SOLVENCY REGIME

• The NAIC’s Solvency Modernization Initiative (SMI) started in June 2008 and was completed in 2012, focuses on five key solvency areas: capital requirements, international accounting, insurance valuation, reinsurance, and group regulatory issues.

• The principles-based approach to valuation of life insurance liabilities is to be effective in all U.S. states from 1 January 2017.

SOLVENCY ASSESSMENT

• **Regulatory capital requirement**: The U.S. risk-based capital (RBC) formula is primarily factor-based and considers all risks that are quantifiable and material for the industry, i.e. the U.S. framework typically covers all risks to some degree even if they are not explicitly reflected within the calculation of required capital.

• Strategic risk, reputational risk and currency risk are not explicitly accounted for in the RBC. The factors of the formula are derived from historical industry-wide data, whilst internal models are used for interest rate and market risk only to some extent.

• **Group regulatory capital requirement**: Regulatory capital requirements are calculated for the legal entity insurer. Recently, an initiative to develop a calculation of group capital from a regulatory perspective has been launched.

• **Risk measure and confidence level**: The formula was not designed to produce a minimum level of aggregate RBC at an explicit level representing a certain statistical outcome. However, the components and factors of RBC, such as asset risk or the catastrophe risk charge, do have a statistical calibration base.

• **Internal model/standard formula**: Internal model application, using prescribed parameters and time horizons, is limited to specific products in the life RBC formula and will be utilised in the catastrophe risk module currently under development for P/C insurers. For the (limited) cases where partial internal models are allowed for life insurance, these models do not need a supervisory authority’s approval as regulatory minimum/floor scenarios persist.

VALUATION

• **Assets**: Regulatory reporting is based on statutory accounting principles (SAP), applying various prescribed modifications to U.S. GAAP and using an amortised cost basis for most bonds and fixed-income assets rather than market values (e.g. used for equities and other similar investments). Additionally, assets are subject to impairment testing.

• **Liabilities**: Life and health insurance liabilities are valued with significant prudence, according to SAP and distinct from U.S. GAAP, whilst most non-life (property/casualty) liabilities are valued aligned with U.S. GAAP. Liabilities are subject to adequacy testing, utilising a minimum reserve that uses locked-in assumptions as well as a cash-flow projection model with an ‘unlocked book yield’ approach. The discount rate formula is intended to represent a prudent estimate of the investment earnings of a typical insurer’s investment portfolio over a long time horizon. For non-life insurance, discounting is not used except for qualifying claims in certain defined lines of business (e.g. workers’ compensation and certain long-term disability policies).
QUALITATIVE REQUIREMENTS

- The Corporate Governance Annual Disclosure Model Act of 2014 requires insurers to disclose their corporate governance framework and structure.

- An ORSA has to be performed by larger insurers and insurance groups from 2015.
9. Annex 2: Survey Questionnaire
1. VALUATION PRINCIPLE

a. Are assets and liabilities measured consistently, i.e. based on comparable principles (for example, at market-consistent values?) If not, please explain shortly the difference in principles used.

b. Is valuation based upon local GAAP? Is local GAAP adjusted? How?

c. Is valuation based upon IFRS? Is IFRS adjusted? How?

d. Are there important differences in the methodologies used for life and non-life, respectively?

Especially on liability measurement:

i. Are companies required to base liability valuation on updated assumptions?

ii. Are liabilities estimated independently from premiums?

iii. If liabilities are based on cash-flow projections, are conservative assumptions made or do you calculate a current estimate? Is discounting of cash-flow projections used?

iv. If a current estimate is used, is a margin over current estimate added to it?

v. Is the discount rate used linked to assets? Or which discount rate is used?

vi. Are there countercyclical elements, reflecting the degree of illiquidity, in the discount rate used? Or would you consider countercyclical elements to be built into the valuation approach?

2. RISK SENSITIVITY

a. Does the solvency capital requirement reflect the underlying risks of the insurance company?

b. Are all quantifiable risks taken included in the prescribed formula for calculating the capital requirement?

c. Is the formula for the calculation of the solvency capital requirement based on a factor or a scenario approach?

d. Would you say that the solvency requirements provide incentives for sound risk management, for example by proper reflection of risk diversification and risk management?

e. Are there any risks not taken into account? Which ones and how/where are they considered?

f. Is the impact of risk mitigation techniques allowed or are there restrictions?

3. CALIBRATION

a. Is the solvency requirement explicitly set at a predetermined confidence level? Which level? What is the risk measure and time horizon?

b. Are management actions allowed for in the calculation of required capital?

c. Is the confidence level set taking into account the existence of an insurance guarantee protection scheme? (besides capital requirements)

4. QUALITATIVE REQUIREMENTS

a. Does the solvency regime besides quantitative requirements also focus on governance issues, the supervisory reporting process, reporting requirements and other qualitative requirements etc.? Which?

b. Are companies required to undertake a formal ORSA (own risk and solvency assessment) process?

5. GROUP ISSUES

a. Do groups have to calculate a group solvency requirement or are solvency capital requirements only calculated for solo entities? Or is there a requirement to do both?

b. If a group solvency capital requirement is calculated, is account taken of diversification effects at group level?

c. Are diversification effects fully taken into account?

d. Is there a requirement to perform an ORSA process at group level?
6. INTERNAL MODELS

a. Is it allowed to calculate the solvency capital requirement based upon an internal model?

b. What is the scope of the internal model, only required capital or also available capital (valuation)?

c. Are there specific requirements which must be met when preparing an internal model (such as predefined parameters by supervisors?)

d. Who determines the criteria for approval of internal models?

e. Who is responsible for approving internal models—the (group) supervisor? Or is responsibility delegated to an external party?

7. MULTI-LAYER SUPERVISORY SYSTEM

a. Are multi-layer groups required to calculate a solvency capital requirement at each level of the group?

8. QUALIFYING CAPITAL

a. Is the quality of capital resources controlled via a subdivision in tiers or handled via eligibility criteria or for example prudence in the balance sheet valuation?

b. If tiering is applied, how many tiers are required?
Acknowledgements

This report has been conducted by The Geneva Association. Dr Matthias Schmautz, independent researcher and lecturer, has assisted The Geneva Association as an analyst and writer of the report, whilst Professor Karel Van Hulle acted as a reviewer.

We especially thank the responding insurance groups and insurance regulators for having taken the time to reply to our structured questionnaire.
This report demonstrates that there is much common ground with regard to the main objectives and key elements of existing and developing solvency regimes. The International Association of Insurance Supervisors (IAIS) is currently developing its global Insurance Capital Standard (ICS), as part of its Common Framework for the supervision of internationally active insurance groups (ComFrame). It is clear that the common elements identified in this report are interpreted and applied in different ways. The IAIS will have to take into account these differences as they strive towards their goal to introduce the ICS.
