

Using Multiple Modeling Techniques to Estimate First Floor Height

Objectives

- Attendees will be able to identify an expert model and understand when to use one.
- Attendees will learn techniques to slice data and determine weights for blending of models
- Attendees will learn techniques to align model results to calibrate the final model.

First Floor Height Case Study

What is first floor height?

Background / FEMA

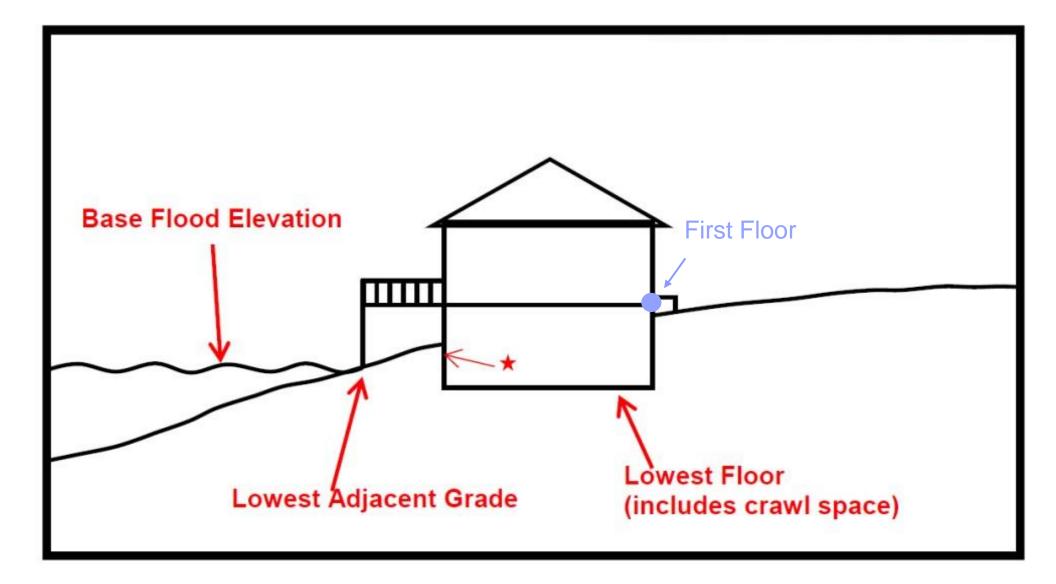

- FEMA & NFIP (*) offer subsidized flood insurance to individuals residing within Special Flood Hazard Area's (SFHA's ("FEMA 100 year flood plain")
- FEMA and the NFIP have endeavored to create a risk rating and flood risk insurance policy pricing system that aligns to current risk rating/risk pricing methodologies for all other perils (wind/hail/fire, etc.): "Risk Rating 2.0"

* FEMA: The Federal Emergency Management Agency (FEMA) NFIP: National Flood Insurance Program

Problem Statement / The First Floor Height of a house

- CoreLogic provided data, tools and services integral to Risk Rating 2.0's development.
- Based on the above, FEMA/NFIP undertook the unusual process to sole source several key deliverables required in the Risk Rating 2.0 algorithm and deliverable to CoreLogic, including:
 - Reconstruction Cost Values
 - Geocoding (inc. building structure footprints)
 - Spatial Flood mapping
 - Specific building structure characteristics relevant to flood issues
 - Parcel boundary data
 - First floor height, inclusive of highest adjacent grade and lowest adjacent grade details.

-

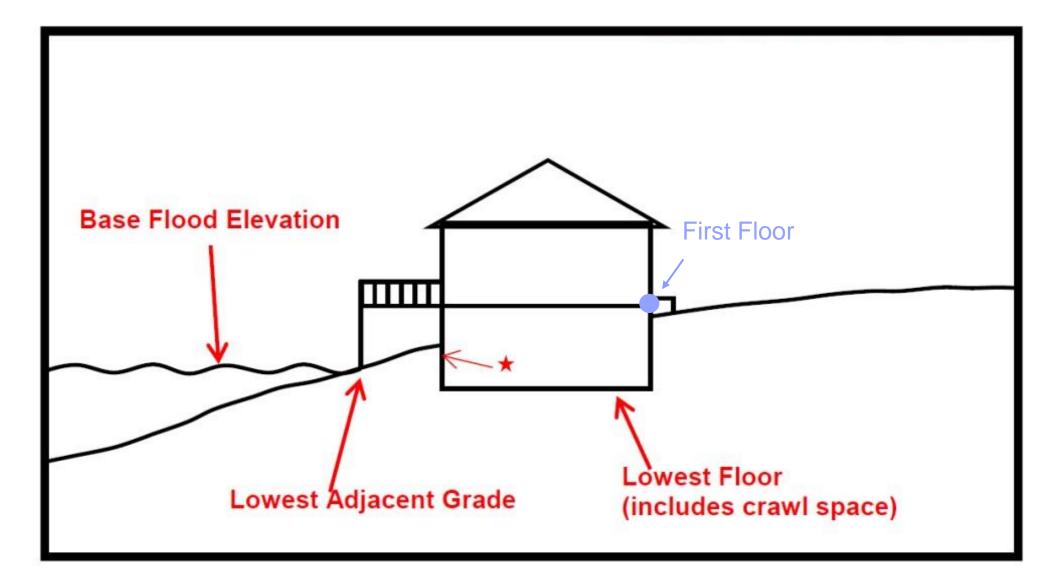

Flood Zones

- Flood Maps are drawn based on expected annual flooding chances.
- A common zone is the 100 year (AE to the right)
- If the house is elevated, flooding on the ground does not directly equate to flooding of the house.

First Floor Height Definition

Expert Model

a.k.a. expert system or rule-based system

Definition: A program designed to solve problems at a level comparable to that of a human expert in a given domain. [1]

These systems were a popular approach to AI in the 70s and 80s. Most AI research has moved on to statistical approaches now. However the expert system approach is still common and useful in applications, and provides a good paradigm to think about potential solutions through. [2]

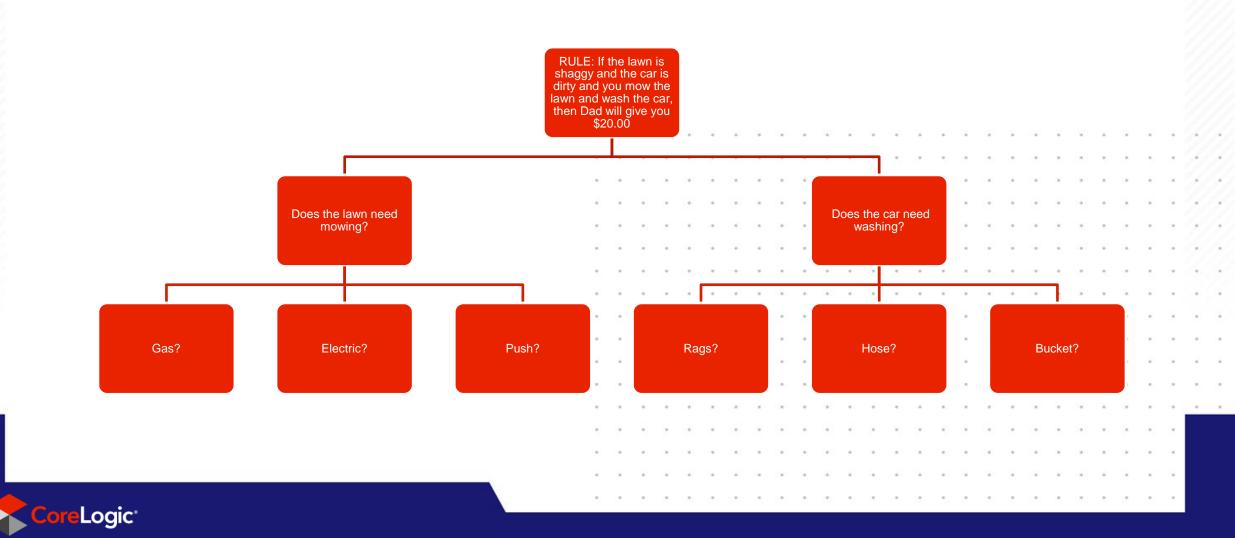

) Russell, S., & Norvig, P. (2002). Artificial intelligence: a modern approach.

Example

Goal: make \$20.00

Factors to Consider For an Expert System

- You lack sufficient data to build a statistical model
 - Too expensive
 - Impossible to collect
- Access to an expert in the field
- Deterministic systems
 - Physical systems
 - Studied cause and effect
 - Regulations
- Variable/Outcome Complexity
 - Too many variables or outcomes make it difficult to reason about a problem

CoreLogic[®] Find. Buy. Protect.

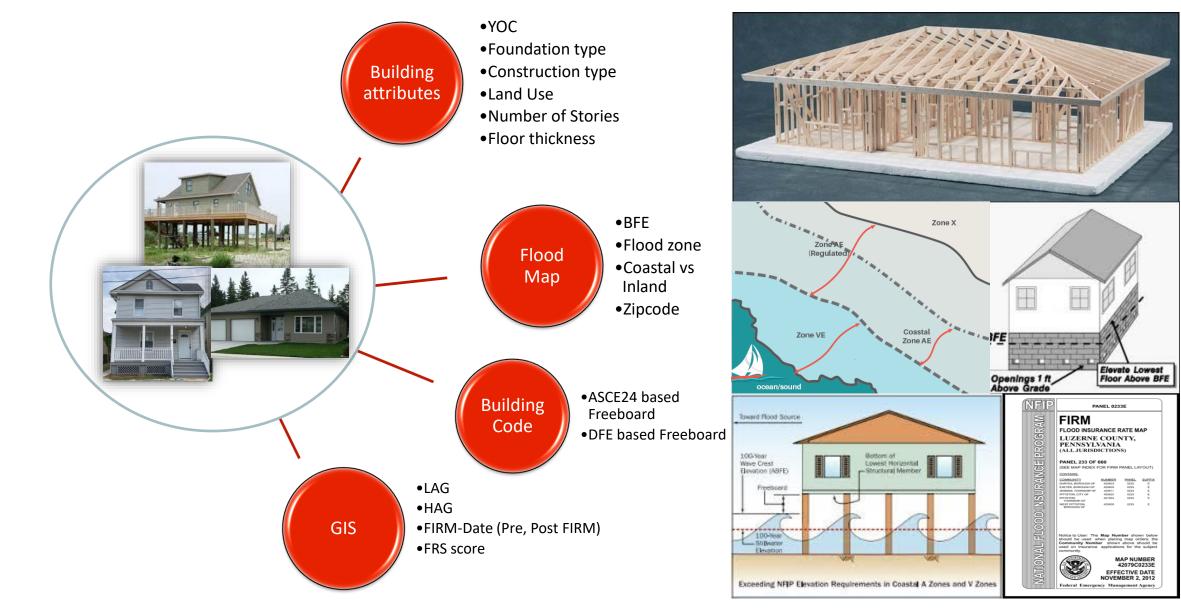

- It can also be a continuum between experts and statistical approaches.
 - Several statistical rule base approaches exist.

Key Inputs of FFH

Foundation Type

•	 Foundation Types are critical to understanding floor height The provide hard limits on how high a floor is There are informative averages for each type 	
•	They inform a great deal of the rule-based logic in the solution	
	They morn a great deat of the rate based togic in the solution	
	· · · · · · · · · · · · · · · · · · ·

	· · · · · · · · · · · · · · · · · · ·	

Foundation Type Examples

Basement

Pile

reLogic[®]

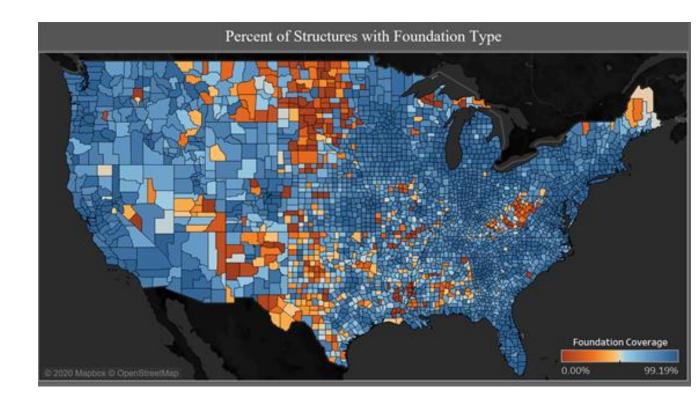

Slab

Data holes and the need for imputation

- Depending on regions, data coverage can vary in:
 - Granularity
 - Fill rate
 - Accuracy
- Where observed data is not available, there can be value in predicting property characteristics (e.g. Foundation Type)
- Predictions can be made, using neighboring properties of known and similar characteristics

Solution

Imagery Approach

- The first-floor height was also estimated using photogrammetric approaches.
- Several imagery models were built to refine and process the data to extract relevant components

Expert Model

- Civil Engineers and Hydrologists built the expert model ٠
