# Actuarial Fairness in Context

Overview of ethical principles

# AI ethics principles

# AI ethics principles

**Non-maleficence:**  
Avoid harm

**Beneficence:**  
Advance the flourishing of people and societies

**Procedural fairness:**  
Promote fair treatment

**Distributive fairness:**  
Promote equitable outcomes

# AI ethics principles

**Non-maleficence:**  
Avoid harm

**Beneficence:**  
Advance the flourishing of people and societies

**Procedural fairness:**  
Promote fair treatment

**Distributive fairness:**  
Promote equitable outcomes

**Comprehension:**  
Explain how to use and when to trust AI

**Control:**  
Allow people to modify or override AI when appropriate

# The need to manage tradeoffs

Core ethical principles are **ideals** to be strived for.

It's often **impossible** to simultaneously satisfy all of them

**Trade-offs** typically must be deliberated

**Innovations** can be explored to make tradeoffs less acute

Think of the ethical principles as **design considerations**.

How many relevant items are selected?  
e.g. How many sick people are correctly identified as having the condition.

Sensitivity =

How many negative selected elements are truly negative?  
e.g. How many healthy people are identified as not having the condition.

Specificity =

12 / 13

### What should the self-driving car do?

In this case, the self-driving car with sudden brake failure will swerve and crash into a concrete barrier. This results in:

- The deaths of an elderly man, an elderly woman and a man.

In this case, the self-driving car with sudden brake failure will continue ahead and drive through a pedestrian crossing ahead. This will result in:

- The deaths of a man, a girl and a boy.

Note that the affected pedestrians are flouting the law by crossing on the red signal.

MIT (Web-Ceremonist)

1

## IMPACT

The moral quality of a technology depends on its consequences. Risks and benefits must be weighed.

- Non-maleficence:** Avoid harm
- Beneficence:** Advance the flourishing of people and societies

# Ethics and quality control

## Artificial Intelligence—The Revolution Hasn't Happened Yet

by Michael I. Jordan

She said, “Ah, that explains why we started seeing an uptick in Down syndrome diagnoses a few years ago. That’s when the new machine arrived.”

### Relationship between ethics and quality control

- Evaluate data provenance
- Ensure operating environment is suitably “regularized” (e.g., in the case of autonomous vehicles)
- Ensure end-users are trained and have a good “mental model” of the technology
- Don’t neglect the “science” part of data science – need for scientifically informed **judgment** in building and using algorithms

# AI and human autonomy

*Individual autonomy: The capacity to be one's own person, to live one's life according to reasons and motives that are taken as one's own and not the product of manipulative or distorting external force.*

— Stanford Encyclopedia of Philosophy

— 3 —  
**AUTONOMY**  
People should be able to make their own choice, free of manipulative forces.

✓ **Comprehension:** Explain how to use and when to trust AI

⏻ **Control:** Allow people to modify or override AI when appropriate

SCIENTIFIC AMERICAN **CELEBRATING 175 YEARS**

## Will Democracy Survive Big Data and Artificial Intelligence?

We are in the middle of a technological upheaval that will transform the way society is organized. We must make the right decisions now

By Dirk Helbing, Bruno S. Frey, Gerd Gigerenzer, Ernst Hafen, Michael Hagner, Yvonne Hofstetter, Jeroen van den Hoven, Roberto V. Zicari, Andrej Zwitter on February 25, 2017

But it won't stop there. Some software platforms are moving towards “persuasive computing.” In the future, using sophisticated manipulation technologies, these platforms will be able to steer us through entire courses of action, be it for the execution of complex work processes or to generate free content for Internet platforms, from which corporations earn billions. *The trend goes from programming computers to programming people.*

# AI and human autonomy

Choice architecture (“Nudge”) is often criticized as a type of manipulation that undermines human autonomy.

Reciprocal Determinism  
in the Person-Situation Interaction

# Procedural justice: fairness and transparency of the decision process

- **Perfect procedural justice** – a procedure that is guaranteed to give the desired outcome.
  - E.g.: the person who cuts the cake is the last one to choose a slice
  - We don't have this in actuarial science because of uncertainty around any estimate of  $E[\text{loss}]$
- **Imperfect procedural justice** – the procedure is not guaranteed to give the desired outcome
  - E.g.: a criminal trial. Sometimes guilty go free and vice versa
  - This maps onto actuarial fairness
- **Pure procedural justice** – no criterion for the desired outcome
  - E.g.: gambling
  - Does this map onto price optimization? Two policyholders with the same risk profile could be charged different amounts.

# Actuarial Fairness – Kenneth Arrow

“Suppose therefore, an agency, a large insurance company plan, or the government, stands ready to offer insurance against medical costs on an actuarially fair basis; that is, if the costs of medical care are a random variable with mean  $\mu$ , the company will charge a premium  $\mu$ , and agree to indemnify the individual for all medical costs. Under these circumstances, the individual will certainly prefer to take out a policy and will have a welfare gain thereby.”

# Actuarial Fairness – CAS

Principle 1: A *rate* is an estimate of the expected value of future costs.

Ratemaking should provide for all costs so that the insurance system is financially sound.

Principle 2: A rate provides for all costs associated with the transfer of risk.

Ratemaking should provide for the costs of an individual risk transfer so that equity among insureds is maintained. When the experience of an individual risk does not provide a credible basis for estimating these costs, it is appropriate to consider the aggregate experience of similar risks. A rate estimated from such experience is an estimate of the costs of the risk transfer for each individual in the class.

Principle 3: A rate provides for the costs associated with an individual risk transfer.

Ratemaking produces cost estimates that are actuarially sound if the estimation is based on Principles 1, 2, and 3. Such rates comply with four criteria commonly used by actuaries: reasonable, not excessive, not inadequate, and not unfairly discriminatory.

Principle 4: A rate is reasonable and not excessive, inadequate, or unfairly discriminatory if it is an actuarially sound estimate of the expected value of all future costs associated with an individual risk transfer.

## Machine Bias

There's software used across the country to predict future criminals. And it's biased against blacks.

by Julia Angwin, Jeff Larson, Surya Mattu and Lauren Kirchner, ProPublica

May 23, 2016

### Prediction Fails Differently for Black Defendants

	WHITE	AFRICAN AMERICAN
Labeled Higher Risk, But Didn't Re-Offend	23.5%	44.9%
Labeled Lower Risk, Yet Did Re-Offend	47.7%	28.0%

### Wisconsin Supreme Court (2016):

- Judges can use risk scores.
- But the scores cannot be a “determinative” factor in whether the defendant is jailed or gets probation.
- Judge must be given a warning about the limits of the algorithm’s accuracy.

# Inherent Trade-Offs in the Fair Determination of Risk Scores

Jon Kleinberg, Sendhil Mullainathan, Manish Raghavan

(Submitted on 19 Sep 2016 (v1), last revised 17 Nov 2016 (this version, v2))

Fact in the world:  
Higher base rate for purple than green

Predictive parity: "high risk" means **2/3 chance of being re-arrested** for each group

# Inherent Trade-Offs in the Fair Determination of Risk Scores

# (How) Does this Apply to Insurance?

Fairness and Bias in Actuarial Applications

Sense & Sensitivity: Should fairness be a reason to eliminate predictive insurance rating factors?

actu

“During the last two congressional sessions, legislators have introduced bills to eliminate so-called “income proxies” including credit scoring, education level and employment status that could greatly impact how actuaries develop rates. In 2021 three states, Colorado, Michigan and Washington, either enacted legislation or implemented regulation in response to those who insist personal auto insurance rates are unfair or discriminatory.”

cover STORY

## Sense & Sensitivity: Should fairness be a reason to eliminate predictive insurance rating factors?

BY ANNMARIE GEDDES BARIBEAU

APRIL 5, 2022

BUSINESS AND TECHNOLOGY

EMERGING ISSUES

For more than 70 years, insurers and insurance regulators have been sensitive to the issue of potentially discriminatory or unfair rating factors.

# Seemingly Obvious Example: Personal Auto Policy sold by a Stock Insurer

- **Possible View:** Insurance pool is a risk sharing device, everyone should pay their expected costs (includes expenses and profits)
  - Focus on “procedural fairness”: Two individuals with the same risk should pay the same premium
  - Procedural Fairness  $\approx$  Actuarial Fairness
  - No need to worry about biases and tradeoffs (?)
- **But: Government mandates car liability coverage, car insurance regulated**

# Thought Experiment in Personal Auto

- Risk classes (true – unknown – and imperfectly classified):
  - Low risk
  - High risk
- Two groups of consumers:
  - Protected **Group A**, riskier on average, poorer on average
  - **Group B**, less risky on average, wealthier on average
- Coverage options:
  - (None)
  - Minimum
  - Premium

# Who benefits from insurance mandate?

- Without insurance:
    - More likely that member of Group A is at fault
    - More likely that member of Group A can't pay claim out-of-pocket
    - More likely that member of Group B suffers financial loss (on net)
  - With actuarially fair insurance, everyone pays their share
- Insurance mandate, on net, is a **transfer from Group A to Group B**  
...although everyone may be better off because insurance avoids surprises...  
("consumption smoothing")
- Focus on procedural/actuarial fairness appropriate?

# So why not drastically limit risk classification? (e.g., charge everyone a flat price for coverage)

- Cross subsidization from Group B to Group A – maybe OK?
- Less competition? Limit realized cost savings?
- Issues around **adverse selection** and **moral hazard**:
  - All risky participants will sort into higher coverage
  - Premiums will increase
- Low risk participants, also and especially from Group A, worse off
  - Possible that even Group A, as a whole, is worse off (“welfare”)
  - Even more pronounced for Group B

Not simple, (normative) tradeoffs we have to navigate...

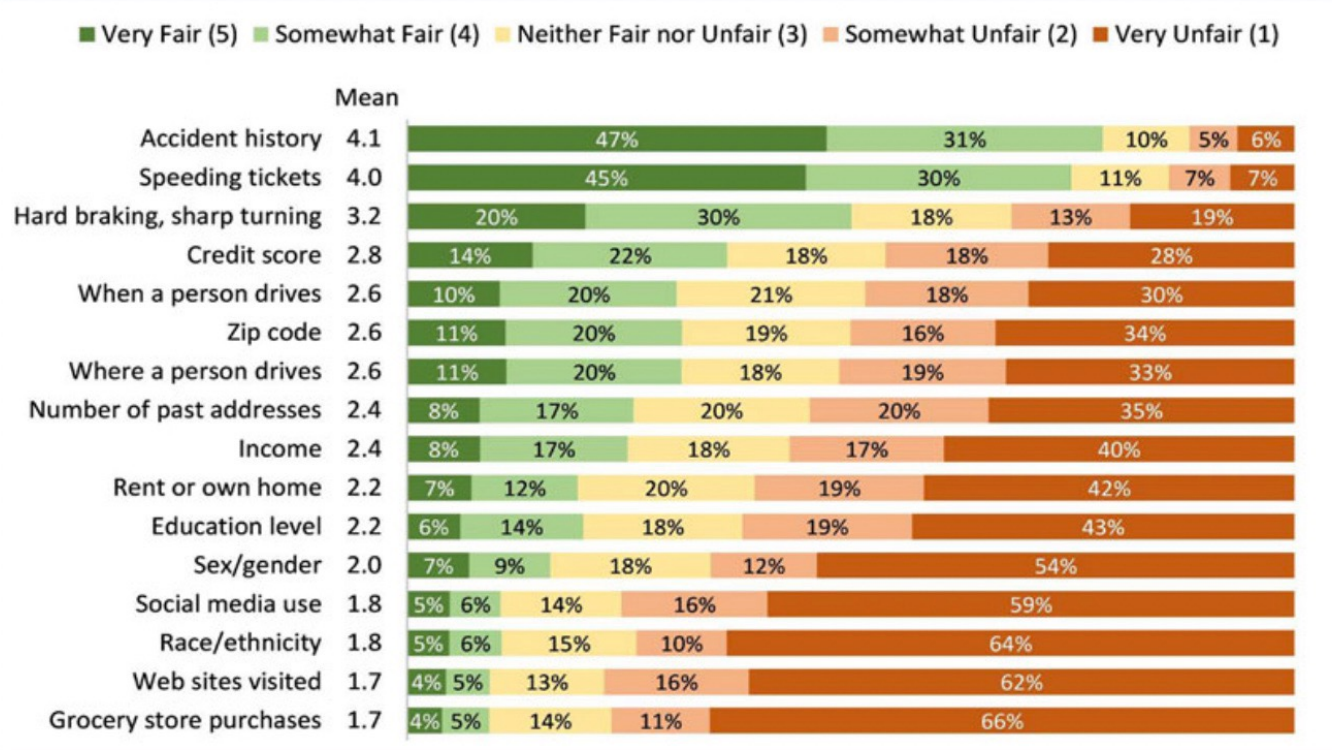

The screenshot shows the North American Actuarial Journal website. At the top left is the journal's logo and name. Below it are two buttons: 'Submit an article' (green) and 'Journal homepage' (blue). A search bar is located at the top right. On the left side, there are statistics: 2,091 Views, 0 CrossRef citations to date, and 0. In the center, there is a 'Listen' button with a play icon. The main article title is 'The Discriminating (Pricing) Actuary' by Edward W. (Jed) Frees & Fei Huang, published online on 06 Aug 2021.

What variables to discriminate on (Avraham, 2018; Prince & Schwarcz, 2020):

- If I control the characteristic, it is ok to use it
- If the variable changes over time (mutable, e.g. age), ok to use it (benefit at some point)
- Acceptable if a variable causes an insurance event (cancer in life insurance)
- More acceptable if correlation is higher (better predictors)
- Avoid if variable reinforces existing discrimination
- If inclusion inhibits socially valuable behavior, don't use

→ But there are many grey areas and algorithms are smart (proxy or indirect discrimination)

**Figure 1. How Americans rate the fairness of companies using various types of data in car insurance decisions.**

**Notes:** Survey conducted by YouGov for the author February 11 to 14, 2019. N = 1, 095. Values weighted to be nationally representative.

**Source:** Barbara Kiviat, "Which Data Fairly Differentiate? American Views on the Use of Personal Data in Two Market Settings," *Sociological Science* 8: 26-47. © 2021.

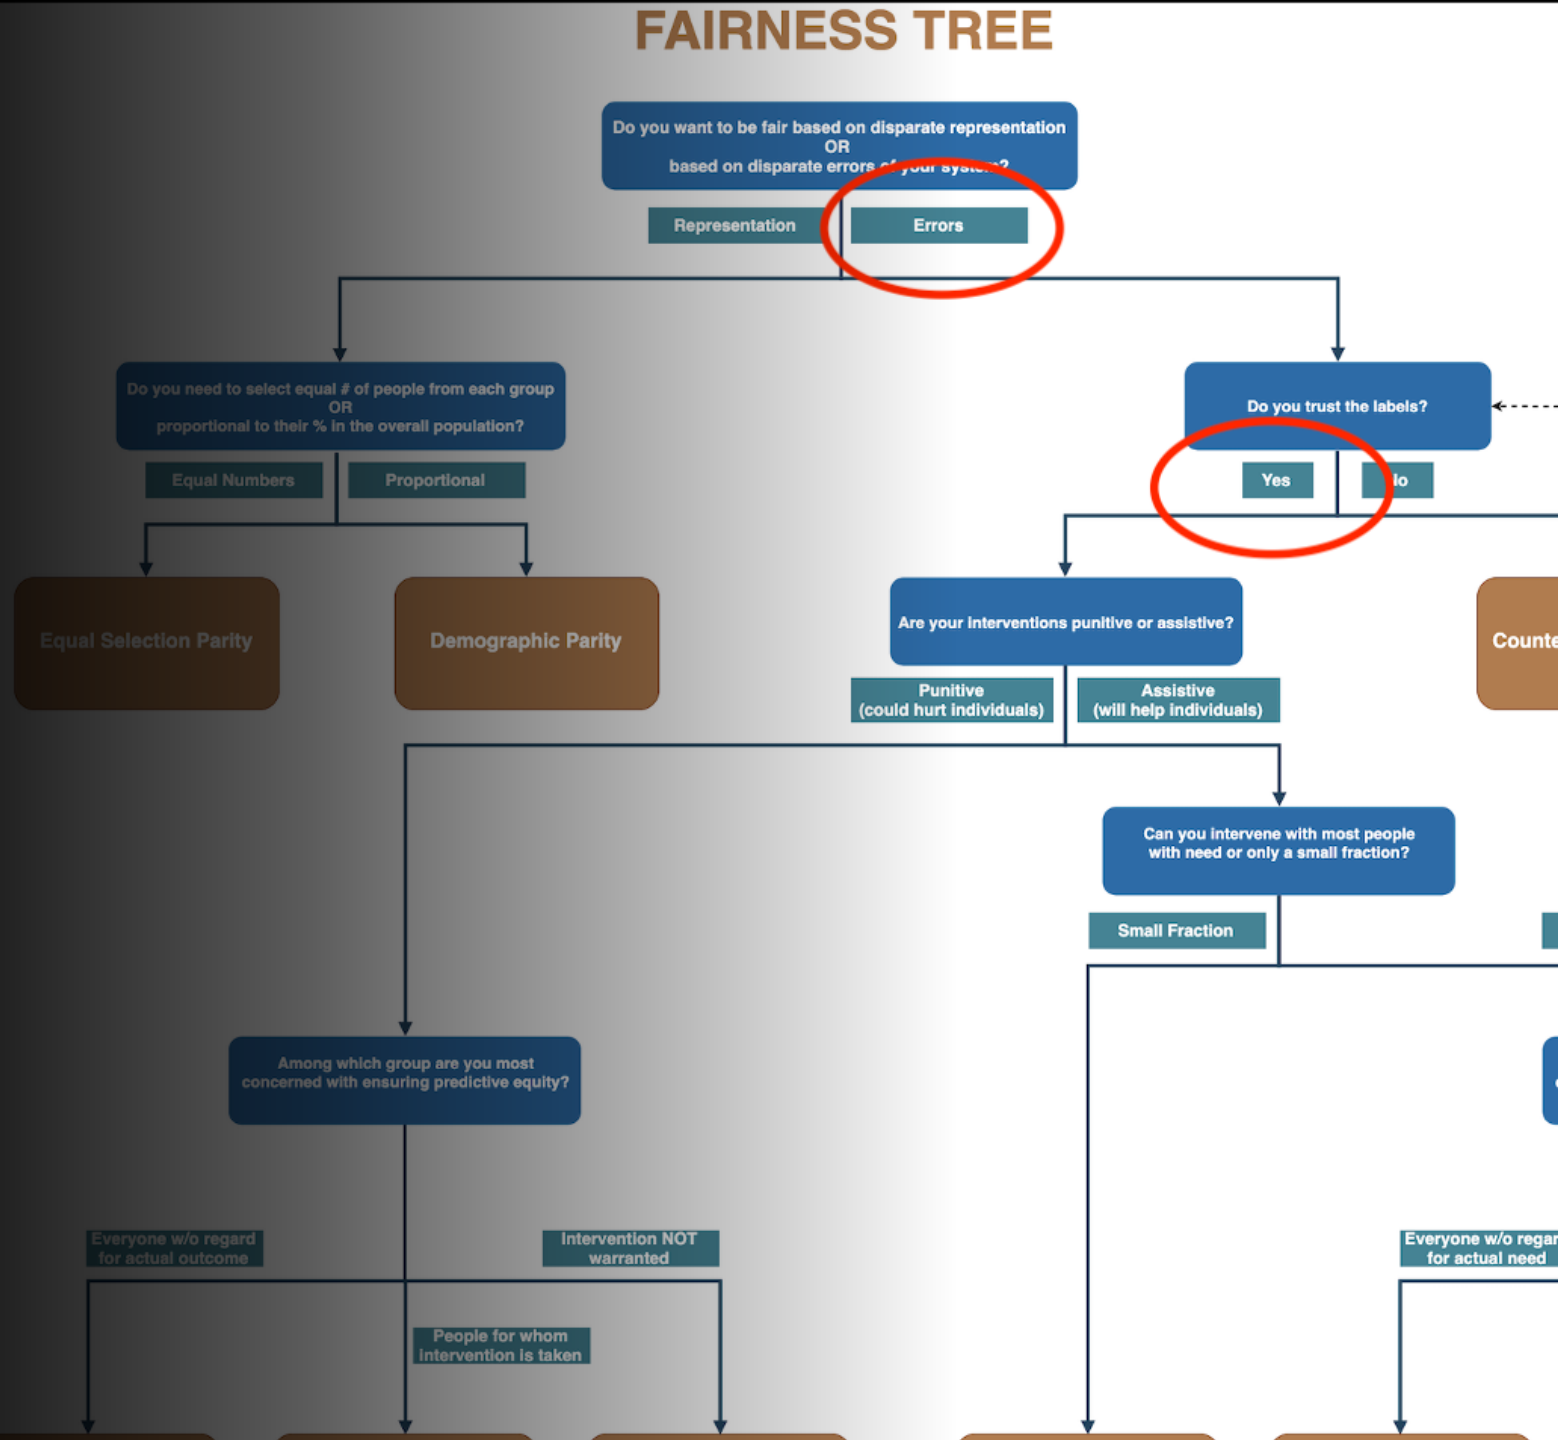

Discriminatory to use location if people in low cost, high crime neighborhood can't move?

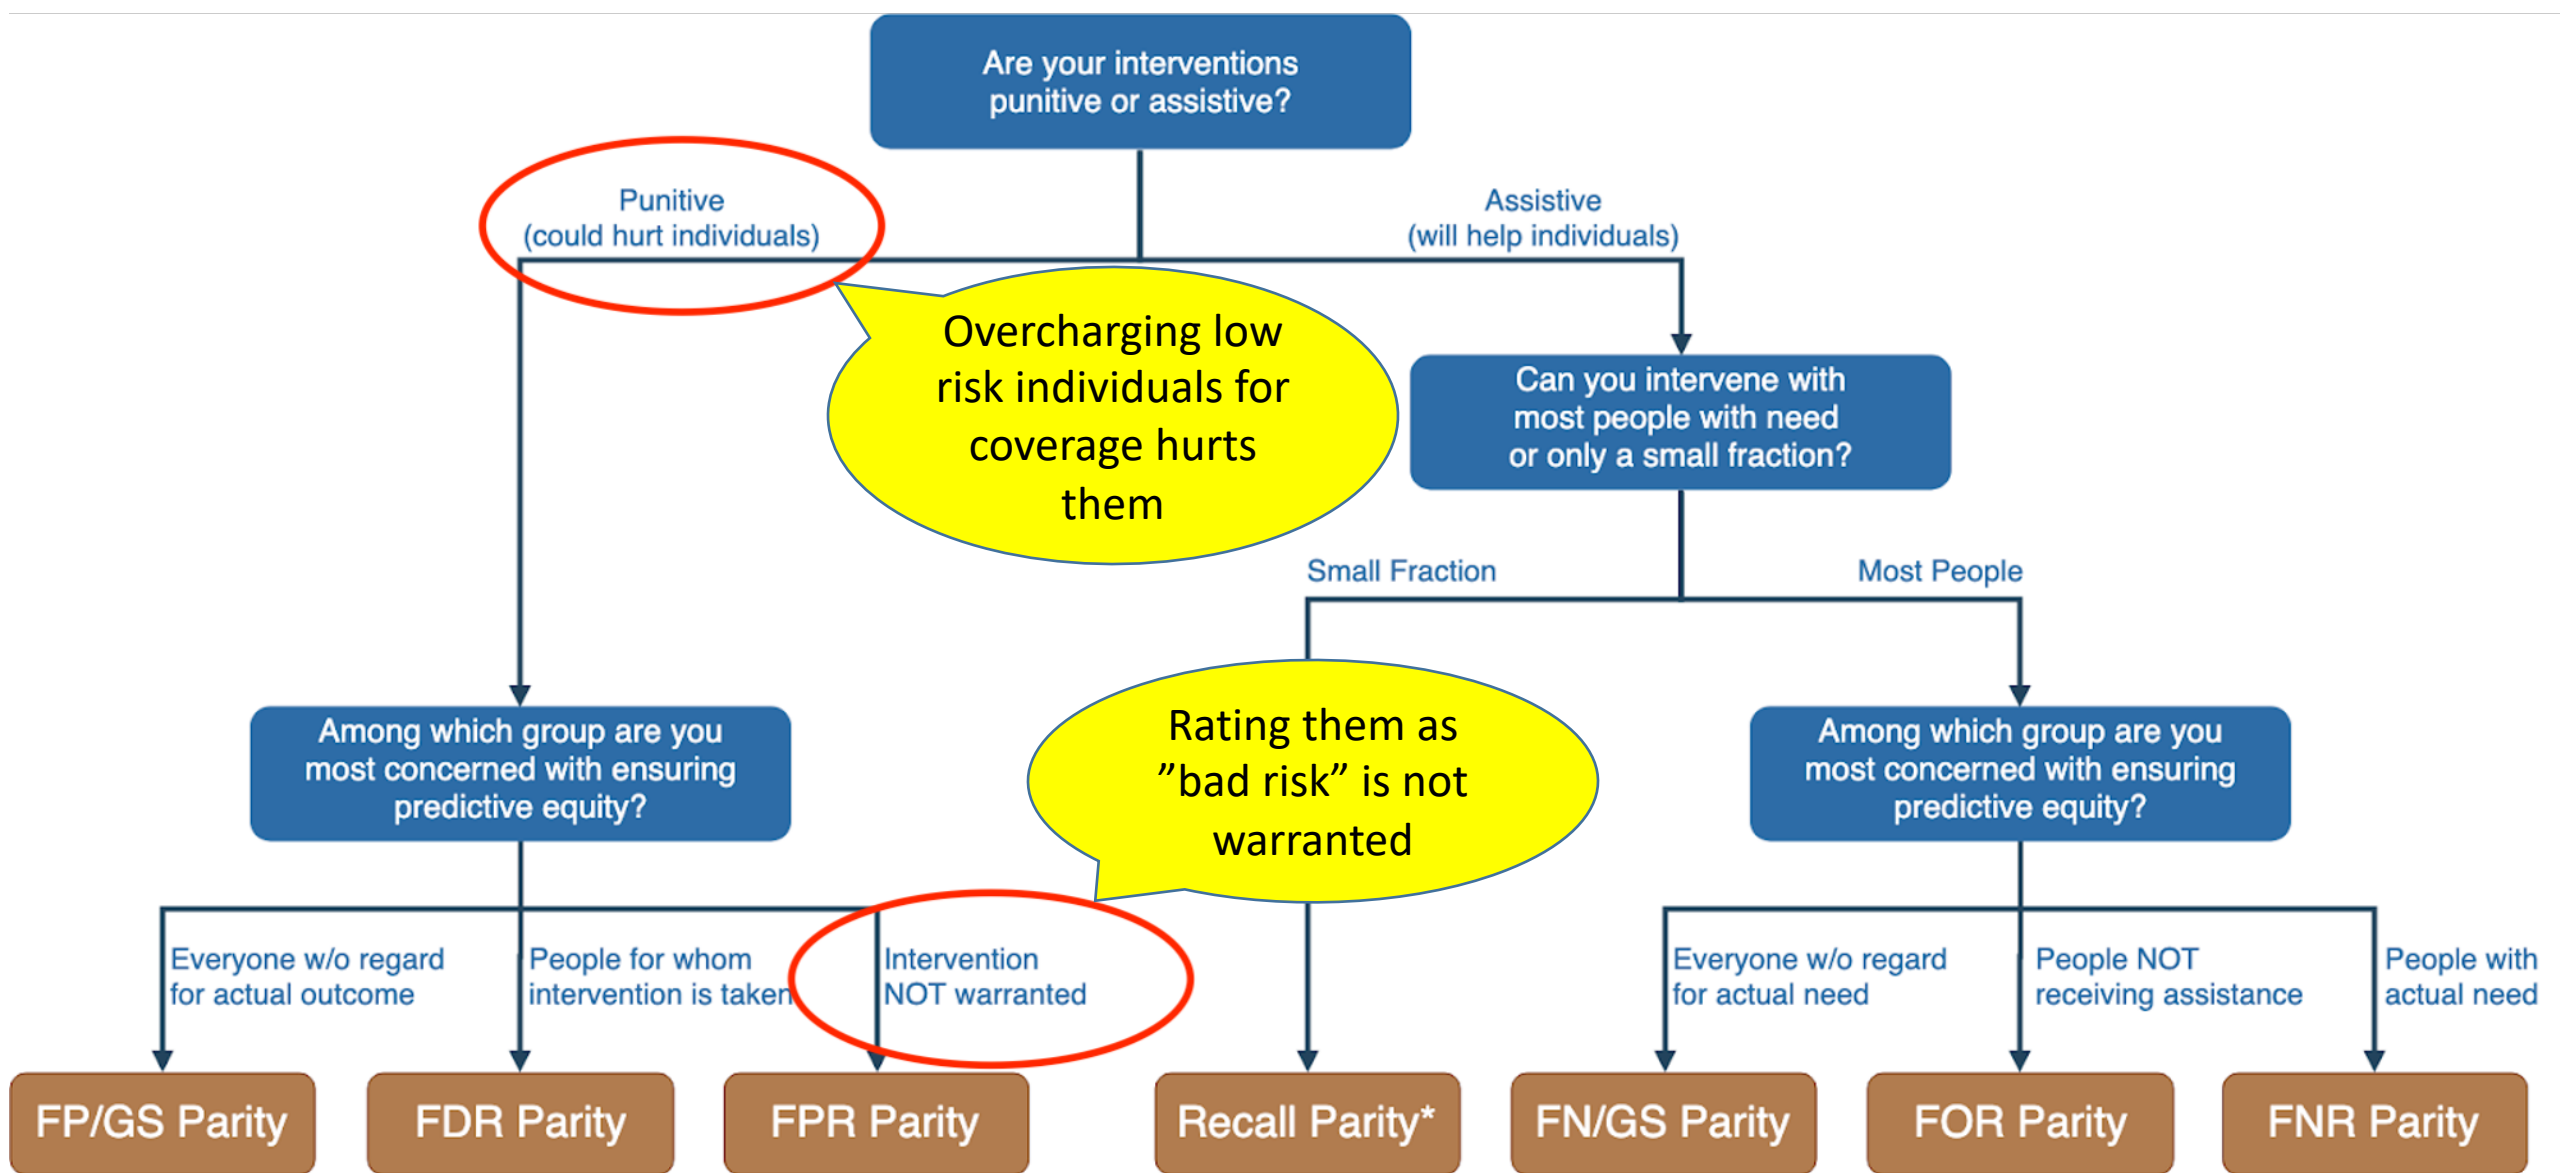

Discriminatory to use location if people in low cost, high crime neighborhood can't move?

Telematics: Tracking time of day unfair to blue collar workers who are more likely to be working at night. When a person drives was considered less fair than credit scoring. (Kiviat study)

OK, let's worry about fairness in ML algorithms – what do we care about?

Rayid Ghani's Tree

Rate of individuals erroneously classified as bad drivers should be the same in Groups A and B (or, in other words, you should not get penalized for being a member of Group A)

# How to ensure FPR Parity?

## Aequitas

An open source bias audit toolkit for machine learning developers, analysts, and policymakers to audit machine learning models for discrimination and bias, and make informed and equitable decisions around developing and deploying predictive risk-assessment tools.

# Is Fairness viable?

- If ascertaining desired fairness possible at low cost regarding accuracy, possibly yes!
  - But what is low cost? And how does one convince competitors?
- Likely depends on type of insurance:

Sense & Sensitivity  
Should fairness be a reason  
to eliminate predictive insurance  
rating factors?

“Nobody knows what constitutes an acceptable balance of correlation to a protected class versus correlation to a business operation [...] And there isn’t even data for many of the protected classes to even begin the analysis [...Laws...] will have a negative impact on all companies and especially smaller companies who would have to comply with the law.”  
(Dave Snyder, APCIA)

cover STORY

## Sense & Sensitivity: Should fairness be a reason to eliminate predictive insurance rating factors?

BY ANNMARIE GEDDES BARIBEAU

APRIL 5, 2022 BUSINESS AND TECHNOLOGY

“While assuring fairness to everyone’s satisfaction is a laudable objective worthy of pursuit, it is elusive by its very nature. Fairness, or impartiality, can be a matter of perception.”

“Developing fair rates requires a sensitive balance between multiple rating factors to assure fairness to policyholders while helping insurers achieve business goals.”

For more than 70 years, insurers and insurance regulators have been sensitive to the issue of potentially discriminatory or unfair rating factors.

### Methods for Quantifying Discriminatory Effects on Protected Classes in Insurance

By Roosevelt Mosley, FCAS, CSPA and Radost Wenman, FCAS

As the insurance industry focuses attention on potential racial bias across all practice areas, this paper examines three approaches to defining and measuring fairness in predictive models. It also provides an overview of several bias mitigation techniques that can be performed during the input, modeling, or output phase of a model once a set of fairness criteria has been adopted.

### Approaches to Address Racial Bias in Financial Services: Lessons for the Insurance Industry

By Members of the 2021 CAS Race and Insurance Research Task Force

This paper examines issues of racial bias in lending practice for mortgages, personal and commercial lending, as well as credit-scoring. It looks at these four areas and describes solutions intended to address any potential bias, which may include government intervention, internal bias testing and monitoring measures, and development of new products to mitigate bias.

[Read More](#)

### Defining Discrimination in Insurance

By Kudakwashe F. Chibanda, FCAS

This paper defines several terms that are currently being used in discussions around potential discrimination in insurance – protected class, unfair discrimination, proxy discrimination, disparate impact, disparate treatment, and disproportionate impact – and provides historical and practical context for them. It also illustrates the inconsistencies in how different stakeholders define these terms.

# The need for AI governance and auditing

*An emerging data science sub-profession: the algorithm auditor.*

- Algorithm auditing should be founded on **more than machine learning**. Social science methodology, ethics, regulation, human-centered design should be brought to bear.
- Often the goal is **to identify tradeoffs** that must be deliberated at societal levels. (e.g., sensitivity/specificity; tradeoffs in different conceptions of “fairness”)
- “Since actuaries are intimately acquainted with rating factors and the data behind them and are required to uphold the highest **standards of professional independence**, they should have a greater voice in the rating variable conversation.” (A. Baribeau)
- Algorithm auditing should ultimately become the purview of a **learned (data science) profession** with proper credentialing, standards of practice, disciplinary procedures, ties to academia, continuing education, training in ethics, regulation, and professionalism

**Harvard  
Business  
Review**
